salt-cloud -f vn_delete opennebula name=my-virtual-network
salt-cloud --function vn_delete opennebula vn_id=3
```

salt.cloud.clouds.opennebula.vn_free_ar\(\text{\texttt{\textbackslash{}call=\textbackslash{}None, kwargs=\textbackslash{}None}}\)\)

Frees a reserved address range from a virtual network.

New in version 2016.3.0.

\textbf{vn\_id} The ID of the virtual network from which to free an address range. Can be used instead of \textbf{vn\_name}.
vn_name The name of the virtual network from which to free an address range. Can be used instead of
vn_id.

ar_id The ID of the address range to free.

CLI Example:

```
salt-cloud -f vn_free_ar opennebula vn_id=3 ar_id=1
salt-cloud -f vn_free_ar opennebula vn_name=my-vn ar_id=1
```

salt.cloud.clouds.opennebula.vn_hold(call=None, kwargs=None)
Holds a virtual network lease as used.

New in version 2016.3.0.

vn_id The ID of the virtual network from which to hold the lease. Can be used instead of vn_name.

vn_name The name of the virtual network from which to hold the lease. Can be used instead of vn_id.

path The path to a file defining the template of the lease to hold. Syntax within the file can be the usual
attribute=value or XML. Can be used instead of data.

data Contains the template of the lease to hold. Syntax can be the usual attribute=value or XML. Can be used
instead of path.

CLI Example:

```
salt-cloud -f vn_hold opennebula vn_id=3 path=/path/to/vn_hold_file.txt
salt-cloud -f vn_hold opennebula vn_name=my-vn data="LEASES=[IP=192.168.0.5]"
```

salt.cloud.clouds.opennebula.vn_info(call=None, kwargs=None)
Retrieves information for the virtual network.

New in version 2016.3.0.

name The name of the virtual network for which to gather information. Can be used instead of vn_id.

vn_id The ID of the virtual network for which to gather information. Can be used instead of name.

CLI Example:

```
salt-cloud -f vn_info opennebula vn_id=3
salt-cloud --function vn_info opennebula name=public
```

salt.cloud.clouds.opennebula.vn_release(call=None, kwargs=None)
Releases a virtual network lease that was previously on hold.

New in version 2016.3.0.

vn_id The ID of the virtual network from which to release the lease. Can be used instead of vn_name.

vn_name The name of the virtual network from which to release the lease. Can be used instead of vn_id.

path The path to a file defining the template of the lease to release. Syntax within the file can be the usual
attribute=value or XML. Can be used instead of data.

data Contains the template defining the lease to release. Syntax can be the usual attribute=value or XML. Can be
used instead of path.

CLI Example:

```
salt-cloud -f vn_release opennebula vn_id=3 path=/path/to/vn_release_file.txt
salt-cloud -f vn_release opennebula vn_name=my-vn data="LEASES=[IP=192.168.0.5]"
```
salt.cloud.clouds.opennebula.vn_reserve(*call=None, kwargs=None*)

Reserve network addresses.

New in version 2016.3.0.

- **vn_id**  
  The ID of the virtual network from which to reserve addresses. Can be used instead of vn_name.

- **vn_name**  
  The name of the virtual network from which to reserve addresses. Can be used instead of vn_id.

- **path**  
  The path to a file defining the template of the address reservation. Syntax within the file can be the usual attribute=value or XML. Can be used instead of data.

- **data**  
  Contains the template defining the address reservation. Syntax can be the usual attribute=value or XML. Data provided must be wrapped in double quotes. Can be used instead of path.

CLI Example:

```
salt-cloud -f vn_reserve opennebula vn_id=3 path=/path/to/vn_reserve_file.txt
salt-cloud -f vn_reserve opennebula vn_name=my-vn data="SIZE=10 AR_ID=8 NETWORK_ID=1"
```

### 21.4.15 salt.cloud.clouds.openstack

**Openstack Cloud Driver**

- **depends**  
  shade>=1.19.0

OpenStack is an open source project that is in use by a number a cloud providers, each of which have their own ways of using it.

This OpenStack driver uses a the shade python module which is managed by the OpenStack Infra team. This module is written to handle all the different versions of different OpenStack tools for salt, so most commands are just passed over to the module to handle everything.

**Provider**

There are two ways to configure providers for this driver. The first one is to just let shade handle everything, and configure using os-client-config and setting up /etc/openstack/clouds.yml.

```
clouds:
  democloud:
    region_name: RegionOne
    auth:
      username: 'demo'
      password: secret
      project_name: 'demo'
      auth_url: 'http://openstack/identity'
```

And then this can be referenced in the salt provider based on the democloud name.

```
myopenstack:
  driver: openstack
  cloud: democloud
  region_name: RegionOne
```

This allows for just using one configuration for salt-cloud and for any other openstack tools which are all using /etc/openstack/clouds.yml
The other method allows for specifying everything in the provider config, instead of using the extra configuration file. This will allow for passing salt-cloud configs only through pillars for minions without having to write a clouds.yml file on each minion.

```
myopenstack:
  driver: openstack
  region_name: RegionOne
  auth:
    username: 'demo'
    password: secret
    project_name: 'demo'
    user_domain_name: default,
    project_domain_name: default,
    auth_url: 'http://openstack/identity'
```

Or if you need to use a profile to setup some extra stuff, it can be passed as a profile to use any of the vendor config options.

```
myrackspace:
  driver: openstack
  profile: rackspace
  auth:
    username: rackusername
    api_key: myapikey
    region_name: ORD
    auth_type: rackspace_apikey
```

And this will pull in the profile for rackspace and setup all the correct options for the auth_url and different api versions for services.

**Profile**

Most of the options for building servers are just passed on to the `create_server` function from shade. The salt specific ones are:

- `ssh_key_file`: The path to the ssh key that should be used to login to the machine to bootstrap it
- `ssh_key_file`: The name of the keypair in openstack
- `userdata_template`: The renderer to use if the userdata is a file that is templated. Default: False
- `ssh_interface`: The interface to use to login for bootstrapping: public_ips, private_ips, floating_ips, fixed_ips

```
centos:
  provider: myopenstack
  image: CentOS 7
  size: ds1G
  ssh_key_name: mykey
  ssh_key_file: /root/.ssh/id_rsa
```

This is the minimum setup required.

If metadata is set to make sure that the host has finished setting up the `wait_for_metadata` can be set.

```
centos:
  provider: myopenstack
  image: CentOS 7
```

(continues on next page)
size: ds1G
ssh_key_name: mykey
ssh_key_file: /root/.ssh/id_rsa
meta:
    build_config: rack_user_only
wait_for_metadata:
    rax_service_levelAutomation: Complete
    rackconnect_automation_status: DEPLOYED

Anything else from the create_server docs can be passed through here.

- image: Image dict, name or ID to boot with. image is required unless boot_volume is given.
- flavor: Flavor dict, name or ID to boot onto.
- auto_ip: Whether to take actions to find a routable IP for the server. (defaults to True)
- ips: List of IPs to attach to the server (defaults to None)
- ip_pool: Name of the network or floating IP pool to get an address from. (defaults to None)
- root_volume: Name or ID of a volume to boot from (defaults to None - deprecated, use boot_volume)
- boot_volume: Name or ID of a volume to boot from (defaults to None)
- terminate_volume: If booting from a volume, whether it should be deleted when the server is destroyed. (defaults to False)
- volumes: (optional) A list of volumes to attach to the server
- meta: (optional) A dict of arbitrary key/value metadata to store for this server. Both keys and values must be <=255 characters.
- files: (optional, deprecated) A dict of files to overwrite on the server upon boot. Keys are file names (i.e. /etc/passwd) and values are the file contents (either as a string or as a file-like object). A maximum of five entries is allowed, and each file must be 10k or less.
- reservation_id: a UUID for the set of servers being requested.
- min_count: (optional extension) The minimum number of servers to launch.
- max_count: (optional extension) The maximum number of servers to launch.
- security_groups: A list of security group names
- userdata: user data to pass to be exposed by the metadata server this can be a file type object as well or a string.
- key_name: (optional extension) name of previously created keypair to inject into the instance.
- availability_zone: Name of the availability zone for instance placement.
- block_device_mapping: (optional) A dict of block device mappings for this server.
- block_device_mapping_v2: (optional) A dict of block device mappings for this server.
- nics: (optional extension) an ordered list of nics to be added to this server, with information about connected networks, fixed IPs, port etc.
- scheduler_hints: (optional extension) arbitrary key-value pairs specified by the client to help boot an instance
- config_drive: (optional extension) value for config drive either boolean, or volume-id
• disk_config: (optional extension) control how the disk is partitioned when the server is created. Possible values are 'AUTO' or 'MANUAL'.
• admin_pass: (optional extension) add a user supplied admin password.
• timeout: (optional) Seconds to wait, defaults to 60. See the wait parameter.
• reuse_ips: (optional) Whether to attempt to reuse pre-existing floating ips should a floating IP be needed (default to True)
• network: (optional) Network dict or name or ID to attach the server to. Mutually exclusive with the nics parameter. Can also be be a list of network names or IDs or network dicts.
• boot_from_volume: Whether to boot from volume. 'boot_volume' implies True, but boot_from_volume=True with no boot_volume is valid and will create a volume from the image and use that.
• volume_size: When booting an image from volume, how big should the created volume be? Defaults to 50.
• nat_destination: Which network should a created floating IP be attached to, if it's not possible to infer from the cloud's configuration. (Optional, defaults to None)
• group: ServerGroup dict, name or id to boot the server in. If a group is provided in both scheduler_hints and in the group param, the group param will win. (Optional, defaults to None)

Note: If there is anything added, that is not in this list, it can be added to an extras dictionary for the profile, and that will be to the create_server function.

salt.cloud.clouds.openstack.avail_images(conn=None, call=None)
List available images for OpenStack

CLI Example

```
salt-cloud -f avail_images myopenstack
salt-cloud --list-images myopenstack
```

salt.cloud.clouds.openstack.avail_sizes(conn=None, call=None)
List available sizes for OpenStack

CLI Example

```
salt-cloud -f avail_sizes myopenstack
salt-cloud --list-sizes myopenstack
```

salt.cloud.clouds.openstack.call(conn=None, call=None, kwars=None)
Call function from shade.

func

function to call from shade.openstackcloud library

CLI Example

```
salt-cloud -f call myopenstack func=list_images
salt-cloud -f call myopenstack func=create_network name=mysubnet
```

salt.cloud.clouds.openstack.create(vm_)
Create a single VM from a data dict

salt.cloud.clouds.openstack.destroy(name, conn=None, call=None)
Delete a single VM
salt.cloud.clouds.openstack.get_configured_provider()
Return the first configured instance.
salt.cloud.clouds.openstack.get_conn()
Return a conn object for the passed VM data
salt.cloud.clouds.openstack.get_dependencies()
Warn if dependencies aren’t met.
salt.cloud.clouds.openstack.list_networks(conn=None, call=None)
List networks for OpenStack
CLI Example
salt-cloud -f list_networks myopenstack
salt.cloud.clouds.openstack.list_nodes(conn=None, call=None)
Return a list of VMs
CLI Example
salt-cloud -f list_nodes myopenstack
salt.cloud.clouds.openstack.list_nodes_full(conn=None, call=None)
Return a list of VMs with all the information about them
CLI Example
salt-cloud -f list_nodes_full myopenstack
salt.cloud.clouds.openstack.list_nodes_min(conn=None, call=None)
Return a list of VMs with minimal information
CLI Example
salt-cloud -f list_nodes_min myopenstack
salt.cloud.clouds.openstack.list_nodes_select(conn=None, call=None)
Return a list of VMs with the fields from query.selection
CLI Example
salt-cloud -f list_nodes_full myopenstack
salt.cloud.clouds.openstack.list_subnets(conn=None, call=None, kwargs=None)
List subnets in a virtual network
    network network to list subnets of
salt-cloud -f list_subnets myopenstack network=salt-net
salt.cloud.clouds.openstack.preferred_ip(vm_, ips)
Return the preferred Internet protocol. Either 'ipv4' (default) or 'ipv6'.
salt.cloud.clouds.openstack.request_instance(vm_, conn=None, call=None)
Request an instance to be built
salt.cloud.clouds.openstack.show_instance(name, conn=None, call=None)
Get VM on this OpenStack account
name
name of the instance

CLI Example

```bash
salt-cloud -a show_instance myserver
```

salt.cloud.clouds.openstack.**ssh_interface**(vm_)

Return the ssh_interface type to connect to. Either 'public_ips' (default) or 'private_ips'.

### 21.4.16 salt.cloud.clouds.parallels

**Parallels Cloud Module**

The Parallels cloud module is used to control access to cloud providers using the Parallels VPS system.

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/parallels.conf`:

```plaintext
my-parallels-config:
  # Parallels account information
  user: myuser
  password: mypassword
  url: https://api.cloud.xmission.com:4465/paci/v1.0/
  driver: parallels
```

salt.cloud.clouds.parallels.**avail_images**(call=None)

Return a list of the images that are on the provider

salt.cloud.clouds.parallels.**create**(vm_)

Create a single VM from a data dict

salt.cloud.clouds.parallels.**create_node**(vm_)

Build and submit the XML to create a node

salt.cloud.clouds.parallels.**destroy**(name, call=None)

Destroy a node.

CLI Example:

```bash
salt-cloud --destroy mymachine
```

salt.cloud.clouds.parallels.**get_configured_provider**()

Return the first configured instance.

salt.cloud.clouds.parallels.**get_image**(vm_)

Return the image object to use

salt.cloud.clouds.parallels.**list_nodes**(call=None)

Return a list of the VMs that are on the provider

salt.cloud.clouds.parallels.**list_nodes_full**(call=None)

Return a list of the VMs that are on the provider

salt.cloud.clouds.parallels.**list_nodes_select**(call=None)

Return a list of the VMs that are on the provider, with select fields

salt.cloud.clouds.parallels.**query**(action=None, command=None, args=None, method='GET', data=None)

Make a web call to a Parallels provider
salt.cloud.clouds.parallels.script(vm_)
    Return the script deployment object

salt.cloud.clouds.parallels.show_image(kwargs, call=None)
    Show the details from Parallels concerning an image

salt.cloud.clouds.parallels.show_instance(name, call=None)
    Show the details from Parallels concerning an instance

salt.cloud.clouds.parallels.start(name, call=None)
    Start a node.
    CLI Example:
    
    ```
    salt-cloud -a start mymachine
    ```

salt.cloud.clouds.parallels.stop(name, call=None)
    Stop a node.
    CLI Example:
    
    ```
    salt-cloud -a stop mymachine
    ```

salt.cloud.clouds.parallels.wait_until(name, state, timeout=300)
    Wait until a specific state has been reached on a node

21.4.17 salt.cloud.clouds.profitbricks

ProfitBricks Cloud Module

The ProfitBricks SaltStack cloud module allows a ProfitBricks server to be automatically deployed and bootstraped with Salt.

    depends profitbrick >= 3.1.0

The module requires ProfitBricks credentials to be supplied along with an existing virtual datacenter UUID where the server resources will reside. The server should also be assigned a public LAN, a private LAN, or both along with SSH key pairs. ...

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/profitbricks.conf`:

```
my-profitbricks-config:
    driver: profitbricks
    # The ProfitBricks login username
    username: user@example.com
    # The ProfitBricks login password
    password: secretpassword
    # The ProfitBricks virtual datacenter UUID
    datacenter_id: <UUID>
    # SSH private key filename
    ssh_private_key: /path/to/private.key
    # SSH public key filename
    ssh_public_key: /path/to/public.key
```

```
my-profitbricks-profile:
    provider: my-profitbricks-config
    # Name of a predefined server size.
```
```python
size: Micro Instance
# Assign CPU family to server.
cpu_family: INTEL_XEON
# Number of CPU cores to allocate to node (overrides server size).
cores: 4
# Amount of RAM in multiples of 256 MB (overrides server size).
ram: 4096
# The server availability zone.
availability_zone: ZONE_1
# Name or UUID of the HDD image to use.
image: <UUID>
# Image alias could be provided instead of image.
# Example 'ubuntu:latest'
#image_alias: <IMAGE_ALIAS>
# Size of the node disk in GB (overrides server size).
disk_size: 40
# Type of disk (HDD or SSD).
disk_type: SSD
# Storage availability zone to use.
disk_availability_zone: ZONE_2
# Assign the server to the specified public LAN.
public_lan: <ID>
# Assign firewall rules to the network interface.
public_firewall_rules:
  SSH:
    protocol: TCP
    port_range_start: 22
    port_range_end: 22
# Assign the server to the specified private LAN.
private_lan: <ID>
# Enable NAT on the private NIC.
nat: true
# Assign additional volumes to the server.
volumes:
  data-volume:
    disk_size: 500
    disk_availability_zone: ZONE_3
  log-volume:
    disk_size: 50
    disk_type: SSD
```

To use a private IP for connecting and bootstrapping node:

```yaml
my-profitbricks-profile:
  ssh_interface: private_lan
```

Set deploy to False if Salt should not be installed on the node.

```yaml
my-profitbricks-profile:
  deploy: False
```

```python
salt.cloud.clouds.profitbricks.avail_images(call=None)
    Return a list of the images that are on the provider
salt.cloud.clouds.profitbricks.avail_locations(call=None)
    Return a dict of all available VM locations on the cloud provider with relevant data
salt.cloud.clouds.profitbricks.avail_sizes(call=None)
```
Return a dict of all available VM sizes on the cloud provider with relevant data. Latest version can be found at:

```
salt.cloud.clouds.profitbricks.create(vm_)
```
Create a single VM from a data dict

```
salt.cloud.clouds.profitbricks.create_datacenter(call=None, kwargs=None)
```
Creates a virtual datacenter based on supplied parameters.

CLI Example:

```
salt-cloud -f create_datacenter profitbricks name=mydatacenter location=us/las description="my description"
```

```
salt.cloud.clouds.profitbricks.create_loadbalancer(call=None, kwargs=None)
```
Creates a loadbalancer within the datacenter from the provider config.

CLI Example:

```
salt-cloud -f create_loadbalancer profitbricks name=mylb
```

```
salt.cloud.clouds.profitbricks.destroy(name, call=None)
```
destroy a machine by name

Parameters

- **name** – name given to the machine
- **call** – call value in this case is ‘action’

Returns array of booleans, true if successfully stopped and true if successfully removed

CLI Example:

```
salt-cloud -d vm_name
```

```
salt.cloud.clouds.profitbricks.get_configured_provider()
```
Return the first configured instance.

```
salt.cloud.clouds.profitbricks.get_conn()
```
Return a conn object for the passed VM data

```
salt.cloud.clouds.profitbricks.get_datacenter(conn)
```
Return the datacenter from the config provider datacenter ID

```
salt.cloud.clouds.profitbricks.get_datacenter_id()
```
Return datacenter ID from provider configuration

```
salt.cloud.clouds.profitbricks.get_dependencies()
```
Warn if dependencies are not met.

```
salt.cloud.clouds.profitbricks.get_disk_type(vm_)
```
Return the type of disk to use. Either 'HDD' (default) or 'SSD'.

```
salt.cloud.clouds.profitbricks.get_image(vm_)
```
Return the image object to use

```
salt.cloud.clouds.profitbricks.get_key_filename(vm_)
```
Check SSH private key file and return absolute path if exists.

```
salt.cloud.clouds.profitbricks.get_node(conn, name)
```
Return a node for the named VM
salt.cloud.clouds.profitbricks.get_public_keys(vm_)
   Retrieve list of SSH public keys.

salt.cloud.clouds.profitbricks.get_size(vm_)
   Return the VM's size object

salt.cloud.clouds.profitbricks.get_wait_timeout(vm_)
   Return the wait_for_timeout for resource provisioning.

salt.cloud.clouds.profitbricks.list_datacenters(conn=None, call=None)
   List all the data centers
   CLI Example:
   
   salt-cloud -f list_datacenters my-profitbricks-config

salt.cloud.clouds.profitbricks.list_images(call=None, kwargs=None)
   List all the images with alias by location
   CLI Example:
   
   salt-cloud -f list_images my-profitbricks-config location=us/las

salt.cloud.clouds.profitbricks.list_loadbalancers(call=None)
   Return a list of the loadbalancers that are on the provider

salt.cloud.clouds.profitbricks.list_nodes(conn=None, call=None)
   Return a list of VMs that are on the provider

salt.cloud.clouds.profitbricks.list_nodes_full(conn=None, call=None)
   Return a list of the VMs that are on the provider, with all fields

salt.cloud.clouds.profitbricks.reboot(name, call=None)
   Reboot a machine by name :param name: name given to the machine :param call: call value in this case is 'action' :return: true if successful
   CLI Example:
   
   salt-cloud -a reboot vm_name

salt.cloud.clouds.profitbricks.reserve_ipblock(call=None, kwargs=None)
   Reserve the IP Block

salt.cloud.clouds.profitbricks.set_public_lan(lan_id)
   Enables public Internet access for the specified public_lan. If no public LAN is available, then a new public LAN is created.

salt.cloud.clouds.profitbricks.show_instance(name, call=None)
   Show the details from the provider concerning an instance

salt.cloud.clouds.profitbricks.signal_event(vm_, event, description)

salt.cloud.clouds.profitbricks.ssh_interface(vm_)
   Return the ssh_interface type to connect to. Either 'public_ips' (default) or 'private_ips'.

salt.cloud.clouds.profitbricks.start(name, call=None)
   Start a machine by name :param name: name given to the machine :param call: call value in this case is 'action' :return: true if successful
   CLI Example:
salt-cloud -a start vm_name

salt.cloud.clouds.profitbricks.stop(name, call=``None``)
stop a machine by name :param name: name given to the machine :param call: call value in this case is ‘action’
:return: true if successful

CLI Example:
```
salt-cloud -a stop vm_name
```

salt.cloud.clouds.profitbricks.version_compatible(version)
Checks profitbricks version

21.4.18 salt.cloud.clouds.proxmox

Proxmox Cloud Module

New in version 2014.7.0.

The Proxmox cloud module is used to control access to cloud providers using the Proxmox system (KVM / OpenVZ / LXC).

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/proxmox.conf`:

```yaml
my-proxmox-config:
  # Proxmox account information
  user: myuser@pam or myuser@pve
  password: mypassword
  url: hypervisor.domain.tld
  driver: proxmox
  verify_ssl: True
```

maintainer Frank Klaassen <frank@cloudright.nl>
depends requests >= 2.2.1
depends IPy >= 0.81

salt.cloud.clouds.proxmox.avail_images(call=``None``, location=``'local'``)
Return a list of the images that are on the provider

CLI Example:
```
salt-cloud --list-images my-proxmox-config
```

salt.cloud.clouds.proxmox.avail_locations(call=``None``)
Return a list of the hypervisors (nodes) which this Proxmox PVE machine manages

CLI Example:
```
salt-cloud --list-locations my-proxmox-config
```

salt.cloud.clouds.proxmox.create(vm_)
Create a single VM from a data dict

CLI Example:
```bash
salt-cloud -p proxmox-ubuntu vmhostname
```

```python
salt.cloud.clouds.proxmox.create_node(vm_, newid)
Build and submit the requestdata to create a new node
```

```python
salt.cloud.clouds.proxmox.destroy(name, call=None)
Destroy a node.
CLI Example:
salt-cloud --destroy mymachine
```

```python
salt.cloud.clouds.proxmox.get_configured_provider()
Return the first configured instance.
```

```python
salt.cloud.clouds.proxmox.get_dependencies()
Warn if dependencies aren’t met.
```

```python
salt.cloud.clouds.proxmox.get_resources_nodes(call=None, resFilter=None)
Retrieve all hypervisors (nodes) available on this environment CLI Example:
salt-cloud -f get_resources_nodes my-proxmox-config
```

```python
salt.cloud.clouds.proxmox.get_resources_vms(call=None, resFilter=None, includeConfig=True)
Retrieve all VMs available on this environment
CLI Example:
salt-cloud -f get_resources_vms my-proxmox-config
```

```python
salt.cloud.clouds.proxmox.get_vm_status(vmid=None, name=None)
Get the status for a VM, either via the ID or the hostname
```

```python
salt.cloud.clouds.proxmox.get_vmconfig(vmid, node=None, node_type='openvz')
Get VM configuration
```

```python
salt.cloud.clouds.proxmox.list_nodes(call=None)
Return a list of the VMs that are managed by the provider
CLI Example:
salt-cloud -Q my-proxmox-config
```

```python
salt.cloud.clouds.proxmox.list_nodes_full(call=None)
Return a list of the VMs that are on the provider
CLI Example:
salt-cloud -F my-proxmox-config
```

```python
salt.cloud.clouds.proxmox.list_nodes_select(call=None)
Return a list of the VMs that are on the provider, with select fields
CLI Example:
salt-cloud -S my-proxmox-config
```

```python
salt.cloud.clouds.proxmox.query(conn_type, option, post_data=None)
Execute the HTTP request to the API
```
salt.cloud.clouds.proxmox.script(vm_)
    Return the script deployment object

salt.cloud.clouds.proxmox.set_vm_status(status, name=None, vmid=None)
    Convenience function for setting VM status

salt.cloud.clouds.proxmox.show_instance(name, call=None)
    Show the details from Proxmox concerning an instance

salt.cloud.clouds.proxmox.shutdown(name=None, vmid=None, call=None)
    Shutdown a node via ACPI.
    CLI Example:
    
    salt-cloud -a shutdown mymachine

salt.cloud.clouds.proxmox.start(name, vmid=None, call=None)
    Start a node.
    CLI Example:
    
    salt-cloud -a start mymachine

salt.cloud.clouds.proxmox.stop(name, vmid=None, call=None)
    Stop a node (“pulling the plug”).
    CLI Example:
    
    salt-cloud -a stop mymachine

salt.cloud.clouds.proxmox.wait_for_created(upid, timeout=300)
    Wait until a the vm has been created successfully

salt.cloud.clouds.proxmox.wait_for_state(vmid, state, timeout=300)
    Wait until a specific state has been reached on a node

21.4.19 salt.cloud.clouds.pyrax

Pyrax Cloud Module

PLEASE NOTE: This module is currently in early development, and considered to be experimental and unstable. It
is not recommended for production use. Unless you are actively developing code in this module, you should use the
OpenStack module instead.

salt.cloud.clouds.pyrax.get_configured_provider()
    Return the first configured instance.

salt.cloud.clouds.pyrax.get_conn(conn_type)
    Return a conn object for the passed VM data

salt.cloud.clouds.pyrax.get_dependencies()
    Warn if dependencies aren’t met.

salt.cloud.clouds.pyrax.queues_create(call, kwargs)
salt.cloud.clouds.pyrax.queues_delete(call, kwargs)
salt.cloud.clouds.pyrax.queues_exists(call, kwargs)
salt.cloud.clouds.pyrax.queues_show(call, kwargs)
21.4.20 salt.cloud.clouds.qingcloud

QingCloud Cloud Module

New in version 2015.8.0.

The QingCloud cloud module is used to control access to the QingCloud. [http://www.qingcloud.com/](http://www.qingcloud.com/)

Use of this module requires the `access_key_id`, `secret_access_key`, `zone` and `key_filename` parameter to be set.

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/qingcloud.conf`:

```yaml
my-qingcloud:
  driver: qingcloud
  access_key_id: AKIDMRTGYONNLTFBBQJ
  secret_access_key: c1yW21USU0mCov4aNV2V2XocaHCG3ZGcxEcFu
  zone: pek2
  key_filename: /path/to/your.pem
```

**depends** requests

salt.cloud.clouds.qingcloud.**avail_images**(kwargs=None, call=None)

Return a list of the images that are on the provider.

CLI Examples:

```
salt-cloud --list-images my-qingcloud
salt-cloud -f avail_images my-qingcloud zone=gd1
```

salt.cloud.clouds.qingcloud.**avail_locations**(call=None)

Return a dict of all available locations on the provider with relevant data.

CLI Examples:

```
salt-cloud --list-locations my-qingcloud
```

salt.cloud.clouds.qingcloud.**avail_sizes**(kwargs=None, call=None)

Return a list of the instance sizes that are on the provider.

CLI Examples:

```
salt-cloud --list-sizes my-qingcloud
salt-cloud -f avail_sizes my-qingcloud zone=pek2
```

salt.cloud.clouds.qingcloud.**create**(vm_)

Create a single instance from a data dict.

CLI Examples:

```
salt-cloud -p qingcloud-ubuntu-c1m1 hostname1
salt-cloud -m /path/to/mymap.sls -P
```

salt.cloud.clouds.qingcloud.**destroy**(instance_id, call=None)

Destroy an instance.

CLI Example:
salt-cloud -a destroy i-2f733r5n
salt-cloud -d i-2f733r5n

callbacks

salt.cloud.clouds.qingcloud.get_configured_provider()
Return the first configured instance.

callbacks

salt.cloud.clouds.qingcloud.get_dependencies()
Warn if dependencies aren’t met.

callbacks

salt.cloud.clouds.qingcloud.list_nodes(call=None)
Return a list of the instances that are on the provider.

CLI Examples:
salt-cloud -Q my-qingcloud

callbacks

salt.cloud.clouds.qingcloud.list_nodes_full(call=None)
Return a list of the instances that are on the provider.

CLI Examples:
salt-cloud -F my-qingcloud

callbacks

salt.cloud.clouds.qingcloud.list_nodes_min(call=None)
Return a list of the instances that are on the provider. Only a list of instances names, and their state, is returned.

CLI Examples:
salt-cloud -f list_nodes_min my-qingcloud

callbacks

salt.cloud.clouds.qingcloud.list_nodes_select(call=None)
Return a list of the instances that are on the provider, with selected fields.

CLI Examples:
salt-cloud -S my-qingcloud

callbacks

salt.cloud.clouds.qingcloud.query(params=None)
Make a web call to QingCloud IaaS API.

callbacks

salt.cloud.clouds.qingcloud.reboot(instance_id, call=None)
Reboot an instance.

CLI Examples:
salt-cloud -a reboot i-2f733r5n

callbacks

salt.cloud.clouds.qingcloud.script(vm_)
Return the script deployment object.

callbacks

salt.cloud.clouds.qingcloud.show_image(kwvars, call=None)
Show the details from QingCloud concerning an image.

CLI Examples:
salt-cloud -f show_image my-qingcloud image=trustysrvx64c
salt-cloud -f show_image my-qingcloud image=trustysrvx64c,coreos4
salt-cloud -f show_image my-qingcloud image=trustysrvx64c zone=ap1
salt.cloud.clouds.qingcloud.show_instance(instance_id, call=None, kwargs=None)

Show the details from QingCloud concerning an instance.

CLI Examples:
```
salt-cloud -a show_instance i-2f733r5n
```

salt.cloud.clouds.qingcloud.start(instance_id, call=None)

Start an instance.

CLI Examples:
```
salt-cloud -a start i-2f733r5n
```

salt.cloud.clouds.qingcloud.stop(instance_id, force=False, call=None)

Stop an instance.

CLI Examples:
```
salt-cloud -a stop i-2f733r5n
salt-cloud -a stop i-2f733r5n force=True
```

21.4.21 salt.cloud.clouds.saltify

Saltify Module

The Saltify module is designed to install Salt on a remote machine, virtual or bare metal, using SSH. This module is useful for provisioning machines which are already installed, but not Salted.

Changed in version 2018.3.0: The wake_on_lan capability, and actions destroy, reboot, and query functions were added.

Use of this module requires some configuration in cloud profile and provider files as described in the Getting Started with Saltify documentation.

salt.cloud.clouds.saltify.avail_images(call=None)

This function returns a list of images available for this cloud provider.

```
salt-cloud --list-images saltify
```

returns a list of available profiles.

..versionadded:: 2018.3.0

salt.cloud.clouds.saltify.avail_locations(call=None)

This function returns a list of locations available.

```
salt-cloud --list-locations my-cloud-provider
```

[ saltify will always return an empty dictionary ]

salt.cloud.clouds.saltify.avail_sizes(call=None)

This function returns a list of sizes available for this cloud provider.

```
salt-cloud --list-sizes saltify
```

[ saltify always returns an empty dictionary ]
salt.cloud.clouds.saltify.create(vm_)
    if configuration parameter deploy is True,
        Provision a single machine, adding its keys to the salt master
    else,
        Test ssh connections to the machine

Configuration parameters:

• deploy: (see above)
• provider: name of entry in salt/cloud.providers.d/???. file
• ssh_host: IP address or DNS name of the new machine
• ssh_username: name used to log in to the new machine
• ssh_password: password to log in (unless key_filename is used)
• key_filename: (optional) SSH private key for passwordless login
• ssh_port: (default=22) TCP port for SSH connection
• wake_on_lan_mac: (optional) hardware (MAC) address for wake on lan
• wol_sender_node: (optional) salt minion to send wake on lan command
• wol_boot_wait: (default=30) seconds to delay while client boots
• force_minion_config: (optional) replace the minion configuration files on the new machine

See also Miscellaneous Salt Cloud Options and Getting Started with Saltify

CLI Example:
    salt-cloud -p mymachine my_new_id

salt.cloud.clouds.saltify.destroy(name, call=None)
    Destroy a node.
    New in version 2018.3.0.
    Disconnect a minion from the master, and remove its keys.
    Optionally, (if remove_config_on_destroy is True), disables salt-minion from running on the minion, and erases the Salt configuration files from it.
    Optionally, (if shutdown_on_destroy is True), orders the minion to halt.

CLI Example:
    salt-cloud --destroy mymachine

salt.cloud.clouds.saltify.get_configured_provider()
    Return the first configured instance.

salt.cloud.clouds.saltify.list_nodes(call=None)
    List the nodes which have salt-cloud:driver:saltify grains.
    salt-cloud -Q

    returns a list of dictionaries of defined standard fields.
    ..versionadded:: 2018.3.0
salt.cloud.clouds.saltify.list_nodes_full(call=None)
Lists complete information for all nodes.

salt-cloud -F
returns a list of dictionaries.
for 'saltify' minions, returns dict of grains (enhanced).
..versionadded:: 2018.3.0

salt.cloud.clouds.saltify.list_nodes_select(call=None)
Return a list of the minions that have salt-cloud grains, with select fields.

salt.cloud.clouds.saltify.reboot(name, call=None)
Reboot a saltify minion.
..versionadded:: 2018.3.0

name The name of the VM to reboot.

CLI Example:
salt-cloud -a reboot vm_name

salt.cloud.clouds.saltify.show_instance(name, call=None)
List the a single node, return dict of grains.

21.4.22 salt.cloud.clouds.scaleway

Scaleway Cloud Module

New in version 2015.8.0.
The Scaleway cloud module is used to interact with your Scaleway BareMetal Servers.
Use of this module only requires the api_key parameter to be set. Set up the cloud configuration at /etc/salt/cloud.providers or /etc/salt/cloud.providers.d/scaleway.conf:

scaleway-config:
  # Scaleway organization and token
  access_key: 0e604a2c-aea6-4081-acb2-e1d1258ef95c
  token: be8fd96b-04eb-4d39-b6ba-a9edbcf17f12
  driver: scaleway

salt.cloud.clouds.scaleway.avail_images(call=None)
Return a list of the images that are on the provider.

salt.cloud.clouds.scaleway.create(server_)
Create a single BareMetal server from a data dict.

salt.cloud.clouds.scaleway.create_node(args)
Create a node.

salt.cloud.clouds.scaleway.destroy(name, call=None)
Destroy a node. Will check termination protection and warn if enabled.

CLI Example: .. code-block:: bash
    salt-cloud --destroy mymachine
salt.cloud.clouds.scaleway.get_configured_provider()
    Return the first configured instance.

salt.cloud.clouds.scaleway.get_image(server_)
    Return the image object to use.

salt.cloud.clouds.scaleway.list_nodes(call=None)
    Return a list of the BareMetal servers that are on the provider.

salt.cloud.clouds.scaleway.list_nodes_full(call=None)
    Return a list of the BareMetal servers that are on the provider.

salt.cloud.clouds.scaleway.list_nodes_select(call=None)
    Return a list of the BareMetal servers that are on the provider, with select fields.

salt.cloud.clouds.scaleway.query(method='servers', server_id=None, command=None,
    args=None, http_method='get')
    Make a call to the Scaleway API.

salt.cloud.clouds.scaleway.script(server_)
    Return the script deployment object.

salt.cloud.clouds.scaleway.show_instance(name, call=None)
    Show the details from a Scaleway BareMetal server.

21.4.23 salt.cloud.clouds.softlayer

SoftLayer Cloud Module

The SoftLayer cloud module is used to control access to the SoftLayer VPS system.
Use of this module only requires the apikey parameter. Set up the cloud configuration at:
/etc/salt/cloud.providers or /etc/salt/cloud.providers.d/softlayer.conf:

```yaml
my-softlayer-config:
  user: MYLOGIN
  apikey: JVkb5JDGHSKjDSDFhgsj6jgjsfjgfdkgjksdfkflhjlsdfffhgdgjkenrtuin
  driver: softlayer
```

The SoftLayer Python Library needs to be installed in order to use the SoftLayer salt.cloud modules. See: https://pypi.python.org/pypi/SoftLayer

    depends softlayer

salt.cloud.clouds.softlayer.avail_images(call=None)
    Return a dict of all available VM images on the cloud provider.

salt.cloud.clouds.softlayer.avail_locations(call=None)
    List all available locations

salt.cloud.clouds.softlayer.avail_sizes(call=None)
    Return a dict of all available VM sizes on the cloud provider with relevant data. This data is provided in three
dicts.

salt.cloud.clouds.softlayer.create(vm_)
    Create a single VM from a data dict

salt.cloud.clouds.softlayer.destroy(name, call=None)
    Destroy a node.
CLI Example:

```
salt-cloud --destroy mymachine
```

```python
salt.cloud.clouds.softlayer.get_configured_provider()
    Return the first configured instance.
	salt.cloud.clouds.softlayer.get_conn(service='SoftLayer_Virtual_Guest')
    Return a conn object for the passed VM data
	salt.cloud.clouds.softlayer.get_dependencies()
    Warn if dependencies aren’t met.
	salt.cloud.clouds.softlayer.get_location(vm_=None)
    Return the location to use, in this order:
    - CLI parameter
    - VM parameter
    - Cloud profile setting
	salt.cloud.clouds.softlayer.list_custom_images(call=None)
    Return a dict of all custom VM images on the cloud provider.
	salt.cloud.clouds.softlayer.list_nodes(call=None)
    Return a list of the VMs that are on the provider
	salt.cloud.clouds.softlayer.list_nodes_full(mask='mask[id]', call=None)
    Return a list of the VMs that are on the provider
	salt.cloud.clouds.softlayer.list_nodes_select(call=None)
    Return a list of the VMs that are on the provider, with select fields
	salt.cloud.clouds.softlayer.list_vlans(call=None)
    List all VLANs associated with the account
	salt.cloud.clouds.softlayer.script(vm_)
    Return the script deployment object
	salt.cloud.clouds.softlayer.show_instance(name, call=None)
    Show the details from SoftLayer concerning a guest
```

### 21.4.24 salt.cloud.clouds.softlayer_hw

**SoftLayer HW Cloud Module**

The SoftLayer HW cloud module is used to control access to the SoftLayer hardware cloud system

Use of this module only requires the `apikey` parameter. Set up the cloud configuration at:

```
/etc/salt/cloud.providers or /etc/salt/cloud.providers.d/softlayer.conf:
```

```ini
my-softlayer-config:
    # SoftLayer account api key
    user: MYLOGIN
    apikey: JVkbSJJDHSDKUKSDJfhsdklfjgsjdkflhjlsdfffhgdgjkenrtuinv
    driver: softlayer_hw
```

The SoftLayer Python Library needs to be installed in order to use the SoftLayer salt.cloud modules. See: [https://pypi.python.org/pypi/SoftLayer](https://pypi.python.org/pypi/SoftLayer)
depends softlayer

salt.cloud.clouds.softlayer_hw.avail_images(call=None)
    Return a dict of all available VM images on the cloud provider.

salt.cloud.clouds.softlayer_hw.avail_locations(call=None)
    List all available locations

salt.cloud.clouds.softlayer_hw.avail_sizes(call=None)
    Return a dict of all available VM sizes on the cloud provider with relevant data. This data is provided in three
dicts.

salt.cloud.clouds.softlayer_hw.create(vm_)
    Create a single VM from a data dict

salt.cloud.clouds.softlayer_hw.destroy(name, call=None)
    Destroy a node.
    CLI Example:
    ```
salt-cloud --destroy mymachine
    ```

salt.cloud.clouds.softlayer_hw.get_configured_provider()
    Return the first configured instance.

salt.cloud.clouds.softlayer_hw.get_conn(service='SoftLayer_Hardware')
    Return a conn object for the passed VM data

salt.cloud.clouds.softlayer_hw.get_dependencies()
    Warn if dependencies aren’t met.

salt.cloud.clouds.softlayer_hw.get_location(vm_=None)
    Return the location to use, in this order:
    • CLI parameter
    • VM parameter
    • Cloud profile setting

salt.cloud.clouds.softlayer_hw.list_nodes(call=None)
    Return a list of the VMs that are on the provider

salt.cloud.clouds.softlayer_hw.list_nodes_full(mask='maskid, hostname, primaryIpAddress, primaryBackendIpAddress, processorPhysicalCoreAmount, memoryCount', call=None)
    Return a list of the VMs that are on the provider

salt.cloud.clouds.softlayer_hw.list_nodes_select(call=None)
    Return a list of the VMs that are on the provider, with select fields

salt.cloud.clouds.softlayer_hw.list_vlans(call=None)
    List all VLANs associated with the account

salt.cloud.clouds.softlayer_hw.script(vm_)
    Return the script deployment object

salt.cloud.clouds.softlayer_hw.show_all_categories(call=None)
    Return a dict of all available categories on the cloud provider.
    New in version 2016.3.0.
salt.cloud.clouds.softlayer_hw.show_all_prices(call=None, kwargs=None)
Return a dict of all prices on the cloud provider.
salt.cloud.clouds.softlayer_hw.show_instance(name, call=None)
Show the details from SoftLayer concerning a guest
salt.cloud.clouds.softlayer_hw.show_pricing(kwargs=None, call=None)
Show pricing for a particular profile. This is only an estimate, based on unofficial pricing sources.
CLI Examples:
```
salt-cloud -f show_pricing my-softlayerhw-config profile=my-profile
```
If pricing sources have not been cached, they will be downloaded. Once they have been cached, they will not be updated automatically. To manually update all prices, use the following command:
```
salt-cloud -f update_pricing <provider>
```
New in version 2015.8.0.

21.4.25 salt.cloud.clouds.tencentcloud

Tencent Cloud Cloud Module

New in version 3000.
The Tencent Cloud Cloud Module is used to control access to the Tencent Cloud instance. https://intl.cloud.tencent.com/
To use this module, set up the cloud configuration at /etc/salt/cloud.providers or /etc/salt/cloud.providers.d/*.conf:

```
my-tencentcloud-config:
  driver: tencentcloud
  # Tencent Cloud Secret Id
  id: AKIDA64p0i9BMemkApevX0HS169S4b750A
  # Tencent Cloud Secret Key
  key: 8r2xmPn0C5FDVAlmcJimiTZKVRsk260
  # Tencent Cloud Region
  location: ap-guangzhou
```

depends tencentcloud-sdk-python
salt.cloud.clouds.tencentcloud.avail_images(call=None)
Return Tencent Cloud available image
CLI Example:
```
salt-cloud --list-images my-tencentcloud-config
salt-cloud -f avail_images my-tencentcloud-config
```
salt.cloud.clouds.tencentcloud.avail_locations(call=None)
Return Tencent Cloud available region
CLI Example:
```
salt-cloud --list-locations my-tencentcloud-config
salt-cloud -f avail_locations my-tencentcloud-config
```
salt.cloud.clouds.tencentcloud.

**avail_sizes**(call=None)

Return Tencent Cloud available instance type

CLI Example:

```
salt-cloud --list-sizes my-tencentcloud-config
salt-cloud -f avail_sizes my-tencentcloud-config
```

salt.cloud.clouds.tencentcloud.

**create**(vm_)

Create a single Tencent Cloud instance from a data dict.

Tencent Cloud profiles require a `provider`, `availability_zone`, `image` and `size`. Set up profile at `/etc/salt/cloud.profiles` or `/etc/salt/cloud.profiles.d/*.conf`:

```
tencentcloud-guangzhou-s1sm1:
    provider: my-tencentcloud-config
    availability_zone: ap-guangzhou-3
    image: img-31tjrtp
    size: S1.SMALL1
    allocate_public_ip: True
    internet_max_bandwidth_out: 1
    password: '153e41ec96140152'
    securitygroups:
        - sg-5e90804b
```

CLI Examples:

```
salt-cloud -p tencentcloud-guangzhou-s1 myinstance
```

salt.cloud.clouds.tencentcloud.

**destroy**(name, call=None)

Destroy a Tencent Cloud instance

CLI Example:

```
salt-cloud -a destroy myinstance
salt-cloud -d myinstance
```

salt.cloud.clouds.tencentcloud.

**get_configured_provider**()

Return the first configured instance.

salt.cloud.clouds.tencentcloud.

**get_dependencies**()

Warn if dependencies aren’t met.

salt.cloud.clouds.tencentcloud.

**get_provider_client**(name=None)

Return a new provider client

salt.cloud.clouds.tencentcloud.

**list_availability_zones**(call=None)

Return all Tencent Cloud availability zones in current region

CLI Example:

```
salt-cloud -f list_availability_zones my-tencentcloud-config
```

salt.cloud.clouds.tencentcloud.

**list_custom_images**(call=None)

Return all Tencent Cloud images in current region

CLI Example:

```
salt-cloud -f list_custom_images my-tencentcloud-config
```
salt.cloud.clouds.tencentcloud.list_nodes(call=None)
  Return a list of instances that are on the provider

  CLI Examples:
  ```
salt-cloud -Q
  ```

salt.cloud.clouds.tencentcloud.list_nodes_full(call=None)
  Return a list of instances that are on the provider, with full details

  CLI Examples:
  ```
salt-cloud -F
  ```

salt.cloud.clouds.tencentcloud.list_nodes_min(call=None)
  Return a list of instances that are on the provider. Only names, and their state, is returned.

  CLI Examples:
  ```
salt-cloud -f list_nodes_min my-tencentcloud-config
  ```

salt.cloud.clouds.tencentcloud.list_nodes_select(call=None)
  Return a list of instances that are on the provider, with select fields

  CLI Examples:
  ```
salt-cloud -S
  ```

salt.cloud.clouds.tencentcloud.list_securitygroups(call=None)
  Return all Tencent Cloud security groups in current region

  CLI Example:
  ```
salt-cloud -f list_securitygroups my-tencentcloud-config
  ```

salt.cloud.clouds.tencentcloud.reboot(name, call=None)
  Reboot a Tencent Cloud instance

  CLI Examples:
  ```
salt-cloud -a reboot myinstance
  ```

salt.cloud.clouds.tencentcloud.script(vm_)
  Return the script deployment object

salt.cloud.clouds.tencentcloud.show_disk(name, call=None)
  Show the disk details of Tencent Cloud instance

  CLI Examples:
  ```
salt-cloud -a show_disk myinstance
  ```

salt.cloud.clouds.tencentcloud.show_image(kw_args, call=None)
  Show the details of Tencent Cloud image

  CLI Examples:
  ```
salt-cloud -f show_image tencentcloud image=img-31tjrtp
  ```
salt.cloud.clouds.tencentcloud.show_instance(name, call=None)
Show the details of Tencent Cloud instance

CLI Examples:
```
salt-cloud -a show_instance myinstance
```

salt.cloud.clouds.tencentcloud.start(name, call=None)
Start a Tencent Cloud instance Notice: the instance state must be stopped

CLI Examples:
```
salt-cloud -a start myinstance
```

salt.cloud.clouds.tencentcloud.stop(name, force=False, call=None)
Stop a Tencent Cloud running instance Note: use force=True to make force stop

CLI Examples:
```
salt-cloud -a stop myinstance
salt-cloud -a stop myinstance force=True
```

21.4.26 salt.cloud.clouds.vagrant

Vagrant Cloud Driver

The Vagrant cloud is designed to "vagrant up" a virtual machine as a Salt minion.

Use of this module requires some configuration in cloud profile and provider files as described in the Getting Started with Vagrant documentation.

New in version 2018.3.0.

salt.cloud.clouds.vagrant.avail_images(call=None)
This function returns a list of images available for this cloud provider. vagrant will return a list of profiles.

```
salt-cloud -list-images my-cloud-provider
```

salt.cloud.clouds.vagrant.avail_locations(call=None)
This function returns a list of locations available.

CLI Example:
```
salt-cloud --list-locations my-cloud-provider
# \[ vagrant will always returns an empty dictionary \]
```

salt.cloud.clouds.vagrant.avail_sizes(call=None)
This function returns a list of sizes available for this cloud provider.

CLI Example:
```
salt-cloud --list-sizes my-cloud-provider
# \[ vagrant always returns an empty dictionary \]
```

salt.cloud.clouds.vagrant.create(vm_)
Provision a single machine

CLI Example:
salt-cloud -p my_profile new_node_1

salt.cloud.clouds.vagrant.destroy(name, call=None)
Destroy a node.

CLI Example:
	salt-cloud --destroy mymachine

class salt.cloud.clouds.vagrant.get_configured_provider()
Return the first configured instance.

class salt.cloud.clouds.vagrant.list_nodes(call=None)
List the nodes which have salt-cloud:driver:vagrant grains.

CLI Example:
	salt-cloud -Q

class salt.cloud.clouds.vagrant.list_nodes_full(call=None)
List the nodes, ask all 'vagrant' minions, return dict of grains (enhanced).

CLI Example:
	salt-call -F

class salt.cloud.clouds.vagrant.list_nodes_select(call=None)
Return a list of the minions that have salt-cloud grains, with select fields.

class salt.cloud.clouds.vagrant.reboot(name, call=None)
Reboot a vagrant minion.

name The name of the VM to reboot.

CLI Example:
	salt-cloud -a reboot vm_name

class salt.cloud.clouds.vagrant.show_instance(name, call=None)
List the a single node, return dict of grains.

21.4.27 salt.cloud.clouds.virtualbox

A salt cloud provider that lets you use virtualbox on your machine and act as a cloud.

depends vboxapi

For now this will only clone existing VMs. It’s best to create a template from which we will clone.

Followed https://docs.saltstack.com/en/latest/topics/cloud/cloud.html#non-libcloud-based-modules to create this.

Dicts provided by salt:

__opts__ [contains the options used to run Salt Cloud,] as well as a set of configuration and environment
variables

class salt.cloud.clouds.virtualbox.create(vm_info)
Creates a virtual machine from the given VM information

This is what is used to request a virtual machine to be created by the cloud provider, wait for it to become
available, and then (optionally) log in and install Salt on it.
Events fired:

This function fires the event `salt/cloud/vm_name/creating`, with the payload containing the names of the VM, profile, and provider.

@param vm_info

```python
{
    name: <str>
    profile: <dict>
    driver: <provider>:<profile>
    clonefrom: <vm_name>
    clonemode: <mode> (default: state, choices: state, child, all)
}
```

@type vm_info dict @return dict of resulting vm. ‼!Passwords can and should be included‼!

**salt.cloud.clouds.virtualbox.destroy** (*name*, *call=None*)

This function irreversibly destroys a virtual machine on the cloud provider. Before doing so, it should fire an event on the Salt event bus.

The tag for this event is `salt/cloud/<vm name>/destroying`. Once the virtual machine has been destroyed, another event is fired. The tag for that event is `salt/cloud/<vm name>/destroyed`.

**Dependencies:** list_nodes

@param name: @type name: str @param call: @type call: @return: True if all went well, otherwise an error message @rtype: bool|str

**salt.cloud.clouds.virtualbox.list_nodes** (*kwargs=None, call=None*)

This function returns a list of nodes available on this cloud provider, using the following fields:

- id (str)
- image (str)
- size (str)
- state (str)
- private_ips (list)
- public_ips (list)

No other fields should be returned in this function, and all of these fields should be returned, even if empty. The private_ips and public_ips fields should always be of a list type, even if empty, and the other fields should always be of a str type. This function is normally called with the -Q option:

```
salt-cloud -Q
```

@param kwargs: @type kwargs: @param call: @type call: @return: @rtype:

**salt.cloud.clouds.virtualbox.list_nodes_full** (*kwargs=None, call=None*)

All information available about all nodes should be returned in this function. The fields in the list_nodes() function should also be returned, even if they would not normally be provided by the cloud provider.

This is because some functions both within Salt and 3rd party will break if an expected field is not present. This function is normally called with the -F option:

```
salt-cloud -F
```

@param kwargs: @type kwargs: @param call: @type call: @return: @rtype:

**salt.cloud.clouds.virtualbox.list_nodes_select** (*call=None*)

Return a list of the VMs that are on the provider, with select fields

**salt.cloud.clouds.virtualbox.map_clonemode** (*vm_info*)

Convert the virtualbox config file values for clone_mode into the integers the API requires

**salt.cloud.clouds.virtualbox.show_image** (*kwargs, call=None*)

Show the details of an image

---

21.4. cloud modules 1135
salt.cloud.clouds.virtualbox.start(name, call=None)
Start a machine. @param name: Machine to start @type name: str @param call: Must be "action" @type call: str

salt.cloud.clouds.virtualbox.stop(name, call=None)
Stop a running machine. @param name: Machine to stop @type name: str @param call: Must be "action" @type call: str

21.4.28 salt.cloud.clouds.vmware

VMware Cloud Module

New in version 2015.5.4.
The VMware cloud module allows you to manage VMware ESX, ESXi, and vCenter.
See Getting started with VMware to get started.

    codeauthor Nitin Madhok <nmadhok@clemson.edu>

Dependencies

- pyVmomi Python Module

pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

Note: Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See Issue #29537 for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original VMware cloud driver was developed against.

Note: Ensure python pyVmomi module is installed by running following one-liner check. The output should be 0.

```
python -c "import pyVmomi" ; echo $? 
```

Configuration

To use this module, set up the vCenter or ESX/ESXi URL, username and password in the cloud configuration at /etc/salt/cloud.providers or /etc/salt/cloud.providers.d/vmware.conf:
**my-vmware-config:**

```yaml
my-vmware-config:
  driver: vmware
  user: 'DOMAIN\user'
  password: 'verybadpass'
  url: '10.20.30.40'
```

**vcenter01:**

```yaml
vcenter01:
  driver: vmware
  user: 'DOMAIN\user'
  password: 'verybadpass'
  url: 'vcenter01.domain.com'
  protocol: 'https'
  port: 443
```

**vcenter02:**

```yaml
vcenter02:
  driver: vmware
  user: 'DOMAIN\user'
  password: 'verybadpass'
  url: 'vcenter02.domain.com'
  protocol: 'http'
  port: 80
```

**esx01:**

```yaml
esx01:
  driver: vmware
  user: 'admin'
  password: 'verybadpass'
  url: 'esx01.domain.com'
```

---

**Note:** Optionally, protocol and port can be specified if the vCenter server is not using the defaults. Default is protocol: https and port: 443.

---

**Note:** Changed in version 2015.8.0.

The provider parameter in cloud provider configuration was renamed to driver. This change was made to avoid confusion with the provider parameter that is used in cloud profile configuration. Cloud provider configuration now uses driver to refer to the salt-cloud driver that provides the underlying functionality to connect to a cloud provider, while cloud profile configuration continues to use provider to refer to the cloud provider configuration that you define.

To test the connection for my-vmware-config specified in the cloud configuration, run

```bash
test_vcenter_connection()
```

```bash
salt.cloud.clouds.vmware.add_host(kwags=None, call=\'exec\')
```

Add a host system to the specified cluster or datacenter in this VMware environment

---

**Note:** To use this function, you need to specify esxi_host_user and esxi_host_password under your provider configuration set up at /etc/salt/cloud.providers or /etc/salt/cloud.providers.d/vmware.conf:

```yaml
vcenter01:
  driver: vmware
  user: 'DOMAIN\user'
  password: 'verybadpass'
```

(continues on next page)
The SSL thumbprint of the host system can be optionally specified by setting `esxi_host_ssl_thumbprint` under your provider configuration. To get the SSL thumbprint of the host system, execute the following command from a remote server:

```bash
echo -n | openssl s_client -connect <YOUR-HOSTSYSTEM-DNS/IP>:443 2>/dev/null | openssl x509 -noout -fingerprint -sha1
```

**CLI Example:**

```bash
salt-cloud -f add_host my-vmware-config host="myHostSystemName" cluster="myClusterName"
salt-cloud -f add_host my-vmware-config host="myHostSystemName" datacenter="myDatacenterName"
```

salt.cloud.clouds.vmware.avail_images(`call=None`)  
Return a list of all the templates present in this VMware environment with basic details  
**CLI Example:**

```bash
salt-cloud --list-images my-vmware-config
```

salt.cloud.clouds.vmware.avail_locations(`call=None`)  
Return a list of all the available locations/datacenters in this VMware environment  
**CLI Example:**

```bash
salt-cloud --list-locations my-vmware-config
```

salt.cloud.clouds.vmware.avail_sizes(`call=None`)  
Return a list of all the available sizes in this VMware environment.  
**CLI Example:**

```bash
salt-cloud --list-sizes my-vmware-config
```

**Note:** Since sizes are built into templates, this function will return an empty dictionary.

salt.cloud.clouds.vmware.build_clonespec(`config_spec, object_ref, reloc_spec, template`)  
Returns the clone spec

salt.cloud.clouds.vmware.connect_host(`kwargs=None, call=None`)  
Connect the specified host system in this VMware environment  
**CLI Example:**
```bash
salt-cloud -f connect_host my-vmware-config host="myHostSystemName"
```

```python
salt.cloud.clouds.vmware.convert_to_template(name, kwars= None, call=None)

Convert the specified virtual machine to template.

CLI Example:
```bash
salt-cloud -a convert_to_template vmname
```

```python
salt.cloud.clouds.vmware.create(vm_)

To create a single VM in the VMware environment.

Sample profile and arguments that can be specified in it can be found here.

CLI Example:
```bash
salt-cloud -p vmware-centos6.5 vmname
```

```python
salt.cloud.clouds.vmware.create_cluster(kwargs=None, call=None)

Create a new cluster under the specified datacenter in this VMware environment

CLI Example:
```bash
salt-cloud -f create_cluster my-vmware-config name="myNewCluster" datacenter="datacenterName"
```

```python
salt.cloud.clouds.vmware.create_datacenter(kwargs=None, call=None)

Create a new data center in this VMware environment

CLI Example:
```bash
salt-cloud -f create_datacenter my-vmware-config name="MyNewDatacenter"
```

```python
salt.cloud.clouds.vmware.create_datastore_cluster(kwargs=None, call=None)

Create a new datastore cluster for the specified datacenter in this VMware environment

CLI Example:
```bash
salt-cloud -f create_datastore_cluster my-vmware-config name="datastoreClusterName" datacenter="datacenterName"
```

```python
salt.cloud.clouds.vmware.create_folder(kwargs=None, call=None)

Create the specified folder path in this VMware environment

Note: To create a Host and Cluster Folder under a Datacenter, specify path="/yourDatacenterName/host/yourFolderName"

To create a Network Folder under a Datacenter, specify path="/yourDatacenterName/network/yourFolderName"

To create a Storage Folder under a Datacenter, specify path="/yourDatacenterName/datastore/yourFolderName"

To create a VM and Template Folder under a Datacenter, specify path="/yourDatacenterName/vm/yourFolderName"

CLI Example:
```
salt-cloud -f create_folder my-vmware-config path="/Local/a/b/c"
salt-cloud -f create_folder my-vmware-config path="/MyDatacenter/vm/MyVMFolder"
salt-cloud -f create_folder my-vmware-config path="/MyDatacenter/host/MyHostFolder"
salt-cloud -f create_folder my-vmware-config path="/MyDatacenter/network/MyNetworkFolder"
salt-cloud -f create_folder my-vmware-config path="/MyDatacenter/storage/MyStorageFolder"

salt.cloud.clouds.vmware.create_snapshot(name, kwargs=None, call=None)
Create a snapshot of the specified virtual machine in this VMware environment

Note: If the VM is powered on, the internal state of the VM (memory dump) is included in the snapshot by
default which will also set the power state of the snapshot to "powered on". You can set memdump=False
to override this. This field is ignored if the virtual machine is powered off or if the VM does not support snapshots
with memory dumps. Default is memdump=True

Note: If the VM is powered on when the snapshot is taken, VMware Tools can be used to quiesce the file
system in the virtual machine by setting quiesce=True. This field is ignored if the virtual machine is
powered off; if VMware Tools are not available or if memdump=True. Default is quiesce=False

CLI Example:
salt-cloud -a create_snapshot vmname snapshot_name="mySnapshot"
salt-cloud -a create_snapshot vmname snapshot_name="mySnapshot" [description="MySnapshot"] [memdump=False] [quiesce=True]

salt.cloud.clouds.vmware.destroy(name, call=None)
To destroy a VM from the VMware environment

CLI Example:
salt-cloud -d vmname
salt-cloud --destroy vmname
salt-cloud -a destroy vmname

salt.cloud.clouds.vmware.disconnect_host(kwargs=None, call=None)
Disconnect the specified host system in this VMware environment

CLI Example:
salt-cloud -f disconnect_host my-vmware-config host="myHostSystemName"

salt.cloud.clouds.vmware.enter_maintenance_mode(kwargs=None, call=None)
To put the specified host system in maintenance mode in this VMware environment

CLI Example:
salt-cloud -f enter_maintenance_mode my-vmware-config host="myHostSystemName"

salt.cloud.clouds.vmware.exit_maintenance_mode(kwargs=None, call=None)
To take the specified host system out of maintenance mode in this VMware environment

CLI Example:
salt-cloud -f exit_maintenance_mode my-vmware-config host="myHostSystemName"

salt.cloud.clouds.vmware.get_clonespec_for_valid_snapshot(config_spec, object_ref, reloc_spec, template, vm_)

return clonespec only if values are valid

salt.cloud.clouds.vmware.get_vcenter_version(kwargs=None, call=None)

Show the vCenter Server version with build number.

CLI Example:
salt-cloud -f get_vcenter_version my-vmware-config

salt.cloud.clouds.vmware.handle_snapshot(config_spec, object_ref, reloc_spec, template, vm_)

Returns a clone spec for cloning from snapshots :rtype vim.vm.CloneSpec

salt.cloud.clouds.vmware.list_clusters(kwargs=None, call=None)

List all the clusters for this VMware environment

CLI Example:
salt-cloud -f list_clusters my-vmware-config

salt.cloud.clouds.vmware.list_clusters_by_datacenter(kwargs=None, call=None)

List clusters for each datacenter; or clusters for a specified datacenter in this VMware environment

To list clusters for each datacenter:

CLI Example:
salt-cloud -f list_clusters_by_datacenter my-vmware-config

To list clusters for a specified datacenter:

CLI Example:
salt-cloud -f list_clusters_by_datacenter my-vmware-config datacenter=→"datacenterName"

salt.cloud.clouds.vmware.list_datacenters(kwargs=None, call=None)

List all the data centers for this VMware environment

CLI Example:
salt-cloud -f list_datacenters my-vmware-config

salt.cloud.clouds.vmware.list_datastore_clusters(kwargs=None, call=None)

List all the datastore clusters for this VMware environment

CLI Example:
salt-cloud -f list_datastore_clusters my-vmware-config

salt.cloud.clouds.vmware.list_datastores(kwargs=None, call=None)

List all the datastores for this VMware environment

CLI Example:
salt-cloud -f list_datastores my-vmware-config
salt.cloud.clouds.vmware.list_dvs(kwArgs=None, call=None)
List all the distributed virtual switches for this VMware environment

CLI Example:
```
salt-cloud -f list_dvs my-vmware-config
```

salt.cloud.clouds.vmware.list_folders(kwArgs=None, call=None)
List all the folders for this VMware environment

CLI Example:
```
salt-cloud -f list_folders my-vmware-config
```

salt.cloud.clouds.vmware.list_hbas(kwArgs=None, call=None)
List all HBAs for each host system; or all HBAs for a specified host system; or HBAs of specified type for each host system; or HBAs of specified type for a specified host system in this VMware environment

**Note:** You can specify type as either parallel, iscsi, block or fibre.

To list all HBAs for each host system:

CLI Example:
```
salt-cloud -f list_hbas my-vmware-config
```

To list all HBAs for a specified host system:

CLI Example:
```
salt-cloud -f list_hbas my-vmware-config host="hostSystemName"
```

To list HBAs of specified type for each host system:

CLI Example:
```
salt-cloud -f list_hbas my-vmware-config type="HBAType"
```

To list HBAs of specified type for a specified host system:

CLI Example:
```
salt-cloud -f list_hbas my-vmware-config host="hostSystemName" type="HBAType"
```

salt.cloud.clouds.vmware.list_hosts(kwArgs=None, call=None)
List all the hosts for this VMware environment

CLI Example:
```
salt-cloud -f list_hosts my-vmware-config
```

salt.cloud.clouds.vmware.list_hosts_by_cluster(kwArgs=None, call=None)
List hosts for each cluster; or hosts for a specified cluster in this VMware environment

To list hosts for each cluster:

CLI Example:
To list hosts for a specified cluster:

CLI Example:

```
salt-cloud -f list_hosts_by_cluster my-vmware-config cluster="clusterName"
```

`salt.cloud.clouds.vmware.list_hosts_by_datacenter` *(kwargs=None, call=None)*

List hosts for each datacenter; or hosts for a specified datacenter in this VMware environment

To list hosts for each datacenter:

CLI Example:

```
salt-cloud -f list_hosts_by_datacenter my-vmware-config
```

To list hosts for a specified datacenter:

CLI Example:

```
salt-cloud -f list_hosts_by_datacenter my-vmware-config datacenter="datacenterName"
```

`salt.cloud.clouds.vmware.list_networks` *(kwargs=None, call=None)*

List all the standard networks for this VMware environment

CLI Example:

```
salt-cloud -f list_networks my-vmware-config
```

`salt.cloud.clouds.vmware.list_nodes` *(kwargs=None, call=None)*

Return a list of all VMs and templates that are on the specified provider, with basic fields

CLI Example:

```
salt-cloud -f list_nodes my-vmware-config
```

To return a list of all VMs and templates present on ALL configured providers, with basic fields:

CLI Example:

```
salt-cloud -Q
```

`salt.cloud.clouds.vmware.list_nodes_full` *(kwargs=None, call=None)*

Return a list of all VMs and templates that are on the specified provider, with full details

CLI Example:

```
salt-cloud -f list_nodes_full my-vmware-config
```

To return a list of all VMs and templates present on ALL configured providers, with full details:

CLI Example:

```
salt-cloud -F
```

`salt.cloud.clouds.vmware.list_nodes_min` *(kwargs=None, call=None)*

Return a list of all VMs and templates that are on the specified provider, with no details

CLI Example:
salt.cloud.clouds.vmware.list_nodes_min my-vmware-config

salt.cloud.clouds.vmware.list_nodes_select(call=None)
Return a list of all VMs and templates that are on the specified provider, with fields specified under query.
selection in /etc/salt/cloud

CLI Example:
salt-cloud -f list_nodes_select my-vmware-config

To return a list of all VMs and templates present on ALL configured providers, with fields specified under
query.selection in /etc/salt/cloud:

CLI Example:
salt-cloud -S

salt.cloud.clouds.vmware.list_portgroups(kwargs=None, call=None)
List all the distributed virtual portgroups for this VMware environment

CLI Example:
salt-cloud -f list_portgroups my-vmware-config

salt.cloud.clouds.vmware.list_resourcepools(kwargs=None, call=None)
List all the resource pools for this VMware environment

CLI Example:
salt-cloud -f list_resourcepools my-vmware-config

salt.cloud.clouds.vmware.list_snapshots(kwargs=None, call=None)
List snapshots either for all VMs and templates or for a specific VM/template in this VMware environment

To list snapshots for all VMs and templates:

CLI Example:
salt-cloud -f list_snapshots my-vmware-config

To list snapshots for a specific VM/template:

CLI Example:
salt-cloud -f list_snapshots my-vmware-config name="vmname"

salt.cloud.clouds.vmware.list_templates(kwargs=None, call=None)
List all the templates present in this VMware environment

CLI Example:
salt-cloud -f list_templates my-vmware-config

salt.cloud.clouds.vmware.list_vapps(kwargs=None, call=None)
List all the vApps for this VMware environment

CLI Example:
salt-cloud -f list_vapps my-vmware-config
salt.cloud.clouds.vmware.reboot_host\((kwargs=None, call=None)\)
    Reboot the specified host system in this VMware environment

    **Note:** If the host system is not in maintenance mode, it will not be rebooted. If you want to reboot the host system regardless of whether it is in maintenance mode, set `force=True`. Default is `force=False`.

    CLI Example:
    ```
    salt-cloud -f reboot_host my-vmware-config host="myHostSystemName" [force=True]
    ```

salt.cloud.clouds.vmware.remove_all_snapshots\((name, kwargs=None, call=None)\)
    Remove all the snapshots present for the specified virtual machine.

    **Note:** All the snapshots higher up in the hierarchy of the current snapshot tree are consolidated and their virtual disks are merged. To override this behavior and only remove all snapshots, set `merge_snapshots=False`. Default is `merge_snapshots=True`.

    CLI Example:
    ```
    salt-cloud -a remove_all_snapshots vmname [merge_snapshots=False]
    ```

salt.cloud.clouds.vmware.remove_host\((kwargs=None, call=None)\)
    Remove the specified host system from this VMware environment

    CLI Example:
    ```
    salt-cloud -f remove_host my-vmware-config host="myHostSystemName"
    ```

salt.cloud.clouds.vmware.remove_snapshot\((name, kwargs=None, call=None)\)
    Remove a snapshot of the specified virtual machine in this VMware environment

    CLI Example:
    ```
    salt-cloud -a remove_snapshot vmname snapshot_name="mySnapshot"
    salt-cloud -a remove_snapshot vmname snapshot_name="mySnapshot" [remove_children=True]
    ```

salt.cloud.clouds.vmware.rescan_hba\((kwargs=None, call=None)\)
    To rescan a specified HBA or all the HBAs on the Host System

    CLI Example:
    ```
    salt-cloud -f rescan_hba my-vmware-config host="hostSystemName"
    salt-cloud -f rescan_hba my-vmware-config hba="hbaDeviceName" host="hostSystemName"
    ```

salt.cloud.clouds.vmware.reset\((name, soft=False, call=None)\)
    To reset a VM using its name

    **Note:** If `soft=True` then issues a command to the guest operating system asking it to perform a reboot. Otherwise hypervisor will terminate VM and start it again. Default is `soft=False`.

    For `soft=True` vmtools should be installed on guest system.

    CLI Example:
salt.cloud.clouds.vmware.revert_to_snapshot(name, kwargs=None, call=None)
Revert virtual machine to its current snapshot. If no snapshot exists, the state of the virtual machine remains unchanged

Note: The virtual machine will be powered on if the power state of the snapshot when it was created was set to "Powered On". Set power_off=True so that the virtual machine stays powered off regardless of the power state of the snapshot when it was created. Default is power_off=False.

If the power state of the snapshot when it was created was "Powered On" and if power_off=True, the VM will be put in suspended state after it has been reverted to the snapshot.

CLI Example:
salt-cloud -a revert_to_snapshot vmame

salt.cloud.clouds.vmware.show_instance(name, call=None)
List all available details of the specified VM

CLI Example:
salt-cloud -a show_instance vmname

salt.cloud.clouds.vmware.start(name, call=None)
To start/power on a VM using its name

CLI Example:
salt-cloud -a start vmname

salt.cloud.clouds.vmware.stop(name, soft=False, call=None)
To stop/power off a VM using its name

Note: If soft=True then issues a command to the guest operating system asking it to perform a clean shutdown of all services. Default is soft=False

For soft=True vmtools should be installed on guest system.

CLI Example:
salt-cloud -a stop vmname

salt.cloud.clouds.vmware.suspend(name, call=None)
To suspend a VM using its name

CLI Example:
salt-cloud -a suspend vmname

salt.cloud.clouds.vmware.terminate(name, call=None)
To do an immediate power off of a VM using its name. A SIGKILL is issued to the vmx process of the VM
CLI Example:
```
salt-cloud -a terminate vmname
```

```
salt.cloud.clouds.vmware.test_vcenter_connection(kwargs=None, call=None)
```
Test if the connection can be made to the vCenter server using the specified credentials inside /etc/salt/cloud.providers or /etc/salt/cloud.providers.d/vmware.conf

CLI Example:
```
salt-cloud -f test_vcenter_connection my-vmware-config
```

```
salt.cloud.clouds.vmware.upgrade_tools(name, reboot=False, call=None)
```
To upgrade VMware Tools on a specified virtual machine.

---

Note: If the virtual machine is running Windows OS, use `reboot=True` to reboot the virtual machine after VMware tools upgrade. Default is `reboot=False`

---

CLI Example:
```
salt-cloud -a upgrade_tools vmname
salt-cloud -a upgrade_tools vmname reboot=True
```

```
salt.cloud.clouds.vmware.upgrade_tools_all(call=None)
```
To upgrade VMware Tools on all virtual machines present in the specified provider

---

Note: If the virtual machine is running Windows OS, this function will attempt to suppress the automatic reboot caused by a VMware Tools upgrade.

---

CLI Example:
```
salt-cloud -f upgrade_tools_all my-vmware-config
```

### 21.4.29 salt.cloud.clouds.vultrpy

**Vultr Cloud Module using python-vultr bindings**

New in version 2016.3.0.

The Vultr cloud module is used to control access to the Vultr VPS system.

Use of this module only requires the `api_key` parameter.

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/vultr.conf`:

```
my-vultr-config:
    # Vultr account api key
    api_key: <supersecretapi_key>
    driver: vultr
```

Set up the cloud profile at `/etc/salt/cloud.profiles` or `/etc/salt/cloud.profiles.d/vultr.conf`:
This driver also supports Vultr’s startup script feature. You can list startup scripts in your account with

```
salt-cloud -f list_scripts <name of vultr provider>
```

That list will include the IDs of the scripts in your account. Thus, if you have a script called 'setup-networking' with an ID of 493234 you can specify that startup script in a profile like so:

```
nyc-2gb-1cpu-ubuntu-17-04:
  location: 1
  provider: my-vultr-config
  image: 223
  size: 13
  startup_script_id: 493234
```

```python
salt.cloud.clouds.vultrpy.avail_images(conn=None)
    Return available images
	salt.cloud.clouds.vultrpy.avail_locations(conn=None)
    return available datacenter locations
	salt.cloud.clouds.vultrpy.avail_scripts(conn=None)
    return available startup scripts
	salt.cloud.clouds.vultrpy.avail_sizes(conn=None)
    Return available sizes ('plans' in VultrSpeak)
	salt.cloud.clouds.vultrpy.create(vm_)
    Create a single VM from a data dict
	salt.cloud.clouds.vultrpy.destroy(name)
    Remove a node from Vultr
	salt.cloud.clouds.vultrpy.get_configured_provider()
    Return the first configured instance
	salt.cloud.clouds.vultrpy.list_nodes(**kwargs)
    Return basic data on nodes
	salt.cloud.clouds.vultrpy.list_nodes_full(**kwargs)
    Return all data on nodes
	salt.cloud.clouds.vultrpy.list_nodes_select(conn=None, call=None)
    Return a list of the VMs that are on the provider, with select fields
	salt.cloud.clouds.vultrpy.list_scripts(conn=None, call=None)
    return list of Startup Scripts
	salt.cloud.clouds.vultrpy.show_instance(name, call=None)
    Show the details from the provider concerning an instance
	salt.cloud.clouds.vultrpy.start(**args, **kwargs)
    Execute a "start" action on a VM
```
salt.cloud.clouds.vultrpy.stop(*args, **kwargs)
Execute a "stop" action on a VM

21.4.30 salt.cloud.clouds.xen

XenServer Cloud Driver

The XenServer driver is designed to work with a Citrix XenServer.

Requires XenServer SDK (can be downloaded from https://www.citrix.com/downloads/xenserver/product-software/)

Place a copy of the XenAPI.py in the Python site-packages folder.

depends XenAPI

Example provider configuration:

```python
# /etc/salt/cloud.providers.d/myxen.conf
myxen:
    driver: xen
    url: http://10.0.0.120
    user: root
    password: p@ssw0rd
```

Example profile configuration:

```python
# /etc/salt/cloud.profiles.d/myxen.conf
suse:
    provider: myxen
    user: root
    password: p@ssw0rd
    image: opensuseleap42_2-template
    storage_repos: 'Local storage'
    resource_pool: default_pool
    clone: True
    minion:
        master: 10.0.0.18

sles:
    provider: myxen
    user: root
    clone: False
    image: sles12sp2-template
    deploy: False

w2k12:
    provider: myxen
    image: w2k12svr-template
    clone: True
    userdata_file: /srv/salt/win/files/windows-firewall.ps1
    win_installer: /srv/salt/win/files/Salt-Minion-2016.11.3-AMD64-Setup.exe
    win_username: Administrator
    win_password: p@ssw0rd
    use_winrm: False
    ipv4_cidr: 10.0.0.215/24
    ipv4_gw: 10.0.0.1
```

salt.cloud.clouds.xen.avail_images(call=None)
Get a list of images from Xen
If called with the `--list-images` then it returns images with all details.

```
salt-cloud --list-images myxen
```

```
salt.cloud.clouds.xen.avail_locations(session=None, call=None)
Return available Xen locations (not implemented)
```

```
salt-cloud --list-locations myxen
```

```
salt.cloud.clouds.xen.avail_sizes(session=None, call=None)
Return a list of Xen template definitions
```

```
salt-cloud --list-sizes myxen
```

```
salt.cloud.clouds.xen.create(vm_)
Create a VM in Xen
   The configuration for this function is read from the profile settings.
```

```
salt-cloud -p some_profile xenvm01
```

```
salt.cloud.clouds.xen.destroy(name=None, call=None)
Destroy Xen VM or template instance
```

```
salt-cloud -d xenvm01
```

```
salt.cloud.clouds.xen.destroy_template(name=None, call=None, kwargs=None)
Destroy Xen VM or template instance
```

```
salt-cloud -f destroy_template myxen name=testvm2
```

```
salt.cloud.clouds.xen.destroy_vm_vdis(name=None, session=None, call=None)
Get virtual block devices on VM
```

```
salt-cloud -a destroy_vm_vdis xenvm01
```

```
salt.cloud.clouds.xen.get_configured_provider()
Return the first configured instance.
```

```
salt.cloud.clouds.xen.get_pv_args(name, session=None, call=None)
Get PV arguments for a VM
```

```
salt-cloud -a get_pv_args xenvm01
```

```
salt.cloud.clouds.xen.get_vm_ip(name=None, session=None, call=None)
Get the IP address of the VM
```

```
salt-cloud -a get_vm_ip xenvm01
```

Note: Requires xen guest tools to be installed in VM

```
salt.cloud.clouds.xen.host_list(call=None)
Get a list of Xen Servers
```

```
salt-cloud -f host_list myxen
```
salt.cloud.clouds.xen.list_nodes()
    List virtual machines
    
    salt-cloud -Q

salt.cloud.clouds.xen.list_nodes_full(session=None)
    List full virtual machines
    
    salt-cloud -F

salt.cloud.clouds.xen.list_nodes_select(call=None)
    Perform a select query on Xen VM instances
    
    salt-cloud -S

salt.cloud.clouds.xen.pause(name, call=None, session=None)
    Pause a vm
    
    salt-cloud -a pause xenvm01

salt.cloud.clouds.xen.pif_list(call=None)
    Get a list of Resource Pools
    
    salt-cloud -f pool_list myxen

salt.cloud.clouds.xen.pool_list(call=None)
    Get a list of Resource Pools
    
    salt-cloud -f pool_list myxen

salt.cloud.clouds.xen.reboot(name, call=None, session=None)
    Reboot a vm
    
    salt-cloud -a reboot xenvm01

salt.cloud.clouds.xen.resume(name, call=None, session=None)
    Resume a vm from disk
    
    salt-cloud -a resume xenvm01

salt.cloud.clouds.xen.set_pv_args(name, kwargs=None, session=None, call=None)
    Set PV arguments for a VM
    
    salt-cloud -a set_pv_args xenvm01 pv_args="utf-8 graphical"

salt.cloud.clouds.xen.set_vm_ip(name=None, ipv4_cidr=None, ipv4_gw=None, session=None, call=None)
    Set the IP address on a virtual interface (vif)

salt.cloud.clouds.xen.show_instance(name, session=None, call=None)
    Show information about a specific VM or template
    
    salt-cloud -a show_instance xenvm01

Note: memory is memory_dynamic_max
salt.cloud.clouds.xen.shutdown(name, call=None, session=None)
    Shutdown a vm
    ```
salt-cloud -a shutdown xenvm01
    ```

salt.cloud.clouds.xen.sr_list(call=None)
    Get a list of storage repositories
    ```
salt-cloud -f sr_list myxen
    ```

salt.cloud.clouds.xen.start(name, call=None, session=None)
    Start a vm
    ```
salt-cloud -a start xenvm01
    ```

salt.cloud.clouds.xen.stop(name, call=None, session=None)
    Stop a vm
    ```
salt-cloud -a stop xenvm01
    ```

salt.cloud.clouds.xen.suspend(name, call=None, session=None)
    Suspend a vm to disk
    ```
salt-cloud -a suspend xenvm01
    ```

salt.cloud.clouds.xen.template_list(call=None)
    Return available Xen template information.
    This returns the details of each template to show number cores, memory sizes, etc..
    ```
salt-cloud -f template_list myxen
    ```

salt.cloud.clouds.xen.unpause(name, call=None, session=None)
    UnPause a vm
    ```
salt-cloud -a unpause xenvm01
    ```

salt.cloud.clouds.xen.vbd_list(name=None, call=None, kwargs=None)
    Get a list of VBDs on a VM
    ```
salt-cloud -a vbd_list xenvm01
    ```

salt.cloud.clouds.xen.vdi_list(call=None, kwargs=None)
    Return available Xen VDI images
    If this function is called with the -f or --function then it can return a list with minimal detail using the
terse=True keyword argument.
    ```
salt-cloud -f vdi_list myxen terse=True
    ```

salt.cloud.clouds.xen.vif_list(name, call=None, kwargs=None)
    Get a list of virtual network interfaces on a VM
    ```
salt-cloud -a vif_list xenvm01
    ```
21.5 engine modules

21.5.1 salt.engines.docker_events module

Send events from Docker events :Depends: Docker API >= 1.22

salt.engines.docker_events.start(docker_url='unix://var/run/docker.sock', timeout=60, tag='salt/engines/docker_events', filters=None)

Scan for Docker events and fire events

Example Config

```
engines:
  - docker_events:
      docker_url: unix://var/run/docker.sock
      filters:
        event:
        - start
        - stop
        - die
        - oom
```

The config above sets up engines to listen for events from the Docker daemon and publish them to the Salt event bus.
21.5.2 salt.engines.fluent

An engine that reads messages from the salt event bus and pushes them onto a fluent endpoint.

New in version 3000.

Configuration

All arguments are optional

Example configuration of default settings

```
engines:
  - fluent:
      host: localhost
      port: 24224
      app: engine
```

Example fluentd configuration

```
<source>
  @type forward
  port 24224
</source>

<match saltstack.**>
  @type file
  path /var/log/td-agent/saltstack
</match>
```

deps: fluent-logger

salt.engines.fluent.start( host='localhost', port=24224, app='engine')

Listen to salt events and forward them to fluent

Parameters

- host (str) – Host running fluentd agent. Default is localhost
- port (int) – Port of fluentd agent. Default is 24224
- app (str) – Text sent as fluentd tag. Default is "engine". This text is appended to "saltstack." to form a fluentd tag, ex: "saltstack.engine"

21.5.3 salt.engines.http_logstash

HTTP Logstash engine

An engine that reads messages from the salt event bus and pushes them onto a logstash endpoint via HTTP requests.

Changed in version 2018.3.0.

Note: By default, this engine take everything from the Salt bus and exports into Logstash. For a better selection of the events that you want to publish, you can use the tags and funs options.
Salt Documentation, Release 3000.2

engines:
  - http_logstash:
    url: http://blabla.com/salt-stuff
    tags:
      - salt/job/*/new
      - salt/job/*/ret/*
    funs:
      - probes.results
      - bgp.config

salt.engines.http_logstash.start(url, funs=None, tags=None)
Listen to salt events and forward them to logstash.

url The Logstash endpoint.

funs: None A list of functions to be compared against, looking into the fun field from the event data. This option helps to select the events generated by one or more functions. If an event does not have the fun field in the data section, it will be published. For a better selection, consider using the tags option. By default, this option accepts any event to be submitted to Logstash.

tags: None A list of pattern to compare the event tag against. By default, this option accepts any event to be submitted to Logstash.

21.5.4 salt.engines.ircbot

IRC Bot engine

New in version 2017.7.0.

Example Configuration

engines:
  - ircbot:
    nick: <nick>
    username: <username>
    password: <password>
    host: chat.freenode.net
    port: 7000
    channels:
      - salt-test
      - '#something'
    use_ssl: True
    use_sasl: True
    disable_query: True
    allow_hosts:
      - salt/engineer/.*
    allow_nicks:
      - gtmanfred

Available commands on irc are:

ping return pong

echo <stuff> return <stuff> targeted at the user who sent the commands

event <tag> [<extra>, <data>] fire event on the master or minion event stream with the tag salt/engines/ircbot/<tag>
and a data object with a list of everything else sent in the message

Example of usage
class salt.engines.ircbot.Event(source, code, line)

    code
    Alias for field number 1

    line
    Alias for field number 2

    source
    Alias for field number 0

class salt.engines.ircbot.IRCClient(nick, host, port=6667, username=None, password=None, channels=None, use_ssl=False, use_sasl=False, char='!', allow_hosts=False, allow_nicks=False, disable_query=True)

    join_channel(channel)

    on_closed()

    on_connect()

    read_messages()

    send_message(line)

class salt.engines.ircbot.PrivEvent(source, nick, user, host, code, channel, command, line)

    channel
    Alias for field number 5

    code
    Alias for field number 4

    command
    Alias for field number 6

    host
    Alias for field number 3

    line
    Alias for field number 7

    nick
    Alias for field number 1

    source
    Alias for field number 0

    user
    Alias for field number 2
salt.engines.ircbot.start(nick, host, port=6667, username=None, password=None, channels=None, use_ssl=False, use_sasl=False, char='!', allow_hosts=False, allow_nicks=False, disable_query=True)

IRC Bot for interacting with salt.

nickname of the connected Bot.
host irc server (example - chat.freenode.net).
port irc port. Default: 6667
password password for authenticating. If not provided, user will not authenticate on the irc server.
channels channels to join.
use_ssl connect to server using ssl. Default: False
use_sasl authenticate using sasl, instead of messaging NickServ. Default: False

Note: This will allow the bot user to be fully authenticated before joining any channels

char command character to look for. Default: !
allow_hosts hostmasks allowed to use commands on the bot. Default: False True to allow all False to allow none List of regexes to allow matching
allow_nicks Nicks that are allowed to use commands on the bot. Default: False True to allow all False to allow none List of regexes to allow matching
disable_query Disable commands from being sent through private queries. Require they be sent to a channel, so that all communication can be controlled by access to the channel. Default: True

Warning: Unauthenticated Access to event stream

This engine sends events calls to the event stream without authenticating them in salt. Authentication will need to be configured and enforced on the irc server or enforced in the irc channel. The engine only accepts commands from channels, so non authenticated users could be banned or quieted in the channel.

/mode +q $~a # quiet all users who are not authenticated /mode +r # do not allow unauthenticated users into the channel

It would also be possible to add a password to the irc channel, or only allow invited users to join.

21.5.5 salt.engines.junos_syslog module

Junos Syslog Engine

New in version 2017.7.0.
depends pyparsing, twisted

An engine that listens to syslog message from Junos devices, extract event information and generate message on SaltStack bus.

The event topic sent to salt is dynamically generated according to the topic title specified by the user. The incoming event data (from the junos device) consists of the following fields:

1. hostname
2. hostip
3. daemon
4. event
5. severity
6. priority
7. timestamp
8. message
9. pid
10. raw (the raw event data forwarded from the device)

The topic title can consist of any of the combination of above fields, but the topic has to start with jnpr/syslog. Here are a couple example combinations:

- jnpr/syslog/hostip/daemon/event
- jnpr/syslog/daemon/severity

The corresponding dynamic topic sent on salt event bus would look something like:

- jnpr/syslog/1.1.1.1/mgd/UI_COMMIT_COMPLETED
- jnpr/syslog/sshd/7

The default topic title is jnpr/syslog/hostname/event.

One can choose the type of data they want from the event bus. For example, if one wants only events pertaining to a particular daemon, this can be specified in the configuration file:

```
daemon: mgd
```

One can even have a list of daemons:

```
daemon:
  - mgd
  - sshd
```

Example configuration (to be written in master config file)

```
engines:
  - junos_syslog:
    port: 9999
    topic: jnpr/syslog/hostip/daemon/event
    daemon:
      - mgd
      - sshd
```

For junos_syslog engine to receive events, syslog must be set on the junos device. This can be done via following configuration:

```
set system syslog host <ip-of-the-salt-device> port 516 any any
```

Below is a sample syslog event which is received from the junos device:

```
<30>May 29 05:18:12 bng-ui-vm-9 mspd[1492]: No chassis configuration found
```

The source for parsing the syslog messages is taken from: https://gist.github.com/leandrosilva/3651640#file-xlog-py
21.5.6 salt.engines.logentries

An engine that sends events to the Logentries logging service.

**maintainer** Jimmy Tang (jimmy_tang@rapid7.com)

**maturity** New

**depends** ssl, certifi

**platform** all

To enable this engine the master and/or minion will need the following python libraries

ssl certifi

If you are running a new enough version of python then the ssl library will be present already.

You will also need the following values configured in the minion or master config.

**configuration** Example configuration

```yaml
environments:
- logentries:
    endpoint: data.logentries.com
    port: 10000
    token: 057af3e2-1c05-47c5-882a-5cd644655dbf
```

The 'token' can be obtained from the Logentries service.

To test this engine

```
salt '*' test.ping cmd.run uptime
```
21.5.7 salt.engines.logstash_engine

An engine that reads messages from the salt event bus and pushes them onto a logstash endpoint.

configuration

```yaml
engines:
- logstash:
  host: log.my_network.com
  port: 5959
  proto: tcp
```

depends logstash

salt.engines.logstash_engine.event_bus_context(opts)
salt.engines.logstash_engine.start(host, port=5959, tag='salt/engine/logstash', proto='udp')

Listen to salt events and forward them to logstash

21.5.8 salt.engines.napalm_syslog

NAPALM syslog engine

New in version 2017.7.0.

An engine that takes syslog messages structured in OpenConfig or IETF format and fires Salt events.

As there can be many messages pushed into the event bus, the user is able to filter based on the object structure.

Requirements

- napalm-logs

This engine transfers objects from the napalm-logs library into the event bus. The top dictionary has the following keys:

- ip
- host
- timestamp
- os: the network OS identified
- model_name: the OpenConfig or IETF model name
- error: the error name (consult the documentation)
- message_details: details extracted from the syslog message
- open_config: the OpenConfig model

The napalm-logs transfers the messages via widely used transport mechanisms such as: ZeroMQ (default), Kafka, etc.

The user can select the right transport using the transport option in the configuration.

configuration

Example configuration
configuration Configuration example, excluding messages from IOS-XR devices:

```yaml
engines:
  - napalm_syslog:
      transport: zmq
      address: 1.2.3.4
      port: 49018

os_blacklist:
  - iosxr
```

Event example:

```json
{
  "_stamp": "2017-05-26T10:03:18.653045",
  "error": "BGP_PREFIX_THRESH_EXCEEDED",
  "host": "vmx01",
  "ip": "192.168.140.252",
  "message_details": {
    "date": "May 25",
    "host": "vmx01",
    "message": "192.168.140.254 (External AS 65001): Configured maximum prefix-limit threshold(22) exceeded for inet-unicast nlri: 28 (instance master)",
    "pri": "28",
    "processId": "2957",
    "processName": "rpd",
    "tag": "BGP_PREFIX_THRESH_EXCEEDED",
    "time": "20:50:41"
  },
  "model_name": "openconfig_bgp",
  "open_config": {
    "bgp": {
      "neighbors": {
        "neighbor": {
          "192.168.140.254": {
            "afi_safis": {
              "afi_safi": {
                "inet": {
                  "afi_safi_name": "inet",
                  "ipv4_unicast": {
                    "prefix_limit": {
                      "state": {
                        "max_prefixes": 22
                      }
                    }
                  }
                }
              }
            }
          }
        }
      }
    }
  }
}
```

(continues on next page)
To consume the events and eventually react and deploy a configuration changes on the device(s) firing the event, one is able to identify the minion ID, using one of the following alternatives, but not limited to:

- **Host grains** to match the event tag
- **Host DNS grain** to match the IP address in the event data
- **Hostname grains** to match the event tag
- **Define static grains**
- **Write a grains module**
- **Targeting minions using pillar data** - The user can configure certain information in the Pillar data and then use it to identify minions

Master configuration example, to match the event and react:

```yaml
reactor:
- 'napalm/syslog/*/BGP_PREFIX_THRESH_EXCEEDED/*/':
  - salt://increase_prefix_limit_on_thresh_exceeded.sls
```

Which matches the events having the error code BGP_PREFIX_THRESH_EXCEEDED from any network operating system, from any host and reacts, executing the `increase_prefix_limit_on_thresh_exceeded.sls` reactor, found under one of the `file_roots` paths.

Reactor example:

```yaml
increase_prefix_limit_on_thresh_exceeded:
  local.net.load_template:
  - tgt: "hostname:{{ data['host'] }}"
  - tgt_type: grain
  - kwarg:
    template_name: salt://increase_prefix_limit.jinja
    openconfig_structure: {{ data['open_config'] }}
```

The reactor in the example increases the BGP prefix limit when triggered by an event as above. The minion is matched using the host field from the data (which is the body of the event), compared to the `hostname grain` field. When the event occurs, the reactor will execute the `net.load_template` function, sending as arguments the template `salt://increase_prefix_limit.jinja` defined by the user in their environment and the complete OpenConfig object under the variable name `openconfig_structure`. Inside the Jinja template, the user can process the object from `openconfig_structure` and define the business logic as required.
salt.engines.napalm_syslog.start(transport='zmq', address='0.0.0.0', port=49017, auth_address='0.0.0.0', auth_port=49018, disable_security=False, certificate=None, os_whitelist=None, os_blacklist=None, error_whitelist=None, error_blacklist=None, host_whitelist=None, host_blacklist=None)

Listen to napalm-logs and publish events into the Salt event bus.

**transport:** zmq  Choose the desired transport.

---

**Note:** Currently zmq is the only valid option.

**address:** 0.0.0.0  The address of the publisher, as configured on napalm-logs.

**port:** 49017  The port of the publisher, as configured on napalm-logs.

**auth_address:** 0.0.0.0  The address used for authentication when security is not disabled.

**auth_port:** 49018  Port used for authentication.

**disable_security:** False  Trust unencrypted messages. Strongly discouraged in production.

**certificate:** None  Absolute path to the SSL certificate.

**os_whitelist:** None  List of operating systems allowed. By default everything is allowed.

**os_blacklist:** None  List of operating systems to be ignored. Nothing ignored by default.

**error_whitelist:** None  List of errors allowed.

**error_blacklist:** None  List of errors ignored.

**host_whitelist:** None  List of hosts or IPs to be allowed.

**host_blacklist:** None  List of hosts or IPs to be ignored.

### 21.5.9 salt.engines.reactor module

Setup Reactor

Example Config in Master or Minion config

```yaml
eengines:
  - reactor:
      refresh_interval: 60
      worker_threads: 10
      worker_hwm: 10000

reactor:
  - 'salt/cloud/*/destroyed':
    - /srv/reactor/destroy/*.sls

salt.engines.reactor.start(refresh_interval=None, worker_threads=None, worker_hwm=None)
```

### 21.5.10 salt.engines.redis_sentinel module

An engine that reads messages from the redis sentinel pubsub and sends reactor events based on the channels they are subscribed to.

---

**21.5. engine modules**
configuration Example configuration

```python
defines redis

class salt.engines.redis_sentinel.Listener(host=None, port=None, channels=None, tag=None)

run()

work(item)

salt.engines.redis_sentinel.start(hosts, channels, tag=None)
```

21.5.11 salt.engines.slack module

An engine that reads messages from Slack and can act on them

depends slackclient Python module

---

Important: This engine requires a bot user. To create a bot user, first go to the Custom Integrations page in your Slack Workspace. Copy and paste the following URL, and replace myworkspace with the proper value for your workspace:

https://myworkspace.slack.com/apps/manage/custom-integrations

Next, click on the Bots integration and request installation. Once approved by an admin, you will be able to proceed with adding the bot user. Once the bot user has been added, you can configure it by adding an avatar, setting the display name, etc. You will also at this time have access to your API token, which will be needed to configure this engine.

Finally, add this bot user to a channel by switching to the channel and using /invite @mybotuser. Keep in mind that this engine will process messages from each channel in which the bot is a member, so it is recommended to narrowly define the commands which can be executed, and the Slack users which are allowed to run commands.

This engine has two boolean configuration parameters that toggle specific features (both default to False):

1. control - If set to True, then any message which starts with the trigger string (which defaults to ! and can be overridden by setting the trigger option in the engine configuration) will be interpreted as a Salt CLI command and the engine will attempt to run it. The permissions defined in the various groups will determine if the Slack user is allowed to run the command. The targets and default_target options can be used to set targets for a given command, but the engine can also read the following two keyword arguments:
   - target - The target expression to use for the command
   - tgt_type - The match type, can be one of glob, list, pcre, grain, grain_pcre, pillar, nodegroup, range, ipcidr, or compound. The default value is glob.

Here are a few examples:
2. fire_all - If set to True, all messages which are not prefixed with the trigger string will fired as events onto Salt’s ref:event bus <event-system>. The tag for these veents will be prefixed with the string specified by the tag config option (default: salt/engines/slack).

The groups_pillar_name config option can be used to pull group configuration from the specified pillar key.

Note: In order to use groups_pillar_name, the engine must be running as a minion running on the master, so that the Caller client can be used to retrieve that minions pillar data, because the master process does not have pillar data.

Configuration Examples

Changed in version 2017.7.0: Access control group support added

This example uses a single group called default. In addition, other groups are being loaded from pillar data. The group names do not have any significance, it is the users and commands defined within them that are used to determine whether the Slack user has permission to run the desired command.

```yaml
engines:
  - slack:
      token: 'xoxb-xxxxxxxxxx-xxxxxxxxxxxxxxxxxxxxxxxxx'
      control: True
      fire_all: False
      groups_pillar_name: 'slack_engine:groups_pillar'
      groups:
        default:
          users:
            - '*'
          commands:
            - test.ping
            - cmd.run
            - list_jobs
            - list_commands
          aliases:
            list_jobs:
              cmd: jobs.list_jobs
            list_commands:
              cmd: 'pillar.get salt:engines:slack:valid_commands target=saltmaster
                  → tgt_type=list'
        default_target:
          target: saltmaster
tgt_type: glob
        targets:
          test.ping:
            target: '*'
tgt_type: glob
          cmd.run:
            target: saltmaster
tgt_type: list
```
This example shows multiple groups applying to different users, with all users having access to run test.ping. Keep in mind that when using *, the value must be quoted, or else PyYAML will fail to load the configuration.

```python
class salt.engines.slack.SlackClient(token)

can_user_run(user, command, groups)
    Break out the permissions into the following:
    Check whether a user is in any group, including whether a group has the '*' membership
    Parameters
        • user (str) – The username being checked against
        • command (str) – The command that is being invoked (e.g. test.ping)
        • groups (dict) – the dictionary with groups permissions structure.
    Return type  tuple

    Returns
    On a successful permitting match, returns 2-element tuple that contains the name of the
    group that successfully matched, and a dictionary containing the configuration of the group
    so it can be referenced.

    On failure it returns an empty tuple

    commandline_to_list(cmdline_str, trigger_string)
    cmdline_str is the string of the command line trigger_string is the trigger string, to be removed

    control_message_target(slack_user_name, text, loaded_groups, trigger_string)
    Returns a tuple of (target, cmdline,) for the response
    Raises IndexError if a user can’t be looked up from all_slack_users
```
Returns (False, False) if the user doesn’t have permission

These are returned together because the commandline and the targeting interact with the group config (specifically aliases and targeting configuration) so taking care of them together works out.

The cmdline that is returned is the actual list that should be processed by salt, and not the alias.

**fire**(tag, msg)
This replaces a function in main called 'fire'
It fires an event into the salt bus.

**format_return_text**(data, function, **kwargs)
Print out YAML using the block mode

**generate_triggered_messages**(token, trigger_string, groups, groups_pillar_name)
slack_token = string trigger_string = string input_valid_users = set input_valid_commands = set
When the trigger_string prefixes the message text, yields a dictionary of:

```python
{
    'message_data': m_data,
    'cmdline': cmdline_list, # this is a list
    'channel': channel,
    'user': m_data['user'],
    'slack_client': sc
}
```
else yields {'message_data': m_data} and the caller can handle that
When encountering an error (e.g. invalid message), yields [], the caller can proceed to the next message
When the websocket being read from has given up all its messages, yields {'done': True} to indicate that the caller has read all of the relevant data for now, and should continue its own processing and check back for more data later.

This relies on the caller sleeping between checks, otherwise this could flood

**get_config_groups**(groups_conf, groups_pillar_name)
get info from groups in config, and from the named pillar
todo: add specification for the minion to use to recover pillar

**get_jobs_from_runner**(outstanding_jids)
Given a list of job_ids, return a dictionary of those job_ids that have completed and their results.
Query the salt event bus via the jobs runner. jobs.list_job will show a job in progress, jobs.lookup_jid will return a job that has completed.
returns a dictionary of job id: result

**get_slack_channels**(token)
Get all channel names from Slack

**get_slack_users**(token)
Get all users from Slack

**get_target**(permitted_group, cmdline, alias_cmdline)
When we are permitted to run a command on a target, look to see what the default targeting is for that group, and for that specific command (if provided).
It’s possible for None or False to be the result of either, which means that it’s expected that the caller provide a specific target.
If no configured target is provided, the command line will be parsed for target=foo and tgt_type=bar
Test for this:

```python
h = {'aliases': {}, 'commands': {'cmd.run', 'pillar.get'},
     'default_target': {'target': '*', 'tgt_type': 'glob'},
     'targets': {'pillar.get': {'target': 'you_momma', 'tgt_type': 'list'}},
     'users': {'dmangot', 'jmickle', 'pcn'}}

f = {'aliases': {}, 'commands': {'cmd.run', 'pillar.get'},
     'default_target': {}, 'targets': {}, 'users': {'dmangot', 'jmickle', 'pcn'}}

g = {'aliases': {}, 'commands': {'cmd.run', 'pillar.get'},
     'default_target': {'target': '*', 'tgt_type': 'glob'},
     'targets': {}, 'users': {'dmangot', 'jmickle', 'pcn'}}
```

Run each of them through `get_configured_target(('foo', f), 'pillar.get')` and confirm a valid target

**message_text(m_data)**

Raises ValueError if a value doesn’t work out, and TypeError if this isn’t a message type

**parse_args_and_kwargs(cmdline)**

cmdline: list

returns tuple of: args (list), kwargs (dict)

**run_command_async(msg)**

Parameters

- **message_generator** (generator of dict) – Generates messages from slack that should be run
- **fire_all** (bool) – Whether to also fire messages to the event bus
- **tag** (str) – The tag to send to use to send to the event bus
- **interval** (int) – time to wait between ending a loop and beginning the next

**run_commands_from_slack_async(message_generator, fire_all, tag, control, interval=1)**

Pull any pending messages from the message_generator, sending each one to either the event bus, the command_async or both, depending on the values of fire_all and command

**salt.engines.slack.start(token, control=False, trigger='!', groups=None, groups_pillar_name=None, fire_all=False, tag='salt/engines/slack')**

Listen to slack events and forward them to salt, new version

### 21.5.12 salt.engines.sqs_events

An engine that continuously reads messages from SQS and fires them as events.

Note that long polling is utilized to avoid excessive CPU usage.

New in version 2015.8.0.

**depends** boto

**Configuration**

This engine can be run on the master or on a minion.

Example Config:
Explicit sqs credentials are accepted but this engine can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not (or for boto version < 2.5.1) used you need to specify them either in a pillar or in the config file of the master or minion, as appropriate:

To deserialize the message from json:

```
sqs.message_format: json
```

It’s also possible to specify key, keyid and region via a profile:

```
sqs.keyid: GKTADJGHEIQSXMKKRBJ08H
sqs.key: askdjghsdfjkghWupUjasdflkdfklgjhsdjkghs
```

A region may also be specified in the configuration:

```
sqs.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjhsdjkghs
  region: us-east-1
```

Additionally you can define cross account sqs:

```
engines:
  - sqs_events:
      queue: prod
      owner_acct_id: 111111111111
```

salt.engines.sqs_events.start(queue, profile=None, tag='salt/engine/sqs', owner_acct_id=None)

Listen to sqs and fire message on event bus

21.5.13 salt.engines.stalekey module

An engine that uses presence detection to keep track of which minions have been recently connected and remove their keys if they have not been connected for a certain period of time.

Requires that the minion_data_cache option be enabled.

configuration Example configuration:

```
engines:
  - stalekey:
```

(continues on next page)
interval: 3600
expire: 86400

salt.engines.stalekey.start(interval=3600, expire=604800)

21.5.14 salt.engines.test

A simple test engine, not intended for real use but as an example
salt.engines.test.event_bus_context(opts)
salt.engines.test.start()

Listen to events and write them to a log file

21.5.15 salt.engines.thorium module

Manage the Thorium complex event reaction system
salt.engines.thorium.start(grains=False, grain_keys=None, pillar=False, pillar_keys=None)

Execute the Thorium runtime

21.5.16 salt.engines.webhook

Send events from webhook api
salt.engines.webhook.start(address=None, port=5000, ssl_crt=None, ssl_key=None)

Api to listen for webhooks to send to the reactor.

Implement the webhook behavior in an engine. rest_cherrypy Webhook docs

Unlike the rest_cherrypy Webhook, this is only an unauthenticated webhook endpoint. If an authenticated
webhook endpoint is needed, use the salt-api webhook which runs on the master and authenticates through
eauth.

Warning: Unauthenticated endpoint

This engine sends webhook calls to the event stream. If the engine is running on a minion with file_client: local the event is sent to the minion event stream. Otherwise it is sent to the master event stream.

Example Config

engines:
  - webhook: {}
21.6 executors modules

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>direct_call</td>
<td>Direct call executor module</td>
</tr>
<tr>
<td>docker</td>
<td>Docker executor module</td>
</tr>
<tr>
<td>splay</td>
<td>Splay function calls across targeted minions</td>
</tr>
<tr>
<td>sudo</td>
<td>Sudo executor module</td>
</tr>
</tbody>
</table>

21.6.1 salt.executors.direct_call module

Direct call executor module

```python
salt.executors.direct_call.execute(opts, data, func, args, kwargs)
```

Directly calls the given function with arguments

21.6.2 salt.executors.docker module

Docker executor module

Used with the docker proxy minion.

```python
salt.executors.docker.allow_missing_func(function)
```

Allow all calls to be passed through to docker container.

The docker call will use direct_call, which will return back if the module was unable to be run.

```python
salt.executors.docker.execute(opts, data, func, args, kwargs)
```

Directly calls the given function with arguments

21.6.3 salt.executors.splay module

Splay function calls across targeted minions

```python
salt.executors.splay.execute(opts, data, func, args, kwargs)
```

Splay a salt function call execution time across minions over a number of seconds (default: 300)

Note: You probably want to use --async here and look up the job results later. If you’re dead set on getting the output from the CLI command, then make sure to set the timeout (with the -t flag) to something greater than the splaytime (max splaytime + time to execute job). Otherwise, it’s very likely that the cli will time out before the job returns.

CLI Example:

```
# With default splaytime
salt --async --module-executors='[splay, direct_call]' '*' pkg.install cowsay
```

```
# With specified splaytime (5 minutes) and timeout with 10 second buffer
salt -t 310 --module-executors='[splay, direct_call]' --executor-opts='''
->[splaytime: 300]' '*' pkg.version cowsay
```

21.6. executors modules
21.6.4 salt.executors.sudo module

Sudo executor module

salt.executors.sudo.execute(\texttt{opts}, \texttt{data}, \texttt{func}, \texttt{args}, \texttt{kwargs})

Allow for the calling of execution modules via sudo.

This module is invoked by the minion if the \texttt{sudo\_user} minion config is present.

Example minion config:

\begin{tabular}{ll}
\texttt{sudo\_user}: & \texttt{saltdev} \\
\end{tabular}

Once this setting is made, any execution module call done by the minion will be run under \texttt{sudo -u <sudo\_user>} \texttt{salt-call}. For example, with the above minion config,

\begin{tabular}{ll}
\texttt{salt sudo\_minion cmd.run}'\texttt{cat /etc/sudoers}' \\
\end{tabular}

is equivalent to

\begin{tabular}{ll}
\texttt{sudo -u saltdev salt-call cmd.run}'\texttt{cat /etc/sudoers}' \\
\end{tabular}

being run on \texttt{sudo\_minion}.

21.7 fileserver modules

<table>

</tbody>
</table>

21.7.1 salt.fileserver.azurefs

The backend for serving files from the Azure blob storage service.

New in version 2015.8.0.

To enable, add \texttt{azurefs} to the \texttt{fileserver\_backend} option in the Master config file.

\begin{tabular}{ll}
\texttt{fileserver\_backend}: & \texttt{- azurefs} \\
\end{tabular}

Starting in Salt 2018.3.0, this fileserver requires the standalone Azure Storage SDK for Python. Theoretically any version $\geq v0.20.0$ should work, but it was developed against the $v0.33.0$ version.

Each storage container will be mapped to an environment. By default, containers will be mapped to the base environment. You can override this behavior with the \texttt{saltenv} configuration option. You can have an unlimited number of storage containers, and can have a storage container serve multiple environments, or have multiple storage containers mapped to the same environment. Normal first-found rules apply, and storage containers are searched in the order they are defined.
You must have either an account_key or a sas_token defined for each container, if it is private. If you use a sas_token, it must have READ and LIST permissions.

```
azurefs:
- account_name: my_storage
  account_key: 'fNH9cRp8+qVIVYZ+5rnZAhHc9ycOUcJnHtzpF0r0sXrtL2KVlMe1xDfLwmded+JJIzaEdWvCPhD4d/
  oqeA=='
  container_name: my_container
- account_name: my_storage
  account_name: my_storage
  sas_token: 'ss=b&sp=&sv=2015-07-08&sig=cohxXabx8FQdXsSEHyUXMjsSfNH2tZ20B970u44pkRE
  %3D&srt=co&se=2017-04-18T21%3A38%3A01Z'
  container_name: my_dev_container
  saltenv: dev
- account_name: my_storage
  container_name: my_public_container
```

**Note:** Do not include the leading ? for sas_token if generated from the web

### 21.7.2 salt.fileserver.gitfs

Git Fileserver Backend

With this backend, branches and tags in a remote git repository are exposed to salt as different environments.

To enable, add `gitfs` to the `fileserver_backend` option in the Master config file.

```
fileserver_backend:
- `gitfs`
```

**Note:** `git` also works here. Prior to the 2018.3.0 release, only `git` would work.

The Git fileserver backend supports both `pygit2` and `GitPython`, to provide the Python interface to git. If both are present, the order of preference for which one will be chosen is the same as the order in which they were listed: `pygit2`, then `GitPython`.

An optional master config parameter (`gitfs_provider`) can be used to specify which provider should be used, in the event that compatible versions of both `pygit2` and `GitPython` are installed.

More detailed information on how to use GitFS can be found in the [GitFS Walkthrough](#).

**Note:** Minimum requirements

To use `pygit2` for GitFS requires a minimum `pygit2` version of 0.20.3. `pygit2` 0.20.3 requires `libgit2` 0.20.0. `pygit2` and `libgit2` are developed alongside one another, so it is recommended to keep them both at the same major release to avoid unexpected behavior. For example, `pygit2` 0.21.x requires `libgit2` 0.21.x, `pygit2` 0.22.x will require `libgit2` 0.22.x, etc.

To use `GitPython` for GitFS requires a minimum `GitPython` version of 0.3.0, as well as the git CLI utility. Instructions for installing GitPython can be found [here](#).

To clear stale refs the git CLI utility must also be installed.
21.7.3 salt.fileserver.hgfs

Mercurial Fileserver Backend

To enable, add hgfs to the `fileserver_backend` option in the Master config file.

```
fileserver_backend:
    - hgfs
```

Note: hg also works here. Prior to the 2018.3.0 release, only hg would work.

After enabling this backend, branches, bookmarks, and tags in a remote mercurial repository are exposed to salt as different environments. This feature is managed by the `fileserver_backend` option in the salt master config file.

This fileserver has an additional option `hgfs_branch_method` that will set the desired branch method. Possible values are: branches, bookmarks, or mixed. If using branches or mixed, the default branch will be mapped to base.

Changed in version 2014.1.0: The `hgfs_base` master config parameter was added, allowing for a branch other than default to be used for the base environment, and allowing for a base environment to be specified when using an `hgfs_branch_method` of bookmarks.

```
depends
    - mercurial
    - python bindings for mercurial (python-hglib)
```

21.7.4 salt.fileserver.minionfs

Fileserver backend which serves files pushed to the Master

The `cp.push` function allows Minions to push files up to the Master. Using this backend, these pushed files are exposed to other Minions via the Salt fileserver.

To enable minionfs, `file_recv` needs to be set to `True` in the master config file (otherwise `cp.push` will not be allowed to push files to the Master), and `minionfs` must be added to the `fileserver_backends` list.

```
fileserver_backend:
    - minionfs
```

Note: minion also works here. Prior to the 2018.3.0 release, only minion would work.

Other `minionfs` settings include: `minionfs_whitelist`, `minionfs_blacklist`, `minionfs_mountpoint`, and `minionfs_env`.

See also:

`MinionFS Backend Walkthrough`

21.7.5 salt.fileserver.roots

The default file server backend
This fileserver backend serves files from the Master’s local filesystem. If `fileserver_backend` is not defined in the Master config file, then this backend is enabled by default. If it is defined then `roots` must be in the `fileserver_backend` list to enable this backend.

```yaml
fileserver_backend:
  - roots
```

Fileserver environments are defined using the `file_roots` configuration option.

### 21.7.6 salt.fileserver.s3fs

Amazon S3 Fileserver Backend

New in version 0.16.0.

This backend exposes directories in S3 buckets as Salt environments. To enable this backend, add `s3fs` to the `fileserver_backend` option in the Master config file.

```yaml
fileserver_backend:
  - s3fs
```

S3 credentials must also be set in the master config file:

```yaml
s3.keyid: GKTADJGHEIQSXMKKRBJ08H
s3.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

Alternatively, if on EC2 these credentials can be automatically loaded from instance metadata.

This fileserver supports two modes of operation for the buckets:

1. A single bucket per environment

```yaml
s3.buckets:
  production:
    - bucket1
    - bucket2
  staging:
    - bucket3
    - bucket4
```

2. Multiple environments per bucket

```yaml
s3.buckets:
  - bucket1
  - bucket2
  - bucket3
  - bucket4
```

Note that bucket names must be all lowercase both in the AWS console and in Salt, otherwise you may encounter `SignatureDoesNotMatch` errors.

A multiple-environment bucket must adhere to the following root directory structure:

```yaml
s3://<bucket name>/<environment>/<files>
```

**Note:** This fileserver back-end requires the use of the MD5 hashing algorithm. MD5 may not be compliant with all security policies.
Note: This fileserver back-end is only compatible with MD5 ETag hashes in the S3 metadata. This means that you must use SSE-S3 or plaintext for bucket encryption, and that you must not use multipart upload when uploading to your bucket. More information here: https://docs.aws.amazon.com/AmazonS3/latest/API/RESTCommonResponseHeaders.html

Objects without an MD5 ETag will be fetched on every fileserver update.

If you deal with objects greater than 8MB, then you should use the following AWS CLI config to avoid multipart upload:

```python
s3 =
  multipart_threshold = 1024MB
```

More info here: https://docs.aws.amazon.com/cli/latest/topic/s3-config.html

### 21.7.7 salt.fileserver.svnfs

Subversion Fileserver Backend

After enabling this backend, branches and tags in a remote subversion repository are exposed to salt as different environments. To enable this backend, add `svnfs` to the `fileserver_backend` option in the Master config file.

```
fileserver_backend:
  - svnfs
```

Note: `svn` also works here. Prior to the 2018.3.0 release, only `svn` would work.

This backend assumes a standard svn layout with directories for branches, tags, and trunk, at the repository root.

```text
depends
  • subversion
  • pysvn
```

Changed in version 2014.7.0: The paths to the trunk, branches, and tags have been made configurable, via the config options `svnfs_trunk`, `svnfs_branches`, and `svnfs_tags`. `svnfs_mountpoint` was also added. Finally, support for per-remote configuration parameters was added. See the documentation for more information.

### 21.8 grains modules

- **citcm**: Generate baseline proxy minion grains for cimc hosts.
- **chronos**: Generate chronos proxy minion grains.
- **core**: The static grains, these are the core, or built in grains.
- **disks**: Detect disks
- **esxi**: Generate baseline proxy minion grains for ESXi hosts.
- **extra**: Generate baseline proxy minion grains for Dell FX2 chassis.

</tbody>
</table>

21.8.1 salt.grains.cimc

Generate baseline proxy minion grains for cimc hosts.

salt.grains.cimc.cimc(proxy=None)

21.8.2 salt.grains.chronos

Generate chronos proxy minion grains.

New in version 2015.8.2.

salt.grains.chronos.kernel()
salt.grains.chronos.os()
salt.grains.chronos.os_data()
salt.grains.chronos.os_family()

21.8.3 salt.grains.core

The static grains, these are the core, or built in grains.

When grains are loaded they are not loaded in the same way that modules are loaded, grain functions are detected and executed, the functions MUST return a dict which will be applied to the main grains dict. This module will always be executed first, so that any grains loaded here in the core module can be overwritten just by returning dict keys with the same value as those returned here

salt.grains.core.append_domain()
    Return append_domain if set

salt.grains.core.cwd()
    Current working directory

salt.grains.core.default_gateway()
    Populates grains which describe whether a server has a default gateway configured or not. Uses `ip -4 route show` and `ip -6 route show` and greps for a `default` at the beginning of any line. Assuming the standard `default` via `<ip>` format for default gateways, it will also parse out the ip address of the default gateway, and put it in `ip4_gw` or `ip6_gw`.

    If the `ip` command is unavailable, no grains will be populated.

    Currently does not support multiple default gateways. The grains will be set to the first default gateway found.

List of grains:
ip4_gw: True # ip/True/False if default ipv4 gateway
ip6_gw: True # ip/True/False if default ipv6
gateway
ip_gw: True # True if either of the above is True, False otherwise

salt.grains.core.dns()
Parse the resolver configuration file

New in version 2016.3.0.

salt.grains.core.fqdns()
Return all known FQDNs for the system by enumerating all interfaces and then trying to reverse resolve them
(excluding 'lo' interface).

salt.grains.core.get_machine_id()
Provide the machine-id for machine/virtualization combination

salt.grains.core.get_master()
Provides the minion with the name of its master. This is useful in states to target other services running on the master.

salt.grains.core.get_server_id()
Provides an integer based on the FQDN of a machine. Useful as server-id in MySQL replication or anywhere else you’ll need an ID like this.

salt.grains.core.hostname()
Return fqdn, hostname, domainname

Note: On Windows the domain grain may refer to the dns entry for the host instead of the Windows domain to which the host is joined. It may also be empty if not a part of any domain. Refer to the windowsdomain grain instead

salt.grains.core.hwaddr_interfaces()
Provide a dict of the connected interfaces and their hw addresses (Mac Address)

salt.grains.core.id_()
Return the id

salt.grains.core.ip4_interfaces()
Provide a dict of the connected interfaces and their ip4 addresses The addresses will be passed as a list for each interface

salt.grains.core.ip6_interfaces()
Provide a dict of the connected interfaces and their ip6 addresses The addresses will be passed as a list for each interface

salt.grains.core.ip_fqdn()
Return ip address and FQDN grains

salt.grains.core.ip_interfaces()
Provide a dict of the connected interfaces and their ip addresses The addresses will be passed as a list for each interface

salt.grains.core.linux_distribution(**kwargs)

salt.grains.core.locale_info()
Provides defaultlanguage defaultencoding

salt.grains.core.os_data()
Return grains pertaining to the operating system
salt.grains.core.path()  
Return the path

salt.grains.core.pythonexecutable()  
Return the python executable in use

salt.grains.core.pythonpath()  
Return the Python path

salt.grains.core.pythonversion()  
Return the Python version

salt.grains.core.saltpath()  
Return the path of the salt module

salt.grains.core.saltversion()  
Return the version of salt

salt.grains.core.saltversioninfo()  
Return the version_info of salt  
  New in version 0.17.0.

salt.grains.core.zmqversion()  
Return the zeromq version

21.8.4 salt.grains.disks

Detect disks

salt.grains.disks.disks()  
Return list of disk devices

21.8.5 salt.grains.esxi

Generate baseline proxy minion grains for ESXi hosts.  
New in version 2015.8.4.

salt.grains.esxi.esxi()  
salt.grains.esxi.kernel()  
salt.grains.esxi.os()  
salt.grains.esxi.os_family()

21.8.6 salt.grains.extra

salt.grains.extra.config()  
Return the grains set in the grains file

salt.grains.extra.shell()  
Return the default shell to use on this system
21.8.7 salt.grains.fx2

Generate baseline proxy minion grains for Dell FX2 chassis. The challenge is that most of Salt isn’t bootstrapped yet, so we need to repeat a bunch of things that would normally happen in proxy/fx2.py—just enough to get data from the chassis to include in grains.

```python
salt.grains.fx2.fx2()
salt.grains.fx2.kernel()
salt.grains.fx2.location()
salt.grains.fx2.os_data()
salt.grains.fx2.os_family()
```

21.8.8 salt.grains.junos

Grains for junos. NOTE this is a little complicated—junos can only be accessed via salt-proxy-minion. Thus, some grains make sense to get them from the minion (PYTHONPATH), but others don’t (ipInterfaces)

```python
salt.grains.junos.defaults()
salt.grains.junos.facts(proxy=None)
salt.grains.junos.os_family()
```

21.8.9 salt.grains.marathon

Generate marathon proxy minion grains.

New in version 2015.8.2.

```python
salt.grains.marathon.kernel()
salt.grains.marathon.marathon()
salt.grains.marathon.os()
salt.grains.marathon.os_data()
salt.grains.marathon.os_family()
```

21.8.10 salt.grains.mdadm

Detect MDADM RAIDs

```python
salt.grains.mdadm.mdadm()
```

- Return list of mdadm devices

21.8.11 salt.grains.metadata

Grains from cloud metadata servers at 169.254.169.254

New in version 2017.7.0.

```python
depends requests
```
To enable these grains that pull from the http://169.254.169.254/latest metadata server set metadata_server_grains: True.

```yaml
metadata_server_grains: True
```

salt.grains.metadata.metadata()

## 21.8.12 salt.grains.napalm

### NAPALM Grains

- **codeauthor** Mircea Ulinic <ping@mirceaulinic.net>
- **maturity** new
- **depends** napalm
- **platform** unix

### Dependencies

- NAPALM proxy module

New in version 2016.11.0.

```python
salt.grains.napalm.getos(proxy=None)
```

Returns the Operating System name running on the network device.

Example: junos, iosxr, eos, ios etc.

CLI Example - select all network devices running JunOS:

```bash
salt -G 'os:junos' test.ping
```

```python
salt.grains.napalm.host(proxy=None)
```

This grain is set by the NAPALM grain module only when running in a proxy minion. When Salt is installed directly on the network device, thus running a regular minion, the host grain provides the physical hostname of the network device, as it would be on an ordinary minion server. When running in a proxy minion, host points to the value configured in the pillar: NAPALM proxy module.

**Note:** The difference between host and hostname is that host provides the physical location - either domain name or IP address, while hostname provides the hostname as configured on the device. They are not necessarily the same.

New in version 2017.7.0.

CLI Example:

```bash
salt 'device*' grains.get host
```

Output:

```yaml
device1:
  ip=172-31-13-136.us-east-2.compute.internal
device2:
```

(continues on next page)
salt.grains.napalm.host_dns(proxy=None)

Return the DNS information of the host. This grain is a dictionary having two keys:

- A
- AAAA

Note: This grain is disabled by default, as the proxy startup may be slower when the lookup fails. The user can enable it using the napalm_host_dns_grain option (in the pillar or proxy configuration file):

```text
napalm_host_dns_grain: true
```

New in version 2017.7.0.

CLI Example:

```
salt 'device*' grains.get host_dns
```

Output:

```text
device1:
  A:
    - 172.31.9.153
  AAAA:
    - fd52:188c:c068::1

device2:
  A:
    - 172.31.46.249
  AAAA:
    - fdca:3b17:31ab::17

device3:
  A:
    - 172.31.8.167
  AAAA:
    - fd0f:9fd6:5fab::1
```

salt.grains.napalm.hostname(proxy=None)

Return the hostname as configured on the network device.

CLI Example:

```
salt 'device*' grains.get hostname
```

Output:

```text
device1: edge01.yyz01
device2: edge01.bjm01
device3: edge01.flw01
```
salt.grains.napalm.**interfaces**(*proxy=None*)
Returns the complete interfaces list of the network device.

Example: ['lc-0/0/0', 'pfe-0/0/0', 'xe-1/3/0', 'lo0', 'irb', 'demux0', 'exp0']

CLI Example - select all devices that have a certain interface, e.g.: xe-1/1/1:

```bash
salt -G 'interfaces:xe-1/1/1' test.ping
```

Output:
```
edge01.yyz01: True
edge01.maa01: True
edge01.syd01: True
edge01.del01: True
edge01.dus01: True
edge01.kix01: True
```

salt.grains.napalm.**model**(*proxy=None*)
Returns the network device chassis model.

Example: MX480, ASR-9904-AC etc.

CLI Example - select all Juniper MX480 routers and execute traceroute to 8.8.8.8:

```bash
salt -G 'model:MX480' net.traceroute 8.8.8.8
```

salt.grains.napalm.**optional_args**(*proxy=None*)
Return the connection optional args.

**Note:** Sensible data will not be returned.

New in version 2017.7.0.

CLI Example - select all devices connecting via port 1234:

```bash
salt -G 'optional_args:port:1234' test.ping
```

Output:
```
device1: True
device2: True
```

salt.grains.napalm.**serial**(*proxy=None*)
Returns the chassis serial number.

Example: FOX1234W00F

CLI Example - select all devices whose serial number begins with FOX and display the serial number value:
salt -G 'serial:FOX*' grains.get serial

Output:

```
edge01.icn01:  
   FOXW00F001
edge01.del01:  
   FOXW00F002
edge01.yyz01:  
   FOXW00F003
edge01.mrs01:  
   FOXW00F004
```

salt.grains.napalm.uptime(proxy=None)
Returns the uptime in seconds.

CLI Example - select all devices started/restarted within the last hour:

```
salt -G 'uptime<3600' test.ping
```

salt.grains.napalm.username(proxy=None)
Return the username.

New in version 2017.7.0.

CLI Example - select all devices using foobar as username for connection:

```
salt -G 'username:foobar' test.ping
```

Output:

salt.grains.napalm.vendor(proxy=None)
Returns the network device vendor.

Example: juniper, cisco, arista etc.

CLI Example - select all devices produced by Cisco and shutdown:

```
salt -G 'vendor:cisco' net.cli "shut"
```

salt.grains.napalm.version(proxy=None)
Returns the OS version.

Example: 13.3R6.5, 6.0.2 etc.

CLI Example - select all network devices running JunOS 13.3R6.5 and return the model:

```
salt -G 'os:junos and version:13.3R6.5' grains.get model
```

Output:

```
edge01.bjm01:  
   MX2000
edge01.sjc01:  
   MX960
edge01.mrs01:  
   MX480
edge01.muc01:  
   MX240
```
21.8.13 salt.grains.opts

Simple grain to merge the opts into the grains directly if the grain_opts configuration value is set
salt.grains.opts.opts()
    Return the minion configuration settings

21.8.14 salt.grains.panos

Generate baseline proxy minion grains for panos hosts.
salt.grains.panos.panos(proxy=None)

21.8.15 salt.grains.philips_hue

Static grains for the Philips HUE lamps
New in version 2015.8.3.
salt.grains.philips_hue.kernel()
salt.grains.philips_hue.os()
salt.grains.philips_hue.os_family()
salt.grains.philips_hue.product()
salt.grains.philips_hue.vendor()

21.8.16 salt.grains.rest_sample

Generate baseline proxy minion grains
salt.grains.rest_sample.kernel()
salt.grains.rest_sample.location()
salt.grains.rest_sample.os()
salt.grains.rest_sample.os_data()
salt.grains.rest_sample.os_family()
salt.grains.rest_sample.proxy_functions(proxy)
    The loader will execute functions with one argument and pass a reference to the proxymodules LazyLoader object. However, grains sometimes get called before the LazyLoader object is setup so proxy might be None.

21.9 execution modules

Virtual modules
21.9.1 salt.modules.group

group is a virtual module that is fulfilled by one of the following modules:

<table>
<thead>
<tr>
<th>Execution Module</th>
<th>Used for</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>groupadd</code></td>
<td>Linux, NetBSD, and OpenBSD systems using <code>groupadd(8)</code>, <code>groupdel(8)</code>, and <code>groupmod(8)</code></td>
</tr>
<tr>
<td><code>pw_group</code></td>
<td>FreeBSD-based OSes using <code>pw(8)</code></td>
</tr>
<tr>
<td><code>solaris_group</code></td>
<td>Solaris-based OSes using <code>groupadd(1M)</code>, <code>groupdel(1M)</code>, and <code>groupmod(1M)</code></td>
</tr>
<tr>
<td><code>win_groupadd</code></td>
<td>Windows</td>
</tr>
</tbody>
</table>

21.9.2 salt.modules.kernelpkg

kernelpkg is a virtual module that is fulfilled by one of the following modules:

<table>
<thead>
<tr>
<th>Execution Module</th>
<th>Used for</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>kernelpkg_linux_apt</code></td>
<td>Debian/Ubuntu-based distros which use <code>apt-get</code> for package management</td>
</tr>
<tr>
<td><code>kernelpkg_linux_yum</code></td>
<td>RedHat-based distros and derivatives using <code>yum</code> or <code>dnf</code></td>
</tr>
</tbody>
</table>

21.9.3 salt.modules.pkg

pkg is a virtual module that is fulfilled by one of the following modules:

<table>
<thead>
<tr>
<th>Execution Module</th>
<th>Used for</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>aixpkg</code></td>
<td>AIX OS using <code>installp</code> and <code>rpm</code></td>
</tr>
<tr>
<td><code>aptpkg</code></td>
<td>Debian/Ubuntu-based distros which use <code>apt-get(8)</code> for package management</td>
</tr>
<tr>
<td><code>mac_brew_pkg</code></td>
<td>Mac OS software management using Homebrew</td>
</tr>
<tr>
<td><code>ebuildpkg</code></td>
<td>Gentoo-based systems (utilizes the <code>portage</code> python module as well as <code>emerge(1)</code>)</td>
</tr>
<tr>
<td><code>freebsdpkg</code></td>
<td>FreeBSD-based OSes using <code>pkg_add(1)</code></td>
</tr>
<tr>
<td><code>openbsdpkg</code></td>
<td>OpenBSD-based OSes using <code>pkg_add(1)</code></td>
</tr>
<tr>
<td><code>pacmanpkg</code></td>
<td>Arch Linux-based distros using <code>pacman(8)</code></td>
</tr>
<tr>
<td><code>pkgin</code></td>
<td>NetBSD-based OSes using <code>pkgin(1)</code></td>
</tr>
<tr>
<td><code>pkgng</code></td>
<td>FreeBSD-based OSes using <code>pkg(8)</code></td>
</tr>
<tr>
<td><code>pkgutil</code></td>
<td>Solaris-based OSes using OpenCSW's <code>pkgutil(1)</code></td>
</tr>
<tr>
<td><code>solarispkg</code></td>
<td>Solaris-based OSes using <code>pkgadd(1M)</code></td>
</tr>
<tr>
<td><code>solarisipspkg</code></td>
<td>Solaris-based OSes using IPS <code>pkg(1)</code></td>
</tr>
<tr>
<td><code>win_pkg</code></td>
<td>Salt's Windows Package Manager</td>
</tr>
<tr>
<td><code>yumpkg</code></td>
<td>RedHat-based distros and derivatives using <code>yum(8)</code> or <code>dnf(8)</code></td>
</tr>
<tr>
<td><code>zypperpkg</code></td>
<td>SUSE-based distros using <code>zypper(8)</code></td>
</tr>
</tbody>
</table>

21.9.4 salt.modules.service

service is a virtual module that is fulfilled by one of the following modules:
### 21.9.5 salt.modules.shadow

`shadow` is a virtual module that is fulfilled by one of the following modules:

<table>
<thead>
<tr>
<th>Execution Module</th>
<th>Used for</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>shadow</code></td>
<td>Linux</td>
</tr>
<tr>
<td><code>bsd_shadow</code></td>
<td>FreeBSD, OpenBSD, NetBSD</td>
</tr>
<tr>
<td><code>solaris_shadow</code></td>
<td>Solaris-based OSes</td>
</tr>
<tr>
<td><code>win_shadow</code></td>
<td>Windows</td>
</tr>
</tbody>
</table>

### 21.9.6 salt.modules.user

`user` is a virtual module that is fulfilled by one of the following modules:

<table>
<thead>
<tr>
<th>Execution Module</th>
<th>Used for</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>useradd</code></td>
<td>Linux, NetBSD, and OpenBSD systems using <code>useradd(8)</code>, <code>userdel(8)</code>, and <code>usermod(8)</code></td>
</tr>
<tr>
<td><code>pw_user</code></td>
<td>FreeBSD-based OSes using <code>pw(8)</code></td>
</tr>
<tr>
<td><code>solaris_user</code></td>
<td>Solaris-based OSes using <code>useradd(1M)</code>, <code>userdel(1M)</code>, and <code>usermod(1M)</code></td>
</tr>
<tr>
<td><code>mac_user</code></td>
<td>MacOS</td>
</tr>
<tr>
<td><code>win_useradd</code></td>
<td>Windows</td>
</tr>
</tbody>
</table>

---

<table>
<thead>
<tr>
<th>Execution Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>acme</code></td>
<td>ACME / Let’s Encrypt module</td>
</tr>
<tr>
<td><code>aix_group</code></td>
<td>Manage groups on Solaris</td>
</tr>
<tr>
<td><code>aixpkg</code></td>
<td>Package support for AIX</td>
</tr>
<tr>
<td><code>aliases</code></td>
<td>Manage the information in the aliases file</td>
</tr>
<tr>
<td><code>alternatives</code></td>
<td>Support for Alternatives system</td>
</tr>
<tr>
<td><code>ansiblegate</code></td>
<td>Ansible Support</td>
</tr>
<tr>
<td><code>apache</code></td>
<td>Support for Apache</td>
</tr>
</tbody>
</table>

**Continued on next page**
<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apcups</td>
<td>Module for apcupsd</td>
</tr>
<tr>
<td>apf</td>
<td>Support for Advanced Policy Firewall (APF)</td>
</tr>
<tr>
<td>apkpkg</td>
<td>Support for apk</td>
</tr>
<tr>
<td>aptpkg</td>
<td>Support for APT (Advanced Packaging Tool)</td>
</tr>
<tr>
<td>archive</td>
<td>A module to wrap (non-Windows) archive calls</td>
</tr>
<tr>
<td>arista_pyeapi</td>
<td>Arista pyeapi</td>
</tr>
<tr>
<td>artifactory</td>
<td>Module for fetching artifacts from Artifactory</td>

<tr>
<td><strong>eix</strong></td>
<td>Support for Eix</td>
</tr>
<tr>
<td><strong>elasticsearch</strong></td>
<td>Elasticsearch - A distributed RESTful search and analytics server</td>
</tr>
<tr>
<td><strong>environ</strong></td>
<td>Support for getting and setting the environment variables of the current salt process.</td>
</tr>
<tr>
<td><strong>eselect</strong></td>
<td>Support for eeselect, Gentoo’s configuration and management tool.</td>
</tr>
<tr>
<td><strong>esxi</strong></td>
<td>Glues the VMware vSphere Execution Module to the VMware ESXi Proxy Minions to the <strong>esxi proxymodule</strong>.</td>
</tr>
<tr>
<td><strong>etcd_mod</strong></td>
<td>Execution module to work with etcd</td>
</tr>
<tr>
<td><strong>ethtool</strong></td>
<td>Module for running ethtool command</td>
</tr>
<tr>
<td><strong>event</strong></td>
<td>Use the Salt Event System to fire events from the master to the minion and vice-versa.</td>
</tr>
<tr>
<td><strong>extfs</strong></td>
<td>Module for managing ext2/3/4 file systems</td>
</tr>
<tr>
<td><strong>file</strong></td>
<td>Manage information about regular files, directories, and special files on the minion, set/read user, group, mode, and data</td>
</tr>
<tr>
<td><strong>firewalld</strong></td>
<td>Support for firewalld.</td>
</tr>
<tr>
<td><strong>freebsd_sysctl</strong></td>
<td>Module for viewing and modifying sysctl parameters</td>
</tr>
<tr>
<td><strong>freebsd_update</strong></td>
<td>Support for freebsd-update utility on FreeBSD.</td>
</tr>
<tr>
<td><strong>freebsdjail</strong></td>
<td>The jail module for FreeBSD</td>
</tr>
<tr>
<td><strong>freebsdmod</strong></td>
<td>Module to manage FreeBSD kernel modules</td>
</tr>
<tr>
<td><strong>freebsdpkg</strong></td>
<td>Remote package support using pkg_add(1)</td>
</tr>
<tr>
<td><strong>freebsdports</strong></td>
<td>Install software from the FreeBSD ports(7) system</td>
</tr>
<tr>
<td><strong>freebsdservice</strong></td>
<td>The service module for FreeBSD</td>
</tr>
<tr>
<td><strong>gem</strong></td>
<td>Manage ruby gems.</td>
</tr>
<tr>
<td><strong>genesis</strong></td>
<td>Module for managing container and VM images</td>
</tr>
<tr>
<td><strong>gentoo_service</strong></td>
<td>Top level package command wrapper, used to translate the os detected by grains to the correct service manager</td>
</tr>
<tr>
<td><strong>gentoolkitmod</strong></td>
<td>Support for Gentoolkit</td>
</tr>
<tr>
<td><strong>git</strong></td>
<td>Support for the Git SCM</td>
</tr>
<tr>
<td><strong>github</strong></td>
<td>Module for interacting with the GitHub v3 API.</td>
</tr>
</tbody>

21.9.7 salt.modules.acme module

ACME / Let’s Encrypt module

This module currently looks for certbot script in the $PATH as - certbot, - letsencrypt, - certbot-auto, - letsencrypt-auto eventually falls back to /opt/letsencrypt/letsencrypt-auto

Note: Installation & configuration of the Let’s Encrypt client can for example be done using https://github.com/saltstack-formulas/letsencrypt-formula

Warning: Be sure to set at least accept-tos = True in cli.ini!

Most parameters will fall back to cli.ini defaults if None is given.

DNS plugins

This module currently supports the CloudFlare certbot DNS plugin. The DNS plugin credentials file needs to be passed in using the dns_plugin_credentials argument.

Make sure the appropriate certbot plugin for the wanted DNS provider is installed before using this module.

salt.modules.acme.cert(name, aliases=None, email=None, webroot=None, test_cert=False, renew=None, keysize=None, server=None, owner='root', group='root', mode='0640', certname=None, preferred_challenges=None, tls_sni_01_port=None, tls_sni_01_address=None, http_01_port=None, http_01_address=None, dns_plugin=None, dns_plugin_credentials=None)

Obtain/renew a certificate from an ACME CA, probably Let’s Encrypt.

Parameters
• name – Common Name of the certificate (DNS name of certificate)
• aliases – subjectAltNames (Additional DNS names on certificate)
• email – e-mail address for interaction with ACME provider
• webroot – True or a full path to use to use webroot. Otherwise use standalone mode
• test_cert – Request a certificate from the Happy Hacker Fake CA (mutually exclusive with ‘server’)
• renew – True/force’ to force a renewal, or a window of renewal before expiry in days
• keysize – RSA key bits
• server – API endpoint to talk to
• owner – owner of the private key file
• group – group of the private key file
• mode – mode of the private key file
• certname – Name of the certificate to save
• preferred_challenges – A sorted, comma delimited list of the preferred challenge to use during authorization with the most preferred challenge listed first.
• tls_sni_01_port – Port used during tls-sni-01 challenge. This only affects the port Certbot listens on. A conforming ACME server will still attempt to connect on port 443.
• tls_sni_01_address – The address the server listens to during tls-sni-01 challenge.
• http_01_port – Port used in the http-01 challenge. This only affects the port Certbot listens on. A conforming ACME server will still attempt to connect on port 80.
• https_01_address – The address the server listens to during http-01 challenge.
• dns_plugin – Name of a DNS plugin to use (currently only ’cloudflare’ or ’digitalocean’)
• dns_plugin_credentials – Path to the credentials file if required by the specified DNS plugin
• dns_plugin_propagate_seconds – Number of seconds to wait for DNS propogations before asking ACME servers to verify the DNS record. (default 10)

Return type  dict

Returns Dictionary with ‘result’ True/False/None, ‘comment’ and certificate’s expiry date (‘not_after’)

CLI example:

```
salt 'gitlab.example.com' acme.cert dev.example.com "[gitlab.example.com]" test_cert=True renew=14 webroot=/opt/gitlab/embedded/service/gitlab-rails/public
```

salt.modules.acme.certs()
Return a list of active certificates

CLI example:

```
salt 'vhost.example.com' acme.certs
```

salt.modules.acme.expires(name)
The expiry date of a certificate in ISO format
Parameters `name (str)` – CommonName of certificate
Return type `str`
Returns Expiry date in ISO format.
CLI example:

```
salt 'gitlab.example.com' acme.expires dev.example.com
```

**salt.modules.acme.has(name)**
Test if a certificate is in the Let's Encrypt Live directory
Parameters `name (str)` – CommonName of certificate
Return type `bool`

Code example:

```
if __salt__['acme.has']('dev.example.com'):
    log.info('That is one nice certificate you have there!')
```

**salt.modules.acme.info(name)**
Return information about a certificate
Parameters `name (str)` – CommonName of certificate
Return type `dict`
Returns Dictionary with information about the certificate. If neither the tls nor the x509 module can be used to determine the certificate information, the information will be retrieved as one big text block under the key `text` using the openssl cli.

CLI example:

```
salt 'gitlab.example.com' acme.info dev.example.com
```

**salt.modules.acme.needs_renewal(name, window=None)**
Check if a certificate needs renewal
Parameters
• `name (str)` – CommonName of certificate
• `window (bool/str/int)` – Window in days to renew earlier or True/force to just return True
Return type `bool`
Returns Whether or not the certificate needs to be renewed.
Code example:

```
if __salt__['acme.needs_renewal']('dev.example.com'):
    __salt__['acme.cert']('dev.example.com', **kwargs)
else:
    log.info('Your certificate is still good')
```

**salt.modules.acme.renew_by(name, window=None)**
Date in ISO format when a certificate should first be renewed
Parameters
• `name (str)` – CommonName of certificate
- **window** (*int*) – number of days before expiry when renewal should take place

  **Return type**  *str*

  **Returns**  Date of certificate renewal in ISO format.

### 21.9.8 salt.modules.aix_group module

Manage groups on Solaris

**Important:** If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to 'group.info' is not available), see [here](#).

**salt.modules.aix_group.add**(*name, gid=None, system=False, root=None*)

Add the specified group

  **CLI Example:**

  ```
  salt '*' group.add foo 3456
  ```

**salt.modules.aix_group.adduser**(*name, username, root=None*)

Add a user in the group.

  **CLI Example:**

  ```
  salt '*' group.adduser foo bar
  ```

Verifies if a valid username 'bar' as a member of an existing group 'foo', if not then adds it.

**salt.modules.aix_group.chgid**(*name, gid*)

Change the gid for a named group

  **CLI Example:**

  ```
  salt '*' group.chgid foo 4376
  ```

**salt.modules.aix_group.delete**(*name*)

Remove the named group

  **CLI Example:**

  ```
  salt '*' group.delete foo
  ```

**salt.modules.aix_group.deluser**(*name, username, root=None*)

Remove a user from the group.

  **CLI Example:**

  ```
  salt '*' group.deluser foo bar
  ```

Removes a member user 'bar' from a group 'foo'. If group is not present then returns True.

**salt.modules.aix_group.getent**(*refresh=False*)

Return info on all groups

  **CLI Example:**

  ```
  salt '*' group.getent
  ```
salt.modules.aix_group.info(name)

Return information about a group

CLI Example:

```
salt '*' group.info foo
```

core:
salt.modules.aix_group.members(name, members_list, root=None)

Replaces members of the group with a provided list.

CLI Example:

```
salt '*' group.members foo 'user1,user2,user3,...'
```

Replaces a membership list for a local group 'foo'. foo:x:1234:user1,user2,user3,...

**21.9.9 salt.modules.aixpkg**

Package support for AIX

**Important:** If you feel that Salt should be using this module to manage filesets or rpm packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see [here](#).

salt.modules.aixpkg.available_version(*names, **kwargs)

This function is an alias of latest_version.

Return the latest version of the named fileset/rpm package available for upgrade or installation. If more than one fileset/rpm package name is specified, a dict of name/version pairs is returned.

If the latest version of a given fileset/rpm package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

NOTE: Repositories are not presently supported for AIX. This function will always return an empty string for a given fileset/rpm package.

salt.modules.aixpkg.install(name=None, refresh=False, pkgs=None, version=None, test=False, **kwargs)

Install the named fileset(s)/rpm package(s).

**name** The name of the fileset or rpm package to be installed.

**refresh** Whether or not to update the yum database before executing.

Multiple Package Installation Options:

**pkgs** A list of filesets and/or rpm packages to install. Must be passed as a python list. The name parameter will be ignored if this option is passed.

**version** Install a specific version of a fileset/rpm package. (Unused at present).

**test** Verify that command functions correctly:

Returns a dict containing the new fileset(s)/rpm package(s) names and versions:

```
{'<packages>': {'old': '<old-version>', 'new': '<new-version>'}}
```
salt.modules.aixpkg.latest_version("names", **kwargs)

Return the latest version of the named fileset/rpm package available for upgrade or installation. If more than one fileset/rpm package name is specified, a dict of name/version pairs is returned.

If the latest version of a given fileset/rpm package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

NOTE: Repositories are not presently supported for AIX. This function will always return an empty string for a given fileset/rpm package.

salt.modules.aixpkg.list_pkgs(versions_as_list=False, **kwargs)

List the filesets/rpm packages currently installed as a dict:

```python
{'<package_name>': '<version>'
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

salt.modules.aixpkg.remove(name=None, pkgs=None, **kwargs)

Remove specified fileset(s)/rpm package(s).

- **name**: The name of the fileset or rpm package to be deleted.
- **pkgs**: A list of filesets and/or rpm packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <fileset/rpm package name>
salt '*' pkg.remove tcsh
salt '*' pkg.remove xlC.rte
salt '*' pkg.remove Firefox.base.adt
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.aixpkg.upgrade_available(name)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```
salt.modules.aixpkg.version(*names, **kwargs)
    Common interface for obtaining the version of installed fileset/rpm package.

    CLI Example:
    ```
salt '*' pkg.version vim
salt '*' pkg.version foo bar baz
```  

21.9.10 salt.modules.aliases

Manage the information in the aliases file

salt.modules.aliases.get_target(alias)
    Return the target associated with an alias

    CLI Example:
    ```
salt '*' aliases.get_target alias
```  

salt.modules.aliases.has_target(alias, target)
    Return true if the alias/target is set

    CLI Example:
    ```
salt '*' aliases.has_target alias target
```  

salt.modules.aliases.list_aliases()
    Return the aliases found in the aliases file in this format:
    ```
    {'alias': 'target'}
    ```

    CLI Example:
    ```
salt '*' aliases.list_aliases
```  

salt.modules.aliases.rm_alias(alias)
    Remove an entry from the aliases file

    CLI Example:
    ```
salt '*' aliases.rm_alias alias
```  

salt.modules.aliases.set_target(alias, target)
    Set the entry in the aliases file for the given alias, this will overwrite any previous entry for the given alias or create a new one if it does not exist.

    CLI Example:
    ```
salt '*' aliases.set_target alias target
```  

21.9.11 salt.modules.alternatives

Support for Alternatives system

codeauthor Radek Rada <radek.rada@gmail.com>
salt.modules.alternatives.auto(name)
    Trigger alternatives to set the path for `<name>` as specified by priority.
    
    CLI Example:
    
    ```
salt '*' alternatives.auto name
    ```

salt.modules.alternatives.check_exists(name, path)
    Check if the given path is an alternative for a name.
    
    New in version 2015.8.4.
    
    CLI Example:
    
    ```
salt '*' alternatives.check_exists name path
    ```

salt.modules.alternatives.check_installed(name, path)
    Check if the current highest-priority match for a given alternatives link is set to the desired path.
    
    CLI Example:
    
    ```
salt '*' alternatives.check_installed name path
    ```

salt.modules.alternatives.display(name)
    Display alternatives settings for defined command name
    
    CLI Example:
    
    ```
salt '*' alternatives.display editor
    ```

salt.modules.alternatives.install(name, link, path, priority)
    Install symbolic links determining default commands
    
    CLI Example:
    
    ```
salt '*' alternatives.install editor /usr/bin/editor /usr/bin/emacs23 50
    ```

salt.modules.alternatives.remove(name, path)
    Remove symbolic links determining the default commands.
    
    CLI Example:
    
    ```
salt '*' alternatives.remove name path
    ```

salt.modules.alternatives.set_(name, path)
    Manually set the alternative `<path>` for `<name>`.
    
    CLI Example:
    
    ```
salt '*' alternatives.set name path
    ```

salt.modules.alternatives.show_current(name)
    Display the current highest-priority alternative for a given alternatives link
    
    CLI Example:
    
    ```
salt '*' alternatives.show_current editor
    ```

salt.modules.alternatives.show_link(name)
    Display master link for the alternative
New in version 2015.8.13, 2016.3.4, 2016.11.0.

CLI Example:

```
salt '*' alternatives.show_link editor
```

## 21.9.12 salt.modules.ansiblegate

### Ansible Support

This module can have an optional minion-level configuration in `/etc/salt/minion.d/` as follows:

```ini
ansible_timeout: 1200
```

The timeout is how many seconds Salt should wait for any Ansible module to respond.

```python
class salt.modules.ansiblegate.AnsibleModuleCaller(resolver)

    DEFAULT_TIMEOUT = 1200

    OPT_TIMEOUT_KEY = 'ansible_timeout'

    def call(module, *args, **kwargs):
        Call an Ansible module by invoking it. :param module: the name of the module. :param args: Arguments to the module :param kwargs: keywords to the module :return:

class salt.modules.ansiblegate.AnsibleModuleResolver(opts)

    This class is to resolve all available modules in Ansible.

    def get_modules_list(pattern=None)
        Return module map references. :return:

    def install()

    def load_module(module)
        Introspect Ansible module.

            Parameters module -
            Returns

    def resolve()

salt.modules.ansiblegate.help(module=None, *args)

    Display help on Ansible standard module.

        Parameters module -
        Returns

salt.modules.ansiblegate.list(pattern=None)

    Lists available modules. :return:

salt.modules.ansiblegate.playbooks(playbook, rundir=None, check=False, diff=False, extra_vars=None, flush_cache=False, forks=5, inventory=None, limit=None, list_hosts=False, list_tags=False, list_tasks=False, module_path=None, skip_tags=None, start_at_task=None, syntax_check=False, tags=None, playbook_kwarg=None)

    Run Ansible Playbooks

        Parameters
```
• **playbook** – Which playbook to run.
• **rundir** – Directory to run `ansible-playbook` in. (Default: None)
• **check** – don’t make any changes; instead, try to predict some of the changes that may occur (Default: False)
• **diff** – when changing (small) files and templates, show the differences in those files; works great with `--check` (default: False)
• **extra_vars** – set additional variables as key=value or YAML/JSON, if filename prepend with @. (default: None)
• **flush_cache** – clear the fact cache for every host in inventory (default: False)
• **forks** – specify number of parallel processes to use (Default: 5)
• **inventory** – specify inventory host path or comma separated host list. (Default: None)
  (Ansible’s default is `/etc/ansible/hosts`)
• **limit** – further limit selected hosts to an additional pattern (Default: None)
• **list_hosts** – outputs a list of matching hosts; does not execute anything else (Default: False)
• **list_tags** – list all available tags (Default: False)
• **list_tasks** – list all tasks that would be executed (Default: False)
• **module_path** – prepend colon-separated path(s) to module library. (Default: None)
• **skip_tags** – only run plays and tasks whose tags do not match these values (Default: False)
• **start_at_task** – start the playbook at the task matching this name (Default: None)
• **tags** – only run plays and tasks tagged with these values (Default: None)

**Param** syntax_check: perform a syntax check on the playbook, but do not execute it (Default: False)

**Returns** Playbook return

CLI Example:

```
salt 'ansiblehost' ansible.playbook playbook=/srv/playbooks/play.yml
```

## 21.9.13 salt.modules.apache

Support for Apache

**Note:** The functions in here are generic functions designed to work with all implementations of Apache. Debian-specific functions have been moved into `deb_apache.py`, but will still load under the `apache` namespace when a Debian-based system is detected.

### salt.modules.apache.config(name, config, edit=True)

Create VirtualHost configuration files

- **name** File for the virtual host
- **config** VirtualHost configurations
Note: This function is not meant to be used from the command line. Config is meant to be an ordered dict of all of the apache configs.

CLI Example:

```
salt '*' apache.config /etc/httpd/conf.d/ports.conf config="[{'Listen': '22'}]
```

salt.modules.apache.directives()
Return list of directives together with expected arguments and places where the directive is valid (apachectl -L)

CLI Example:

```
salt '*' apache.directives
```

salt.modules.apache.fullversion()
Return server version (apachectl -V)

CLI Example:

```
salt '*' apache.fullversion
```

salt.modules.apache.modules()
Return list of static and shared modules (apachectl -M)

CLI Example:

```
salt '*' apache.modules
```

salt.modules.apache.server_status(profile='default')
Get Information from the Apache server-status handler

Note: The server-status handler is disabled by default. In order for this function to work it needs to be enabled. See http://httpd.apache.org/docs/2.2/mod/mod_status.html

The following configuration needs to exists in pillar/grains. Each entry nested in apache.server-status is a profile of a vhost/server. This would give support for multiple apache servers/vhosts.

```
apache.server-status:
  default:
    url: http://localhost/server-status
    user: someuser
    pass: password
    realm: 'authentication realm for digest passwords'
    timeout: 5
```

CLI Examples:

```
salt '*' apache.server_status
salt '*' apache.server_status other-profile
```

salt.modules.apache.servermods()
Return list of modules compiled into the server (apachectl -l)

CLI Example:
salt '*/' apache.servermods

salt.modules.apache.signal(signal=None)
    Signals httpd to start, restart, or stop.
    CLI Example:
    salt '*/' apache.signal restart

salt.modules.apache.useradd(pwfile, user, password, opts="")
    Add HTTP user using the htpasswd command. If the htpasswd file does not exist, it will be created. Valid options that can be passed are:
    n  Don't update file; display results on stdout.
    m  Force MD5 hashing of the password (default).
    d  Force CRYPT(3) hashing of the password.
    p  Do not hash the password (plaintext).
    s  Force SHA1 hashing of the password.
    CLI Examples:
    salt '*/' apache.useradd /etc/httpd/htpasswd larry badpassword
    salt '*/' apache.useradd /etc/httpd/htpasswd larry badpass opts=ns

salt.modules.apache.userdel(pwfile, user)
    Delete HTTP user from the specified htpasswd file.
    CLI Example:
    salt '*/' apache.userdel /etc/httpd/htpasswd larry

salt.modules.apache.version()
    Return server version (apachectl -v)
    CLI Example:
    salt '*/' apache.version

salt.modules.apache.vhosts()
    Show the settings as parsed from the config file (currently only shows the virtualhost settings) (apachectl -S). Because each additional virtual host adds to the execution time, this command may require a long timeout be specified by using -t 10.
    CLI Example:
    salt -t 10 '*/' apache.vhosts

21.9.14 salt.modules.apcups

Module for apcupsd

salt.modules.apcups.status()
    Return apcaccess output
    CLI Example:
Salt Documentation, Release 3000.2

salt 'Salt' apcups.status

salt.modules.apcups.status_battery()
Return true if running on battery power
CLI Example:
salt 'Salt' apcups.status_battery

salt.modules.apcups.status_charge()
Return battery charge
CLI Example:
salt 'Salt' apcups.status_charge

salt.modules.apcups.status_load()
Return load
CLI Example:
salt 'Salt' apcups.status_load

21.9.15 salt.modules.apf

Support for Advanced Policy Firewall (APF)

maintainer  Mostafa Hussein <mostafa.hussein91@gmail.com>
maturity  new
depends  python-iptables
platform  Linux

salt.modules.apf.allow(ip, port=None)
Add host (IP/FQDN) to allow_hosts.rules and immediately load new rule into firewall CLI Example:
salt 'Salt' apf.allow 127.0.0.1

salt.modules.apf.deny(ip)
Add host (IP/FQDN) to deny_hosts.rules and immediately load new rule into firewall CLI Example:
salt 'Salt' apf.deny 1.2.3.4

salt.modules.apf.disable()
Stop (flush) all firewall rules CLI Example:
salt 'Salt' apf.disable

salt.modules.apf.enable()
Load all firewall rules CLI Example:
salt 'Salt' apf.enable

salt.modules.apf.refresh()
Refresh & resolve dns names in trust rules CLI Example:
salt '★' apf.refresh

salt.modules.apf.reload()
Stop (flush) & reload firewall rules CLI Example:

```
salt '★' apf.reload
```

salt.modules.apf.remove(ip)
Remove host from [glob]*_hosts.rules and immediately remove rule from firewall CLI Example:

```
salt '★' apf.remove 1.2.3.4
```

salt.modules.apf.running()
Check apf status CLI Example:

```
salt '★' apf.running
```

### 21.9.16 salt.modules.apkpkg

Support for apk

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

salt.modules.apkpkg.file_dict('packages')
List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system’s package database (not generally recommended).

CLI Examples:

```
salt '★' pkg.file_list httpd
salt '★' pkg.file_list httpd postfix
salt '★' pkg.file_list
```

salt.modules.apkpkg.file_list('packages')
List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system’s package database (not generally recommended).

CLI Examples:

```
salt '★' pkg.file_list httpd
salt '★' pkg.file_list httpd postfix
salt '★' pkg.file_list
```

salt.modules.apkpkg.install(name=None, refresh=False, pkgs=None, sources=None, **kwargs)
Install the passed package, add refresh=True to update the apk database.

**name** The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option.

CLI Example:

```
salt '★' pkg.install <package name>
```
refresh  Whether or not to refresh the package database before installing.

Multiple Package Installation Options:

pkgs  A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
```

sources  A list of IPK packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package. Dependencies are automatically resolved and marked as auto-installed.

CLI Example:

```
salt '*' pkg.install sources='["networkd", "salt://foo.deb"],["bar": "salt://bar.deb"]'
```

install_recommends  Whether to install the packages marked as recommended. Default is True.

Returns a dict containing the new package names and versions:

```
{"<package>":{"old": "<old-version>", "new": "<new-version>"}}
```

salt.modules.apkpkg.latest_version(*names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.apkpkg.list_pkgs(versions_as_list=False, **kwargs)

List the packages currently installed in a dict:

```
{"<package_name>": "<version>"}
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

salt.modules.apkpkg.list_upgrades(refresh=True)

List all available package upgrades.

CLI Example:

```
salt '*' pkg.list_upgrades
```

salt.modules.apkpkg.owner(*paths)

Return the name of the package that owns the file. Multiple file paths can be passed. Like pkg.version <salt.modules.apk.version>, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.
If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

```bash
salt '*' pkg.owns /usr/bin/apachectl
salt '*' pkg.owns /usr/bin/apachectl /usr/bin/basename
```

salt.modules.apkpkg.purge(name=None, pkgs=None, **kwargs)

Alias to remove

salt.modules.apkpkg.refresh_db()

Updates the package list

- **True**: Database updated successfully
- **False**: Problem updating database

CLI Example:

```bash
salt '*' pkg.refresh_db
```

salt.modules.apkpkg.remove(name=None, pkgs=None, purge=False, **kwargs)

Remove packages using `apk del`.

- **name**: The name of the package to be deleted.

Multiple Package Options:

- **pkgs**: A list of packages to delete. Must be passed as a Python list. The `name` parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```bash
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.apkpkg.upgrade(name=None, pkgs=None, refresh=True)

Upgrades all packages via `apk upgrade` or a specific package if `name` or `pkgs` is specified. Name is ignored if `pkgs` is specified.

Returns a dict containing the changes.

```bash
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

CLI Example:

```bash
salt '*' pkg.upgrade
```

salt.modules.apkpkg.version(*names, **kwargs)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```bash
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```
21.9.17 salt.modules.aptpkg

Support for APT (Advanced Packaging Tool)

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see [here](#).

For repository management, the `python-apt` package must be installed.

### salt.modules.aptpkg.add_repo_key(path=None, text=None, keyserver=None, keyid=None, saltenv='base')

New in version 2017.7.0.

Add a repo key using `apt-key add`.

**Parameters**

- **path** *(str)* – The path of the key file to import.
- **text** *(str)* – The key data to import, in string form.
- **keyserver** *(str)* – The server to download the repo key specified by the keyid.
- **keyid** *(str)* – The key id of the repo key to add.
- **saltenv** *(str)* – The environment the key file resides in.

**Returns** A boolean representing whether the repo key was added.

**Return type** *bool*

**CLI Examples:**

```bash
salt '*' pkg.add_repo_key 'salt://apt/sources/test.key'
salt '*' pkg.add_repo_key text='$KEY1'
salt '*' pkg.add_repo_key keyserver='keyserver.example' keyid='0000AAAA'
```

### salt.modules.aptpkg.autoremove(list_only=False, purge=False)

New in version 2015.5.0.

Remove packages not required by another package using `apt-get autoremove`.

**list_only** *(False)* Only retrieve the list of packages to be auto-removed, do not actually perform the auto-removal.

**purge** *(False)* Also remove package config data when autoremoving packages.

New in version 2015.8.0.

**CLI Example:**

```bash
salt '*' pkg.autoremove
salt '*' pkg.autoremove list_only=True
salt '*' pkg.autoremove purge=True
```

### salt.modules.aptpkg.del_repo(repo, **kwargs)

Delete a repo from the sources.list / sources.list.d

If the .list file is in the sources.list.d directory and the file that the repo exists in does not contain any other repo configuration, the file itself will be deleted.
The repo passed in must be a fully formed repository definition string.

CLI Examples:

```
salt '*' pkg.del_repo "myrepo definition"
```

`salt.modules.aptpkg.del_repo_key(name=None, **kwargs)`

New in version 2015.8.0.

Remove a repo key using `apt-key del`.

- `name`: Repo from which to remove the key. Unnecessary if `keyid` is passed.
- `keyid`: The KeyID of the GPG key to remove.
- `keyid_ppa`: [False] If set to `True`, the repo’s GPG key ID will be looked up from ppa.launchpad.net and removed.

Note: Setting this option to `True` requires that the `name` param also be passed.

CLI Examples:

```
salt '*' pkg.del_repo_key keyid=0123ABCD
salt '*' pkg.del_repo_key name='ppa:foo/bar' keyid_ppa=True
```

`salt.modules.aptpkg.expand_repo_def(**kwargs)`

Take a repository definition and expand it to the full pkg repository dict that can be used for comparison. This is a helper function to make the Debian/Ubuntu apt sources sane for comparison in the pkgrepo states.

This is designed to be called from pkgrepo states and will have little use being called on the CLI.

`salt.modules.aptpkg.file_dict(**packages)`

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system’s package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_dict httpd
salt '*' pkg.file_dict httpd postfix
salt '*' pkg.file_dict
```

`salt.modules.aptpkg.file_list(**packages)`

List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system’s package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.aptpkg.get_repo(repo, **kwargs)`

Display a repo from the sources.list / sources.list.d.

The repo passed in needs to be a complete repo entry.

CLI Examples:

```
salt '*' pkg.get_repo "myrepo definition"
```
salt.modules.aptpkg.get_repo_keys()

New in version 2017.7.0.

List known repo key details.

Returns A dictionary containing the repo keys.

Return type dict

CLI Examples:

```
salt '*' pkg.get_repo_keys
```

salt.modules.aptpkg.get_selections(pattern=None, state=None)

View package state from the dpkg database.

Returns a dict of dicts containing the state, and package names:

```
{'<host>': {
    '<state>': ['pkg1', ...
    ],
}, ...
}
```

CLI Example:

```
salt '*' pkg.get_selections
salt '*' pkg.get_selections 'python-*'
salt '*' pkg.get_selections state=hold
salt '*' pkg.get_selections 'openssh*' state=hold
```

salt.modules.aptpkg.hold(name=None, pkgs=None, sources=None, **kwargs)

New in version 2014.7.0.

Set package in 'hold' state, meaning it will not be upgraded.

name The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.hold <package name>
```

pkgs A list of packages to hold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.hold pkgs='["foo", "bar"]'
```

salt.modules.aptpkg.info_installed(names, **kwargs)

Return the information of the named package(s) installed on the system.

names The names of the packages for which to return information.

failhard Whether to throw an exception if none of the packages are installed. Defaults to True.

CLI example:
salt modules.aptpkg.install(name=None, refresh=False, fromrepo=None, skip_verify=False, debconf=None, pkgs=None, sources=None, reinstall=False, downloadonly=False, ignore_epoch=False, **kwargs)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run() is now used to isolate commands which modify installed packages from the salt-minion daemon’s control group. This is done to keep systemd from killing any apt-get/dpkg commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run() can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Install the passed package, add refresh=True to update the dpkg database.

name The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option.

32-bit packages can be installed on 64-bit systems by appending the architecture designation (:i386, etc.) to the end of the package name.

CLI Example:

salt '*' pkg.install <package name>

refresh Whether or not to refresh the package database before installing.

cache_valid_time

New in version 2016.11.0.

Skip refreshing the package database if refresh has already occurred within <value> seconds

fromrepo Specify a package repository to install from (e.g., apt-get -t unstable install somepackage)

skip_verify Skip the GPG verification check (e.g., --allow-unauthenticated, or --force-bad-verify for install from package file).

debconf Provide the path to a debconf answers file, processed before installation.

version Install a specific version of the package, e.g. 1.2.3-0ubuntu0. Ignored if "pkgs" or "sources" is passed.

Changed in version 2018.3.0: version can now contain comparison operators (e.g. >1.2.3, <=2.0, etc.)

reinstall [False] Specifying reinstall=True will use apt-get install --reinstall rather than simply apt-get install for requested packages that are already installed.

If a version is specified with the requested package, then apt-get install --reinstall will only be used if the installed version matches the requested version.

New in version 2015.8.0.

ignore_epoch [False] Only used when the version of a package is specified using a comparison operator (e.g. >4.1). If set to True, then the epoch will be ignored when comparing the currently-installed version to the desired version.

New in version 2018.3.0.

Multiple Package Installation Options:
**pkgs** A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```bash
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3-0ubuntu0"}]'
```

**sources** A list of DEB packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package. Dependencies are automatically resolved and marked as auto-installed.

32-bit packages can be installed on 64-bit systems by appending the architecture designation (:i386, etc.) to the end of the package name.

Changed in version 2014.7.0.

CLI Example:

```bash
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"},{"bar": "salt://bar.deb"}]'
```

**force_yes** Passes --force-yes to the apt-get command. Don’t use this unless you know what you’re doing.

New in version 0.17.4.

**install_recommends** Whether to install the packages marked as recommended. Default is True.

New in version 2015.5.0.

**only_upgrade** Only upgrade the packages, if they are already installed. Default is False.

New in version 2015.5.0.

**force_conf_new** Always install the new version of any configuration files.

New in version 2015.8.0.

Returns a dict containing the new package names and versions:

```python
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

**salt.modules.aptpkg.latest_version(names, **kwargs)**

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

A specific repo can be requested using the fromrepo keyword argument.

```bash
cache_valid_time
```

New in version 2016.11.0.

Skip refreshing the package database if refresh has already occurred within <value> seconds

CLI Example:

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> fromrepo=unstable
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

**salt.modules.aptpkg.list_downloaded(root=None, **kwargs)**

New in version 3000?.
List prefetched packages downloaded by apt in the local disk.

**root** operate on a different root directory.

CLI example:

```bash
salt '*' pkg.list_downloaded
```

```python
salt.modules.aptpkg.list_pkgs(versions_as_list=False, removed=False, purge_desired=False, **kwargs)
```

List the packages currently installed in a dict:

```python
{'<package_name>': '<version>'}
```

- **removed** If True, then only packages which have been removed (but not purged) will be returned.
- **purge_desired** If True, then only packages which have been marked to be purged, but can't be purged due to their status as dependencies for other installed packages, will be returned. Note that these packages will appear in installed

  Changed in version 2014.1.1: Packages in this state now correctly show up in the output of this function.

CLI Example:

```bash
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

```python
salt.modules.aptpkg.list_repo_pkgs('args, **kwargs)
```

New in version 2017.7.0.

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names.

This function can be helpful in discovering the version or repo to specify in a `pkg.installed` state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. For example:

```python
{
  'bash': ['4.3-14ubuntul.1', '4.3-14ubuntul1'],
  'nginx': ['1.10.0-0ubuntu0.16.04.4', '1.9.15-0ubuntu1']
}
```

CLI Examples:

```bash
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
```

```python
salt.modules.aptpkg.list_repos()
```

Lists all repos in the sources.list (and sources.list.d) files

CLI Example:

```bash
salt '*' pkg.list_repos
salt '*' pkg.list_repos disabled=True
```

```python
salt.modules.aptpkg.list_upgrades(refresh=True, dist_upgrade=True, **kwargs)
```

List all available package upgrades.
**refresh**  Whether to refresh the package database before listing upgrades. Default: True.

**cache_valid_time**

    New in version 2016.11.0.

    Skip refreshing the package database if refresh has already occurred within <value> seconds

**dist_upgrade**  Whether to list the upgrades using dist-upgrade vs upgrade. Default is to use dist-upgrade.

**CLI Example:**

```
salt '*' pkg.list_upgrades
```

```python
salt.modules.aptpkg.mod_repo(repo, saltenv='base', **kwargs)
```

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as the definition is well formed. For Ubuntu the ppa:<project>/repo format is acceptable. ppa: format can only be used to create a new repository.

The following options are available to modify a repo definition:

- **architectures** A comma-separated list of supported architectures, e.g. amd64 If this option is not set, all architectures (configured in the system) will be used.
- **comps** A comma separated list of components for the repo, e.g. main
- **file** A file name to be used
- **keyserver** Keyserver to get gpg key from
- **keyid** Key ID or a list of key IDs to load with the keyserver argument
- **key_url** URL to a GPG key to add to the APT GPG keyring
- **key_text** GPG key in string form to add to the APT GPG keyring

    New in version 2018.3.0.

- **consolidate** [False] If True, will attempt to de-duplicate and consolidate sources
- **comments** Sometimes you want to supply additional information, but not as enabled configuration. All comments provided here will be joined into a single string and appended to the repo configuration with a comment marker (#) before it.

    New in version 2015.8.9.

- **refresh** [True] Enable or disable (True or False) refreshing of the apt package database. The previous refresh_db argument was deprecated in favor of refresh`. The refresh_db argument will still continue to work to ensure backwards compatibility, but please change to using the preferred refresh.

**Note:** Due to the way keys are stored for APT, there is a known issue where the key won’t be updated unless another change is made at the same time. Keys should be properly added on initial configuration.

**CLI Examples:**

```
salt '*' pkg.mod_repo 'myrepo definition' uri=http://new/uri
salt '*' pkg.mod_repo 'myrepo definition' comps=main,universe
```

```python
salt.modules.aptpkg.normalize_name(name)
```

Strips the architecture from the specified package name, if necessary.

**CLI Example:**
salt 'x' pkg.normalize_name zsh:amd64

salt.modules.aptpkg.owner('*paths')
New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version`, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:
```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /usr/bin/basename
```

salt.modules.aptpkg.parse_arch(name)
Parse name and architecture from the specified package name.

CLI Example:
```
salt '*' pkg.parse_arch zsh:amd64
```

salt.modules.aptpkg.purge(name=None, pkgs=None, **kwargs)
Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the salt-minion daemon’s control group. This is done to keep systemd from killing any apt-get/dpkg commands spawned by Salt when the salt-minion service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a config option called `systemd.scope`, with a value of `False` (no quotes).

Remove packages via `apt-get purge` along with all configuration files.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:
```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.aptpkg.refresh_db(cache_valid_time=0, failhard=False)
Updates the APT database to latest packages based upon repositories.

Returns a dict, with the keys being package databases and the values being the result of the update attempt. Values can be one of the following:

- **True**: Database updated successfully
- **False**: Problem updating database
- **None**: Database already up-to-date
cache_valid_time

New in version 2016.11.0.
Skip refreshing the package database if refresh has already occurred within <value> seconds

failhard

If False, return results of Err lines as False for the package database that encountered the error.
If True, raise an error with a list of the package databases that encountered errors.

CLI Example:

```bash
salt '*' pkg.refresh_db
```

salt.modules.aptpkg.remove(name=None, pkgs=None, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemctl from killing any apt-get/dpkg commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Remove packages using apt-get remove.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```bash
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.aptpkg.set_selections(path=None, selection=None, clear=False, saltenv='base')

Change package state in the dpkg database.

The state can be any one of, documented in dpkg(1):

- install
- hold
- deinstall
- purge

This command is commonly used to mark specific packages to be held from being upgraded, that is, to be kept at a certain version. When a state is changed to anything but being held, then it is typically followed by apt-get -u dselect-upgrade.

Note: Be careful with the clear argument, since it will start with setting all packages to deinstall state.

Returns a dict of dicts containing the package names, and the new and old versions:
{
    '<host>':
    {
        '<package>':
        {
            'new': '<new-state>',
            'old': '<old-state>'
        },
    },
...
}

CLI Example:

salt '*' pkg.set_selections selection='{"install": ["netcat"]}'
salt '*' pkg.set_selections selection='{"hold": ["openssh-server", "openssh-client"]}'
salt '*' pkg.set_selections salt://path/to/file
salt '*' pkg.set_selections salt://path/to/file clear=True

salt.modules.aptpkg.show('names', **kwargs)
New in version 2019.2.0.

Runs an apt-cache show on the passed package names, and returns the results in a nested dictionary. The top level of the return data will be the package name, with each package name mapping to a dictionary of version numbers to any additional information returned by apt-cache show.

filter An optional comma-separated list (or quoted Python list) of case-insensitive keys on which to filter. This allows one to restrict the information returned for each package to a smaller selection of pertinent items.

refresh [False] If True, the apt cache will be refreshed first. By default, no refresh is performed.

CLI Examples:

salt myminion pkg.show gawk
salt myminion pkg.show 'nginx-*'
salt myminion pkg.show 'nginx-*' filter=description,provides

salt.modules.aptpkg.unhold(name=None, pkgs=None, sources=None, **kwargs)
New in version 2014.7.0.

Set package current in 'hold' state to install state, meaning it will be upgraded.

name The name of the package, e.g., 'tmux'

CLI Example:

salt '*' pkg.unhold <package name>

pkgs A list of packages to unhold. Must be passed as a python list.

CLI Example:

salt '*' pkg.unhold pkgs=['"foo", "bar"']

salt.modules.aptpkg.upgrade(refresh=True, dist_upgrade=False, **kwargs)
Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemctl-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any apt-get/dpkg commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemctl.kill(5) manpage for more information). If desired, usage of systemctl-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Upgrades all packages via apt-get upgrade or apt-get dist-upgrade if dist_upgrade is True.

Returns a dictionary containing the changes:
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}

dist_upgrade Whether to perform the upgrade using dist-upgrade vs upgrade. Default is to use upgrade.
New in version 2014.7.0.
cache_valid_time
New in version 2016.11.0.
Skip refreshing the package database if refresh has already occurred within <value> seconds
download_only (or downloadonly) Only download the packages, don’t unpack or install them. Use downloadonly to be in line with yum and zypper module.
New in version 2018.3.0.
force_conf_new Always install the new version of any configuration files.
New in version 2015.8.0.

CLI Example:
salt '*' pkg.upgrade

salt.modules.aptpkg.upgrade_available(name)
Check whether or not an upgrade is available for a given package
CLI Example:
salt '*' pkg.upgrade_available <package name>
salt.modules.aptpkg.version('names, **kwargs)
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.
CLI Example:
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
salt.modules.aptpkg.version_cmp(pkg1, pkg2, ignore_epoch=False)
Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.
ignore_epoch [False] Set to True to ignore the epoch when comparing versions
New in version 2015.8.10,2016.3.2.
CLI Example:
salt '*' pkg.version_cmp '0.2.4-0ubuntu1' '0.2.4.1-0ubuntu1'

21.9.18 salt.modules.archive
A module to wrap (non-Windows) archive calls
New in version 2014.1.0.
salt.modules.archive.cmd_unzip(zip_file, dest, excludes=None, options=None, template=None, 
runas=None, trim_output=False, password=None)

New in version 2015.5.0: In versions 2014.7.x and earlier, this function was known as archive.unzip.

Uses the `unzip` command to unpack zip files. This command is part of the Info-ZIP suite of tools, and is typically packaged as simply `unzip`.

**zip_file**  Path of zip file to be unpacked

**dest**  The destination directory into which the file should be unpacked

**excludes**  [None] Comma-separated list of files not to unpack. Can also be passed in a Python list.

**template**  [None] Can be set to `jinja` or another supported template engine to render the command arguments before execution:

```
salt '*' archive.cmd_unzip template=jinja /tmp/zipfile.zip '/tmp/{{grains.id}}' 
    excludes=file_1,file_2
```

**options**  Optional when using `zip` archives, ignored when using other archives files. This is mostly used to overwrite existing files with `o`. This options are only used when `unzip` binary is used.

New in version 2016.3.1.

**runas**  [None] Unpack the zip file as the specified user. Defaults to the user under which the minion is running.

New in version 2015.5.0.

**trim_output**  [False] The number of files we should output on success before the rest are trimmed, if this is set to `True` then it will default to 100

**password**  Password to use with password protected zip files

---

**Note:** This is not considered secure. It is recommended to instead use `archive.unzip` for password-protected ZIP files. If a password is used here, then the `unzip` command run to extract the ZIP file will not show up in the minion log like most shell commands Salt runs do. However, the password will still be present in the events logged to the minion log at the `debug` log level. If the minion is logging at `debug` (or more verbose), then be advised that the password will appear in the log.

New in version 2016.11.0.

CLI Example:

```
salt '*' archive.cmd_unzip /tmp/zipfile.zip /home/strongbad/ excludes=file_1,file_2
```

salt.modules.archive.cmd_zip(zip_file, sources, template=None, cwd=None, runas=None)

New in version 2015.5.0: In versions 2014.7.x and earlier, this function was known as archive.zip.

Uses the `zip` command to create zip files. This command is part of the Info-ZIP suite of tools, and is typically packaged as simply `zip`.

**zip_file**  Path of zip file to be created

**sources**  Comma-separated list of sources to include in the zip file. Sources can also be passed in a Python list.

Changed in version 2017.7.0: Globbing is now supported for this argument

**template**  [None] Can be set to `jinja` or another supported template engine to render the command arguments before execution:
salt '...' archive.cmd_zip template=jinja /tmp/zipfile.zip /tmp/sourcefile1,/.../tmp/{{grains.id}}.txt

cwd [None] Use this argument along with relative paths in sources to create zip files which do not contain the leading directories. If not specified, the zip file will be created as if the cwd was /, and creating a zip file of /foo/bar/baz.txt will contain the parent directories foo and bar. To create a zip file containing just baz.txt, the following command would be used:

    salt '...' archive.cmd_zip /tmp/baz.zip baz.txt cwd=/foo/bar

New in version 2014.7.1.

runas [None] Create the zip file as the specified user. Defaults to the user under which the minion is running.

    New in version 2015.5.0.

CLI Example:

    salt '*' archive.cmd_zip /tmp/zipfile.zip /tmp/sourcefile1,/tmp/sourcefile2
    # Globbing for sources (2017.7.0 and later)
    salt '*' archive.cmd_zip /tmp/zipfile.zip '/tmp/sourcefile*'

salt.modules.archive.gunzip(gzipfile, template=None, runas=None, options=None)

Uses the gunzip command to unpack gzip files

    template [None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

    salt '*' archive.gunzip template=jinja /tmp/{{grains.id}}.txt.gz

runas [None] The user with which to run the gzip command line

options [None] Pass any additional arguments to gzip

    New in version 2016.3.4.

    CLI Example:

    # Create /tmp/sourcefile.txt
    salt '*' archive.gunzip /tmp/sourcefile.txt.gz
    salt '*' archive.gunzip /tmp/sourcefile.txt options='--verbose'

salt.modules.archive.gzip(sourcefile, template=None, runas=None, options=None)

Uses the gzip command to create gzip files

    template [None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

    salt '*' archive.gzip template=jinja /tmp/{{grains.id}}.txt

runas [None] The user with which to run the gzip command line

options [None] Pass any additional arguments to gzip

    New in version 2016.3.4.

    CLI Example:

    # Create /tmp/sourcefile.txt.gz
    salt '*' archive.gzip /tmp/sourcefile.txt
    salt '*' archive.gzip /tmp/sourcefile.txt options='--verbose'

salt.modules.archive.**is_encrypted**(name, clean=False, saltenv='base', source_hash=None)

New in version 2016.11.0.

Returns `True` if the zip archive is password-protected, `False` if not. If the specified file is not a ZIP archive, an error will be raised.

**name** The path / URL of the archive to check.

**clean** [False] Set this value to `True` to delete the path referred to by `name` once the contents have been listed. This option should be used with care.

**Note:** If there is an error listing the archive’s contents, the cached file will not be removed, to allow for troubleshooting.

**saltenv** [base] Specifies the fileserver environment from which to retrieve `archive`. This is only applicable when `archive` is a file from the `salt://` fileserver.

**source_hash** If `name` is an http(s)/ftp URL and the file exists in the minion’s file cache, this option can be passed to keep the minion from re-downloading the archive if the cached copy matches the specified hash.

New in version 2018.3.0.

CLI Examples:

```
salt '*' archive.is_encrypted /path/to/myfile.zip
salt '*' archive.is_encrypted salt://foo.zip
salt '*' archive.is_encrypted salt://foo.zip saltenv=dev
salt '*' archive.is_encrypted https://domain.tld/myfile.zip clean=True
salt '*' archive.is_encrypted https://domain.tld/myfile.zip source_hash=f1d2d2f924e986ac86fddf7b36c94bcdf32beec15
salt '*' archive.is_encrypted ftp://10.1.2.3/foo.zip
```

salt.modules.archive.**list_**(name, archive_format=None, options=None, strip_components=None, clean=False, verbose=False, saltenv='base', source_hash=None)

New in version 2016.11.0.

Changed in version 2016.11.2: The `rarfile` Python module is now supported for listing the contents of rar archives. This is necessary on minions with older releases of the `rar` CLI tool, which do not support listing the contents in a parsable format.

List the files and directories in an tar, zip, or rar archive.

**Note:** This function will only provide results for XZ-compressed archives if the `xz` CLI command is available, as Python does not at this time natively support XZ compression in its `tarfile` module. Keep in mind however that most Linux distros ship with `xz` already installed.

To check if a given minion has `xz`, the following Salt command can be run:

```
salt minion_id cmd.which xz
```

If `None` is returned, then `xz` is not present and must be installed. It is widely available and should be packaged as either `xz` or `xz-utils`.

**name** Path/URL of archive

**archive_format** Specify the format of the archive (tar, zip, or rar). If this argument is omitted, the archive format will be guessed based on the value of the `name` parameter.
options  For tar archives only. This function will, by default, try to use the tarfile module from the Python standard library to get a list of files/directories. If this method fails, then it will fall back to using the shell to decompress the archive to stdout and pipe the results to tar -tf - to produce a list of filenames. XZ-compressed archives are already supported automatically, but in the event that the tar archive uses a different sort of compression not supported natively by tarfile, this option can be used to specify a command that will decompress the archive to stdout. For example:

```
salt minion_id archive.list /path/to/foo.tar.gz options='gzip --decompress -- --stdout'
```

Note: It is not necessary to manually specify options for gzip’ed archives, as gzip compression is natively supported by tarfile.

strip_components  This argument specifies a number of top-level directories to strip from the results. This is similar to the paths that would be extracted if --strip-components (or --strip) were used when extracting tar archives.

New in version 2016.11.2.

clean  [False] Set this value to True to delete the path referred to by name once the contents have been listed. This option should be used with care.

Note: If there is an error listing the archive’s contents, the cached file will not be removed, to allow for troubleshooting.

verbose  [False] If False, this function will return a list of files/dirs in the archive. If True, it will return a dictionary categorizing the paths into separate keys containing the directory names, file names, and also directories/files present in the top level of the archive.

Changed in version 2016.11.2: This option now includes symlinks in their own list. Before, they were included with files.

saltenv  [base] Specifies the fileserver environment from which to retrieve archive. This is only applicable when archive is a file from the salt:// fileserver.

source_hash  If name is an http(s)/ftp URL and the file exists in the minion’s file cache, this option can be passed to keep the minion from re-downloading the archive if the cached copy matches the specified hash.

New in version 2018.3.0.

CLI Examples:

```
salt '*' archive.list /path/to/myfile.tar.gz
salt '*' archive.list /path/to/myfile.tar.gz strip_components=1
salt '*' archive.list salt://foo.tar.gz
salt '*' archive.list https://domain.tld/myfile.zip
salt '*' archive.list https://domain.tld/myfile.zip source_hash=1d2d2f924e986ac86f2f7b36c94bcdf32beec15
salt '*' archive.list ftp://10.1.2.3/foo.rar
```

salt.modules.archive.rar(rarfile, sources, template=None, cwd=None, runas=None)

Uses rar for Linux to create rar files

rarfile  Path of rar file to be created
**sources** Comma-separated list of sources to include in the rar file. Sources can also be passed in a Python list.

Changed in version 2017.7.0: Globbing is now supported for this argument

**cwd** [None] Run the rar command from the specified directory. Use this argument along with relative file paths to create rar files which do not contain the leading directories. If not specified, this will default to the home directory of the user under which the salt minion process is running.

New in version 2014.7.1.

**template** [None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```python
salt '*' archive.rar template=jinja /tmp/rarfile.rar '/tmp/sourcefile1,/tmp/{→(grains.id)}.txt'
```

CLI Example:

```bash
salt '*' archive.rar /tmp/rarfile.rar /tmp/sourcefile1,/tmp/sourcefile2
# Globbing for sources (2017.7.0 and later)
salt '*' archive.rar /tmp/rarfile.rar '/tmp/sourcefile*'
```

`salt.modules.archive.tar(options, tarfile, sources=None, dest=None, cwd=None, template=None, runas=None)`

**Note:** This function has changed for version 0.17.0. In prior versions, the `cwd` and `template` arguments must be specified, with the source directories/files coming as a space-separated list at the end of the command. Beginning with 0.17.0, `sources` must be a comma-separated list, and the `cwd` and `template` arguments are optional.

Uses the tar command to pack, unpack, etc. tar files

**options** Options to pass to the tar command

Changed in version 2015.8.0: The mandatory -p prefixing has been removed. An options string beginning with a `-long-option`, would have uncharacteristically needed its first - removed under the former scheme.

Also, tar will parse its options differently if short options are used with or without a preceding -, so it is better to not confuse the user into thinking they’re using the non-- format, when really they are using the with-- format.

**tarfile** The filename of the tar archive to pack/unpack

**sources** Comma delimited list of files to pack into the tarfile. Can also be passed as a Python list.

Changed in version 2017.7.0: Globbing is now supported for this argument

**dest** The destination directory into which to unpack the tarfile

**cwd** [None] The directory in which the tar command should be executed. If not specified, will default to the home directory of the user under which the salt minion process is running.

**template** [None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```bash
salt '*' archive.tar cjvf /tmp/salt.tar.bz2 {{grains.saltpath}} template=jinja
```

CLI Examples:
# Create a tarfile
```
salt '*' archive.tar cjvf /tmp/tarfile.tar.bz2 /tmp/file_1,/tmp/file_2
```

# Create a tarfile using globbing (2017.7.0 and later)
```
salt '*' archive.tar cjvf /tmp/tarfile.tar.bz2 '/tmp/file_*'
```

# Unpack a tarfile
```
salt '*' archive.tar xf foo.tar dest=/target/directory
```

---

salt.modules.archive.unrar(rarfile, dest=None, excludes=None, template=None, runas=None, trim_output=False)

Uses [rar](https://en.wikipedia.org/wiki/RAR) for Linux to unpack rar files

**rarfile** Name of rar file to be unpacked

**dest** The destination directory into which to unpack the rar file

**template** [None] Can be set to `jinja` or another supported template engine to render the command arguments before execution:

```
salt '*' archive.unrar template=jinja /tmp/rarfile.rar /tmp/{{grains.id}}/
\rightarrow excludes=file_1,file_2
```

**trim_output** [False] The number of files we should output on success before the rest are trimmed, if this is set to True then it will default to 100

---

salt.modules.archive.unzip(zip_file, dest=None, excludes=None, options=None, template=None, runas=None, trim_output=False, password=None, extract_perms=True)

Uses the [zipfile](https://docs.python.org/3/library/zipfile.html) Python module to unpack zip files

Changed in version 2015.5.0: This function was rewritten to use Python’s native zip file support. The old functionality has been preserved in the new function `archive.cmd_unzip`. For versions 2014.7.x and earlier, see the `archive.cmd_zip` documentation.

**zip_file** Path of zip file to be unpacked

**dest** The destination directory into which the file should be unpacked

**excludes** [None] Comma-separated list of files not to unpack. Can also be passed in a Python list.

**options** This options are only used when unzip binary is used. In this function is ignored.

New in version 2016.3.1.

**template** [None] Can be set to `jinja` or another supported template engine to render the command arguments before execution:

```
salt '*' archive.unzip template=jinja /tmp/zipfile.zip /tmp/{{grains.id}}/
\rightarrow excludes=file_1,file_2
```

**runas** [None] Unpack the zip file as the specified user. Defaults to the user under which the minion is running.

**trim_output** [False] The number of files we should output on success before the rest are trimmed, if this is set to True then it will default to 100

---

CLI Example:

```
salt '*' archive.unrar /tmp/rarfile.rar /home/strongbad/ excludes=file_1,file_2
```

```
salt '*' archive.unzip /tmp/zipfile.zip /home/strongbad/ excludes=file_1,file_2
```
**password**  Password to use with password protected zip files

**Note:** The password will be present in the events logged to the minion log file at the debug log level. If the minion is logging at debug (or more verbose), then be advised that the password will appear in the log.

New in version 2016.3.0.

**extract_perms**  [True]  The Python zipfile module does not extract file/directory attributes by default. When this argument is set to True, Salt will attempt to apply the file permission attributes to the extracted files/folders.

On Windows, only the read-only flag will be extracted as set within the zip file, other attributes (i.e. user/group permissions) are ignored.

Set this argument to False to disable this behavior.

New in version 2016.11.0.

CLI Example:

```
salt '*' archive.unzip /tmp/zipfile.zip /home/strongbad/ password='BadPassword'
```

**salt.modules.archive.zip**  
(zip_file, sources, template=None, cwd=None, runas=None, zip64=False)

Uses the zipfile Python module to create zip files

Changed in version 2015.5.0: This function was rewritten to use Python’s native zip file support. The old functionality has been preserved in the new function `archive.cmd_zip`. For versions 2014.7.x and earlier, see the `archive.cmd_zip` documentation.

### zip_file

Path of zip file to be created

### sources

Comma-separated list of sources to include in the zip file. Sources can also be passed in a Python list.

Changed in version 2017.7.0: Globbing is now supported for this argument

### template

[None]  Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.zip template=jinja /tmp/zipfile.zip /tmp/sourcefile1,/tmp/\{ \{-grains.id\}\}.txt
```

### cwd

[None]  Use this argument along with relative paths in sources to create zip files which do not contain the leading directories. If not specified, the zip file will be created as if the cwd was /, and creating a zip file of /foo/bar/baz.txt will contain the parent directories foo and bar. To create a zip file containing just baz.txt, the following command would be used:

```
salt '*' archive.zip /tmp/baz.zip baz.txt cwd=/foo/bar
```

### runas

[None]  Create the zip file as the specified user. Defaults to the user under which the minion is running.

### zip64

[False]  Used to enable ZIP64 support, necessary to create archives larger than 4 GByte in size. If true, will create ZIP file with the ZIPp64 extension when the zipfile is larger than 2 GB. ZIP64 extension is disabled by default in the Python native zip support because the default zip and unzip commands on Unix (the InfoZIP utilities) don’t support these extensions.

CLI Example:
21.9.19 salt.modules.arista_pyeapi

Arista pyeapi

New in version 2019.2.0.

Execution module to interface the connection with Arista switches, connecting to the remote network device using the pyeapi library. It is flexible enough to execute the commands both when running under an Arista Proxy Minion, as well as running under a Regular Minion by specifying the connection arguments, i.e., device_type, host, username, password etc.

- codeauthor: Mircea Ulinic <ping@mirceaulinic.net>
- maturity: new
- depends: pyeapi
- platform: unix

Note: To understand how to correctly enable the eAPI on your switch, please check https://eos.arista.com/arista-eapi-101/.

Dependencies

The pyeapi Execution module requires the Python Client for eAPI (pyeapi) to be installed: `pip install pyeapi`.

Usage

This module can equally be used via the pyeapi Proxy module or directly from an arbitrary (Proxy) Minion that is running on a machine having access to the network device API, and the pyeapi library is installed.

When running outside of the pyeapi Proxy (i.e., from another Proxy Minion type, or regular Minion), the pyeapi connection arguments can be either specified from the CLI when executing the command, or in a configuration block under the pyeapi key in the configuration opts (i.e., (Proxy) Minion configuration file), or Pillar. The module supports these simultaneously. These fields are the exact same supported by the pyeapi Proxy Module:

- transport: https Specifies the type of connection transport to use. Valid values for the connection are socket, http_local, http, and https.
- host: localhost The IP address or DNS host name of the connection device.
- username: admin The username to pass to the device to authenticate the eAPI connection.
- password The password to pass to the device to authenticate the eAPI connection.
- port The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).
- enablepwd The enable mode password if required by the destination node.
Example (when not running in a `pyeapi` Proxy Minion):

```yaml
pyeapi:
  username: test
  password: test
```

In case the `username` and `password` are the same on any device you are targeting, the block above (besides other parameters specific to your environment you might need) should suffice to be able to execute commands from outside a `pyeapi` Proxy, e.g.:

```bash
salt '*' pyeapi.send_commands 'show version' 'show interfaces'
salt '*' pyeapi.config 'ntp server 1.2.3.4'
```

Note: Remember that the above applies only when not running in a `pyeapi` Proxy Minion. If you want to use the `pyeapi Proxy`, please follow the documentation notes for a proper setup.

```python
salt.modules.arista_pyeapi.call(method, *args, **kwargs)
```

Invoke an arbitrary pyeapi method.

- `method`: The name of the pyeapi method to invoke.
- `args`: A list of arguments to send to the method invoked.
- `kwargs`: Key-value dictionary to send to the method invoked.
- `transport`: `https` Specifies the type of connection transport to use. Valid values for the connection are `socket`, `http_local`, `http`, and `https`.

Note: This argument does not need to be specified when running in a `pyeapi` Proxy Minion.

- `host`: `localhost` The IP address or DNS host name of the connection device.

Note: This argument does not need to be specified when running in a `pyeapi` Proxy Minion.

- `username`: `admin` The username to pass to the device to authenticate the eAPI connection.

Note: This argument does not need to be specified when running in a `pyeapi` Proxy Minion.

- `password`: The password to pass to the device to authenticate the eAPI connection.

Note: This argument does not need to be specified when running in a `pyeapi` Proxy Minion.

- `port`: The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).

Note: This argument does not need to be specified when running in a `pyeapi` Proxy Minion.

- `enablepwd`: The enable mode password if required by the destination node.
Note: This argument does not need to be specified when running in a pyeapi Proxy Minion.

CLI Example:
```
salt '*' pyeapi.call run_commands "[\'show version\']"
```

```
salt.modules.arista_pyeapi.config(commands=None, config_file=None, template_engine='jinja', context=None, defaults=None, saltenv='base', **kwargs)
```

Configures the node with the specified commands.

This method is used to send configuration commands to the node. It will take either a string or a list and prepend the necessary commands to put the session into config mode.

Returns the diff after the configuration commands are loaded.

**config_file** The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice.

This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

**commands** The commands to send to the node in config mode. If the commands argument is a string it will be cast to a list. The list of commands will also be prepended with the necessary commands to put the session in config mode.

Note: This argument is ignored when `config_file` is specified.

**template_engine**: `jinja` The template engine to use when rendering the source file. Default: `jinja`. To simply fetch the file without attempting to render, set this argument to `None`.

**context** Variables to add to the template context.

**defaults** Default values of the `context` dict.

**transport**: `https` Specifies the type of connection transport to use. Valid values for the connection are `socket`, `http_local`, `http`, and `https`.

Note: This argument does not need to be specified when running in a pyeapi Proxy Minion.

**host**: `localhost` The IP address or DNS host name of the connection device.

Note: This argument does not need to be specified when running in a pyeapi Proxy Minion.

**username**: `admin` The username to pass to the device to authenticate the eAPI connection.
Note: This argument does not need to be specified when running in a pyeapi Proxy Minion.

**password**  The password to pass to the device to authenticate the eAPI connection.

Note: This argument does not need to be specified when running in a pyeapi Proxy Minion.

**port**  The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).

Note: This argument does not need to be specified when running in a pyeapi Proxy Minion.

**enablepwd**  The enable mode password if required by the destination node.

Note: This argument does not need to be specified when running in a pyeapi Proxy Minion.

**CLI Example:**
```
salt '*' pyeapi.config commands="['ntp server 1.2.3.4', 'ntp server 5.6.7.8']"
salt '*' pyeapi.config config_file=salt://config.txt
salt '*' pyeapi.config config_file=https://bit.ly/2LGLcDy context="{'servers': ["1.2.3.4"]}"
```

salt.modules.arista_pyeapi.get_config(config='running-config',
                                       params=None,
                                       as_string=False, **kwargs)

Retrieves the config from the device.

This method will retrieve the config from the node as either a string or a list object. The config to retrieve can be specified as either the startup-config or the running-config.

**config:**  running-config  Specifies to return either the nodes startup-config or running-config. The default value is the running-config.

**params**  A string of keywords to append to the command for retrieving the config.

**as_string:**  False  Flag that determines the response. If True, then the configuration is returned as a raw string. If False, then the configuration is returned as a list. The default value is False.

**transport:**  https  Specifies the type of connection transport to use. Valid values for the connection are socket, http_local, http, and https.

Note: This argument does not need to be specified when running in a pyeapi Proxy Minion.

**host:**  localhost  The IP address or DNS host name of the connection device.

Note: This argument does not need to be specified when running in a pyeapi Proxy Minion.

**username:**  admin  The username to pass to the device to authenticate the eAPI connection.

Note: This argument does not need to be specified when running in a pyeapi Proxy Minion.
password  The password to pass to the device to authenticate the eAPI connection.

Note: This argument does not need to be specified when running in a pyeapi Proxy Minion.

port  The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).

Note: This argument does not need to be specified when running in a pyeapi Proxy Minion.

enablepwd  The enable mode password if required by the destination node.

Note: This argument does not need to be specified when running in a pyeapi Proxy Minion.

CLI Example:

```plaintext
salt '*' pyeapi.get_config
salt '*' pyeapi.get_config params='section snmp-server'
salt '*' pyeapi.get_config config='startup-config'
```

salt.modules.arista_pyeapi.get_connection(**kwargs)
Return the connection object to the pyeapi Node.

Warning: This function returns an unserializable object, hence it is not meant to be used on the CLI. This should mainly be used when invoked from other modules for the low level connection with the network device.

kwargs  Key-value dictionary with the authentication details.

Usage Example:

```plaintext
conn = __salt__['pyeapi.get_connection'](host='router1.example.com', username='example', password='example')
show_ver = conn.run_commands(['show version', 'show interfaces'])
```

salt.modules.arista_pyeapi.run_commands(*commands, **kwargs)
Sends the commands over the transport to the device.

This function sends the commands to the device using the nodes transport. This is a lower layer function that shouldn’t normally need to be used, preferring instead to use config() or enable().

transport: https  Specifies the type of connection transport to use. Valid values for the connection are socket, http_local, http, and https.

Note: This argument does not need to be specified when running in a pyeapi Proxy Minion.

host: localhost  The IP address or DNS host name of the connection device.

Note: This argument does not need to be specified when running in a pyeapi Proxy Minion.
username: **admin** The username to pass to the device to authenticate the eAPI connection.

**Note:** This argument does not need to be specified when running in a **pyeapi** Proxy Minion.

**password** The password to pass to the device to authenticate the eAPI connection.

**Note:** This argument does not need to be specified when running in a **pyeapi** Proxy Minion.

**port** The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).

**Note:** This argument does not need to be specified when running in a **pyeapi** Proxy Minion.

**enablepwd** The enable mode password if required by the destination node.

**Note:** This argument does not need to be specified when running in a **pyeapi** Proxy Minion.

**CLI Example:**

```bash
salt '*' pyeapi.run_commands 'show version'
salt '*' pyeapi.run_commands 'show version' encoding=text
salt '*' pyeapi.run_commands 'show version' encoding=text host=cr1.thn.lon
  → username=example password=weak
```

**Output example:**

```
veos1:
  |______________
  |            
  |   architecture: i386
  |   bootupTimestamp: 1527541728.53
  |   hardwareRevision: internalBuildId:
  |   internalVersion: 63d2e89a-228d-4b8a-a9b3-0524fa8f9c5f
  |   internalVersion: 4.18.1F-4591672.4181F
  |   isIntlVersion: False
  |   memFree: 501468
  |   memTotal: 1893316
  |   modelName: vEOS
  |   serialNumber: systemMacAddress:
  |     52:54:00:3f:e6:d0
  |     version: 4.18.1F
```
salt.modules.arista_pyeapi.section(regex, config='running-config', **kwargs)

Return a section of the config.

regex  A valid regular expression used to select sections of configuration to return.

config: running-config  The configuration to return. Valid values for config are running-config or startup-config. The default value is running-config.

transport: https  Specifies the type of connection transport to use. Valid values for the connection are socket, http_local, http, and https.

Note: This argument does not need to be specified when running in a pyeapi Proxy Minion.

host: localhost  The IP address or DNS host name of the connection device.

Note: This argument does not need to be specified when running in a pyeapi Proxy Minion.

username: admin  The username to pass to the device to authenticate the eAPI connection.

Note: This argument does not need to be specified when running in a pyeapi Proxy Minion.

password  The password to pass to the device to authenticate the eAPI connection.

Note: This argument does not need to be specified when running in a pyeapi Proxy Minion.

port  The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).

Note: This argument does not need to be specified when running in a pyeapi Proxy Minion.

enablepwd  The enable mode password if required by the destination node.

Note: This argument does not need to be specified when running in a pyeapi Proxy Minion.

CLI Example:

```
salt '*'
```

21.9.20  salt.modules.artifactory

Module for fetching artifacts from Artifactory

exception  salt.modules.artifactory.ArtifactError(value)

salt.modules.artifactory.get_latest_release(artifactory_url, repository, group_id, artifact_id, packaging, target_dir='/tmp', target_file=None, classifier=None, username=None, password=None, use_literal_group_id=False)

Gets the latest release of the artifact
artifact_url  URL of artifactory instance
repository  Release repository in artifactory to retrieve artifact from, for example: libs-releases
group_id  Group Id of the artifact
artifact_id  Artifact Id of the artifact
packaging  Packaging type (jar,war,ear,etc)
target_dir  Target directory to download artifact to (default: /tmp)
target_file  Target file to download artifact to (by default it is target_dir/artifact_id-version.packaging)
classifier  Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.
username  Artifactory username. Optional parameter.
password  Artifactory password. Optional parameter.

salt.modules.artifactory.get_latest_snapshot(artifact_url, repository, group_id, artifact_id, packaging, target_dir='/tmp', target_file=None, classifier=None, username=None, password=None, use_literal_group_id=False)

Gets latest snapshot of the given artifact
artifact_url  URL of artifactory instance
repository  Snapshot repository in artifactory to retrieve artifact from, for example: libs-snapshots
group_id  Group Id of the artifact
artifact_id  Artifact Id of the artifact
packaging  Packaging type (jar,war,ear,etc)
target_dir  Target directory to download artifact to (default: /tmp)
target_file  Target file to download artifact to (by default it is target_dir/artifact_id-snapshot_version.packaging)
classifier  Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.
username  Artifactory username. Optional parameter.
password  Artifactory password. Optional parameter.

salt.modules.artifactory.get_release(artifact_url, repository, group_id, artifact_id, packaging, version, target_dir='/tmp', target_file=None, classifier=None, username=None, password=None, use_literal_group_id=False)

Gets the specified release of the artifact
artifact_url  URL of artifactory instance
repository  Release repository in artifactory to retrieve artifact from, for example: libs-releases
group_id  Group Id of the artifact
artifact_id  Artifact Id of the artifact
packaging  Packaging type (jar,war,ear,etc)
version  Version of the artifact
target_dir  Target directory to download artifact to (default: /tmp)
target_file  Target file to download artifact to (by default it is target_dir/artifact_id-version.packaging)
classifier: Artifact classifier name (ex: sources, javadoc, etc). Optional parameter.
username: Artifactory username. Optional parameter.
password: Artifactory password. Optional parameter.
salt.modules.artifactory.get_snapshot(artifactory_url, repository, group_id, artifact_id, packaging, version, snapshot_version=None, target_dir='/tmp', target_file=None, classifier=None, username=None, password=None, use_literal_group_id=False)

Gets snapshot of the desired version of the artifact

artifactory_url: URL of artifactory instance
repository: Snapshot repository in artifactory to retrieve artifact from, for example: libs-snapshots
group_id: Group Id of the artifact
artifact_id: Artifact Id of the artifact
packaging: Packaging type (jar, war, ear, etc)
version: Version of the artifact
target_dir: Target directory to download artifact to (default: /tmp)
target_file: Target file to download artifact to (by default it is target_dir/artifact_id-
snapshot_version.packaging)
classifier: Artifact classifier name (ex: sources, javadoc, etc). Optional parameter.
username: Artifactory username. Optional parameter.
password: Artifactory password. Optional parameter.

21.9.21 salt.modules.at

Wrapper module for at(1)
Also, a ‘tag’ feature has been added to more easily tag jobs.

platform: linux, openbsd, freebsd

Changed in version 2017.7.0.
salt.modules.at.at(*args, **kwargs)
Add a job to the queue.

The ‘timespec’ follows the format documented in the at(1) manpage.

CLI Example:
salt '*' at.at <timespec> <cmd> [tag=<tag>] [runas=<user>]
salt '*' at.at 12:05am '/sbin/reboot' tag=reboot
salt '*' at.at '3:05am +3 days' 'bin/myscript' tag=nightly runas=jim

salt.modules.at.atc(jobid)
Print the at(1) script that will run for the passed job id. This is mostly for debugging so the output will just be text.

CLI Example:
salt '...' at.atc <jobid>

salt.modules.at.atq(tag=None)
   List all queued and running jobs or only those with an optional 'tag'.
   CLI Example:
   
   salt '...' at.at
   salt '...' at.atq [tag]
   salt '...' at.atq [job number]

salt.modules.at.atrm('args')
   Remove jobs from the queue.
   CLI Example:
   
   salt '...' at.atrm <jobid> <jobid> .. <jobid>
   salt '...' at.atrm all
   salt '...' at.atrm all [tag]

salt.modules.at.jobcheck(**kwargs)
   Check the job from queue. The kwargs dict include 'hour minute day month year tag runas' Other parameters
   will be ignored.
   CLI Example:
   
   salt '...' at.jobcheck runas=jam day=13
   salt '...' at.jobcheck day=13 month=12 year=13 tag=rose

21.9.22 salt.modules.at_solaris

Wrapper for at(1) on Solaris-like systems

Note: we try to mirror the generic at module where possible

   maintainer jorge schrauwen <sjorge@blackdot.be>
   maturity new
   platform solaris,illumos,smartso

New in version 2017.7.0.

salt.modules.at_solaris.at('args, **kwargs)
   Add a job to the queue.
   The 'timespec' follows the format documented in the at(1) manpage.
   CLI Example:
   
   salt '...' at.at <timespec> <cmd> [tag=<tag>] [runas=<user>]
   salt '...' at.at 12:05am '/sbin/reboot' tag=reboot
   salt '...' at.at '3:05am +3 days' 'bin/myscript' tag=nightly runas=jim

salt.modules.at_solaris.atc(jobid)
   Print the at(1) script that will run for the passed job id. This is mostly for debugging so the output will just be text.
CLI Example:

```
salt '*' at.atc <jobid>
```

salt.modules.at_solaris.atq(*tag=*)
List all queued and running jobs or only those with an optional `tag`.

CLI Example:

```
salt '*' at.atq
salt '*' at.atq [tag]
salt '*' at.atq [job number]
```

salt.modules.at_solaris.atrm(*args)
Remove jobs from the queue.

CLI Example:

```
salt '*' at.atrm <jobid> <jobid> .. <jobid>
salt '*' at.atrm all
salt '*' at.atrm all [tag]
```

salt.modules.at_solaris.jobcheck(**kwargs)
Check the job from queue. The kwargs dict include `hour minute day month year tag runas` Other parameters will be ignored.

CLI Example:

```
salt '*' at.jobcheck runas=jam day=13
salt '*' at.jobcheck day=13 month=12 year=13 tag=rose
```

### 21.9.23 salt.modules.augeas_cfg

Manages configuration files via augeas

This module requires the augeas Python module.

**Warning:** Minimal installations of Debian and Ubuntu have been seen to have packaging bugs with python-augeas, causing the augeas module to fail to import. If the minion has the augeas module installed, but the functions in this execution module fail to run due to being unavailable, first restart the salt-minion service. If the problem persists past that, the following command can be run from the master to determine what is causing the import to fail:

```
salt minion-id cmd.run 'python -c "from augeas import Augeas"'
```

For affected Debian/Ubuntu hosts, installing libpython2.7 has been known to resolve the issue.

salt.modules.augeas_cfg.execute(context=None, lens=None, commands=(), load_path=None)
Execute Augeas commands

New in version 2014.7.0.

CLI Example:

```
salt '*' augeas.execute /files/etc/redis/redis.conf \
commands='["set bind 0.0.0.0", "set maxmemory 1G"]'
```
context The Augeas context
lens  The Augeas lens to use
commands The Augeas commands to execute

New in version 2016.3.0.
load_path A colon-spearated list of directories that modules should be searched in. This is in addition to the
standard load path and the directories in AUGEAS_LENS_LIB.

salt.modules.augeas_cfg.get(path, value=", load_path=None)
Get a value for a specific augeas path

CLI Example:

```
salt '*' augeas.get /files/etc/hosts/1/ ipaddr
```

path The path to get the value of
value The optional value to get

New in version 2016.3.0.
load_path A colon-spearated list of directories that modules should be searched in. This is in addition to the
standard load path and the directories in AUGEAS_LENS_LIB.

salt.modules.augeas_cfg.ls(path, load_path=None)
List the direct children of a node

CLI Example:

```
salt '*' augeas.ls /files/etc/passwd
```

path The path to list

New in version 2016.3.0.
load_path A colon-spearated list of directories that modules should be searched in. This is in addition to the
standard load path and the directories in AUGEAS_LENS_LIB.

salt.modules.augeas_cfg.match(path, value=", load_path=None)
Get matches for path expression

CLI Example:

```
salt '*' augeas.match /files/etc/services/service-name ssh
```

path The path to match
value The value to match on

New in version 2016.3.0.
load_path A colon-spearated list of directories that modules should be searched in. This is in addition to the
standard load path and the directories in AUGEAS_LENS_LIB.

salt.modules.augeas_cfg.remove(path, load_path=None)
Get matches for path expression

CLI Example:
**salt**

```
salt '*' augeas.remove \n/files/etc/sysctl.conf/net.ipv4.conf.all.log_martians
```

**path** The path to remove

New in version 2016.3.0.

**load_path** A colon-separated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LENS_LIB.

**salt.modules.augeas_cfg.setvalue('args)**
Set a value for a specific augeas path

CLI Example:

```
salt '*' augeas.setvalue /files/etc/hosts/1/canonical localhost
```

This will set the first entry in /etc/hosts to localhost

CLI Example:

```
salt '*' augeas.setvalue /files/etc/hosts/01/ipaddr 192.168.1.1 \n/files/etc/hosts/01/canonical test
```

Adds a new host to /etc/hosts the ip address 192.168.1.1 and hostname test

CLI Example:

```
salt '*' augeas.setvalue prefix=/files/etc/sudoers/ \n  "spec[user = '%wheel']/user" "%wheel" \n  "spec[user = '%wheel']/host_group/host" ALL \n  "spec[user = '%wheel']/host_group/command[1]" ALL \n  "spec[user = '%wheel']/host_group/command[1]/tag" PASSWD \n  "spec[user = '%wheel']/host_group/command[2]/tag" '/usr/bin/apt-get' \n  "spec[user = '%wheel']/host_group/command[2]/tag" NOPASSWD
```

Ensures that the following line is present in /etc/sudoers:

```
%wheel ALL = PASSWD : ALL , NOPASSWD : /usr/bin/apt-get , /usr/bin/aptitude
```

**salt.modules.augeas_cfg.tree(path, load_path=None)**
Returns recursively the complete tree of a node

CLI Example:

```
salt '*' augeas.tree /files/etc/
```

**path** The base of the recursive listing

New in version 2016.3.0.

**load_path** A colon-separated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LENS_LIB.

### 21.9.24 salt.modules.aws_sqs

Support for the Amazon Simple Queue Service.
salt.modules.aws_sqs.create_queue

Creates a queue with the correct name.

- **name**: Name of the SQS queue to create
- **region**: Region to create the SQS queue in
- **opts**: [None] Any additional options to add to the command line
- **user**: [None] Run hg as a user other than what the minion runs as

CLI Example:

```bash
salt '*' aws_sqs.create_queue <sqs queue> <region>
```

salt.modules.aws_sqs.delete_message

Delete one or more messages from a queue in a region

- **queue**: The name of the queue to delete messages from
- **region**: Region where SQS queues exists
- **receipthandle**: The ReceiptHandle of the message to delete. The ReceiptHandle is obtained in the return from `receive_message`
- **opts**: [None] Any additional options to add to the command line
- **user**: [None] Run as a user other than what the minion runs as

CLI Example:

```bash
salt '*' aws_sqs.delete_message <sqs queue> <region> receipthandle='\'<sqs
→ReceiptHandle>'
```

New in version 2014.7.0.

salt.modules.aws_sqs.delete_queue

Deletes a queue in the region.

- **name**: Name of the SQS queue to deletes
- **region**: Name of the region to delete the queue from
- **opts**: [None] Any additional options to add to the command line
- **user**: [None] Run hg as a user other than what the minion runs as

CLI Example:

```bash
salt '*' aws_sqs.delete_queue <sqs queue> <region>
```

salt.modules.aws_sqs.list_queues

List the queues in the selected region.

- **region**: Region to list SQS queues for
- **opts**: [None] Any additional options to add to the command line
- **user**: [None] Run hg as a user other than what the minion runs as

CLI Example:

```bash
salt '*' aws_sqs.list_queues <region>
```

salt.modules.aws_sqs.queue_exists

Returns True or False on whether the queue exists in the region

- **name**: Name of the SQS queue to search for
region Name of the region to search for the queue in
opts [None] Any additional options to add to the command line
user [None] Run hg as a user other than what the minion runs as

CLI Example:
  salt '*' aws_sqs.queue_exists <sqs queue> <region>
salt.modules.aws_sqs.receive_message(queue, region, num=1, opts=None, user=None)
  receive one or more messages from a queue in a region
queue The name of the queue to receive messages from
region Region where SQS queues exists
num [1] The max number of messages to receive
opts [None] Any additional options to add to the command line
user [None] Run as a user other than what the minion runs as

CLI Example:
  salt '*' aws_sqs.receive_message <sqs queue> <region>
  salt '*' aws_sqs.receive_message <sqs queue> <region> num=10

New in version 2014.7.0.

21.9.25 salt.modules.azurearm_compute

Azure (ARM) Compute Execution Module

New in version 2019.2.0.

maintainer <devops@decisionlab.io>
maturity new
depends
  • azure >= 2.0.0
  • azure-common >= 1.1.8
  • azure-mgmt >= 1.0.0
  • azure-mgmt-compute >= 1.0.0
  • azure-mgmt-network >= 1.7.1
  • azure-mgmt-resource >= 1.1.0
  • azure-mgmt-storage >= 1.0.0
  • azure-mgmt-web >= 0.32.0
  • azure-storage >= 0.34.3
  • msrestazure >= 0.4.21

platform linux
configuration This module requires Azure Resource Manager credentials to be passed as keyword arguments to every function in order to work properly.

Required provider parameters:

if using username and password:

- subscription_id
- username
- password

if using a service principal:

- subscription_id
- tenant
- client_id
- secret

Optional provider parameters:

cloud_environment: Used to point the cloud driver to different API endpoints, such as Azure GovCloud.

Possible values:

- AZURE_PUBLIC_CLOUD (default)
- AZURE_CHINA_CLOUD
- AZURE_US_GOV_CLOUD
- AZURE_GERMAN_CLOUD

New in version 2019.2.0.

Create or update an availability set.

Parameters

- **name** – The availability set to create.
- **resource_group** – The resource group name assigned to the availability set.

CLI Example:

```
salt-call azurearm_compute.availability_set_create_or_update testset testgroup
```

New in version 2019.2.0.

Delete an availability set.

Parameters

- **name** – The availability set to delete.
- **resource_group** – The resource group name assigned to the availability set.

CLI Example:
salt-call azurearm_compute.availability_set_delete testset testgroup

call azurearm_compute.availability_set_get(name, resource_group, **kwargs)

Get a dictionary representing an availability set’s properties.

Parameters

• **name** – The availability set to get.
• **resource_group** – The resource group name assigned to the availability set.

CLI Example:
salt-call azurearm_compute.availability_set_get testset testgroup

call azurearm_compute.availability_sets_list(resource_group, **kwargs)

List all availability sets within a resource group.

Parameters **resource_group** – The resource group name to list availability sets within.

CLI Example:
salt-call azurearm_compute.availability_sets_list testgroup
call azurearm_compute.availability_sets_list_available_sizes(name, resource_group, **kwargs)

List all available virtual machine sizes that can be used to create a new virtual machine in an existing availability set.

Parameters

• **name** – The availability set name to list available virtual machine sizes within.
• **resource_group** – The resource group name assigned to the availability set.

CLI Example:
salt-call azurearm_compute.availability_sets_list_available_sizes testset
call azurearm_compute.virtual_machine_capture(name, destination_name, resource_group, prefix='capture-', overwrite=False, **kwargs)

Captures the VM by copying virtual hard disks of the VM and outputs a template that can be used to create similar VMs.

Parameters

• **name** – The name of the virtual machine.
• **destination_name** – The destination container name.
• **resource_group** – The resource group name assigned to the virtual machine.
- **prefix** – (Default: 'capture-') The captured virtual hard disk’s name prefix.
- **overwrite** – (Default: False) Overwrite the destination disk in case of conflict.

CLI Example:

```
salt-call azurearm_compute.virtual_machine_capture testvm testcontainer testgroup
```

salt.modules.azurearm_compute.virtual_machine_convert_to_managed_disks(name, resource_group, **kwargs)

New in version 2019.2.0.

Converts virtual machine disks from blob-based to managed disks. Virtual machine must be stop-deallocation before invoking this operation.

Parameters

- **name** – The name of the virtual machine to convert.
- **resource_group** – The resource group name assigned to the virtual machine.

CLI Example:

```
salt-call azurearm_compute.virtual_machine_convert_to_managed_disks testvm testgroup
```

salt.modules.azurearm_compute.virtual_machine_deallocate(name, resource_group, **kwargs)

New in version 2019.2.0.

Power off a virtual machine and deallocate compute resources.

Parameters

- **name** – The name of the virtual machine to deallocate.
- **resource_group** – The resource group name assigned to the virtual machine.

CLI Example:

```
salt-call azurearm_compute.virtual_machine_deallocate testvm testgroup
```

salt.modules.azurearm_compute.virtual_machine_generalize(name, resource_group, **kwargs)

New in version 2019.2.0.

Set the state of a virtual machine to 'generalized'.

Parameters

- **name** – The name of the virtual machine.
- **resource_group** – The resource group name assigned to the virtual machine.

CLI Example:

```
salt-call azurearm_compute.virtual_machine_generalize testvm testgroup
```

salt.modules.azurearm_compute.virtual_machine_get(name, resource_group, **kwargs)

New in version 2019.2.0.

Retrieves information about the model view or the instance view of a virtual machine.
Parameters

- **name** – The name of the virtual machine.
- **resource_group** – The resource group name assigned to the virtual machine.

CLI Example:

```
salt-call azurearm_compute.virtual_machine_get testvm testgroup
```

salt.modules.azurearm_compute.virtual_machine_power_off(name, resource_group, **kwargs)

New in version 2019.2.0.

Power off (stop) a virtual machine.

Parameters

- **name** – The name of the virtual machine to stop.
- **resource_group** – The resource group name assigned to the virtual machine.

CLI Example:

```
salt-call azurearm_compute.virtual_machine_power_off testvm testgroup
```

salt.modules.azurearm_compute.virtual_machine_redeploy(name, resource_group, **kwargs)

Redeploy a virtual machine.

Parameters

- **name** – The name of the virtual machine to redeploy.
- **resource_group** – The resource group name assigned to the virtual machine.

CLI Example:

```
salt-call azurearm_compute.virtual_machine_redeploy testvm testgroup
```

salt.modules.azurearm_compute.virtual_machine_restart(name, resource_group, **kwargs)

Restart a virtual machine.

Parameters

- **name** – The name of the virtual machine to restart.
- **resource_group** – The resource group name assigned to the virtual machine.

CLI Example:

```
salt-call azurearm_compute.virtual_machine_restart testvm testgroup
```

salt.modules.azurearm_compute.virtual_machine_start(name, resource_group, **kwargs)

Power on (start) a virtual machine.

Parameters
• `name` – The name of the virtual machine to start.

• `resource_group` – The resource group name assigned to the virtual machine.

CLI Example:

```
salt-call azurearm_compute.virtual_machine_start testvm testgroup
```

```
salt.modules.azurearm_compute.virtual_machines_list(resource_group, **kwargs)
```

New in version 2019.2.0.

List all virtual machines within a resource group.

Parameters `resource_group` – The resource group name to list virtual machines within.

CLI Example:

```
salt-call azurearm_compute.virtual_machines_list testgroup
```

```
salt.modules.azurearm_compute.virtual_machines_list_all(**kwargs)
```

New in version 2019.2.0.

List all virtual machines within a subscription.

CLI Example:

```
salt-call azurearm_compute.virtual_machines_list_all
```

```
salt.modules.azurearm_compute.virtual_machines_list_available_sizes(name, resource_group, **kwargs)
```

New in version 2019.2.0.

Lists all available virtual machine sizes to which the specified virtual machine can be resized.

Parameters

• `name` – The name of the virtual machine.

• `resource_group` – The resource group name assigned to the virtual machine.

CLI Example:

```
salt-call azurearm_compute.virtual_machines_list_available_sizes testvm testgroup
```

### 21.9.26 `salt.modules.azurearm_network`

Azure (ARM) Network Execution Module

New in version 2019.2.0.

**maintainer** <devops@decisionlab.io>

**maturity** new

**depends**

• `azure` >= 2.0.0

• `azure-common` >= 1.1.8

• `azure-mgmt` >= 1.0.0

• `azure-mgmt-compute` >= 1.0.0
• azure-mgmt-network >= 1.7.1
• azure-mgmt-resource >= 1.1.0
• azure-mgmt-storage >= 1.0.0
• azure-mgmt-web >= 0.32.0
• azure-storage >= 0.34.3
• msrestazure >= 0.4.21

platform  linux

classification  This module requires Azure Resource Manager credentials to be passed as keyword arguments to every function in order to work properly.

Required provider parameters:

if using username and password:
  • subscription_id
  • username
  • password

if using a service principal:
  • subscription_id
  • tenant
  • client_id
  • secret

Optional provider parameters:

cloud_environment: Used to point the cloud driver to different API endpoints, such as Azure GovCloud.

Possible values:
  • AZURE_PUBLIC_CLOUD (default)
  • AZURE_CHINA_CLOUD
  • AZURE_US_GOV_CLOUD
  • AZURE_GERMAN_CLOUD

salt.modules.azurearm_network.check_dns_name_availability(name, region, **kwargs)

New in version 2019.2.0.

Check whether a domain name in the current zone is available for use.

Parameters

• name – The DNS name to query.
• region – The region to query for the DNS name in question.

CLI Example:
salt-call azurearm_network.check_dns_name_availability testdnsname westus
salt.modules.azurearm_network.check_ip_address_availability(ip_address, virtual_network, resource_group, **kwargs)

New in version 2019.2.0.
Check that a private ip address is available within the specified virtual network.

Parameters
- **ip_address** – The ip_address to query.
- **virtual_network** – The virtual network to query for the IP address in question.
- **resource_group** – The resource group name assigned to the virtual network.

CLI Example:
```bash
salt-call azurearm_network.check_ip_address_availability 10.0.0.4 testnet
```

salt.modules.azurearm_network.default_security_rule_get(name, security_group, resource_group, **kwargs)

New in version 2019.2.0.
Get details about a default security rule within a security group.

Parameters
- **name** – The name of the security rule to query.
- **security_group** – The network security group containing the security rule.
- **resource_group** – The resource group name assigned to the network security group.

CLI Example:
```bash
salt-call azurearm_network.default_security_rule_get DenyAllOutBound testnsg
```

salt.modules.azurearm_network.default_security_rules_list(security_group, resource_group, **kwargs)

New in version 2019.2.0.
List default security rules within a security group.

Parameters
- **security_group** – The network security group to query.
- **resource_group** – The resource group name assigned to the network security group.

CLI Example:
```bash
salt-call azurearm_network.default_security_rules_list testnsg testgroup
```

salt.modules.azurearm_network.get_virtual_machine_scale_set_network_interface(name, scale_set, vm_index, resource_group, **kwargs)

New in version 2019.2.0.
Get information about a specific network interface within a scale set.

Parameters

- **name** – The name of the network interface to query.
- **scale_set** – The name of the scale set containing the interface.
- **vm_index** – The virtual machine index.
- **resource_group** – The resource group name assigned to the scale set.

CLI Example:

```
salt-call azurearm_network.get_virtual_machine_scale_set_network_interface test-face0 testset testvm testgroup
```

salt.modules.azurearm_network.list_virtual_machine_scale_set_network_interfaces(scale_set, resource_group, **kwargs)

New in version 2019.2.0.

Get information about all network interfaces within a scale set.

Parameters

- **scale_set** – The name of the scale set to query.
- **resource_group** – The resource group name assigned to the scale set.

CLI Example:

```
salt-call azurearm_network.list_virtual_machine_scale_set_vm_network_interfaces testset testgroup
```

salt.modules.azurearm_network.list_virtual_machine_scale_set_vm_network_interfaces(scale_set, vm_index, resource_group, **kwargs)

New in version 2019.2.0.

Get information about all network interfaces in a specific virtual machine within a scale set.

Parameters

- **scale_set** – The name of the scale set to query.
- **vm_index** – The virtual machine index.
- **resource_group** – The resource group name assigned to the scale set.

CLI Example:

```
salt-call azurearm_network.list_virtual_machine_scale_set_vm_network_interfaces testset testvm testgroup
```

salt.modules.azurearm_network.load_balancer_create_or_update(name, resource_group, **kwargs)

New in version 2019.2.0.

Create or update a load balancer within a specified resource group.
Parameters

- **name** – The name of the load balancer to create.
- **resource_group** – The resource group name assigned to the load balancer.

CLI Example:
```
salt-call azurearm_network.load_balancer_create_or_update testlb testgroup
```

salt.modules.azurearm_network.load_balancer_delete(name, resource_group, **kwargs)
New in version 2019.2.0.
Delete a load balancer.

Parameters

- **name** – The name of the load balancer to delete.
- **resource_group** – The resource group name assigned to the load balancer.

CLI Example:
```
salt-call azurearm_network.load_balancer_delete testlb testgroup
```

salt.modules.azurearm_network.load_balancer_get(name, resource_group, **kwargs)
New in version 2019.2.0.
Get details about a specific load balancer.

Parameters

- **name** – The name of the load balancer to query.
- **resource_group** – The resource group name assigned to the load balancer.

CLI Example:
```
salt-call azurearm_network.load_balancer_get testlb testgroup
```

salt.modules.azurearm_network.load_balancers_list(resource_group, **kwargs)
New in version 2019.2.0.
List all load balancers within a resource group.

Parameters **resource_group** – The resource group name to list load balancers within.

CLI Example:
```
salt-call azurearm_network.load_balancers_list testgroup
```

salt.modules.azurearm_network.load_balancers_list_all(**kwargs)
New in version 2019.2.0.
List all load balancers within a subscription.

CLI Example:
```
salt-call azurearm_network.load_balancers_list_all
```
salt.modules.azurearm_network.network_interface_create_or_update(name, ip_configurations, subnet, virtual_network, resource_group, **kwargs)

New in version 2019.2.0.
Create or update a network interface within a specified resource group.

Parameters

- **name** – The name of the network interface to create.
- **ip_configurations** – A list of dictionaries representing valid NetworkInterfaceIP-Configuration objects. The 'name' key is required at minimum. At least one IP Configuration must be present.
- **subnet** – The name of the subnet assigned to the network interface.
- **virtual_network** – The name of the virtual network assigned to the subnet.
- **resource_group** – The resource group name assigned to the virtual network.

CLI Example:
salt-call azurearm_network.network_interface_create_or_update test-iface0 testipconfig1 testsubnet testnet testgroup

salt.modules.azurearm_network.network_interface_delete(name, resource_group, **kwargs)

New in version 2019.2.0.
Delete a network interface.

Parameters

- **name** – The name of the network interface to delete.
- **resource_group** – The resource group name assigned to the network interface.

CLI Example:
salt-call azurearm_network.network_interface_delete test-iface0 testgroup

salt.modules.azurearm_network.network_interface_get(name, resource_group, **kwargs)

New in version 2019.2.0.
Get details about a specific network interface.

Parameters

- **name** – The name of the network interface to query.
- **resource_group** – The resource group name assigned to the network interface.

CLI Example:
salt-call azurearm_network.network_interface_get test-iface0 testgroup
salt.modules.azurearm_network.network_interface_get_effective_route_table

New in version 2019.2.0.

Get all route tables for a specific network interface.

Parameters

- **name** – The name of the network interface to query.
- **resource_group** – The resource group name assigned to the network interface.

CLI Example:

```
salt-call azurearm_network.network_interface_get_effective_route_table test-iface0 testgroup
```

salt.modules.azurearm_network.network_interface_list_effective_network_security_groups

New in version 2019.2.0.

Get all network security groups applied to a specific network interface.

Parameters

- **name** – The name of the network interface to query.
- **resource_group** – The resource group name assigned to the network interface.

CLI Example:

```
salt-call azurearm_network.network_interface_list_effective_network_security_groups test-iface0 testgroup
```

salt.modules.azurearm_network.network_interfaces_list

New in version 2019.2.0.

List all network interfaces within a resource group.

Parameters **resource_group** – The resource group name to list network interfaces within.

CLI Example:

```
salt-call azurearm_network.network_interfaces_list testgroup
```

salt.modules.azurearm_network.network_interfaces_list_all

New in version 2019.2.0.

List all network interfaces within a subscription.

CLI Example:

```
salt-call azurearm_network.network_interfaces_list_all
```

salt.modules.azurearm_network.network_security_group_create_or_update

New in version 2019.2.0.
Create or update a network security group.

Parameters

- **name** – The name of the network security group to create.
- **resource_group** – The resource group name assigned to the network security group.

CLI Example:

```
salt-call azurearm_network.network_security_group_create_or_update testnsg testgroup
```

```
salt.modules.azurearm_network.network_security_group_delete(name, resource_group, **kwargs)
```

New in version 2019.2.0.

Delete a network security group within a resource group.

Parameters

- **name** – The name of the network security group to delete.
- **resource_group** – The resource group name assigned to the network security group.

CLI Example:

```
salt-call azurearm_network.network_security_group_delete testnsg testgroup
```

```
salt.modules.azurearm_network.network_security_group_get(name, resource_group, **kwargs)
```

New in version 2019.2.0.

Get details about a network security group within a resource group.

Parameters

- **name** – The name of the network security group to query.
- **resource_group** – The resource group name assigned to the network security group.

CLI Example:

```
salt-call azurearm_network.network_security_group_get testnsg testgroup
```

```
salt.modules.azurearm_network.network_security_groups_list(resource_group, **kwargs)
```

New in version 2019.2.0.

List all network security groups within a resource group.

Parameters **resource_group** – The resource group name to list network security groups within.

CLI Example:

```
salt-call azurearm_network.network_security_groups_list testgroup
```

```
salt.modules.azurearm_network.network_security_groups_list_all(**kwargs)
```

New in version 2019.2.0.

List all network security groups within a subscription.

CLI Example:
New in version 2019.2.0.
Create or update a public IP address within a specified resource group.

**Parameters**
- **name** – The name of the public IP address to create.
- **resource_group** – The resource group name assigned to the public IP address.

**CLI Example:**
salt-call azurearm_network.public_ip_address_create_or_update test-ip-0 testgroup

New in version 2019.2.0.
Delete a public IP address.

**Parameters**
- **name** – The name of the public IP address to delete.
- **resource_group** – The resource group name assigned to the public IP address.

**CLI Example:**
salt-call azurearm_network.public_ip_address_delete test-pub-ip testgroup

New in version 2019.2.0.
Get details about a specific public IP address.

**Parameters**
- **name** – The name of the public IP address to query.
- **resource_group** – The resource group name assigned to the public IP address.

**CLI Example:**
salt-call azurearm_network.public_ip_address_get test-pub-ip testgroup

New in version 2019.2.0.
List all public IP addresses within a resource group.

**Parameters**
- **resource_group** – The resource group name to list public IP addresses within.

**CLI Example:**
salt-call azurearm_network.public_ip_addresses_list testgroup
salt.modules.azurearm_network.public_ip_addresses_list_all(**kwargs)

New in version 2019.2.0.
List all public IP addresses within a subscription.
CLI Example:
salt-call azurearm_network.public_ip_addresses_list_all

salt/modules/azurearm_network.route_create_or_update(name, address_prefix, next_hop_type, route_table, resource_group, next_hop_ip_address=None, **kwargs)

New in version 2019.2.0.
Create or update a route within a specified route table.
Parameters
- **name** – The name of the route to create.
- **address_prefix** – The destination CIDR to which the route applies.
- **next_hop_type** – The type of Azure hop the packet should be sent to. Possible values are: 'VirtualNetworkGateway', 'VnetLocal', 'Internet', 'VirtualAppliance', and 'None'.
- **next_hop_ip_address** – Optional IP address to which packets should be forwarded. Next hop values are only allowed in routes where the next_hop_type is 'VirtualAppliance'.
- **route_table** – The name of the route table containing the route.
- **resource_group** – The resource group name assigned to the route table.
CLI Example:
salt-call azurearm_network.route_create_or_update test-rt '10.0.0.0/8' test-rt-testgroup

salt/modules/azurearm_network.route_delete(name, route_table, resource_group, **kwargs)

New in version 2019.2.0.
Delete a route from a route table.
Parameters
- **name** – The route to delete.
- **route_table** – The route table containing the route.
- **resource_group** – The resource group name assigned to the route table.
CLI Example:
salt-call azurearm_network.route_delete test-rt test-rt-table testgroup

salt/modules/azurearm_network.route_filter_create_or_update(name, resource_group, **kwargs)

New in version 2019.2.0.
Create or update a route filter within a specified resource group.
Parameters
• **name** – The name of the route filter to create.

• **resource_group** – The resource group name assigned to the route filter.

CLI Example:
```
salt-call azurearm_network.route_filter_create_or_update test-filter testgroup
```

```python
salt.modules.azurearm_network.route_filter_delete(name, resource_group, **kwargs)
```
New in version 2019.2.0.

Delete a route filter.

Parameters

• **name** – The name of the route filter to delete.

• **resource_group** – The resource group name assigned to the route filter.

CLI Example:
```
salt-call azurearm_network.route_filter_delete test-filter testgroup
```

```python
salt.modules.azurearm_network.route_filter_get(name, resource_group, **kwargs)
```
New in version 2019.2.0.

Get details about a specific route filter.

Parameters

• **name** – The name of the route filter to query.

• **resource_group** – The resource group name assigned to the route filter.

CLI Example:
```
salt-call azurearm_network.route_filter_get test-filter testgroup
```

```python
salt.modules.azurearm_network.route_filter_rule_create_or_update(name, access, communities, route_filter, resource_group, **kwargs)
```
New in version 2019.2.0.

Create or update a rule within a specified route filter.

Parameters

• **name** – The name of the rule to create.

• **access** – The access type of the rule. Valid values are 'Allow' and 'Deny'.

• **communities** – A list of BGP communities to filter on.

• **route_filter** – The name of the route filter containing the rule.

• **resource_group** – The resource group name assigned to the route filter.

CLI Example:
```
salt-call azurearm_network.route_filter_rule_create_or_update test-rule allow "['12076:51006']" test-filter testgroup
```
salt.modules.azurearm_network.route_filter_rule_delete(name, route_filter, resource_group, **kwargs)

New in version 2019.2.0.
Delete a route filter rule.

Parameters

- `name` – The route filter rule to delete.
- `route_filter` – The route filter containing the rule.
- `resource_group` – The resource group name assigned to the route filter.

CLI Example:
salt-call azurearm_network.route_filter_rule_delete test-rule test-filter testgroup

salt.modules.azurearm_network.route_filter_rule_get(name, route_filter, resource_group, **kwargs)

New in version 2019.2.0.
Get details about a specific route filter rule.

Parameters

- `name` – The route filter rule to query.
- `route_filter` – The route filter containing the rule.
- `resource_group` – The resource group name assigned to the route filter.

CLI Example:
salt-call azurearm_network.route_filter_rule_get test-rule test-filter testgroup testgroup

salt.modules.azurearm_network.route_filter_rules_list(route_filter, resource_group, **kwargs)

New in version 2019.2.0.
List all routes within a route filter.

Parameters

- `route_filter` – The route filter to query.
- `resource_group` – The resource group name assigned to the route filter.

CLI Example:
salt-call azurearm_network.route_filter_rules_list test-filter test-filter testgroup testgroup

salt.modules.azurearm_network.route_filters_list(resource_group, **kwargs)

New in version 2019.2.0.
List all route filters within a resource group.

Parameters

- `resource_group` – The resource group name to list route filters within.

CLI Example:
salt-call azurearm_network.route_filters_list testgroup
salt.modules.azurearm_network.route_filters_list_all(**kwargs)
New in version 2019.2.0.
List all route filters within a subscription.
CLI Example:
```
salt-call azurearm_network.route_filters_list_all
```

salt.modules.azurearm_network.route_get(name, route_table, resource_group, **kwargs)
New in version 2019.2.0.
Get details about a specific route.

Parameters
- **name** – The route to query.
- **route_table** – The route table containing the route.
- **resource_group** – The resource group name assigned to the route table.

CLI Example:
```
salt-call azurearm_network.route_get test-rt test-rt-table testgroup
```

salt.modules.azurearm_network.route_table_create_or_update(name, resource_group, **kwargs)
New in version 2019.2.0.
Create or update a route table within a specified resource group.

Parameters
- **name** – The name of the route table to create.
- **resource_group** – The resource group name assigned to the route table.

CLI Example:
```
salt-call azurearm_network.route_table_create_or_update test-rt-table testgroup
```

salt.modules.azurearm_network.route_table_delete(name, resource_group, **kwargs)
New in version 2019.2.0.
Delete a route table.

Parameters
- **name** – The name of the route table to delete.
- **resource_group** – The resource group name assigned to the route table.

CLI Example:
```
salt-call azurearm_network.route_table_delete test-rt-table testgroup
```

salt.modules.azurearm_network.route_table_get(name, resource_group, **kwargs)
New in version 2019.2.0.
Get details about a specific route table.

Parameters
- **name** – The name of the route table to query.
• **resource_group** – The resource group name assigned to the route table.

CLI Example:
```
salt-call azurearm_network.route_table_get test-rt-table testgroup
```

salt.modules.azurearm_network.route_tables_list(resource_group, **kwargs)
New in version 2019.2.0.
List all route tables within a resource group.

Parameters

- **resource_group** – The resource group name to list route tables within.

CLI Example:
```
salt-call azurearm_network.route_tables_list testgroup
```

salt.modules.azurearm_network.route_tables_list_all(**kwargs)
New in version 2019.2.0.
List all route tables within a subscription.

CLI Example:
```
salt-call azurearm_network.route_tables_list_all
```

salt.modules.azurearm_network.routes_list(route_table, resource_group, **kwargs)
New in version 2019.2.0.
List all routes within a route table.

Parameters

- **route_table** – The route table to query.
- **resource_group** – The resource group name assigned to the route table.

CLI Example:
```
salt-call azurearm_network.routes_list test-rt-table testgroup
```

salt.modules.azurearm_network.security_rule_create_or_update(name, access, direction, priority, protocol, security_group, resource_group, source_address_prefix=None, destination_address_prefix=None, source_port_range=None, destination_port_range=None, source_address_prefixes=None, destination_address_prefixes=None, source_port_ranges=None, destination_port_ranges=None, **kwargs)
New in version 2019.2.0.
Create or update a security rule within a specified network security group.

**Parameters**

- **name** – The name of the security rule to create.
- **access** – 'allow' or 'deny'
- **direction** – 'inbound' or 'outbound'
- **priority** – Integer between 100 and 4096 used for ordering rule application.
- **protocol** – 'tcp', 'udp', or '*'
- **destination_address_prefix** – The CIDR or destination IP range. Asterix '*' can also be used to match all destination IPs. Default tags such as 'VirtualNetwork', 'AzureLoadBalancer' and 'Internet' can also be used. If this is an ingress rule, specifies where network traffic originates from.
- **destination_port_range** – The destination port or range. Integer or range between 0 and 65535. Asterix '*' can also be used to match all ports.
- **source_address_prefix** – The CIDR or source IP range. Asterix '*' can also be used to match all source IPs. Default tags such as 'VirtualNetwork', 'AzureLoadBalancer' and 'Internet' can also be used. If this is an ingress rule, specifies where network traffic originates from.
- **source_port_range** – The source port or range. Integer or range between 0 and 65535. Asterix '*' can also be used to match all ports.
- **destination_address_prefixes** – A list of destination_address_prefix values. This parameter overrides destination_address_prefix and will cause any value entered there to be ignored.
- **destination_port_ranges** – A list of destination_port_range values. This parameter overrides destination_port_range and will cause any value entered there to be ignored.
- **source_address_prefixes** – A list of source_address_prefix values. This parameter overrides source_address_prefix and will cause any value entered there to be ignored.
- **source_port_ranges** – A list of source_port_range values. This parameter overrides source_port_range and will cause any value entered there to be ignored.
- **security_group** – The network security group containing the security rule.
- **resource_group** – The resource group name assigned to the network security group.

**CLI Example:**
```
salt-call azurearm_network.security_rule_create_or_update testrule1 allow outbound 101 tcp testnsg testgroup destination_address_prefix=Internet source_port_range='*'
destination_port_range=1-1024
```

salt.modules.azurearm_network.security_rule_delete(security_rule, security_group, resource_group, **kwargs)

New in version 2019.2.0.

Delete a security rule within a specified security group.

**Parameters**

- **name** – The name of the security rule to delete.
- **security_group** – The network security group containing the security rule.
- **resource_group** – The resource group name assigned to the network security group.

  CLI Example:

  ```
salt-call azurearm_network.security_rule_delete testrule1 testnsg testgroup
  ```

  ```
salt.modules.azurearm_network.security_rule_get(security_rule, security_group, resource_group, **kwargs)
  ```

  New in version 2019.2.0.

  Get a security rule within a specified network security group.

  Parameters
  
  - **name** – The name of the security rule to query.
  
  - **security_group** – The network security group containing the security rule.
  
  - **resource_group** – The resource group name assigned to the network security group.

  CLI Example:

  ```
salt-call azurearm_network.security_rule_get testrule1 testnsg testgroup
  ```

  ```
salt.modules.azurearm_network.security_rules_list(security_group, resource_group, **kwargs)
  ```

  New in version 2019.2.0.

  List security rules within a network security group.

  Parameters
  
  - **security_group** – The network security group to query.
  
  - **resource_group** – The resource group name assigned to the network security group.

  CLI Example:

  ```
salt-call azurearm_network.security_rules_list testnsg testgroup
  ```

  ```
salt.modules.azurearm_network.subnet_create_or_update(name, address_prefix, virtual_network, resource_group, **kwargs)
  ```

  New in version 2019.2.0.

  Create or update a subnet.

  Parameters
  
  - **name** – The name assigned to the subnet being created or updated.
  
  - **address_prefix** – A valid CIDR block within the virtual network.
  
  - **virtual_network** – The virtual network name containing the subnet.
  
  - **resource_group** – The resource group name assigned to the virtual network.

  CLI Example:

  ```
salt-call azurearm_network.subnet_create_or_update testsubnet --'10.0.0.0/24' testnet testgroup
  ```

  ```
salt.modules.azurearm_network.subnet_delete(name, virtual_network, resource_group, **kwargs)
  ```

  New in version 2019.2.0.
Delete a subnet.

Parameters

- **name** – The name of the subnet to delete.
- **virtual_network** – The virtual network name containing the subnet.
- **resource_group** – The resource group name assigned to the virtual network.

CLI Example:

```
salt-call azurearm_network.subnet_delete testsubnet testnet testgroup
```

salt.modules.azurearm_network.subnet_get(name, virtual_network, resource_group, **kwargs)

New in version 2019.2.0.

Get details about a specific subnet.

Parameters

- **name** – The name of the subnet to query.
- **virtual_network** – The virtual network name containing the subnet.
- **resource_group** – The resource group name assigned to the virtual network.

CLI Example:

```
salt-call azurearm_network.subnet_get testsubnet testnet testgroup
```

salt.modules.azurearm_network.subnets_list(virtual_network, resource_group, **kwargs)

New in version 2019.2.0.

List all subnets within a virtual network.

Parameters

- **virtual_network** – The virtual network name to list subnets within.
- **resource_group** – The resource group name assigned to the virtual network.

CLI Example:

```
salt-call azurearm_network.subnets_list testnet testgroup
```

salt.modules.azurearm_network.usages_list(location, **kwargs)

New in version 2019.2.0.

List subscription network usage for a location.

Parameters **location** – The Azure location to query for network usage.

CLI Example:

```
salt-call azurearm_network.usages_list westus
```

salt.modules.azurearm_network.virtual_network_create_or_update(name, address_prefixes, resource_group, **kwargs)

New in version 2019.2.0.

Create or update a virtual network.
Parameters

- **name** – The name assigned to the virtual network being created or updated.
- **address_prefixes** – A list of CIDR blocks which can be used by subnets within the virtual network.
- **resource_group** – The resource group name assigned to the virtual network.

CLI Example:

```bash
salt-call azurearm_network.virtual_network_create_or_update name testnet address_prefixes ['10.0.0.0/16'] testgroup
```

New in version 2019.2.0.

```bash
salt.modules.azurearm_network.virtual_network_delete(name, resource_group, **kwargs)
```

Delete a virtual network.

Parameters

- **name** – The name of the virtual network to delete.
- **resource_group** – The resource group name assigned to the virtual network

CLI Example:

```bash
salt-call azurearm_network.virtual_network_delete name testnet resource_group testgroup
```

New in version 2019.2.0.

```bash
salt.modules.azurearm_network.virtual_network_get(name, resource_group, **kwargs)
```

Get details about a specific virtual network.

Parameters

- **name** – The name of the virtual network to query.
- **resource_group** – The resource group name assigned to the virtual network

CLI Example:

```bash
salt-call azurearm_network.virtual_network_get name testnet resource_group testgroup
```

New in version 2019.2.0.

```bash
salt.modules.azurearm_network.virtual_networks_list(resource_group, **kwargs)
```

List all virtual networks within a resource group.

Parameters **resource_group** – The resource group name to list virtual networks within.

CLI Example:

```bash
salt-call azurearm_network.virtual_networks_list resource_group testgroup
```

New in version 2019.2.0.

```bash
salt.modules.azurearm_network.virtual_networks_list_all(**kwargs)
```

List all virtual networks within a subscription.

CLI Example:

```bash
salt-call azurearm_network.virtual_networks_list_all
```
21.9.27 salt.modules.azurearm_resource

Azure (ARM) Resource Execution Module

New in version 2019.2.0.

maintainer  <devops@decisionlab.io>
maturity new
depends
  • azure >= 2.0.0
  • azure-common >= 1.1.8
  • azure-mgmt >= 1.0.0
  • azure-mgmt-compute >= 1.0.0
  • azure-mgmt-network >= 1.7.1
  • azure-mgmt-resource >= 1.1.0
  • azure-mgmt-storage >= 1.0.0
  • azure-mgmt-web >= 0.32.0
  • azure-storage >= 0.34.3
  • msrestazure >= 0.4.21

platform linux

configuration This module requires Azure Resource Manager credentials to be passed as keyword arguments to every function in order to work properly.

Required provider parameters:

if using username and password:
  • subscription_id
  • username
  • password

if using a service principal:
  • subscription_id
  • tenant
  • client_id
  • secret

Optional provider parameters:

cloud_environment: Used to point the cloud driver to different API endpoints, such as Azure GovCloud.

Possible values:
  • AZURE_PUBLIC_CLOUD (default)
  • AZURE_CHINA_CLOUD
  • AZURE_US_GOV_CLOUD
  • AZURE_GERMAN_CLOUD
salt.modules.azurearm_resource.deployment_cancel(name, resource_group, **kwargs)

New in version 2019.2.0.

Cancel a deployment if in 'Accepted' or 'Running' state.

Parameters

- **name** – The name of the deployment to cancel.
- **resource_group** – The resource group name assigned to the deployment.

CLI Example:

```
salt-call azurearm_resource.deployment_cancel testdeploy testgroup
```

salt.modules.azurearm_resource.deployment_check_existence(name, resource_group, **kwargs)

New in version 2019.2.0.

Check the existence of a deployment.

Parameters

- **name** – The name of the deployment to query.
- **resource_group** – The resource group name assigned to the deployment.

CLI Example:

```
salt-call azurearm_resource.deployment_check_existence testdeploy testgroup
```

salt.modules.azurearm_resource.deployment_create_or_update(name, resource_group, deploy_mode='incremental', debug_setting='none', deploy_params=None, parameters_link=None, deploy_template=None, template_link=None, **kwargs)

New in version 2019.2.0.

Deploys resources to a resource group.

Parameters

- **name** – The name of the deployment to create or update.
- **resource_group** – The resource group name assigned to the deployment.
- **deploy_mode** – The mode that is used to deploy resources. This value can be either 'incremental' or 'complete'. In Incremental mode, resources are deployed without deleting existing resources that are not included in the template. In Complete mode, resources are deployed and existing resources in the resource group that are not included in the template are deleted. Be careful when using Complete mode as you may unintentionally delete resources.
- **debug_setting** – The debug setting of the deployment. The permitted values are 'none', 'requestContent', 'responseContent', or 'requestContent,responseContent'. By logging information about the request or response, you could potentially expose sensitive data that is retrieved through the deployment operations.
• **deploy_params** – JSON string containing name and value pairs that define the deployment parameters for the template. You use this element when you want to provide the parameter values directly in the request rather than link to an existing parameter file. Use either the parameters_link property or the deploy_params property, but not both.

• **parameters_link** – The URI of a parameters file. You use this element to link to an existing parameters file. Use either the parameters_link property or the deploy_params property, but not both.

• **deploy_template** – JSON string of template content. You use this element when you want to pass the template syntax directly in the request rather than link to an existing template. Use either the template_link property or the deploy_template property, but not both.

• **template_link** – The URI of the template. Use either the template_link property or the deploy_template property, but not both.

CLI Example:

```
salt-call azurearm_resource.deployment_create_or_update testdeploy testgroup
```

salt.modules.azurearm_resource.deployment_delete(name, resource_group, **kwargs)

New in version 2019.2.0.

Delete a deployment.

Parameters

- **name** – The name of the deployment to delete.

- **resource_group** – The resource group name assigned to the deployment.

CLI Example:

```
salt-call azurearm_resource.deployment_delete testdeploy testgroup
```

salt.modules.azurearm_resource.deployment_export_template(name, resource_group, **kwargs)

New in version 2019.2.0.

Exports the template used for the specified deployment.

Parameters

- **name** – The name of the deployment to query.

- **resource_group** – The resource group name assigned to the deployment.

CLI Example:

```
salt-call azurearm_resource.deployment_export_template testdeploy testgroup
```

salt.modules.azurearm_resource.deployment_get(name, resource_group, **kwargs)

New in version 2019.2.0.

Get details about a specific deployment.

Parameters

- **name** – The name of the deployment to query.

- **resource_group** – The resource group name assigned to the deployment.

CLI Example:
salt-call azurearm_resource.deployment_get testdeploy testgroup

salt.modules.azurearm_resource.deployment_operation_get(operation, deployment, resource_group, **kwargs)

New in version 2019.2.0.

Get a deployment operation within a deployment.

Parameters

- **operation** – The operation ID of the operation within the deployment.
- **deployment** – The name of the deployment containing the operation.
- **resource_group** – The resource group name assigned to the deployment.

CLI Example:
salt-call azurearm_resource.deployment_operation_get XXXXX testdeploy testgroup

salt.modules.azurearm_resource.deployment_operations_list(name, resource_group, result_limit=10, **kwargs)

New in version 2019.2.0.

List all deployment operations within a deployment.

Parameters

- **name** – The name of the deployment to query.
- **resource_group** – The resource group name assigned to the deployment.
- **result_limit** – (Default: 10) The limit on the list of deployment operations.

CLI Example:
salt-call azurearm_resource.deployment_operations_list testdeploy testgroup

salt.modules.azurearm_resource.deployment_validate(name, resource_group, deploy_mode=None, debug_setting=None, deploy_params=None, parameters_link=None, deploy_template=None, template_link=None, **kwargs)

New in version 2019.2.0.

Validates whether the specified template is syntactically correct and will be accepted by Azure Resource Manager.

Parameters

- **name** – The name of the deployment to validate.
- **resource_group** – The resource group name assigned to the deployment.
- **deploy_mode** – The mode that is used to deploy resources. This value can be either 'incremental' or 'complete'. In Incremental mode, resources are deployed without deleting existing resources that are not included in the template. In Complete mode, resources are deployed and existing resources in the resource group that are not included in the template are deleted. Be careful when using Complete mode as you may unintentionally delete resources.
- **debug_setting** – The debug setting of the deployment. The permitted values are ‘none’, ‘requestContent’, ‘responseContent’, or ‘requestContent,responseContent’. By logging information about the request or response, you could potentially expose sensitive data that is retrieved through the deployment operations.

- **deploy_params** – JSON string containing name and value pairs that define the deployment parameters for the template. You use this element when you want to provide the parameter values directly in the request rather than link to an existing parameter file. Use either the parameters_link property or the deploy_params property, but not both.

- **parameters_link** – The URI of a parameters file. You use this element to link to an existing parameters file. Use either the parameters_link property or the deploy_params property, but not both.

- **deploy_template** – JSON string of template content. You use this element when you want to pass the template syntax directly in the request rather than link to an existing template. Use either the template_link property or the deploy_template property, but not both.

- **template_link** – The URI of the template. Use either the template_link property or the deploy_template property, but not both.

CLI Example:

```
salt-call azurearm_resource.deployment_validate testdeploy testgroup
```

salt.modules.azurearm_resource.deployments_list(resource_group, **kwargs)

New in version 2019.2.0.

List all deployments within a resource group.

CLI Example:

```
salt-call azurearm_resource.deployments_list testgroup
```

salt.modules.azurearm_resource.policy_assignment_create(name, scope, definition_name, **kwargs)

New in version 2019.2.0.

Create a policy assignment.

Parameters

- **name** – The name of the policy assignment to create.
- **scope** – The scope of the policy assignment.
- **definition_name** – The name of the policy definition to assign.

CLI Example:

```
salt-call azurearm_resource.policy_assignment_create testassign /subscriptions/bc75htn-a0fhsi-349b-56gh-4fghti-f84852 testpolicy
```

salt.modules.azurearm_resource.policy_assignment_delete(name, scope, **kwargs)

New in version 2019.2.0.

Delete a policy assignment.

Parameters

- **name** – The name of the policy assignment to delete.
- **scope** – The scope of the policy assignment.
Salt Documentation, Release 3000.2

CLI Example:
```
salt-call azurearm_resource.policy_assignment_delete testassign / →subscriptions/bc75htn-a0fhsI-349b-56gh-4fghti-f84852
```

**salt.modules.azurearm_resource.policy_assignment_get(name, scope, **kwargs)**

New in version 2019.2.0.

Get details about a specific policy assignment.

Parameters

- **name** – The name of the policy assignment to query.
- **scope** – The scope of the policy assignment.

CLI Example:
```
salt-call azurearm_resource.policy_assignment_get testassign / →subscriptions/bc75htn-a0fhsI-349b-56gh-4fghti-f84852
```

**salt.modules.azurearm_resource.policy_assignments_list(**kwargs)**

New in version 2019.2.0.

List all policy assignments for a subscription.

CLI Example:
```
salt-call azurearm_resource.policy_assignments_list
```

**salt.modules.azurearm_resource.policy_assignments_list_for_resource_group(resource_group, **kwargs)**

New in version 2019.2.0.

List all policy assignments for a resource group.

Parameters **resource_group** – The resource group name to list policy assignments within.

CLI Example:
```
salt-call azurearm_resource.policy_assignments_list_for_resource_group testgroup
```

**salt.modules.azurearm_resource.policy_definition_create_or_update(name, policy_rule, **kwargs)**

New in version 2019.2.0.

Create or update a policy definition.

Parameters

- **name** – The name of the policy definition to create or update.
- **policy_rule** – A dictionary defining the policy rule.

CLI Example:
```
salt-call azurearm_resource.policy_definition_create_or_update testpolicy '{... →rule definition..}'
```

**salt.modules.azurearm_resource.policy_definition_delete(name, **kwargs)**

New in version 2019.2.0.

Delete a policy definition.
Parameters **name** – The name of the policy definition to delete.

CLI Example:

```
salt-call azurearm_resource.policy_definition_delete testpolicy
```

`salt.modules.azurearm_resource.policy_definition_get**(name, **kwargs)**

New in version 2019.2.0.

Get details about a specific policy definition.

Parameters **name** – The name of the policy definition to query.

CLI Example:

```
salt-call azurearm_resource.policy_definition_get testpolicy
```

`salt.modules.azurearm_resource.policy_definitions_list**(hide_builtin=False, **kwargs)**`

New in version 2019.2.0.

List all policy definitions for a subscription.

Parameters **hide_builtin** – Boolean which will filter out BuiltIn policy definitions from the result.

CLI Example:

```
salt-call azurearm_resource.policy_definitions_list
```

`salt.modules.azurearm_resource.resource_group_check_existence**(name, **kwargs)**`

New in version 2019.2.0.

Check for the existence of a named resource group in the current subscription.

Parameters **name** – The resource group name to check.

CLI Example:

```
salt-call azurearm_resource.resource_group_check_existence testgroup
```

`salt.modules.azurearm_resource.resource_group_create_or_update**(name, location, **kwargs)**`

New in version 2019.2.0.

Create or update a resource group in a given location.

Parameters

- **name** – The name of the resource group to create or update.
- **location** – The location of the resource group. This value is not able to be updated once the resource group is created.

CLI Example:

```
salt-call azurearm_resource.resource_group_create_or_update testgroup westus
```

`salt.modules.azurearm_resource.resource_group_delete**(name, **kwargs)**`

New in version 2019.2.0.

Delete a resource group from the subscription.

Parameters **name** – The resource group name to delete.
salt.modules.azurearm_resource.resource_group_delete testgroup

salt.modules.azurearm_resource.resource_group_get(name, **kwargs)
New in version 2019.2.0.
Get a dictionary representing a resource group’s properties.

Parameters name – The resource group name to get.

CLI Example:
salt-call azurearm_resource.resource_group_get testgroup

salt.modules.azurearm_resource.resource_groups_list(**kwargs)
New in version 2019.2.0.
List all resource groups within a subscription.

CLI Example:
salt-call azurearm_resource.resource_groups_list

salt.modules.azurearm_resource.subscription_get(subscription_id=None, **kwargs)
New in version 2019.2.0.
Get details about a subscription.

Parameters subscription_id – The ID of the subscription to query.

CLI Example:
salt-call azurearm_resource.subscription_get XXXXXXXX

salt.modules.azurearm_resource.subscriptions_list(**kwargs)
New in version 2019.2.0.
List all subscriptions for a tenant.

CLI Example:
salt-call azurearm_resource.subscriptions_list

salt.modules.azurearm_resource.subscriptions_list_locations(subscription_id=None, **kwargs)
New in version 2019.2.0.
List all locations for a subscription.

Parameters subscription_id – The ID of the subscription to query.

CLI Example:
salt-call azurearm_resource.subscriptions_list_locations XXXXXXXX

salt.modules.azurearm_resource.tenants_list(**kwargs)
New in version 2019.2.0.
List all tenants for your account.

CLI Example:
21.9.28 salt.modules.bamboohr

Support for BambooHR

New in version 2015.8.0.

Requires a subdomain and an apikey in /etc/salt/minion:

```
<table>
<thead>
<tr>
<th>bamboohr:</th>
</tr>
</thead>
<tbody>
<tr>
<td>apikey:</td>
</tr>
<tr>
<td>subdomain:</td>
</tr>
</tbody>
</table>
```

salt.modules.bamboohr.list_employees(order_by='id')

Show all employees for this company.

CLI Example:

```
salt myminion bamboohr.list_employees
```

By default, the return data will be keyed by ID. However, it can be ordered by any other field. Keep in mind that if the field that is chosen contains duplicate values (i.e., location is used, for a company which only has one location), then each duplicate value will be overwritten by the previous. Therefore, it is advisable to only sort by fields that are guaranteed to be unique.

CLI Examples:

```
salt myminion bamboohr.list_employees order_by=id
salt myminion bamboohr.list_employees order_by=displayName
salt myminion bamboohr.list_employees order_by=workEmail
```

salt.modules.bamboohr.list_meta_fields()

Show all meta data fields for this company.

CLI Example:

```
salt myminion bamboohr.list_meta_fields
```

salt.modules.bamboohr.list_users(order_by='id')

Show all users for this company.

CLI Example:

```
salt myminion bamboohr.list_users
```

By default, the return data will be keyed by ID. However, it can be ordered by any other field. Keep in mind that if the field that is chosen contains duplicate values (i.e., location is used, for a company which only has one location), then each duplicate value will be overwritten by the previous. Therefore, it is advisable to only sort by fields that are guaranteed to be unique.

CLI Examples:

```
salt myminion bamboohr.list_users order_by=id
salt myminion bamboohr.list_users order_by=email
```

salt.modules.bamboohr.show_employee(emp_id, fields=None)

Show all employees for this company.

CLI Example:

```
salt myminion bamboohr.show_employee 1138
```

By default, the fields normally returned from bamboohr.list_employees are returned. These fields are:
Salt Documentation, Release 3000.2

• canUploadPhoto
• department
• displayName
• firstName
• id
• jobTitle
• lastName
• location
• mobilePhone
• nickname
• photoUploaded
• photoUrl
• workEmail
• workPhone
• workPhoneExtension
If needed, a different set of fields may be specified, separated by commas:
CLI Example:
salt myminion bamboohr.show_employee 1138 displayName,dateOfBirth
A list of available fields can be found at http://www.bamboohr.com/api/documentation/employees.php
salt.modules.bamboohr.update_employee(emp_id, key=None, value=None, items=None)
Update one or more items for this employee. Specifying an empty value will clear it for that employee.
CLI Examples:
salt myminion bamboohr.update_employee 1138 nickname Curly salt myminion bamboohr.update_employee 1138 nickname ” salt myminion bamboohr.update_employee
1138 items=’{”nickname”:
”Curly”} salt myminion bamboohr.update_employee 1138
items=’{”nickname”: ””}

21.9.29 salt.modules.bcache module
Module for managing BCache sets
BCache is a block-level caching mechanism similar to ZFS L2ARC/ZIL, dm-cache and fscache. It works by formatting
one block device as a cache set, then adding backend devices (which need to be formatted as such) to the set and
activating them.
It’s available in Linux mainline kernel since 3.10
https://www.kernel.org/doc/Documentation/bcache.txt
This module needs the bcache userspace tools to function.
salt.modules.bcache.attach_(dev=None)
Attach a backing devices to a cache set If no dev is given, all backing devices will be attached.
CLI example:

1280

Chapter 21. Salt Module Reference


salt '*' bcache.attach sdc
salt '*' bcache.attach /dev/bcache1

Returns bool or None if nuttin’ happened

salt.modules.bcache.back_make(dev, cache_mode='writeback', force=False, attach=True, bucket_size=None)
Create a backing device for attachment to a set. Because the block size must be the same, a cache set already needs to exist.

CLI example:
salt '*' bcache.back_make sdc cache_mode=writeback attach=True

Parameters

• **cache_mode** – writethrough, writeback, writenaround or none.
• **force** – Overwrite existing bcaches
• **attach** – Immediately attach the backing device to the set
• **bucket_size** – Size of a bucket (see kernel doc)

salt.modules.bcache.cache_make(dev, reserved=None, force=False, block_size=None, bucket_size=None, attach=True)
Create BCache cache on a block device. If blkdiscard is available the entire device will be properly cleared in advance.

CLI example:
salt '*' bcache.cache_make sdb reserved=10% block_size=4096

Parameters

• **reserved** – if dev is a full device, create a partition table with this size empty.

    **Note:** this increases the amount of reserved space available to SSD garbage collectors, potentially (vastly) increasing performance

• **block_size** – Block size of the cache; defaults to devices’ logical block size
• **force** – Overwrite existing BCache sets
• **attach** – Attach all existing backend devices immediately

salt.modules.bcache.config_(dev=None, **kwargs)
Show or update config of a bcache device.

If no device is given, operate on the cache set itself.

CLI example:
salt '*' bcache.config
salt '*' bcache.config bcache1
salt '*' bcache.config errors=panic journal_delay_ms=150
salt '*' bcache.config bcache1 cache_mode=writeback writeback_percent=15
Returns config or True/False

salt.modules.bcache.detach(dev=None)
Detach a backing device(s) from a cache set. If no dev is given, all backing devices will be attached.

Detaching a backing device will flush its write cache. This should leave the underlying device in a consistent state, but might take a while.

CLI example:
```
salt '*' bcache.detach sdc
salt '*' bcache.detach bcache1
```

salt.modules.bcache.device(dev, stats=False, config=False, internals=False, superblock=False)
Check the state of a single bcache device

CLI example:
```
salt '*' bcache.device bcache0
salt '*' bcache.device /dev/sdc stats=True
```

Parameters
- **stats** – include statistics
- **settings** – include all settings
- **internals** – include all internals
- **superblock** – include superblock info

salt.modules.bcache.start()
Trigger a start of the full bcache system through udev.

CLI example:
```
salt '*' bcache.start
```

salt.modules.bcache.status(stats=False, config=False, internals=False, superblock=False, alldevs=False)
Show the full status of the BCache system and optionally all its involved devices

CLI example:
```
salt '*' bcache.status
salt '*' bcache.status stats=True
salt '*' bcache.status internals=True alldevs=True
```

Parameters
- **stats** – include statistics
- **config** – include settings
- **internals** – include internals
- **superblock** – include superblock

salt.modules.bcache.stop(dev=None)
Stop a bcache device. If no device is given, all backing devices will be detached from the cache, which will subsequently be stopped.
**Warning:** 'Stop' on an individual backing device means hard-stop; no attempt at flushing will be done and the bcache device will seemingly 'disappear' from the device lists.

CLI example:

```bash
salt '*' bcache.stop
```

`salt.modules.bcache.super_(dev)`
Read out BCache SuperBlock

CLI example:

```bash
salt '*' bcache.device bcache0
salt '*' bcache.device /dev/sdc
```

`salt.modules.bcache.uuid(dev=None)`
Return the bcache UUID of a block device. If no device is given, the Cache UUID is returned.

CLI example:

```bash
salt '*' bcache.uuid
salt '*' bcache.uuid /dev/sda
salt '*' bcache.uuid bcache0
```

### 21.9.30 `salt.modules.beacons`

Module for managing the Salt beacons on a minion

New in version 2015.8.0.

`salt.modules.beacons.add(name, beacon_data, **kwargs)`
Add a beacon on the minion

**Parameters**
- `name` – Name of the beacon to configure
- `beacon_data` – Dictionary or list containing configuration for beacon.

**Returns** Boolean and status message on success or failure of add.

CLI Example:

```bash
salt '*' beacons.add ps """{"processes": {"salt-master": "stopped", 'apache2': "stopped"}}""
```

`salt.modules.beacons.delete(name, **kwargs)`
Delete a beacon item

**Parameters** `name` – Name of the beacon to delete

**Returns** Boolean and status message on success or failure of delete.

CLI Example:

```bash
salt '*' beacons.delete ps
salt '*' beacons.delete load
```
salt.modules.beacons.disable(**kwargs)
   Disable all beacons jobs on the minion

   ** Returns ** Boolean and status message on success or failure of disable.

   CLI Example:
   ```bash
   salt '*' beacons.disable
   ```

salt.modules.beacons.disable_beacon(name, **kwargs)
   Disable beacon on the minion

   ** Name ** Name of the beacon to disable.

   ** Returns ** Boolean and status message on success or failure of disable.

   CLI Example:
   ```bash
   salt '*' beacons.disable_beacon ps
   ```

salt.modules.beacons.enable(**kwargs)
   Enable all beacons on the minion

   ** Returns ** Boolean and status message on success or failure of enable.

   ** Return type ** bool

   CLI Example:
   ```bash
   salt '*' beacons.enable
   ```

salt.modules.beacons.enable_beacon(name, **kwargs)
   Enable beacon on the minion

   ** Name ** Name of the beacon to enable.

   ** Returns ** Boolean and status message on success or failure of enable.

   CLI Example:
   ```bash
   salt '*' beacons.enable_beacon ps
   ```

salt.modules.beacons.list_(return_yaml=True, include_pillar=True, include_opts=True, **kwargs)
   List the beacons currently configured on the minion

   ** Parameters **
   - ** return_yaml ** – Whether to return YAML formatted output, default True
   - ** include_pillar ** – Whether to include beacons that are configured in pillar, default is True.
   - ** include_opts ** – Whether to include beacons that are configured in opts, default is True.

   ** Returns ** List of currently configured Beacons.

   CLI Example:
   ```bash
   salt '*' beacons.list
   ```

salt.modules.beacons.list_available(return_yaml=True, **kwargs)
   List the beacons currently available on the minion
Parameters **return_yaml** – Whether to return YAML formatted output, default True

**Returns** List of currently configured Beacons.

CLI Example:

```bash
salt '*' beacons.list_available
```

salt.modules.beacons.modify(name, beacon_data, **kwargs)

Modify an existing beacon

**Parameters**

- **name** – Name of the beacon to configure
- **beacon_data** – Dictionary or list containing updated configuration for beacon.

**Returns** Boolean and status message on success or failure of modify.

CLI Example:

```bash
salt '*' beacons.modify ps "[{'salt-master': 'stopped'}, {'apache2': 'stopped'}]"
```

salt.modules.beacons.reset(**kwargs)

Reset beacon configuration on the minion

CLI Example:

```bash
salt '*' beacons.reset
```

salt.modules.beacons.save(**kwargs)

Save all beacons on the minion

**Returns** Boolean and status message on success or failure of save.

CLI Example:

```bash
salt '*' beacons.save
```

### 21.9.31 salt.modules.bigip

An execution module which can manipulate an f5 bigip via iControl REST

**maturity** develop

**platform** f5_bigip_11.6

salt.modules.bigip.add_pool_member(hostname, username, password, name, member)

A function to connect to a bigip device and add a new member to an existing pool.

- **hostname** The host/address of the bigip device
- **username** The iControl REST username
- **password** The iControl REST password
- **name** The name of the pool to modify
- **member** The name of the member to add i.e. 10.1.1.2:80

CLI Example:
salt.modules.bigip.commit_transaction(hostname, username, password, label)
A function to connect to a bigip device and commit an existing transaction.

hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
label     the label of this transaction stored within the grain: bigip_f5_trans:<label>

CLI Example:
salt '*' bigip.commit_transaction bigip admin admin my_transaction

salt.modules.bigip.create_monitor(hostname, username, password, monitor_type, name, **kwargs)
A function to connect to a bigip device and create a monitor.

hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
monitor_type The type of monitor to create
name      The name of the monitor to create
kwargs    Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

CLI Example:
salt '*' bigip.create_monitor bigip admin admin http my-http-monitor timeout=10 interval=5

salt.modules.bigip.create_node(hostname, username, password, name, address, trans_label=None)
A function to connect to a bigip device and create a node.

hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
name      The name of the node
address   The address of the node
trans_label The label of the transaction stored within the grain: bigip_f5_trans:<label>

CLI Example:
salt '*' bigip.create_node bigip admin admin 10.1.1.2
salt.modules.bigip.create_pool(hostname, username, password, name, members=None, allow_nat=None, allow_snat=None, description=None, gateway_failsafe_device=None, ignore_persisted_weight=None, ip_tos_to_client=None, ip_tos_to_server=None, link_qos_to_client=None, link_qos_to_server=None, load_balancing_mode=None, min_active_members=None, min_up_members=None, min_up_members_action=None, min_up_members_checking=None, monitor=None, profiles=None, queue_depth_limit=None, queue_on_connection_limit=None, queue_time_limit=None, reselect_tries=None, service_down_action=None, slow_ramp_time=None)

A function to connect to a bigip device and create a pool.

hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
name  The name of the pool to create.
members  List of comma delimited pool members to add to the pool. i.e. 10.1.1.1:80,10.1.1.2:80,10.1.1.3:80
allow_nat  [yes | no]
allow_snat  [yes | no]
description  [string]
gateway_failsafe_device  [string]
ignore_persisted_weight  [enabled | disabled]
ip_tos_to_client  [pass-through | [integer]]
ip_tos_to_server  [pass-through | [integer]]
link_qos_to_client  [pass-through | [integer]]
link_qos_to_server  [pass-through | [integer]]
load_balancing_mode  [dynamic-ratio-member | dynamic-ratio-node | fastest-app-response | fastest-node | least-connections-members | least-connections-node | least-sessions | observed-member | observed-node | predictive-member | predictive-node | ratio-least-connections-member | ratio-least-connections-node | ratio-member | ratio-node | ratio-session | round-robin | weighted-least-connections-member | weighted-least-connections-node]
min_active_members  [integer]
min_up_members  [integer]
min_up_members_action  [failover | reboot | restart-all]
min_up_members_checking  [enabled | disabled]
monitor  [name]
profiles  [none | profile_name]
queue_depth_limit  [integer]
queue_on_connection_limit  [enabled | disabled]
queue_time_limit  [integer]
reselect_tries  [integer]
service_down_action [drop | none | reselect | reset]
slow_ramp_time [integer]

CLI Example:

```
salt '*' bigip.create_pool bigip admin admin my-pool 10.1.1.1:80,10.1.1.2:80,10.1.1.3:80 monitor=http
```

salt.modules.bigip.create_profile(hostname, username, password, profile_type, name, **kwargs)

A function to connect to a bigip device and create a profile.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
profile_type The type of profile to create
name The name of the profile to create
kwargs [ arg=val ] ... [arg=key1:val1,key2:val2] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

Creating Complex Args Profiles can get pretty complicated in terms of the amount of possible config options. Use the following shorthand to create complex arguments such as lists, dictionaries, and lists of dictionaries. An option is also provided to pass raw json as well.

lists [i,i,i]: param='item1,item2,item3'
Dictionary [k:v,k:v,k:v]: param='key-1:val-1,key-2:val2,key-3:va-3'
List of Dictionaries [k:v,k:v|k:v,k:v|k:v,k:v]: param='key-1:val-1,key-2:val-2|key-1:val-1,key-2:val2|key-1:val-1,key-2:val2'
JSON: 'j{ ... }j': cert-key-chain='j{ "default": { "cert": "default.crt", "chain": "default.crt", "key": "default.key" } }j'

Escaping Delimiters: Use `, or \: or \| to escape characters which shouldn’t be treated as delimiters i.e. ciphers='DEFAULT:\!SSLv3'

CLI Examples:

```
salt '*' bigip.create_profile bigip admin admin http my-http-profile defaultsFrom="/Common/http"
salt '*' bigip.create_profile bigip admin admin http my-http-profile defaultsFrom="/Common/http" 
  enforcement=maxHeaderCount:3200,maxRequests:10
```
salt.modules.bigip.create_virtual(hostname, username, password, name, destination, pool=None, address_status=None, auto_lasthop=None, bwc_policy=None, cmp_enabled=None, connection_limit=None, dhcp_relay=None, description=None, fallback_persistence=None, flow_eviction_policy=None, gtm_score=None, ip_forward=None, ip_protocol=None, internal=None, twelve_forward=None, last_hop_pool=None, mask=None, mirror=None, nat64=None, persist=None, profiles=None, policies=None, rate_class=None, rate_limit=None, rate_limit_mode=None, rate_limit_dst=None, rate_limit_src=None, rules=None, related_rules=None, reject=None, source=None, source_address_translation=None, source_port=None, state=None, traffic_classes=None, translate_address=None, translate_port=None, vlans=None)

A function to connect to a bigip device and create a virtual server.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the virtual to create
destination [ [virtual_address_name:port] | [ipv4:port] | [ipv6:port] ]
pool [ [pool_name] | none ]
address_status [yes | no]
auto_lasthop [default | enabled | disabled ]
bwc_policy [none | string]
cmp_enabled [yes | no]
dhcp_relay [yes | no]
connection_limit [integer]
description [string]
state [disabled | enabled]
fallback_persistence [none | [profile name] ]
flow_eviction_policy [none | [eviction policy name] ]
gtm_score [integer]
ip_forward [yes | no]
ip_protocol [any | protocol]
internal [yes | no]
twelve_forward (12-forward) [yes | no]
last_hop_pool [ [pool_name] | none ]
mask { [ipv4] | [ipv6] }
mirror { [disabled | enabled | none] }
nat64 [enabled | disabled]
persist [none | profile1,profile2,profile3 ... ]
<table>

**CLI Examples:**

```bash
salt '*' bigip.create_virtual bigip admin admin my-virtual-3 26.2.2.5:80 \ pool=my-http-pool-http profiles=http,tcp

salt '*' bigip.create_virtual bigip admin admin my-virtual-3 43.2.2.5:80 \ pool=test-http-pool-http profiles=http,websecurity persist=cookie,hash \ policies=asm_auto_l7_policy__http-virtual \ rules=_sys_APM_ExchangeSupport_helper,_sys_https_redirect \ related_rules=_sys_APM_activesync,_sys_APM_ExchangeSupport_helper \ source_address_translation=snat:my-snat-pool \ translate_address=enabled translate_port=enabled \ traffic_classes=my-class,other-class \ vlans=enabled:external,internal
```

**salt.modules.bigip.delete_monitor( hostname, username, password, monitor_type, name )**

A function to connect to a bigip device and delete an existing monitor.

- **hostname** The host/address of the bigip device
- **username** The iControl REST username
- **password** The iControl REST password
- **monitor_type** The type of monitor to delete
- **name** The name of the monitor to delete

**CLI Example:**
salt '*' bigip.delete_monitor bigip admin admin http my-http-monitor

```python
salt.modules.bigip.delete_node(hostname, username, password, name, trans_label=None)
```
A function to connect to a bigip device and delete a specific node.

- `hostname`: The host/address of the bigip device
- `username`: The iControl REST username
- `password`: The iControl REST password
- `name`: The name of the node which will be deleted.
- `trans_label`: The label of the transaction stored within the grain: bigip_f5_trans:<label>

CLI Example:
```bash
salt '*' bigip.delete_node bigip admin admin my-node
```

```python
salt.modules.bigip.delete_pool(hostname, username, password, name)
```
A function to connect to a bigip device and delete a specific pool.

- `hostname`: The host/address of the bigip device
- `username`: The iControl REST username
- `password`: The iControl REST password
- `name`: The name of the pool which will be deleted

CLI Example:
```bash
salt '*' bigip.delete_pool bigip admin admin my-pool
```

```python
salt.modules.bigip.delete_pool_member(hostname, username, password, name, member)
```
A function to connect to a bigip device and delete a specific pool.

- `hostname`: The host/address of the bigip device
- `username`: The iControl REST username
- `password`: The iControl REST password
- `name`: The name of the pool to modify
- `member`: The name of the pool member to delete

CLI Example:
```bash
salt '*' bigip.delete_pool_member bigip admin admin my-pool 10.2.2.80
```

```python
salt.modules.bigip.delete_profile(hostname, username, password, profile_type, name)
```
A function to connect to a bigip device and delete an existing profile.

- `hostname`: The host/address of the bigip device
- `username`: The iControl REST username
- `password`: The iControl REST password
- `profile_type`: The type of profile to delete
- `name`: The name of the profile to delete

CLI Example:
salt.modules.bigip.delete_transaction(\(hostname, username, password, label\))
A function to connect to a bigip device and delete an existing transaction.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
label The label of this transaction stored within the grain: bigip_f5_trans:<label>

CLI Example:
salt '*' bigip.delete_transaction bigip admin admin my_transaction

salt.modules.bigip.delete_virtual(\(hostname, username, password, name\))
A function to connect to a bigip device and delete a specific virtual.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the virtual to delete

CLI Example:
salt '*' bigip.delete_virtual bigip admin admin my_virtual

salt.modules.bigip.list_monitor(\(hostname, username, password, monitor_type, name=None\))
A function to connect to a bigip device and list an existing monitor. If no name is provided than all monitors of the specified type will be listed.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
monitor_type The type of monitor(s) to list
name The name of the monitor to list

CLI Example:
salt '*' bigip.list_monitor bigip admin admin http my-http-monitor

salt.modules.bigip.list_node(\(hostname, username, password, name=None, trans_label=None\))
A function to connect to a bigip device and list all nodes or a specific node.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the node to list. If no name is specified than all nodes will be listed.
trans_label The label of the transaction stored within the grain: bigip_f5_trans:<label>

CLI Example:
salt.modules.bigip.list_node bigip admin admin my-node

salt.modules.bigip.list_pool(hostname, username, password, name=None)
    A function to connect to a bigip device and list all pools or a specific pool.
    hostname The host/address of the bigip device
    username The iControl REST username
    password The iControl REST password
    name The name of the pool to list. If no name is specified then all pools will be listed.
    CLI Example:
    salt '*' bigip.list_pool bigip admin admin my-pool

salt.modules.bigip.list_profile(hostname, username, password, profile_type, name=None)
    A function to connect to a bigip device and list an existing profile. If no name is provided then all profiles of the specified type will be listed.
    hostname The host/address of the bigip device
    username The iControl REST username
    password The iControl REST password
    profile_type The type of profile(s) to list
    name The name of the profile to list
    CLI Example:
    salt '*' bigip.list_profile bigip admin admin http my-http-profile

salt.modules.bigip.list_transaction(hostname, username, password, label)
    A function to connect to a bigip device and list an existing transaction.
    hostname The host/address of the bigip device
    username The iControl REST username
    password The iControl REST password
    label The label of this transaction stored within the grain: bigip_f5_trans:<label>
    CLI Example:
    salt '*' bigip.list_transaction bigip admin admin my_transaction

salt.modules.bigip.list_virtual(hostname, username, password, name=None)
    A function to connect to a bigip device and list all virtuals or a specific virtual.
    hostname The host/address of the bigip device
    username The iControl REST username
    password The iControl REST password
    name The name of the virtual to list. If no name is specified than all virtuals will be listed.
    CLI Example:
    salt '*' bigip.list_virtual bigip admin admin my-virtual
salt.modules.bigip.modify_monitor(hostname, username, password, monitor_type, name, **kwargs)

A function to connect to a bigip device and modify an existing monitor.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
monitor_type The type of monitor to modify
name The name of the monitor to modify
kwargs Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

CLI Example:
```
salt '*' bigip.modify_monitor bigip admin admin http my-http-monitor timeout=16
    →interval=6
```

salt.modules.bigip.modify_node(hostname, username, password, name, connection_limit=None, description=None, dynamic_ratio=None, logging=None, monitor=None, rate_limit=None, ratio=None, session=None, state=None, trans_label=None)

A function to connect to a bigip device and modify an existing node.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the node to modify
connection_limit [integer]
description [string]
dynamic_ratio [integer]
logging [enabled | disabled]
monitor [[name] | none | default]
ratio_limit [integer]
state [user-down | user-up]
trans_label The label of the transaction stored within the grain: bigip_f5_trans:<label>

CLI Example:
```
salt '*' bigip.modify_node bigip admin admin 10.1.1.2 ratio=2 logging=enabled
```
salt.modules.bigip.modify_pool(hostname, username, password, name, allow_nat=None, allow_snat=None, description=None, gateway_failsafe_device=None, ignore.persisted_weight=None, ip_tos_to_client=None, ip_tos_to_server=None, link_qos_to_client=None, link_qos_to_server=None, load_balancing_mode=None, min_active_members=None, min_up_members=None, min_up_members_action=None, min_up_members_checking=None, monitor=None, profiles=None, queue_depth_limit=None, queue_on_connection_limit=None, queue_time_limit=None, reselect_tries=None, service_down_action=None, slow_ramp_time=None)

A function to connect to a bigip device and modify an existing pool.

hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
name  The name of the pool to modify.
allow_nat  [yes | no]
allow_snat  [yes | no]
description  [string]
gateway_failsafe_device  [string]
ignore.persisted_weight  [yes | no]
ip_tos_to_client  [pass-through | [integer]]
ip_tos_to_server  [pass-through | [integer]]
link_qos_to_client  [pass-through | [integer]]
link_qos_to_server  [pass-through | [integer]]
load_balancing_mode  [dynamic-ratio-member | dynamic-ratio-node | fastest-app-response | fastest-node | least-connections-members | least-connections-node | least-sessions | observed-member | observed-node | predictive-member | predictive-node | ratio-least-connections-member | ratio-least-connections-node | ratio-member | ratio-node | ratio-session | round-robin | weighted-least-connections-member | weighted-least-connections-node]
min_active_members  [integer]
min_up_members  [integer]
min_up_members_action  [failover | reboot | restart-all]
min_up_members_checking  [enabled | disabled]
monitor  [name]
profiles  [none | profile_name]
queue_on_connection_limit  [enabled | disabled]
queue_depth_limit  [integer]
queue_time_limit  [integer]
reselect_tries  [integer]
service_down_action  [drop | none | reselect | reset]
**slow_ramp_time** [integer]

CLI Example:

```
salt '*' bigip.modify_pool bigip admin admin my-pool 10.1.1.80,10.1.1.2:80,10.1.1.3:80
```

```
min_active_members=1
```

salt.modules.bigip.modify_pool_member

```
hostname, username, password, name, member, connection_limit=None, description=None,
dynamic_ratio=None, inherit_profile=None, logging=None, monitor=None, priority_group=None,
profiles=None, rate_limit=None, ratio=None, session=None, state=None)
```

A function to connect to a bigip device and modify an existing member of a pool.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the pool to modify

**member** The name of the member to modify i.e. 10.1.1.2:80

**connection_limit** [integer]

**description** [string]

**dynamic_ratio** [integer]

**inherit_profile** [enabled | disabled]

**logging** [enabled | disabled]

**monitor** [name]

**priority_group** [integer]

**profiles** [none | profile_name]

**rate_limit** [integer]

**ratio** [integer]

**session** [user-enabled | user-disabled]

**state** [user-up | user-down]

CLI Example:

```
salt '*' bigip.modify_pool_member bigip admin admin my-pool 10.2.2.1:80 state=use-
```

```
down session=user-disabled
```

salt.modules.bigip.modify_profile

```
hostname, username, password, profile_type, name, **kwargs)
```

A function to connect to a bigip device and create a profile.

A function to connect to a bigip device and create a profile.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**profile_type** The type of profile to create
name  The name of the profile to create

kwargs  [ arg=val ] ... [arg=key1:val1,key2:val2] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

Creating Complex Args

Profiles can get pretty complicated in terms of the amount of possible config options. Use the following shorthand to create complex arguments such as lists, dictionaries, and lists of dictionaries. An option is also provided to pass raw json as well.

lists  [i,i,i]: param='item1,item2,item3'

Dictionary  [k:v,k:v,k:v]: param='key-1:val-1,key-2:val2,key-3:va-3'

List of Dictionaries  [k:v,k:v|k:v,k:v|k:v,k:v]: param='key-1:val-1,key-2:val-2|key-1:val-1,key-2:val-2'

JSON:  j{ ... }j: cert-key-chain='j{ "default": { "cert": "default.crt", "chain": "default.crt", "key": "default.key" } }j'

Escaping Delimiters: Use \, or \: or \| to escape characters which shouldn’t be treated as delimiters i.e. ciphers='DEFAULT\:!SSLv3'

CLI Examples:

```bash
salt '*' bigip.modify_profile bigip admin admin http my-http-profile defaultsFrom=/Common/http
salt '*' bigip.modify_profile bigip admin admin http my-http-profile defaultsFrom=/Common/http \
  enforcement=maxHeaderCount:3200,maxRequests:10
salt '*' bigip.modify_profile bigip admin admin client-ssl my-client-ssl-18 \
  retainCertificate=false \
  ciphers='DEFAULT\:!SSLv3' \
  cert_key_chain='j{ "default": { "cert": "default.crt", "chain": "default.crt", "key": "default.key" } }j'
```

salt.modules.bigip.modify_virtual(*hostname, username, password, name, destination=None, pool=None, address_status=None, auto_lasthop=None, bwc_policy=None, cmp_enabled=None, connection_limit=None, dhcp_relay=None, description=None, fallback_persistence=None, flow_eviction_policy=None, gtm_score=None, ip_forward=None, ip_protocol=None, internal=None, twelve_forward=None, last_hop_pool=None, mask=None, mirror=None, nat64=None, persist=None, profiles=None, policies=None, rate_class=None, rate_limit=None, rate_limit_mode=None, rate_limit_dst=None, rate_limit_src=None, rules=None, related_rules=None, reject=None, source=None, source_address_translation=None, source_port=None, state=None, traffic_classes=None, translate_address=None, translate_port=None, vlans=None)

A function to connect to a bigip device and modify an existing virtual server.

hostname  The host/address of the bigip device

username  The iControl REST username

password  The iControl REST password
<table>

</table>
source_port [change | preserve | preserve-strict]
state [enabled | disable]
traffic_classes [none | default | class_one,class_two ... ]
translate_address [enabled | disabled]
translate_port [enabled | disabled]
vlands [none | default | [enabled|disabled]:vlan1,vlan2,vlan3 ... ]

CLI Example:
```
salt '*' bigip.modify_virtual bigip admin admin my-virtual source_address_
    →translation=none
salt '*' bigip.modify_virtual bigip admin admin my-virtual rules=my-rule,my-other=
    →rule
```

salt.modules.bigip.replace_pool_members(hostname, username, password, name, members)
A function to connect to a bigip device and replace members of an existing pool with new members.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to modify
members List of comma delimited pool members to replace existing members with. i.e.
    10.1.1.1:80,10.1.1.2:80,10.1.1.3:80

CLI Example:
```
salt '*' bigip.replace_pool_members bigip admin admin my-pool 10.2.2.1:80,10.2.2.
    →2:80,10.2.2.3:80
```

salt.modules.bigip.start_transaction(hostname, username, password, label)
A function to connect to a bigip device and start a new transaction.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
label The name / alias for this transaction. The actual transaction id will be stored within a grain called
    bigip_f5_trans:<label>

CLI Example:
```
salt '*' bigip.start_transaction bigip admin admin my_transaction
```

21.9.32 salt.modules.bluez_bluetooth

Support for Bluetooth (using BlueZ in Linux).

The following packages are required packages for this module:

    bluez >= 5.7 bluez-libs >= 5.7 bluez-utils >= 5.7 pybluez >= 0.18
salt.modules.bluez_bluetooth.address()
Get the many addresses of the Bluetooth adapter

CLI Example:
```
salt '*' bluetooth.address
```

salt.modules.bluez_bluetooth.block(bdaddr)
Block a specific bluetooth device by BD Address

CLI Example:
```
```

salt.modules.bluez_bluetooth.discoverable(dev)
Enable this bluetooth device to be discoverable.

CLI Example:
```
salt '*' bluetooth.discoverable hci0
```

salt.modules.bluez_bluetooth.noscan(dev)
Turn off scanning modes on this device.

CLI Example:
```
salt '*' bluetooth.noscan hci0
```

salt.modules.bluez_bluetooth.pair(address, key)
Pair the bluetooth adapter with a device

CLI Example:
```
salt '*' bluetooth.pair DE:AD:BE:EF:CA:FE 1234
```

Where DE:AD:BE:EF:CA:FE is the address of the device to pair with, and 1234 is the passphrase.

TODO: This function is currently broken, as the bluez-simple-agent program no longer ships with BlueZ >= 5.0. It needs to be refactored.

salt.modules.bluez_bluetooth.power(dev, mode)
Power a bluetooth device on or off

CLI Examples:
```
salt '*' bluetooth.power hci0 on
salt '*' bluetooth.power hci0 off
```

salt.modules.bluez_bluetooth.scan()
Scan for bluetooth devices in the area

CLI Example:
```
salt '*' bluetooth.scan
```

salt.modules.bluez_bluetooth.start()
Start the bluetooth service.

CLI Example:
salt modules.bluez_bluetooth.stop()
    Stop the bluetooth service.
    CLI Example:
    ```
salt '*' bluetooth.stop
    ```

salt modules.bluez_bluetooth.unblock(bdaddr)
    Unblock a specific bluetooth device by BD Address
    CLI Example:
    ```
    ```

salt modules.bluez_bluetooth.unpair(address)
    Unpair the bluetooth adapter from a device
    CLI Example:
    ```
    ```

    Where DE:AD:BE:EF:CA:FE is the address of the device to unpair.
    TODO: This function is currently broken, as the bluez-simple-agent program no longer ships with BlueZ >= 5.0. It needs to be refactored.

salt modules.bluez_bluetooth.version()
    Return Bluez version from bluetoothd -v
    CLI Example:
    ```
salt '*' bluetoothd.version
    ```

21.9.33 salt modules.boto3_elasticache module

Execution module for Amazon Elasticache using boto3

New in version 2017.7.0.

configuration This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

```
elasticache.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticache.key: askdjghsdfjkgWupUjasdflkdkfjlsgjdfjajkghs
```

A region may also be specified in the configuration:

```
elasticache.region: us-east-1
```
If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkgWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

depends boto3

```python
salt.modules.boto3_elasticache.add_tags_to_resource(name, region=None, key=None, keyid=None, profile=None, **args)
```

Add tags to an Elasticache resource.

Note that this function is essentially useless as it requires a full AWS ARN for the resource being operated on, but there is no provided API or programmatic way to find the ARN for a given object from its name or ID alone. It requires specific knowledge about the account number, AWS partition, and other magic details to generate.

If you happen to have those at hand though, feel free to utilize this function...

Example:

```bash
salt myminion boto3_elasticache.add_tags_to_resource name=\`arn:aws:elasticache:us-west-2:0123456789:snapshot:mySnapshot\` Tags=[\`
[\`
  \`
  \`
  \`
```

```python
salt.modules.boto3_elasticache.authorize_cache_security_group_ingress(name, region=None, key=None, keyid=None, profile=None, **args)
```

Authorize network ingress from an ec2 security group to a cache security group.

Example:

```bash
salt myminion boto3_elasticache.authorize_cache_security_group_ingress EC2SecurityGroupName=someEC2sg EC2SecurityGroupOwnerId=SOMEOWNERID
```

```python
salt.modules.boto3_elasticache.cache_cluster_exists(name, conn=None, region=None, key=None, keyid=None, profile=None)
```

Check to see if a cache cluster exists.

Example:

```bash
salt myminion boto3_elasticache.cache_cluster_exists myelasticache
```

```python
salt.modules.boto3_elasticache.cache_security_group_exists(name, region=None, key=None, keyid=None, profile=None)
```

Chapter 21. Salt Module Reference
Check to see if an ElastiCache security group exists.

Example:

```
salt myminion boto3_elasticache.cache_security_group_exists mysecuritygroup
```

```
salt.modules.boto3_elasticache.cache_security_group_exists(name, region=None, key=None, keyid=None, profile=None)
```

Check to see if an ElastiCache subnet group exists.

Example:

```
salt myminion boto3_elasticache.cache_subnet_group_exists my-subnet-group
```

```
salt.modules.boto3_elasticache.cache_subnet_group_exists(name, region=None, key=None, keyid=None, profile=None)
```

Make a copy of an existing snapshot.

Example:

```
salt myminion boto3_elasticache.copy_snapshot name=mySnapshot

    TargetSnapshotName=copyOfMySnapshot
```

```
salt.modules.boto3_elasticache.copy_snapshot(name, region=None, key=None, keyid=None, profile=None, **args)
```

Create a cache cluster.

Example:

```
salt myminion boto3_elasticache.create_cache_cluster name=myCacheCluster

    Engine=redis
    CacheNodeType=cache.t2.micro
    NumCacheNodes=1
    SecurityGroupIds=['sg-11223344']

    CacheSubnetGroupName=myCacheSubnetGroup
```

```
salt.modules.boto3_elasticache.create_cache_cluster(name, region=None, security_groups=None, Engine=None, CacheNodeType=None, NumCacheNodes=None, SecurityGroupIds=None, CacheSubnetGroupName=None, wait=600, key=None, keyid=None, profile=None, **args)
```

Create a cache parameter group.

Example:

```
salt myminion boto3_elasticache.create_cache_parameter_group name=myParamGroup

    CacheParameterGroupFamily=redis2.8

    Description="My Parameter Group"
```

```
salt.modules.boto3_elasticache.create_cache_parameter_group(name, region=None, Engine=None, CacheParameterGroupFamily=None, key=None, keyid=None, profile=None, **args)
```

Create a cache security group.

Example:
salt.myminion boto3_elasticache.create_cache_security_group mycachesecgrp
  →Description='My Cache Security Group'

salt.modules.boto3_elasticache.create_cache_subnet_group(name, subnets=None, region=None, key=None, keyid=None, profile=None, **args)

Create an ElastiCache subnet group

Example:

salt.myminion boto3_elasticache.create_cache_subnet_group name=my-subnet-group CacheSubnetGroupDescription='description' subnets='[myVPCSubnet1,myVPCSubnet2]'

salt.modules.boto3_elasticache.create_replication_group(name, wait=600, security_groups=None, region=None, key=None, keyid=None, profile=None, **args)

Example:

salt.myminion boto3_elasticache.create_replication_group name=myelasticache ReplicationGroupDescription='description'

salt.modules.boto3_elasticache.delete_cache_cluster(name, wait=600, region=None, key=None, keyid=None, profile=None, **args)

Delete a cache cluster.

Example:

salt.myminion boto3_elasticache.delete myelasticache

salt.modules.boto3_elasticache.delete_cache_parameter_group(name, region=None, key=None, keyid=None, profile=None, **args)

Delete a cache parameter group.

Example:

salt.myminion boto3_elasticache.delete_cache_parameter_group myParamGroup

salt.modules.boto3_elasticache.delete_cache_security_group(name, region=None, key=None, keyid=None, profile=None, **args)

Delete a cache security group.

Example:
salt myminion boto3_elasticache.delete_cache_security_group myelasticachesg

salt.modules.boto3_elasticache.delete_cache_subnet_group(name, region=None, key=None, keyid=None, profile=None, **args)

Delete an ElastiCache subnet group.

Example:

salt myminion boto3_elasticache.delete_subnet_group my-subnet-group region=us-east-1

salt.modules.boto3_elasticache.delete_replication_group(name, wait=600, region=None, key=None, keyid=None, profile=None, **args)

Delete an ElastiCache replication group, optionally taking a snapshot first.

Example:

salt myminion boto3_elasticache.delete_replication_group my-replication-group

salt.modules.boto3_elasticache.describe_cache_clusters(name=None, conn=None, region=None, key=None, keyid=None, profile=None, **args)

Return details about all (or just one) Elasticache cache clusters.

Example:

salt myminion boto3_elasticache.describe_cache_clusters
salt myminion boto3_elasticache.describe_cache_clusters myelasticache

salt.modules.boto3_elasticache.describe_cache_parameter_groups(name=None, conn=None, region=None, key=None, keyid=None, profile=None)

Return details about all (or just one) Elasticache cache clusters.

Example:

salt myminion boto3_elasticache.describe_cache_parameter_groups
salt myminion boto3_elasticache.describe_cache_parameter_groups myParameterGroup

salt.modules.boto3_elasticache.describe_cache_security_groups(name=None, conn=None, region=None, key=None, keyid=None, profile=None)

Return details about all (or just one) Elasticache cache clusters.

Example:

salt myminion boto3_elasticache.describe_cache_security_groups
salt myminion boto3_elasticache.describe_cache_security_groups mycachesecgrp
salt.modules.boto3_elasticache.describe_cache_subnet_groups(name=None, conn=None, region=None, key=None, keyid=None, profile=None)

Return details about all (or just one) Elasticache replication groups.

Example:

```
salt myminion boto3_elasticache.describe_cache_subnet_groups region=us-east-1
```

salt.modules.boto3_elasticache.describe_replication_groups(name=None, conn=None, region=None, key=None, keyid=None, profile=None)

Return details about all (or just one) Elasticache replication groups.

Example:

```
salt myminion boto3_elasticache.describe_replication_groups
salt myminion boto3_elasticache.describe_replication_groups myelasticache
```

salt.modules.boto3_elasticache.list_cache_subnet_groups(region=None, key=None, keyid=None, profile=None)

Return a list of all cache subnet group names

Example:

```
salt myminion boto3_elasticache.list_cache_subnet_groups region=us-east-1
```

salt.modules.boto3_elasticache.list_tags_for_resource(name, region=None, key=None, keyid=None, profile=None, **args)

List tags on an Elasticache resource.

Note that this function is essentially useless as it requires a full AWS ARN for the resource being operated on, but there is no provided API or programmatic way to find the ARN for a given object from its name or ID alone. It requires specific knowledge about the account number, AWS partition, and other magic details to generate.

If you happen to have those handy, feel free to utilize this however...

Example:

```
```

salt.modules.boto3_elasticache.modify_cache_cluster(name, wait=600, security_groups=None, region=None, key=None, keyid=None, profile=None, **args)

Update a cache cluster in place.

Notes: [ApplyImmediately: False] is pretty danged silly in the context of salt. You can pass it, but for fairly obvious reasons the results over multiple runs will be undefined and probably contrary to your desired state. Reducing the number of nodes requires an EXPLICIT CacheNodeIdsToRemove be passed, which until a reasonable heuristic for programmatically deciding which nodes to remove has been established,
MUST be decided and populated intentionally before a state call, and removed again before the next. In practice this is not particularly useful and should probably be avoided.

Example:

```python
salt myminion boto3_elasticache.create_cache_cluster name=myCacheCluster
  → NotificationTopicStatus=inactive
```

salt.modules.boto3_elasticache.modify_cache_subnet_group(name, subnets=None, region=None, key=None, keyid=None, profile=None, **args)

Modify an ElastiCache subnet group

Example:

```python
salt myminion boto3_elasticache.modify_cache_subnet_group
  → name=my-subnet-group
  → subnets='[myVPCSubnet3]'
```

salt.modules.boto3_elasticache.modify_replication_group(name, wait=600, security_groups=None, region=None, key=None, keyid=None, profile=None, **args)

Modify a replication group.

Example:

```python
salt myminion boto3_elasticache.modify_replication_group
  → name=myelasticache
  → ReplicationGroupDescription=newDescription
```

salt.modules.boto3_elasticache.remove_tags_from_resource(name, region=None, key=None, keyid=None, profile=None, **args)

Remove tags from an Elasticache resource.

Note that this function is essentially useless as it requires a full AWS ARN for the resource being operated on, but there is no provided API or programmatic way to find the ARN for a given object from its name or ID alone. It requires specific knowledge about the account number, AWS partition, and other magic details to generate.

If you happen to have those at hand though, feel free to utilize this function...

Example:

```python
salt myminion boto3_elasticache.remove_tags_from_resource
  → TagKeys=['TeamOwner']
```

salt.modules.boto3_elasticache.replication_group_exists(name, region=None, key=None, keyid=None, profile=None)

Check to see if a replication group exists.

Example:
```python
salt myminion boto3_elasticache.replication_group_exists myelasticache

salt.modules.boto3_elasticache.revoke_cache_security_group_ingress(name, region=None, key=None, keyid=None, profile=None, **args)
```

Revoke network ingress from an ec2 security group to a cache security group.

Example:

```bash
salt myminion boto3_elasticache.revoke_cache_security_group_ingress
  EC2SecurityGroupName=someEC2sg
  EC2SecurityGroupOwnerId=SOMEOWNERID
```

### 21.9.34 `salt.modules.boto3_elasticsearch` module

Connection module for Amazon Elasticsearch Service

New in version Natrium.

**Configuration**

This module accepts explicit IAM credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

```yaml
es.keyid: GKTADJGHEIQSXMKKRBJ08H
es.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```yaml
es.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

All methods return a dict with: 'result' key containing a boolean indicating success or failure, 'error' key containing the error message returned by boto on error, 'response' key containing the data of the response returned by boto on success.

**Codeauthor** Herbert Buurman <herbert.buurman@ogd.nl>

**Depends** boto3
salt.modules.boto3_elasticsearch.add_tags(domain_name=None, arn=None, tags=None, region=None, key=None, keyid=None, profile=None)

Attaches tags to an existing Elasticsearch domain. Tags are a set of case-sensitive key value pairs. An Elasticsearch domain may have up to 10 tags.

Parameters

- **domain_name** (str) – The name of the Elasticsearch domain you want to add tags to.
- **arn** (str) – The ARN of the Elasticsearch domain you want to add tags to. Specifying this overrides domain_name.
- **tags** (dict) – The dict of tags to add to the Elasticsearch domain.

Return type  dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

CLI Example:
salt myminion boto3_elasticsearch.add_tags domain_name=mydomain tags='{"foo": "bar", "baz": "qux"}"

salt.modules.boto3_elasticsearch.cancel_elasticsearch_service_software_update(domain_name, region=None, keyid=None, key=None, profile=None)

Cancels a scheduled service software update for an Amazon ES domain. You can only perform this operation before the AutomatedUpdateDate and when the UpdateStatus is in the PENDING_UPDATE state.

Parameters **domain_name** (str) – The name of the domain that you want to stop the latest service software update on.

Return type  dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with the current service software options. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

salt.modules.boto3_elasticsearch.check_upgrade_eligibility(domain_name, elasticsearch_version, region=None, keyid=None, key=None, profile=None)

Helper function to determine in one call if an Elasticsearch domain can be upgraded to the specified Elasticsearch version.

This assumes that the Elasticsearch domain is at rest at the moment this function is called. I.e. The domain is not in the process of:

- being created.
- being updated.
• another upgrade running, or a check thereof.
• being deleted.

Behind the scenes, this does 3 things:
• Check if `elasticsearch_version` is among the compatible elasticsearch versions.
• Perform a check if the Elasticsearch domain is eligible for the upgrade.
• Check the result of the check and return the result as a boolean.

**Parameters**

- `name (str)` – The Elasticsearch domain name to check.
- `elasticsearch_version (str)` – The Elasticsearch version to upgrade to.

**Return type** `dict`

**Returns** Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with boolean result of the check. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

CLI Example:

```
salt myminion boto3_elasticsearch.check_upgrade_eligibility mydomain '6.7'
```

```python
salt.modules.boto3_elasticsearch.create_elasticsearch_domain(domain_name, elastic_search_version=None, elastic_search_cluster_config=None, ebs_options=None, access_policies=None, snapshot_options=None, vpc_options=None, cognito_options=None, encryption_at_rest_options=None, node_to_node_encryption_options=None, advanced_options=None, log_publishing_options=None, blocking=False, region=None, key=None, keyid=None, profile=None)
```

Given a valid config, create a domain.

**Parameters**

- `domain_name (str)` – The name of the Elasticsearch domain that you are creating. Domain names are unique across the domains owned by an account within an AWS region.
Domain names must start with a letter or number and can contain the following characters: a-z (lowercase), 0-9, and - (hyphen).

- `elasticsearch_version (str)` – String of format X.Y to specify version for the Elasticsearch domain eg. "1.5" or "2.3".
- `elasticsearch_cluster_config (dict)` – Dictionary specifying the configuration options for an Elasticsearch domain. Keys (case sensitive) in here are:
  - `InstanceType (str)`: The instance type for an Elasticsearch cluster.
  - `InstanceCount (int)`: The instance type for an Elasticsearch cluster.
  - `DedicatedMasterEnabled (bool)`: Indicate whether a dedicated master node is enabled.
  - `ZoneAwarenessEnabled (bool)`: Indicate whether zone awareness is enabled. If this is not enabled, the Elasticsearch domain will only be in one availability zone.
  - `ZoneAwarenessConfig (dict)`: Specifies the zone awareness configuration for a domain when zone awareness is enabled. Keys (case sensitive) in here are:
    - `AvailabilityZoneCount (int)`: An integer value to indicate the number of availability zones for a domain when zone awareness is enabled. This should be equal to number of subnets if VPC endpoints is enabled. Allowed values: 2, 3
    - `DedicatedMasterType (str)`: The instance type for a dedicated master node.
    - `DedicatedMasterCount (int)`: Total number of dedicated master nodes, active and on standby, for the cluster.
- `ebs_options (dict)` – Dict specifying the options to enable or disable and specifying the type and size of EBS storage volumes. Keys (case sensitive) in here are:
  - `EBSEnabled (bool)`: Specifies whether EBS-based storage is enabled.
  - `VolumeType (str)`: Specifies the volume type for EBS-based storage.
  - `VolumeSize (int)`: Integer to specify the size of an EBS volume.
  - `Iops (int)`: Specifies the IOPD for a Provisioned IOPS EBS volume (SSD).
- `access_policies (str or dict)` – Dict or JSON string with the IAM access policy.
- `snapshot_options (dict)` – Dict specifying the snapshot options. Keys (case sensitive) in here are:
  - `AutomatedSnapshotStartHour (int)`: Specifies the time, in UTC format, when the service takes a daily automated snapshot of the specified Elasticsearch domain. Default value is 0 hours.
- `vpc_options (dict)` – Dict with the options to specify the subnets and security groups for the VPC endpoint. Keys (case sensitive) in here are:
  - `SubnetIds (list)`: The list of subnets for the VPC endpoint.
  - `SecurityGroupIds (list)`: The list of security groups for the VPC endpoint.
- `cognito_options (dict)` – Dict with options to specify the cognito user and identity pools for Kibana authentication. Keys (case sensitive) in here are:
  - `Enabled (bool)`: Specifies the option to enable Cognito for Kibana authentication.
  - `UserPoolId (str)`: Specifies the Cognito user pool ID for Kibana authentication.
  - `IdentityPoolId (str)`: Specifies the Cognito identity pool ID for Kibana authentication.
- RoleArn (str): Specifies the role ARN that provides Elasticsearch permissions for accessing Cognito resources.

- **encryption_at_rest_options (dict)** – Dict specifying the encryption at rest options. Keys (case sensitive) in here are:
  - Enabled (bool): Specifies the option to enable Encryption At Rest.
  - KmsKeyId (str): Specifies the KMS Key ID for Encryption At Rest options.

- **node_to_node_encryption_options (dict)** – Dict specifying the node to node encryption options. Keys (case sensitive) in here are:
  - Enabled (bool): Specify True to enable node-to-node encryption.

- **advanced_options (dict)** – Dict with option to allow references to indices in an HTTP request body. Must be False when configuring access to individual sub-resources. By default, the value is True. See [http://docs.aws.amazon.com/elasticsearch-service/latest/developerguide/es-createupdatedomains.html#es-createdomain-configure-advanced-options](http://docs.aws.amazon.com/elasticsearch-service/latest/developerguide/es-createupdatedomains.html#es-createdomain-configure-advanced-options) for more information.

- **log_publishing_options (dict)** – Dict with options for various type of logs. The keys denote the type of log file and can be one of the following:
  - INDEX_SLOW_LOGS
  - SEARCH_SLOW_LOGS
  - ES_APPLICATION_LOGS

  The value assigned to each key is a dict with the following case sensitive keys:
  - CloudWatchLogsLogGroupArn (str): The ARN of the Cloudwatch log group to which the log needs to be published.
  - Enabled (bool): Specifies whether given log publishing option is enabled or not.

- **blocking (bool)** – Whether or not to wait (block) until the Elasticsearch domain has been created.

Note: Not all instance types allow enabling encryption at rest. See [https://docs.aws.amazon.com/elasticsearch-service/latest/developerguide/aes-supported-instance-types.html](https://docs.aws.amazon.com/elasticsearch-service/latest/developerguide/aes-supported-instance-types.html)

**Return type**  
dict

**Returns**  
Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with the domain status configuration. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

CLI Example:

```bash
salt myminion boto3_elasticsearch.create_elasticsearch_domain mydomain \
  elasticsearch_cluster_config='{
    "InstanceType": "t2.micro.elasticsearch", 
    "InstanceCount": 1, 
    "DedicatedMasterEnabled": False, 
    "ZoneAwarenessEnabled": False}
  ebs_options='{
    "EBSEnabled": True, 
    "VolumeType": "gp2", 
    "VolumeSize": 10, 
    "Iops": 0}'
```

(continues on next page)
access_policies='{" Version": "2012-10-17", \\
"Statement": [ \
  {"Effect": "Allow", \
    "Principal": {"AWS": "+"}, \
    "Action": "es:*", \
    "Resource": "arn:aws:es:us-east-1:111111111111:domain/mydomain/*", \
    "Condition": {"IpAddress": ["127.0.0.1"]}}]}}'

snapshot_options='{"AutomatedSnapshotStartHour": 0}'}
advanced_options='{"rest.action.multi.allow_explicit_index": "true"}'}

salt.modules.boto3_elasticsearch.delete_elasticsearch_domain(domain_name, blocking=False, region=None, key=None, keyid=None, profile=None)

Permanently deletes the specified Elasticsearch domain and all of its data. Once a domain is deleted, it cannot
be recovered.

Parameters

- **domain_name** *(str)* – The name of the domain to delete.
- **blocking** *(bool)* – Whether or not to wait (block) until the Elasticsearch domain has
  been deleted.

Return type  **dict**

Returns  Dictionary with key 'result' and as value a boolean denoting success or failure. Upon
failure, also contains a key 'error' with the error message as value.

New in version Natrium.

salt.modules.boto3_elasticsearch.delete_elasticsearch_service_role(region=None, keyid=None, key=None, profile=None)

Deletes the service-linked role that Elasticsearch Service uses to manage and maintain VPC domains. Role
deleion will fail if any existing VPC domains use the role. You must delete any such Elasticsearch domains
before deleting the role.

Return type  **dict**

Returns  Dictionary with key 'result' and as value a boolean denoting success or failure. Upon
failure, also contains a key 'error' with the error message as value.

New in version Natrium.

salt.modules.boto3_elasticsearch.describe_elasticsearch_domain(domain_name, region=None, keyid=None, key=None, profile=None)

Given a domain name gets its status description.

Parameters **domain_name** *(str)* – The name of the domain to get the status of.

Return type  **dict**
**Returns** Dictionary ith key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with the domain status information. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

salt.modules.boto3_elasticsearch.describe_elasticsearch_domain_config(domain_name, region=None, keyid=None, key=None, profile=None)

Provides cluster configuration information about the specified Elasticsearch domain, such as the state, creation date, update version, and update date for cluster options.

- **Parameters**  
  domain_name (str) – The name of the domain to describe.

- **Return type**  
  dict

- **Returns** Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with the current configuration information. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

salt.modules.boto3_elasticsearch.describe_elasticsearch_domains(domain_names, region=None, keyid=None, key=None, profile=None)

Returns domain configuration information about the specified Elasticsearch domains, including the domain ID, domain endpoint, and domain ARN.

- **Parameters**  
  domain_names (list) – List of domain names to get information for.

- **Return type**  
  dict

- **Returns** Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with the list of domain status information. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

CLI Example:

```
salt myminion boto3_elasticsearch.describe_elasticsearch_domains ['"domain_a", "domain_b"]
```

salt.modules.boto3_elasticsearch.describe_elasticsearch_instance_type_limits(instance_type, elastic_search_version, domain_name=None, region=None, keyid=None, key=None, profile=None)
Describe Elasticsearch Limits for a given InstanceType and ElasticsearchVersion. When modifying existing Domain, specify the “DomainName” to know what Limits are supported for modifying.

Parameters

- **instance_type (str)** – The instance type for an Elasticsearch cluster for which Elasticsearch Limits are needed.

- **elasticsearch_version (str)** – Version of Elasticsearch for which Limits are needed.

- **domain_name (str)** – Represents the name of the Domain that we are trying to modify. This should be present only if we are querying for Elasticsearch Limits for existing domain.

**Return type** dict

**Returns** Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with the limits information. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

CLI Example:

```bash
salt myminion boto3_elasticsearch.describe_elasticsearch_instance_type_limits instance_type=r3.8xlarge.elasticsearch elasticsearch_version='6.2'
```

salt.modules.boto3_elasticsearch.describe_reserved_elasticsearch_instance_offerings(reserved_elasticsearch_instance_offering_id=None, region=None, keyid=None, key=None, profile=None)

Lists available reserved Elasticsearch instance offerings.

**Parameters** reserved_elasticsearch_instance_offering_id (str) – The offering identifier filter value. Use this parameter to show only the available offering that matches the specified reservation identifier.

**Return type** dict

**Returns** Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with the list of offerings information. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

salt.modules.boto3_elasticsearch.describe_reserved_elasticsearch_instances(reserved_elasticsearch_instance_id=None, region=None, keyid=None, key=None, profile=None)

Returns information about reserved Elasticsearch instances for this account.

**Parameters** reserved_elasticsearch_instance_id (str) – The reserved instance identifier filter value. Use this parameter to show only the reservation that matches the specified reserved Elasticsearch instance ID.
Return type  dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with a list of information on reserved instances. Upon failure, also contains a key 'error' with the error message as value.

Note Version 1.9.174 of boto3 has a bug in that reserved_elasticsearch_instance_id is considered a required argument, even though the documentation says otherwise.

New in version Natrium.
salt.modules.boto3_elasticsearch.exists(domain_name, region=None, key=None, keyid=None, profile=None)

Given a domain name, check to see if the given domain exists.

Parameters domain_name  (str) – The name of the domain to check.

Return type  dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.
salt.modules.boto3_elasticsearch.get_compatible_elasticsearch_versions(domain_name=None, region=None, keyid=None, key=None, profile=None)

Returns a list of upgrade compatible Elasticsearch versions. You can optionally pass a domain_name to get all upgrade compatible Elasticsearch versions for that specific domain.

Parameters domain_name  (str) – The name of an Elasticsearch domain.

Return type  dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with a list of compatible versions. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.
salt.modules.boto3_elasticsearch.get_upgrade_history(domain_name, region=None, keyid=None, key=None, profile=None)

Retrieves the complete history of the last 10 upgrades that were performed on the domain.

Parameters domain_name  (str) – The name of an Elasticsearch domain. Domain names are unique across the domains owned by an account within an AWS region. Domain names start with a letter or number and can contain the following characters: a-z (lowercase), 0-9, and -(hyphen).

Return type  dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with a list of upgrade histories. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.
Retrieves the latest status of the last upgrade or upgrade eligibility check that was performed on the domain.

Parameters 

- **domain_name** (*str*) – The name of an Elasticsearch domain. Domain names are unique across the domains owned by an account within an AWS region. Domain names start with a letter or number and can contain the following characters: a-z (lowercase), 0-9, and - (hyphen).

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with upgrade status information. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

Returns the name of all Elasticsearch domains owned by the current user’s account.

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with a list of domain names. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

List all Elasticsearch instance types that are supported for given ElasticsearchVersion.

Parameters

- **elasticsearch_version** (*str*) – Version of Elasticsearch for which list of supported elasticsearch instance types are needed.
- **domain_name** (*str*) – DomainName represents the name of the Domain that we are trying to modify. This should be present only if we are querying for list of available Elasticsearch instance types when modifying existing domain.

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with a list of Elasticsearch instance types. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.
List all supported Elasticsearch versions.

Return type  dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with a list of Elasticsearch versions. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

salt.modules.boto3_elasticsearch.list_tags(domain_name=None, arn=None, region=None, key=None, keyid=None, profile=None)

Returns all tags for the given Elasticsearch domain.

Return type  dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with a dict of tags. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

salt.modules.boto3_elasticsearch.purchase_reserved_elasticsearch_instance_offering(reserved_elasticsearch_instance_offering_id, reservation_name, instance_count=None, region=None, keyid=None, key=None, profile=None)

Allows you to purchase reserved Elasticsearch instances.

Parameters

- reserved_elasticsearch_instance_offering_id (str) – The ID of the reserved Elasticsearch instance offering to purchase.
- reservation_name (str) – A customer-specified identifier to track this reservation.
- instance_count (int) – The number of Elasticsearch instances to reserve.

Return type  dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with purchase information. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

salt.modules.boto3_elasticsearch.remove_tags(tag_keys, domain_name=None, arn=None, region=None, key=None, keyid=None, profile=None)

Removes the specified set of tags from the specified Elasticsearch domain.

Parameters

- tag_keys (list) – List with tag keys you want to remove from the Elasticsearch domain.
- **domain_name** *(str)* – The name of the Elasticsearch domain you want to remove tags from.
- **arn** *(str)* – The ARN of the Elasticsearch domain you want to remove tags from. Specifying this overrides `domain_name`.

**Return type**  `dict`

**Returns** Dictionary with key 'result' and as value a boolean denoting success or failure. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

CLI Example:

```
salt myminion boto3_elasticsearch.remove_tags 'foo, bar' domain_name=my_domain
```

salt.modules.boto3_elasticsearch.`start_elasticsearch_service软件_update`

Schedules a service software update for an Amazon ES domain.

**Parameters**
- **domain_name** *(str)* – The name of the domain that you want to update to the latest service software.

**Return type**  `dict`

**Returns** Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with service software information. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

salt.modules.boto3_elasticsearch.`update_elasticsearch_domain_config`

Schedules a service software update for an Amazon ES domain.

**Parameters**
- **domain_name** *(str)* – The name of the domain that you want to update to the latest service software.

**Return type**  `dict`

**Returns** Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with service software information. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.
Modifies the cluster configuration of the specified Elasticsearch domain, for example setting the instance type and the number of instances.

**Parameters**

- `domain_name (str)` – The name of the Elasticsearch domain that you are creating. Domain names are unique across the domains owned by an account within an AWS region. Domain names must start with a letter or number and can contain the following characters: a-z (lowercase), 0-9, and - (hyphen).

- `elasticsearch_cluster_config (dict)` – Dictionary specifying the configuration options for an Elasticsearch domain. Keys (case sensitive) in here are:

  - `InstanceType (str)`: The instance type for an Elasticsearch cluster.
  - `InstanceCount (int)`: The instance type for an Elasticsearch cluster.
  - `DedicatedMasterEnabled (bool)`: Indicate whether a dedicated master node is enabled.
  - `ZoneAwarenessEnabled (bool)`: Indicate whether zone awareness is enabled.
  - `ZoneAwarenessConfig (dict)`: Specifies the zone awareness configuration for a domain when zone awareness is enabled. Keys (case sensitive) in here are:

    - `AvailabilityZoneCount (int)`: An integer value to indicate the number of availability zones for a domain when zone awareness is enabled. This should be equal to number of subnets if VPC endpoints is enabled.
    - `DedicatedMasterType (str)`: The instance type for a dedicated master node.
    - `DedicatedMasterCount (int)`: Total number of dedicated master nodes, active and on standby, for the cluster.

- `ebs_options (dict)` – Dict specifying the options to enable or disable and specifying the type and size of EBS storage volumes. Keys (case sensitive) in here are:

  - `EBSEnabled (bool)`: Specifies whether EBS-based storage is enabled.
  - `VolumeType (str)`: Specifies the volume type for EBS-based storage.
  - `VolumeSize (int)`: Integer to specify the size of an EBS volume.
  - `Iops (int)`: Specifies the IOPD for a Provisioned IOPS EBS volume (SSD).

- `snapshot_options (dict)` – Dict specifying the snapshot options. Keys (case sensitive) in here are:

  - `AutomatedSnapshotStartHour (int)`: Specifies the time, in UTC format, when the service takes a daily automated snapshot of the specified Elasticsearch domain. Default value is 0 hours.

- `vpc_options (dict)` – Dict with the options to specify the subnets and security groups for the VPC endpoint. Keys (case sensitive) in here are:

  - `SubnetIds (list)`: The list of subnets for the VPC endpoint.
  - `SecurityGroupIds (list)`: The list of security groups for the VPC endpoint.

- `cognito_options (dict)` – Dict with options to specify the cognito user and identity pools for Kibana authentication. Keys (case sensitive) in here are:

  - `Enabled (bool)`: Specifies the option to enable Cognito for Kibana authentication.
  - `UserPoolId (str)`: Specifies the Cognito user pool ID for Kibana authentication.
  - `IdentityPoolId (str)`: Specifies the Cognito identity pool ID for Kibana authentication.
RoleArn (str): Specifies the role ARN that provides Elasticsearch permissions for accessing Cognito resources.

- **advanced_options (dict)** – Dict with option to allow references to indices in an HTTP request body. Must be False when configuring access to individual sub-resources. By default, the value is True. See [http://docs.aws.amazon.com/elasticsearch-service/latest/developerguide/es-createupdatedomains.html#es-createdomain-configure-advanced-options](http://docs.aws.amazon.com/elasticsearch-service/latest/developerguide/es-createupdatedomains.html#es-createdomain-configure-advanced-options) for more information.

- **access_policies (str/dict)** – Dict or JSON string with the IAM access policy.

- **log_publishing_options (dict)** – Dict with options for various type of logs. The keys denote the type of log file and can be one of the following:
  - INDEX_SLOW_LOGS, SEARCH_SLOW_LOGS, ES_APPLICATION_LOGS.
  
  The value assigned to each key is a dict with the following case sensitive keys:
  - CloudWatchLogsLogGroupArn (str): The ARN of the Cloudwatch log group to which the log needs to be published.
  - Enabled (bool): Specifies whether given log publishing option is enabled or not.

- **blocking (bool)** – Whether or not to wait (block) until the Elasticsearch domain has been updated.

**Return type** dict

**Returns** Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with the domain configuration. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

CLI Example:

```bash
salt myminion boto3_elasticsearch.update_elasticsearch_domain_config mydomain \
  elasticsearch_cluster_config='{{
    "InstanceType": "t2.micro.elasticsearch", 
    "InstanceCount": 1, 
    "DedicatedMasterEnabled": false, 
    "ZoneAwarenessEnabled": false}' \
  ebs_options='{{
    "EBSEnabled": true, 
    "VolumeType": "gp2", 
    "VolumeSize": 10, 
    "Iops": 0}' \
  access_policies='{"Version": "2012-10-17", "Statement": [{
    "Effect": "Allow", "Principal": {"AWS": "*"}, "Action": "es:*", 
    "Condition": {"IpAddress": {"aws:SourceIp": ["127.0.0.1"]}}}]}' \
  snapshot_options='{"AutomatedSnapshotStartHour": 0}' \
  advanced_options='{"rest.action.multi.allow_explicit_index": "true"}'
```
salt.modules.boto3_elasticsearch.upgrade_elasticsearch_domain(
    domain_name, target_version, perform_check_only=None, blocking=False, region=None, keyid=None, key=None, profile=None)

Allows you to either upgrade your domain or perform an Upgrade eligibility check to a compatible Elasticsearch version.

Parameters

- **domain_name** *(str)* – The name of an Elasticsearch domain. Domain names are unique across the domains owned by an account within an AWS region. Domain names start with a letter or number and can contain the following characters: a-z (lowercase), 0-9, and -(hyphen).

- **target_version** *(str)* – The version of Elasticsearch that you intend to upgrade the domain to.

- **perform_check_only** *(bool)* – This flag, when set to True, indicates that an Upgrade Eligibility Check needs to be performed. This will not actually perform the Upgrade.

- **blocking** *(bool)* – Whether or not to wait (block) until the Elasticsearch domain has been upgraded.

Return type  **dict**

Returns  Dictionary with key `result` and as value a boolean denoting success or failure. Upon success, also contains a key `response` with the domain configuration. Upon failure, also contains a key `error` with the error message as value.

New in version Natrium.

CLI Example:
```
salt myminion boto3_elasticsearch.upgrade_elasticsearch_domain mydomain target_version='6.7' perform_check_only=True
```

salt.modules.boto3_elasticsearch.wait_for_upgrade(
    domain_name, region=None, keyid=None, key=None, profile=None)

Block until an upgrade-in-progress for domain name is finished.

Parameters  **name** *(str)* – The name of the domain to wait for.

Rtype  **dict**

Returns  Dictionary with key `result` and as value a boolean denoting success or failure. Upon failure, also contains a key `error` with the error message as value.

New in version Natrium.

21.9.35  **salt.modules.boto3_route53 module**

Execution module for Amazon Route53 written against Boto 3

New in version 2017.7.0.
configuration This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

```
route53.keyid: GKTADJGHEIQSXMKKRBJ08H
route53.key: askdjghsdfjkghWupUjasdflkdlgjsdfjajkghs
```

A region may also be specified in the configuration:

```
route53.region: us-east-1
```

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:  
  keyid: GKTADJGHEIQSXMKKRBJ08H  
  key: askdjghsdfjkghWupUjasdflkdlgjsdfjajkghs  
  region: us-east-1
```

Note that Route53 essentially ignores all (valid) settings for 'region', since there is only one End-point (in us-east-1 if you care) and any (valid) region setting will just send you there. It is entirely safe to set it to None as well.

depends boto3

```
salt.modules.boto3_route53.associate_vpc_with_hosted_zone(HostedZoneld=None,  
  Name=None,  
  VPCCId=None,  
  VPCName=None,  
  Region=None,  
  Comment=None,  
  key=None,  
  keyid=None,  
  profile=None)
```

Associates an Amazon VPC with a private hosted zone.

To perform the association, the VPC and the private hosted zone must already exist. You can’t convert a public hosted zone into a private hosted zone. If you want to associate a VPC from one AWS account with a zone from another, the AWS account owning the hosted zone must first submit a CreateVPCAssociationAuthorization (using create_vpc_association_authorization() or by other means, such as the AWS console). With that done, the account owning the VPC can then call associate_vpc_with_hosted_zone() to create the association.

Note that if both sides happen to be within the same account, associate_vpc_with_hosted_zone() is enough on its own, and there is no need for the CreateVPCAssociationAuthorization step.

Also note that looking up hosted zones by name (e.g. using the Name parameter) only works within a single account - if you’re associating a VPC to a zone in a different account, as outlined above, you unfortunately MUST use the HostedZoneld parameter exclusively.

HostedZoneld The unique Zone Identifier for the Hosted Zone.

Name The domain name associated with the Hosted Zone(s).

VPCId When working with a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCName.
**VPCName** When working with a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCId.

**VPCRegion** When working with a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from VPCId or VPCName, if possible. If this fails, you’ll need to provide an explicit value for VPCRegion.

**Comment** Any comments you want to include about the change being made.

CLI Example:

```bash
salt myminion boto3_route53.associate_vpc_with_hosted_zone → Name=example.org. VPCName=myVPC VPCRegion=us-east-1 Comment="Whoo-hoo! I added another VPC."
```

**salt.modules.boto3_route53.aws_encode(x)**

An implementation of the encoding required to support AWS’s domain name rules defined here:

While AWS’s documentation specifies individual ASCII characters which need to be encoded, we instead just try to force the string to one of escaped unicode or idna depending on whether there are non-ASCII characters present.

This means that we support things like `xn--dog` as a domain name string.

More information about IDNA encoding in python is found here:

**salt.modules.boto3_route53.change_resource_record_sets(HostedZoneId=None, Name=None, PrivateZone=None, ChangeBatch=None, region=None, key=None, keyid=None, profile=None)**

See the AWS Route53 API docs as well as the Boto3 documentation for all the details...

The syntax for a ChangeBatch parameter is as follows, but note that the permutations of allowed parameters and combinations thereof are quite varied, so perusal of the above linked docs is highly recommended for any non-trivial configurations.

```json
{
  "Comment": "string",
  "Changes": [
    {
      "Action": "CREATE"|"DELETE"|"UPSERT",
      "ResourceRecordSet": {
        "Name": "string",
        "Type": "SOA"|"A"|"TXT"|"NS"|"CNAME"|"MX"|"NAPTR"|"PTR"|"SRV"|"SPF"
      },
      "SetIdentifier": "string",
      "Weight": 123,
      "Region": "us-east-1"|"us-east-2"|"us-west-1"|"us-west-2"|"ca-central-1"|"eu-west-1"|"eu-west-2"|"eu-central-1"|"ap-southeast-1"|"ap-southeast-2"|"ap-northeast-1"|"ap-northeast-2"|"sa-east-1"|"cn-north-1"|"ap-south-1",
      "GeoLocation": {
        "ContinentCode": "string",
        "CountryCode": "string",
        "SubdivisionCode": "string"
      },
      "Failover": "PRIMARY"|"SECONDARY",
      "TTL": 123,
```

(continues on next page)
"ResourceRecords": [
  {
    "Value": "string"
  },
],
"AliasTarget": {
  "HostedZoneId": "string",
  "DNSName": "string",
  "EvaluateTargetHealth": True|False
},
"HealthCheckId": "string",
"TrafficPolicyInstanceId": "string"
}
],

CLI Example:

```
foo='{
  "Name": "my-cname.example.org.",
  "TTL": 600,
  "Type": "CNAME",
  "ResourceRecords": [
    {
      "Value": "my-host.example.org"
    }
  ]
}
```

```
foo=`echo $foo` # Remove newlines
salt myminion boto3_route53.change_resource_record_sets DomainName=example.org. keyid=A1234567890ABCDEF123 key=xblahblahblah
salt.modules.boto3_route53.create_hosted_zone(Name, VPCId=None, VPCName=None, VPCRegion=None, CallerReference=None, Comment="", PrivateZone=False, DelegationSetId=None, region=None, key=None, keyid=None, profile=None)
```

Create a new Route53 Hosted Zone. Returns a Python data structure with information about the newly created Hosted Zone.

**Name**  The name of the domain. This should be a fully-specified domain, and should terminate with a period. This is the name you have registered with your DNS registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request.

**VPCId** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCName. Ignored if passed for a non-private zone.

**VPCName** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCId. Ignored if passed for a non-private zone.

**VPCRegion** When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from VPCId or VPCName, if possible. If this fails, you’ll need to provide an explicit value for this option. Ignored if passed for a non-private zone.

**CallerReference** A unique string that identifies the request and that allows create_hosted_zone() calls to be retried without the risk of executing the operation twice. This is a required parameter when creating
new Hosted Zones. Maximum length of 128.

**Comment**  Any comments you want to include about the hosted zone.

**PrivateZone**  Boolean - Set to True if creating a private hosted zone.

**DelegationSetId**  If you want to associate a reusable delegation set with this hosted zone, the ID that Amazon Route 53 assigned to the reusable delegation set when you created it. Note that XXX TODO create_delegation_set() is not yet implemented, so you’d need to manually create any delegation sets before utilizing this.

**region**  Region endpoint to connect to.

**key**  AWS key to bind with.

**keyid**  AWS keyid to bind with.

**profile**  Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

**CLI Example:**

```bash
salt myminion boto3_route53.create_hosted_zone example.org.
```

salt.modules.boto3_route53.delete_hosted_zone(Id, region=None, key=None, keyid=None, profile=None)

Delete a Route53 hosted zone.

**CLI Example:**

```bash
salt myminion boto3_route53.delete_hosted_zone Z1234567890
```

salt.modules.boto3_route53.delete_hosted_zone_by_domain(Name, PrivateZone=None, region=None, key=None, keyid=None, profile=None)

Delete a Route53 hosted zone by domain name, and PrivateZone status if provided.

**CLI Example:**

```bash
salt myminion boto3_route53.delete_hosted_zone_by_domain example.org.
```

salt.modules.boto3_route53.disassociate_vpc_from_hosted_zone(HostedZoneId=None, Name=None, VP-CId=None, VPC-Name=None, VPCRegion=None, Comment=None, region=None, key=None, keyid=None, profile=None)

Disassociates an Amazon VPC from a private hosted zone.

You can’t disassociate the last VPC from a private hosted zone. You also can’t convert a private hosted zone into a public hosted zone.

Note that looking up hosted zones by name (e.g. using the Name parameter) only works XXX FACTCHECK within a single AWS account - if you’re disassociating a VPC in one account from a hosted zone in a different account you unfortunately MUST use the HostedZoneId parameter exclusively. XXX FIXME DOCU

**HostedZoneId**  The unique Zone Identifier for the Hosted Zone.

**Name**  The domain name associated with the Hosted Zone(s).
VPCId  When working with a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCName.

VPCName  When working with a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCId.

VPCRegion  When working with a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from VPCId or VPCName, if possible. If this fails, you'll need to provide an explicit value for VPCRegion.

Comment  Any comments you want to include about the change being made.

CLI Example:

```
salt myminion boto3_route53.disassociate_vpc_from_hosted_zone
  → Name=example.org, VPCName=myVPC, VPCRegion=us-east-1, Comment=
  → "Whoops! Don't wanna talk to this-here zone no more."
```

```
salt.modules.boto3_route53.find_hosted_zone
( Id=None, Name=None, PrivateZone=None, region=None, key=None, keyid=None, profile=None)
```

Find a hosted zone with the given characteristics.

**Id**  The unique Zone Identifier for the Hosted Zone. Exclusive with Name.

**Name**  The domain name associated with the Hosted Zone. Exclusive with Id. Note this has the potential to match more then one hosted zone (e.g. a public and a private if both exist) which will raise an error unless PrivateZone has also been passed in order split the different.

**PrivateZone**  Boolean - Set to True if searching for a private hosted zone.

**region**  Region to connect to.

**key**  Secret key to be used.

**keyid**  Access key to be used.

**profile**  Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:

```
salt myminion boto3_route53.find_hosted_zone
  → Name=salt.org, profile='{"region": "us-east-1", "keyid": "A12345678AB", "key": "xblahblahblah"}'
```

```
salt.modules.boto3_route53.get_hosted_zone
( Id, region=None, key=None, keyid=None, profile=None)
```

Return detailed info about the given zone.

**Id**  The unique Zone Identifier for the Hosted Zone.

**region**  Region to connect to.

**key**  Secret key to be used.

**keyid**  Access key to be used.

**profile**  Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:

```
salt myminion boto3_route53.get_hosted_zone Z1234567690 profile='{"region": "us-east-1", "keyid": "A12345678AB", "key": "xblahblahblah"}'}
```
salt.modules.boto3_route53.get_hosted_zones_by_domain(Name, region=None, key=None, keyid=None, profile=None)

Find any zones with the given domain name and return detailed info about them. Note that this can return multiple Route53 zones, since a domain name can be used in both public and private zones.

Name  The domain name associated with the Hosted Zone(s).

region  Region to connect to.

key  Secret key to be used.

keyid  Access key to be used.

profile  Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:

```
salt myminion boto3_route53.get_hosted_zones_by_domain salt.org.
```

-> profile={'"region": "us-east-1", "keyid": "A12345678AB", "key": "xblahblahblah"'}

salt.modules.boto3_route53.get_resource_records(HostedZoneId=None, Name=None, StartRecordName=None, StartRecordType=None, PrivateZone=None, region=None, key=None, keyid=None, profile=None)

Get all resource records from a given zone matching the provided StartRecordName (if given) or all records in the zone (if not), optionally filtered by a specific StartRecordType. This will return any and all RRs matching, regardless of their special AWS flavors (weighted, geolocation, alias, etc.) so your code should be prepared for potentially large numbers of records back from this function - for example, if you've created a complex geolocation mapping with lots of entries all over the world providing the same server name to many different regional clients.

If you want EXACTLY ONE record to operate on, you'll need to implement any logic required to pick the specific RR you care about from those returned.

Note that if you pass in Name without providing a value for PrivateZone (either True or False), CommandExecutionError can be raised in the case of both public and private zones matching the domain. XXX FIXME

CLI example:

```
salt myminion boto3_route53.get_records test.example.org example.org A
```

salt.modules.boto3_route53.list_hosted_zones(DelegationSetId=None, region=None, key=None, keyid=None, profile=None)

Return detailed info about all zones in the bound account.

DelegationSetId  If you're using reusable delegation sets and you want to list all of the hosted zones that are associated with a reusable delegation set, specify the ID of that delegation set.

region  Region to connect to.

key  Secret key to be used.

keyid  Access key to be used.

profile  Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:
salt myminion boto3_route53.describe_hosted_zones

salt.modules.boto3_route53.update_hosted_zone_comment(Id=None, Name=None, Comment=None, PrivateZone=None, region=None, key=None, keyid=None, profile=None)

Update the comment on an existing Route 53 hosted zone.

Id The unique Zone Identifier for the Hosted Zone.

Name The domain name associated with the Hosted Zone(s).

Comment Any comments you want to include about the hosted zone.

PrivateZone Boolean - Set to True if changing a private hosted zone.

CLI Example:

salt myminion boto3_route53.update_hosted_zone_comment Name=example.org, Comment="This is an example comment for an example zone"

21.9.36 salt.modules.boto_apigateway module

Connection module for Amazon APIGateway

New in version 2016.11.0.

depends

- boto >= 2.8.0
- boto3 >= 1.2.1
- botocore >= 1.4.49

configuration This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance trough Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

apigateway.keyid: GKTADJGHEIQSXMKKRBJ08H
apigateway.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

A region may also be specified in the configuration:

apigateway.region: us-west-2

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkgWupUjasdfklgdflgjsdfjagkgh
  region: us-west-2

Changed in version 2015.8.0: All methods now return a dictionary. Create and delete methods return:

```
created: true
```

or

```
created: false
error:
  message: error message
```

Request methods (e.g., `describe_apigateway`) return:

```
apigateway:
  - {...}
  - {...}
```

or

```
error:
  message: error message
```

`salt.modules.boto_apigateway.activate_api_deployment(restApiId, stageName, deploymentId=None, region=None, key=None, keyid=None, profile=None)`

Activates previously deployed deployment for a given stage

CLI Example:

```
salt myminion boto_apigateway.activate_api_deployment restApiId stagename
```

`salt.modules.boto_apigateway.api_exists(name, description=None, region=None, key=None, keyid=None, profile=None)`

Check to see if the given Rest API Name and optionally description exists.

CLI Example:

```
salt myminion boto_apigateway.exists myapi_name
```

`salt.modules.boto_apigateway.api_model_exists(restApiId, modelName, region=None, key=None, keyid=None, profile=None)`

Check to see if the given modelName exists in the given restApiId

CLI Example:

```
salt myminion boto_apigateway.api_model_exists restApiId modelName
```

`salt.modules.boto_apigateway.associate_api_key_stagekeys(apiKey, stagekeyslist, region=None, key=None, keyid=None, profile=None)`

associate the given stagekeyslist to the given apiKey.
CLI Example:

```bash
salt myminion boto_apigateway.associate_stagekeys_api_key
    api_key '[["restapi id/stage name", ...]]'
```

caller='salt.modules.boto_apigateway.attach_usage_plan_to_apis(plan_id, apis, region=None,
key=None, keyid=None, profile=None)

Attaches given usage plan to each of the apis provided in a list of apid and stage values

**New in version 2017.7.0.**

**apis** a list of dictionaries, where each dictionary contains the following:

- **apid** a string, which is the id of the created API in AWS ApiGateway
- **stage** a string, which is the stage that the created API is deployed to.

CLI Example:

```bash
salt myminion boto_apigateway.attach_usage_plan_to_apis
    plan_id='usage plan id'
        apis='[[{"apid": "some id 1", "stage": "some stage 1"}]]'
```

caller='salt.modules.boto_apigateway.create_api(name, description, cloneFrom=None, region=None,
key=None, keyid=None, profile=None)

Create a new REST API Service with the given name

Returns {created: True} if the rest api was created and returns {created: False} if the rest api was not created.

CLI Example:

```bash
salt myminion boto_apigateway.create_api
    myapi_name api_description
```

caller='salt.modules.boto_apigateway.create_api_deployment(restApiId, stageName, stageDescription="",
    description="", cacheClusterEnabled=False, cacheClusterSize='0.5', variables=None, region=None,
key=None, keyid=None, profile=None)

Creates a new API deployment.

CLI Example:

```bash
salt myminion boto_apigateway.create_api_deployment
    restApiId stagename
    stageDescription=""
    description="" cacheClusterEnabled=True|False cacheClusterSize=0.5
        variables='{"name": "value"}'}
```

caller='salt.modules.boto_apigateway.create_api_integration(restApiId, resourcePath, http-
    Method, integrationType, integrationHttpMethod, uri, credentials, requestParam-
    eters=None, requestTem-
    plates=None, region=None,
key=None, keyid=None, profile=None)

Creates an integration for a given method in a given API. If integrationType is MOCK, uri and credential
parameters will be ignored.
uri is in the form of (substitute APIGATEWAY_REGION and LAMBDA_FUNC_ARN) "arn:aws:apigateway:APIGATEWAY_REGION:lambda:path/2015-03-31/functions/LAMBDA_FUNC_ARN/invocations"
credentials is in the form of an iam role name or role arn.

CLI Example:

```
salt myminion boto_apigateway.create_api_integration restApiId resourcePath httpMethod integrationType integrationHttpMethod uri credentials ['{}'] ['{}']
```

```
salt.modules.boto_apigateway.create_api_integration_response(restApiId, resourcePath, httpMethod, statusCode, selectionPattern, responseParameters=None, responseTemplates=None, region=None, key=None, keyid=None, profile=None)
```

Creates an integration response for a given method in a given API

CLI Example:

```
salt myminion boto_apigateway.create_api_integration_response restApiId resourcePath httpMethod statusCode selectionPattern ['{}'] ['{}']
```

```
salt.modules.boto_apigateway.create_api_key(name, description, enabled=True, stageKeys=None, region=None, key=None, keyid=None, profile=None)
```

Create an API key given name and description.

An optional enabled argument can be provided. If provided, the valid values are True|False. This argument
defaults to True.

An optional stageKeys argument can be provided in the form of list of dictionary with 'restApiId' and 'stageName' as keys.

CLI Example:

```
salt myminion boto_apigateway.create_api_key name description
salt myminion boto_apigateway.create_api_key name description enabled=False
salt myminion boto_apigateway.create_api_key name description stageKeys='["restApiId": "id", "stageName": "stagename"]'
```

```
salt.modules.boto_apigateway.create_api_method(restApiId, resourcePath, httpMethod, authorizationType, apiKeyRequired=False, requestParameters=None, requestModels=None, region=None, key=None, keyid=None, profile=None)
```

Creates API method for a resource in the given API

CLI Example:
salt.myminion.boto_apigateway.create_api_method_response(restApiId, resourcePath, httpMethod, statusCode, responseParameters=None, responseModels=None, region=None, key=None, keyid=None, profile=None)

Create API method response for a method on a given resource in the given API

CLI Example:

given rest api id, and an absolute resource path, create all the resources and return all resources in the resource path, returns False on failure.

CLI Example:

salt.myminion.boto_apigateway.create_api_resource(restApiId, resourcePath)

salt.myminion.boto_apigateway.create_api_stage(restApiId, stageName, deploymentId, description='', cacheClusterEnabled=False, cacheClusterSize='0.5', variables=None, region=None, key=None, keyid=None, profile=None)

Creates a new API stage for a given restApiId and deploymentId.

CLI Example:

salt.myminion.boto_apigateway.create_usage_plan(name, description=None, throttle=None, quota=None, region=None, key=None, keyid=None, profile=None)
Creates a new usage plan with throttling and quotas optionally applied

New in version 2017.7.0.

name  Name of the usage plan

throttle  A dictionary consisting of the following keys:

    rateLimit  requests per second at steady rate, float
    burstLimit  maximum number of requests per second, integer

quota  A dictionary consisting of the following keys:

    limit  number of allowed requests per specified quota period [required if quota parameter is present]
    offset  number of requests to be subtracted from limit at the beginning of the period [optional]
    period  quota period, must be one of DAY, WEEK, or MONTH. [required if quota parameter is present

CLI Example:

```
salt myminion boto_apigateway.create_usage_plan name='usage plan name' throttle='{"rateLimit": 10.0, "burstLimit": 10}"
```

salt.modules.boto_apigateway.delete_api(name, description=None, region=None, key=None, keyid=None, profile=None)

Delete all REST API Service with the given name and an optional API description

Returns {deleted: True, count: deleted_count} if apis were deleted, and returns {deleted: False} if error or not found.

CLI Example:

```
salt myminion boto_apigateway.delete_api myapi_name
salt myminion boto_apigateway.delete_api myapi_name description='api description'
```

salt.modules.boto_apigateway.delete_api_deployment(restApiId, deploymentId, region=None, key=None, keyid=None, profile=None)

Deletes API deployment for a given restApiId and deploymentID

CLI Example:

```
salt myminion boto_apigateway.delete_api_deployent restApiId deploymentId
```

salt.modules.boto_apigateway.delete_api_integration(restApiId, resourcePath, httpMethod, region=None, key=None, keyid=None, profile=None)

Deletes an integration for a given method in a given API

CLI Example:

```
salt myminion boto_apigateway.delete_api_integration restApiId resourcePath httpMethod
```
salt.modules.boto_apigateway.delete_api.integration_response(restApiId, resourcePath, httpMethod, statusCode, region=None, key=None, keyid=None, profile=None)

Deletes an integration response for a given method in a given API

CLI Example:
```
salt myminion boto_apigateway.delete_api.integration_response restApiId resourcePath httpMethod statusCode
```

salt.modules.boto_apigateway.delete_api.key(apiKey, region=None, key=None, keyid=None, profile=None)

Deletes a given apiKey

CLI Example:
```
salt myminion boto_apigateway.delete_api.key apikeystring
```

salt.modules.boto_apigateway.delete_api.method(restApiId, resourcePath, httpMethod, region=None, key=None, keyid=None, profile=None)

Delete API method for a resource in the given API

CLI Example:
```
salt myminion boto_apigateway.delete_api.method restApiId resourcePath httpMethod
```

salt.modules.boto_apigateway.delete_api.method.response(restApiId, resourcePath, httpMethod, statusCode, region=None, key=None, keyid=None, profile=None)

Delete API method response for a resource in the given API

CLI Example:
```
salt myminion boto_apigateway.delete_api.method.response restApiId resourcePath httpMethod statusCode
```

salt.modules.boto_apigateway.delete_api.model(restApiId, modelName, region=None, key=None, keyid=None, profile=None)

Delete a model identified by name in a given API

CLI Example:
```
salt myminion boto_apigateway.delete_api.model restApiId modelName
```

salt.modules.boto_apigateway.delete_api.resources(restApiId, path, region=None, key=None, keyid=None, profile=None)

Given restApiId and an absolute resource path, delete the resources starting from the absolute resource path. If resourcepath is the root resource '/', the function will return False. Returns False on failure.

CLI Example:
salt myminion boto_apigateway.delete_api_resources myapi_id, resource_path

salt.modules.boto_apigateway.delete_api_stage(restApiId, stageName, region=None, key=None, keyid=None, profile=None)

Delete stage identified by stageName from API identified by restApiId

CLI Example:
salt myminion boto_apigateway.delete_api_stage restApiId stageName

salt.modules.boto_apigateway.delete_usage_plan(plan_id, region=None, key=None, keyid=None, profile=None)

Delete usage plan identified by plan_id

New in version 2017.7.0.

CLI Example:
salt myminion boto_apigateway.delete_usage_plan plan_id='usage plan id'

salt.modules.boto_apigateway.describe_api_deployment(restApiId, deploymentId, region=None, key=None, keyid=None, profile=None)

Get API deployment for a given restApiId and deploymentId.

CLI Example:
salt myminion boto_apigateway.describe_api_deployment restApiId deploymentId

salt.modules.boto_apigateway.describe_api_deployments(restApiId, region=None, key=None, keyid=None, profile=None)

Get information about the defined API Deployments. Return list of api deployments.

CLI Example:
salt myminion boto_apigateway.describe_api_deployments restApiId

salt.modules.boto_apigateway.describe_api_integration(restApiId, resourcePath, httpMethod, region=None, key=None, keyid=None, profile=None)

Get an integration for a given method in a given API

CLI Example:
salt myminion boto_apigateway.describe_api_integration restApiId resourcePath httpMethod
	salt.modules.boto_apigateway.describe_api_integration_response(restApiId, resourcePath, httpMethod, statusCode, region=None, key=None, keyid=None, profile=None)

Get an integration response for a given method in a given API
Salt Documentation, Release 3000.2

21.9. execution modules

CLI Example:

```
salt myminion boto_apigateway.describe_api_integration_response restApiId=
  resourcePath httpMethod statusCode
```

_salt.modules.boto_apigateway.describe_api_key(apiKey, region=None, key=None, keyid=None, profile=None)_

Gets info about the given api key

CLI Example:

```
salt myminion boto_apigateway.describe_api_key apigw_api_key
```

_salt.modules.boto_apigateway.describe_api_keys(region=None, key=None, keyid=None, profile=None)_

Gets information about the defined API Keys. Return list of apiKeys.

CLI Example:

```
salt myminion boto_apigateway.describe_api_keys
```

_salt.modules.boto_apigateway.describe_api_method(restApiId, resourcePath, httpMethod, region=None, key=None, keyid=None, profile=None)_

Get API method for a resource in the given API

CLI Example:

```
salt myminion boto_apigateway.describe_api_method restApiId resourcePath=
  httpMethod
```

_salt.modules.boto_apigateway.describe_api_method_response(restApiId, resourcePath, httpMethod, status-Code, region=None, key=None, keyid=None, profile=None)_

Get API method response for a resource in the given API

CLI Example:

```
salt myminion boto_apigateway.describe_api_method_response restApiId resourcePath=
  httpMethod statusCode
```

_salt.modules.boto_apigateway.describe_api_model(restApiId, modelName, flatten=True, region=None, key=None, keyid=None, profile=None)_

Get a model by name for a given API

CLI Example:

```
salt myminion boto_apigateway.describe_api_model restApiId modelName [True]
```

_salt.modules.boto_apigateway.describe_api_models(restApiId, region=None, key=None, keyid=None, profile=None)_

Get all models for a given API

CLI Example:

```
salt myminion boto_apigateway.describe_api_models restApiId
```
salt.modules.boto_apigateway.describe_api_resource(restApiId, path, region=None, key=None, keyid=None, profile=None)

Given rest api id, and an absolute resource path, returns the resource id for the given path.

CLI Example:
```
salt myminion boto_apigateway.describe_api_resource myapi_id resource_path
```

salt.modules.boto_apigateway.describe_api_resource_method(restApiId, resourcePath, httpMethod, region=None, key=None, keyid=None, profile=None)

Given rest api id, resource path, and http method (must be one of DELETE, GET, HEAD, OPTIONS, PATCH, POST, PUT), return the method for the api/resource path if defined. Return False if method is not defined.

CLI Example:
```
salt myminion boto_apigateway.describe_api_resource_method myapi_id resource_path httpMethod
```

salt.modules.boto_apigateway.describe_api_resources(restApiId, region=None, key=None, keyid=None, profile=None)

Given rest api id, return all resources for this api.

CLI Example:
```
salt myminion boto_apigateway.describe_api_resources myapi_id
```

salt.modules.boto_apigateway.describe_api_stage(restApiId, stageName, region=None, key=None, keyid=None, profile=None)

Get API stage for a given apiID and stage name

CLI Example:
```
salt myminion boto_apigateway.describe_api_stage restApiId stageName
```

salt.modules.boto_apigateway.describe_api_stages(restApiId, deploymentId, region=None, key=None, keyid=None, profile=None)

Get all API stages for a given apiID and deploymentID

CLI Example:
```
salt myminion boto_apigateway.describe_api_stages restApiId deploymentId
```

salt.modules.boto_apigateway.describe_apis(name=None, description=None, region=None, key=None, keyid=None, profile=None)

Returns all rest apis in the defined region. If optional parameter name is included, returns all rest apis matching the name in the defined region.

CLI Example:
```
salt myminion boto_apigateway.describe_apis
salt myminion boto_apigateway.describe_apis name='api name'
salt myminion boto_apigateway.describe_apis name='api name' description='desc str'
```
salt.modules.boto_apigateway.describe_usage_plans(name=None, plan_id=None, region=None, key=None, keyid=None, profile=None)

Returns a list of existing usage plans, optionally filtered to match a given plan name

New in version 2017.7.0.

CLI Example:

```
salt myminion boto_apigateway.describe_usage_plans
salt myminion boto_apigateway.describe_usage_plans name='usage plan name'
salt myminion boto_apigateway.describe_usage_plans plan_id='usage plan id'
```

salt.modules.boto_apigateway.detach_usage_plan_from_apis(plan_id, apis, region=None, key=None, keyid=None, profile=None)

Detaches given usage plan from each of the apis provided in a list of apiId and stage value

New in version 2017.7.0.

apis a list of dictionaries, where each dictionary contains the following:

- apiId a string, which is the id of the created API in AWS ApiGateway
- stage a string, which is the stage that the created API is deployed to.

CLI Example:

```
salt myminion boto_apigateway.detach_usage_plan_from_apis plan_id='usage plan id'
-apis='[["apiId": "some id 1", "stage": "some stage 1"]]
```

salt.modules.boto_apigateway.disable_api_key(apiKey, region=None, key=None, keyid=None, profile=None)

disable the given apiKey.

CLI Example:

```
salt myminion boto_apigateway.enable_api_key api_key
```

salt.modules.boto_apigateway.disassociate_api_key_stagekeys(apiKey, stagekeyslist, region=None, key=None, keyid=None, profile=None)

disassociate the given stagekeyslist to the given apiKey.

CLI Example:

```
salt myminion boto_apigateway.disassociate_api_key_stagekeys api_key \
api_key '[["restapi id/stage name", ...]]'
```

salt.modules.boto_apigateway.enable_api_key(apiKey, region=None, key=None, keyid=None, profile=None)

enable the given apiKey.

CLI Example:

```
salt myminion boto_apigateway.enable_api_key api_key
```
salt.modules.boto_apigateway.flush_api_stage_cache(restApiId, stageName, region=None, key=None, keyid=None, profile=None)

Flushes cache for the stage identified by stageName from API identified by restApiId

CLI Example:
```shell
salt myminion boto_apigateway.flush_api_stage_cache restApiId stageName
```

salt.modules.boto_apigateway.overwrite_api_stage_variables(restApiId, stageName, variables, region=None, key=None, keyid=None, profile=None)

Overwrite the stage variables for the given restApiId and stage name with the given variables, variables must be in the form of a dictionary. Overwrite will always remove all the existing stage variables associated with the given restApiId and stage name, follow by the adding of all the variables specified in the variables dictionary

CLI Example:
```shell
salt myminion boto_apigateway.overwrite_api_stage_variables restApiId stageName variables='{"name": "value"}'
```

salt.modules.boto_apigateway.update_api_key_description(apiKey, description, region=None, key=None, keyid=None, profile=None)

update the given apiKey with the given description.

CLI Example:
```shell
salt myminion boto_apigateway.update_api_key_description apiKey description
```

salt.modules.boto_apigateway.update_api_model_schema(restApiId, modelName, schema, region=None, key=None, keyid=None, profile=None)

update the schema (in python dictionary format) for the given model in the given restApiId

CLI Example:
```shell
salt myminion boto_apigateway.update_api_model_schema restApiId modelName schema
```

salt.modules.boto_apigateway.update_usage_plan(plan_id, throttle=None, quota=None, region=None, key=None, keyid=None, profile=None)

Updates an existing usage plan with throttling and quotas

New in version 2017.7.0.

plan_id Id of the created usage plan

throttle A dictionary consisting of the following keys:

rateLimit requests per second at steady rate, float

burstLimit maximum number of requests per second, integer

quota A dictionary consisting of the following keys:

limit number of allowed requests per specified quota period [required if quota parameter is present]

offset number of requests to be subtracted from limit at the beginning of the period [optional]
period quota period, must be one of DAY, WEEK, or MONTH. [required if quota parameter is present

CLI Example:

```
salt myminion boto_apigateway.update_usage_plan plan_id='usage plan id' throttle='
...{"rateLimit": 10.0, "burstLimit": 10}'
```

21.9.37 salt.modules.boto_asg

Connection module for Amazon Autoscale Groups

New in version 2014.7.0.

**configuration** This module accepts explicit autoscale credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
```

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

```
asg.keyid: GKTADJGHEIQSXMKKRBJ08H
asg.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
asg.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

**depends** boto

**depends** boto3

**salt.modules.boto_asg.create**(name, launch_config_name, availability_zones, min_size, max_size, desired_capacity=None, load_balancers=None, default_cooldown=None, health_check_type=None, health_check_period=None, placement_group=None, vpc_zone_identifier=None, tags=None, termination_policies=None, suspended_processes=None, scaling_policies=None, scheduled_actions=None, region=None, notification_arn=None, notification_types=None, key=None, keyid=None, profile=None)

Create an autoscale group.

CLI example:

```
salt myminion boto_asg.create myasg mylc ["us-east-1a", "us-east-1e"] 1 10 load_
...balancers=['"myelb", "myelb2"]' tags='[{"key": "Name", value="myasg",
..."propagate_at_launch": True}]'
```
salt.modules.boto_asg.create_launch_configuration(name, image_id, key_name=None, vpc_id=None, vpc_name=None, security_groups=None, user_data=None, instance_type='m1.small', kernel_id=None, ramdisk_id=None, block_device_mappings=None, instance_monitoring=False, spot_price=None, instance_profile_name=None, ebs_optimized=False, associate_public_ip_address=None, volume_type=None, delete_on_termination=True, iops=None, use_block_device_types=False, region=None, key=None, keyid=None, profile=None)

Create a launch configuration.

CLI example:

call boto_asg.create_launch_configuration mylc image_id=ami-0b9c9f62 key_=name='mykey' security_groups='["mygroup"]' instance_type='c3.2xlarge'

salt.modules.boto_asg.delete(name, force=False, region=None, key=None, keyid=None, profile=None)

Delete an autoscale group.

CLI example:

call boto_asg.delete myasg region=us-east-1

salt.modules.boto_asg.delete_launch_configuration(name, region=None, key=None, keyid=None, profile=None)

Delete a launch configuration.

CLI example:

call boto_asg.delete_launch_configuration mylc

salt.modules.boto_asg.describe_launch_configuration(name, region=None, key=None, keyid=None, profile=None)

Dump details of a given launch configuration.

CLI example:

call boto_asg.describe_launch_configuration mylc

salt.modules.boto_asg.enter_standby(name, instance_ids, should_decrement_desired_capacity=False, region=None, key=None, keyid=None, profile=None)

Switch desired instances to StandBy mode

New in version 2016.11.0.

CLI example:

call boto_asg.enter_standby my_autoscale_group 'i-xxxxxx'
salt.modules.boto_asg.exists(name, region=None, key=None, keyid=None, profile=None)

Check to see if an autoscale group exists.

CLI example:
```
salt myminion boto_asg.exists myasg region=us-east-1
```

salt.modules.boto_asg.exit_standby(name, instance_ids, should_decrement_desired_capacity=False, region=None, key=None, keyid=None, profile=None)

Exit desired instances from StandBy mode

New in version 2016.11.0.

CLI example:
```
salt-call boto_asg.exit_standby my_autoscale_group_name ["i-xxxxxx"]
```

salt.modules.boto_asg.get_all_groups(region=None, key=None, keyid=None, profile=None)

Return all AutoScale Groups visible in the account (as a list of boto.ec2.autoscale.group.AutoScalingGroup).

New in version 2016.11.0.

CLI example:
```
salt-call boto_asg.get_all_groups region=us-east-1 --output yaml
```

salt.modules.boto_asg.get_all_launch_configurations(region=None, key=None, keyid=None, profile=None)

Fetch and return all Launch Configuration with details.

CLI example:
```
salt myminion boto_asg.get_all_launch_configurations
```

salt.modules.boto_asg.get_cloud_init_mime(cloud_init)

Get a mime multipart encoded string from a cloud-init dict. Currently supports boothooks, scripts and cloud-config.

CLI Example:
```
salt myminion boto.get_cloud_init_mime <cloud init>
```

salt.modules.boto_asg.get_config(name, region=None, key=None, keyid=None, profile=None)

Get the configuration for an autoscale group.

CLI example:
```
salt myminion boto_asg.get_config myasg region=us-east-1
```

salt.modules.boto_asg.get_instances(name, lifecycle_state='InService', health_status='Healthy', attribute='private_ip_address', attributes=None, region=None, key=None, keyid=None, profile=None)

return attribute of all instances in the named autoscale group.

CLI example:
```
salt-call boto_asg.get_instances my_autoscale_group_name
```
salt.modules.boto_asg.get_scaling_policy_arn(as_group, scaling_policy_name, region=None, key=None, keyid=None, profile=None)

Return the arn for a scaling policy in a specific autoscale group or None if not found. Mainly used as a helper method for boto_cloudwatch_alarm, for linking alarms to scaling policies.

CLI Example:
```
salt '*' boto_asg.get_scaling_policy_arn mygroup mypolicy
```

salt.modules.boto_asg.launch_configuration_exists(name, region=None, key=None, keyid=None, profile=None)

Check for a launch configuration’s existence.

CLI example:
```
salt myminion boto_asg.launch_configuration_exists mylc
```

salt.modules.boto_asg.list_groups(region=None, key=None, keyid=None, profile=None)

Return all AutoScale Groups visible in the account (as a list of names).

New in version 2016.11.0.

CLI example:
```
salt-call boto_asg.list_groups region=us-east-1
```

salt.modules.boto_asg.list_launch_configurations(region=None, key=None, keyid=None, profile=None)

List all Launch Configurations.

CLI example:
```
salt myminion boto_asg.list_launch_configurations
```

salt.modules.boto_asg.update(name, launch_config_name, availability_zones, min_size, max_size, desired_capacity=None, load_balancers=None, default_cooldown=None, health_check_type=None, health_check_period=None, placement_group=None, vpc_zone_identifier=None, tags=None, termination_policies=None, scaling_policies=None, scheduled_actions=None, notification_arn=None, notification_types=None, region=None, key=None, keyid=None, profile=None)

Update an autoscale group.

CLI example:
```
salt myminion boto_asg.update myasg mylc '[["us-east-1a", "us-east-1e"] 1 10 load_ balancers=['"myelb", "myelb2"] tags='[['key": "Name", value="myasg", \n"propagate_at_launch": True]]
```

21.9.38 salt.modules.boto_cfn

Connection module for Amazon Cloud Formation

New in version 2015.5.0.
**configuration**  This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

```
cfn.keyid: GKTADJGHEIQSXMKKRBJ08H
cfn.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
cfn.region: us-east-1
```

depends  boto

**salt.modules.boto_cfn.create**

```
name, template_body=None, template_url=None, parameters=None, notification_arns=None, disable_rollback=None, timeout_in_minutes=None, capabilities=None, tags=None, on_failure=None, stack_policy_body=None, stack_policy_url=None, region=None, key=None, keyid=None, profile=None)
```

Create a CFN stack.

CLI Example:

```
salt myminion boto_cfn.create mystack template_url='https://s3.amazonaws.com/bucket/template.cft' region=us-east-1
```

**salt.modules.boto_cfn.delete**

```
name, region=None, key=None, keyid=None, profile=None)
```

Delete a CFN stack.

CLI Example:

```
salt myminion boto_cfn.delete mystack region=us-east-1
```

**salt.modules.boto_cfn.describe**

```
name, region=None, key=None, keyid=None, profile=None)
```

Describe a stack.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_cfn.describe mystack region=us-east-1
```

**salt.modules.boto_cfn.exists**

```
name, region=None, key=None, keyid=None, profile=None)
```

Check to see if a stack exists.

CLI Example:

```
salt myminion boto_cfn.exists mystack region=us-east-1
```

**salt.modules.boto_cfn.get_template**

```
name, region=None, key=None, keyid=None, profile=None)
```

Check to see if attributes are set on a CFN stack.

CLI Example:

```
salt myminion boto_cfn.get_template mystack
```
Update a CFN stack.
New in version 2015.8.0.

CLI Example:

```shell
salt myminion boto_cfn.update_stack mystack template_url='https://s3.amazonaws.com/bucket/template.cft' region=us-east-1
```

Validate cloudformation template
New in version 2015.8.0.

CLI Example:

```shell
salt myminion boto_cfn.validate_template mystack-template
```

salt.modules.boto_cfn.update_stack

```
(name, template_body=None, template_url=None, parameters=None, notification_arns=None, disable_rollback=False, timeout_in_minutes=None, capabilities=None, tags=None, use_previous_template=None, stack_policy_during_update_body=None, stack_policy_during_update_url=None, stack_policy_body=None, stack_policy_url=None, region=None, key=None, keyid=None, profile=None)
```

salt.modules.boto_cfn.validate_template

```
(template_body=None, template_url=None, region=None, key=None, keyid=None, profile=None)
```

21.9.39 salt.modules.boto_cloudfront

Connection module for Amazon CloudFront
New in version 2018.3.0.

```python
depends boto3
```

configuration This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles or it can read them from the ~/.aws/credentials file or from these environment variables: AWS_ACCESS_KEY_ID, AWS_SECRET_ACCESS_KEY. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

```python
cloudfront.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudfront.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```python
cloudfront.region: us-east-1
```

If a region is not specified, the default is us-east-1.
Salt Documentation, Release 3000.2

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a
string to pull from pillars or minion config:
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
region: us-east-1

salt.modules.boto_cloudfront.create_distribution(name,
config,
tags=None,
region=None, key=None, keyid=None,
profile=None)
Create a CloudFront distribution with the given name, config, and (optionally) tags.
name Name for the CloudFront distribution
config Configuration for the distribution
tags Tags to associate with the distribution
region Region to connect to
key Secret key to use
keyid Access key to use
profile A dict with region, key, and keyid, or a pillar key (string) that contains such a dict.
CLI Example:
salt myminion boto_cloudfront.create_distribution name=mydistribution
,→profile=awsprofile
config='{"Comment":"partial configuration",
,→"Enabled":true}'

salt.modules.boto_cloudfront.export_distributions(region=None,
key=None,
keyid=None, profile=None)
Get details of all CloudFront distributions. Produces results that can be used to create an SLS file.
CLI Example:
salt-call boto_cloudfront.export_distributions --out=txt |
,→local: //" > cloudfront_distributions.sls

salt.modules.boto_cloudfront.get_distribution(name,
region=None,
keyid=None, profile=None)
Get information about a CloudFront distribution (configuration, tags) with a given name.

sed "s/

key=None,

name Name of the CloudFront distribution
region Region to connect to
key Secret key to use
keyid Access key to use
profile A dict with region, key, and keyid, or a pillar key (string) that contains such a dict.
CLI Example:
salt myminion boto_cloudfront.get_distribution name=mydistribution
,→profile=awsprofile

21.9. execution modules

1347


Salt Documentation, Release 3000.2

salt.modules.boto_cloudfront.update_distribution(name,
config,
tags=None,
region=None, key=None, keyid=None,
profile=None)
Update the config (and optionally tags) for the CloudFront distribution with the given name.
name Name of the CloudFront distribution
config Configuration for the distribution
tags Tags to associate with the distribution
region Region to connect to
key Secret key to use
keyid Access key to use
profile A dict with region, key, and keyid, or a pillar key (string) that contains such a dict.
CLI Example:
salt myminion boto_cloudfront.update_distribution name=mydistribution
,→profile=awsprofile
config='{"Comment":"partial configuration",
,→"Enabled":true}'

21.9.40 salt.modules.boto_cloudtrail module
Connection module for Amazon CloudTrail
New in version 2016.3.0.
depends
• boto
• boto3
The dependencies listed above can be installed via package or pip.
configuration This module accepts explicit Lambda credentials but can also utilize IAM roles assigned
to the instance through Instance Profiles. Dynamic credentials are then automatically obtained
from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:
cloudtrail.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudtrail.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

A region may also be specified in the configuration:
cloudtrail.region: us-east-1

If a region is not specified, the default is us-east-1.
It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a
string to pull from pillars or minion config:

1348

Chapter 21. Salt Module Reference


salt.modules.boto_cloudtrail.add_tags(Name, region=None, key=None, keyid=None, profile=None, **kwargs)

Add tags to a trail

Returns {tagged: true} if the trail was tagged and returns {tagged: False} if the trail was not tagged.

CLI Example:

```
salt myminion boto_cloudtrail.add_tags my_trail tag_a=tag_value tag_b=tag_value
```

salt.modules.boto_cloudtrail.create(Name, S3BucketName, S3KeyPrefix=None, SnsTopicName=None, IncludeGlobalServiceEvents=None, IsMultiRegionTrail=None, EnableLogFileValidation=None, CloudWatchLogsLogGroupArn=None, CloudWatchLogsRoleArn=None, KmsKeyId=None, region=None, key=None, keyid=None, profile=None)

Given a valid config, create a trail.

Returns {created: true} if the trail was created and returns {created: False} if the trail was not created.

CLI Example:

```
salt myminion boto_cloudtrail.create my_trail my_bucket
```

salt.modules.boto_cloudtrail.delete(Name, region=None, key=None, keyid=None, profile=None)

Given a trail name, delete it.

Returns {deleted: true} if the trail was deleted and returns {deleted: false} if the trail was not deleted.

CLI Example:

```
salt myminion boto_cloudtrail.delete mytrail
```

salt.modules.boto_cloudtrail.describe(Name, region=None, key=None, keyid=None, profile=None)

Given a trail name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_cloudtrail.describe mytrail
```

salt.modules.boto_cloudtrail.exists(Name, region=None, key=None, keyid=None, profile=None)

Given a trail name, check to see if the given trail exists.

Returns True if the given trail exists and returns False if the given trail does not exist.

CLI Example:

```
salt myminion boto_cloudtrail.exists mytrail
```

salt.modules.boto_cloudtrail.list(region=None, key=None, keyid=None, profile=None)

List all trails
Returns list of trails

CLI Example:

```
policies:
  - {...}
  - {...}
```

```python
salt.modules.boto_cloudtrail.list_tags(Name, region=None, key=None, keyid=None, profile=None)
```

List tags of a trail

Returns

- {...}
- {...}

Return type tags

CLI Example:

```
salt myminion boto_cloudtrail.list_tags my_trail
```

```python
salt.modules.boto_cloudtrail.remove_tags(Name, region=None, key=None, keyid=None, profile=None, **kwargs)
```

Remove tags from a trail

Returns {tagged: true} if the trail was tagged and returns {tagged: False} if the trail was not tagged.

CLI Example:

```
salt myminion boto_cloudtrail.remove_tags my_trail tag_a=tag_value tag_b=tag_value
```

```python
salt.modules.boto_cloudtrail.start_logging(Name, region=None, key=None, keyid=None, profile=None)
```

Start logging for a trail

Returns {started: true} if the trail was started and returns {started: False} if the trail was not started.

CLI Example:

```
salt myminion boto_cloudtrail.start_logging my_trail
```

```python
salt.modules.boto_cloudtrail.status(Name, region=None, key=None, keyid=None, profile=None)
```

Given a trail name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_cloudtrail.describe mytrail
```

```python
salt.modules.boto_cloudtrail.stop_logging(Name, region=None, key=None, keyid=None, profile=None)
```

Stop logging for a trail

Returns {stopped: true} if the trail was stopped and returns {stopped: False} if the trail was not stopped.

CLI Example:
salt myminion boto_cloudtrail.stop_logging my_trail

call.modules.boto_cloudtrail.update(Name, S3BucketName, S3KeyPrefix=None, SnsTopicName=None, IncludeGlobalServiceEvents=None, IsMultiRegionTrail=None, EnableLogFileValidation=None, CloudWatchLogsLogGroupArn=None, CloudWatchLogsRoleArn=None, KmsKeyId=None, region=None, key=None, keyid=None, profile=None)

Given a valid config, update a trail.

Returns {created: true} if the trail was created and returns {created: False} if the trail was not created.

CLI Example:
salt myminion boto_cloudtrail.update my_trail my_bucket

21.9.41 salt.modules.boto_cloudwatch

Connection module for Amazon CloudWatch

New in version 2014.7.0.

configuration This module accepts explicit credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

cloudwatch.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

A region may also be specified in the configuration:

cloudwatch.region: us-east-1

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1

depends boto

call.modules.boto_cloudwatch.convert_to_arn(arns, region=None, key=None, keyid=None, profile=None)

Convert a list of strings into actual arns. Converts convenience names such as 'scaling_policy:…'

CLI Example:
salt '*' convert_to_arn 'scaling_policy:'

21.9. execution modules
salt.modules.boto_cloudwatch.create_or_update_alarm(connection=None, name=None, metric=None, namespace=None, statistic=None, comparison=None, threshold=None, period=None, evaluation_periods=None, unit=None, description=None, dimensions=None, alarm_actions=None, insufficient_data_actions=None, ok_actions=None, region=None, key=None, keyid=None, profile=None)

Create or update a cloudwatch alarm.

Params are the same as: https://boto.readthedocs.io/en/latest/ref/cloudwatch.html#boto.ec2.cloudwatch.AlarmsMetricAlarm.

Dimensions must be a dict. If the value of Dimensions is a string, it will be json decoded to produce a dict. alarm_actions, insufficient_data_actions, and ok_actions must be lists of string. If the passed-in value is a string, it will be split on "," to produce a list. The strings themselves for alarm_actions, insufficient_data_actions, and ok_actions must be Amazon resource names (ARN's); however, this method also supports an arn lookup notation, as follows:

    arn:aws:... ARN as per http://docs.aws.amazon.com/general/latest/gr/aws-arns-and-namespaces.html scaling_policy:<as_name>::<scaling_policy_name> The named autoscale group scaling policy, for the named group (e.g. scaling_policy:my-asg:ScaleDown)

This is convenient for setting up autoscaling as follows. First specify a boto_asg.present state for an ASG with scaling_policies, and then set up boto_cloudwatch_alarm.present states which have alarm_actions that reference the scaling_policy.

CLI example:

    salt myminion boto_cloudwatch.create_alarm name=myalarm ... region=us-east-1

salt.modules.boto_cloudwatch.delete_alarm(name, region=None, key=None, keyid=None, profile=None)

Delete a cloudwatch alarm

CLI example to delete a queue:

    salt myminion boto_cloudwatch.delete_alarm myalarm region=us-east-1

salt.modules.boto_cloudwatch.get_alarm(name, region=None, key=None, keyid=None, profile=None)

Get alarm details. Also can be used to check to see if an alarm exists.

CLI example:

    salt myminion boto_cloudwatch.get_alarm myalarm region=us-east-1

salt.modules.boto_cloudwatch.get_all_alarms(region=None, prefix=None, key=None, keyid=None, profile=None)

Get all alarm details. Produces results that can be used to create an sls file.

If prefix parameter is given, alarm names in the output will be prepended with the prefix; alarms that have the prefix will be skipped. This can be used to convert existing alarms to be managed by salt, as follows:

1. Make a "backup" of all existing alarms $ salt-call boto_cloudwatch.get_all_alarms -out=txt | sed "s/local: //" > legacy_alarms.sls
2. Get all alarms with new prefixed names
   $ salt-call boto_cloudwatch.get_all_alarms "prefix=""MANAGED BY SALT"" --out=txt | sed "s/local: //" > managed_alarms.sls

3. Insert the managed alarms into cloudwatch
   $ salt-call state.template managed_alarms.sls

4. Manually verify that the new alarms look right

5. Delete the original alarms
   $ sed s/present/absent/ legacy_alarms.sls > remove_legacy_alarms.sls
   $ salt-call state.template remove_legacy_alarms.sls

6. Get all alarms again, verify no changes
   $ salt-call boto_cloudwatch.get_all_alarms --out=txt | sed "s/local: //" > final_alarms.sls
   $ diff final_alarms.sls managed_alarms.sls

CLI example:

```
salt myminion boto_cloudwatch.get_all_alarms region=us-east-1 --out=txt
```

### 21.9.42 salt.modules.boto_cloudwatch_event module

Connection module for Amazon CloudWatch Events

New in version 2016.11.0.

**configuration** This module accepts explicit credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
```

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

```
cloudwatch_event.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch_event.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
cloudwatch_event.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQXSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

**depends** boto3

```
salt.modules.boto_cloudwatch_event.create_or_update(Name, ScheduleExpression= None, EventPattern= None, Description= None, RoleArn= None, State= None, region= None, key= None, keyid= None, profile= None)
```

Given a valid config, create an event rule.

Returns `created: true` if the rule was created and returns `created: False` if the rule was not created.
**CLI Example:**

```bash
salt myminion boto_cloudwatch_event.create_or_update my_rule
```

**salt.modules.boto_cloudwatch_event.delete**(Name, region=None, key=None, keyid=None, profile=None)

Given a rule name, delete it.

Returns {deleted: true} if the rule was deleted and returns {deleted: false} if the rule was not deleted.

**CLI Example:**

```bash
salt myminion boto_cloudwatch_event.delete myrule
```

**salt.modules.boto_cloudwatch_event.describe**(Name, region=None, key=None, keyid=None, profile=None)

Given a rule name describe its properties.

Returns a dictionary of interesting properties.

**CLI Example:**

```bash
salt myminion boto_cloudwatch_event.describe myrule
```

**salt.modules.boto_cloudwatch_event.exists**(Name, region=None, key=None, keyid=None, profile=None)

Given a rule name, check to see if the given rule exists.

Returns True if the given rule exists and returns False if the given rule does not exist.

**CLI example:**

```bash
salt myminion boto_cloudwatch_event.exists myevent region=us-east-1
```

**salt.modules.boto_cloudwatch_event.list_rules**(region=None, key=None, keyid=None, profile=None)

List, with details, all Cloudwatch Event rules visible in the current scope.

**CLI example:**

```bash
salt myminion boto_cloudwatch_event.list_rules region=us-east-1
```

**salt.modules.boto_cloudwatch_event.list_targets**(Rule, region=None, key=None, keyid=None, profile=None)

Given a rule name list the targets of that rule.

Returns a dictionary of interesting properties.

**CLI Example:**

```bash
salt myminion boto_cloudwatch_event.list_targets myrule
```

**salt.modules.boto_cloudwatch_event.put_targets**(Rule, Targets, region=None, key=None, keyid=None, profile=None)

Add the given targets to the given rule

Returns a dictionary describing any failures.

**CLI Example:**

```bash
salt myminion boto_cloudwatch_event.put_targets myrule [{{'Id': 'target1', 'Arn': 'arn:***'}}]
```
salt.modules.boto_cloudwatch_event.remove_targets(Rule, Ids, region=None, key=None, keyid=None, profile=None)

Given a rule name remove the named targets from the target list
Returns a dictionary describing any failures.

CLI Example:
salt myminion boto_cloudwatch_event.remove_targets myrule ['Target1']

21.9.43 salt.modules.boto_cognitoidentity module

Connection module for Amazon CognitoIdentity
New in version 2016.11.0.

configuration This module accepts explicit CognitoIdentity credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

cognitoidentity.keyid: GKTADJGHEIQSXMKKRBJ08H
cognitoidentity.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

A region may also be specified in the configuration:

cognitoidentity.region: us-east-1

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1

Changed in version 2015.8.0: All methods now return a dictionary. Create, delete, set, and update methods return:

created: true

or

created: false
error:
    message: error message

Request methods (e.g., describe_identity_pools) return:

identity_pools:
    - {...}
    - {...}
or

```
error:
   message: error message
```

```
depends boto3
```

```
salt.modules.boto_cognitoidentity.create_identity_pool(IdentityPoolName, AllowUnauthenticatedIdentities=False, SupportedLoginProviders=None, DeveloperProviderName=None, OpenIdConnectProviderARNs=None, region=None, key=None, keyid=None, profile=None)
```

Creates a new identity pool. All parameters except for IdentityPoolName is optional. SupportedLoginProviders should be a dictionary mapping provider names to provider app IDs. OpenIdConnectProviderARNs should be a list of OpenID Connect provider ARNs.

Returns the created identity pool if successful

CLI Example:

```
salt myminion boto_cognitoidentity.create_identity_pool my_id_pool_name
   DeveloperProviderName=custom_developer_provider
```

```
salt.modules.boto_cognitoidentity.delete_identity_pools(IdentityPoolName, IdentityPoolId=None, region=None, key=None, keyid=None, profile=None)
```

Given an identity pool name, (optionally if an identity pool id is given, the given name will be ignored)

Deletes all identity pools matching the given name, or the specific identity pool with the given identity pool id.

CLI Example:

```
salt myminion boto_cognitoidentity.delete_identity_pools my_id_pool_name
salt myminion boto_cognitoidentity.delete_identity_pools 'my_id_pool_id'
```

```
salt.modules.boto_cognitoidentity.describe_identity_pools(IdentityPoolName, IdentityPoolId=None, region=None, key=None, keyid=None, profile=None)
```

Given an identity pool name, (optionally if an identity pool id is given, the given name will be ignored)

Returns a list of matched identity pool name’s pool properties

CLI Example:

```
salt myminion boto_cognitoidentity.describe_identity_pools my_id_pool_name
salt myminion boto_cognitoidentity.describe_identity_pools 'my_id_pool_id'
```
salt.modules.boto_cognitoidentity.get_identity_pool_roles(IdentityPoolName, IdentityPoolId=None, region=None, key=None, keyid=None, profile=None)

Given an identity pool name, (optionally if an identity pool id if given, the given name will be ignored)

Returns a list of matched identity pool name's associated roles

CLI Example:

```
salt myminion boto_cognitoidentity.get_identity_pool_roles my_id_pool_name
salt myminion boto_cognitoidentity.get_identity_pool_roles '' IdentityPoolId=my_id_pool_id
```

salt.modules.boto_cognitoidentity.set_identity_pool_roles(IdentityPoolId, AuthenticatedRole=None, UnauthenticatedRole=None, region=None, key=None, keyid=None, profile=None)

Given an identity pool id, set the given AuthenticatedRole and UnauthenticatedRole (the Role can be an iam arn, or a role name) If AuthenticatedRole or UnauthenticatedRole is not given, the authenticated and/or the unauthenticated role associated previously with the pool will be cleared.

Returns set True if successful, set False if unsuccessful with the associated errors.

CLI Example:

```
salt myminion boto_cognitoidentity.set_identity_pool_roles my_id_pool_roles # this clears the roles
salt myminion boto_cognitoidentity.set_identity_pool_roles my_id_pool_id AuthenticatedRole=my_auth_role UnauthenticatedRole=my_unauth_role # this set both roles
salt myminion boto_cognitoidentity.set_identity_pool_roles my_id_pool_id AuthenticatedRole=my_auth_role UnauthenticatedRole=my_unauth_role # this will set the auth role and clear the unauth role
salt myminion boto_cognitoidentity.set_identity_pool_roles my_id_pool_id UnauthenticatedRole=my_unauth_role # this will set the unauth role and clear the auth role
```

salt.modules.boto_cognitoidentity.update_identity_pool(IdentityPoolId, IdentityPoolName=None, AllowUnauthenticatedIdentities=False, SupportedLoginProviders=None, DeveloperProviderName=None, OpenIdConnectProviderARNs=None, region=None, key=None, keyid=None, profile=None)

Updates the given IdentityPoolId’s properties. All parameters except for IdentityPoolId, is optional. SupportedLoginProviders should be a dictionary mapping provider names to provider app IDs. OpenIdConnectProviderARNs should be a list of OpenID Connect provider ARNs.

To clear SupportedLoginProviders pass '[]'

To clear OpenIdConnectProviderARNs pass '[]'
boto3 api prevents DeveloperProviderName to be updated after it has been set for the first time.

Returns the updated identity pool if successful

CLI Example:

```bash
salt myminion boto_cognito_identity.update_identity_pool my_id_pool_id my_id_pool_name
   DeveloperProviderName=custom_developer
```

### 21.9.44 salt.modules.boto_datapipeline module

Connection module for Amazon Data Pipeline

New in version 2016.3.0.

```bash
depends boto3
```

salt.modules.boto_datapipeline.activate_pipeline(pipeline_id, region=None, key=None, keyid=None, profile=None)

Start processing pipeline tasks. This function is idempotent.

CLI example:

```bash
salt myminion boto_datapipeline.activate_pipeline my_pipeline_id
```

salt.modules.boto_datapipeline.create_pipeline(name, unique_id, description='', region=None, key=None, keyid=None, profile=None)

Create a new, empty pipeline. This function is idempotent.

CLI example:

```bash
salt myminion boto_datapipeline.create_pipeline my_name my_unique_id
```

salt.modules.boto_datapipeline.delete_pipeline(pipeline_id, region=None, key=None, keyid=None, profile=None)

Delete a pipeline, its pipeline definition, and its run history. This function is idempotent.

CLI example:

```bash
salt myminion boto_datapipeline.delete_pipeline my_pipeline_id
```

salt.modules.boto_datapipeline.describe_pipelines(pipeline_ids, region=None, key=None, keyid=None, profile=None)

Retrieve metadata about one or more pipelines.

CLI example:

```bash
salt myminion boto_datapipeline.describe_pipelines ['my_pipeline_id']
```

salt.modules.boto_datapipeline.get_pipeline_definition(pipeline_id, version='latest', region=None, key=None, keyid=None, profile=None)

Get the definition of the specified pipeline.

CLI example:
salt modules.boto_datapipeline.list_pipelines

Get a list of pipeline ids and names for all pipelines.

CLI Example:
salt myminion boto_datapipeline.list_pipelines profile=myprofile

salt.modules.boto_datapipeline.pipeline_id_from_name

Get the pipeline id, if it exists, for the given name.

CLI example:
salt myminion boto_datapipeline.pipeline_id_from_name my_pipeline_name

salt.modules.boto_datapipeline.put_pipeline_definition

Add tasks, schedules, and preconditions to the specified pipeline. This function is idempotent and will replace an existing definition.

CLI example:
salt myminion boto_datapipeline.put_pipeline_definition my_pipeline_id my_pipeline_objects

21.9.45 salt.modules.boto_dynamodb

Connection module for Amazon DynamoDB

New in version 2015.5.0.

configuration This module accepts explicit DynamoDB credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

A region may also be specified in the configuration:

region: us-east-1

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:
depends boto

salt.modules.boto_dynamodb.create_global_secondary_index(table_name, global_index, region=None, key=None, keyid=None, profile=None)

Creates a single global secondary index on a DynamoDB table.

CLI Example: .. code-block:: bash

    salt myminion boto_dynamodb.create_global_secondary_index table_name / index_name

salt.modules.boto_dynamodb.create_table(table_name, region=None, key=None, keyid=None, profile=None, read_capacity_units=None, write_capacity_units=None, hash_key=None, hash_key_data_type=None, range_key=None, range_key_data_type=None, local_indexes=None, global_indexes=None)

Creates a DynamoDB table.

CLI Example:

    salt myminion boto_dynamodb.create_table table_name / region=us-east-1 / hash_key=id / hash_key_data_type=N / range_key=created_at / range_key_data_type=N / read_capacity_units=1 / write_capacity_units=1

salt.modules.boto_dynamodb.delete(table_name, region=None, key=None, keyid=None, profile=None)

Delete a DynamoDB table.

CLI Example:

    salt myminion boto_dynamodb.delete table_name region=us-east-1

salt.modules.boto_dynamodb.describe(table_name, region=None, key=None, keyid=None, profile=None)

Describe a DynamoDB table.

CLI example:

    salt myminion boto_dynamodb.describe table_name region=us-east-1

salt.modules.boto_dynamodb.exists(table_name, region=None, key=None, keyid=None, profile=None)

Check to see if a table exists.

CLI Example:
```
salt myminion boto_dynamodb.exists table_name region=us-east-1
```

```
salt.modules.boto_dynamodb.extract_index(index_data, global_index=False)
Instantiates and returns an AllIndex object given a valid index configuration

CLI Example: salt myminion boto_dynamodb.extract_index index
```

```
salt.modules.boto_dynamodb.update(table_name, throughput=None, global_indexes=None, region=None, key=None, keyid=None, profile=None)
Update a DynamoDB table.

CLI example:
```
salt myminion boto_dynamodb.update table_name region=us-east-1
```

```
salt.modules.boto_dynamodb.update_global_secondary_index(table_name, global_indexes, region=None, key=None, keyid=None, profile=None)
Updates the throughput of the given global secondary indexes.

CLI Example: .. code-block:: bash
```
```
salt myminion boto_dynamodb.update_global_secondary_index table_name / indexes
```

### 21.9.46 salt.modules.boto_ec2

Connection module for Amazon EC2

New in version 2015.8.0.

**configuration** This module accepts explicit EC2 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available [here](#).

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

```
ec2.keyid: GKTADJGHEIQSXMKKRBJ08H
ec2.key: askdjghsdfjkgwUjasdfklkdgjsdfjajkghs
```

A region may also be specified in the configuration:

```
ec2.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid, and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkgwUjasdfklkdgjsdfjajkghs
  region: us-east-1
```

**depends** boto

```
salt.modules.boto_ec2.allocate_eip_address(domain=None, region=None, key=None, keyid=None, profile=None)
Allocates a new Elastic IP address and associate it with your account.
```

21.9. execution modules
**domain** (string) Optional param - if set to exactly 'vpc', the address will be allocated to the VPC. The default simply maps the EIP to your account container.

**returns** (dict) dict of 'interesting' information about the newly allocated EIP, with probably the most interesting keys being 'public_ip'; and 'allocation_id' iff 'domain=vpc' was passed.

CLI Example:
```
salt-call boto_ec2.allocate_eip_address domain=vpc
```

New in version 2016.3.0.

salt.modules.boto_ec2.**assign_private_ip_addresses**(network_interface_name=None, network_interface_id=None, private_ip_addresses=None, secondary_private_ip_address_count=None, allow_reassignment=False, region=None, key=None, keyid=None, profile=None)

Assigns one or more secondary private IP addresses to a network interface.

**network_interface_id** (string) - ID of the network interface to associate the IP with (exclusive with 'network_interface_name')

**network_interface_name** (string) - Name of the network interface to associate the IP with (exclusive with 'network_interface_id')

**private_ip_addresses** (list) - Assigns the specified IP addresses as secondary IP addresses to the network interface (exclusive with 'secondary_private_ip_address_count')

**secondary_private_ip_address_count** (int) - The number of secondary IP addresses to assign to the network interface. (exclusive with 'private_ip_addresses')

**allow_reassociation** (bool) – Allow a currently associated EIP to be re-associated with the new instance or interface.

**returns** (bool) - True on success, False on failure.

CLI Example:
```
salt myminion boto_ec2.assign_private_ip_addresses network_interface_name=my_eni
to_private_ip_addresses=private_ip
salt myminion boto_ec2.assign_private_ip_addresses network_interface_name=my_eni
to_secondary_private_ip_address_count=2
```

New in version 2017.7.0.

salt.modules.boto_ec2.**associate_eip_address**(instance_id=None, instance_name=None, public_ip=None, allocation_id=None, network_interface_id=None, network_interface_name=None, private_ip_address=None, allow_reassociation=False, region=None, key=None, keyid=None, profile=None)

Associate an Elastic IP address with a currently running instance or a network interface. This requires exactly one of either 'public_ip' or 'allocation_id', depending on whether you’re associating a VPC address or a plain EC2 address.

**instance_id** (string) – ID of the instance to associate with (exclusive with 'instance_name')

**instance_name** (string) – Name tag of the instance to associate with (exclusive with 'instance_id')
public_ip (string) – Public IP address, for standard EC2 based allocations.

allocation_id (string) – Allocation ID for a VPC-based EIP.

network_interface_id (string) - ID of the network interface to associate the EIP with

network_interface_name (string) - Name of the network interface to associate the EIP with

private_ip_address (string) – The primary or secondary private IP address to associate with the Elastic IP address.

allow_reassociation (bool) – Allow a currently associated EIP to be re-associated with the new instance or interface.

returns (bool) - True on success, False on failure.

CLI Example:
salt myminion boto_ec2.associate_eip_address instance_name=bubba.ho.tep
allocation_id=eipalloc-ef382c8a

New in version 2016.3.0.

salt.modules.boto_ec2.attach_network_interface(device_index, name=None, network_interface_id=None, instance_name=None, instance_id=None, region=None, key=None, keyid=None, profile=None)

Attach an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:
salt myminion boto_ec2.attach_network_interface my_eni instance_name=salt-master
device_index=0

salt.modules.boto_ec2.attach_volume(volume_id, instance_id, device, region=None, key=None, keyid=None, profile=None)

Attach an EBS volume to an EC2 instance..

volume_id (string) – The ID of the EBS volume to be attached.

instance_id (string) – The ID of the EC2 instance to attach the volume to.

device (string) – The device on the instance through which the volume is exposed (e.g. /dev/sdh)

returns (bool) - True on success, False on failure.

CLI Example:
salt-call boto_ec2.attach_volume vol-12345678 i-87654321 /dev/sdh

salt.modules.boto_ec2.create_image(ami_name, instance_id=None, instance_name=None, tags=None, region=None, key=None, keyid=None, profile=None, description=None, no_reboot=False, dry_run=False, filters=None)

Given instance properties that define exactly one instance, create AMI and return AMI-id.

CLI Examples:
salt myminion boto_ec2.create_image ami_name instance_name=myinstance
salt myminion boto_ec2.create_image another_ami_name tags="\"mytag\": "value\"\"
.description='this is my ami'
salt.modules.boto_ec2.create_key(key_name, save_path, region=None, key=None, keyid=None, profile=None)

Creates a key and saves it to a given path. Returns the private key.

CLI Example:
```
salt myminion boto_ec2.create_key mykey /root/
```

salt.modules.boto_ec2.create_network_interface(name, subnet_id=None, subnet_name=None, private_ip_address=None, description=None, groups=None, region=None, key=None, keyid=None, profile=None)

Create an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:
```
salt myminion boto_ec2.create_network_interface my_eni subnet-12345678
        --description=my_eni groups=['my_group']
```

salt.modules.boto_ec2.create_tags(resource_ids, tags, region=None, key=None, keyid=None, profile=None)

Create new metadata tags for the specified resource ids.

New in version 2016.11.0.

resource_ids (string) or (list) – List of resource IDs. A plain string will be converted to a list of one element.

tags (dict) – Dictionary of name/value pairs. To create only a tag name, pass " as the value.

returns (bool) - True on success, False on failure.

CLI Example:
```
salt-call boto_ec2.create_tags vol-12345678 '{"Name": "myVolume01"}'
```

salt.modules.boto_ec2.create_volume(zone_name, size=None, snapshot_id=None, volume_type=None, iops=None, encrypted=False, kms_key_id=None, wait_for_creation=False, region=None, key=None, keyid=None, profile=None)

Create an EBS volume to an availability zone.

zone_name (string) – The Availability zone name of the EBS volume to be created.

size (int) – The size of the new volume, in GiB. If you’re creating the volume from a snapshot and don’t specify a volume size, the default is the snapshot size.

snapshot_id (string) – The snapshot ID from which the new volume will be created.

volume_type

(string) - The type of the volume. Valid volume types for AWS can be found here: http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EBSVolumeTypes.html

iops (int) - The provisioned IOPS you want to associate with this volume.

encrypted (bool) - Specifies whether the volume should be encrypted.
kms_key_id

(string) - If encrypted is True, this KMS Key ID may be specified to encrypt volume with this key e.g.:
arn:aws:kms:us-east-1:012345678910:key/abcd1234-a123-456a-a12b-a123b4cd56ef

wait_for_creation (bool) - Whether or not to wait for volume creation to complete.

returns (string) - created volume id on success, error message on failure.

CLI Example:

```
salt-call boto_ec2.create_volume us-east-1a size=10
salt-call boto_ec2.create_volume us-east-1a snapshot_id=snap-0123abcd
```

```
salt.modules.boto_ec2.delete_key(key_name, region=None, key=None, keyid=None, profile=None)
```

Deletes a key. Always returns True

CLI Example:

```
salt myminion boto_ec2.delete_key mykey
```

```
salt.modules.boto_ec2.delete_network_interface(name=None, network_interface_id=None, region=None, key=None, keyid=None, profile=None)
```

Create an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_ec2.create_network_interface my_eni subnet-123450
←description=my_eni groups=['my_group']
```

```
salt.modules.boto_ec2.delete_tags(resource_ids, tags, region=None, key=None, keyid=None, profile=None)
```

Delete metadata tags for the specified resource ids.

New in version 2016.11.0.

resource_ids (string) or (list) – List of resource IDs. A plain string will be converted to a list of one element.

tags

(dict) or (list) – Either a dictionary containing name/value pairs or a list containing just tag names.

If you pass in a dictionary, the values must match the actual tag values or the tag will not be deleted.

If you pass in a value of None for the tag value, all tags with that name will be deleted.

returns (bool) - True on success, False on failure.

CLI Example:

```
salt-call boto_ec2.delete_tags vol-12345678 '{"Name": "myVolume01"}'}
salt-call boto_ec2.delete_tags vol-12345678 [{'"Name","MountPoint"}]
```

```
salt.modules.boto_ec2.delete_volume(volume_id, instance_id=None, device=None, force=False, region=None, key=None, keyid=None, profile=None)
```

Detach an EBS volume from an EC2 instance.

New in version 2016.11.0.

volume_id (string) – The ID of the EBS volume to be deleted.

force (bool) – Forces deletion even if the device has not yet been detached from its instance.
returns (bool) - True on success, False on failure.

CLI Example:

```
salt-call boto_ec2.delete_volume vol-12345678
```

```salt.modules.boto_ec2.detach_network_interface(name=None, network_interface_id=None, attachment_id=None, force=False, region=None, key=None, keyid=None, profile=None)```

Detach an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_ec2.detach_network_interface my_eni
```

```salt.modules.boto_ec2.detach_volume(volume_id, instance_id=None, device=None, force=False, wait_for_detachement=False, region=None, key=None, keyid=None, profile=None)```

Detach an EBS volume from an EC2 instance.

New in version 2016.11.0.

**volume_id** (string) – The ID of the EBS volume to be detached.

**instance_id** (string) – The ID of the EC2 instance from which it will be detached.

**device** (string) – The device on the instance through which the volume is exposed (e.g. /dev/sdh)

**force**

(bool) – Forces detachment if the previous detachment attempt did not occur cleanly. This option can lead to data loss or a corrupted file system. Use this option only as a last resort to detach a volume from a failed instance. The instance will not have an opportunity to flush file system caches nor file system meta data. If you use this option, you must perform file system check and repair procedures.

**wait_for_detachement** (bool) - Whether or not to wait for volume detachment to complete.

returns (bool) - True on success, False on failure.

CLI Example:

```
salt-call boto_ec2.detach_volume vol-12345678 i-87654321
```

```salt.modules.boto_ec2.disassociate_eip_address(public_ip=None, association_id=None, region=None, key=None, keyid=None, profile=None)```

Disassociate an Elastic IP address from a currently running instance. This requires exactly one of either 'association_id' or 'public_ip', depending on whether you’re dealing with a VPC or EC2 Classic address.

**public_ip** (string) – Public IP address, for EC2 Classic allocations.

**association_id** (string) – Association ID for a VPC-bound EIP.

returns (bool) - True on success, False on failure.

CLI Example:

```
salt myminion boto_ec2.disassociate_eip_address association_id=eipassoc-e3ba2d16
```
New in version 2016.3.0.

**salt.modules.boto_ec2.exists** *(instance_id=None, name=None, tags=None, region=None, key=None, keyid=None, profile=None, in_states=None, filters=None)*

Given an instance id, check to see if the given instance id exists.

Returns True if the given instance with the given id, name, or tags exists; otherwise, False is returned.

CLI Example:
```
salt myminion boto_ec2.exists myinstance
```

**salt.modules.boto_ec2.find_images** *(ami_name=None, executable_by=None, owners=None, image_ids=None, tags=None, region=None, key=None, keyid=None, profile=None, return_objs=False)*

Given image properties, find and return matching AMI ids

CLI Examples:
```
salt myminion boto_ec2.find_images tags='{"mytag": "value"}'
```

**salt.modules.boto_ec2.find_instances** *(instance_id=None, name=None, tags=None, region=None, key=None, keyid=None, profile=None, return_objs=False, in_states=None, filters=None)*

Given instance properties, find and return matching instance ids

CLI Examples:
```
salt myminion boto_ec2.find_instances # Lists all instances
salt myminion boto_ec2.find_instances name=myinstance
salt myminion boto_ec2.find_instances tags='{"mytag": "value"}'
salt myminion boto_ec2.find_instances filters='{"vpc-id": "vpc-12345678"}''
```

**salt.modules.boto_ec2.get_all_eip_addresses** *(addresses=None, allocation_ids=None, region=None, key=None, keyid=None, profile=None)*

Get public addresses of some, or all EIPs associated with the current account.

addresses (list) - Optional list of addresses. If provided, only the addresses associated with those in the list will be returned.

allocation_ids (list) - Optional list of allocation IDs. If provided, only the addresses associated with the given allocation IDs will be returned.

returns (list) - A list of the requested EIP addresses

CLI Example:
```
salt-call boto_ec2.get_all_eip_addresses
```

New in version 2016.3.0.

**salt.modules.boto_ec2.get_all_tags** *(filters=None, region=None, key=None, keyid=None, profile=None)*

Describe all tags matching the filter criteria, or all tags in the account otherwise.

New in version 2018.3.0.

filters (dict) - Additional constraints on which volumes to return. Note that valid filters vary extensively depending on the resource type. When in doubt, search first without a filter and then use the returned data to help fine-tune your search. You can generally garner the resource type from its ID (e.g. vol-XXXXX is a volume, i-XXXXX is an instance, etc.)
CLI Example:

```
salt-call boto_ec2.get_all_tags '{"tag:Name": myInstanceNameTag, resource-type:instance}'
```

```python
salt.modules.boto_ec2.get_all_volumes(volume_ids=None, filters=None, return_objs=False, region=None, key=None, keyid=None, profile=None)
```

Get a list of all EBS volumes, optionally filtered by provided 'filters' param.

New in version 2016.11.0.

- **volume_ids** (list) - Optional list of volume_ids. If provided, only the volumes associated with those in the list will be returned.
- **filters** (dict) - Additional constraints on which volumes to return. Valid filters are:
  - `attachment.attach-time` - The time stamp when the attachment initiated.
  - `attachment.delete-on-termination` - Whether the volume is deleted on instance termination.
  - `attachment.device` - The device name that is exposed to the instance (for example, /dev/sda1).
  - `attachment.instance-id` - The ID of the instance the volume is attached to.
  - `attachment.status` - The attachment state (attaching | attached | detaching | detached).
  - `availability-zone` - The Availability Zone in which the volume was created.
  - `create-time` - The time stamp when the volume was created.
  - `encrypted` - The encryption status of the volume.
  - `size` - The size of the volume, in GiB.
  - `snapshot-id` - The snapshot from which the volume was created.
  - `status` - The status of the volume (creating | available | in-use | deleting | deleted | error).
  - `tag:key=value` - The key/value combination of a tag assigned to the resource.
  - `volume-id` - The volume ID.
  - `volume-type` - The Amazon EBS volume type. This can be `gp2` for General Purpose SSD, `io1` for Provisioned IOPS SSD, `st1` for Throughput Optimized HDD, `sc1` for Cold HDD, or `standard` for Magnetic volumes.

- **return_objs** (bool) - Changes the return type from list of volume IDs to list of boto.ec2.volume.Volume objects.

```
salt-call boto_ec2.get_all_volumes filters='{"tag:Name": "myVolume01"}'
```

```python
salt.modules.boto_ec2.get_attribute(attribute, instance_name=None, instance_id=None, region=None, key=None, keyid=None, profile=None, filters=None)
```

Get an EC2 instance attribute.

CLI Example:

```
salt myminion boto_ec2.get_attribute sourceDestCheck instance_name=my_instance
```
Available attributes:
- instanceType
- kernel
- ramdisk
- userData
- disableApiTermination
- instanceInitiatedShutdownBehavior
- rootDeviceName
- blockDeviceMapping
- productCodes
- sourceDestCheck
- groupSet
- ebsOptimized
- srivNetSupport

```
salt.modules.boto_ec2.get_eip_address_info(addresses=None, allocation_ids=None, region=None, key=None, keyid=None, profile=None)
```

Get 'interesting' info about some, or all EIPs associated with the current account.

- **addresses** (list) - Optional list of addresses. If provided, only the addresses associated with those in the list will be returned.
- **allocation_ids** (list) - Optional list of allocation IDs. If provided, only the addresses associated with the given allocation IDs will be returned.

- **returns** (list of dicts) - A list of dicts, each containing the info for one of the requested EIPs.

CLI Example:

```
salt-call boto_ec2.get_eip_address_info addresses=52.4.2.15
```

New in version 2016.3.0.

```
salt.modules.boto_ec2.get_id(name=None, tags=None, region=None, key=None, keyid=None, profile=None, in_states=None, filters=None)
```

Given instance properties, return the instance id if it exists.

CLI Example:

```
salt myminion boto_ec2.get_id myinstance
```

```
salt.modules.boto_ec2.get_key(key_name, region=None, key=None, keyid=None, profile=None)
```

Check to see if a key exists. Returns fingerprint and name if it does and False if it doesn’t CLI Example:

```
salt myminion boto_ec2.get_key mykey
```

```
salt.modules.boto_ec2.get_keys(keynames=None, filters=None, region=None, key=None, keyid=None, profile=None)
```

Gets all keys or filters them by name and returns a list. keynames (list): A list of the names of keypairs to retrieve. If not provided, all key pairs will be returned. filters (dict): Optional filters that can be used to limit the results returned. Filters are provided in the form of a dictionary consisting of filter names as the key and

21.9. execution modules
filter values as the value. The set of allowable filter names/values is dependent on the request being performed. Check the EC2 API guide for details.

CLI Example:

```bash
salt myminion boto_ec2.get_keys
```

**salt.modules.boto_ec2.get_network_interface**

Get an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:

```bash
salt myminion boto_ec2.get_network_interface name=my_eni
```

**salt.modules.boto_ec2.get_network_interface_id**

Get an Elastic Network Interface id from its name tag.

New in version 2016.3.0.

CLI Example:

```bash
salt myminion boto_ec2.get_network_interface_id name=my_eni
```

**salt.modules.boto_ec2.get_tags**

Given an instance_id, return a list of tags associated with that instance.

returns (list) - list of tags as key/value pairs

CLI Example:

```bash
salt myminion boto_ec2.get_tags instance_id
```

**salt.modules.boto_ec2.get_unassociated_eip_address**

Return the first unassociated EIP.

**domain** Indicates whether the address is an EC2 address or a VPC address (standard|vpc).

CLI Example:

```bash
salt-call boto_ec2.get_unassociated_eip_address
```

New in version 2016.3.0.

**salt.modules.boto_ec2.get_zones**

Get a list of AZs for the configured region.

CLI Example:

```bash
salt myminion boto_ec2.get_zones
```

**salt.modules.boto_ec2.import_key**

Imports the public key from an RSA key pair that you created with a third-party tool. Supported formats: OpenSSH public key format (e.g., the format in ~/.ssh/authorized_keys) - Base64 encoded DER format - SSH
public key file format as specified in RFC4716 - DSA keys are not supported. Make sure your key generator is set up to create RSA keys. Supported lengths: 1024, 2048, and 4096.

CLI Example:
```bash
salt myminion boto_ec2.import mykey publickey
```

**salt.modules.boto_ec2.modify_network_interface_attribute**(name=None, network_interface_id=None, attr=None, value=None, region=None, key=None, keyid=None, profile=None)

Modify an attribute of an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:
```bash
salt myminion boto_ec2.modify_network_interface_attribute my_eni attr=description value='example description'
```

**salt.modules.boto_ec2.release_eip_address**(public_ip=None, allocation_id=None, region=None, key=None, keyid=None, profile=None)

Free an Elastic IP address. Pass either a public IP address to release an EC2 Classic EIP, or an AllocationId to release a VPC EIP.

**public_ip** (string) - The public IP address - for EC2 elastic IPs.

**allocation_id** (string) - The Allocation ID - for VPC elastic IPs.

**returns** (bool) - True on success, False on failure

CLI Example:
```bash
salt myminion boto_ec2.release_eip_address allocation_id=eipalloc-ef382c8a
```

New in version 2016.3.0.

**salt.modules.boto_ec2.run**(image_id, name=None, tags=None, key_name=None, security_groups=None, user_data=None, instance_type='m1.small', placement=None, kernel_id=None, ramdisk_id=None, monitoring_enabled=None, vpc_id=None, vpc_name=None, subnet_id=None, subnet_name=None, private_ip_address=None, block_device_map=None, disable_api_termination=None, instance_initiated_shutdown_behavior=None, client_token=None, security_group_ids=None, security_group_names=None, additional_info=None, tenancy=None, instance_profile_arn=None, instance_profile_name=None, ebs_optimized=None, network_interface_id=None, network_interface_name=None, region=None, key=None, keyid=None, profile=None, network_interfaces=None)

Create and start an EC2 instance.

Returns True if the instance was created; otherwise False.

CLI Example:
salt myminion boto_ec2.run ami-b80c2b87 name=myinstance

image_id (string) – The ID of the image to run.
name (string) - The name of the instance.
tags (dict of key: value pairs) - tags to apply to the instance.
key_name (string) – The name of the key pair with which to launch instances.
security_groups (list of strings) – The names of the EC2 classic security groups with which to associate instances
user_data (string) – The Base64-encoded MIME user data to be made available to the instance(s) in this reservation.
instance_type (string) – The type of instance to run. Note that some image types (e.g. hvm) only run on some instance types.
placement (string) – The Availability Zone to launch the instance into.
kernel_id (string) – The ID of the kernel with which to launch the instances.
ramdisk_id (string) – The ID of the RAM disk with which to launch the instances.
monitoring_enabled (bool) – Enable detailed CloudWatch monitoring on the instance.
vpc_id (string) - ID of a VPC to bind the instance to. Exclusive with vpc_name.
vpc_name (string) - Name of a VPC to bind the instance to. Exclusive with vpc_id.
subnet_id (string) – The subnet ID within which to launch the instances for VPC.
subnet_name (string) – The name of a subnet within which to launch the instances for VPC.
private_ip_address (string) – If you’re using VPC, you can optionally use this parameter to assign the instance a specific available IP address from the subnet (e.g. 10.0.0.25).
block_device_map (boto.ec2.blockdevicemapping.BlockDeviceMapping) – A BlockDeviceMapping data structure describing the EBS volumes associated with the Image. (string) - A string representation of a BlockDeviceMapping structure (dict) - A dict describing a BlockDeviceMapping structure

YAML example:

```
device-maps:
  /dev/sdb:
    ephemeral_name: ephemeral0
  /dev/sdc:
    ephemeral_name: ephemeral1
  /dev/sdd:
    ephemeral_name: ephemeral2
  /dev/sde:
    ephemeral_name: ephemeral3
  /dev/sdf:
    size: 20
    volume_type: gp2
```

disable_api_termination (bool) – If True, the instances will be locked and will not be able to be terminated via the API.
instance_initiated_shutdown_behavior (string) – Specifies whether the instance stops or terminates on instance-initiated shutdown. Valid values are: stop, terminate
**placement_group** (string) – If specified, this is the name of the placement group in which the instance(s) will be launched.

**client_token** (string) – Unique, case-sensitive identifier you provide to ensure idempotency of the request. Maximum 64 ASCII characters.

**security_group_ids** (list of strings) – The ID(s) of the VPC security groups with which to associate instances.

**security_group_names** (list of strings) – The name(s) of the VPC security groups with which to associate instances.

**additional_info** (string) – Specifies additional information to make available to the instance(s).

**tenancy** (string) – The tenancy of the instance you want to launch. An instance with a tenancy of ‘dedicated’ runs on single-tenant hardware and can only be launched into a VPC. Valid values are: “default” or “dedicated”. NOTE: To use dedicated tenancy you MUST specify a VPC subnet-ID as well.

**instance_profile_arn** (string) – The Amazon resource name (ARN) of the IAM Instance Profile (IIP) to associate with the instances.

**instance_profile_name** (string) – The name of the IAM Instance Profile (IIP) to associate with the instances.

**ebs_optimized** (bool) – Whether the instance is optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal EBS I/O performance. This optimization isn’t available with all instance types.

**network_interfaces** (boto.ec2.networkinterface.NetworkInterfaceCollection) – A NetworkInterfaceCollection data structure containing the ENI specifications for the instance.

**network_interface_id** (string) – ID of the network interface to attach to the instance

**network_interface_name** (string) – Name of the network interface to attach to the instance

```py
salt.modules.boto_ec2.set_attribute(attribute, attribute_value, instance_name=None, instance_id=None, region=None, key=None, keyid=None, profile=None, filters=None)
```

Set an EC2 instance attribute. Returns whether the operation succeeded or not.

**CLI Example:**

```
salt myminion boto_ec2.set_attribute sourceDestCheck False instance_name=my_instance
```

Available attributes:

- instanceType
- kernel
- ramdisk
- userData
- disableApiTermination
- instanceInitiatedShutdownBehavior
- rootDeviceName
- blockDeviceMapping
- productCodes
- sourceDestCheck
salt.modules.boto_ec2.set_volumes_tags(tag_maps, authoritative=False, dry_run=False, region=None, key=None, keyid=None, profile=None)

New in version 2016.11.0.

tag_maps (list) List of dicts of filters and tags, where 'filters' is a dict suitable for passing to the 'filters' argument of get_all_volumes() above, and 'tags' is a dict of tags to be set on volumes (via create_tags/delete_tags) as matched by the given filters. The filter syntax is extended to permit passing either a list of volume_ids or an instance_name (with instance_name being the Name tag of the instance to which the desired volumes are mapped). Each mapping in the list is applied separately, so multiple sets of volumes can be all tagged differently with one call to this function. If filtering by instance Name, You may additionally limit the instances matched by passing in a list of desired instance states. The default set of states is ('pending', 'rebooting', 'running', 'stopping', 'stopped').

YAML example fragment:

```
- filters:
  attachment.instance_id: i-abcdef12
tags:
  Name: dev-int-abcdef12.aws-foo.com
- filters:
  attachment.device: /dev/sdf
tags:
  ManagedSnapshots: true
  BillingGroup: bubba.hotep@aws-foo.com
in_states:
  stopped
  terminated
- filters:
  instance_name: prd-foo-01.aws-foo.com
tags:
  BillingGroup: infra-team@aws-foo.com
- filters:
  volume_ids: [vol-12345689, vol-abcdef12]
tags:
  BillingGroup: infra-team@aws-foo.com
```

authoritative (bool) If true, any existing tags on the matched volumes, and not explicitly requested here, will be removed.

dry_run (bool) If true, don’t change anything, just return a dictionary describing any changes which would have been applied.

returns (dict) A dict describing status and any changes.

salt.modules.boto_ec2.terminate(instance_id=None, name=None, region=None, key=None, keyid=None, profile=None, filters=None)

Terminate the instance described by instance_id or name.

CLI Example:

```
salt myminion boto_ec2.terminate name=myinstance
salt myminion boto_ec2.terminate instance_id=i-a46b9f
```
salt.modules.boto_ec2.unassign_private_ip_addresses(network_interface_name=None, network_interface_id=None, private_ip_addresses=None, region=None, key=None, keyid=None, profile=None)

Unassigns one or more secondary private IP addresses from a network interface

**network_interface_id** (string) - ID of the network interface to associate the IP with (exclusive with 'network_interface_name')

**network_interface_name** (string) - Name of the network interface to associate the IP with (exclusive with 'network_interface_id')

**private_ip_addresses** (list) - Assigns the specified IP addresses as secondary IP addresses to the network interface.

**returns** (bool) - True on success, False on failure.

**CLI Example:**

```bash
salt myminion boto_ec2.unassign_private_ip_addresses network_interface_name=my_eni private_ip_addresses=private_ip
```

New in version 2017.7.0.

### 21.9.47 salt.modules.boto_efs module

Connection module for Amazon EFS

New in version 2017.7.0.

**configuration** This module accepts explicit EFS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles or it can read them from the `~/.aws/credentials` file or from these environment variables: `AWS_ACCESS_KEY_ID`, `AWS_SECRET_ACCESS_KEY`. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available at:

- [Access Control: Managing Permissions](http://docs.aws.amazon.com/efs/latest/ug/access-control-managing-permissions.html)
- [Configuration](http://boto3.readthedocs.io/en/latest/guide/configuration.html#guide-configuration)

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file

```yaml
# Pillar:
efs.keyid: GKTADJGHEIQSXMKKRBJ08H
efs.key: askd+ghsdfjkgWupU/asdflkdfklgjsdfajkghs

# Minion config file:
[efs]
keyid=GKTADJGHEIQSXMKKRBJ08H
key=askd+ghsdfjkgWupU/asdflkdfklgjsdfajkghs
```

A region may also be specified in the configuration

```yaml
efs.region: us-east-1
```

If a region is not specified, the default is `us-east-1`.

It’s also possible to specify key, keyid, and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config.
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askd+ghsdfjkghWupU/asdflkdfklgjsdfjajkghs
  region: us-east-1

depends boto3

salt.modules.boto_efs.create_file_system(name, performance_mode='generalPurpose', keyid=None, key=None, profile=None, region=None, creation_token=None, **kwargs)

Creates a new, empty file system.

name (string) - The name for the new file system

performance_mode (string) - The PerformanceMode of the file system. Can be either generalPurpose or maxIO

creation_token (string) - A unique name to be used as reference when creating an EFS. This will ensure idempotency. Set to name if not specified otherwise

returns (dict) - A dict of the data for the elastic file system

CLI Example:
salt 'my-minion' boto_efs.create_file_system efs-name generalPurpose

salt.modules.boto_efs.create_mount_target(filesystemid, subnetid, ipaddress=None, securitygroups=None, keyid=None, key=None, profile=None, region=None, **kwargs)

Creates a mount target for a file system. You can then mount the file system on EC2 instances via the mount target.

You can create one mount target in each Availability Zone in your VPC. All EC2 instances in a VPC within a given Availability Zone share a single mount target for a given file system.

If you have multiple subnets in an Availability Zone, you create a mount target in one of the subnets. EC2 instances do not need to be in the same subnet as the mount target in order to access their file system.

filesystemid (string) - ID of the file system for which to create the mount target.

subnetid (string) - ID of the subnet to add the mount target in.

ipaddress
  (string) - Valid IPv4 address within the address range of the specified subnet.

securitygroups
  (list[string]) - Up to five VPC security group IDs, of the form sg-yyyyyyyy. These must be for the same VPC as subnet specified.

returns (dict) - A dict of the response data

CLI Example:
salt 'my-minion' boto_efs.create_mount_target filesystemid subnetid

salt.modules.boto_efs.create_tags(filesystemid, tags, keyid=None, key=None, profile=None, region=None, **kwargs)

Creates or overwrites tags associated with a file system. Each tag is a key-value pair. If a tag key specified in the request already exists on the file system, this operation overwrites its value with the value provided in the request.
filesystemid (string) - ID of the file system for whose tags will be modified.

tags (dict) - The tags to add to the file system

CLI Example:
```
salt 'my-minion' boto_efs.create_tags
```

salt.modules.boto_efs.delete_file_system(filesystemid, keyid=None, key=None, profile=None, region=None, **kwargs)

Deletes a file system, permanently severing access to its contents. Upon return, the file system no longer exists and you can't access any contents of the deleted file system. You can't delete a file system that is in use. That is, if the file system has any mount targets, you must first delete them.

filesystemid (string) - ID of the file system to delete.

CLI Example:
```
salt 'my-minion' boto_efs.delete_file_system filesystemid
```

salt.modules.boto_efs.delete_mount_target(mounttargetid, keyid=None, key=None, profile=None, region=None, **kwargs)

Deletes the specified mount target.

This operation forcibly breaks any mounts of the file system via the mount target that is being deleted, which might disrupt instances or applications using those mounts. To avoid applications getting cut off abruptly, you might consider unmounting any mounts of the mount target, if feasible. The operation also deletes the associated network interface. Uncommitted writes may be lost, but breaking a mount target using this operation does not corrupt the file system itself. The file system you created remains. You can mount an EC2 instance in your VPC via another mount target.

mounttargetid (string) - ID of the mount target to delete

CLI Example:
```
salt 'my-minion' boto_efs.delete_mount_target mounttargetid
```

salt.modules.boto_efs.delete_tags(filesystemid, tags, keyid=None, key=None, profile=None, region=None, **kwargs)

Deletes the specified tags from a file system.

filesystemid (string) - ID of the file system for whose tags will be removed.

tags (list[string]) - The tag keys to delete to the file system

CLI Example:
```
salt 'my-minion' boto_efs.delete_tags
```

salt.modules.boto_efs.get_file_systems(filesystemid=None, keyid=None, key=None, profile=None, region=None, creation_token=None, **kwargs)

Get all EFS properties or a specific instance property if filesystemid is specified

filesystemid (string) - ID of the file system to retrieve properties

creation_token (string) - A unique token that identifies an EFS. If filesystem created via create_file_system this would either be explicitly passed in or set to name. You can limit your search with this.

returns (list[dict]) - list of all elastic file system properties

CLI Example:
**salt.modules.boto_efs.get_file_systems**

```
salt 'my-minion' boto_efs.get_file_systems efs-id
```

**salt.modules.boto_efs.get_mount_targets**

```
salt.modules.boto_efs.get_mount_targets(filesystemid=None, mounttargetid=None, keyid=None, key=None, profile=None, region=None, **kwargs)
```

Get all the EFS mount point properties for a specific filesystemid or the properties for a specific mounttargetid. One or the other must be specified.

- **filesystemid** *(string) - ID of the file system whose mount targets to list*  
  Must be specified if mounttargetid is not specified.

- **mounttargetid** *(string) - ID of the mount target to have its properties returned*  
  Must be specified if filesystemid is not specified.

**returns** *(list[dict]) - list of all mount point properties*

**CLI Example:**
```
salt 'my-minion' boto_efs.get_mount_targets
```

**salt.modules.boto_efs.get_tags**

```
salt.modules.boto_efs.get_tags(filesystemid=None, keyid=None, key=None, profile=None, region=None, **kwargs)
```

Return the tags associated with an EFS instance.

- **filesystemid** *(string) - ID of the file system whose tags to list*  
  
- **returns** *(list) - list of tags as key/value pairs*

**CLI Example:**
```
salt 'my-minion' boto_efs.get_tags efs-id
```

**salt.modules.boto_efs.set_security_groups**

```
salt.modules.boto_efs.set_security_groups(mounttargetid, securitygroup, keyid=None, key=None, profile=None, region=None, **kwargs)
```

Modifies the set of security groups in effect for a mount target.

- **mounttargetid** *(string) - ID of the mount target whose security groups will be modified*  
  
- **securitygroups** *(list[string]) - list of no more than 5 VPC security group IDs.*  
  
**CLI Example:**
```
salt 'my-minion' boto_efs.set_security_groups my-mount-target-id my-sec-group
```

## 21.9.48 salt.modules.boto_elasticache

Connection module for Amazon Elasticache

New in version 2014.7.0.

**configuration**  
This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
```

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:
**elasticache.keyid**: GKTADJGHEIQSXMKKRBJ08H
**elasticache.key**: askdjghsdfjkgHwupUjasdfklkdfklgjdsdfjkajkghs

A region may also be specified in the configuration:

**elasticache.region**: us-east-1

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkgHwupUjasdfklkdfklgjdsdfjkajkghs
  region: us-east-1
```

depends boto

```
salt.modules.boto_elasticache.authorize_cache_security_group_ingress(name, ec2_security_group_name, ec2_security_group_owner_id, region=None, key=None, keyid=None, profile=None)
```

Authorize network ingress from an ec2 security group to a cache security group.

CLI example:

```
salt myminion boto_elasticache.authorize_cache_security_group_ingress myelasticachesg myec2sg
```

```
salt.modules.boto_elasticache.create(name, num_cache_nodes=None, engine=None, cache_node_type=None, replication_group_id=None, engine_version=None, cache_parameter_group_name=None, cache_subnet_group_name=None, cache_security_group_names=None, security_group_ids=None, snapshot_arns=None, preferred_availability_zone=None, preferred_maintenance_window=None, port=None, notification_topic_arn=None, auto_minor_version_upgrade=None, wait=None, region=None, key=None, keyid=None, profile=None)
```

Create a cache cluster.

CLI example:

```
salt myminion boto_elasticache.create myelasticache 1 redis cache.t1.micro cache_security_group_names='["myelasticachesg"]'
```

```
salt.modules.boto_elasticache.create_cache_security_group(name, description, region=None, key=None, keyid=None, profile=None)
```

21.9. execution modules
Create a cache security group.

CLI example:
```
salt myminion boto_elasticache.create_cache_security_group myelasticachesg 'My Cache Security Group'
```

```
salt.modules.boto_elasticache.create_cache_security_group(name, primary_cluster_id, replication_group_description, wait=None, region=None, key=None, keyid=None, profile=None)
```

Create replication group.

CLI example:
```
salt myminion boto_elasticache.create_replication_group myelasticache myprimarycluster description
```

```
salt.modules.boto_elasticache.create_replication_group(name, primary_cluster_id, replication_group_description, wait=None, region=None, key=None, keyid=None, profile=None)
```

Create a cache cluster.

CLI example:
```
salt myminion boto_elasticache.delete myelasticache
```

```
salt.modules.boto_elasticache.delete(name, wait=False, region=None, key=None, keyid=None, profile=None)
```

Create an ElastiCache subnet group

CLI example to create an ElastiCache subnet group:
```
salt myminion boto_elasticache.create_subnet_group my-subnet-group "group description" subnet_ids='[subnet-12345678, subnet-87654321]' region=us-east-1
```

```
salt.modules.boto_elasticache.create_subnet_group(name, description, subnet_ids=None, subnet_names=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Delete a cache cluster.

CLI example:
```
salt myminion boto_elasticache.delete myelasticache
```

```
salt.modules.boto_elasticache.delete(name, wait=False, region=None, key=None, keyid=None, profile=None)
```

Delete a cache security group.

CLI example:
```
salt myminion boto_elasticache.delete_cache_security_group myelasticachesg 'My Cache Security Group'
```

```
salt.modules.boto_elasticache.delete_cache_security_group(name, region=None, key=None, keyid=None, profile=None)
```

Delete a cache security group.

CLI example:
```
salt myminion boto_elasticache.delete_cache_security_group myelasticachesg 'My Cache Security Group'
```

```
salt.modules.boto_elasticache.delete_cache_security_group(name, region=None, key=None, keyid=None, profile=None)
```

Delete a cache security group.

CLI example:
```
salt myminion boto_elasticache.delete_cache_security_group myelasticachesg 'My Cache Security Group'
```

```
salt.modules.boto_elasticache.delete_cache_security_group(name, region=None, key=None, keyid=None, profile=None)
```

Delete an ElastiCache replication group.

CLI example:
```
salt myminion boto_elasticache.delete_replication_group my-replication-group region=us-east-1
```

```
salt.modules.boto_elasticache.delete_replication_group(name, region=None, key=None, keyid=None, profile=None)
```
salt.modules.boto_elasticache.delete_subnet_group(name, region=None, key=None, keyid=None, profile=None)

Delete an ElastiCache subnet group.

CLI example:
```bash
salt myminion boto_elasticache.delete_subnet_group my-subnet-group → region=us-east-1
```

salt.modules.boto_elasticache.describe_replication_group(name, region=None, key=None, keyid=None, profile=None, parameter=None)

Get replication group information.

CLI example:
```bash
salt myminion boto_elasticache.describe_replication_group mygroup
```

salt.modules.boto_elasticache.exists(name, region=None, key=None, keyid=None, profile=None)

Check to see if a cache cluster exists.

CLI example:
```bash
salt myminion boto_elasticache.exists myelasticache
```

salt.modules.boto_elasticache.get_all_cache_subnet_groups(name=None, region=None, key=None, keyid=None, profile=None)

Return a list of all cache subnet groups with details

CLI example:
```bash
salt myminion boto_elasticache.get_all_subnet_groups region=us-east-1
```

salt.modules.boto_elasticache.get_cache_subnet_group(name, region=None, key=None, keyid=None, profile=None)

Get information about a cache subnet group.

CLI example:
```bash
salt myminion boto_elasticache.get_cache_subnet_group mycache_subnet_group
```

salt.modules.boto_elasticache.get_config(name, region=None, key=None, keyid=None, profile=None)

Get the configuration for a cache cluster.

CLI example:
```bash
salt myminion boto_elasticache.get_config myelasticache
```

salt.modules.boto_elasticache.get_group_host(name, region=None, key=None, keyid=None, profile=None)

Get hostname from replication cache group

CLI example:
salt Documentation, Release 3000.2

salt myminion boto_elasticache.get_group_host myelasticachegroup

salt.modules.boto_elasticache.get_node_host(name, region=None, key=None, keyid=None, profile=None)

Get hostname from cache node

CLI example:
salt myminion boto_elasticache.get_node_host myelasticache

salt.modules.boto_elasticache.group_exists(name, region=None, key=None, keyid=None, profile=None)

Check to see if a replication group exists.

CLI example:
salt myminion boto_elasticache.group_exists myelasticache

salt.modules.boto_elasticache.list_cache_subnet_groups(name=None, region=None, key=None, keyid=None, profile=None)

Return a list of all cache subnet group names

CLI example:
salt myminion boto_elasticache.list_subnet_groups region=us-east-1

salt.modules.boto_elasticache.revoke_cache_security_group_ingress(name, ec2_security_group_name, ec2_security_group_owner_id, region=None, key=None, keyid=None, profile=None)

Revoke network ingress from an ec2 security group to a cache security group.

CLI example:
salt myminion boto_elasticache.revoke_cache_security_group_ingress myelasticachesg myec2sg

salt.modules.boto_elasticache.subnet_group_exists(name, tags=None, region=None, key=None, keyid=None, profile=None)

Check to see if an ElastiCache subnet group exists.

CLI example:
salt myminion boto_elasticache.subnet_group_exists my-param-group region=us-east-1

21.9.49 salt.modules.boto_elasticsearch_domain module

Connection module for Amazon Elasticsearch Service

New in version 2016.11.0.
configuration  This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

```
lambda.keyid: GKTADJGHEIQSXMKKRBJ08H
lambda.key: askdjghsdfjkgWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
lambda.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkgWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

Create and delete methods return:

```
created: true
```

or

```
created: false
error:  
  message: error message
```

Request methods (e.g., describe_function) return:

```
domain:
  - {...}
  - {...}
```

or

```
error:
  message: error message
```

depends  boto3

salt.modules.boto_elasticsearch_domain.add_tags(DomainName=None, ARN=None, region=None, key=None, keyid=None, profile=None, **kwargs)

Add tags to a domain

Returns [tagged: true] if the domain was tagged and returns [tagged: False] if the domain was not tagged.

CLI Example:
salt::boto_elasticsearch_domain.add_tags mydomain tag_a=tag_value tag_b=tag_value

salt::modules::boto_elasticsearch_domain.create (DomainName, ElasticsearchClusterConfig=None, EBSOptions=None, AccessPolicies=None, SnapshotOptions=None, AdvancedOptions=None, region=None, key=None, keyid=None, profile=None, ElasticsearchVersion=None)

Given a valid config, create a domain.

Returns {created: true} if the domain was created and returns {created: False} if the domain was not created.

CLI Example:

```
salt myminion boto_elasticsearch_domain.create mydomain
{
    "InstanceType": "t2.micro.elasticsearch",
    "InstanceCount": 1,
    "DedicatedMasterEnabled": false,
    "ZoneAwarenessEnabled": false,
    "EBSEnabled": true,
    "VolumeType": "gp2",
    "VolumeSize": 10,
    "Iops": 0,
    "Version": "2012-10-17",
    "Statement": [{
        "Effect": "Allow",
        "Principal": {
            "AWS": "*"},
        "Action": "es:*",
        "Condition": {
            "IpAddress": {
                "aws:SourceIp": ["127.0.0.1"]}
        }
    }],
    "AutomatedSnapshotStartHour": 0,
    "rest.action.multi.allow_explicit_index": true
}
```

salt::modules::boto_elasticsearch_domain.delete (DomainName, region=None, key=None, keyid=None, profile=None)

Given a domain name, delete it.

Returns {deleted: true} if the domain was deleted and returns {deleted: false} if the domain was not deleted.

CLI Example:

```
salt myminion boto_elasticsearch_domain.delete mydomain
```

salt::modules::boto_elasticsearch_domain.describe (DomainName, region=None, key=None, keyid=None, profile=None)

Given a domain name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_elasticsearch_domain.describe mydomain
```

salt::modules::boto_elasticsearch_domain.exists (DomainName, region=None, key=None, keyid=None, profile=None)

Given a domain name, check to see if the given domain exists.

Returns True if the given domain exists and returns False if the given function does not exist.

CLI Example:

```
salt myminion boto_elasticsearch_domain.exists mydomain
```

salt::modules::boto_elasticsearch_domain.list_tags (DomainName=None, ARN=None, region=None, key=None, keyid=None, profile=None)

1384 Chapter 21. Salt Module Reference
List tags of a trail

Returns

• {...}
• {...}

Return type: tags

CLI Example:
salt myminion boto_cloudtrail.list_tags my_trail

salt.modules.boto_elasticsearch_domain.remove_tags(TagKeys, DomainName=None, ARN=None, region=None, key=None, keyid=None, profile=None)

Remove tags from a trail

Returns {tagged: true} if the trail was tagged and returns {tagged: False} if the trail was not tagged.

CLI Example:
salt myminion boto_cloudtrail.remove_tags my_trail tag_a=tag_value tag_b=tag_value

salt.modules.boto_elasticsearch_domain.status(DomainName, region=None, key=None, keyid=None, profile=None)

Given a domain name describe its status.

Returns a dictionary of interesting properties.

CLI Example:
salt myminion boto_elasticsearch_domain.status mydomain

salt.modules.boto_elasticsearch_domain.update(DomainName, ElasticsearchClusterConfig=None, EBSOptions=None, AccessPolicies=None, SnapshotOptions=None, AdvancedOptions=None, region=None, key=None, keyid=None, profile=None)

Update the named domain to the configuration.

Returns {updated: true} if the domain was updated and returns {updated: False} if the domain was not updated.

CLI Example:
salt myminion boto_elasticsearch_domain.update mydomain 

{ "InstanceType": "t2.micro.elasticsearch", "InstanceCount": 1, 
"DedicatedMasterEnabled": false, "ZoneAwarenessEnabled": false} 
{ "EBSEnabled": true, "VolumeType": "gp2", "VolumeSize": 10, 
"Iops": 0} 
{ "Version": "2012-10-17", "Statement": [{"Effect": "Allow", "Principal": {"AWS": "*"}, "Action": "es:*", 
"Condition": {"IpAddress": {"aws:SourceIp": ["127.0.0.1"]}}}]} 
{ "AutomatedSnapshotStartHour": 0} 
{ "rest.action.multi.allow_explicit_index": "true"}
21.9.50 salt.modules.boto_elb

Connection module for Amazon ELB

New in version 2014.7.0.

configuration  This module accepts explicit elb credentials but can also utilize IAM roles assigned to
the instance through Instance Profiles. Dynamic credentials are then automatically obtained from
AWS API and no further configuration is necessary. More Information available at:

http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
→ec2.html

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

```
elb.keyid: GKTADJGHEIQSXMKKRBJ08H
elb.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
elb.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a
string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

depends  boto >= 2.33.0

salt.modules.boto_elb.apply_security_groups(name, security_groups, region=None,
key=None, keyid=None, profile=None)

Apply security groups to ELB.

CLI example:

```
salt myminion boto_elb.apply_security_groups myelb ['"mysecgroup1"']
```

salt.modules.boto_elb.attach_subnets(name, subnets, region=None, key=None, keyid=None,
profile=None)

Attach ELB to subnets.

CLI example:

```
salt myminion boto_elb.attach_subnets myelb ['"mysubnet"]
```

salt.modules.boto_elb.create(name, availability_zones, listeners, subnets=None, secu-
urity_groups=None, scheme='internet-facing', region=None,
key=None, keyid=None, profile=None)

Create an ELB

CLI example to create an ELB:

```
salt myminion boto_elb.create myelb ['"us-east-1a", "us-east-1e"]' '{"elb_port":443,
"elb_protocol": "HTTPS", ...}' region=us-east-1
```
salt.modules.boto_elb.create_listeners(name, listeners, region=None, key=None, keyid=None, profile=None)

Create listeners on an ELB.
CLI example:
```
salt myminion boto_elb.create_listeners myelb '[["HTTPS", "HTTP", 443, 80, ←"arn:aws:iam::111111:server-certificate/mycert"]]'```

salt.modules.boto_elb.create_policy(name, policy_name, policy_type, policy, region=None, key=None, keyid=None, profile=None)

Create an ELB policy.
New in version 2016.3.0.
CLI example:
```
salt myminion boto_elb.create_policy myelb mypolicy LBCookieStickinessPolicyType ←{"CookieExpirationPeriod": 3600}'```

salt.modules.boto_elb.delete(name, region=None, key=None, keyid=None, profile=None)

Delete an ELB.
CLI example to delete an ELB:
```
salt myminion boto_elb.delete myelb region=us-east-1```

salt.modules.boto_elb.delete_listeners(name, ports, region=None, key=None, keyid=None, profile=None)

Delete listeners on an ELB.
CLI example:
```
salt myminion boto_elb.delete_listeners myelb '[[80,443]]'```

salt.modules.boto_elb.delete_policy(name, policy_name, region=None, key=None, keyid=None, profile=None)

Delete an ELB policy.
New in version 2016.3.0.
CLI example:
```
salt myminion boto_elb.delete_policy myelb mypolicy```

salt.modules.boto_elb.delete_tags(name, tags, region=None, key=None, keyid=None, profile=None)

Add the tags on an ELB
name name of the ELB
tags list of tags to remove
CLI Example:
```
salt myminion boto_elb.delete_tags my-elb-name ['TagToRemove1', 'TagToRemove2']```

salt.modules.boto_elb.deregister_instances(name, instances, region=None, key=None, keyid=None, profile=None)

Deregister instances with an ELB. Instances is either a string instance id or a list of string instance id’s.
Returns:
- True: instance(s) deregistered successfully
- False: instance(s) failed to be deregistered
- None: instance(s) not valid or not registered, no action taken

CLI example:

```bash
salt myminion boto_elb.deregister_instances myelb instance_id
salt myminion boto_elb.deregister_instances myelb "[instance_id, instance_id]"
```

```
salt.modules.boto_elb.detach_subnets(name, subnets, region=None, key=None, keyid=None, profile=None)
```

Detach ELB from subnets.

CLI example:

```
salt myminion boto_elb.detach_subnets myelb '["mysubnet"]'
```

```
salt.modules.boto_elb.disable_availability_zones(name, availability_zones, region=None, key=None, keyid=None, profile=None)
```

Disable availability zones for ELB.

CLI example:

```
salt myminion boto_elb.disable_availability_zones myelb '["us-east-1a"]'
```

```
salt.modules.boto_elb.enable_availability_zones(name, availability_zones, region=None, key=None, keyid=None, profile=None)
```

Enable availability zones for ELB.

CLI example:

```
salt myminion boto_elb.enable_availability_zones myelb '["us-east-1a"]'
```

```
salt.modules.boto_elb.exists(name, region=None, key=None, keyid=None, profile=None)
```

Check to see if an ELB exists.

CLI example:

```
salt myminion boto_elb.exists myelb region=us-east-1
```

```
salt.modules.boto_elb.get_all_elbs(region=None, key=None, keyid=None, profile=None)
```

Return all load balancers associated with an account.

CLI example:

```
salt myminion boto_elb.get_all_elbs region=us-east-1
```

```
salt.modules.boto_elb.get_attributes(name, region=None, key=None, keyid=None, profile=None)
```

Check to see if attributes are set on an ELB.

CLI example:

```
salt myminion boto_elb.get_attributes myelb
```

```
salt.modules.boto_elb.get_elb_config(name, region=None, key=None, keyid=None, profile=None)
```

Get an ELB configuration.
CLI example:
```
salt myminion boto_elb.exists myelb region=us-east-1
```

```python
salt.modules.boto_elb.get_health_check(name, region=None, key=None, keyid=None, profile=None)
```
Get the health check configured for this ELB.

CLI example:
```
salt myminion boto_elb.get_health_check myelb
```

```python
salt.modules.boto_elb.get_instance_health(name, region=None, key=None, keyid=None, profile=None, instances=None)
```
Get a list of instances and their health state

CLI example:
```
salt myminion boto_elb.get_instance_health myelb
```
```
salt myminion boto_elb.get_instance_health myelb region=us-east-1 instances="[instance_id,instance_id]"
```

```python
salt.modules.boto_elb.list_elbs(region=None, key=None, keyid=None, profile=None)
```
Return names of all load balancers associated with an account

CLI example:
```
salt myminion boto_elb.list_elbs region=us-east-1
```

```python
salt.modules.boto_elb.listener_dict_to_tuple(listener)
```
Convert an ELB listener dict into a listener tuple used by certain parts of the AWS ELB API.

CLI example:
```
salt myminion boto_elb.listener_dict_to_tuple "{elb_port":80,"instance_port":80,"elb_protocol":"HTTP"}"
```

```python
salt.modules.boto_elb.register_instances(name, instances, region=None, key=None, keyid=None, profile=None)
```
Register instances with an ELB. Instances is either a string instance id or a list of string instance id’s.

Returns:
- **True**: instance(s) registered successfully
- **False**: instance(s) failed to be registered

CLI example:
```
salt myminion boto_elb.register_instances myelb instance_id
salt myminion boto_elb.register_instances myelb "[instance_id,instance_id]"
```

```python
salt.modules.boto_elb.set_attributes(name, attributes, region=None, key=None, keyid=None, profile=None)
```
Set attributes on an ELB.

**name** (string) Name of the ELB instance to set attributes for

**attributes** A dict of attributes to set.

Valid attributes are:

- **access_log** (dict)
enabled (bool)  Enable storage of access logs.

s3_bucket_name (string)  The name of the S3 bucket to place logs.

s3_bucket_prefix (string)  Prefix for the log file name.

emit_interval (int)  Interval for storing logs in S3 in minutes. Valid values are 5 and 60.

connection_draining (dict)
  enabled (bool)  Enable connection draining.
  timeout (int)  Maximum allowed time in seconds for sending existing connections to an instance that is deregistering or unhealthy. Default is 300.

cross_zone_load_balancing (dict)
  enabled (bool)  Enable cross-zone load balancing.

CLI example to set attributes on an ELB:

```bash
salt myminion boto_elb.set_attributes myelb '{"access_log": {"enabled": "true",
  "s3_bucket_name": "mybucket", "s3_bucket_prefix": "/mylogs/", "emit_interval": "5"}}'
region=us-east-1
```

salt.modules.boto_elb.set_backend_policy(name, port, policies=None, region=None, key=None, keyid=None, profile=None)

Set the policies of an ELB backend server.

CLI example:

```bash
salt myminion boto_elb.set_backend_policy myelb 443 "[policy1,policy2]"
```

salt.modules.boto_elb.set_health_check(name, health_check, region=None, key=None, keyid=None, profile=None)

Set attributes on an ELB.

CLI example to set attributes on an ELB:

```bash
salt myminion boto_elb.set_health_check myelb '{"target": "HTTP:80/"}'
```

salt.modules.boto_elb.set_instances(name, instances, test=False, region=None, key=None, keyid=None, profile=None)

Set the instances assigned to an ELB to exactly the list given

CLI example:

```bash
salt myminion boto_elb.set_instances myelb region=us-east-1 instances="[instance_id,instance_id]"
```

salt.modules.boto_elb.set_listener_policy(name, port, policies=None, region=None, key=None, keyid=None, profile=None)

Set the policies of an ELB listener.

New in version 2016.3.0.

CLI example:

```bash
salt myminion boto_elb.set_listener_policy myelb 443 "[policy1,policy2]"
```

salt.modules.boto_elb.set_tags(name, tags, region=None, key=None, keyid=None, profile=None)

Add the tags on an ELB

New in version 2016.3.0.
**name** name of the ELB

**tags** dict of name/value pair tags

**CLI Example:**

```
salt myminion boto_elb.set_tags my-elb-name "{'Tag1': 'Value', 'Tag2': 'Another Value'}"
```

## 21.9.51 salt.modules.boto_elbv2 module

Connection module for Amazon ALB

New in version 2017.7.0.

**configuration** This module accepts explicit elb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
```

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

```
elbv2.keyid: GKTADJGHEIQSXMKKRBJ08H
elbv2.key: askdjghsdfjkghWupUjasdflkdfklgjhsdkfajkghs
elbv2.region: us-west-2
```

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
   keyid: GKTADJGHEIQSXMKKRBJ08H
   key: askdjghsdfjkghWupUjasdflkdfklgjhsdkfajkghs
   region: us-east-1
```

**depends** boto3

```
salt.modules.boto_elbv2.create_target_group(name, protocol, port, vpc_id, region=None, key=None, keyid=None, profile=None, health_check_protocol='HTTP', health_check_port='traffic-port', health_check_path='/',
   health_check_interval_seconds=30,
   health_check_timeout_seconds=5,
   healthy_threshold_count=5, unhealthy_threshold_count=2)
```

Create target group if not present.

- **name** (string) - The name of the target group.
- **protocol** (string) - The protocol to use for routing traffic to the targets
- **port** (int) - The port on which the targets receive traffic. This port is used unless you specify a port override when registering the traffic.
- **vpc_id** (string) - The identifier of the virtual private cloud (VPC).
**health_check_protocol** (string) - The protocol the load balancer uses when performing health check on targets. The default is the HTTP protocol.

**health_check_port** (string) - The port the load balancer uses when performing health checks on targets. The default is 'traffic-port', which indicates the port on which each target receives traffic from the load balancer.

**health_check_path** (string) - The ping path that is the destination on the targets for health checks. The default is '/.

**health_check_interval_seconds** (integer) - The approximate amount of time, in seconds, between health checks of an individual target. The default is 30 seconds.

**health_check_timeout_seconds** (integer) - The amount of time, in seconds, during which no response from a target means a failed health check. The default is 5 seconds.

**healthy_threshold_count** (integer) - The number of consecutive health checks successes required before considering an unhealthy target healthy. The default is 5.

**unhealthy_threshold_count** (integer) - The number of consecutive health check failures required before considering a target unhealthy. The default is 2.

**returns** (bool) - True on success, False on failure.

CLI example: .. code-block:: bash

    salt myminion boto_elbv2.create_target_group learn1give1 protocol=HTTP port=54006 vpc_id=vpc-deadbeef

salt.modules.boto_elbv2.delete_target_group(name, region=None, key=None, keyid=None, profile=None)

Delete target group.

**name** (string) - Target Group Name or Amazon Resource Name (ARN).

**returns** (bool) - True on success, False on failure.

CLI example:

    salt myminion boto_elbv2.delete_target_group arn:aws:elasticloadbalancing:us-west-2:644138682826:targetgroup/learn1give1-api/414788a16b5cf163

salt.modules.boto_elbv2.deregister_targets(name, targets=None, region=None, key=None, keyid=None, profile=None)

Deregister targets to a target froup of an ALB. **targets** is either a instance id string or a list of instance id’s.

**Returns:**

- True: instance(s) deregistered successfully
- False: instance(s) failed to be deregistered

CLI example:

    salt myminion boto_elbv2.deregister_targets myelb instance_id
    salt myminion boto_elbv2.deregister_targets myelb "[instance_id,instance_id]"

salt.modules.boto_elbv2.describe_target_health(name, targets=None, region=None, key=None, keyid=None, profile=None)

Get the current health check status for targets in a target group.

CLI example:
salt.myminion boto_elbv2.describe_target_health arn:aws:elasticloadbalancing:us-west-2:644138682826:targetgroup/learn1give1-api/414788a16b5cf163 targets=['i-isdf23ifjf']

salt.modules.boto_elbv2.register_targets(name, targets, region=None, key=None, keyid=None, profile=None)

Register targets to a target group of an ALB. targets is either a instance id string or a list of instance id’s.

Returns:
- True: instance(s) registered successfully
- False: instance(s) failed to be registered

CLI example:
salt myminion boto_elbv2.register_targets myelb instance_id
salt myminion boto_elbv2.register_targets myelb "[instance_id,instance_id]"

salt.modules.boto_elbv2.target_group_exists(name, region=None, key=None, keyid=None, profile=None)

Check to see if an target group exists.

CLI example:
salt myminion boto_elbv2.target_group_exists arn:aws:elasticloadbalancing:us-west-2:644138682826:targetgroup/learn1give1-api/414788a16b5cf163

21.9.52 salt.modules.boto_iam

Connection module for Amazon IAM

New in version 2014.7.0.

configuration This module accepts explicit iam credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

iam.keyid: GKTADJGHEIQSXMKKRBJ08H
iam.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
iam.region: us-east-1

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1

depends boto
salt.modules.boto_iam.add_user_to_group(  
    user_name,  
    group_name,  
    region=None,  
    key=None,  
    keyid=None,  
    profile=None  
)  
Add user to group.  
New in version 2015.8.0.  
CLI Example:
```
salt myminion boto_iam.add_user_to_group myuser mygroup
```

salt.modules.boto_iam.associate_profile_to_role(  
    profile_name,  
    role_name,  
    region=None,  
    key=None,  
    keyid=None,  
    profile=None  
)  
Associate an instance profile with an IAM role.  
CLI Example:
```
salt myminion boto_iam.associate_profile_to_role myirole myiprofile
```

salt.modules.boto_iam.attach_group_policy(  
    policy_name,  
    group_name,  
    region=None,  
    key=None,  
    keyid=None,  
    profile=None  
)  
Attach a managed policy to a group.  
CLI Example:
```
salt myminion boto_iam.attach_group_policy mypolicy mygroup
```

salt.modules.boto_iam.attach_role_policy(  
    policy_name,  
    role_name,  
    region=None,  
    key=None,  
    keyid=None,  
    profile=None  
)  
Attach a managed policy to a role.  
CLI Example:
```
salt myminion boto_iam.attach_role_policy mypolicy myrole
```

salt.modules.boto_iam.attach_user_policy(  
    policy_name,  
    user_name,  
    region=None,  
    key=None,  
    keyid=None,  
    profile=None  
)  
Attach a managed policy to a user.  
CLI Example:
```
salt myminion boto_iam.attach_user_policy mypolicy myuser
```

salt.modules.boto_iam.build_policy(  
    region=None,  
    key=None,  
    keyid=None,  
    profile=None  
)  
Build a default assume role policy.  
New in version 2015.8.0.  
CLI Example:
```
salt myminion boto_iam.build_policy
```

salt.modules.boto_iam.create_access_key(  
    user_name,  
    region=None,  
    key=None,  
    keyid=None,  
    profile=None  
)  
Create access key id for a user.  
New in version 2015.8.0.  
CLI Example:
```
salt myminion boto_iam.create_access_key myuser
```
salt.modules.boto_iam.create_group(group_name, path=None, region=None, key=None, keyid=None, profile=None)

Create a group.
New in version 2015.8.0.
CLI Example:
salt myminion boto_iam.create_group group

salt.modules.boto_iam.create_instance_profile(name, region=None, key=None, keyid=None, profile=None)

Create an instance profile.
CLI Example:
salt myminion boto_iam.create_instance_profile myiprofile

salt.modules.boto_iam.create_login_profile(user_name, password, region=None, key=None, keyid=None, profile=None)

Creates a login profile for the specified user, give the user the ability to access AWS services and the AWS Management Console.
New in version 2015.8.0.
CLI Example:
salt myminion boto_iam.create_login_profile user_name password

salt.modules.boto_iam.create_policy(policy_name, policy_document, path=None, description=None, region=None, key=None, keyid=None, profile=None)

Create a policy.
CLI Example:

salt.modules.boto_iam.create_policy_version(policy_name, policy_document, set_as_default=None, region=None, key=None, keyid=None, profile=None)

Create a policy version.
CLI Example:

salt.modules.boto_iam.create_role(name, policy_document=None, path=None, region=None, key=None, keyid=None, profile=None)

Create an instance role.
CLI Example:
salt myminion boto_iam.create_role myrole
salt.modules.boto_iam.create_role_policy(role_name, policy_name, policy, region=None, key=None, keyid=None, profile=None)

Create or modify a role policy.

CLI Example:

```bash
salt myminion boto_iam.create_role_policy myirole mypolicy '
{
  "MyPolicy":
  {
    "Statement": [
      {
        "Action": ["sqs:*"],
        "Effect": "Allow",
        "Resource": ["arn:aws:sqs:*:*:*"],
        "Sid": "MyPolicySqs1"
      }
    ]
  }
}'
```

salt.modules.boto_iam.create_saml_provider(name, saml_metadata_document, region=None, key=None, keyid=None, profile=None)

Create SAML provider.

CLI Example:

```bash
salt myminion boto_iam.create_saml_provider my_saml_provider_name saml_metadata_document
```

salt.modules.boto_iam.create_user(user_name, path=None, region=None, key=None, keyid=None, profile=None)

Create a user.

New in version 2015.8.0.

CLI Example:

```bash
salt myminion boto_iam.create_user myuser
```

salt.modules.boto_iam.deactivate_mfa_device(user_name, serial, region=None, key=None, keyid=None, profile=None)

Deactivates the specified MFA device and removes it from association with the user.

New in version 2016.3.0.

CLI Example:

```bash
salt myminion boto_iam.deactivate_mfa_device user_name serial_num
```

salt.modules.boto_iam.delete_access_key(access_key_id, user_name=None, region=None, key=None, keyid=None, profile=None)

Delete access key id from a user.

New in version 2015.8.0.

CLI Example:

```bash
salt myminion boto_iam.delete_access_key myuser
```

salt.modules.boto_iam.delete_group(group_name, region=None, key=None, keyid=None, profile=None)

Delete a group policy.

CLI Example:

```bash
code-block:: bash

salt myminion boto_iam.delete_group mygroup
```
salt.modules.boto_iam.delete_group_policy(group_name, policy_name, region=None, key=None, keyid=None, profile=None)

Delete a group policy.

CLI Example:

```bash
salt myminion boto_iam.delete_group_policy mygroup mypolicy
```

salt.modules.boto_iam.delete_instance_profile(name, region=None, key=None, keyid=None, profile=None)

Delete an instance profile.

CLI Example:

```bash
salt myminion boto_iam.delete_instance_profile myiprofile
```

salt.modules.boto_iam.delete_login_profile(user_name, region=None, key=None, keyid=None, profile=None)

Deletes a login profile for the specified user.

New in version 2016.3.0.

CLI Example:

```bash
salt myminion boto_iam.delete_login_profile user_name
```

salt.modules.boto_iam.delete_policy(policy_name, region=None, key=None, keyid=None, profile=None)

Delete a policy.

CLI Example:

```bash
salt myminion boto_iam.delete_policy mypolicy
```

salt.modules.boto_iam.delete_policy_version(policy_name, version_id, region=None, key=None, keyid=None, profile=None)

Delete a policy version.

CLI Example:

```bash
salt myminion boto_iam.delete_policy_version mypolicy v1
```

salt.modules.boto_iam.delete_role(name, region=None, key=None, keyid=None, profile=None)

Delete an IAM role.

CLI Example:

```bash
salt myminion boto_iam.delete_role myirole
```

salt.modules.boto_iam.delete_role_policy(role_name, policy_name, region=None, key=None, keyid=None, profile=None)

Delete a role policy.

CLI Example:

```bash
salt myminion boto_iam.delete_role_policy myirole mypolicy
```
salt.modules.boto_iam.delete_saml_provider(name, region=None, key=None, keyid=None, profile=None)

Delete SAML provider

CLI Example:

```
salt myminion boto_iam.delete_saml_provider my_saml_provider_name
```

salt.modules.boto_iam.delete_server_cert(cert_name, region=None, key=None, keyid=None, profile=None)

Deletes a certificate from Amazon.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.delete_server_cert mycert_name
```

salt.modules.boto_iam.delete_user(user_name, region=None, key=None, keyid=None, profile=None)

Delete a user.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.delete_user myuser
```

salt.modules.boto_iam.delete_user_policy(user_name, policy_name, region=None, key=None, keyid=None, profile=None)

Delete a user policy.

CLI Example:

```
salt myminion boto_iam.delete_user_policy myuser mypolicy
```

salt.modules.boto_iam.delete_virtual_mfa_device(serial, region=None, key=None, keyid=None, profile=None)

Deletes the specified virtual MFA device.

CLI Example:

```
salt myminion boto_iam.delete_virtual_mfa_device serial_num
```

salt.modules.boto_iam.describe_role(name, region=None, key=None, keyid=None, profile=None)

Get information for a role.

CLI Example:

```
salt myminion boto_iam.describe_role myirole
```

salt.modules.boto_iam.detach_group_policy(policy_name, group_name, region=None, key=None, keyid=None, profile=None)

Detach a managed policy to a group.

CLI Example:

```
salt myminion boto_iam.detach_group_policy mypolicy mygroup
```
salt.modules.boto_iam.detach_role_policy(policy_name, role_name, region=None, key=None, keyid=None, profile=None)

Detach a managed policy to a role.

CLI Example:

```
salt myminion boto_iam.detach_role_policy mypolicy myrole
```

salt.modules.boto_iam.detach_user_policy(policy_name, user_name, region=None, key=None, keyid=None, profile=None)

Detach a managed policy to a user.

CLI Example:

```
salt myminion boto_iam.detach_user_policy mypolicy myuser
```

salt.modules.boto_iam.disassociate_profile_from_role(profile_name, role_name, region=None, key=None, keyid=None, profile=None)

Disassociate an instance profile from an IAM role.

CLI Example:

```
salt myminion boto_iam.disassociate_profile_from_role myirole myiprofile
```

salt.modules.boto_iam.export_roles(path_prefix='/', region=None, key=None, keyid=None, profile=None)

Get all IAM role details. Produces results that can be used to create an sls file.

CLI Example:

```
salt-call boto_iam.export_roles -out=txt | sed "s/local: //" > iam_roles.sls
```

salt.modules.boto_iam.export_users(path_prefix='/', region=None, key=None, keyid=None, profile=None)

Get all IAM user details. Produces results that can be used to create an sls file.

New in version 2016.3.0.

CLI Example:

```
salt-call boto_iam.export_users -out=txt | sed "s/local: //" > iam_users.sls
```

salt.modules.boto_iam.get_account_id(region=None, key=None, keyid=None, profile=None)

Get a the AWS account id associated with the used credentials.

CLI Example:

```
salt myminion boto_iam.get_account_id
```

salt.modules.boto_iam.get_account_policy(region=None, key=None, keyid=None, profile=None)

Get account policy for the AWS account.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.get_account_policy
```
salt.modules.boto_iam.

get_all_access_keys

(user_name, marker=None, max_items=None, region=None, key=None, keyid=None, profile=None)

Get all access keys from a user.
New in version 2015.8.0.
CLI Example:
salt myminion boto_iam.get_all_access_keys myuser

salt.modules.boto_iam.

get_all_group_policies

(group_name, region=None, key=None, keyid=None, profile=None)

Get a list of policy names from a group.
CLI Example:
salt myminion boto_iam.get_all_group_policies mygroup

salt.modules.boto_iam.

get_all_groups

(path_prefix='/', region=None, key=None, keyid=None, profile=None)

Get and return all IAM group details, starting at the optional path.
New in version 2016.3.0.
CLI Example:
salt-call boto_iam.get_all_groups

salt.modules.boto_iam.

get_all_instance_profiles

(path_prefix='/', region=None, key=None, keyid=None, profile=None)

Get and return all IAM instance profiles, starting at the optional path.
New in version 2016.11.0.
CLI Example:
salt-call boto_iam.get_all_instance_profiles

salt.modules.boto_iam.

get_all_mfa_devices

(user_name, region=None, key=None, keyid=None, profile=None)

Get all MFA devices associated with an IAM user.
New in version 2016.3.0.
CLI Example:
salt myminion boto_iam.get_all_mfa_devices user_name

salt.modules.boto_iam.

get_all_roles

(path_prefix='/', region=None, key=None, keyid=None, profile=None)

Get and return all IAM role details, starting at the optional path.
New in version 2016.3.0.
CLI Example:
salt-call boto_iam.get_all_roles

salt.modules.boto_iam.

get_all_user_policies

(user_name, marker=None, max_items=None, region=None, key=None, keyid=None, profile=None)

Get all user policies.
New in version 2015.8.0.
CLI Example:
```bash
salt myminion boto_iam.get_all_user_policies myuser
```

salt.modules.boto_iam.get_all_users(path_prefix='/', region=None, key=None, keyid=None, profile=None)
Get and return all IAM user details, starting at the optional path.
New in version 2016.3.0.
CLI Example:
```bash
salt-call boto_iam.get_all_users
```

salt.modules.boto_iam.get_group(group_name, region=None, key=None, keyid=None, profile=None)
Get group information.
New in version 2015.8.0.
CLI Example:
```bash
salt myminion boto_iam.get_group mygroup
```

salt.modules.boto_iam.get_group_members(group_name, region=None, key=None, keyid=None, profile=None)
Get group information.
New in version 2016.3.0.
CLI Example:
```bash
salt myminion boto_iam.get_group mygroup
```

salt.modules.boto_iam.get_group_policy(group_name, policy_name, region=None, key=None, keyid=None, profile=None)
Retrieves the specified policy document for the specified group.
New in version 2015.8.0.
CLI Example:
```bash
salt myminion boto_iam.get_group_policy mygroup policymapname
```

salt.modules.boto_iam.get_policy(policy_name, region=None, key=None, keyid=None, profile=None)
Check to see if policy exists.
CLI Example:
```bash
salt myminion boto_iam.instance_profile_exists myiprofile
```

salt.modules.boto_iam.get_policy_version(policy_name, version_id, region=None, key=None, keyid=None, profile=None)
Check to see if policy exists.
CLI Example:
```bash
salt myminion boto_iam.instance_profile_exists myiprofile
```

salt.modules.boto_iam.get_role_policy(role_name, policy_name, region=None, key=None, keyid=None, profile=None)
Get a role policy.
CLI Example:
```
salt myminion boto_iam.get_role_policy myirole mypolicy
```

```
salt.modules.boto_iam.get_saml_provider(name, region=None, key=None, keyid=None, profile=None)
```
Get SAML provider document.

CLI Example:
```
salt myminion boto_iam.get_saml_provider arn
```

```
salt.modules.boto_iam.get_saml_provider_arn(name, region=None, key=None, keyid=None, profile=None)
```
Get SAML provider

CLI Example:
```
salt myminion boto_iam.get_saml_provider_arn my_saml_provider_name
```

```
salt.modules.boto_iam.get_server_certificate(cert_name, region=None, key=None, keyid=None, profile=None)
```
Returns certificate information from Amazon

New in version 2015.8.0.

CLI Example:
```
salt myminion boto_iam.get_server_certificate mycert_name
```

```
salt.modules.boto_iam.get_user(user_name=None, region=None, key=None, keyid=None, profile=None)
```
Get user information.

New in version 2015.8.0.

CLI Example:
```
salt myminion boto_iam.get_user myuser
```

```
salt.modules.boto_iam.get_user_policy(user_name, policy_name, region=None, key=None, keyid=None, profile=None)
```
Retrieves the specified policy document for the specified user.

New in version 2015.8.0.

CLI Example:
```
salt myminion boto_iam.get_user_policy myuser mypolicyname
```

```
salt.modules.boto_iam.instance_profile_exists(name, region=None, key=None, keyid=None, profile=None)
```
Check to see if an instance profile exists.

CLI Example:
```
salt myminion boto_iam.instance_profile_exists myiprofile
```
salt.modules.boto_iam.list_attached_group_policies(group_name, path_prefix=None, entity_filter=None, region=None, key=None, keyid=None, profile=None)

List entities attached to the given group.
CLI Example:
```
salt myminion boto_iam.list_entities_for_policy mypolicy
```

salt.modules.boto_iam.list_attached_role_policies(role_name, path_prefix=None, entity_filter=None, region=None, key=None, keyid=None, profile=None)

List entities attached to the given role.
CLI Example:
```
salt myminion boto_iam.list_entities_for_policy mypolicy
```

salt.modules.boto_iam.list_attached_user_policies(user_name, path_prefix=None, entity_filter=None, region=None, key=None, keyid=None, profile=None)

List entities attached to the given user.
CLI Example:
```
salt myminion boto_iam.list_entities_for_policy mypolicy
```

salt.modules.boto_iam.list_entities_for_policy(policy_name, path_prefix=None, entity_filter=None, region=None, key=None, keyid=None, profile=None)

List entities that a policy is attached to.
CLI Example:
```
salt myminion boto_iam.list_entities_for_policy mypolicy
```

salt.modules.boto_iam.list_instance_profiles(path_prefix='/', region=None, key=None, keyid=None, profile=None)

List all IAM instance profiles, starting at the optional path.
New in version 2016.11.0.
CLI Example:
```
salt-call boto_iam.list_instance_profiles
```

salt.modules.boto_iam.list_policies(region=None, key=None, keyid=None, profile=None)

List policies.
CLI Example:
```
salt myminion boto_iam.list_policies
```

salt.modules.boto_iam.list_policy_versions(policy_name, region=None, key=None, keyid=None, profile=None)

List versions of a policy.
CLI Example:
salt myminion boto_iam.list_policy_versions mypolicy

```python
salt.modules.boto_iam.list_role_policies(role_name, region=None, key=None, keyid=None, profile=None)
```

Get a list of policy names from a role.

CLI Example:
```
salt myminion boto_iam.list_role_policies myirole
```

```python
salt.modules.boto_iam.list_saml_providers(region=None, key=None, keyid=None, profile=None)
```

List SAML providers.

CLI Example:
```
salt myminion boto_iam.list_saml_providers
```

```python
salt.modules.boto_iam.policy_exists(policy_name, region=None, key=None, keyid=None, profile=None)
```

Check to see if policy exists.

CLI Example:
```
salt myminion boto_iam.instance_profile_exists myiprofile
```

```python
salt.modules.boto_iam.policy_version_exists(policy_name, version_id, region=None, key=None, keyid=None, profile=None)
```

Check to see if policy exists.

CLI Example:
```
salt myminion boto_iam.instance_profile_exists myiprofile
```

```python
salt.modules.boto_iam.profile_associated(role_name, profile_name, region, key, keyid, profile)
```

Check to see if an instance profile is associated with an IAM role.

CLI Example:
```
salt myminion boto_iam.profile_associated myirole myiprofile
```

```python
salt.modules.boto_iam.put_group_policy(group_name, policy_name, policy_json, region=None, key=None, keyid=None, profile=None)
```

Adds or updates the specified policy document for the specified group.

New in version 2015.8.0.

CLI Example:
```
salt myminion boto_iam.put_group_policy mygroup policymap policynames policyrules
```

```python
salt.modules.boto_iam.put_user_policy(user_name, policy_name, policy_json, region=None, key=None, keyid=None, profile=None)
```

Adds or updates the specified policy document for the specified user.

New in version 2015.8.0.

CLI Example:
salt myminion boto_iam.put_user_policy myuser policynname policyrules

salt.modules.boto_iam.remove_user_from_group(group_name, user_name, region=None, key=None, keyid=None, profile=None)

Remove user from group.
New in version 2015.8.0.
CLI Example:
salt myminion boto_iam.remove_user_from_group mygroup myuser

salt.modules.boto_iam.role_exists(name, region=None, key=None, keyid=None, profile=None)

Check to see if an IAM role exists.
CLI Example:
salt myminion boto_iam.role_exists myirole

salt.modules.boto_iam.set_default_policy_version(policy_name, version_id, region=None, key=None, keyid=None, profile=None)

Set the default version of a policy.
CLI Example:
salt myminion boto_iam.set_default_policy_version mypolicy v1

salt.modules.boto_iam.update_account_password_policy(allow_users_to_change_password=None, hard_expiry=None, max_password_age=None, minimum_password_length=None, password_reuse_prevention=None, require_lowercase_characters=None, require_numbers=None, require_symbols=None, require_uppercase_characters=None, region=None, key=None, keyid=None, profile=None)

Update the password policy for the AWS account.
New in version 2015.8.0.
CLI Example:
salt myminion boto_iam.update_account_password_policy True

salt.modules.boto_iam.update_assume_role_policy(role_name, policy_document, region=None, key=None, keyid=None, profile=None)

Update an assume role policy for a role.
New in version 2015.8.0.
CLI Example:
```python
salt myminion boto_iam.update_assume_role_policy myrole '{"Statement":"...")'
```

`salt.modules.boto_iam.update_saml_provider(name, saml_metadata_document, region=None, key=None, keyid=None, profile=None)`

Update SAML provider.

CLI Example:

```python
salt myminion boto_iam.update_saml_provider my_saml_provider_name saml_metadata_document
```

`salt.modules.boto_iam.upload_server_cert(cert_name, cert_body, private_key, cert_chain=None, path=None, region=None, key=None, keyid=None, profile=None)`

Upload a certificate to Amazon.

New in version 2015.8.0.

CLI Example:

```python
salt myminion boto_iam.upload_server_cert mycert_name crt priv_key
```

Parameters

- **cert_name** – The name for the server certificate. Do not include the path in this value.
- **cert_body** – The contents of the public key certificate in PEM-encoded format.
- **private_key** – The contents of the private key in PEM-encoded format.
- **cert_chain** – The contents of the certificate chain. This is typically a concatenation of the PEM-encoded public key certificates of the chain.
- **path** – The path for the server certificate.
- **region** – The name of the region to connect to.
- **key** – The key to be used in order to connect
- **keyid** – The keyid to be used in order to connect
- **profile** – The profile that contains a dict of region, key, keyid

Returns True / False

`salt.modules.boto_iam.user_exists_in_group(user_name, group_name, region=None, key=None, keyid=None, profile=None)`

Check if user exists in group.

New in version 2015.8.0.

CLI Example:

```python
salt myminion boto_iam.user_exists_in_group myuser mygroup
```

21.9.53 salt.modules.boto_iot module

Connection module for Amazon IoT

New in version 2016.3.0.
The dependencies listed above can be installed via package or pip.

**configuration** This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

- `iot.keyid`: GKTADJGHEIQSXMKKRBJ08H
- `iot.key`: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

A region may also be specified in the configuration:

- `iot.region`: us-east-1

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

- `myprofile`:
  - `keyid`: GKTADJGHEIQSXMKKRBJ08H
  - `key`: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  - `region`: us-east-1

salt.modules.boto_iot.attach_principal_policy(policyName, principal, region=None, key=None, keyid=None, profile=None)

Attach the specified policy to the specified principal (certificate or other credential.)

Returns {attached: true} if the policy was attached {attached: False} if the policy was not attached.

CLI Example:

```
salt myminion boto_iot.attach_principal_policy mypolicy mycognitoID
```

salt.modules.boto_iot.create_policy(policyName, policyDocument, region=None, key=None, keyid=None, profile=None)

Given a valid config, create a policy.

Returns {created: true} if the policy was created and returns {created: False} if the policy was not created.

CLI Example:

```
salt myminion boto_iot.create_policy my_policy

{"Version":"2015-12-12","Statement": [{"Effect":"Allow","Action": ["iot:Publish"],"Resource": ["arn:::::topic/foo/bar"]}]
```

salt.modules.boto_iot.create_policy_version(policyName, policyDocument, setAsDefault=False, region=None, key=None, keyid=None, profile=None)

Given a valid config, create a new version of a policy.
Returns {created: true} if the policy version was created and returns {created: False} if the policy version was not created.

CLI Example:
```
salt myminion boto_iot.create_policy_version my_policy
    '{"Statement": ["Effect":"Allow","Action": ["iot:Publish"], "Resource": ["arn:::topic/foo/bar"]}]'
```

**salt.modules.boto_iot.create_thing_type**(thingTypeName, thingTypeDescription, searchableAttributesList, region=None, key=None, keyid=None, profile=None)

Given a valid config, create a thing type.

Returns {created: true} if the thing type was created and returns {created: False} if the thing type was not created.

New in version 2016.11.0.

CLI Example:
```
salt myminion boto_iot.create_thing_type mythingtype
    thingtype_description_string '
        ["searchable_attr_1", "searchable_attr_2"]'
```

**salt.modules.boto_iot.create_topic_rule**(ruleName, sql, actions, description, ruleDisabled=False, region=None, key=None, keyid=None, profile=None)

Given a valid config, create a topic rule.

Returns {created: true} if the rule was created and returns {created: False} if the rule was not created.

CLI Example:
```
salt myminion boto_iot.create_topic_rule my_rule
    "SELECT * FROM 'some/thing'" 
    '[{"lambda":{"functionArn":"arn:::something"},"sns":{"targetArn":"arn:::something","roleArn":"arn:::something"}}]'
```

**salt.modules.boto_iot.delete_policy**(policyName, region=None, key=None, keyid=None, profile=None)

Given a policy name, delete it.

Returns {deleted: true} if the policy was deleted and returns {deleted: false} if the policy was not deleted.

CLI Example:
```
salt myminion boto_iot.delete_policy mypolicy
```

**salt.modules.boto_iot.delete_policy_version**(policyName, policyVersionId, region=None, key=None, keyid=None, profile=None)

Given a policy name and version, delete it.

Returns {deleted: true} if the policy version was deleted and returns {deleted: false} if the policy version was not deleted.

CLI Example:
```
salt myminion boto_iot.delete_policy_version mypolicy version
```

**salt.modules.boto_iot.delete_thing_type**(thingTypeName, region=None, key=None, keyid=None, profile=None)

Given a thing type name, delete it.
Returns {deleted: true} if the thing type was deleted and returns {deleted: false} if the thing type was not deleted.

New in version 2016.11.0.

CLI Example:

```bash
salt myminion boto_iot.delete_thing_type mythingtype
```

salt.modules.boto_iot.delete_topic_rule(ruleName, region=None, key=None, keyid=None, profile=None)

Given a rule name, delete it.

Returns {deleted: true} if the rule was deleted and returns {deleted: false} if the rule was not deleted.

CLI Example:

```bash
salt myminion boto_iot.delete_rule myrule
```

salt.modules.boto_iot.deprecate_thing_type(thingTypeName, undoDeprecate=False, region=None, key=None, keyid=None, profile=None)

Given a thing type name, deprecate it when undoDeprecate is False and undeprecate it when undoDeprecate is True.

Returns {deprecated: true} if the thing type was deprecated and returns {deprecated: false} if the thing type was not deprecated.

New in version 2016.11.0.

CLI Example:

```bash
salt myminion boto_iot.deprecate_thing_type mythingtype
```

salt.modules.boto_iot.describe_policy(policyName, region=None, key=None, keyid=None, profile=None)

Given a policy name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```bash
salt myminion boto_iot.describe_policy mypolicy
```

salt.modules.boto_iot.describe_policy_version(policyName, policyVersionId, region=None, key=None, keyid=None, profile=None)

Given a policy name and version describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```bash
salt myminion boto_iot.describe_policy_version mypolicy version
```

salt.modules.boto_iot.describe_thing_type(thingTypeName, region=None, key=None, keyid=None, profile=None)

Given a thing type name describe its properties.

Returns a dictionary of interesting properties.

New in version 2016.11.0.

CLI Example:
salt.myminion boto_iot.describe_thing_type mythingtype

salt.modules.boto_iot.describe_topic_rule(
    ruleName, region=None, key=None, keyid=None, profile=None
)

Given a topic rule name describe its properties.
Returns a dictionary of interesting properties.

CLI Example:
salt myminion boto_iot.describe_topic_rule myrule

salt.modules.boto_iot.detach_principal_policy(
    policyName, principal, region=None, key=None, keyid=None, profile=None
)

Detach the specified policy from the specified principal (certificate or other credential.)
Returns {detached: true} if the policy was detached {detached: False} if the policy was not detached.

CLI Example:
salt myminion boto_iot.detach_principal_policy mypolicy mycognitoID

salt.modules.boto_iot.list_policies(
    region=None, key=None, keyid=None, profile=None
)

List all policies
Returns list of policies

CLI Example:
salt myminion boto_iot.list_policies

Example Return:

```
policies:
  - {...}
  - {...}
```

salt.modules.boto_iot.list_policy_versions(
    policyName, region=None, key=None, keyid=None, profile=None
)

List the versions available for the given policy.

CLI Example:
salt myminion boto_iot.list_policy_versions mypolicy

Example Return:

```
policyVersions:
  - {...}
  - {...}
```

salt.modules.boto_iot.list_principal_policies(
    principal, region=None, key=None, keyid=None, profile=None
)

List the policies attached to the given principal.

CLI Example:
salt myminion boto_iot.list_principal_policies myprincipal

Example Return:
policies:
- {...}
- {...}

```
salt.modules.boto_iot.list_topic_rules(topic=None, ruleDisabled=None, region=None, key=None, keyid=None, profile=None)
```

List all rules (for a given topic, if specified)

Returns list of rules

CLI Example:

```
salt myminion boto_iot.list_topic_rules
```

Example Return:

```
rules:
- {...}
- {...}
```

```
salt.modules.boto_iot.policy_exists(policyName, region=None, key=None, keyid=None, profile=None)
```

Given a policy name, check to see if the given policy exists.

Returns True if the given policy exists and returns False if the given policy does not exist.

CLI Example:

```
salt myminion boto_iot.policy_exists mypolicy
```

```
salt.modules.boto_iot.policy_version_exists(policyName, policyVersionId, region=None, key=None, keyid=None, profile=None)
```

Given a policy name and version ID, check to see if the given policy version exists.

Returns True if the given policy version exists and returns False if the given policy version does not exist.

CLI Example:

```
salt myminion boto_iot.policy_version_exists mypolicy versionid
```

```
salt.modules.boto_iot.replace_topic_rule(ruleName, sql, actions, description, ruleDisabled=False, region=None, key=None, keyid=None, profile=None)
```

Given a valid config, replace a topic rule with the new values.

Returns [created: true] if the rule was created and returns [created: False] if the rule was not created.

CLI Example:

```
salt myminion boto_iot.replace_topic_rule my_rule 'SELECT * FROM some.thing' 

'[["lambda":{"functionArn":"arn::something"}],{"sns":{
  "targetArn":"arn::something","roleArn":"arn::something"}}]
```

```
salt.modules.boto_iot.set_default_policy_version(policyName, policyVersionId, region=None, key=None, keyid=None, profile=None)
```

Sets the specified version of the specified policy as the policy’s default (operative) version. This action affects all certificates that the policy is attached to.

Returns [changed: true] if the policy version was set [changed: False] if the policy version was not set.
CLI Example:
```
salt myminion boto_iot.set_default_policy_version mypolicy versionid
```

```python
salt.modules.boto_iot.thing_type_exists(thingTypeName, region=None, key=None, keyid=None, profile=None)
```

Given a thing type name, check to see if the given thing type exists.

Returns True if the given thing type exists and returns False if the given thing type does not exist.

New in version 2016.11.0.

CLI Example:
```
salt myminion boto_iot.thing_type_exists mythingtype
```

```python
salt.modules.boto_iot.topic_rule_exists(ruleName, region=None, key=None, keyid=None, profile=None)
```

Given a rule name, check to see if the given rule exists.

Returns True if the given rule exists and returns False if the given rule does not exist.

CLI Example:
```
salt myminion boto_iot.topic_rule_exists myrule
```

### 21.9.54 `salt.modules.boto_kinesis module`

Connection module for Amazon Kinesis

New in version 2017.7.0.

**configuration**  This module accepts explicit Kinesis credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

```
kinesis.keyid: GKTADJGHEIQSXMKKRBJ08H
kinesis.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
kinesis.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

**depends** boto3
salt.modules.boto_kinesis.create_stream(stream_name, num_shards, region=None, key=None, keyid=None, profile=None)

Create a stream with name stream_name and initial number of shards num_shards.

CLI example:
```
salt myminion boto_kinesis.create_stream my_stream N region=us-east-1
```

salt.modules.boto_kinesis.decrease_stream_retention_period(stream_name, retention_hours, region=None, key=None, keyid=None, profile=None)

Decrease stream retention period to retention_hours

CLI example:
```
salt myminion boto_kinesis.decrease_stream_retention_period my_stream N region=us-east-1
```

salt.modules.boto_kinesis.delete_stream(stream_name, region=None, key=None, keyid=None, profile=None)

Delete the stream with name stream_name. This cannot be undone! All data will be lost‼

CLI example:
```
salt myminion boto_kinesis.delete_stream my_stream region=us-east-1
```

salt.modules.boto_kinesis.disable_enhanced_monitoring(stream_name, metrics, region=None, key=None, keyid=None, profile=None)

Disable enhanced monitoring for the specified shard-level metrics on stream stream_name

CLI example:
```
salt myminion boto_kinesis.disable_enhanced_monitoring my_stream ["metrics", "to", "disable"] region=us-east-1
```

salt.modules.boto_kinesis.enable_enhanced_monitoring(stream_name, metrics, region=None, key=None, keyid=None, profile=None)

Enable enhanced monitoring for the specified shard-level metrics on stream stream_name

CLI example:
```
salt myminion boto_kinesis.enable_enhanced_monitoring my_stream ["metrics", "to", "enable"] region=us-east-1
```

salt.modules.boto_kinesis.exists(stream_name, region=None, key=None, keyid=None, profile=None)

Check if the stream exists. Returns False and the error if it does not.

CLI example:
```
salt myminion boto_kinesis.exists my_stream region=us-east-1
```

salt.modules.boto_kinesis.get_info_for_reshard(stream_details)

Collect some data: number of open shards, key range, etc. Modifies stream_details to add a sorted list of OpenShards. Returns (min_hash_key, max_hash_key, stream_details)
CLI example:
```
salt myminion boto_kinesis.get_info_for_reshard existing_stream_details
```

salt.modules.boto_kinesis.get_stream_when_active(stream_name, region=None, key=None, keyid=None, profile=None)

Get complete stream info from AWS, returning only when the stream is in the ACTIVE state. Continues to retry when stream is updating or creating. If the stream is deleted during retries, the loop will catch the error and break.

CLI example:
```
salt myminion boto_kinesis.get_stream_when_active my_stream region=us-east-1
```

salt.modules.boto_kinesis.increase_stream_retention_period(stream_name, retention_hours, region=None, key=None, keyid=None, profile=None)

Increase stream retention period to retention_hours

CLI example:
```
salt myminion boto_kinesis.increase_stream_retention_period my_stream N region=us-east-1
```

salt.modules.boto_kinesis.list_streams(region=None, key=None, keyid=None, profile=None)

Return a list of all streams visible to the current account

CLI example:
```
salt myminion boto_kinesis.list_streams
```

salt.modules.boto_kinesis.long_int(hash_key)

The hash key is a 128-bit int, sent as a string. It’s necessary to convert to int/long for comparison operations. This helper method handles python 2/3 incompatibility

CLI example:
```
salt myminion boto_kinesis.long_int some_MD5_hash_as_string
```

Returns: long object if python 2.X, int object if python 3.X

salt.modules.boto_kinesis.reshard(stream_name, desired_size, force=False, region=None, key=None, keyid=None, profile=None)

Reshard a kinesis stream. Each call to this function will wait until the stream is ACTIVE, then make a single split or merge operation. This function decides where to split or merge with the assumption that the ultimate goal is a balanced partition space.

For safety, user must pass in force=True; otherwise, the function will dry run.

CLI example:
```
salt myminion boto_kinesis.reshard my_stream N True region=us-east-1
```

Returns: True if a split or merge was found/operated, False if nothing is needed
21.9.55 salt.modules.boto_kms

Connection module for Amazon KMS

New in version 2015.8.0.

**configuration** This module accepts explicit kms credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```python
kms.keyid: GKTADJGHEIQSXMKKRBJ08H
kms.key: askdjghsdfjkghWupUjasdflkJdkfjlgjsdfjajkghs
```

A region may also be specified in the configuration:

```python
kms.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```python
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkJdkfjlgjsdfjajkghs
  region: us-east-1
```

**depends** boto

salt.modules.boto_kms.create_alias(alias_name, target_key_id, region=None, key=None, keyid=None, profile=None)

Create a display name for a key.

CLI example:

```bash
salt myminion boto_kms.create_alias 'alias/mykey' key_id
```

salt.modules.boto_kms.create_grant(key_id, grantee_principal, retiring_principal=None, operations=None, constraints=None, grant_tokens=None, region=None, key=None, keyid=None, profile=None)

Adds a grant to a key to specify who can access the key and under what conditions.

CLI example:

```bash
salt myminion boto_kms.create_grant 'alias/mykey' 'arn:aws:iam::11111111:role/myrole' operations='["Encrypt","Decrypt"]'
```

salt.modules.boto_kms.create_key(policy=None, description=None, key_usage=None, region=None, key=None, keyid=None, profile=None)

Creates a master key.

CLI example:

```bash
salt myminion boto_kms.create_key '{"Statement":...}' "My master key"
```

salt.modules.boto_kms.decrypt(ciphertext_blob, encryption_context=None, grant_tokens=None, region=None, key=None, keyid=None, profile=None)

Decrypt ciphertext.
CLI example:
```
salt myminion boto_kms.decrypt encrypted_ciphertext
```

```python
salt.modules.boto_kms.describe_key(key_id, region=None, key=None, keyid=None, profile=None)
```
Get detailed information about a key.

CLI example:
```
salt myminion boto_kms.describe_key 'alias/mykey'
```

```python
salt.modules.boto_kms.disable_key(key_id, region=None, key=None, keyid=None, profile=None)
```
Mark key as disabled.

CLI example:
```
salt myminion boto_kms.disable_key 'alias/mykey'
```

```python
salt.modules.boto_kms.disable_key_rotation(key_id, region=None, key=None, keyid=None, profile=None)
```
Disable key rotation for specified key.

CLI example:
```
salt myminion boto_kms.disable_key_rotation 'alias/mykey'
```

```python
salt.modules.boto_kms.enable_key(key_id, region=None, key=None, keyid=None, profile=None)
```
Mark key as enabled.

CLI example:
```
salt myminion boto_kms.enable_key 'alias/mykey'
```

```python
salt.modules.boto_kms.enable_key_rotation(key_id, region=None, key=None, keyid=None, profile=None)
```
Disable key rotation for specified key.

CLI example:
```
salt myminion boto_kms.enable_key_rotation 'alias/mykey'
```

```python
salt.modules.boto_kms.encrypt(key_id, plaintext, encryption_context=None, grant_tokens=None, region=None, key=None, keyid=None, profile=None)
```
Encrypt plaintext into cipher text using specified key.

CLI example:
```
salt myminion boto_kms.encrypt 'alias/mykey' 'myplaindata' '{"aws:username":"myuser"}'
```

```python
salt.modules.boto_kms.generate_data_key(key_id, encryption_context=None, number_of_bytes=None, key_spec=None, grant_tokens=None, region=None, key=None, keyid=None, profile=None)
```
Generate a secure data key.

CLI example:
salt myminion boto_kms.generate_data_key 'alias/mykey' number_of_bytes=1024 key_spec=AES_128

salt.modules.boto_kms.generate_data_key_without_plaintext(key_id, encryption_context=None, number_of_bytes=None, key_spec=None, grant_tokens=None, region=None, key=None, keyid=None, profile=None)

Generate a secure data key without a plaintext copy of the key.

CLI example:
```
salt myminion boto_kms.generate_data_key_without_plaintext 'alias/mykey' number_of_bytes=1024 key_spec=AES_128
```

salt.modules.boto_kms.generate_random(number_of_bytes=None, region=None, key=None, keyid=None, profile=None)

Generate a random string.

CLI example:
```
salt myminion boto_kms.generate_random number_of_bytes=1024
```

salt.modules.boto_kms.get_key_policy(key_id, policy_name, region=None, key=None, keyid=None, profile=None)

Get the policy for the specified key.

CLI example:
```
salt myminion boto_kms.get_key_policy 'alias/mykey' mypolicy
```

salt.modules.boto_kms.get_key_rotation_status(key_id, region=None, key=None, keyid=None, profile=None)

Get status of whether or not key rotation is enabled for a key.

CLI example:
```
salt myminion boto_kms.get_key_rotation_status 'alias/mykey'
```

salt.modules.boto_kms.key_exists(key_id, region=None, key=None, keyid=None, profile=None)

Check for the existence of a key.

CLI example:
```
salt myminion boto_kms.key_exists 'alias/mykey'
```

salt.modules.boto_kms.list_grants(key_id, limit=None, marker=None, region=None, key=None, keyid=None, profile=None)

List grants for the specified key.

CLI example:
```
salt myminion boto_kms.list_grants 'alias/mykey'
```

21.9. execution modules
salt.modules.boto_kms.list_key_policies(key_id, limit=None, marker=None, region=None, key=None, keyid=None, profile=None)

List key_policies for the specified key.

CLI example:
```
salt myminion boto_kms.list_key_policies 'alias/mykey'
```

salt.modules.boto_kms.put_key_policy(key_id, policy_name, policy, region=None, key=None, keyid=None, profile=None)

Attach a key policy to the specified key.

CLI example:
```
salt myminion boto_kms.put_key_policy 'alias/mykey' default '{"Statement":...}'
```

salt.modules.boto_kms.re_encrypt(ciphertext_blob, destination_key_id, source_encryption_context=None, destination_encryption_context=None, grant_tokens=None, region=None, key=None, keyid=None, profile=None)

Reencrypt encrypted data with a new master key.

CLI example:
```
salt myminion boto_kms.re_encrypt 'encrypted_data' 'alias/mynewkey' default '{"Statement":...}'
```

salt.modules.boto_kms.revoke_grant(key_id, grant_id, region=None, key=None, keyid=None, profile=None)

Revoke a grant from a key.

CLI example:
```
salt myminion boto_kms.revoke_grant 'alias/mykey' 8u89hf-j09j...
```

salt.modules.boto_kms.update_key_description(key_id, description, region=None, key=None, keyid=None, profile=None)

Update a key’s description.

CLI example:
```
salt myminion boto_kms.update_key_description 'alias/mykey' 'My key'
```

21.9.56 salt.modules.boto_lambda module

Connection module for Amazon Lambda

New in version 2016.3.0.

depends
- boto
- boto3

The dependencies listed above can be installed via package or pip.

configuration This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available here.
If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

```yaml
lambda.keyid: GKTADJGHEIQSXMKKRBJ08H
lambda.key: askdjghsdfjkgHwupUjasdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```yaml
lambda.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkgHwupUjasdfklgjsdfjajkghs
  region: us-east-1
```

Changed in version 2015.8.0: All methods now return a dictionary. Create and delete methods return:

```yaml
created: true
```

or

```yaml
created: false
error:
  message: error message
```

Request methods (e.g., `describe_function`) return:

```yaml
function:
  - {...}
  - {...}
```

or

```yaml
error:
  message: error message
```

salt.modules.boto_lambda.add_permission(FunctionName, StatementId, Action, Principal, SourceArn=None, SourceAccount=None, Qualifier=None, region=None, key=None, keyid=None, profile=None)

Add a permission to a lambda function.

Returns {added: true} if the permission was added and returns {added: False} if the permission was not added.

CLI Example:

```bash
salt myminion boto_lamba.add_permission my_function my_id "lambda:*"
 s3.amazonaws.com aws:arn:::bucket-name
 aws:account-id
```

salt.modules.boto_lambda.alias_exists(FunctionName, Name, region=None, key=None, keyid=None, profile=None)

Given a function name and alias name, check to see if the given alias exists.

Returns True if the given alias exists and returns False if the given alias does not exist.
CLI Example:
```
salt myminion boto_lambda.alias_exists myfunction myalias
```

**salt.modules.boto_lambda.create_alias** (*FunctionName, Name, FunctionVersion, Description=", region=None, key=None, keyid=None, profile=None*)

Given a valid config, create an alias to a function.

Returns {created: true} if the alias was created and returns {created: False} if the alias was not created.

CLI Example:
```
salt myminion boto_lamba.create_alias my_function my_alias $LATEST "An alias"
```

**salt.modules.boto_lambda.create_event_source_mapping** (*EventSourceArn, FunctionName, StartingPosition, Enabled=True, BatchSize=100, region=None, key=None, keyid=None, profile=None*)

Identifies a stream as an event source for a Lambda function. It can be either an Amazon Kinesis stream or an Amazon DynamoDB stream. AWS Lambda invokes the specified function when records are posted to the stream.

Returns {created: true} if the event source mapping was created and returns {created: False} if the event source mapping was not created.

CLI Example:
```
salt myminion boto_lamba.create_event_source_mapping arn::::eventsource
  → myfunction LATEST
```

**salt.modules.boto_lambda.create_function** (*FunctionName, Runtime, Role, Handler, ZipFile=None, S3Bucket=None, S3Key=None, S3ObjectVersion=None, Description="", Timeout=3, MemorySize=128, Publish=False, WaitForRole=False, RoleRetries=5, region=None, key=None, keyid=None, profile=None, VpcConfig=None, Environment=None*)

New in version 2017.7.0.

Given a valid config, create a function.

**Environment** The parent object that contains your environment’s configuration settings. This is a dictionary of the form:

```
{
    'Variables': {
        'VariableName': 'VariableValue'
    }
}
```

Returns {'created': True} if the function was created and {created: False} if the function was not created.

CLI Example:
```
salt myminion boto_lamba.create_function my_function python2.7 my_role my_file.my_
  →function my_function.zip
salt.modules.boto_lambda.delete_alias(FunctionName, Name, region=None, key=None, keyid=None, profile=None)

Given a function name and alias name, delete the alias.

Returns {deleted: true} if the alias was deleted and returns {deleted: false} if the alias was not deleted.

CLI Example:
```
salt myminion boto_lambda.delete_alias myfunction myalias
```

salt.modules.boto_lambda.delete_event_source_mapping(UUID=None, EventSourceArn=None, FunctionName=None, region=None, key=None, keyid=None, profile=None)

Given an event source mapping ID or an event source ARN and FunctionName, delete the event source mapping

Returns {deleted: true} if the mapping was deleted and returns {deleted: false} if the mapping was not deleted.

CLI Example:
```
salt myminion boto_lambda.delete_event_source_mapping 260c423d-e8b5-4443-8d6a-5e91b9ec0fa
```

salt.modules.boto_lambda.delete_function(FunctionName, Qualifier=None, region=None, key=None, keyid=None, profile=None)

Given a function name and optional version qualifier, delete it.

Returns {deleted: true} if the function was deleted and returns {deleted: false} if the function was not deleted.

CLI Example:
```
salt myminion boto_lambda.delete_function myfunction
```

salt.modules.boto_lambda.describe_alias(FunctionName, Name, region=None, key=None, keyid=None, profile=None)

Given a function name and alias name describe the properties of the alias.

Returns a dictionary of interesting properties.

CLI Example:
```
salt myminion boto_lambda.describe_alias myalias
```

salt.modules.boto_lambda.describe_event_source_mapping(UUID=None, EventSourceArn=None, FunctionName=None, region=None, key=None, keyid=None, profile=None)

Given an event source mapping ID or an event source ARN and FunctionName, obtain the current settings of that mapping.

Returns a dictionary of interesting properties.

CLI Example:
```
salt myminion boto_lambda.describe_event_source_mapping uuid
```
salt.modules.boto_lambda.describe_function(FunctionName, region=None, key=None, keyid=None, profile=None)

Given a function name describe its properties.
Returns a dictionary of interesting properties.

CLI Example:
```
salt myminion boto_lambda.describe_function myfunction
```

salt.modules.boto_lambda.event_source_mapping_exists(UUID=None, EventSourceArn=None, FunctionName=None, region=None, key=None, keyid=None, profile=None)

Given an event source mapping ID or an event source ARN and FunctionName, check whether the mapping exists.
Returns True if the given alias exists and returns False if the given alias does not exist.

CLI Example:
```
salt myminion boto_lambda.alias_exists myfunction myalias
```

salt.modules.boto_lambda.function_exists(FunctionName, region=None, key=None, keyid=None, profile=None)

Given a function name, check to see if the given function name exists.
Returns True if the given function exists and returns False if the given function does not exist.

CLI Example:
```
salt myminion boto_lambda.function_exists myfunction
```

salt.modules.boto_lambda.get_event_source_mapping_ids(EventSourceArn, FunctionName, region=None, key=None, keyid=None, profile=None)

Given an event source and function name, return a list of mapping IDs

CLI Example:
```
salt myminion boto_lambda.get_event_source_mapping_ids arn:::: myfunction
```

salt.modules.boto_lambda.get_permissions(FunctionName, Qualifier=None, region=None, key=None, keyid=None, profile=None)

Get resource permissions for the given lambda function
Returns dictionary of permissions, by statement ID

CLI Example:
```
salt myminion boto_lamba.get_permissions my_function
permissions: {...}
```

salt.modules.boto_lambda.list_function_versions(FunctionName, region=None, key=None, keyid=None, profile=None)

List the versions available for the given function.
Returns list of function versions
CLI Example:

```python
versions:
- {...}
- {...}
```

```python
salt.modules.boto_lambda.list_functions(region=None, key=None, keyid=None, profile=None)
```

List all Lambda functions visible in the current scope.

CLI Example:

```bash
salt myminion boto_lambda.list_functions
```

```python
salt.modules.boto_lambda.remove_permission(FunctionName, StatementId, Qualifier=None, region=None, key=None, keyid=None, profile=None)
```

Remove a permission from a lambda function.

Returns {removed: true} if the permission was removed and returns {removed: False} if the permission was not removed.

CLI Example:

```bash
salt myminion boto_lamba.remove_permission my_function my_id
```

```python
salt.modules.boto_lambda.update_alias(FunctionName, Name, FunctionVersion=None, Description=None, region=None, key=None, keyid=None, profile=None)
```

Update the named alias to the configuration.

Returns {updated: true} if the alias was updated and returns {updated: False} if the alias was not updated.

CLI Example:

```bash
salt myminion boto_lamba.update_alias my_lambda my_alias $LATEST
```

```python
salt.modules.boto_lambda.update_event_source_mapping(UUID, FunctionName=None, Enabled=None, BatchSize=None, region=None, key=None, keyid=None, profile=None)
```

Update the event source mapping identified by the UUID.

Returns {updated: true} if the alias was updated and returns {updated: False} if the alias was not updated.

CLI Example:

```bash
salt myminion boto_lamba.update_event_source_mapping uuid FunctionName=new_function
```

```python
salt.modules.boto_lambda.update_function_code(FunctionName, ZipFile=None, S3Bucket=None, S3Key=None, S3ObjectVersion=None, Publish=False, region=None, key=None, keyid=None, profile=None)
```

Upload the given code to the named lambda function.

Returns {updated: true} if the function was updated and returns {updated: False} if the function was not updated.
CLI Example:

```
salt myminion boto_lamba.update_function_code my_function ZipFile=function.zip
```

salt.modules.boto_lambda.update_function_config(FunctionName, Role=None, Handler=None, Description=None, Timeout=None, MemorySize=None, region=None, key=None, keyid=None, profile=None, VpcConfig=None, WaitForRole=False, RoleRetries=5, Environment=None)

New in version 2017.7.0.

Update the named lambda function to the configuration.

**Environment** The parent object that contains your environment’s configuration settings. This is a dictionary of the form:

```
{
    'Variables': {
        'VariableName': 'VariableValue'
    }
}
```

Returns `{ 'updated': True }` if the function was updated, and `{ 'updated': False }` if the function was not updated.

CLI Example:

```
salt myminion boto_lamba.update_function_config my_function my_role my_file.my_function "my lambda function"
```

21.9.57 salt.modules.boto_rds

Connection module for Amazon RDS

New in version 2015.8.0.

**configuration** This module accepts explicit rds credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
rds.keyid: GKTADJGHEIQSXMKKRBJ08H
rds.key: askdjghsdfjkghWupUjasdflkdfklgjsdfgjksghhs
```

A region may also be specified in the configuration:

```
rds.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:
depends boto3

salt.modules.boto_rds.create(name, allocated_storage, db_instance_class, engine, master_username, master_user_password, db_name=None, db_security_groups=None, vpc_security_group_ids=None, vpc_security_groups=None, availability_zone=None, db_subnet_group_name=None, preferred_maintenance_window=None, db_parameter_group_name=None, backup_retention_period=None, preferred_backup_window=None, port=None, multi_az=None, engine_version=None, auto_minor_version_upgrade=None, license_model=None, iops=None, option_group_name=None, character_set_name=None, publicly_accessible=None, wait_status=None, tags=None, db_cluster_identifier=None, storage_type=None, tde_credential_arn=None, tde_credential_password=None, storage_encrypted=None, kms_key_id=None, domain=None, copy_tags_to_snapshot=None, monitoring_interval=None, monitoring_role_arn=None, domain_iam_role_name=None, region=None, promotion_tier=None, key=None, keyid=None, profile=None)

Create an RDS Instance

CLI example to create an RDS Instance:

gotogetopt -myminion boto_rds.create myrds 10 db.t2.micro MySQL sqlusr sqlpassw

salt.modules.boto_rds.create_option_group(name, engine_name, major_engine_version, option_group_description, tags=None, region=None, key=None, keyid=None, profile=None)

Create an RDS option group

CLI example to create an RDS option group:

gotogetopt -myminion boto_rds.create_option_group my-opt-group mysql 5.6 "group description"

salt.modules.boto_rds.create_parameter_group(name, db_parameter_group_family, description, tags=None, region=None, key=None, keyid=None, profile=None)

Create an RDS parameter group

CLI example to create an RDS parameter group:

gotogetopt -myminion boto_rds.create_parameter_group my-param-group mysql5.6 "group description"
salt.modules.boto_rds.create_read_replica(name, source_name, db_instance_class=None, availability_zone=None, port=None, auto_minor_version_upgrade=None, iops=None, option_group_name=None, publicly_accessible=None, tags=None, db_subnet_group_name=None, storage_type=None, copy_tags_to_snapshot=None, monitoring_interval=None, monitoring_role_arn=None, region=None, key=None, keyid=None, profile=None)

Create an RDS read replica
CLI example to create an RDS read replica:
```bash
salt myminion boto_rds.create_read_replica replicaname source_name
```

salt.modules.boto_rds.create_subnet_group(name, description, subnet_ids, tags=None, region=None, key=None, keyid=None, profile=None)

Create an RDS subnet group
CLI example to create an RDS subnet group:
```bash
salt myminion boto_rds.create_subnet_group my-subnet-group "groupA" --description '[[subnet-12345678, subnet-87654321]]' region=us-east-1
```

salt.modules.boto_rds.delete(name, skip_final_snapshot=None, final_db_snapshot_identifier=None, region=None, key=None, keyid=None, profile=None, tags=None, wait_for_deletion=True, timeout=180)

Delete an RDS instance.
CLI example:
```bash
salt myminion boto_rds.delete myrds skip_final_snapshot=True region=us-east-1
```

salt.modules.boto_rds.delete_option_group(name, region=None, key=None, keyid=None, profile=None)

Delete an RDS option group.
CLI example:
```bash
salt myminion boto_rds.delete_option_group my-opt-group region=us-east-1
```

salt.modules.boto_rds.delete_parameter_group(name, region=None, key=None, keyid=None, profile=None)

Delete an RDS parameter group.
CLI example:
```bash
salt myminion boto_rds.delete_parameter_group my-param-group region=us-east-1
```

salt.modules.boto_rds.delete_subnet_group(name, region=None, key=None, keyid=None, profile=None)

Delete an RDS subnet group.
CLI example:
```python
salt myminion boto_rds.delete_subnet_group my-subnet-group
  region=us-east-1
```

salt.modules.boto_rds.describe(name, tags=None, region=None, key=None, keyid=None, profile=None)

Return RDS instance details.

CLI example:

```bash
salt myminion boto_rds.describe myrds
```

salt.modules.boto_rds.describe_db_instances(name=None, filters=None, jmes-path='DBInstances', region=None, key=None, keyid=None, profile=None)

Return a detailed listing of some, or all, DB Instances visible in the current scope. Arbitrary subelements or subsections of the returned dataset can be selected by passing in a valid JMSEPath filter as well.

CLI example:

```
salt myminion boto_rds.describe_db_instances jmespath='DBInstances[*].DBInstanceIdentifier'
```

salt.modules.boto_rds.describe_db_subnet_groups(name=None, filters=None, jmes-path='DBSubnetGroups', region=None, key=None, keyid=None, profile=None)

Return a detailed listing of some, or all, DB Subnet Groups visible in the current scope. Arbitrary subelements or subsections of the returned dataset can be selected by passing in a valid JMSEPath filter as well.

CLI example:

```
salt myminion boto_rds.describe_db_subnet_groups
```

salt.modules.boto_rds.describe_parameter_group(name, Filters=None, MaxRecords=None, Marker=None, region=None, key=None, keyid=None, profile=None)

Returns a list of DBParameterGroup descriptions.

CLI example to description of parameter group:

```
salt myminion boto_rds.describe_parameter_group parametergroupname
  region=us-east-1
```

salt.modules.boto_rds.describe_parameters(name, Source=None, MaxRecords=None, Marker=None, region=None, key=None, keyid=None, profile=None)

Returns a list of DBParameterGroup parameters.

CLI example to description of parameters

```
salt myminion boto_rds.describe_parameters parametergroupname
  region=us-east-1
```

salt.modules.boto_rds.exists(name, tags=None, region=None, key=None, keyid=None, profile=None)

Check to see if an RDS exists.

CLI example:

```
salt myminion boto_rds.exists myrds region=us-east-1
```

salt.modules.boto_rds.get_endpoint(name, tags=None, region=None, key=None, keyid=None, profile=None)

Return the endpoint of an RDS instance.

---

**21.9. execution modules**
salt modules.boto_rds.modify_db_instance(name, allocated_storage=None, allow_major_version_upgrade=None, apply_immediately=None, auto_minor_version_upgrade=None, backup_retention_period=None, ca_certificate_identifier=None, character_set_name=None, copy_tags_to_snapshot=None, db_cluster_identifier=None, db_instance_class=None, db_name=None, db_parameter_group_name=None, db_port_number=None, db_security_groups=None, db_subnet_group_name=None, domain=None, domain_iam_role_name=None, engine_version=None, iops=None, kms_key_id=None, license_model=None, master_user_password=None, monitoring_interval=None, monitoring_role_arn=None, multi_az=None, new_db_instance_identifier=None, option_group_name=None, preferred_backup_window=None, preferred_maintenance_window=None, promotion_tier=None, publicly_accessible=None, storage_encrypted=None, storage_type=None, tde_credential_arn=None, tde_credential_password=None, vpc_security_group_ids=None, region=None, key=None, keyid=None, profile=None)

Modify settings for a DB instance. CLI example to description of parameters

```bash
salt myminion boto_rds.modify_db_instance db_instance_identifier region=us-east-1
```

salt modules.boto_rds.option_group_exists(name, tags=None, region=None, key=None, keyid=None, profile=None)

Check to see if an RDS option group exists.

CLI example:

```bash
salt myminion boto_rds.option_group_exists myoptiongr region=us-east-1
```

salt modules.boto_rds.parameter_group_exists(name, tags=None, region=None, key=None, keyid=None, profile=None)

Check to see if an RDS parameter group exists.

CLI example:

```bash
salt myminion boto_rds.parameter_group_exists myparametergroup region=us-east-1
```

salt modules.boto_rds.subnet_group_exists(name, tags=None, region=None, key=None, keyid=None, profile=None)

```bash
salt myminion boto_rds.get_endpoint myrds
```
Check to see if an RDS subnet group exists.

CLI example:

```
salt myminion boto_rds subnet_group_exists my-param-group
     region=us-east-1
```

salt.modules.boto_rds.update_parameter_group(name, parameters, apply_method='pending-reboot', tags=None, region=None, key=None, keyid=None, profile=None)

Update an RDS parameter group.

CLI example:

```
salt myminion boto_rds update_parameter_group my-param-group
     parameters='{"back_log":1, "binlog_cache_size":4096}'
     region=us-east-1
```

21.9.58 salt.modules.boto_route53

Connection module for Amazon Route53

New in version 2014.7.0.

**configuration** This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

```
route53.keyid: GKTADJGHEIQSXMKKRBJ08H
route53.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
route53.region: us-east-1
```

If a region is not specified, the default is ‘universal’, which is what the boto_route53 library expects, rather than None.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

**depends** boto

salt.modules.boto_route53.add_record(name, value, zone, record_type, identifier=None, ttl=None, region=None, key=None, keyid=None, profile=None, wait_for_sync=True, split_dns=False, private_zone=False, retry_on_rate_limit=None, rate_limit_retries=None, retry_on_errors=True, error_retries=5)
Add a record to a zone.

CLI example:

```
salt myminion boto_route53.add_record test.example.org 1.1.1.1 example.org A
```

**retry_on_errors**

Continue to query if the zone exists after an error is raised. The previously used argument `retry_on_rate_limit` was deprecated for this argument. Users can still use `retry_on_rate_limit` to ensure backwards compatibility, but please migrate to using the favored `retry_on_errors` argument instead.

**error_retries** Amount of times to attempt to query if the zone exists. The previously used argument `rate_limit_retries` was deprecated for this argument. Users can still use `rate_limit_retries` to ensure backwards compatibility, but please migrate to using the favored `error_retries` argument instead.

```
salt.modules.boto_route53.create_healthcheck(ip_addr=None, fqdn=None, region=None, key=None, keyid=None, profile=None, port=53, hc_type='TCP', resource_path='', string_match=None, request_interval=30, failure_threshold=3, retry_on_errors=True, error_retries=5)
```

Create a Route53 healthcheck

New in version 2018.3.0.

**ip_addr**

IP address to check. `ip_addr` or `fqdn` is required.

**fqdn**

Domain name of the endpoint to check. `ip_addr` or `fqdn` is required

**port**

Port to check

**hc_type**

Healthcheck type. HTTP | HTTPS | HTTP_STR_MATCH | HTTPS_STR_MATCH | TCP

**resource_path**

Path to check

**string_match**

If `hc_type` is HTTP_STR_MATCH or HTTPS_STR_MATCH, the string to search for in the response body from the specified resource

**request_interval**

The number of seconds between the time that Amazon Route 53 gets a response from your endpoint and the time that it sends the next health-check request.

**failure_threshold**

The number of consecutive health checks that an endpoint must pass or fail for Amazon Route 53 to change the current status of the endpoint from unhealthy to healthy or vice versa.

**region**
Region endpoint to connect to

key
AWS key

keyid
AWS keyid

profile
AWS pillar profile

CLI Example:

```
salt myminion boto_route53.create_healthcheck 192.168.0.1
salt myminion boto_route53.create_healthcheck 192.168.0.1 port=443 hc_type=HTTPS &
resource_path=/ fqdn=blog.
saltstack.furniture
```

```
salt.modules.boto_route53.create_hosted_zone(domain_name, caller_ref=None, comment='', private_zone=False, vpc_id=None, vpc_name=None, vpc_region=None, region=None, key=None, keyid=None, profile=None)
```

Create a new Route53 Hosted Zone. Returns a Python data structure with information about the newly created Hosted Zone.

- **domain_name** The name of the domain. This must be fully-qualified, terminating with a period. This is the name you have registered with your domain registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request.

- **caller_ref** A unique string that identifies the request and that allows create_hosted_zone() calls to be retried without the risk of executing the operation twice. It can take several minutes for the change to replicate globally, and change from PENDING to INSYNC status. Thus it’s best to provide some value for this where possible, since duplicate calls while the first is in PENDING status will be accepted and can lead to multiple copies of the zone being created. On the other hand, if a zone is created with a given caller_ref, then deleted, a second attempt to create a zone with the same caller_ref will fail until that caller_ref is flushed from the Route53 system, which can take upwards of 24 hours.

- **comment** Any comments you want to include about the hosted zone.

- **private_zone** Set True if creating a private hosted zone.

- **vpc_id** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpc_name. Ignored when creating a non-private zone.

- **vpc_name** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpc_id. Ignored when creating a non-private zone.

- **vpc_region** When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from vpc_id or vpc_name, where possible. If this fails, you’ll need to provide an explicit value for this option. Ignored when creating a non-private zone.

- **region** Region endpoint to connect to.

- **key** AWS key to bind with.

- **keyid** AWS keyid to bind with.

- **profile** Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:
salt myminion boto_route53.create_hosted_zone example.org

salt.modules.boto_route53.create_zone(zone, private=False, vpc_id=None, vpc_region=None, region=None, key=None, keyid=None, profile=None)

Create a Route53 hosted zone.
New in version 2015.8.0.

zone DNS zone to create
private True/False if the zone will be a private zone
vpc_id VPC ID to associate the zone to (required if private is True)
vpc_region VPC Region (required if private is True)
region region endpoint to connect to
key AWS key
keyid AWS keyid
profile AWS pillar profile

CLI Example:
salt myminion boto_route53.create_zone example.org

salt.modules.boto_route53.delete_record(name, zone, record_type, identifier=None, all_records=False, region=None, key=None, keyid=None, profile=None, wait_for_sync=True, split_dns=False, private_zone=False, retry_on_rate_limit=None, rate_limit_retries=None, retry_on_errors=True, error_retries=5)

Modify a record in a zone.

CLI example:
salt myminion boto_route53.delete_record test.example.org example.org A

retry_on_errors
Continue to query if the zone exists after an error is raised. The previously used argument retry_on_rate_limit was deprecated for this argument. Users can still use retry_on_rate_limit to ensure backwards compatibility, but please migrate to using the favored retry_on_errors argument instead.

error_retries Amount of times to attempt to query if the zone exists. The previously used argument rate_limit_retries was deprecated for this arguments. Users can still use rate_limit_retries to ensure backwards compatibility, but please migrate to using the favored error_retries argument instead.

salt.modules.boto_route53.delete_zone(zone, region=None, key=None, keyid=None, profile=None)

Delete a Route53 hosted zone.
New in version 2015.8.0.

CLI Example:
salt myminion boto_route53.delete_zone example.org
salt.modules.boto_route53.describe_hosted_zones(zone_id=None, domain_name=None, region=None, key=None, keyid=None, profile=None)

Return detailed info about one, or all, zones in the bound account. If neither zone_id nor domain_name is provided, return all zones. Note that the return format is slightly different between the 'all' and 'single' description types.

zone_id The unique identifier for the Hosted Zone

domain_name The FQDN of the Hosted Zone (including final period)

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:
salt myminion boto_route53.describe_hosted_zones domain_name=foo.bar.com.

salt.modules.boto_route53.get_record(name, zone, record_type, fetch_all=False, region=None, key=None, keyid=None, profile=None, split_dns=False, private_zone=False, identifier=None, retry_on_rate_limit=None, rate_limit_retries=None, retry_on_errors=True, error_retries=5)

Get a record from a zone.

CLI example:
salt myminion boto_route53.get_record test.example.org example.org A

retry_on_errors

Continue to query if the zone exists after an error is raised. The previously used argument retry_on_rate_limit was deprecated for this argument. Users can still use retry_on_rate_limit to ensure backwards compatibility, but please migrate to using the favored retry_on_errors argument instead.

error_retries Amount of times to attempt to query if the zone exists. The previously used argument rate_limit_retries was deprecated for this arguments. Users can still use rate_limit_retries to ensure backwards compatibility, but please migrate to using the favored error_retries argument instead.

salt.modules.boto_route53.list_all_zones_by_id(region=None, key=None, keyid=None, profile=None)

List, by their IDs, all hosted zones in the bound account.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
CLI Example:

```
salt myminion boto_route53.list_all_zones_by_id
```

```
salt.modules.boto_route53.list_all_zones_by_name(region=None, key=None, keyid=None, profile=None)
```

List, by their FQDNs, all hosted zones in the bound account.

**region**  Region to connect to.

**key**  Secret key to be used.

**keyid**  Access key to be used.

**profile**  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:

```
salt myminion boto_route53.list_all_zones_by_name
```

```
salt.modules.boto_route53.update_record(name, value, zone, record_type, identifier=None, ttl=None, region=None, key=None, keyid=None, profile=None, wait_for_sync=True, split_dns=False, private_zone=False, retry_on_rate_limit=None, rate_limit_retries=None, retry_on_errors=True, error_retries=5)
```

Modify a record in a zone.

CLI example:

```
salt myminion boto_route53.modify_record test.example.org 1.1.1.1 example.org A
```

**retry_on_errors**

Continue to query if the zone exists after an error is raised. The previously used argument `retry_on_rate_limit` was deprecated for this argument. Users can still use `retry_on_rate_limit` to ensure backwards compatibility, but please migrate to using the favored `retry_on_errors` argument instead.

**error_retries**  Amount of times to attempt to query if the zone exists. The previously used argument `rate_limit_retries` was deprecated for this arguments. Users can still use `rate_limit_retries` to ensure backwards compatibility, but please migrate to using the favored `error_retries` argument instead.

```
salt.modules.boto_route53.zone_exists(zone, region=None, key=None, keyid=None, profile=None, retry_on_rate_limit=None, rate_limit_retries=None, retry_on_errors=True, error_retries=5)
```

Check for the existence of a Route53 hosted zone.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_route53.zone_exists example.org
```

**retry_on_errors**
Continue to query if the zone exists after an error is raised. The previously used argument `retry_on_rate_limit` was deprecated for this argument. Users can still use `retry_on_rate_limit` to ensure backwards compatibility, but please migrate to using the favored `retry_on_errors` argument instead.

**error_retries** Amount of times to attempt to query if the zone exists. The previously used argument `rate_limit_retries` was deprecated for this arguments. Users can still use `rate_limit_retries` to ensure backwards compatibility, but please migrate to using the favored `error_retries` argument instead.

### 21.9.59 salt.modules.boto_s3_bucket module

Connection module for Amazon S3 Buckets

New in version 2016.3.0.

**depends**
- boto
- boto3

The dependencies listed above can be installed via package or pip.

**configuration** This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
```

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

```
s3.keyid: GKTADJGHEIQSXMKKRBJ08H
s3.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
s3.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

**salt.modules.boto_s3_bucket.create**(Bucket, ACL=None, LocationConstraint=None, GrantFullControl=None, GrantRead=None, GrantReadACP=None, GrantWrite=None, GrantWriteACP=None, region=None, key=None, keyid=None, profile=None)

Given a valid config, create an S3 Bucket.

Returns `{created: true}` if the bucket was created and returns `{created: False}` if the bucket was not created.

CLI Example:
Given a bucket name, delete it, optionally emptying it first.

Returns [deleted: true] if the bucket was deleted and returns [deleted: false] if the bucket was not deleted.

CLI Example:
```
salt myminion boto_s3_bucket.delete mybucket
```

Delete the CORS configuration for the given bucket

Returns [deleted: true] if CORS was deleted and returns [deleted: False] if CORS was not deleted.

CLI Example:
```
salt myminion boto_s3_bucket.delete_cors my_bucket
```

Delete the lifecycle configuration for the given bucket

Returns [deleted: true] if Lifecycle was deleted and returns [deleted: False] if Lifecycle was not deleted.

CLI Example:
```
salt myminion boto_s3_bucket.delete_lifecycle_configuration my_bucket
```

Delete objects in a given S3 bucket.

Returns {deleted: true} if all objects were deleted and {deleted: false, failed: [key, ...]} otherwise

CLI Example:
```
salt myminion boto_s3_bucket.delete_objects mybucket '
  {Objects: [Key: myobject]}'
```

Delete the policy from the given bucket

Returns [deleted: true] if policy was deleted and returns [deleted: False] if policy was not deleted.

CLI Example:
```
salt myminion boto_s3_bucket.delete_policy my_bucket
```
salt.modules.boto_s3_bucket.delete_replication(Bucket, region=None, key=None, keyid=None, profile=None)

Delete the replication config from the given bucket

Returns {deleted: true} if replication configuration was deleted and returns {deleted: False} if replication configuration was not deleted.

CLI Example:
salt myminion boto_s3_bucket.delete_replication my_bucket

salt.modules.boto_s3_bucket.delete_tagging(Bucket, region=None, key=None, keyid=None, profile=None)

Delete the tags from the given bucket

Returns {deleted: true} if tags were deleted and returns {deleted: False} if tags were not deleted.

CLI Example:
salt myminion boto_s3_bucket.delete_tagging my_bucket

salt.modules.boto_s3_bucket.delete_website(Bucket, region=None, key=None, keyid=None, profile=None)

Remove the website configuration from the given bucket

Returns {deleted: true} if website configuration was deleted and returns {deleted: False} if website configuration was not deleted.

CLI Example:
salt myminion boto_s3_bucket.delete_website my_bucket

salt.modules.boto_s3_bucket.describe(Bucket, region=None, key=None, keyid=None, profile=None)

Given a bucket name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:
salt myminion boto_s3_bucket.describe mybucket

salt.modules.boto_s3_bucket.empty(Bucket, MFA=None, RequestPayer=None, region=None, key=None, keyid=None, profile=None)

Delete all objects in a given S3 bucket.

Returns {deleted: true} if all objects were deleted and {deleted: false, failed: [key, ...]} otherwise

CLI Example:
salt myminion boto_s3_bucket.empty mybucket

salt.modules.boto_s3_bucket.exists(Bucket, region=None, key=None, keyid=None, profile=None)

Given a bucket name, check to see if the given bucket exists.

Returns True if the given bucket exists and returns False if the given bucket does not exist.

CLI Example:
salt myminion boto_s3_bucket.exists mybucket
**salt.modules.boto_s3_bucket.list**(region=None, key=None, keyid=None, profile=None)

List all buckets owned by the authenticated sender of the request.

Returns list of buckets

CLI Example:

```
Owner: {...}
Buckets:
  - {...}
  - {...}
```

**salt.modules.boto_s3_bucket.list_object_versions**(Bucket, Delimiter=None, EncodingType=None, Prefix=None, region=None, key=None, keyid=None, profile=None)

List objects in a given S3 bucket.

Returns a list of objects.

CLI Example:

```
salt myminion boto_s3_bucket.list_object_versions mybucket
```

**salt.modules.boto_s3_bucket.list_objects**(Bucket, Delimiter=None, EncodingType=None, Prefix=None, FetchOwner=False, StartAfter=None, region=None, key=None, keyid=None, profile=None)

List objects in a given S3 bucket.

Returns a list of objects.

CLI Example:

```
salt myminion boto_s3_bucket.list_objects mybucket
```

**salt.modules.boto_s3_bucket.put_acl**(Bucket, ACL=None, AccessControlPolicy=None, GrantFullControl=None, GrantRead=None, GrantReadACP=None, GrantWrite=None, GrantWriteACP=None, region=None, key=None, keyid=None, profile=None)

Given a valid config, update the ACL for a bucket.

Returns {updated: true} if the ACL was updated and returns {updated: False} if the ACL was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_acl my_bucket 'public' \  
  GrantFullControl='emailaddress@example@example.com' \  
  GrantRead='uri="http://acs.amazonaws.com/groups/global/AllUsers"' \  
  GrantReadACP='emailaddress="exampl@example.com",id=\  
  "2345678909876432"'
```

**salt.modules.boto_s3_bucket.put_cors**(Bucket, CORSRules, region=None, key=None, keyid=None, profile=None)

Given a valid config, update the CORS rules for a bucket.

Returns {updated: true} if CORS was updated and returns {updated: False} if CORS was not updated.

CLI Example:
salt myminion boto_s3_bucket.put_cors my_bucket '[[
   "AllowedHeaders": [],
   "AllowedMethods": ["GET"],
   "AllowedOrigins": ["*"],
   "ExposeHeaders": [],
   "MaxAgeSeconds": 123,
]]'

salt.modules.boto_s3_bucket.put_lifecycle_configuration(Bucket, Rules, region=None, 
 key=None, keyid=None, 
 profile=None)

Given a valid config, update the Lifecycle rules for a bucket.

Returns {updated: true} if Lifecycle was updated and returns {updated: False} if Lifecycle was not updated.

CLI Example:

salt myminion boto_s3_bucket.put_lifecycle_configuration my_bucket '[[
   "Expiration": {...},
   "ID": "idstring",
   "Prefix": "prefixstring",
   "Status": "enabled",
   "Transitions": [...][],
   "NoncurrentVersionTransitions": [...][],
   "NoncurrentVersionExpiration": {...},
]]'

salt.modules.boto_s3_bucket.put_logging(Bucket, TargetBucket=None, TargetPrefix=None, 
 TargetGrants=None, region=None, key=None, 
 keyid=None, profile=None)

Given a valid config, update the logging parameters for a bucket.

Returns {updated: true} if parameters were updated and returns {updated: False} if parameters were not up-

CLI Example:

salt myminion boto_s3_bucket.put_logging my_bucket log_bucket '[[...]]' prefix

salt.modules.boto_s3_bucket.put_notification_configuration(Bucket, TopicConfi-
 gurations=None, QueueConfigurations=None, 
 LambdaFunctionConfigurations=None, region=None, key=None, 
 keyid=None, profile=None)

Given a valid config, update the notification parameters for a bucket.

Returns {updated: true} if parameters were updated and returns {updated: False} if parameters were not up-

CLI Example:

salt myminion boto_s3_bucket.put_notification_configuration my_bucket 
 [[[...]] \ 
 [......] \ 
 [......] \
salt.modules.boto_s3_bucket.put_policy(Bucket, Policy, region=None, key=None, keyid=None, profile=None)

Given a valid config, update the policy for a bucket.
Returns {updated: true} if policy was updated and returns {updated: False} if policy was not updated.
CLI Example:

```
salt myminion boto_s3_bucket.put_policy my_bucket {...}
```

salt.modules.boto_s3_bucket.put_replication(Bucket, Role, Rules, region=None, key=None, keyid=None, profile=None)

Given a valid config, update the replication configuration for a bucket.
Returns {updated: true} if replication configuration was updated and returns {updated: False} if replication configuration was not updated.
CLI Example:

```
salt myminion boto_s3_bucket.put_replication my_bucket my_role [...]
```

salt.modules.boto_s3_bucket.put_request_payment(Bucket, Payer, region=None, key=None, keyid=None, profile=None)

Given a valid config, update the request payment configuration for a bucket.
Returns {updated: true} if request payment configuration was updated and returns {updated: False} if request payment configuration was not updated.
CLI Example:

```
salt myminion boto_s3_bucket.put_request_payment my_bucket Requester
```

salt.modules.boto_s3_bucket.put_tagging(Bucket, region=None, key=None, keyid=None, profile=None, **kwargs)

Given a valid config, update the tags for a bucket.
Returns {updated: true} if tags were updated and returns {updated: False} if tags were not updated.
CLI Example:

```
salt myminion boto_s3_bucket.put_tagging my_bucket my_role [...]
```

salt.modules.boto_s3_bucket.put_versioning(Bucket, Status, MFADelete=None, MFA=None, region=None, key=None, keyid=None, profile=None)

Given a valid config, update the versioning configuration for a bucket.
Returns {updated: true} if versioning configuration was updated and returns {updated: False} if versioning configuration was not updated.
CLI Example:

```
salt myminion boto_s3_bucket.put_versioning my_bucket Enabled
```

salt.modules.boto_s3_bucket.put_website(Bucket, ErrorDocument=None, IndexDocument=None, RedirectAllRequestsTo=None, RoutingRules=None, region=None, key=None, keyid=None, profile=None)

Given a valid config, update the website configuration for a bucket.
Returns {updated: true} if website configuration was updated and returns {updated: False} if website configuration was not updated.
CLI Example:

```bash
salt myminion boto_s3_bucket.put_website my_bucket IndexDocument='{"Suffix": "index.html"}'
```

## 21.9.60 salt.modules.boto_secgroup

Connection module for Amazon Security Groups

New in version 2014.7.0.

**configuration** This module accepts explicit ec2 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

```yaml
secgroup.keyid: GKTADJGHEIQXSXMKRB08H
secgroup.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```yaml
secgroup.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
    keyid: GKTADJGHEIQXSXMKRB08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

**depends** boto

salt.modules.boto_secgroup.authorize(name=None, source_group_name=None, source_group_owner_id=None, ip_protocol=None, from_port=None, to_port=None, cidr_ip=None, group_id=None, source_group_group_id=None, region=None, key=None, keyid=None, profile=None, vpc_id=None, vpc_name=None, egress=False)

Add a new rule to an existing security group.

CLI example:

```bash
salt myminion boto_secgroup.authorize mysecgroup ip_protocol=tcp from_port=80 to_port=80 cidr_ip=['10.0.0.0/8', '192.168.0.0/24']
```

salt.modules.boto_secgroup.convert_to_group_ids(groups, vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)

Given a list of security groups and a vpc_id, convert_to_group_ids will convert all list items in the given list to security group ids.

---

**21.9. execution modules** 1441
CLI example:
```
salt myminion boto_secgroup.convert_to_group_ids mysecgroup vpc-89yhh7h
```

```
salt.modules.boto_secgroup.create(name, description, vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)
```
Create a security group.

CLI example:
```
salt myminion boto_secgroup.create mysecgroup 'My Security Group'
```

```
salt.modules.boto_secgroup.delete(name=None, group_id=None, region=None, key=None, keyid=None, profile=None, vpc_id=None, vpc_name=None)
```
Delete a security group.

CLI example:
```
salt myminion boto_secgroup.delete mysecgroup
```

```
salt.modules.boto_secgroup.delete_tags(tags, name=None, group_id=None, vpc_name=None, vpc_id=None, region=None, key=None, keyid=None, profile=None)
```
Deletes tags from a security group.

New in version 2016.3.0.

```
tags a list of tags to remove
name the name of the security group
group_id the group id of the security group (in lieu of a name/vpc combo)
vpc_name the name of the vpc to search the named group for
vpc_id the id of the vpc, in lieu of the vpc_name
region the amazon region
key amazon key
keyid amazon keyid
profile amazon profile
```

CLI example:
```
salt myminion boto_secgroup.delete_tags [TAG_TO_DELETE1,'TAG_TO_DELETE2']
security_group_name vpc_id=vpc-13435 profile=my_aws_profile
```

```
salt.modules.boto_secgroup.exists(name=None, region=None, key=None, keyid=None, profile=None, vpc_id=None, vpc_name=None, group_id=None)
```
Check to see if a security group exists.

CLI example:
```
salt myminion boto_secgroup.exists mysecgroup
```

```
salt.modules.boto_secgroup.get_all_security_groups(groupnames=None, group_ids=None, filters=None, region=None, key=None, keyid=None, profile=None)
```
Return a list of all Security Groups matching the given criteria and filters.
Note that the groupnames argument only functions correctly for EC2 Classic and default VPC Security Groups. To find groups by name in other VPCs you’ll want to use the group-name filter instead.

The valid keys for the filters argument can be found in AWS’s API documentation.

CLI example:

```
salt myminion boto_secgroup.get_all_security_groups filters='
  
  {group-name: mygroup}

```
profile  amazon profile

CLI example:

```
salt myminion boto_secgroup.set_tags "{'TAG1': 'Value1', 'TAG2': 'Value2'}" --security_group_name vpc_id=vpc-13435 profile=my_aws_profile
```

21.9.61  salt.modules.boto_sns

Connection module for Amazon SNS

configuration  This module accepts explicit sns credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

```
sns.keyid: GKTADJGHEIQSXMKKRBJ08H
sns.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
sns.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

depends  boto

salt.modules.boto_sns.create(name, region=None, key=None, keyid=None, profile=None)
Create an SNS topic.

CLI example to create a topic:

```
salt myminion boto_sns.create mytopic region=us-east-1
```

salt.modules.boto_sns.delete(name, region=None, key=None, keyid=None, profile=None)
Delete an SNS topic.

CLI example to delete a topic:

```
salt myminion boto_sns.delete mytopic region=us-east-1
```

salt.modules.boto_sns.exists(name, region=None, key=None, keyid=None, profile=None)
Check to see if an SNS topic exists.

CLI example:
salt myminion boto_sns.exists mytopic region=us-east-1

salt.modules.boto_sns.get_all_subscriptions_by_topic(name, region=None, key=None, keyid=None, profile=None)

Get list of all subscriptions to a specific topic.

CLI example to delete a topic:
salt myminion boto_sns.get_all_subscriptions_by_topic mytopic region=us-east-1

salt.modules.boto_sns.get_all_topics(region=None, key=None, keyid=None, profile=None)

Returns a list of all topics.

CLI example:
salt myminion boto_sns.get_all_topics

salt.modules.boto_sns.get_arn(name, region=None, key=None, keyid=None, profile=None)

Returns the full ARN for a given topic name.

CLI example:
salt myminion boto_sns.get_arn mytopic

salt.modules.boto_sns.subscribe(topic, protocol, endpoint, region=None, key=None, keyid=None, profile=None)

Subscribe to a Topic.

CLI example to delete a topic:
salt myminion boto_sns.subscribe mytopic https https://www.example.com/sns-endpoint region=us-east-1

salt.modules.boto_sns.unsubscribe(topic, subscription_arn, region=None, key=None, keyid=None, profile=None)

Unsubscribe a specific SubscriptionArn of a topic.

CLI Example:
salt myminion boto_sns.unsubscribe my_topic my_subscription_arn region=us-east-1

New in version 2016.11.0.

**21.9.62 salt.modules.boto_sqs**

Connection module for Amazon SQS

New in version 2014.7.0.

**configuration** This module accepts explicit sqs credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

New in version 2014.7.0.
sqs.keyid: GKTADJGHEIQXSXMCRBFIK8H
sqs.key: askdjghsdfjkgWupUjasdfkldfgjsdfajkgghs

A region may also be specified in the configuration:

sqs.region: us-east-1

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

myprofile:
  keyid: GKTADJGHEIQXSXMCRBFIK8H
  key: askdjghsdfjkgWupUjasdfkldfgjsdfajkgghs
  region: us-east-1

depends boto3

salt.modules.boto_sqs.create(name, attributes=None, region=None, key=None, keyid=None, profile=None)

Create an SQS queue.

CLI Example:

salt myminion boto_sqs.create myqueue region=us-east-1

salt.modules.boto_sqs.delete(name, region=None, key=None, keyid=None, profile=None)

Delete an SQS queue.

CLI Example:

salt myminion boto_sqs.delete myqueue region=us-east-1

salt.modules.boto_sqs.exists(name, region=None, key=None, keyid=None, profile=None)

Check to see if a queue exists.

CLI Example:

salt myminion boto_sqs.exists myqueue region=us-east-1

salt.modules.boto_sqs.get_attributes(name, region=None, key=None, keyid=None, profile=None)

Return attributes currently set on an SQS queue.

CLI Example:

salt myminion boto_sqs.get_attributes myqueue

salt.modules.boto_sqs.list_(prefix='', region=None, key=None, keyid=None, profile=None)

Return a list of the names of all visible queues.

New in version 2016.11.0.

CLI Example:

salt myminion boto_sqs.list region=us-east-1
**salt.modules.boto_sqs.set_attributes** *(name, attributes, region=None, key=None, keyid=None, profile=None)*

Set attributes on an SQS queue.

CLI Example:

```
salt myminion boto_sqs.set_attributes myqueue '{ReceiveMessageWaitTimeSeconds: 20}' region=us-east-1
```

**21.9.63 salt.modules.boto_vpc**

Connection module for Amazon VPC

New in version 2014.7.0.

**depends**
- boto >= 2.8.0
- boto3 >= 1.2.6

**configuration** This module accepts explicit VPC credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available [here](#).

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

```
[vpc]
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
[vpc.region]
region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

Changed in version 2015.8.0: All methods now return a dictionary. Create and delete methods return:

```
created: true
```

or

```
created: false
error:
  message: error message
```

Request methods (e.g., `describe_vpc`) return:

```
vpcs:
  - {...}
  - {...}
```

**21.9. execution modules**
New in version 2016.11.0.

Functions to request, accept, delete and describe VPC peering connections. Named VPC peering connections can be requested using these modules. VPC owner accounts can accept VPC peering connections (named or otherwise).

Examples showing creation of VPC peering connection

```python
# Create a named VPC peering connection
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
  → name=my_vpc_connection
# Without a name
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
# Specify a region
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
  → region=us-west-2
```

Check to see if VPC peering connection is pending

```python
salt myminion boto_vpc.is_peering_connection_pending name=salt-vpc
# Specify a region
salt myminion boto_vpc.is_peering_connection_pending name=salt-vpc region=us-west-2
# specify an id
salt myminion boto_vpc.is_peering_connection_pending conn_id=pcx-8a8939e3
```

Accept VPC peering connection

```python
salt myminion boto_vpc.accept_vpc_peering_connection name=salt-vpc
# Specify a region
salt myminion boto_vpc.accept_vpc_peering_connection name=salt-vpc region=us-west-2
# specify an id
salt myminion boto_vpc.accept_vpc_peering_connection conn_id=pcx-8a8939e3
```

Deleting VPC peering connection via this module

```python
# Delete a named VPC peering connection
salt myminion boto_vpc.delete_vpc_peering_connection name=salt-vpc
# Specify a region
salt myminion boto_vpc.delete_vpc_peering_connection name=salt-vpc region=us-west-2
# specify an id
salt myminion boto_vpc.delete_vpc_peering_connection conn_id=pcx-8a8939e3
```

```
Request a VPC peering connection between two VPCS.

New in version 2016.11.0.

Parameters

- **conn_id** – The ID to use. String type.
- **name** – The name of this VPC peering connection. String type.
- **region** – The AWS region to use. Type string.

salt.modules.boto_vpc.accept_vpc_peering_connection(conn_id=", name=", region=None, key=None, keyid=None, profile=None, dry_run=False)
```
**Key** – The key to use for this connection. Type string.

**Keyid** – The key id to use.

**Profile** – The profile to use.

**Dry_run** – The dry_run flag to set.

**Returns** `dict`

Warning: Please specify either the `vpc_peering_connection_id` or `name` but not both. Specifying both will result in an error!

CLI Example:

```bash
salt myminion boto_vpc.accept_vpc_peering_connection name=salt-vpc
# Specify a region
salt myminion boto_vpc.accept_vpc_peering_connection name=salt-vpc region=us-west-2
# Specify an id
salt myminion boto_vpc.accept_vpc_peering_connection conn_id=pcx-8a8939e3
```

salt.modules.boto_vpc.assoc `<replace` `_ate_dhcp_options_to_vpc` `dhcp_options_id` `vpc_id=None`, `vpc_name=None`, `region=None`, `key=None`, `keyid=None`, `profile=None` `)`

Given valid DHCP options id and a valid VPC id, associate the DHCP options record with the VPC.

Returns True if the DHCP options record were associated and returns False if the DHCP options record was not associated.

CLI Example:

```bash
salt myminion boto_vpc.associate_dhcp_options_to_vpc 'dhcp-a0bl34pp' 'vpc-6b1fe402'
```

salt.modules.boto_vpc.associate_network_acl_to_subnet(`network_acl_id=None`, `subnet_id=None`, `network_acl_name=None`, `subnet_name=None`, `region=None`, `key=None`, `keyid=None`, `profile=None`)

Given a network acl and subnet ids or names, associate a network acl to a subnet.

CLI Example:

```bash
salt myminion boto_vpc.associate_network_acl_to_subnet
   network_acl_id='acl-5fb85d36' subnet_id='subnet-6a1fe403'
```

salt.myminion boto_vpc.associate_network_acl_to_subnet
   network_acl_id='myacl' subnet_id='mysubnet'

salt.modules.boto_vpc.associate_route_table(`route_table_id=None`, `subnet_id=None`, `route_table_name=None`, `subnet_name=None`, `region=None`, `key=None`, `keyid=None`, `profile=None`)

Given a route table and subnet name or id, associates the route table with the subnet.

CLI Example:
salt myminion boto_vpc.associate_route_table 'rtb-1f382e7d' 'subnet-6a1fe403'
salt myminion boto_vpc.associate_route_table route_table_name='myrtb' subnet_name='mysubnet'
salt.modules.boto_vpc.check_vpc(vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)
Check whether a VPC with the given name or id exists. Returns the vpc_id or None. Raises SaltInvocationError if both vpc_id and vpc_name are None. Optionally raise a CommandExecutionError if the VPC does not exist.
New in version 2016.3.0.
CLI Example:
salt myminion boto_vpc.check_vpc vpc_name=myvpc profile=awsprofile
salt.modules.boto_vpc.create(cidr_block, instance_tenancy=None, vpc_name=None, enable_dns_support=None, enable_dns_hostnames=None, tags=None, region=None, key=None, keyid=None, profile=None)
Given a valid CIDR block, create a VPC.
An optional instance_tenancy argument can be provided. If provided, the valid values are 'default' or 'dedicated'
An optional vpc_name argument can be provided.
Returns {created: true} if the VPC was created and returns {created: False} if the VPC was not created.
CLI Example:
salt myminion boto_vpc.create '10.0.0.0/24'
salt.modules.boto_vpc.create_customer_gateway(vpn_connection_type, ip_address, bgp_asn, customer_gateway_name=None, tags=None, region=None, key=None, keyid=None, profile=None)
Given a valid VPN connection type, a static IP address and a customer gateway’s Border Gateway Protocol (BGP) Autonomous System Number, create a customer gateway.
Returns the customer gateway id if the customer gateway was created and returns False if the customer gateway was not created.
CLI Example:
salt myminion boto_vpc.create_customer_gateway 'ipsec.1', '12.1.2.3', 65534
salt.modules.boto_vpc.create_dhcp_options(domain_name=None, domain_name_servers=None, ntp_servers=None, netbios_name_servers=None, netbios_node_type=None, dhcp_options_name=None, tags=None, vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)
Given valid DHCP options, create a DHCP options record, optionally associating it with an existing VPC.
Returns True if the DHCP options record was created and returns False if the DHCP options record was not deleted.
Changed in version 2015.8.0: Added vpc_name and vpc_id arguments
CLI Example:

```python
salt myminion boto_vpc.create_dhcp_options
domain_name='example.com'
    domain_name_servers='[1.2.3.4]' ntp_servers='[5.6.7.8]' netbios_name_servers='[10.0.0.1]' netbios_node_type=1
    vpc_name='myvpc'
```

```
salt.modules.boto_vpc.create_internet_gateway
    internet_gateway_name=None,
vpc_id=None, vpc_name=None,
tags=None, region=None, key=None,
    keyid=None, profile=None)
```

Create an Internet Gateway, optionally attaching it to an existing VPC.

Returns the internet gateway id if the internet gateway was created and returns False if the internet gateways was not created.

New in version 2015.8.0.

CLI Example:

```python
salt myminion boto_vpc.create_internet_gateway
    internet_gateway_name=myigw vpc_name=myvpc
```

```
salt.modules.boto_vpc.create_nat_gateway
    subnet_id=None, subnet_name=None, allocation_id=None, region=None, key=None,
        keyid=None, profile=None)
```

Create a NAT Gateway within an existing subnet. If allocation_id is specified, the elastic IP address it references is associated with the gateway. Otherwise, a new allocation_id is created and used.

This function requires boto3 to be installed.

Returns the nat gateway id if the nat gateway was created and returns False if the nat gateway was not created.

New in version 2016.11.0.

CLI Example:

```python
salt myminion boto_vpc.create_nat_gateway subnet_name=mysubnet
```

```
salt.modules.boto_vpc.create_network_acl
    vpc_id=None, vpc_name=None, network_acl_name=None, subnet_id=None, subnet_name=None, tags=None, region=None,
        key=None, keyid=None, profile=None)
```

Given a vpc_id, creates a network acl.

Returns the network acl id if successful, otherwise returns False.

Changed in version 2015.8.0: Added vpc_name, subnet_id, and subnet_name arguments

CLI Example:

```python
salt myminion boto_vpc.create_network_acl 'vpc-6b1fe402'
```

```
salt.modules.boto_vpc.create_network_acl_entry
    network_acl_id=None, rule_number=None, protocol=None, rule_action=None, cidr_block=None,
        egress=None, network_acl_name=None, icmp_code=None, icmp_type=None,
            port_range_from=None, port_range_to=None, region=None, key=None, keyid=None, profile=None)
```

21.9. execution modules
Creates a network acl entry.

CLI Example:
```
salt myminion boto_vpc.create_network_acl_entry 'acl-5fb85d36' '32767' \
   'all' 'deny' '0.0.0.0/0' egress=true
```

```
salt.modules.boto_vpc.create_network_acl_entry('acl-5fb85d36', 32767, 'all', 'deny', '0.0.0.0/0', egress=True)
```

`salt.modules.boto_vpc.create_route_table` function:
```
salt.modules.boto_vpc.create_route_table(vpc_id=None, vpc_name=None, route_table_name=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Creates a route table.

Changed in version 2015.8.0: Added vpc_name argument

CLI Examples:
```
salt myminion boto_vpc.create_route_table vpc_id='vpc-6b1fe402' \  
   route_table_name='myroutetable'
```

```
salt myminion boto_vpc.create_route_table vpc_name='myvpc' \  
   route_table_name='myroutetable'
```

`salt.modules.boto_vpc.create_subnet` function:
```
salt.modules.boto_vpc.create_subnet(vpc_id=None, cidr_block=None, vpc_name=None, availability_zone=None, subnet_name=None, tags=None, region=None, key=None, keyid=None, profile=None, auto_assign_public_ipv4=False)
```

Given a valid VPC ID or Name and a CIDR block, create a subnet for the VPC.

An optional availability zone argument can be provided.

Returns True if the VPC subnet was created and returns False if the VPC subnet was not created.

Changed in version 2015.8.0: Added vpc_name argument

CLI Examples:
```
salt myminion boto_vpc.create_subnet vpc_id='vpc-6b1fe402' \  
   subnet_name='mysubnet' cidr_block='10.0.0.0/25'
```

```
salt myminion boto_vpc.create_subnet vpc_name='myvpc' \  
   subnet_name='mysubnet',cidr_block='10.0.0.0/25'
```

`salt.modules.boto_vpc.customer_gateway_exists` function:
```
salt.modules.boto_vpc.customer_gateway_exists(customer_gateway_id=None, customer_gateway_name=None, region=None, key=None, keyid=None, profile=None)
```

1452 Chapter 21. Salt Module Reference
Given a customer gateway ID, check if the customer gateway ID exists.
Returns True if the customer gateway ID exists; Returns False otherwise.
CLI Example:
```
salt myminion boto_vpc.customer_gateway_exists cgw-b6a247df
salt myminion boto_vpc.customer_gateway_exists customer_gateway_name=mycgw
```

`salt.modules.boto_vpc.delete(vpc_id=None, name=None, vpc_name=None, tags=None, region=None, key=None, keyid=None, profile=None)`

Given a VPC ID or VPC name, delete the VPC.
Returns {deleted: true} if the VPC was deleted and returns {deleted: false} if the VPC was not deleted.
CLI Example:
```
salt myminion boto_vpc.delete vpc_id='vpc-6b1fe402'
salt myminion boto_vpc.delete name='myvpc'
```

`salt.modules.boto_vpc.delete_customer_gateway(customer_gateway_id=None, customer_gateway_name=None, region=None, key=None, keyid=None, profile=None)`

Given a customer gateway ID or name, delete the customer gateway.
Returns True if the customer gateway was deleted and returns False if the customer gateway was not deleted.
Changed in version 2015.8.0: Added customer_gateway_name argument
CLI Example:
```
salt myminion boto_vpc.delete_customer_gateway 'cgw-b6a247df'
```

`salt.modules.boto_vpc.delete_dhcp_options(dhcp_options_id=None, dhcp_options_name=None, region=None, key=None, keyid=None, profile=None)`

Delete dhcp options by id or name.
New in version 2015.8.0.
CLI Example:
```
salt myminion boto_vpc.delete_dhcp_options 'dopt-b6a247df'
```

`salt.modules.boto_vpc.delete_internet_gateway(internet_gateway_id=None, internet_gateway_name=None, detach=False, region=None, key=None, keyid=None, profile=None)`

Delete an internet gateway (by name or id).
Returns True if the internet gateway was deleted and otherwise False.
New in version 2015.8.0.
CLI Examples:
```
salt myminion boto_vpc.delete_internet_gateway internet_gateway_id=igw-1a2b3c
salt myminion boto_vpc.delete_internet_gateway internet_gateway_name=myigw
```
salt.modules.boto_vpc.delete_nat_gateway(nat_gateway_id, release_eips=False, region=None, key=None, keyid=None, profile=None, wait_for_delete=False, wait_for_delete_retries=5)

Delete a nat gateway (by id).

Returns True if the internet gateway was deleted and otherwise False.

This function requires boto3 to be installed.

New in version 2016.11.0.

**nat_gateway_id** Id of the NAT Gateway

**release_eips** whether to release the elastic IPs associated with the given NAT Gateway Id

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**wait_for_delete** whether to wait for delete of the NAT gateway to be in failed or deleted state after issuing the delete call.

**wait_for_delete_retries** NAT gateway may take some time to be go into deleted or failed state. During the deletion process, subsequent release of elastic IPs may fail; this state will automatically retry this number of times to ensure the NAT gateway is in deleted or failed state before proceeding.

CLI Examples:

```bash
salt myminion boto_vpc.delete_nat_gateway nat_gateway_id=igw-1a2b3c
```

salt.modules.boto_vpc.delete_network_acl(network_acl_id=None, network_acl_name=None, disassociate=False, region=None, key=None, keyid=None, profile=None)

Delete a network acl based on the network_acl_id or network_acl_name provided.

CLI Examples:

```bash
salt myminion boto_vpc.delete_network_acl network_acl_id='acl-5fb85d36' \ disassociate=false
```

```bash
salt myminion boto_vpc.delete_network_acl network_acl_name='myacl' \ disassociate=true
```

salt.modules.boto_vpc.delete_network_acl_entry(network_acl_id=None, rule_number=None, egress=None, network_acl_name=None, region=None, key=None, keyid=None, profile=None)

Deletes a network acl entry.

CLI Example:

```bash
salt myminion boto_vpc.delete_network_acl_entry 'acl-5fb85d36' '32767'
```

salt.modules.boto_vpc.delete_route(route_table_id=None, destination_cidr_block=None, route_table_name=None, region=None, key=None, keyid=None, profile=None)

Deletes a route.
salt.modules.boto_vpc.delete_route_table

Deletes a route table.

CLI Examples:

```
salt myminion boto_vpc.delete_route_table route_table_id='rtb-1f382e7d'
salt myminion boto_vpc.delete_route_table route_table_name='myroutetable'
```

salt.modules.boto_vpc.delete_subnet

Given a subnet ID or name, delete the subnet.

Returns True if the subnet was deleted and returns False if the subnet was not deleted.

Changed in version 2015.8.0: Added subnet_name argument

CLI Example:

```
salt myminion boto_vpc.delete_subnet 'subnet-6a1fe403'
```

salt.modules.boto_vpc.delete_vpc_peering_connection

Delete a VPC peering connection.

New in version 2016.11.0.

- **conn_id** The connection ID to check. Exclusive with conn_name.
- **conn_name** The connection name to check. Exclusive with conn_id.
- **region** Region to connect to.
- **key** Secret key to be used.
- **keyid** Access key to be used.
- **profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
- **dry_run** If True, skip application and simply return projected status.

CLI Example:

```
# Create a named VPC peering connection
salt myminion boto_vpc.delete_vpc_peering_connection conn_name=salt-vpc
# Specify a region
salt myminion boto_vpc.delete_vpc_peering_connection conn_name=salt-vpc region=us-west-2
# specify an id
salt myminion boto_vpc.delete_vpc_peering_connection conn_id=pcx-8a8939e3
```

salt.modules.boto_vpc.describe

Given a VPC ID describe its properties.

Returns a dictionary of interesting properties.
Changed in version 2015.8.0: Added `vpc_name` argument

CLI Example:

```shell
salt myminion boto_vpc.describe vpc_id=vpc-123456
salt myminion boto_vpc.describe vpc_name=myvpc
```

```python
salt.modules.boto_vpc.describe_nat_gateways(nat_gateway_id=None, subnet_id=None, subnet_name=None, vpc_id=None, vpc_name=None, states=('pending', 'available'), region=None, key=None, keyid=None, profile=None)
```

Return a description of nat gateways matching the selection criteria

This function requires boto3 to be installed.

CLI Example:

```shell
salt myminion boto_vpc.describe_nat_gateways nat_gateway_id='nat-03b02643b43216fe7'
```

```shell
salt myminion boto_vpc.describe_nat_gateways subnet_id='subnet-5b05942d'
```

```python
salt.modules.boto_vpc.describe_route_table(route_table_id=None, route_table_name=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Given route table properties, return route table details if matching table(s) exist.

New in version 2015.8.0.

CLI Example:

```shell
salt myminion boto_vpc.describe_route_table route_table_id='rtb-1f382e7d'
```

```python
salt.modules.boto_vpc.describe_route_tables(route_table_id=None, route_table_name=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Given route table properties, return details of all matching route tables.

This function requires boto3 to be installed.

New in version 2016.11.0.

CLI Example:

```shell
salt myminion boto_vpc.describe_route_tables vpc_id='vpc-a6a9efc3'
```

```python
salt.modules.boto_vpc.describe_subnet(subnet_id=None, subnet_name=None, region=None, key=None, keyid=None, profile=None)
```

Given a subnet id or name, describe its properties.

Returns a dictionary of interesting properties.

New in version 2015.8.0.

CLI Examples:

```shell
salt myminion boto_vpc.describe_subnet subnet_id=subnet-123456
```

```shell
salt myminion boto_vpc.describe_subnet subnet_name=mysubnet
```
Given a VPC ID or subnet CIDR, returns a list of associated subnets and their details. Return all subnets if VPC ID or CIDR are not provided. If a subnet id or CIDR is provided, only its associated subnet details will be returned.

New in version 2015.8.0.

CLI Examples:

```bash
salt myminion boto_vpc.describe_subnets
salt myminion boto_vpc.describe_subnets subnet_ids=['subnet-ba1987ab', 'subnet-ba1987cd']
salt myminion boto_vpc.describe_subnets vpc_id=vpc-123456
salt myminion boto_vpc.describe_subnets cidr=10.0.0.0/21
```

Returns any VPC peering connection id(s) for the given VPC peering connection name.

VPC peering connection ids are only returned for connections that are in the active, pending-acceptance or provisioning state.

New in version 2016.11.0.

Parameters

- `name` – The string name for this VPC peering connection
- `region` – The aws region to use
- `key` – Your aws key
- `keyid` – The key id associated with this aws account
- `profile` – The profile to use

Returns `dict`

CLI Example:

```bash
salt myminion boto_vpc.describe_vpc_peering_connection salt-vpc
# Specify a region
salt myminion boto_vpc.describe_vpc_peering_connection salt-vpc region=us-west-2
```

Describe all VPCs, matching the filter criteria if provided.

Returns a list of dictionaries with interesting properties.

New in version 2015.8.0.

CLI Example:

```bash
salt myminion boto_vpc.describe_vpcs
```
salt.modules.boto_vpc.dhcp_options_exists(dhcp_options_id=None, name=None, dhcp_options_name=None, tags=None, region=None, key=None, keyid=None, profile=None)

Check if a dhcp option exists.
Returns True if the dhcp option exists; Returns False otherwise.

CLI Example:
```
salt myminion boto_vpc.dhcp_options_exists dhcp_options_id='dhcp-a0bl34pp'
```

salt.modules.boto_vpc.disassociate_network_acl(subnet_id=None, vpc_id=None, subnet_name=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)

Given a subnet ID, disassociates a network acl.

CLI Example:
```
salt myminion boto_vpc.disassociate_network_acl 'subnet-6a1fe403'
```

salt.modules.boto_vpc.disassociate_route_table(association_id, region=None, key=None, keyid=None, profile=None)

Disassociates a route table.

**association_id** The Route Table Association ID to disassociate

CLI Example:
```
salt myminion boto_vpc.disassociate_route_table 'rtbassoc-d8ccddba'
```

salt.modules.boto_vpc.exists(vpc_id=None, name=None, cidr=None, tags=None, region=None, key=None, keyid=None, profile=None)

Given a VPC ID, check to see if the given VPC ID exists.
Returns True if the given VPC ID exists and returns False if the given VPC ID does not exist.

CLI Example:
```
salt myminion boto_vpc.exists myvpc
```

salt.modules.boto_vpc.get_dhcp_options(dhcp_options_name=None, dhcp_options_id=None, region=None, key=None, keyid=None, profile=None)

Return a dict with the current values of the requested DHCP options set

CLI Example:
```
salt myminion boto_vpc.get_dhcp_options 'myfunnydhcopptionsname'
```

New in version 2016.3.0.

salt.modules.boto_vpc.get_id(name=None, cidr=None, tags=None, region=None, key=None, keyid=None, profile=None)

Given VPC properties, return the VPC id if a match is found.

CLI Example:
```
salt myminion boto_vpc.get_id myvpc
```
salt.modules.boto_vpc.get_resource_id(resource, name=None, resource_id=None, region=None, key=None, keyid=None, profile=None)

Get an AWS id for a VPC resource by type and name.

New in version 2015.8.0.

CLI Example:
```
salt myminion boto_vpc.get_resource_id internet_gateway myigw
```

salt.modules.boto_vpc.get_subnet_association(subnets, region=None, key=None, keyid=None, profile=None)

Given a subnet (aka: a vpc zone identifier) or list of subnets, returns vpc association.

Returns a VPC ID if the given subnets are associated with the same VPC ID. Returns False on an error or if the given subnets are associated with different VPC IDs.

CLI Examples:
```
salt myminion boto_vpc.get_subnet_association subnet-61b47516

salt myminion boto_vpc.get_subnet_association ['subnet-61b47516', 'subnet-2cb9785b
 ...
]
```

salt.modules.boto_vpc.is_peering_connection_pending(conn_id=None, conn_name=None, region=None, key=None, keyid=None, profile=None)

Check if a VPC peering connection is in the pending state.

New in version 2016.11.0.

**conn_id** The connection ID to check. Exclusive with conn_name.

**conn_name** The connection name to check. Exclusive with conn_id.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:
```
salt myminion boto_vpc.is_peering_connection_pending conn_name=salt-vpc
# Specify a region
salt myminion boto_vpc.is_peering_connection_pending conn_name=salt-vpc region=us-west-2
# specify on id
salt myminion boto_vpc.is_peering_connection_pending conn_id=pcx-8a8939e3
```

salt.modules.boto_vpc.nat_gateway_exists(nat_gateway_id=None, subnet_id=None, subnet_name=None, vpc_id=None, vpc_name=None, states=('', 'available'), region=None, key=None, keyid=None, profile=None)

Checks if a nat gateway exists.

This function requires boto3 to be installed.

New in version 2016.11.0.
CLI Example:

```
salt myminion boto_vpc.nat_gateway_exists nat_gateway_id='nat-03b02643b43216fe7'
salt myminion boto_vpc.nat_gateway_exists subnet_id='subnet-5b065942d'
```

salt.modules.boto_vpc.network_acl_exists(network_acl_id=None, name=None, network_acl_name=None, tags=None, region=None, key=None, keyid=None, profile=None)

Checks if a network acl exists.

Returns True if the network acl exists or returns False if it doesn’t exist.

CLI Example:

```
salt myminion boto_vpc.network_acl_exists network_acl_id='acl-5fb85d36'
```

salt.modules.boto_vpc.peering_connection_pending_from_vpc(conn_id=None, conn_name=None, vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)

Check if a VPC peering connection is in the pending state, and requested from the given VPC.

New in version 2016.11.0.

**conn_id** The connection ID to check. Exclusive with conn_name.

**conn_name** The connection name to check. Exclusive with conn_id.

**vpc_id** Is this the ID of the requesting VPC for this peering connection. Exclusive with vpc_name.

**vpc_name** Is this the Name of the requesting VPC for this peering connection. Exclusive with vpc_id.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:

```
salt myminion boto_vpc.is_peering_connection_pending name=salt-vpc
```

salt.modules.boto_vpc.replace_network_acl_entry(network_acl_id=None, rule_number=None, protocol=None, rule_action=None, cidr_block=None, egress=None, network_acl_name=None, icmp_code=None, icmp_type=None, port_range_from=None, port_range_to=None, region=None, key=None, keyid=None, profile=None)

Replaces a network acl entry.

CLI Example:

```
salt myminion boto_vpc.replace_network_acl_entry 'acl-5fb85d36' '32767' \ 'all' 'deny' '0.0.0.0/0' egress=true
```
salt.modules.boto_vpc.replace_route(route_table_id=None, destination_cidr_block=None, route_table_name=None, gateway_id=None, instance_id=None, interface_id=None, region=None, key=None, keyid=None, profile=None, vpc_peering_connection_id=None)

Replaces a route.

CLI Example:

```
salt myminion boto_vpc.replace_route 'rtb-1f382e7d' '10.0.0.0/16' gateway_id='vgw-1a1b2c3'
```

salt.modules.boto_vpc.replace_route_table_association(association_id, route_table_id, region=None, key=None, keyid=None, profile=None)

Replaces a route table association.

CLI Example:

```
salt myminion boto_vpc.replace_route_table_association 'rtbassoc-d8ccddba' 'rtb-1f382e7d'
```

salt.modules.boto_vpc.request_vpc_peering_connection(requester_vpc_id=None, requester_vpc_name=None, peer_vpc_id=None, peer_vpc_name=None, name=None, peer_owner_id=None, region=None, key=None, keyid=None, profile=None, dry_run=False)

Request a VPC peering connection between two VPCs.

New in version 2016.11.0.

- **requester_vpc_id** ID of the requesting VPC. Exclusive with requester_vpc_name.
- **requester_vpc_name** Name tag of the requesting VPC. Exclusive with requester_vpc_id.
- **peer_vpc_id** ID of the VPC to create VPC peering connection with. This can be a VPC in another account. Exclusive with peer_vpc_name.
- **peer_vpc_name** Name tag of the VPC to create VPC peering connection with. This can only be a VPC in the same account, else resolving it into a vpc ID will almost certainly fail. Exclusive with peer_vpc_id.
- **name** The name to use for this VPC peering connection.
- **peer_owner_id** ID of the owner of the peer VPC. Defaults to your account ID, so a value is required if peering with a VPC in a different account.
- **region** Region to connect to.
- **key** Secret key to be used.
- **keyid** Access key to be used.
- **profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
- **dry_run** If True, skip application and return status.

CLI Example:
Create a named VPC peering connection

```bash
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
--name=my_vpc_connection
```

Without a name

```bash
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
```

Specify a region

```bash
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
--region=us-west-2
```

```
salt.modules.boto_vpc.resource_exists(
    resource, name=None, resource_id=None, tags=None,
    region=None, key=None, keyid=None, profile=None)
```

Given a resource type and name, return {exists: true} if it exists, {exists: false} if it does not exist, or {error: [message: error text]} on error.

New in version 2015.8.0.

CLI Example:

```bash
salt myminion boto_vpc.resource_exists internet_gateway myigw
```

```
salt.modules.boto_vpc.route_exists(
    destination_cidr_block,     route_table_name=None,
    route_table_id=None,        gateway_id=None,     instance_id=None,
    interface_id=None,          tags=None,          region=None,     key=None,
    keyid=None, profile=None)
```

Checks if a route exists.

New in version 2015.8.0.

CLI Example:

```bash
salt myminion boto_vpc.route_exists destination_cidr_block='10.0.0.0/20' gateway_id='local' route_table_name='test'
```

```
salt.modules.boto_vpc.route_table_exists(
    route_table_id=None,  name=None,
    route_table_name=None, tags=None,  region=None,
    key=None, keyid=None, profile=None)
```

Checks if a route table exists.

CLI Example:

```bash
salt myminion boto_vpc.route_table_exists route_table_id='rtb-1f382e7d'
```

```
salt.modules.boto_vpc.subnet_exists(
    subnet_id=None,  name=None,  subnet_name=None,
    cidr=None, tags=None, zones=None, region=None,
    key=None, keyid=None, profile=None)
```

Check if a subnet exists.

Returns True if the subnet exists, otherwise returns False.

Changed in version 2015.8.0: Added subnet_name argument

Deprecated name argument

CLI Example:

```bash
salt myminion boto_vpc.subnet_exists subnet_id='subnet-6a1fe403'
```

### 21.9.64 salt.modules.bower
Manage and query Bower packages

This module manages the installed packages using Bower. Note that npm, git and bower must be installed for this module to be available.

**salt.modules.bower.install(pkg, dir, pkgs=None, runas=None, env=None)**

Install a Bower package.

If no package is specified, the dependencies (from bower.json) of the package in the given directory will be installed.

- **pkg** A package name in any format accepted by Bower, including a version identifier
- **dir** The target directory in which to install the package
- **pkgs** A list of package names in the same format as the **pkg** parameter
- **runas** The user to run Bower with
- **env** Environment variables to set when invoking Bower. Uses the same **env** format as the **cmd.run** execution function.

CLI Example:

```
salt '*' bower.install underscore /path/to/project
salt '*' bower.install jquery#2.0 /path/to/project
```

**salt.modules.bower.list_(dir, runas=None, env=None)**

List installed Bower packages.

- **dir** The directory whose packages will be listed
- **runas** The user to run Bower with
- **env** Environment variables to set when invoking Bower. Uses the same **env** format as the **cmd.run** execution function.

CLI Example:

```
salt '*' bower.list /path/to/project
```

**salt.modules.bower.prune(dir, runas=None, env=None)**

New in version 2017.7.0.

Remove extraneous local Bower packages, i.e. those not referenced in bower.json

- **dir** The directory whose packages will be pruned
- **runas** The user to run Bower with
- **env** Environment variables to set when invoking Bower. Uses the same **env** format as the **cmd.run** execution function.

CLI Example:

```
salt '*' bower.prune /path/to/project
```

**salt.modules.bower.uninstall(pkg, dir, runas=None, env=None)**

Uninstall a Bower package.

- **pkg** A package name in any format accepted by Bower
- **dir** The target directory from which to uninstall the package
runas  The user to run Bower with

env  Environment variables to set when invoking Bower. Uses the same env format as the cmd.run execution function.

CLI Example:

```
salt '*' bower.uninstall underscore /path/to/project
```

## 21.9.65 salt.modules.bridge

Module for gathering and managing bridging information

salt.modules.bridge.add(br=None)

Creates a bridge

CLI Example:

```
salt '*' bridge.add br0
```

salt.modules.bridge.addif(br=None, iface=None)

Adds an interface to a bridge

CLI Example:

```
salt '*' bridge.addif br0 eth0
```

salt.modules.bridge.delete(br=None)

Deletes a bridge

CLI Example:

```
salt '*' bridge.delete br0
```

salt.modules.bridge.delif(br=None, iface=None)

Removes an interface from a bridge

CLI Example:

```
salt '*' bridge.delif br0 eth0
```

salt.modules.bridge.find_interfaces(*args)

Returns the bridge to which the interfaces are bond to

CLI Example:

```
salt '*' bridge.find_interfaces eth0 [eth1...]
```

salt.modules.bridge.interfaces(br=None)

Returns interfaces attached to a bridge

CLI Example:

```
salt '*' bridge.interfaces br0
```

salt.modules.bridge.list_()

Returns the machine’s bridges list

CLI Example:
salt '*' bridge.list

salt.modules.bridge.show(br=None)

Returns bridges interfaces along with enslaved physical interfaces. If no interface is given, all bridges are shown, else only the specified bridge values are returned.

CLI Example:

```
salt '*' bridge.show
salt '*' bridge.show br0
```

salt.modules.bridge.stp(br=None, state='disable', iface=None)

Sets Spanning Tree Protocol state for a bridge

CLI Example:

```
salt '*' bridge.stp br0 enable
salt '*' bridge.stp br0 disable
```

For BSD-like operating systems, it is required to add the interface on which to enable the STP.

CLI Example:

```
salt '*' bridge.stp bridge0 enable fxp0
salt '*' bridge.stp bridge0 disable fxp0
```

21.9.66 salt.modules.bsd_shadow

Manage the password database on BSD systems

**Important:** If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to **shadow.info** is not available), see [here](#).

salt.modules.bsd_shadow.default_hash()

Returns the default hash used for unset passwords

CLI Example:

```
salt '*' shadow.default_hash
```

salt.modules.bsd_shadow.del_password(name)

New in version 2015.8.2.

Delete the password from name user

CLI Example:

```
salt '*' shadow.del_password username
```

salt.modules.bsd_shadow.info(name)

Return information for the specified user

CLI Example:

```
salt '*' shadow.info someuser
```
salt.modules.bsd_shadow.set_change(name, change)
Sets the time at which the password expires (in seconds since the UNIX epoch). See man 8 usermod on NetBSD and OpenBSD or man 8 pw on FreeBSD.

A value of 0 sets the password to never expire.

CLI Example:
```
salt '*' shadow.set_change username 1419980400
```

salt.modules.bsd_shadow.set_expire(name, expire)
Sets the time at which the account expires (in seconds since the UNIX epoch). See man 8 usermod on NetBSD and OpenBSD or man 8 pw on FreeBSD.

A value of 0 sets the account to never expire.

CLI Example:
```
salt '*' shadow.set_expire username 1419980400
```

salt.modules.bsd_shadow.set_password(name, password)
Set the password for a named user. The password must be a properly defined hash. The password hash can be generated with this command:
```
python -c "import crypt; print crypt.crypt('password', ciphersalt)"
```

Note: When constructing the ciphersalt string, you must escape any dollar signs, to avoid them being interpolated by the shell.

'password' is, of course, the password for which you want to generate a hash.

ciphersalt is a combination of a cipher identifier, an optional number of rounds, and the cryptographic salt. The arrangement and format of these fields depends on the cipher and which flavor of BSD you are using. For more information on this, see the manpage for crypt(3). On NetBSD, additional information is available in passwd.conf(5).

It is important to make sure that a supported cipher is used.

CLI Example:
```
salt '*' shadow.set_password someuser '$1$UYCIxa628.9qXjpQCjM4a..'
```

21.9.67 salt.modules.btrfs

Module for managing BTRFS file systems.

salt.modules.btrfs.add(mountpoint, *devices, **kwargs)
Add a devices to a BTRFS filesystem.

General options:
- nodiscard: Do not perform whole device TRIM
- force: Force overwrite existing filesystem on the disk

CLI Example:
```
salt '*' btrfs.add /mountpoint /dev/sda1 /dev/sda2
```
salt.modules.btrfs.convert\( device, \text{permanent} = \text{False}, \text{keeplf} = \text{False} \)  
Convert ext2/3/4 to BTRFS. Device should be mounted.

Filesystem can be converted temporarily so the further processing and rollback is possible, or permanently, where previous extended filesystem image gets deleted. Please note, permanent conversion takes a while as BTRFS filesystem needs to be properly rebalanced afterwards.

General options:

- **permanent**: Specify if the migration should be permanent (false by default)
- **keeplf**: Keep lost+found of the partition (removed by default, but still in the image, if not permanent migration)

CLI Example:
```bash
salt '*' btrfs.convert /dev/sda1  
salt '*' btrfs.convert /dev/sda1 permanent=True
```

salt.modules.btrfs.defragment\( path \)  
Defragment mounted BTRFS filesystem. In order to defragment a filesystem, device should be properly mounted and writable.

If passed a device name, then defragmented whole filesystem, mounted on it. If passed a mountpoint of the filesystem, then only this mount point is defragmented.

CLI Example:
```bash
salt '*' btrfs.defragment /dev/sda1  
salt '*' btrfs.defragment /path/on/filesystem
```

salt.modules.btrfs.delete\( mountpoint, *devices, **kwargs \)  
Remove devices from a BTRFS filesystem.

CLI Example:
```bash
salt '*' btrfs.delete /mountpoint /dev/sda1 /dev/sda2
```

salt.modules.btrfs.devices\()  
Get known BTRFS formatted devices on the system.

CLI Example:
```bash
salt '*' btrfs.devices
```

salt.modules.btrfs.features\()  
List currently available BTRFS features.

CLI Example:
```bash
salt '*' btrfs.mkfs_features
```

salt.modules.btrfs.info\( device \)  
Get BTRFS filesystem information.

CLI Example:
```bash
salt '*' btrfs.info /dev/sda1
```

salt.modules.btrfs.mkfs\( *devices, **kwargs \)  
Create a file system on the specified device. By default wipes out with force.
General options:

- **allocsize**: Specify the BTRFS offset from the start of the device.
- **bytecount**: Specify the size of the resultant filesystem.
- **nodesize**: Node size.
- **leavesize**: Specify the nodesize, the tree block size in which btrfs stores data.
- **noforce**: Prevent force overwrite when an existing filesystem is detected on the device.
- **sectorsize**: Specify the sectorsize, the minimum data block allocation unit.
- **nodiscard**: Do not perform whole device TRIM operation by default.
- **uuid**: Pass UUID or pass True to generate one.

Options:

- **dto**: (raid0|raid1|raid5|raid6|raid10|single|dup) Specify how the data must be spanned across the devices specified.
- **mto**: (raid0|raid1|raid5|raid6|raid10|single|dup) Specify how metadata must be spanned across the devices specified.
- **fts**: Features (call `salt <host> btrfs.features` for full list of available features)

See the `mkfs.btrfs(8)` manpage for a more complete description of corresponding options description.

CLI Example:

```bash
salt '*' btrfs.mkfs /dev/sda1
salt '*' btrfs.mkfs /dev/sda1 noforce=True
```

**salt.modules.btrfs.properties**(obj, type=None, set=None)

List properties for given btrfs object. The object can be path of BTRFS device, mount point, or any directories/files inside the BTRFS filesystem.

General options:

- **type**: Possible types are s[ubvol], f[ilesystem], i[node] and d[evice].
- **force**: Force overwrite existing filesystem on the disk
- **set**: `<key=value,key1=value1...>` Options for a filesystem properties.

CLI Example:

```bash
salt '*' btrfs.properties /mountpoint
salt '*' btrfs.properties /dev/sda1 type=subvol set='ro=false,label="My Storage"'
```

**salt.modules.btrfs.resize**(mountpoint, size)

Resize filesystem.

General options:

- **mountpoint**: Specify the BTRFS mountpoint to resize.
- **size**: 
  
  `([+/-]<newsize>[kKmMgGtTpPeE]max)` Specify the new size of the target.

CLI Example:

```bash
salt '*' btrfs.resize /mountpoint size=+1g
salt '*' btrfs.resize /dev/sda1 size=max
```
salt.modules.btrfs.subvolume_create(name, dest=None, qgroupids=None)
Create subvolume name in dest.

- **name**: Name of the new subvolume
- **dest**: If not given, the subvolume will be created in the current directory, if given will be in /dest/name
- **qgroupids**: Add the newly created subvolume to a qgroup. This parameter is a list

CLI Example:

```bash
salt '*' btrfs.subvolume_create var
salt '*' btrfs.subvolume_create var dest=/mnt
salt '*' btrfs.subvolume_create var qgroupids='[200]'
```

salt.modules.btrfs.subvolume_delete(name=None, names=None, commit=None)
Delete the subvolume(s) from the filesystem

- The user can remove one single subvolume (name) or multiple of them at the same time (names). One of the two parameters needs to specified.
- Please, refer to the documentation to understand the implication on the transactions, and when the subvolume is really deleted.

Return True if the subvolume is deleted, False is the subvolume was already missing.

- **name**: Name of the subvolume to remove
- **names**: List of names of subvolumes to remove
- **commit**:
  - 'after': Wait for transaction commit at the end
  - 'each': Wait for transaction commit after each delete

CLI Example:

```bash
salt '*' btrfs.subvolume_delete /var/volumes/tmp
salt '*' btrfs.subvolume_delete /var/volumes/tmp commit=after
```

salt.modules.btrfs.subvolume_exists(path)
Check if a subvolume is present in the filesystem.

- **path**: Mount point for the subvolume (full path)

CLI Example:

```bash
salt '*' btrfs.subvolume_exists /mnt/var
```

salt.modules.btrfs.subvolume_find_new(name, last_gen)
List the recently modified files in a subvolume

- **name**: Name of the subvolume
- **last_gen**: Last transid marker from where to compare

CLI Example:

```bash
salt '*' btrfs.subvolume_find_new /var/volumes/tmp 1024
```

salt.modules.btrfs.subvolume_get_default(path)
Get the default subvolume of the filesystem path
**path**  Mount point for the subvolume

CLI Example:

```
salt '*' btrfs.subvolume_get_default /var/volumes/tmp
```

```
salt.modules.btrfs.subvolume_list(path, parent_id=False, absolute=False, ogeneration=False, generation=False, subvolumes=False, uuid=False, parent_uuid=False, sent_subvolume_uuid=False, snapshots=False, readonly=False, deleted=False, generation_cmp=None, ogeneration_cmp=None, sort=None)
```

List the subvolumes present in the filesystem.

**path**  Mount point for the subvolume

**parent_id**  Print parent ID

**absolute**  Print all the subvolumes in the filesystem and distinguish between absolute and relative path with respect to the given <path>

**ogeneration**  Print the ogeneration of the subvolume

**generation**  Print the generation of the subvolume

**subvolumes**  Print only subvolumes below specified <path>

**uuid**  Print the UUID of the subvolume

**parent_uuid**  Print the parent uuid of subvolumes (and snapshots)

**sent_subvolume_uuid**  Print the UUID of the sent subvolume, where the subvolume is the result of a receive operation

**snapshots**  Only snapshot subvolumes in the filesystem will be listed

**readonly**  Only readonly subvolumes in the filesystem will be listed

**deleted**  Only deleted subvolumes that are ye not cleaned

**generation_cmp**  List subvolumes in the filesystem that its generation is >=, <= or = value. '+' means >= value, '-' means <= value, If there is neither '+' nor '-', it means = value

**ogeneration_cmp**  List subvolumes in the filesystem that its ogeneration is >=, <= or = value

**sort**  List subvolumes in order by specified items. Possible values: * rootid * gen * ogen * path You can add '+' or '-' in front of each items, '+' means ascending, '-' means descending. The default is ascending. You can combine it in a list.

CLI Example:

```
salt '*' btrfs.subvolume_list /var/volumes/tmp
salt '*' btrfs.subvolume_list /var/volumes/tmp path=True
salt '*' btrfs.subvolume_list /var/volumes/tmp sort=['-rootid']
```

```
salt.modules.btrfs.subvolume_set_default(subvolid, path)
```

Set the subvolume as default

**subvolid**  ID of the new default subvolume

**path**  Mount point for the filesystem

CLI Example:

```
salt '*' btrfs.subvolume_set_default 257 /var/volumes/tmp
```
salt.modules.btrfs.subvolume_show(path)
  Show information of a given subvolume
  path  Mount point for the filesystem
  CLI Example:
  ```
  salt '*' btrfs.subvolume_show /var/volumes/tmp
  ```

salt.modules.btrfs.subvolume_snapshot(source, dest=None, name=None, read_only=False)
  Create a snapshot of a source subvolume
  source  Source subvolume from where to create the snapshot
  dest  If only dest is given, the subvolume will be named as the basename of the source
  name  Name of the snapshot
  read_only  Create a read only snapshot
  CLI Example:
  ```
  salt '*' btrfs.subvolume_snapshot /var/volumes/tmp dest=/snapshots
  ```
  ```
  salt '*' btrfs.subvolume_snapshot /var/volumes/tmp name=backup
  ```

salt.modules.btrfs.subvolume_sync(path, subvolids=None, sleep=None)
  Wait until given subvolume are completely removed from the filesystem after deletion.
  path  Mount point for the filesystem
  subvolids  List of IDs of subvolumes to wait for
  sleep  Sleep N seconds betwenn checks (default: 1)
  CLI Example:
  ```
  salt '*' btrfs.subvolume_sync /var/volumes/tmp
  ```
  ```
  salt '*' btrfs.subvolume_sync /var/volumes/tmp subvolids='[257]'
  ```

salt.modules.btrfs.usage(path)
  Show in which disk the chunks are allocated.
  CLI Example:
  ```
  salt '*' btrfs.usage /your/mountpoint
  ```

salt.modules.btrfs.version()
  Return BTRFS version.
  CLI Example:
  ```
  salt '*' btrfs.version
  ```

21.9.68 salt.modules.cabal

Manage and query Cabal packages

New in version 2015.8.0.

salt.modules.cabal.install(pkg=None, pkgs=None, user=None, install_global=False, env=None)
  Install a cabal package.
pkg  A package name in format accepted by cabal-install. See: https://wiki.haskell.org/Cabal-Install

pkgs  A list of packages names in same format as pkg

user  The user to run cabal install with

install_global  Install package globally instead of locally

ever  Environment variables to set when invoking cabal. Uses the same env format as the cmd.run execution function

CLI Example:

```
salt '*' cabal.install shellcheck
salt '*' cabal.install shellcheck-0.3.5
```

salt.modules.cabal.list_(pkg=None, user=None, installed=False, env=None)
List packages matching a search string.

pkg  Search string for matching package names

user  The user to run cabal list with

installed  If True, only return installed packages.

ever  Environment variables to set when invoking cabal. Uses the same env format as the cmd.run execution function

CLI example:

```
salt '*' cabal.list
salt '*' cabal.list ShellCheck
```

salt.modules.cabal.uninstall(pkg, user=None, env=None)
Uninstall a cabal package.

pkg  The package to uninstall

user  The user to run ghc-pkg unregister with

env  Environment variables to set when invoking cabal. Uses the same env format as the cmd.run execution function

CLI Example:

```
salt '*' cabal.uninstall ShellCheck
```

salt.modules.cabal.update(user=None, env=None)
Updates list of known packages.

user  The user to run cabal update with

env  Environment variables to set when invoking cabal. Uses the same env format as the cmd.run execution function.

CLI Example:

```
salt '*' cabal.update
```

21.9.69  salt.modules.capirca_acl module
Capirca ACL

Generate ACL (firewall) configuration for network devices.

New in version 2017.7.0.

codeauthor Mircea Ulinic <ping@mirceaulinic.net> & Robert Ankeny <robankeny@google.com>
maturity new
depends capirca
platform unix

Dependencies

The firewall configuration is generated by Capirca.

To install Capirca, execute: pip install capirca.

```
salt.modules.capirca_acl.get_filter_config(platform, filter_name, filter_options=None, terms=None, prepend=True, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=True, only_lower_merge=False, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d')
```

Return the configuration of a policy filter.

platform The name of the Capirca platform.

filter_name The name of the policy filter.

filter_options Additional filter options. These options are platform-specific. See the complete list of options.

terms List of terms for this policy filter. If not specified or empty, will try to load the configuration from the pillar, unless merge_pillar is set as False.

prepend: True When merge_pillar is set as True, the final list of terms generated by merging the terms from terms with those defined in the pillar (if any): new terms are prepended at the beginning, while existing ones will preserve the position. To add the new terms at the end of the list, set this argument to False.

pillar_key: acl The key in the pillar containing the default attributes values. Default: acl.
pillarenv Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
saltenv Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

merge_pillar: True Merge the CLI variables with the pillar. Default: True.

only_lower_merge: False Specify if it should merge only the terms fields. Otherwise it will try to merge also filters fields. Default: False.

revision_id Add a comment in the filter config having the description for the changes applied.

revision_no The revision count.

revision_date: True Boolean flag: display the date when the filter configuration was generated. Default: True.

revision_date_format: %Y/%m/%d The date format to be used when generating the perforce data. Default: %Y/%m/%d (<year>/<month>/<day>).
CLI Example:

```
salt '*' capirca.get_filter_config ciscoxr my-filter pillar_key=netacl
```

Output Example:

```
! $Id:$
! $Date:$
! $Revision:$
no ipv4 access-list my-filter
ipv4 access-list my-filter
  remark $Id:$
  remark my-term
  deny ipv4 any eq 1234 any
  deny ipv4 any eq 1235 any
  remark my-other-term
  permit tcp any range 5678 5680 any
exit
```

The filter configuration has been loaded from the pillar, having the following structure:

```
netacl:
  - my-filter:
    terms:
      - my-term:
        source_port: [1234, 1235]
        action: reject
      - my-other-term:
        source_port: [5678, 5680]
        protocol: tcp
        action: accept
```

salt.modules.capirca_acl.get_filter_pillar(filter_name, pillar_key='acl', pillarenv=None, saltenv=None)

Helper that can be used inside a state SLS, in order to get the filter configuration given its name.

- `filter_name` The name of the filter.
- `pillar_key` The root key of the whole policy config.
- `pillarenv` Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
- `saltenv` Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

salt.modules.capirca_acl.get_policy_config(platform, filters=None, prepend=True, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=True, only_lower_merge=False, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d')

Return the configuration of the whole policy.

- `platform` The name of the Capirca platform.
- `filters` List of filters for this policy. If not specified or empty, will try to load the configuration from the pillar, unless merge_pillar is set as False.
- `prepend: True` When merge_pillar is set as True, the final list of filters generated by merging the filters from filters with those defined in the pillar (if any): new filters are prepended at the beginning, while
existing ones will preserve the position. To add the new filters at the end of the list, set this argument to False.

**pillar_key:** acl  The key in the pillar containing the default attributes values. Default: acl.

**pillarenv**  Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv**  Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

**merge_pillar:** True  Merge the CLI variables with the pillar. Default: True.

**only_lower_merge:** False  Specify if it should merge only the filters and terms fields. Otherwise it will try to merge everything at the policy level. Default: False.

**revision_id**  Add a comment in the policy config having the description for the changes applied.

**revision_no**  The revision count.

**revision_date:** True  Boolean flag: display the date when the policy configuration was generated. Default: True.

**revision_date_format:** %Y/%m/%d  The date format to be used when generating the perforce data. Default: %Y/%m/%d (\textlangle year\textrangle/\textlangle month\textrangle/\textlangle day\textrangle).

CLI Example:

```
salt '*' capirca.get_policy_config juniper pillar_key=netacl
```

Output Example:

```
firewall {
  family inet {
    replace: /*
    ** $Id:$
    ** $Date:$
    ** $Revision:$
    */
    filter my-filter {
      term my-term {
        from {
          source-port [ 1234 1235 ];
        }
        then {
          reject;
        }
      }
      term my-other-term {
        from {
          protocol tcp;
          source-port 5678-5680;
        }
        then accept;
      }
    }
  }
}
```

(continues on next page)
The policy configuration has been loaded from the pillar, having the following structure:

```yaml
metacl:
  - my-filter:
    options:
      - not-interface-specific
    terms:
      - my-term:
        source_port: [1234, 1235]
        action: reject
      - my-other-term:
        source_port:
          - [5678, 5680]
        protocol: tcp
        action: accept
      - my-other-filter:
        terms:
          - dummy-term:
            protocol:
              - tcp
              - udp
            action: reject
```

`salt.modules.capirca_acl.get_term_config`(*platform*, *filter_name*, *term_name*, *filter_options=None*, *pillar_key='acl'* , *pillarenv=None*, *saltenv=None*, *merge_pillar=True*, *revision_id=None*, *revision_no=None*, *revision_date=True*, *revision_date_format='%Y/%m/%d'*, *source_service=None*, *destination_service=None*, **term_fields**)  

Return the configuration of a single policy term.

*platform* The name of the Capirca platform.

*filter_name* The name of the policy filter.
term_name  The name of the term.

filter_options  Additional filter options. These options are platform-specific. E.g.: inet6, bridge, object-group. See the complete list of options.

pillar_key: acl  The key in the pillar containing the default attributes values. Default: acl. If the pillar contains the following structure:

```yaml
firewall:
  - my-filter:
    terms:
      - my-term:
        source_port: 1234
        source_address:
        - 1.2.3.4/32
        - 5.6.7.8/32
```

The pillar_key field would be specified as firewall.

pillarenv  Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv  Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

merge_pillar: True  Merge the CLI variables with the pillar. Default: True.

revision_id  Add a comment in the term config having the description for the changes applied.

revision_no  The revision count.

revision_date: True  Boolean flag: display the date when the term configuration was generated. Default: True.

revision_date_format: %Y/%m/%d  The date format to be used when generating the perforce data. Default: %Y/%m/%d (<year>/<month>/<day>).

source_service  A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a source_port and protocol.

As this module is available on Unix platforms only, it reads the IANA port assignment from /etc/services.

If the user requires additional shortcuts to be referenced, they can add entries under /etc/services, which can be managed using the file state.

destination_service  A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a destination_port and protocol. Allows the same options as source_service.

term_fields  Term attributes. To see what fields are supported, please consult the list of supported keywords. Some platforms have few other optional keywords.

---

Note:  The following fields are accepted:

- action
- address
- address_exclude
- comment
- counter
- expiration
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix
- forwarding_class
- forwarding_class_except
- logging
- log_name
- loss_priority
- option
- policer
- port
- precedence
- principals
- protocol
- protocol_except
- qos
- pan_application
- routing_instance
- source_address
- source_address_exclude
- source_port
- source_prefix
- verbatim
- packet_length
- fragment_offset
- hop_limit
- icmp_type
- ether_type
- traffic_class_count
- traffic_type
- translated
- dscp_set
- dscp_match
- dscp_except
• next_ip
• flexible_match_range
• source_prefix_except
• destination_prefix_except
• vpn
• source_tag
• destination_tag
• source_interface
• destination_interface
• flattened
• flattened_addr
• flattened_saddr
• flattened_daddr
• priority

Note: The following fields can be also a single value and a list of values:
• action
• address
• address_exclude
• comment
• destination_address
• destination_address_exclude
• destination_port
• destination_prefix
• forwarding_class
• forwarding_class_except
• logging
• option
• port
• precedence
• principals
• protocol
• protocol_except
• pan_application
• source_address
• source_address_exclude
• source_port
• source_prefix
• verbatim
• icmp_type
• ether_type
• traffic_type
• dscp_match
• dscp_except
• flexible_match_range
• source_prefix_except
• destination_prefix_except
• source_tag
• destination_tag
• source_service
• destination_service

Example: destination_address can be either defined as:

```
### destination_address: 172.17.17.1/24
```

or as a list of destination IP addresses:

```
### destination_address:
    - 172.17.17.1/24
    - 172.17.19.1/24
```

or a list of services to be matched:

```
### source_service:
    - ntp
    - snmp
    - ldap
    - bgpd
```

**Note:** The port fields source_port and destination_port can be used as above to select either a single value, either a list of values, but also they can select port ranges. Example:

```
### source_port:
    - [1000, 2000]
    - [3000, 4000]
```

With the configuration above, the user is able to select the 1000-2000 and 3000-4000 source port ranges.

CLI Example:

```
salt '*' capirca.get_term_config arista filter-name term-name source_address=1.2.3.4 destination_address=5.6.7.8 action=accept
```
Output Example:

```shell
! $Date: 2017/03/22 $
no ip access-list filter-name
ip access-list filter-name
  remark term-name
  permit ip host 1.2.3.4 host 5.6.7.8
exit
```

`salt.modules.capirca_acl.get_term_pillar(filter_name, term_name, pillar_key=\'acl\', pillarenv=None, saltenv=None)`

Helper that can be used inside a state SLS, in order to get the term configuration given its name, under a certain filter uniquely identified by its name.

- **filter_name** The name of the filter.
- **term_name** The name of the term.
- **pillar_key:** `acl` The root key of the whole policy config. Default: `acl`.
- **pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
- **saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

### 21.9.70 salt.modules.cassandra

Cassandra NoSQL Database Module

- **depends**
  - pycassa Cassandra Python adapter

- **configuration** The location of the ‘nodetool’ command, host, and thrift port needs to be specified via pillar:

```shell
cassandra.nodetool: /usr/local/bin/nodetool
cassandra.host: localhost
cassandra.thrift_port: 9160
```

`salt.modules.cassandra.column_families(keyspace=None)`

Return existing column families for all keyspaces or just the provided one.

CLI Example:

```
salt '*' cassandra.column_families
salt '*' cassandra.column_families <keyspace>
```

`salt.modules.cassandra.column_family_definition(keyspace, column_family)`

Return a dictionary of column family definitions for the given keyspace/column_family

CLI Example:

```
salt '*' cassandra.column_family_definition <keyspace> <column_family>
```

`salt.modules.cassandra.compactionstats()`

Return compactionstats info

CLI Example:
salt.modules.cassandra.info()
Return cassandra node info
CLI Example:
salt '*' cassandra.info
	salt.modules.cassandra.keyspaces()
Return existing keyspaces
CLI Example:
salt '*' cassandra.keyspaces
	salt.modules.cassandra.netstats()
Return netstats info
CLI Example:
salt '*' cassandra.netstats
	salt.modules.cassandra.ring()
Return cassandra ring info
CLI Example:
salt '*' cassandra.ring
	salt.modules.cassandra.tpstats()
Return tpstats info
CLI Example:
salt '*' cassandra.tpstats
	salt.modules.cassandra.version()
Return the cassandra version
CLI Example:
salt '*' cassandra.version

21.9.71 salt.modules.cassandra_cql

Cassandra Database Module
New in version 2015.5.0.
This module works with Cassandra v2 and v3 and hence generates queries based on the internal schema of said version.

  depends DataStax Python Driver for Apache Cassandra https://github.com/datastax/python-driver pip install cassandra-driver
  referenced by Salt’s cassandra_cql returner
configuration  The Cassandra cluster members and connection port can either be specified in the master or minion config, the minion’s pillar or be passed to the module.

Example configuration in the config for a single node:

```
cassandra:
    cluster: 192.168.50.10
    port: 9000
```

Example configuration in the config for a cluster:

```
cassandra:
    cluster:
        - 192.168.50.10
        - 192.168.50.11
        - 192.168.50.12
    port: 9000
    username: cas_admin
```

Changed in version 2016.11.0.

Added support for `ssl_options` and `protocol_version`.

Example configuration with `ssl options`:

If `ssl_options` are present in cassandra config the cassandra_cql returner will use SSL. SSL isn’t used if `ssl_options` isn’t specified.

```
cassandra:
    cluster:
        - 192.168.50.10
        - 192.168.50.11
        - 192.168.50.12
    port: 9000
    username: cas_admin

ssl_options:
    ca_certs: /etc/ssl/certs/ca-bundle.trust.crt

    # SSL version should be one from the ssl module
    # This is an optional parameter
    ssl_version: PROTOCOL_TLSv1
```

Additionally you can also specify the `protocol_version` to use.

```
cassandra:
    cluster:
        - 192.168.50.10
        - 192.168.50.11
        - 192.168.50.12
    port: 9000
    username: cas_admin

    # defaults to 4, if not set
    protocol_version: 3
```

```
salt.modules.cassandra_cql.cql_query(query, contact_points=None, port=None, cql_user=None, cql_pass=None)
```

Run a query on a Cassandra cluster and return a dictionary.
Parameters

- **query (str)** – The query to execute.
- **contact_points (str | list[str])** – The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user (str)** – The Cassandra user if authentication is turned on.
- **cql_pass (str)** – The Cassandra user password if authentication is turned on.
- **port (int)** – The Cassandra cluster port, defaults to None.
- **params (str)** – The parameters for the query, optional.

Returns A dictionary from the return values of the query

Return type list[dict]

CLI Example:

```bash
salt 'cassandra-server' cassandra_cql.cql_query "SELECT * FROM users_by_name WHERE first_name = 'jane'"
```

salt.modules.cassandra_cql.cql_query_with_prepare(query, statement_name, statement_arguments, callback_errors=None, contact_points=None, port=None, cql_user=None, cql_pass=None, **kwargs)

Run a query on a Cassandra cluster and return a dictionary.

This function should not be used asynchronously for SELECTs – it will not return anything and we don’t currently have a mechanism for handling a future that will return results.

Parameters

- **query (str)** – The query to execute.
- **statement_name (str)** – Name to assign the prepared statement in the __context__ dictionary
- **statement_arguments (list[str])** – Bind parameters for the SQL statement
- **async (bool)** – Run this query in asynchronous mode
- **callback_errors (Function callable)** – Function to call after query runs if there is an error
- **contact_points (str | list[str])** – The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user (str)** – The Cassandra user if authentication is turned on.
- **cql_pass (str)** – The Cassandra user password if authentication is turned on.
- **port (int)** – The Cassandra cluster port, defaults to None.
- **params (str)** – The parameters for the query, optional.

Returns A dictionary from the return values of the query

Return type list[dict]

CLI Example:
salt.modules.cassandra_cql.create_keyspace(keyspace, replication_strategy='SimpleStrategy', replication_factor=1, replication_datacenters=None, contact_points=None, port=None, cql_user=None, cql_pass=None)

Create a new keyspace in Cassandra.

Parameters

- **keyspace** *(str)* – The keyspace name
- **replication_strategy** *(str)* – either *SimpleStrategy* or *NetworkTopologyStrategy*
- **replication_factor** *(int)* – number of replicas of data on multiple nodes. not used if using NetworkTopologyStrategy
- **replication_datacenters** *(str | dict[str, int])* – string or dict of datacenter names to replication factors, required if using NetworkTopologyStrategy (will be a dict if coming from state file).
- **contact_points** *(str | list[str])* – The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** *(str)* – The Cassandra user if authentication is turned on.
- **cql_pass** *(str)* – The Cassandra user password if authentication is turned on.
- **port** *(int)* – The Cassandra cluster port, defaults to None.

Returns The info for the keyspace or False if it does not exist.

Return type *dict*

CLI Example:

```
# CLI Example:
salt 'minion1' cassandra_cql.create_keyspace keyspace=newkeyspace
```

salt.modules.cassandra_cql.create_user(username, password, superuser=False, contact_points=None, port=None, cql_user=None, cql_pass=None)

Create a new cassandra user with credentials and superuser status.

Parameters

- **username** *(str)* – The name of the new user.
- **password** *(str)* – The password of the new user.
- **superuser** *(bool)* – Is the new user going to be a superuser? default: False

- **contact_points** *(str | list[str]*) – The Cassandra cluster addresses, can either be a string or a list of IPs.

- **cql_user** *(str)* – The Cassandra user if authentication is turned on.

- **cql_pass** *(str)* – The Cassandra user password if authentication is turned on.

- **port** *(int)* – The Cassandra cluster port, defaults to None.

Returns

Return type

CLI Example:

```
salt 'minion1' cassandra_cql.create_user username=joe password=secret
salt 'minion1' cassandra_cql.create_user username=joe password=secret
   → superuser=True
salt 'minion1' cassandra_cql.create_user username=joe password=secret
   → superuser=True contact_points=minion1
```

salt.modules.cassandra_cql.drop_keyspace *(keyspace, contact_points=None, port=None, cql_user=None, cql_pass=None)*

Drop a keyspace if it exists in a Cassandra cluster.

Parameters

- **keyspace** *(str)* – The keyspace to drop.

- **contact_points** *(str | list[str]*) – The Cassandra cluster addresses, can either be a string or a list of IPs.

- **cql_user** *(str)* – The Cassandra user if authentication is turned on.

- **cql_pass** *(str)* – The Cassandra user password if authentication is turned on.

- **port** *(int)* – The Cassandra cluster port, defaults to None.

Returns

The info for the keyspace or False if it does not exist.

Return type

dict

CLI Example:

```
salt 'minion1' cassandra_cql.drop_keyspace keyspace=test
salt 'minion1' cassandra_cql.drop_keyspace keyspace=test contact_points=minion1
```

salt.modules.cassandra_cql.grant_permission *(username, resource=None, resource_type='keyspace', permission=None, contact_points=None, port=None, cql_user=None, cql_pass=None)*

Grant permissions to a user.

Parameters

- **username** *(str)* – The name of the user to grant permissions to.

- **resource** *(str)* – The resource (keyspace or table), if None, permissions for all resources are granted.
• **resource_type** *(str)* – The resource_type (keyspace or table), defaults to 'keyspace'.

• **permission** *(str)* – A permission name (e.g. select), if None, all permissions are granted.

• **contact_points** *(str | list[str]*) – The Cassandra cluster addresses, can either be a string or a list of IPs.

• **cql_user** *(str)* – The Cassandra user if authentication is turned on.

• **cql_pass** *(str)* – The Cassandra user password if authentication is turned on.

• **port** *(int)* – The Cassandra cluster port, defaults to None.

Returns

Return type

CLI Example:

```python
salt 'minion1' cassandra_cql.grant_permission
salt 'minion1' cassandra_cql.grant_permission username=joe resource=test_keyspace permission=select
salt 'minion1' cassandra_cql.grant_permission username=joe resource=test_table resource_type=table permission=select contact_points=minion1
```

salt.modules.cassandra_cql.info(contact_points=None, port=None, cql_user=None, cql_pass=None)

Show the Cassandra information for this cluster.

Parameters

• **contact_points** *(str | list[str]*) – The Cassandra cluster addresses, can either be a string or a list of IPs.

• **cql_user** *(str)* – The Cassandra user if authentication is turned on.

• **cql_pass** *(str)* – The Cassandra user password if authentication is turned on.

• **port** *(int)* – The Cassandra cluster port, defaults to None.

Returns The information for this Cassandra cluster.

Return type `dict`

CLI Example:

```python
salt 'minion1' cassandra_cql.info
salt 'minion1' cassandra_cql.info contact_points=minion1
```

salt.modules.cassandra_cql.keyspace_exists(keyspace, contact_points=None, port=None, cql_user=None, cql_pass=None)

Check if a keyspace exists in a Cassandra cluster.

:paramref keyspace The keyspace name to check for. :type keyspace: str :paramref contact_points: The Cassandra cluster addresses, can either be a string or a list of IPs. :type contact_points: str | list[str] :paramref cql_user: The Cassandra user if authentication is turned on. :type cql_user: str :paramref cql_pass: The Cassandra user password if authentication is turned on. :type cql_pass: str :paramref port: The Cassandra cluster port, defaults to None. :type port: int :return: The info for the keyspace or False if it does not exist. :rtype: dict

CLI Example:
```python
salt 'minion1' cassandra_cql.keystore_exists keyspace=system
```

```python
salt.modules.cassandra_cql.list_column_families(keyspace=None, contact_points=None, port=None, cql_user=None, cql_pass=None)
```

List column families in a Cassandra cluster for all keyspaces or just the provided one.

**Parameters**

- **keyspace** *(str)* – The keyspace to provide the column families for, optional.
- **contact_points** *(str | list[str])* – The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** *(str)* – The Cassandra user if authentication is turned on.
- **cql_pass** *(str)* – The Cassandra user password if authentication is turned on.
- **port** *(int)* – The Cassandra cluster port, defaults to None.

**Returns**
The column families in this Cassandra cluster.

**Return type**
`list[dict]`

**CLI Example:**
```
salt 'minion1' cassandra_cql.list_column_families
salt 'minion1' cassandra_cql.list_column_families contact_points=minion1
salt 'minion1' cassandra_cql.list_column_families keyspace=system
```

```python
salt.modules.cassandra_cql.list_keyspaces(contact_points=None, port=None, cql_user=None, cql_pass=None)
```

List keyspaces in a Cassandra cluster.

**Parameters**

- **contact_points** *(str | list[str])* – The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** *(str)* – The Cassandra user if authentication is turned on.
- **cql_pass** *(str)* – The Cassandra user password if authentication is turned on.
- **port** *(int)* – The Cassandra cluster port, defaults to None.

**Returns**
The keyspaces in this Cassandra cluster.

**Return type**
`list[dict]`

**CLI Example:**
```
salt 'minion1' cassandra_cql.list_keyspaces
salt 'minion1' cassandra_cql.list_keyspaces contact_points=minion1
salt 'minion1' cassandra_cql.list_keyspaces port=9000
```

```python
salt.modules.cassandra_cql.list_permissions(username=None, resource=None, resource_type='keyspace', permission=None, contact_points=None, port=None, cql_user=None, cql_pass=None)
```

List permissions.

**Parameters**
• **username** *(str)* – The name of the user to list permissions for.
• **resource** *(str)* – The resource (keyspace or table), if None, permissions for all resources are listed.
• **resource_type** *(str)* – The resource_type (keyspace or table), defaults to 'keyspace'.
• **permission** *(str)* – A permission name (e.g. select), if None, all permissions are listed.
• **contact_points** *(str | list[str]*) – The Cassandra cluster addresses, can either be a string or a list of IPs.
• **cql_user** *(str)* – The Cassandra user if authentication is turned on.
• **cql_pass** *(str)* – The Cassandra user password if authentication is turned on.
• **port** *(int)* – The Cassandra cluster port, defaults to None.

Returns Dictionary of permissions.

Return type **dict**

CLI Example:

```python
salt 'minion1' cassandra_cql.list_permissions
salt 'minion1' cassandra_cql.list_permissions username=joe resource=test_keyspace permission=select
salt 'minion1' cassandra_cql.list_permissions username=joe resource=test_table resource_type=table permission=select contact_points=minion1
```

**salt.modules.cassandra_cql.list_users** *(contact_points=None, port=None, cql_user=None, cql_pass=None)*

List existing users in this Cassandra cluster.

Parameters

• **contact_points** *(str | list[str]*) – The Cassandra cluster addresses, can either be a string or a list of IPs.
• **port** *(int)* – The Cassandra cluster port, defaults to None.
• **cql_user** *(str)* – The Cassandra user if authentication is turned on.
• **cql_pass** *(str)* – The Cassandra user password if authentication is turned on.

Returns The list of existing users.

Return type **dict**

CLI Example:

```python
salt 'minion1' cassandra_cql.list_users
salt 'minion1' cassandra_cql.list_users contact_points=minion1
```

**salt.modules.cassandra_cql.version** *(contact_points=None, port=None, cql_user=None, cql_pass=None)*

Show the Cassandra version.

Parameters

• **contact_points** *(str | list[str]*) – The Cassandra cluster addresses, can either be a string or a list of IPs.
• **cql_user** (*str*) – The Cassandra user if authentication is turned on.

• **cql_pass** (*str*) – The Cassandra user password if authentication is turned on.

• **port** (*int*) – The Cassandra cluster port, defaults to None.

Returns The version for this Cassandra cluster.

Return type *str*

CLI Example:

```
salt 'minion1' cassandra_cql.version
salt 'minion1' cassandra_cql.version contact_points=minion1
```

### 21.9.72 salt.modules.celery module

Support for scheduling celery tasks. The worker is independent of salt and thus can run in a different virtualenv or on a different python version, as long as broker, backend and serializer configurations match. Also note that celery and packages required by the celery broker, e.g. redis must be installed to load the salt celery execution module.

Note: A new app (and thus new connections) is created for each task execution

salt.modules.celery.run_task(**task_name**, **args=None**, **kwargs=None**, **broker=None**, **backend=None**, **wait_for_result=False**, **timeout=None**, **propagate=True**, **interval=0.5**, **no_ack=True**, **raise_timeout=True**, **config=None**)  
Execute celery tasks. For celery specific parameters see celery documentation.

CLI Example:

```
salt '*' celery.run_task tasks.sleep args=[4] broker=redis://localhost \  backend=redis://localhost wait_for_result=true
```

- **task_name** The task name, e.g. tasks.sleep
- **args** Task arguments as a list
- **kwargs** Task keyword arguments
- **broker** Broker for celeryapp, see celery documentation
- **backend** Result backend for celeryapp, see celery documentation
- **wait_for_result** Wait until task result is read from result backend and return result, Default: False
- **timeout** Timeout waiting for result from celery, see celery AsyncResult.get documentation
- **propagate** Propagate exceptions from celery task, see celery AsyncResult.get documentation, Default: True
- **interval** Interval to check for task result, see celery AsyncResult.get documentation, Default: 0.5
- **no_ack** see celery AsyncResult.get documentation. Default: True
- **raise_timeout** Raise timeout exception if waiting for task result times out. Default: False
- **config** Config dict for celery app, See celery documentation
21.9.73 salt.modules.ceph module

Module to provide ceph control with salt.

**depends**

- ceph_cfg Python module

New in version 2016.11.0.

salt.modules.ceph.ceph_version()

Get the version of ceph installed

CLI Example:

```
salt '*' ceph.ceph_version
```

salt.modules.ceph.cluster_quorum(**kwargs)

Get the cluster's quorum status

CLI Example:

```
salt '*' ceph.cluster_quorum
   'cluster_name'=ceph
   'cluster_uuid'=cluster_uuid
```

- **cluster_uuid** The cluster UUID. Defaults to value found in ceph config file.
- **cluster_name** The cluster name. Defaults to ceph.

salt.modules.ceph.cluster_status(**kwargs)

Get the cluster status, including health if in quorum

CLI Example:

```
salt '*' ceph.cluster_status
   'cluster_name'=ceph
   'cluster_uuid'=cluster_uuid
```

- **cluster_uuid** The cluster UUID. Defaults to value found in ceph config file.
- **cluster_name** The cluster name. Defaults to ceph.

salt.modules.ceph.keyring_auth_add(**kwargs)

Add keyring to authorized list

CLI Example:

```
salt '*' ceph.keyring_auth_add
   'keyring_type'=admin
   'cluster_name'=ceph
   'cluster_uuid'=cluster_uuid
```

- **keyring_type** (required) One of admin, mon, osd, rgw, mds
- **cluster_uuid** The cluster UUID. Defaults to value found in ceph config file.
- **cluster_name** The cluster name. Defaults to ceph.
salt.modules.ceph.keyring_auth_del(**kwargs)
Remove keyring from authorised list

CLI Example:
```bash
salt '*' ceph.keyring_osd_auth_del
  'keyring_type'='admin'
  'cluster_name'='ceph'
  'cluster_uuid'='cluster_uuid'
```

keyring_type (required) One of admin, mon, osd, rgw, mds
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.

salt.modules.ceph.keyring_auth_list(**kwargs)
List all cephx authorization keys

CLI Example:
```bash
salt '*' ceph.keyring_auth_list
  'cluster_name'='ceph'
  'cluster_uuid'='cluster_uuid'
```

cluster_name The cluster name. Defaults to ceph.
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

salt.modules.ceph.keyring_create(**kwargs)
Create keyring for cluster

CLI Example:
```bash
salt '*' ceph.keyring_create
  'keyring_type'='admin'
  'cluster_name'='ceph'
  'cluster_uuid'='cluster_uuid'
```

keyring_type (required) One of admin, mon, osd, rgw, mds
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.

salt.modules.ceph.keyring_present(**kwargs)
Returns True if the keyring is present on disk, otherwise False

CLI Example:
```bash
salt '*' ceph.keyring_present
  'keyring_type'='admin'
  'cluster_name'='ceph'
  'cluster_uuid'='cluster_uuid'
```

keyring_type (required) One of admin, mon, osd, rgw, mds
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.

salt.modules.ceph.keyring_purge(**kwargs)
Delete keyring for cluster

CLI Example:

```
salt '*' ceph.keyring_purge \
  'keyring_type'='admin' \
  'cluster_name'='ceph' \
  'cluster_uuid'='cluster_uuid'
```

keyring_type (required) One of admin, mon, osd, rgw, mds
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.

If no ceph config file is found, this command will fail.

salt.modules.ceph.keyring_save(**kwargs)
Create save keyring locally

CLI Example:

```
salt '*' ceph.keyring_save \
  'keyring_type'='admin' \
  'cluster_name'='ceph' \
  'cluster_uuid'='cluster_uuid'
```

keyring_type (required) One of admin, mon, osd, rgw, mds
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.

salt.modules.ceph.mds_create(**kwargs)
Create a mds

CLI Example:

```
salt '*' ceph.mds_create \
  'name' = 'mds.name' \
  'port' = 1000, \
  'addr' = 'fqdn.example.org' \
  'cluster_name'='ceph' \
  'cluster_uuid'='cluster_uuid'
```

name (required) The MDS name (must start with mds.)
port (required) Port to which the MDS will listen
addr (required) Address or IP address for the MDS to listen
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.
salt.modules.ceph.mds_destroy(**kwargs)
Remove a mds

CLI Example:

```python
salt '*' ceph.mds_destroy
    'name' = 'mds.name' \n    'cluster_name'='ceph' \n    'cluster_uuid'='cluster_uuid'
```

name (required) The MDS name (must start with mds.)
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.

salt.modules.ceph.mon_active(**kwargs)
Returns True if the mon daemon is running, otherwise False

CLI Example:

```python
salt '*' ceph.mon_active
    'cluster_name'='ceph' \n    'cluster_uuid'='cluster_uuid'
```

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.

salt.modules.ceph.mon_create(**kwargs)
Create a mon node

CLI Example:

```python
salt '*' ceph.mon_create
    'cluster_name'='ceph' \n    'cluster_uuid'='cluster_uuid'
```

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.

salt.modules.ceph.mon_is(**kwargs)
Returns True if the target is a mon node, otherwise False

CLI Example:

```python
salt '*' ceph.mon_is
    'cluster_name'='ceph' \n    'cluster_uuid'='cluster_uuid'
```

cluster_name The cluster name. Defaults to ceph.
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

salt.modules.ceph.mon_quorum(**kwargs)
Returns True if the mon daemon is in the quorum, otherwise False

CLI Example:
salt '*' ceph.mon_quorum \
  'cluster_name'='ceph' \
  'cluster_uuid'='cluster_uuid'

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.

**salt.modules.ceph.mon_status**(**kwargs**)
Get status from mon daemon

CLI Example:

```
salt '*' ceph.mon_status \
  'cluster_name'='ceph' \
  'cluster_uuid'='cluster_uuid'
```

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.

**salt.modules.ceph.osd_activate**(**kwargs**)
Activate an OSD

CLI Example:

```
salt '*' ceph.osd_activate 'osd_dev'='/dev/vdc'
```

**salt.modules.ceph.osd_discover()**
List all OSD by cluster

CLI Example:

```
salt '*' ceph.osd_discover
```

**salt.modules.ceph.osd_prepare**(**kwargs**)
Prepare an OSD

CLI Example:

```
salt '*' ceph.osd_prepare 'osd_dev'='/dev/vdc' \
  'journal_dev'='device' \
  'cluster_name'='ceph' \
  'cluster_uuid'='cluster_uuid' \
  'osd_fs_type'='xfs' \
  'osd_uuid'='2a143b73-6d85-4389-a9e9-b8a78d9e1e07' \
  'journal_uuid'='4562a5db-ff6f-4268-811d-12fd4a09ae98'
```

cluster_uuid The device to store the osd data on.
journal_dev The journal device. defaults to osd_dev.
cluster_name The cluster name. Defaults to ceph.
cluster_uuid The cluster date will be added too. Defaults to the value found in local config.
osd_fs_type set the file system to store OSD data with. Defaults to "xfs".
osd_uuid set the OSD data UUID. If set will return if OSD with data UUID already exists.
Salt Documentation, Release 3000.2

Journal UUID

set the OSD journal UUID. If set will return if OSD with journal UUID already exists.

```
salt.modules.ceph.partition_is(dev)
```
Check whether a given device path is a partition or a full disk.

CLI Example:

```
salt '*' ceph.partition_is /dev/sdc1
```

```
salt.modules.ceph.partition_is()  
```
List partitions by disk

CLI Example:

```
salt '*' ceph.partition_list
```

```
salt.modules.ceph.partition_list_journal()  
```
List all OSD journal partitions by partition

CLI Example:

```
salt '*' ceph.partition_list_journal
```

```
salt.modules.ceph.partition_list_osd()  
```
List all OSD data partitions by partition

CLI Example:

```
salt '*' ceph.partition_list_osd
```

```
salt.modules.ceph.pool_add(pool_name, **kwargs)
```
Create a pool

CLI Example:

```
salt '*' ceph.pool_add pool_name \  
  'cluster_name'='ceph' \  
  'cluster_uuid'='cluster_uuid'
```

**cluster_name** The cluster name. Defaults to *ceph*.

**cluster_uuid** The cluster UUID. Defaults to value found in ceph config file.

**pg_num** Default to 8

**pgp_num** Default to pg_num

**pool_type** can take values "replicated" or "erasure"

**erasure_code_profile** The "erasure_code_profile"

**crush_ruleset** The crush map rule set

```
salt.modules.ceph.pool_del(pool_name, **kwargs)
```
Delete a pool

CLI Example:

```
salt '*' ceph.pool_del pool_name \  
  'cluster_name'='ceph' \  
  'cluster_uuid'='cluster_uuid'
```
cluster_name  The cluster name. Defaults to ceph.
cluster_uuid  The cluster UUID. Defaults to value found in ceph config file.

salt.modules.ceph.pool_list(**kwargs)
List all pools

CLI Example:

```
salt '*' ceph.pool_list \\
    'cluster_name'='ceph' \\
    'cluster_uuid'='cluster_uuid'
```

cluster_name  The cluster name. Defaults to ceph.
cluster_uuid  The cluster UUID. Defaults to value found in ceph config file.

salt.modules.ceph.purge(**kwargs)
purge ceph configuration on the node

CLI Example:

```
salt '*' ceph.purge \\
    'cluster_name'='ceph' \\
    'cluster_uuid'='cluster_uuid'
```

cluster_name  The cluster name. Defaults to ceph.
cluster_uuid  The cluster UUID. Defaults to value found in ceph config file.

salt.modules.ceph.rgw_create(**kwargs)
Create a rgw

CLI Example:

```
salt '*' ceph.rgw_create \\
    'name' = 'rgw.name' \\
    'cluster_name'='ceph' \\
    'cluster_uuid'='cluster_uuid'
```

name (required)  The RGW client name. Must start with rgw.
cluster_uuid  The cluster UUID. Defaults to value found in ceph config file.
cluster_name  The cluster name. Defaults to ceph.

salt.modules.ceph.rgw_destroy(**kwargs)
Remove a rgw

CLI Example:

```
salt '*' ceph.rgw_destroy \\
    'name' = 'rgw.name' \\
    'cluster_name'='ceph' \\
    'cluster_uuid'='cluster_uuid'
```

name (required)  The RGW client name (must start with rgw.)
cluster_uuid  The cluster UUID. Defaults to value found in ceph config file.
cluster_name  The cluster name. Defaults to ceph.

salt.modules.ceph.rgw_pools_create(**kwargs)
Create pools for rgw

CLI Example:

```shell
salt '*' ceph.rgw_pools_create
```

cluster_uuid  The cluster UUID. Defaults to value found in ceph config file.

cluster_name  The cluster name. Defaults to ceph.

salt.modules.ceph.rgw_pools_missing(**kwargs)
Show pools missing for rgw

CLI Example:

```shell
salt '*' ceph.rgw_pools_missing
```

cluster_uuid  The cluster UUID. Defaults to value found in ceph config file.

cluster_name  The cluster name. Defaults to ceph.

salt.modules.ceph.zap(target=None, **kwargs)
Destroy the partition table and content of a given disk.

```shell
salt '*' ceph.osd_prepare 'dev=/dev/vdc' \
   'cluster_name'='ceph' \
   'cluster_uuid'='cluster_uuid'
```

dev  The block device to format.

cluster_name  The cluster name. Defaults to ceph.

cluster_uuid  The cluster UUID. Defaults to value found in ceph config file.

21.9.74 salt.modules.chassis

Glue execution module to link to the fx2 proxymodule.

Depends: iDRAC Remote execution module (salt.modules.dracr)

For documentation on commands that you can direct to a Dell chassis via proxy, look in the documentation for salt.modules.dracr.

This execution module calls through to a function in the fx2 proxy module called chconfig. That function looks up the function passed in the cmd parameter in salt.modules.dracr and calls it.

New in version 2015.8.2.

salt.modules.chassis.chassis_credentials()
salt.modules.chassis.cmd(cmd, *args, **kwargs)
21.9.75 salt.modules.chef

Execute chef in server or solo mode

salt.modules.chef.client(whyrun=False, localmode=False, logfile=None, **kwargs)
Execute a chef client run and return a dict with the stderr, stdout, return code, and pid.

CLI Example:

```
salt '*' chef.client server=https://localhost
```

server  The chef server URL
client_key  Set the client key file location
config  The configuration file to use
config-file-jail Directory under which config files are allowed to be loaded (no client.rb or knife.rb outside this path will be loaded).
environment  Set the Chef Environment on the node
group  Group to set privilege to
json-attributes  Load attributes from a JSON file or URL
localmode  Point chef-client at local repository if True
log_level  Set the log level (debug, info, warn, error, fatal)
logfile  Set the log file location
node-name  The node name for this client
override-runlist  Replace current run list with specified items for a single run
pid  Set the PID file location, defaults to /tmp/chef-client.pid
run-lock-timeout  Set maximum duration to wait for another client run to finish, default is indefinitely.
runlist  Permanently replace current run list with specified items
user  User to set privilege to
validation_key  Set the validation key file location, used for registering new clients
whyrun  Enable whyrun mode when set to True

salt.modules.chef.solo(whyrun=False, logfile=None, **kwargs)
Execute a chef solo run and return a dict with the stderr, stdout, return code, and pid.

CLI Example:

```
salt '*' chef.solo override-runlist=test
```

config  The configuration file to use
environment  Set the Chef Environment on the node
group  Group to set privilege to
json-attributes  Load attributes from a JSON file or URL
log_level  Set the log level (debug, info, warn, error, fatal)
logfile  Set the log file location
node-name The node name for this client
override-runlist Replace current run list with specified items for a single run
recipe-url Pull down a remote gzipped tarball of recipes and untar it to the cookbook cache
run-lock-timeout Set maximum duration to wait for another client run to finish, default is indefinitely.
user User to set privilege to
whyrun Enable whyrun mode when set to True

21.9.76 salt.modules.chocolatey

A dead simple module wrapping calls to the Chocolatey package manager (http://chocolatey.org)
New in version 2014.1.0.
salt.modules.chocolatey.add_source(name, source_location, username=None, password=None)
Instructs Chocolatey to add a source.
name The name of the source to be added as a chocolatey repository.
source Location of the source you want to work with.
username Provide username for chocolatey sources that need authentication credentials.
password Provide password for chocolatey sources that need authentication credentials.

CLI Example:
salt '*' chocolatey.add_source <source name> <source_location>
salt '*' chocolatey.add_source <source name> <source_location> user=<user> password=<password>
salt.modules.chocolatey.bootstrap(force=False)
Download and install the latest version of the Chocolatey package manager via the official bootstrap.
Chocolatey requires Windows PowerShell and the .NET v4.0 runtime. Depending on the host’s version of Windows, chocolatey.bootstrap will attempt to ensure these prerequisites are met by downloading and executing the appropriate installers from Microsoft.
Note that if PowerShell is installed, you may have to restart the host machine for Chocolatey to work.
force Run the bootstrap process even if Chocolatey is found in the path.

CLI Example:
salt '*' chocolatey.bootstrap
salt '*' chocolatey.bootstrap force=True
salt.modules.chocolatey.chocolatey_version()
Returns the version of Chocolatey installed on the minion.

CLI Example:
salt '*' chocolatey.chocolatey_version
salt.modules.chocolatey.disable_source(name)
Instructs Chocolatey to disable a source.
name Name of the source repository to disable.

CLI Example:
salt '∀' chocolatey.disable_source <name>

salt.modules.chocolatey.enable_source(name)
Instructs Chocolatey to enable a source.

name Name of the source repository to enable.

CLI Example:
salt '∀' chocolatey.enable_source <name>

salt.modules.chocolatey.install(name, version=None, source=None, force=False, pre_versions=False, install_args=None, override_args=False, force_x86=False, package_args=None, allow_multiple=False, execution_timeout=None)

Instructs Chocolatey to install a package.

Parameters

• name (str) – The name of the package to be installed. Only accepts a single argument. Required.
• version (str) – Install a specific version of the package. Defaults to latest version. Default is None.
• source (str) – Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed. Default is None.

Alternate Sources:
– cygwin
– python
– ruby
– webpi
– windowsfeatures
• force (bool) – Reinstall the current version of an existing package. Do not use with allow_multiple. Default is False.
• pre_versions (bool) – Include pre-release packages. Default is False.
• install_args (str) – A list of install arguments you want to pass to the installation process i.e product key or feature list. Default is None.
• override_args (bool) – Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False, install_args will be appended to the end of the default arguments. Default is None.
• force_x86 (bool) – Force x86 (32bit) installation on 64 bit systems. Default is False.
• package_args (str) – Arguments you want to pass to the package. Default is None.
• allow_multiple (bool) – Allow multiple versions of the package to be installed. Do not use with force. Does not work with all packages. Default is False.

New in version 2017.7.0.
• execution_timeout (str) –
• execution timeout value you want to pass to the installation process. Default is None. (Chocolatey) – New in version 2018.3.0.
Returns The output of the chocolatey command

Return type str

CLI Example:

```bash
salt '*' chocolatey.install <package name>
salt '*' chocolatey.install <package name> version=<package version>
salt '*' chocolatey.install <package name> install_args=<args> override_args=True
```

salt.modules.chocolatey.install_cygwin(name, install_args=None, override_args=False)
Instructs Chocolatey to install a package via Cygwin.

**name** The name of the package to be installed. Only accepts a single argument.

**install_args** A list of install arguments you want to pass to the installation process i.e product key or feature list

**override_args** Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments

CLI Example:

```bash
salt '*' chocolatey.install_cygwin <package name>
salt '*' chocolatey.install_cygwin <package name> install_args=<args> override_args=True
```

salt.modules.chocolatey.install_gem(name, version=None, install_args=None, override_args=False)
Instructs Chocolatey to install a package via Ruby’s Gems.

**name** The name of the package to be installed. Only accepts a single argument.

**version** Install a specific version of the package. Defaults to latest version available.

**install_args** A list of install arguments you want to pass to the installation process i.e product key or feature list

**override_args** Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments

CLI Example:

```bash
salt '*' chocolatey.install_gem <package name>
salt '*' chocolatey.install_gem <package name> version=<package version>
salt '*' chocolatey.install_gem <package name> install_args=<args> override_args=True
```

salt.modules.chocolatey.install_missing(name, version=None, source=None)
Instructs Chocolatey to install a package if it doesn’t already exist.

Changed in version 2014.7.0: If the minion has Chocolatey >= 0.9.8.24 installed, this function calls chocolatey.install instead, as installmissing is deprecated as of that version and will be removed in Chocolatey 1.0.

**name** The name of the package to be installed. Only accepts a single argument.

**version** Install a specific version of the package. Defaults to latest version available.

**source** Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed.
**CLI Example:**

```
salt '*' chocolatey.install_missing <package name>
salt '*' chocolatey.install_missing <package name> version=<package version>
```

```python
salt.modules.chocolatey.install_python(name, version=None, install_args=None, override_args=False)
```

Instructions Choclatey to install a package via Python's easy_install.

- **name** The name of the package to be installed. Only accepts a single argument.
- **version** Install a specific version of the package. Defaults to latest version available.
- **install_args** A list of install arguments you want to pass to the installation process i.e product key or feature list
- **override_args** Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments

**CLI Example:**

```
salt '*' chocolatey.install_python <package name>
salt '*' chocolatey.install_python <package name> version=<package version>
salt '*' chocolatey.install_python <package name> install_args=<args> override_args=True
```

```python
salt.modules.chocolatey.install_webpi(name, install_args=None, override_args=False)
```

Instructions Choclatey to install a package via the Microsoft Web PI service.

- **name** The name of the package to be installed. Only accepts a single argument.
- **install_args** A list of install arguments you want to pass to the installation process i.e product key or feature list
- **override_args** Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments

**CLI Example:**

```
salt '*' chocolatey.install_webpi <package name>
salt '*' chocolatey.install_webpi <package name> install_args=<args> override_args=True
```

```python
salt.modules.chocolatey.install_windowsfeatures(name)
```

Instructions Choclatey to install a Windows Feature via the Deployment Image Servicing and Management tool.

- **name** The name of the feature to be installed. Only accepts a single argument.

**CLI Example:**

```
salt '*' chocolatey.install_windowsfeatures <package name>
```

```python
salt.modules.chocolatey.list_(narrow=None, all_versions=False, pre_versions=False, source=None, local_only=False, exact=False)
```

Instructions Choclatey to pull a vague package list from the repository.

**Parameters**

- **narrow (str)** - Term used to narrow down results. Searches against name/description/tag. Default is None.
- **all_versions** (*bool*) – Display all available package versions in results. Default is False.
- **pre_versions** (*bool*) – Display pre-release packages in results. Default is False.
- **source** (*str*) – Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed if None is passed. Default is None.
- **local_only** (*bool*) – Display packages only installed locally. Default is False.
- **exact** (*bool*) – Display only packages that match narrow exactly. Default is False.

New in version 2017.7.0.

Returns A dictionary of results.

Return type **dict**

CLI Example:

```
salt '*' chocolatey.list <narrow>
salt '*' chocolatey.list <narrow> all_versions=True
```

salt.modules.chocolatey.list_webpi()
Instructs Chocolatey to pull a full package list from the Microsoft Web PI repository.

Returns List of webpi packages

Return type **str**

CLI Example:

```
salt '*' chocolatey.list_webpi
```

salt.modules.chocolatey.list_windowsfeatures()
Instructs Chocolatey to pull a full package list from the Windows Features list, via the Deployment Image Servicing and Management tool.

Returns List of Windows Features

Return type **str**

CLI Example:

```
salt '*' chocolatey.list_windowsfeatures
```

salt.modules.chocolatey.uninstall(*name*, version=None, uninstall_args=None, override_args=False)
Instructs Chocolatey to uninstall a package.

**name** The name of the package to be uninstalled. Only accepts a single argument.

**version** Uninstalls a specific version of the package. Defaults to latest version installed.

**uninstall_args** A list of uninstall arguments you want to pass to the uninstallation process i.e product key or feature list

**override_args** Set to true if you want to override the original uninstall arguments (for the native uninstaller) in the package and use your own. When this is set to False uninstall_args will be appended to the end of the default arguments

CLI Example:
salt.modules.chocolatey.update(name, source=None, pre_versions=False)

Instructs Chocolatey to update packages on the system.

**name**  The name of the package to update, or "all" to update everything installed on the system.

**source**  Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed.

**pre_versions**  Include pre-release packages in comparison. Defaults to False.

CLI Example:

```
salt '*' chocolatey.update all
salt '*' chocolatey.update <package name> pre_versions=True
```

salt.modules.chocolatey.upgrade(name, version=None, source=None, force=False, pre_versions=False, install_args=None, override_args=False, force_x86=False, package_args=None)

New in version 2016.3.4.

Instructs Chocolatey to upgrade packages on the system. (update is being deprecated). This command will install the package if not installed.

**Parameters**

- **name** *(str)*  - The name of the package to update, or "all" to update everything installed on the system.
- **version** *(str)*  - Install a specific version of the package. Defaults to latest version.
- **source** *(str)*  - Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed.
- **force** *(bool)*  - Reinstall the same version already installed
- **pre_versions** *(bool)*  - Include pre-release packages in comparison. Defaults to False.
- **install_args** *(str)*  - A list of install arguments you want to pass to the installation process i.e product key or feature list
- **override_args** *(str)*  - Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments
- **force_x86**  - Force x86 (32bit) installation on 64 bit systems. Defaults to false.
- **package_args**  - A list of arguments you want to pass to the package

**Returns**  Results of the chocolatey command

**Return type**  *str*

CLI Example:

```
salt '*' chocolatey.upgrade all
salt '*' chocolatey.upgrade <package name> pre_versions=True
```
salt.modules.chocolatey.version(name, check_remote=False, source=None, pre_versions=False)

Instructs Chocolatey to check an installed package version, and optionally compare it to one available from a remote feed.

Parameters

- **name** (str) – The name of the package to check. Required.
- **check_remote** (bool) – Get the version number of the latest package from the remote feed. Default is False.
- **source** (str) – Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed. Default is None.
- **pre_versions** (bool) – Include pre-release packages in comparison. Default is False.

Returns

A dictionary of currently installed software and versions

Return type: dict

CLI Example:

```
salt '*' chocolatey.version <package name>
salt '*' chocolatey.version <package name> check_remote=True
```

### 21.9.77 salt.modules.chronos module

Module providing a simple management interface to a chronos cluster.

Currently this only works when run through a proxy minion.

New in version 2015.8.2.

salt.modules.chronos.has_job(name)

Return whether the given job is currently configured.

CLI Example:

```
salt chronos-minion-id chronos.has_job my-job
```

salt.modules.chronos.job(name)

Return the current server configuration for the specified job.

CLI Example:

```
salt chronos-minion-id chronos.job my-job
```

salt.modules.chronos.jobs()

Return a list of the currently installed job names.

CLI Example:

```
salt chronos-minion-id chronos.jobs
```

salt.modules.chronos.rm_job(name)

Remove the specified job from the server.

CLI Example:

```
salt chronos-minion-id chronos.rm_job my-job
```
salt.modules.chronos.update_job(name, config)
Update the specified job with the given configuration.

CLI Example:

```
salt chronos-minion-id chronos.update_job my-job '<config yaml>'
```

21.9.78 salt.modules.cimc module

Module to provide Cisco UCS compatibility to Salt

- **codeauthor** Spencer Ervin <spencer_ervin@hotmail.com>
- **maturity** new
- **depends** none
- **platform** unix

Configuration

This module accepts connection configuration details either as parameters, or as configuration settings in pillar as a Salt proxy. Options passed into opts will be ignored if options are passed into pillar.

See also:

*Cisco UCS Proxy Module*

About

This execution module was designed to handle connections to a Cisco UCS server. This module adds support to send connections directly to the device through the rest API.

salt.modules.cimc.activate_backup_image(reset=False)
Activates the firmware backup image.

CLI Example:

```
salt '*' cimc.activate_backup_image
salt '*' cimc.activate_backup_image reset=True
```

salt.modules.cimc.create_user(uid=None, username=None, password=None, priv=None)
Create a CIMC user with username and password.

Parameters

- **uid** (int) – The user ID slot to create the user account in.
- **username** (str) – The name of the user.
- **password** (str) – The clear text password of the user.
- **priv** (str) – The privilege level of the user.

CLI Example:

```
salt '*' cimc.create_user 11 username=admin password=foobar priv=admin
```
salt.modules.cimc.get_bios_defaults()
Get the default values of BIOS tokens.

CLI Example:

```
salt '*' cimc.get_bios_defaults
```

salt.modules.cimc.get_bios_settings()
Get the C240 server BIOS token values.

CLI Example:

```
salt '*' cimc.get_bios_settings
```

salt.modules.cimc.get_boot_order()
Retrieves the configured boot order table.

CLI Example:

```
salt '*' cimc.get_boot_order
```

salt.modules.cimc.get_cpu_details()
Get the CPU product ID details.

CLI Example:

```
salt '*' cimc.get_cpu_details
```

salt.modules.cimc.get_disks()
Get the HDD product ID details.

CLI Example:

```
salt '*' cimc.get_disks
```

salt.modules.cimc.get_ethernet_interfaces()
Get the adapter Ethernet interface details.

CLI Example:

```
salt '*' cimc.get_ethernet_interfaces
```

salt.modules.cimc.get_fibre_channel_interfaces()
Get the adapter fibre channel interface details.

CLI Example:

```
salt '*' cimc.get_fibre_channel_interfaces
```

salt.modules.cimc.get_firmware()
Retrieves the current running firmware versions of server components.

CLI Example:

```
salt '*' cimc.get_firmware
```

salt.modules.cimc.get_hostname()
Retrieves the hostname from the device.

New in version 2019.2.0.

CLI Example:
salt '*' cimc.get_hostname

cimc.get_ldap()
Retrieves LDAP server details.

CLI Example:
salt '*' cimc.get_ldap

cimc.get_management_interface()
Retrieve the management interface details.

CLI Example:
salt '*' cimc.get_management_interface

cimc.get_memory_token()
Get the memory RAS BIOS token.

CLI Example:
salt '*' cimc.get_memory_token

cimc.get_memory_unit()
Get the IMM/Memory unit product ID details.

CLI Example:
salt '*' cimc.get_memory_unit

cimc.get_network_adapters()
Get the list of network adapters and configuration details.

CLI Example:
salt '*' cimc.get_network_adapters

cimc.get_ntp()
Retrieves the current running NTP configuration.

CLI Example:
salt '*' cimc.get_ntp

cimc.get_pci_adapters()
Get the PCI adapter product ID details.

CLI Example:
salt '*' cimc.get_pci_adapters

cimc.get_power_configuration()
Get the configuration of the power settings from the device. This is only available on some C-Series servers.

New in version 2019.2.0.

CLI Example:
salt '*' cimc.get_power_configuration
salt.modules.cimc.get_power_supplies()
Retrieves the power supply unit details.

CLI Example:
```
salt '*' cimc.get_power_supplies
```

salt.modules.cimc.get_snmp_config()
Get the snmp configuration details.

CLI Example:
```
salt '*' cimc.get_snmp_config
```

salt.modules.cimc.get_syslog()
Get the Syslog client-server details.

CLI Example:
```
salt '*' cimc.get_syslog
```

salt.modules.cimc.get_syslog_settings()
Get the Syslog configuration settings from the system.

New in version 2019.2.0.

CLI Example:
```
salt '*' cimc.get_syslog_settings
```

salt.modules.cimc.get_system_info()
Get the system information.

CLI Example:
```
salt '*' cimc.get_system_info
```

salt.modules.cimc.get_users()
Get the CIMC users.

CLI Example:
```
salt '*' cimc.get_users
```

salt.modules.cimc.get_vic_adapters()
Get the VIC adapter general profile details.

CLI Example:
```
salt '*' cimc.get_vic_adapters
```

salt.modules.cimc.get_vic_uplinks()
Get the VIC adapter uplink port details.

CLI Example:
```
salt '*' cimc.get_vic_uplinks
```
salt.modules.cimc.mount_share(name=None, remote_share=None, remote_file=None, mount_type='nfs', username=None, password=None)

Mounts a remote file through a remote share. Currently, this feature is supported in version 1.5 or greater. The remote share can be either NFS, CIFS, or WWW.

Some of the advantages of CIMC Mounted vMedia include: Communication between mounted media and target stays local (inside datacenter) Media mounts can be scripted/automated No vKVM requirements for media connection Multiple share types supported Connections supported through all CIMC interfaces

Note: CIMC Mounted vMedia is enabled through BIOS configuration.

Parameters

- **name** *(str)* – The name of the volume on the CIMC device.
- **remote_share** *(str)* – The file share link that will be used to mount the share. This can be NFS, CIFS, or WWW. This
- **be the directory path and not the full path to the remote file.** *(must)* –
- **remote_file** *(str)* – The name of the remote file to mount. It must reside within remote_share.
- **mount_type** *(str)* – The type of share to mount. Valid options are nfs, cifs, and www.
- **username** *(str)* – An optional requirement to pass credentials to the remote share. If not provided, an
- **connection attempt will be made.** *(unauthenticated)* –
- **password** *(str)* – An optional requirement to pass a password to the remote share. If not provided, an
- **connection attempt will be made.** –

CLI Example:

```bash
salt '*' cimc.mount_share name=WIN7 remote_share=10.xxx.27.xxx:/nfs remote_file=s11huu.iso
salt '*' cimc.mount_share name=WIN7 remote_share=10.xxx.27.xxx:/nfs remote_file=s11huu.iso username=bob password=badpassword
```

salt.modules.cimc.reboot()

Power cycling the server.

CLI Example:

```bash
salt '*' cimc.reboot
```

salt.modules.cimc.set_hostname(hostname=None)

Sets the hostname on the server.

New in version 2019.2.0.

Parameters **hostname** *(str)* – The new hostname to set.

CLI Example:

```bash
salt '*' cimc.set_hostname foobar
```
salt.modules.cimc.set_logging_levels(remote=None, local=None)

Sets the logging levels of the CIMC devices. The logging levels must match the following options: emergency, alert, critical, error, warning, notice, informational, debug.

New in version 2019.2.0.

Parameters

- **remote** *(str)* – The logging level for SYSLOG logs.
- **local** *(str)* – The logging level for the local device.

CLI Example:

```python
salt '*' cimc.set_logging_levels remote=error local=notice
```

salt.modules.cimc.set_ntp_server(server1=", server2=", server3=", server4=")

Sets the NTP servers configuration. This will also enable the client NTP service.

Parameters

- **server1** *(str)* – The first IP address or FQDN of the NTP servers.
- **server2** *(str)* – The second IP address or FQDN of the NTP servers.
- **server3** *(str)* – The third IP address or FQDN of the NTP servers.
- **server4** *(str)* – The fourth IP address or FQDN of the NTP servers.

CLI Example:

```python
salt '*' cimc.set_ntp_server 10.10.10.1
salt '*' cimc.set_ntp_server 10.10.10.1 foo.bar.com
```

salt.modules.cimc.set_power_configuration(policy=None, delayType=None, delayValue=None)

Sets the power configuration on the device. This is only available for some C-Series servers.

New in version 2019.2.0.

Parameters

- **policy** *(str)* – The action to be taken when chassis power is restored after
- **unexpected power loss. This can be one of the following** *(an)* –
  - reset: The server is allowed to boot up normally when power is restored. The server can restart immediately or, optionally, after a fixed or random delay.
  - stay-off: The server remains off until it is manually restarted.
  - last-state: The server restarts and the system attempts to restore any processes that were running before power was lost.
- **delayType** *(str)* – If the selected policy is reset, the restart can be
- **with this option. This can be one of the following** *(delayed)* –
  - fixed: The server restarts after a fixed delay.
  - random: The server restarts after a random delay.
- **delayValue** *(int)* – If a fixed delay is selected, once chassis power is
- **and the Cisco IMC has finished rebooting, the system waits** *(restored)* –
• specified number of seconds before restarting the server.
  Enter an (the) –
  • between 0 and 240. (integer) –

CLI Example:
```
salt '*' cimc.set_power_configuration stay-off
salt '*' cimc.set_power_configuration reset fixed 0
```

```text
salt.modules.cimc.set_syslog_server(server=None, type='primary')
```
Set the SYSLOG server on the host.

Parameters
- **server** (str) – The hostname or IP address of the SYSLOG server.
- **type** (str) – Specifies the type of SYSLOG server. This can either be primary (default) or secondary.

CLI Example:
```
salt '*' cimc.set_syslog_server foo.bar.com
salt '*' cimc.set_syslog_server foo.bar.com primary
salt '*' cimc.set_syslog_server foo.bar.com secondary
```

```text
salt.modules.cimc.set_user(uid=None, username=None, password=None, priv=None, status=None)
```
Sets a CIMC user with specified configurations.

New in version 2019.2.0.

Parameters
- **uid** (int) – The user ID slot to create the user account in.
- **username** (str) – The name of the user.
- **password** (str) – The clear text password of the user.
- **priv** (str) – The privilege level of the user.
- **status** (str) – The account status of the user.

CLI Example:
```
salt '*' cimc.set_user 11 username=admin password=foobar priv=admin active
```

```text
salt.modules.cimc.tftp_update_bios(server=None, path=None)
```
Update the BIOS firmware through TFTP.

Parameters
- **server** (str) – The IP address or hostname of the TFTP server.
- **path** (str) – The TFTP path and filename for the BIOS image.

CLI Example:
```
salt '*' cimc.tftp_update_bios foo.bar.com HP-SL2.cap
```

```text
salt.modules.cimc.tftp_update_cimc(server=None, path=None)
```
Update the CIMC firmware through TFTP.
Parameters

- **server** *(str)* – The IP address or hostname of the TFTP server.
- **path** *(str)* – The TFTP path and filename for the CIMC image.

CLI Example:

```
salt '*' cimc.tftp_update_cimc foo.bar.com HP-SL2.bin
```

### 21.9.79 salt.modules.ciscoconfparse_mod module

**Execution module for ciscoconfparse**

New in version 2019.2.0.

This module can be used for basic configuration parsing, audit or validation for a variety of network platforms having Cisco IOS style configuration (one space indentation), including: Cisco IOS, Cisco Nexus, Cisco IOS-XR, Cisco IOS-XR, Cisco ASA, Arista EOS, Brocade, HP Switches, Dell PowerConnect Switches, or Extreme Networks devices. In newer versions, ciscoconfparse provides support for brace-delimited configuration style as well, for platforms such as: Juniper Junos, Palo Alto, or F5 Networks.

See [http://www.pennington.net/py/ciscoconfparse/index.html](http://www.pennington.net/py/ciscoconfparse/index.html) for further details.

**depends** ciscoconfparse

This module depends on the Python library with the same name, ciscoconfparse - to install execute: `pip install ciscoconfparse`.

```python
salt.modules.ciscoconfparse_mod.filter_lines(config=None, config_path=None, parent_regex=None, child_regex=None, saltenv='base')
```

Return a list of detailed matches, for the configuration blocks (parent-child relationship) whose parent respects the regular expressions configured via the `parent_regex` argument, and the child matches the `child_regex` regular expression. The result is a list of dictionaries with the following keys:

- **match**: a boolean value that tells whether `child_regex` matched any children lines.
- **parent**: the parent line (as text).
- **child**: the child line (as text). If no child line matched, this field will be `None`.

Note that the return list contains the elements that matched the parent condition, the `parent_regex` regular expression. Therefore, the `parent` field will always have a valid value, while `match` and `child` may default to `False` and `None` respectively when there is not child match.

CLI Example:

```
salt '*' ciscoconfparse.filter_lines config_path=https://bit.ly/2mAdq7z parent_regex='Gigabit' child_regex='shutdown'
```

Example output (for the example above):

```
[
    {
        'parent': 'interface GigabitEthernet1',
        'match': False,
        'child': None
    },
]
```

(continues on next page)
salt.modules.ciscoconfparse_mod.find_lines(config=None, config_path=None, regex=None, saltenv='base')

Return all the lines (as text) that match the expression in the regex argument.

**config**  The configuration sent as text.

**Note:** This argument is ignored when config_path is specified.

**config_path**  The absolute or remote path to the file with the configuration to be parsed. This argument supports the usual Salt filesystem URLs, e.g., salt://, https://, ftp://, s3://, etc.

**regex**  The regular expression to match the lines against.

**saltenv:**  base  Salt fileserver environment from which to retrieve the file. This argument is ignored when config_path is not a salt:// URL.

**CLI Example:**

```
salt '*' ciscoconfparse.find_lines config_path=https://bit.ly/2mAdq7z regex='ip address'
```

**Output example:**

```
cisco-ios-router:
  - ip address dhcp
  - ip address 172.20.0.1 255.255.255.0
  - no ip address
```

salt.modules.ciscoconfparse_mod.find_lines_w_child(config=None, config_path=None, parent_regex=None, child_regex=None, ignore_ws=False, saltenv='base')

Return a list of parent lines (as text) matching the regular expression parent_regex that have children lines matching child_regex.

**config**  The configuration sent as text.

**Note:** This argument is ignored when config_path is specified.

**config_path**  The absolute or remote path to the file with the configuration to be parsed. This argument supports the usual Salt filesystem URLs, e.g., salt://, https://, ftp://, s3://, etc.

**parent_regex**  The regular expression to match the parent lines against.

**child_regex**  The regular expression to match the child lines against.
ignore_ws: **False**  Whether to ignore the white spaces.

**saltenv: base**  Salt fileserver environment from which to retrieve the file. This argument is ignored when **config_path** is not a salt:// URL.

CLI Example:

```
salt '*' ciscoconfparse.find_lines_w_child config_path=https://bit.ly/2mAdq7z
  → parent_line='line con' child_line='stopbits'
salt '*' ciscoconfparse.find_lines_w_child config_path=https://bit.ly/2uIRxau
  → parent_regex='ge-(.*)' child_regex='unit \d+'
```

salt.modules.ciscoconfparse_mod.find_lines_wo_child(**config=None, config_path=None, parent_regex=None, child_regex=None, ignore_ws=False, saltenv='base'**)

Return a list of parent ciscoconfparse.IOSCfgLine lines as text, which matched the parent_regex and whose children did not match child_regex. Only the parent ciscoconfparse.IOSCfgLine text lines will be returned. For simplicity, this method only finds oldest ancestors without immediate children that match.

**config**  The configuration sent as text.

---

**Note:**  This argument is ignored when **config_path** is specified.

**config_path**  The absolute or remote path to the file with the configuration to be parsed. This argument supports the usual Salt filesystem URIs, e.g., salt://, https://, ftp://, s3://, etc.

**parent_regex**  The regular expression to match the parent lines against.

**child_regex**  The regular expression to match the child lines against.

**ignore_ws:** **False**  Whether to ignore the white spaces.

**saltenv: base**  Salt fileserver environment from which to retrieve the file. This argument is ignored when **config_path** is not a salt:// URL.

CLI Example:

```
salt '*' ciscoconfparse.find_lines_wo_child config_path=https://bit.ly/2mAdq7z
  → parent_line='line con' child_line='stopbits'
```

salt.modules.ciscoconfparse_mod.find_objects(**config=None, config_path=None, regex=None, saltenv='base'**)

Return all the line objects that match the expression in the **regex** argument.

---

**Warning:**  This function is mostly valuable when invoked from other Salt components (i.e., execution modules, states, templates etc.). For CLI usage, please consider using ciscoconfparse.find_lines

**config**  The configuration sent as text.

---

**Note:**  This argument is ignored when **config_path** is specified.

**config_path**  The absolute or remote path to the file with the configuration to be parsed. This argument supports the usual Salt filesystem URIs, e.g., salt://, https://, ftp://, s3://, etc.

---
regex  The regular expression to match the lines against.

saltenv: base  Salt fileservor environment from which to retrieve the file. This argument is ignored when config_path is not a salt:// URL.

Usage example:

```python
objects = __salt__['ciscoconfparse.find_objects'](config_path='salt://path/to/config.txt', regex='Gigabit')
for obj in objects:
    print(obj.text)
```

salt.modules.ciscoconfparse_mod.find_objects_w_child(config=None, config_path=None, parent_regex=None, child_regex=None, ignore_ws=False, saltenv='base')

Parse through the children of all parent lines matching parent_regex, and return a list of child objects, which matched the child_regex.

**Warning:** This function is mostly valuable when invoked from other Salt components (i.e., execution modules, states, templates etc.). For CLI usage, please consider using ciscoconfparse.find_lines_w_child.

config  The configuration sent as text.

Note: This argument is ignored when config_path is specified.

config_path  The absolute or remote path to the file with the configuration to be parsed. This argument supports the usual Salt filesystem URIs, e.g., salt://, https://, ftp://, s3://, etc.

parent_regex  The regular expression to match the parent lines against.

child_regex  The regular expression to match the child lines against.

ignore_ws: False  Whether to ignore the white spaces.

saltenv: base  Salt fileserver environment from which to retrieve the file. This argument is ignored when config_path is not a salt:// URL.

Usage example:

```python
objects = __salt__['ciscoconfparse.find_objects_w_child'](config_path='https://bit.ly/2mAdq7z', parent_regex='line con', child_regex='stopbits')
for obj in objects:
    print(obj.text)
```

salt.modules.ciscoconfparse_mod.find_objects_wo_child(config=None, config_path=None, parent_regex=None, child_regex=None, ignore_ws=False, saltenv='base')

21.9. execution modules
Return a list of parent ciscoconfparse.IOSCfgLine objects, which matched the parent_regex and whose children did not match child_regex. Only the parent ciscoconfparse.IOSCfgLine objects will be returned. For simplicity, this method only finds oldest ancestors without immediate children that match.

**Warning:** This function is mostly valuable when invoked from other Salt components (i.e., execution modules, states, templates etc.). For CLI usage, please consider using ciscoconfparse.find_lines_wo_child

```python
config  The configuration sent as text.

Note: This argument is ignored when config_path is specified.

config_path  The absolute or remote path to the file with the configuration to be parsed. This argument supports the usual Salt filesystem URIs, e.g., salt://, https://, ftp://, s3://, etc.

parent_regex  The regular expression to match the parent lines against.

child_regex  The regular expression to match the child lines against.

ignore_ws: False  Whether to ignore the white spaces.

saltenv: base  Salt fileserver environment from which to retrieve the file. This argument is ignored when config_path is not a salt:// URL.
```

**Usage example:**

```python
objects = __salt__['ciscoconfparse.find_objects_wo_child'](config_path='https://bit.ly/2mAdq7z',
parent_regex='line con',
child_regex='stopbits')

for obj in objects:
    print(obj.text)
```

### 21.9.80 salt.modules.cisconso

Execution module for Cisco Network Services Orchestrator Proxy minions

For documentation on setting up the cisconso proxy minion look in the documentation for salt.proxy.cisconso.

**salt.modules.cisconso.applyrollback** *(datastore, name)*

Apply a system rollback

Parameters

- **datastore** *(DatastoreType (str enum)) – The datastore, e.g. running, operational.*
  One of the NETCONF store IETF types
- **name** *(str) – an ID of the rollback to restore*

```bash
salt cisco-nso cisconso.apply_rollback 52
```

**salt.modules.cisconso.getdata** *(datastore, path)*

Get the configuration of the device tree at the given path
Parameters

- **datastore** (DatastoreType(str enum)) – The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (list, str OR tuple) – The device path to set the value at, a list of element names in order, / separated

Returns The network configuration at that tree

Return type dict

```python
salt cisco-nso cisconso.get_data running 'devices/ex0'
```

salt.modules.cisconso.get_rollback(name)
Get the backup of stored a configuration rollback

Parameters **name** (str) – Typically an ID of the backup

Return type str

Returns the contents of the rollback snapshot

```python
salt cisco-nso cisconso.get_rollback 52
```

salt.modules.cisconso.get_rollbacks()
Get a list of stored configuration rollbacks

```python
salt cisco-nso cisconso.get_rollbacks
```

salt.modules.cisconso.info()
Return system information for grains of the NSO proxy minion

```python
salt '*' cisconso.info
```

salt.modules.cisconso.set_data_value(datastore, path, data)
Set a data entry in a datastore

Parameters

- **datastore** (DatastoreType(str enum)) – The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (list, str OR tuple) – The device path to set the value at, a list of element names in order, / separated
- **data** (dict) – The new value at the given path

Return type bool

Returns True if successful, otherwise error.

```python
salt cisco-nso cisconso.set_data_value running 'devices/ex0/routes' 10.0.0.20/24
```

21.9.81 salt.modules.cloud

Salt-specific interface for calling Salt Cloud directly

```python
salt.modules.cloud.action(fun=None, cloudmap=None, names=None, provider=None, instance=None, **kwargs)
```
Execute a single action on the given provider/instance
CLI Example:
```
salt minionname cloud.action start instance=myinstance
salt minionname cloud.action stop instance=myinstance
salt minionname cloud.action show_image provider=my-ec2-config image=ami-1624987f
```

salt.modules.cloud.create(provider, names, opts=None, **kwargs)
Create an instance using Salt Cloud

CLI Example:
```
salt minionname cloud.create my-ec2-config myinstance image=ami-1624987f size='t1.micro' ssh_username=ec2-user securitygroup=default delvol_on_destroy=True
```

salt.modules.cloud.destroy(names)
Destroy the named VM(s)

CLI Example:
```
salt minionname cloud.destroy myinstance
```

salt.modules.cloud.full_query(query_type='list_nodes_full')
List all available cloud provider data

CLI Example:
```
salt minionname cloud.full_query
```

salt.modules.cloud.get_instance(name, provider=None)
Return details on an instance.
Similar to the cloud action show_instance but returns only the instance details.

CLI Example:
```
salt minionname cloud.get_instance myinstance
```

SLS Example:
```
{{ salt['cloud.get_instance']['myinstance']['mac_address'] }}
```

salt.modules.cloud.has_instance(name, provider=None)
Return true if the instance is found on a provider

CLI Example:
```
salt minionname cloud.has_instance myinstance
```

salt.modules.cloud.list_images(provider='all')
List cloud provider images for the given providers

CLI Example:
```
salt minionname cloud.list_images my-gce-config
```

salt.modules.cloud.list_locations(provider='all')
List cloud provider locations for the given providers

CLI Example:
salt minionname cloud.list_locations my-gce-config

```python
salt.modules.cloud.list_sizes(provider='all')
```

List cloud provider sizes for the given providers

CLI Example:

```bash
salt minionname cloud.list_sizes my-gce-config
```

salt.modules.cloud.map_run(path=None, **kwargs)

Execute a salt cloud map file

Cloud Map data can be retrieved from several sources:
- a local file (provide the path to the file to the ‘path’ argument)
- a JSON-formatted map directly (provide the appropriately formatted to using the ‘map_data’ argument)
- the Salt Pillar (provide the map name of under ‘pillar:cloud:maps’ to the ‘map_pillar’ argument)

**Note:** Only one of these sources can be read at a time. The options are listed in their order of precedence.

CLI Examples:

```bash
salt minionname cloud.map_run /path/to/cloud.map
salt minionname cloud.map_run path=/path/to/cloud.map
salt minionname cloud.map_run map_pillar='<map_pillar>'
.. versionchanged:: 2018.3.1
salt minionname cloud.map_run map_data='<actual map data>'
```

salt.modules.cloud.network_create(provider, names, **kwargs)

Create private network

CLI Example:

```bash
salt minionname cloud.network_create my-nova names=['salt'] cidr='192.168.100.0/24'
```

salt.modules.cloud.network_list(provider)

List private networks

CLI Example:

```bash
salt minionname cloud.network_list my-nova
```

salt.modules.cloud.profile_(profile, names, vm_overrides=None, opts=None, **kwargs)

Spin up an instance using Salt Cloud

CLI Example:

```bash
salt minionname cloud.profile my-gce-config myinstance
```

salt.modules.cloud.query(query_type='list_nodes')

List cloud provider data for all providers

CLI Examples:
**salt.minionname.cloud.query**
- `list_nodes_full`
- `list_nodes_select`

**salt.modules.cloud.select_query**(query_type='list_nodes_select')
List selected nodes

CLI Example:
```bash
salt minionname cloud.select_query
```

**salt.modules.cloud.virtual_interface_create**(provider, names, **kwargs)
Attach private interfaces to a server

CLI Example:
```bash
salt minionname cloud.virtual_interface_create my-nova names=['salt-master'] net_→name='salt'
```

**salt.modules.cloud.virtual_interface_list**(provider, names, **kwargs)
List virtual interfaces on a server

CLI Example:
```bash
salt minionname cloud.virtual_interface_list my-nova names=['salt-master']
```

**salt.modules.cloud.volume_attach**(provider, names, **kwargs)
Attach volume to a server

CLI Example:
```bash
salt minionname cloud.volume_attach my-nova myblock server_name=myserver device=/dev/xvdf
```

**salt.modules.cloud.volume_create**(provider, names, **kwargs)
Create volume

CLI Example:
```bash
salt minionname cloud.volume_create my-nova myblock size=100 voltype=SSD
```

**salt.modules.cloud.volume_delete**(provider, names, **kwargs)
Delete volume

CLI Example:
```bash
salt minionname cloud.volume_delete my-nova myblock
```

**salt.modules.cloud.volume_detach**(provider, names, **kwargs)
Detach volume from a server

CLI Example:
```bash
salt minionname cloud.volume_detach my-nova myblock server_name=myserver
```

**salt.modules.cloud.volume_list**(provider)
List block storage volumes

CLI Example:
21.9.82 salt.modules.cmdmod

A module for shelling out.

Keep in mind that this module is insecure, in that it can give whomever has access to the master root execution access to all salt minions.

salt.modules.cmdmod.exec_code(lang, code, cwd=None, args=None, **kwargs)

Pass in two strings, the first naming the executable language, aka - python2, python3, ruby, perl, lua, etc. the second string containing the code you wish to execute. The stdout will be returned.

All parameters from cmd.run_all except python_shell can be used.

CLI Example:

```
salt '*' cmd.exec_code ruby 'puts "cheese"'
salt '*' cmd.exec_code ruby 'puts "cheese"' args='["arg1", "arg2"]' env='{"FOO": "bar"}"
```

salt.modules.cmdmod.exec_code_all(lang, code, cwd=None, args=None, **kwargs)

Pass in two strings, the first naming the executable language, aka - python2, python3, ruby, perl, lua, etc. the second string containing the code you wish to execute. All cmd artifacts (stdout, stderr, retcode, pid) will be returned.

All parameters from cmd.run_all except python_shell can be used.

CLI Example:

```
salt '*' cmd.exec_code_all ruby 'puts "cheese"'
salt '*' cmd.exec_code_all ruby 'puts "cheese"' args='["arg1", "arg2"]' env='{"FOO": "bar"}"
```

salt.modules.cmdmod.has_exec(cmd)

Returns true if the executable is available on the minion, false otherwise.

CLI Example:

```
salt '*' cmd.has_exec cat
```

salt.modules.cmdmod.powershell(cmd, cwd=None, stdin=None, runas=None, shell='/bin/sh', env=None, clean_env=False, template=None, rstrip=True, umask=None, output_encoding=None, output_loglevel='debug', hide_output=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv='base', use_vt=False, password=None, depth=None, encode_cmd=False, success_retcodes=None, **kwargs)

Execute the passed PowerShell command and return the output as a dictionary.

Other cmd.* functions (besides cmd.powershell_all) return the raw text output of the command. This function appends | ConvertTo-JSON to the command and then parses the JSON into a Python dictionary. If you want the raw textual result of your PowerShell command you should use cmd.run with the shell=powershell option.

For example:
In addition to the normal `cmd.run` parameters, this command offers the `depth` parameter to change the Windows default depth for the `ConvertTo-JSON` powershell command. The Windows default is 2. If you need more depth, set that here.

**Warning:** This passes the cmd argument directly to PowerShell without any further processing! Be absolutely sure that you have properly sanitized the command passed to this function and do not use untrusted inputs.

**Note:** For some commands, setting the depth to a value greater than 4 greatly increases the time it takes for the command to return and in many cases returns useless data.

### Parameters

- **cmd** *(str)* – The powershell command to run.
- **cwd** *(str)* – The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **stdin** *(str)* – A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** *(str)* – Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.
- **password** *(str)* – Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.
- **shell** *(str)* – Specify an alternate shell. Defaults to the system’s default shell.
- **python_shell** *(bool)* – If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **env** *(dict)* – Environment variables to be set prior to execution.
- **clean_env** *(bool)* – Attempt to clean out all other shell environment variables and set only those provided in the `env` argument to this function.

```bash
salt '*' cmd.run '$PSVersionTable.CLRVersion' shell=powershell
salt '*' cmd.run 'Get-NetTCPConnection' shell=powershell
```
- **template** *(str)* – If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.

- **rstrip** *(bool)* – Strip all whitespace off the end of output before it is returned.

- **umask** *(str)* – The umask (in octal) to use when running the command.

- **output_encoding** *(str)* – Control the encoding used to decode the command’s output.

  **Note:** This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

  To see the encoding Salt has detected from the system locale, check the `locale` line in the output of `test.versions_report`.

  New in version 2018.3.0.

- **output_loglevel** *(str)* – Control the loglevel at which the output from the command is logged to the minion log.

  **Note:** The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

- **ignore_retcode** *(bool)* – If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn’t necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.

- **hide_output** *(bool)* – If `True`, suppress stdout and stderr in the return data.

  **Note:** This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

  New in version 2018.3.0.

- **timeout** *(int)* – A timeout in seconds for the executed process to return.

- **use_vt** *(bool)* – Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

- **reset_system_locale** *(bool)* – Resets the system locale

- **saltenv** *(str)* – The salt environment to use. Default is 'base'

- **depth** *(int)* – The number of levels of contained objects to be included. Default is 2. Values greater than 4 seem to greatly increase the time it takes for the command to complete for some commands. eg: `dir`

  New in version 2016.3.4.

- **encode_cmd** *(bool)* – Encode the command before executing. Use in cases where characters may be dropped or incorrectly converted when executed. Default is `False`.

- **success_retcodes** *(list)* –
This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

- **stdin_raw_newlines** *(bool)* –

  False If True, Salt will not automatically convert the characters \n present in the stdin value to newlines.

New in version 2019.2.0.

Returns

dict A dictionary of data returned by the powershell command.

CLI Example:

```
salt '*' cmd.powershell "$PSVersionTable.CLRVersion"
```

salt.modules.cmdmod.powershell_all(cmd, cwd=None, stdin=None, runas=None, shell='\bin\sh', env=None, clean_env=False, template=None, rstrip=True, umask=None, output_encoding=None, output_loglevel='debug', quiet=False, timeout=None, reset_system_locale=True, ignore_retcodes=False, saltenv='base', use_vt=False, password=None, depth=None, encode_cmd=False, force_list=False, success_retcodes=None, **kwargs)

Execute the passed PowerShell command and return a dictionary with a result field representing the output of the command, as well as other fields showing us what the PowerShell invocation wrote to stderr, the process id, and the exit code of the invocation.

This function appends | ConvertTo-JSON to the command before actually invoking powershell.

An unquoted empty string is not valid JSON, but it’s very normal for the Powershell output to be exactly that. Therefore, we do not attempt to parse empty Powershell output (which would result in an exception). Instead we treat this as a special case and one of two things will happen:

- If the value of the force_list parameter is True, then the result field of the return dictionary will be an empty list.

- If the value of the force_list parameter is False, then the return dictionary will not have a result key added to it. We aren’t setting result to None in this case, because None is the Python representation of “null” in JSON. (We likewise can’t use False for the equivalent reason.)

If Powershell’s output is not an empty string and Python cannot parse its content, then a CommandExecutionError exception will be raised.

If Powershell’s output is not an empty string, Python is able to parse its content, and the type of the resulting Python object is other than list then one of two things will happen:

- If the value of the force_list parameter is True, then the result field will be a singleton list with the Python object as its sole member.

- If the value of the force_list parameter is False, then the value of result will be the unmodified Python object.

If Powershell’s output is not an empty string, Python is able to parse its content, and the type of the resulting Python object is list, then the value of result will be the unmodified Python object. The force_list parameter has no effect in this case.
Note: An example of why the `force_list` parameter is useful is as follows: The Powershell command `dir x | Convert-to-Json` results in

- no output when `x` is an empty directory.
- a dictionary object when `x` contains just one item.
- a list of dictionary objects when `x` contains multiple items.

By setting `force_list` to `True` we will always end up with a list of dictionary items, representing files, no matter how many files `x` contains. Conversely, if `force_list` is `False`, we will end up with no `result` key in our return dictionary when `x` is an empty directory, and a dictionary object when `x` contains just one file.

If you want a similar function but with a raw textual result instead of a Python dictionary, you should use `cmd.run_all` in combination with `shell=powershell`.

The remaining fields in the return dictionary are described in more detail in the `Returns` section.

Example:

```bash
salt '*' cmd.run_all '$PSVersionTable.CLRVersion' shell=powershell
salt '*' cmd.run_all 'Get-NetTCPConnection' shell=powershell
```

New in version 2018.3.0.

Warning: This passes the `cmd` argument directly to PowerShell without any further processing! Be absolutely sure that you have properly sanitized the command passed to this function and do not use untrusted inputs.

In addition to the normal `cmd.run` parameters, this command offers the `depth` parameter to change the Windows default depth for the `ConvertTo-JSON` powershell command. The Windows default is 2. If you need more depth, set that here.

Note: For some commands, setting the depth to a value greater than 4 greatly increases the time it takes for the command to return and in many cases returns useless data.

Parameters

- `cmd (str)` – The powershell command to run.
- `cwd (str)` – The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- `stdin (str)` – A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- `runas (str)` – Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.
Salt Documentation, Release 3000.2

• password (str) – Windows only. Required when specifying runas. This parameter
will be ignored on non-Windows platforms.
• shell (str) – Specify an alternate shell. Defaults to the system’s default shell.
• python_shell (bool) – If False, let python handle the positional arguments. Set to
True to use shell features, such as pipes or redirection.
• env (dict) – Environment variables to be set prior to execution.
Note: When passing environment variables on the CLI, they should be passed as the string
representation of a dictionary.
salt myminion cmd.powershell_all 'some command' env='{"FOO": "bar"}
,→'

• clean_env (bool) – Attempt to clean out all other shell environment variables and set
only those provided in the ’env’ argument to this function.
• template (str) – If this setting is applied then the named templating engine will be
used to render the downloaded file. Currently jinja, mako, and wempy are supported.
• rstrip (bool) – Strip all whitespace off the end of output before it is returned.
• umask (str) – The umask (in octal) to use when running the command.
• output_encoding (str) – Control the encoding used to decode the command’s output.
Note: This should not need to be used in most cases. By default, Salt will try to use the
encoding detected from the system locale, and will fall back to UTF-8 if this fails. This
should only need to be used in cases where the output of the command is encoded in
something other than the system locale or UTF-8.
To see the encoding Salt has detected from the system locale, check the locale line in the
output of test.versions_report.
New in version 2018.3.0.
• output_loglevel (str) – Control the loglevel at which the output from the command
is logged to the minion log.
Note: The command being run will still be logged at the debug loglevel regardless, unless
quiet is used for this value.
• ignore_retcode (bool) – If the exit code of the command is nonzero, this is treated
as an error condition, and the output from the command will be logged to the minion log.
However, there are some cases where programs use the return code for signaling and a
nonzero exit code doesn’t necessarily mean failure. Pass this argument as True to skip
logging the output if the command has a nonzero exit code.
• timeout (int) – A timeout in seconds for the executed process to return.
• use_vt (bool) – Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
• reset_system_locale (bool) – Resets the system locale

1528

Chapter 21. Salt Module Reference


- **ignore_retcode** – If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn’t necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.

- **saltenv (str)** – The salt environment to use. Default is 'base'

- **depth (int)** – The number of levels of contained objects to be included. Default is 2. Values greater than 4 seem to greatly increase the time it takes for the command to complete for some commands. eg: `dir`

- **encode_cmd (bool)** – Encode the command before executing. Use in cases where characters may be dropped or incorrectly converted when executed. Default is False.

- **force_list (bool)** – The purpose of this parameter is described in the preamble of this function’s documentation. Default value is False.

- **success_retcodes (list)** –
  This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

- **stdin_raw_newlines (bool)** –
  False If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

New in version 2019.2.0.

**Returns**

A dictionary with the following entries:

- **result** For a complete description of this field, please refer to this function’s preamble. This key will not be added to the dictionary when force_list is False and Powershell’s output is the empty string.

- **stderr** What the PowerShell invocation wrote to stderr.

- **pid** The process id of the PowerShell invocation

- **retcode** This is the exit code of the invocation of PowerShell. If the final execution status (in PowerShell) of our command (with | ConvertTo-JSON appended) is `False` this should be non-0. Likewise if PowerShell exited with $LASTEXITCODE set to some non-0 value, then `retcode` will end up with this value.

**Return type** dict

**CLI Example:**

```
salt '*' cmd.powershell_all "$PSVersionTable.CLRVersion"
```

**CLI Example:**

```
salt '*' cmd.powershell_all "dir mydirectory" force_list=True
```
salt.modules.cmdmod.retcodestr{cmd, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh', python_shell=False, env=None, clean_env=False, template=None, umask=None, output_encoding=None, out_put_loglevel='debug', log_callback=None, timeout=None, re_set_system_locale=True, ignore_retcode=False, saltenv='base', use_vt=False, password=None, success_retcodes=None, **kwargs)

Execute a shell command and return the command’s return code.

Parameters

- **cmd**(str) – The command to run. ex: `ls -lart /home`
- **cwd**(str) – The directory from which to execute the command. Defaults to the home directory of the user specified by runas (or the user under which Salt is running if runas is not specified).
- **stdin**(str) – A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas**(str) – Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the password argument, and the target user account must be in the Administrators group.

**Warning:** For versions 2018.3.3 and above on macOS while using runas, to pass special characters to the command you need to escape the characters on the shell.

**Example:**

```
|cmd.retcodes | 'echo \"h="baz\"\" runas=macuser
```

- **password**(str) – Windows only. Required when specifying runas. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.

- **group**(str) – Group to run command as. Not currently supported on Windows.
- **shell**(str) – Specify an alternate shell. Defaults to the system’s default shell.
- **python_shell**(bool) – If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **env**(dict) – Environment variables to be set prior to execution.

**Note:** When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.retcode 'some command' env={"F00": "bar"}'
```

- **clean_env**(bool) – Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **template**(str) – If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **rstrip**(bool) – Strip all whitespace off the end of output before it is returned.
• **umask** *(str)* – The umask (in octal) to use when running the command.

• **output_encoding** *(str)* – Control the encoding used to decode the command’s output.

**Note:** This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the *locale* line in the output of `test.versions_report`.

New in version 2018.3.0.

• **output_loglevel** *(str)* – Control the loglevel at which the output from the command is logged to the minion log.

**Note:** The command being run will still be logged at the *debug* loglevel regardless, unless *quiet* is used for this value.

• **ignore_retcode** *(bool)* – If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn’t necessarily mean failure. Pass this argument as *True* to skip logging the output if the command has a nonzero exit code.

• **timeout** *(int)* – A timeout in seconds for the executed process to return.

• **use_vt** *(bool)* – Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

• **success_retcodes** *(list)* – This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

• **stdin_raw_newlines** *(bool)* – *False* If *True*, Salt will not automatically convert the characters \n present in the *stdin* value to newlines.

New in version 2019.2.0.

**Return type**  *int*

**Return type**  *None*

**Returns**  Return Code as an int or None if there was an exception.

** CLI Example:**

```
salt '*' cmd.retcode "file /bin/bash"
```

The template arg can be set to ‘jinja’ or another supported template engine to render the command arguments before execution. For example:
A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

```python
salt '* cmd.retcode "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

salt.modules.cmdmod.run(cmd, cwd=None, stdin=None, runas=None, group=None, password=None, shell='/bin/sh', python_shell=None, env=None, clean_env=False, template=None, rstrip=True, umask=None, output_encoding=None, output_loglevel='debug', log_callback=None, hide_output=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv='base', use_vt=False, bg=False, encoded_cmd=False, raise_err=False, prepend_path=None, success_retcodes=None, **kwargs)

Execute the passed command and return the output as a string

**Parameters**

- **cmd**(str) – The command to run. ex: `ls -lart /home`
- **cwd**(str) – The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **stdin**(str) – A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas**(str) – Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running.

**Warning:** For versions 2018.3.3 and above on macosx while using `runas`, on linux while using `run`, to pass special characters to the command you need to escape the characters on the shell.

```python
salt '*' cmd.retcode template=jinja "file {{grains.pythonpath[0]}}/python"
```

Example:

```
cmd.run 'echo "h="baz""' runas=macuser
```

- **group**(str) – Group to run command as. Not currently supported on Windows.
- **password**(str) – Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.

- **shell**(str) – Specify an alternate shell. Defaults to the system’s default shell.
- **python_shell**(bool) – If `False`, let python handle the positional arguments. Set to `True` to use shell features, such as pipes or redirection.
- **bg**(bool) – If `True`, run command in background and do not await or deliver it’s results

New in version 2016.3.0.

- **env**(dict) – Environment variables to be set prior to execution.

**Note:** When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.
• **clean_env**(bool) – Attempt to clean out all other shell environment variables and set only those provided in the ‘env’ argument to this function.

• **prepend_path**(str) – $PATH segment to prepend (trailing ’;’ not necessary) to $PATH

  New in version 2018.3.0.

• **template**(str) – If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.

• **rstrip**(bool) – Strip all whitespace off the end of output before it is returned.

• **umask**(str) – The umask (in octal) to use when running the command.

• **output_encoding**(str) – Control the encoding used to decode the command’s output.

  Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

  To see the encoding Salt has detected from the system locale, check the `locale` line in the output of `test.versions_report`.

  New in version 2018.3.0.

• **output_loglevel**(str) – Control the loglevel at which the output from the command is logged to the minion log.

  Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

• **ignore_retcode**(bool) – If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn’t necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.

• **hide_output**(bool) – If `True`, suppress stdout and stderr in the return data.

  Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

  New in version 2018.3.0.

• **timeout**(int) – A timeout in seconds for the executed process to return.

• **use_vt**(bool) – Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

• **encoded_cmd**(bool) – Specify if the supplied command is encoded. Only applies to shell ’powershell’.
- `raise_err (bool)` – If True and the command has a nonzero exit code, a CommandExecutionError exception will be raised.

**Warning:** This function does not process commands through a shell unless the python_shell flag is set to True. This means that any shell-specific functionality such as `echo` or the use of pipes, redirection or `&&`, should either be migrated to cmd.shell or have the python_shell=True flag set here.

The use of python_shell=True means that the shell will accept _any_ input including potentially malicious commands such as `good_command;rm -rf/`. Be absolutely certain that you have sanitized your input prior to using python_shell=True

**Parameters**

- `success_retcodes (list)` –
  This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.

- `stdin_raw_newlines (bool)` –
  False If True, Salt will not automatically convert the characters \n present in the stdin value to newlines.

  New in version 2019.2.0.

**CLI Example:**

```shell
salt '*' cmd.run "ls -l | awk '/foo/\{print $2\}""
```

The template arg can be set to ‘jinja’ or another supported template engine to render the command arguments before execution. For example:

```shell
salt '*' cmd.run template='jinja' "ls -l /tmp/{{grains.id}} | awk '/foo/\{print $2\}""
```

Specify an alternate shell with the shell parameter:

```shell
salt '*' cmd.run "Get-ChildItem C:\" shell='powershell'
```

A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input.

```shell
salt '*' cmd.run "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format key=val. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```shell
salt '*' cmd.run cmd='sed -e s/=/:/g'
```
salt.modules.cmdmod.run_all(cmd, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh', python_shell=None, env=None, clean_env=False, template=None, rstrip=True, umask=None, output_encoding=None, output_loglevel='debug', log_callback=None, hide_output=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv='base', use_vt=False, redirect_stderr=False, password=None, encoded_cmd=False, prepend_path=None, success_retcodes=None, **kwargs)

Execute the passed command and return a dict of return data

Parameters

- **cmd (str)** - The command to run. ex: `ls -lart /home`
- **cwd (str)** - The directory from which to execute the command. Defaults to the home directory of the user specified by runas (or the user under which Salt is running if runas is not specified).
- **stdin (str)** - A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas (str)** - Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the password argument, and the target user account must be in the Administrators group.

**Warning:** For versions 2018.3.3 and above on macOS while using runas, to pass special characters to the command you need to escape the characters on the shell.

Example:
```
cmd.run_all 'echo \"h=\"baz\\"\"' runas=macuser
```

- **password (str)** - Windows only. Required when specifying runas. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.
- **group (str)** - Group to run command as. Not currently supported on Windows.
- **shell (str)** - Specify an alternate shell. Defaults to the system’s default shell.
- **python_shell (bool)** - If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **env (dict)** - Environment variables to be set prior to execution.

  **Note:** When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.run_all 'some command' env='{"FOO": "bar"}'
```

- **clean_env (bool)** - Attempt to clean out all other shell environment variables and set only those provided in the ‘env’ argument to this function.
- **prepend_path (str)** - $PATH segment to prepend (trailing ‘;’ not necessary) to $PATH
New in version 2018.3.0.

- **template** *(str)* – If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.

- **rstrip** *(bool)* – Strip all whitespace off the end of output before it is returned.

- **umask** *(str)* – The umask (in octal) to use when running the command.

- **output_encoding** *(str)* – Control the encoding used to decode the command’s output.

  **Note:** This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

  To see the encoding Salt has detected from the system locale, check the locale line in the output of *test.versions_report*.

New in version 2018.3.0.

- **output_loglevel** *(str)* – Control the loglevel at which the output from the command is logged to the minion log.

  **Note:** The command being run will still be logged at the debug loglevel regardless, unless quiet is used for this value.

- **ignore_retcode** *(bool)* – If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn’t necessarily mean failure. Pass this argument as True to skip logging the output if the command has a nonzero exit code.

- **hide_output** *(bool)* – If True, suppress stdout and stderr in the return data.

  **Note:** This is separate from output_loglevel, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

- **timeout** *(int)* – A timeout in seconds for the executed process to return.

- **use_vt** *(bool)* – Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

- **encoded_cmd** *(bool)* – Specify if the supplied command is encoded. Only applies to shell ‘powershell’.

  New in version 2018.3.0.

- **redirect_stderr** *(bool)* – If set to True, then stderr will be redirected to stdout. This is helpful for cases where obtaining both the retcode and output is desired, but it is not desired to have the output separated into both stdout and stderr.

  New in version 2015.8.2.

- **password** – Windows only. Required when specifying runas. This parameter will be ignored on non-Windows platforms.
New in version 2016.3.0.

- **bg** *(bool)* – If True, run command in background and do not await or deliver its results  
  New in version 2016.3.6.

- **success_retcodes** *(list)* –  
  This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.  
  New in version 2019.2.0.

- **stdin_raw_newlines** *(bool)* – False  
  If True, Salt will not automatically convert the characters \n present in the stdin value to newlines.  
  New in version 2019.2.0.

### CLI Example:

```
salt '*' cmd.run_all "ls -l | awk '/foo/{print \$2}'"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.run_all template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/{print \$2}"
```

A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input.

```
salt '*' cmd.run_all "grep f stdin='one
ntwo
three
four
five
'
```

salt.modules.cmdmod.run_bg(*cmd*, *cwd=None*, *runas=None*, *group=None*, *shell='/bin/sh'*, *python_shell=None*, *env=None*, *clean_env=False*, *template=None*, *umask=None*, *timeout=None*, *output_encoding=None*, *output_loglevel='debug'*, *log_callback=None*, *reset_system_locale=True*, *ignore_retcode=False*, *saltenv='base'*, *password=None*, *prepend_path=None*, **success_retcodes=None**, **kwargs)

Execute the passed command in the background and return it’s PID

**Note:** If the init system is systemd and the backgrounded task should run even if the salt-minion process is restarted, prepend systemd-run --scope to the command. This will reparent the process in its own scope separate from salt-minion, and will not be affected by restarting the minion service.

### Parameters

- **cmd**(str) – The command to run. ex: ls -lart /home
- **cwd**(str) – The directory from which to execute the command. Defaults to the home directory of the user specified by runas (or the user under which Salt is running if runas is not specified).
- **group**(str) – Group to run command as. Not currently supported on Windows.
- **shell**(str) – Shell to execute under. Defaults to the system default shell.
- **output_encoding** *(str)* – Control the encoding used to decode the command’s output.

  **Note:** This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

  To see the encoding Salt has detected from the system locale, check the `locale` line in the output of `test.versions_report`.

  New in version 2018.3.0.

- **output_loglevel** *(str)* – Control the loglevel at which the output from the command is logged to the minion log.

  **Note:** The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

- **ignore_retcode** *(bool)* – If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn’t necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.

- **runas** *(str)* – Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

  **Warning:** For versions 2018.3.3 and above on macOS while using `runas`, to pass special characters to the command you need to escape the characters on the shell.

  Example:

  ```
  cmd.run_bg 'echo \"h="baz\"\" runas=macuser
  ```

- **password** *(str)* – Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

- **shell** – Specify an alternate shell. Defaults to the system’s default shell.

- **python_shell** *(bool)* – If False, let python handle the positional arguments. Set to `True` to use shell features, such as pipes or redirection.

- **env** *(dict)* – Environment variables to be set prior to execution.

  **Note:** When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

  ```
  salt myminion cmd.run_bg 'some command' env='{"FOO": "bar"}''
  ```
- **clean_env**(bool) – Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.

- **prepend_path**(str) – $PATH segment to prepend (trailing ':' not necessary) to $PATH
  New in version 2018.3.0.

- **template**(str) – If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.

- **umask**(str) – The umask (in octal) to use when running the command.

- **timeout**(int) – A timeout in seconds for the executed process to return.

**Warning:** This function does not process commands through a shell unless the python_shell argument is set to True. This means that any shell-specific functionality such as 'echo' or the use of pipes, redirection or &&, should either be migrated to cmd.shell or have the python_shell=True flag set here.

The use of python_shell=True means that the shell will accept _any_ input including potentially malicious commands such as 'good_command;rm -rf /'. Be absolutely certain that you have sanitized your input prior to using python_shell=True.

**Parameters**

- **success_retcodes**(list) –
  This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.
  New in version 2019.2.0.

- **stdin_raw_newlines**(bool) –
  False If True, Salt will not automatically convert the characters "{\n" present in the stdin value to newlines.
  New in version 2019.2.0.

**CLI Example:**

```
salt '*' cmd.run_bg "fstrim-all"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.run_bg template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/{print \$2}'"
```

Specify an alternate shell with the shell parameter:

```
salt '*' cmd.run_bg "Get-ChildItem C:\\ " shell='powershell'
```

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' cmd.run_bg cmd='ls -lR / | sed -e s/=/:/g > /tmp/dontwait'
```
salt.modules.cmdmod.run_chroot(root, cmd, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh', python_shell=True, binds=None, env=None, clean_env=False, template=None, rstrip=True, umask=None, output_encoding=None, output_loglevel='quiet', log_callback=None, hide_output=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv='base', use_vt=False, bg=False, success_retcodes=None, **kwargs)

New in version 2014.7.0.

This function runs cmd.run_all wrapped within a chroot, with dev and proc mounted in the chroot

Parameters

- **root** *(str)* – Path to the root of the jail to use.
- **stdin** *(str)* – A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** *(str)* – User to run script as.
- **group** *(str)* – Group to run script as.
- **shell** *(str)* – Shell to execute under. Defaults to the system default shell.
- **cmd** *(str)* – The command to run. ex: ls -lart /home
- **cwd** *(str)* – The directory from which to execute the command. Defaults to the home directory of the user specified by runas (or the user under which Salt is running if runas is not specified).
- **runas** – Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the password argument, and the target user account must be in the Administrators group.
- **shell** – Specify an alternate shell. Defaults to the system’s default shell.
- **python_shell** *(bool)* – If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **binds** *(list)* – List of directories that will be exported inside the chroot with the bind option.

New in version 3000.

- **env** *(dict)* – Environment variables to be set prior to execution.

Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.run_chroot 'some command' env='{"FOO": "bar"}'
```

- **clean_env** *(dict)* – Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **template** *(str)* – If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **rstrip** *(bool)* – Strip all whitespace off the end of output before it is returned.
- **umask** *(str)* – The umask (in octal) to use when running the command.
• **output_encoding** *(str)* – Control the encoding used to decode the command’s output.

  **Note:** This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

  To see the encoding Salt has detected from the system locale, check the *locale* line in the output of *test.versions_report*.

  New in version 2018.3.0.

• **output_loglevel** *(str)* – Control the loglevel at which the output from the command is logged to the minion log.

  **Note:** The command being run will still be logged at the *debug* loglevel regardless, unless *quiet* is used for this value.

• **ignore_retcode** *(bool)* – If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn’t necessarily mean failure. Pass this argument as *True* to skip logging the output if the command has a nonzero exit code.

• **hide_output** *(bool)* – If *True*, suppress stdout and stderr in the return data.

  **Note:** This is separate from *output_loglevel*, which only handles how Salt logs to the minion log.

  New in version 2018.3.0.

• **timeout** *(int)* – A timeout in seconds for the executed process to return.

• **use_vt** *(bool)* – Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

  **Parar str stdin** A string of standard input can be specified for the command to be run using the *stdin* parameter. This can be useful in cases where sensitive information must be read from standard input.

  **success_retcodes:** This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.

  CLI Example:

```
salt '*' cmd.run_chroot /var/lib/lxc/container_name/rootfs 'sh /tmp/bootstrap.sh'
```
Execute a command and only return the standard error

Parameters

- **cmd** *(str)* - The command to run. ex: `ls -lart /home`
- **cwd** *(str)* - The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **stdin** *(str)* - A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** *(str)* - Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

**Warning**: For versions 2018.3.3 and above on macOS while using `runas`, to pass special characters to the command you need to escape the characters on the shell.

Example:

```
cmd.run_stderr 'echo "\"h\"="baz\"\"' runas=macuser
```

- **password** *(str)* - Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.
- **group** *(str)* - Group to run command as. Not currently supported on Windows.
- **shell** *(str)* - Specify an alternate shell. Defaults to the system’s default shell.
- **python_shell** *(bool)* - If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **env** *(dict)* - Environment variables to be set prior to execution.

**Note**: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.run_stderr 'some command' env="{'FOO': "bar"}"
```

- **clean_env** *(bool)* - Attempt to clean out all other shell environment variables and set only those provided in the `env` argument to this function.
- **prepend_path** *(str)* - $PATH segment to prepend (trailing `:` not necessary) to $PATH

New in version 2018.3.0.
- **template** *(str)* – If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.

- **rstrip** *(bool)* – Strip all whitespace off the end of output before it is returned.

- **umask** *(str)* – The umask (in octal) to use when running the command.

- **output_encoding** *(str)* – Control the encoding used to decode the command’s output.

  Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

  To see the encoding Salt has detected from the system locale, check the *locale* line in the output of `test.versions_report`.

New in version 2018.3.0.

- **output_loglevel** *(str)* – Control the loglevel at which the output from the command is logged to the minion log.

  Note: The command being run will still be logged at the *debug* loglevel regardless, unless *quiet* is used for this value.

- **ignore_retcode** *(bool)* – If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn’t necessarily mean failure. Pass this argument as *True* to skip logging the output if the command has a nonzero exit code.

- **hide_output** *(bool)* – If *True*, suppress stdout and stderr in the return data.

  Note: This is separate from *output_loglevel*, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

- **timeout** *(int)* – A timeout in seconds for the executed process to return.

- **use_vt** *(bool)* – Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

- **success_retcodes** *(list)* – This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.

- **stdin_raw_newlines** *(bool)* – False If *True*, Salt will not automatically convert the characters \n present in the stdin value to newlines.

  New in version 2019.2.0.
CLI Example:

```bash
salt '*' cmd.run_stderr "ls -l | awk '/foo/{print $2}'"
```

The template arg can be set to ‘jinja’ or another supported template engine to render the command arguments before execution. For example:

```bash
salt '*' cmd.run_stderr template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/{print $2}'"
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

```bash
salt '*' cmd.run_stderr "grep f stdin='one
two
three
four
five
'"
```

salt.modules.cmdmod.run_stdout(
    cmd, cwd=None, stdin=None, runas=None, group=None,
    shell='/bin/sh', python_shell=None, env=None, clean_env=False,
    template=None, rstrip=True, umask=None,
    output_encoding=None, output_loglevel='debug',
    hide_output=False, timeout=None, reset_system_locale=True,
    ignore_retcode=False, saltenv='base', use_vt=False, password=None,
    prepend_path=None, success_retcodes=None, **kwargs)

Execute a command, and only return the standard out.

### Parameters

- **cmd** *(str)* – The command to run. ex: `ls -lart /home`
- **cwd** *(str)* – The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **stdin** *(str)* – A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** *(str)* – Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

**Warning:** For versions 2018.3.3 and above on macosx while using runas, to pass special characters to the command you need to escape the characters on the shell.

Example:

```bash
cmd.run_stdout 'echo '\"h="baz"\"' runas=macuser
```

- **password** *(str)* – Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.
  
  New in version 2016.3.0.
- **group** *(str)* – Group to run command as. Not currently supported on Windows.
- **shell** *(str)* – Specify an alternate shell. Defaults to the system’s default shell.
- **python_shell** *(bool)* – If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
• **env** *(dict)* – Environment variables to be set prior to execution.

Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.run_stdout 'some command' env='{"FOO": "bar"}'
```

• **clean_env** *(bool)* – Attempt to clean out all other shell environment variables and set only those provided in the ‘env’ argument to this function.

• **prepend_path** *(str)* – $PATH segment to prepend (trailing ‘:’ not necessary) to $PATH

New in version 2018.3.0.

• **template** *(str)* – If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.

• **rstrip** *(bool)* – Strip all whitespace off the end of output before it is returned.

• **umask** *(str)* – The umask (in octal) to use when running the command.

• **output_encoding** *(str)* – Control the encoding used to decode the command’s output.

Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the `locale` line in the output of `test.versions_report`.

New in version 2018.3.0.

• **output_loglevel** *(str)* – Control the loglevel at which the output from the command is logged to the minion log.

Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

• **ignore_retcode** *(bool)* – If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn’t necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.

• **hide_output** *(bool)* – If `True`, suppress stdout and stderr in the return data.

Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

• **timeout** *(int)* – A timeout in seconds for the executed process to return.
- **use_vt** *(bool)* – Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

- **success_retcodes** *(list)* –
  
  This parameter will allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.

- **stdin_raw_newlines** *(bool)* –
  
  False If True, Salt will not automatically convert the characters \n present in the stdin value to newlines.

  New in version 2019.2.0.

**CLI Example:**

```
salt '*' cmd.run_stdout "ls -l | awk '/foo/ {print \$2}"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.run_stdout template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/ {print \$2}"
```

A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input.

```
salt '*' cmd.run_stdout "grep f stdin='one\ntwo\nthree\nfour\nfive\n'
```

salt.modules.cmdmod.script *(source, args=None, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh', python_shell=None, env=None, template=None, umask=None, output_encoding=None, output_loglevel='debug', log_callback=None, hide_output=False, timeout=None, set_system_locale=True, saltenv='base', use_vt=False, bg=False, success_retcodes=None, **kwargs)*

Download a script from a remote location and execute the script locally. The script can be located on the salt master file server or on an HTTP/FTP server.

The script will be executed directly, so it can be written in any available programming language.

**Parameters**

- **source** *(str)* – The location of the script to download. If the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs

- **args** *(str)* – String of command line args to pass to the script. Only used if no args are specified as part of the name argument. To pass a string containing spaces in YAML, you will need to double-quote it:

```
salt myminion cmd.script salt://foo.sh "arg1 'arg two' arg3"
```

- **cwd** *(str)* – The directory from which to execute the command. Defaults to the home directory of the user specified by runas (or the user under which Salt is running if runas is not specified).
- **stdin** *(str)* – A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input.

- **runas** *(str)* – Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the password argument, and the target user account must be in the Administrators group.

Note: For Windows users, specifically Server users, it may be necessary to specify your runas user using the User Logon Name instead of the legacy logon name. Traditionally, logons would be in the following format.

```
Domain/user
```

In the event this causes issues when executing scripts, use the UPN format which looks like the following.

```
user@domain.local
```

More information <https://github.com/saltstack/salt/issues/55080>

- **password** *(str)* – Windows only. Required when specifying runas. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

- **group** *(str)* – Group to run script as. Not currently supported on Windows.

- **shell** *(str)* – Specify an alternate shell. Defaults to the system’s default shell.

- **python_shell** *(bool)* – If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.

- **bg** *(bool)* – If True, run script in background and do not await or deliver it’s results

- **env** *(dict)* – Environment variables to be set prior to execution.

Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.script 'some command' env='{"FOO": "bar"}'
```

- **template** *(str)* – If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.

- **umask** *(str)* – The umask (in octal) to use when running the command.

- **output_encoding** *(str)* – Control the encoding used to decode the command’s output.

Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the `locale` line in the output of `test.versions_report`. 

21.9. execution modules
New in version 2018.3.0.

- **output_loglevel**(str) – Control the loglevel at which the output from the command is logged to the minion log.

  **Note:** The command being run will still be logged at the debug loglevel regardless, unless quiet is used for this value.

- **ignore_retcode**(bool) – If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn’t necessarily mean failure. Pass this argument as True to skip logging the output if the command has a nonzero exit code.

- **hide_output**(bool) – If True, suppress stdout and stderr in the return data.

  **Note:** This is separate from output_loglevel, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

- **timeout**(int) – If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill

- **use_vt**(bool) – Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

- **success_retcodes**(list) –

  This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

- **stdin_raw_newlines**(bool) –

  False If True, Salt will not automatically convert the characters \n present in the stdin value to newlines.

New in version 2019.2.0.

CLI Example:

```bash
salt '*' cmd.script salt://scripts/runme.sh
salt '*' cmd.script salt://scripts/runme.sh 'arg1 arg2 "arg 3"
  →
  shell='powershell'
  stdin='one
two
three
four
five
'

salt.modules.cmdmod.script_retcode(source, args=None, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh', python_shell=None, env=None, template='jinja', umask=None, timeout=None, reset_system_locale=True, saltenv='base', output_encoding=None, output_loglevel='debug', log_callback=None, use_vt=False, password=None, success_retcodes=None, **kwargs)
```
Download a script from a remote location and execute the script locally. The script can be located on the salt master file server or on an HTTP/FTP server.

The script will be executed directly, so it can be written in any available programming language.

The script can also be formatted as a template, the default is jinja.

Only evaluate the script return code and do not block for terminal output

**Parameters**

- **source (str)** – The location of the script to download. If the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs

- **args (str)** – String of command line args to pass to the script. Only used if no args are specified as part of the *name* argument. To pass a string containing spaces in YAML, you will need to doubly-quote it: "arg1 'arg two' arg3"

- **cwd (str)** – The directory from which to execute the command. Defaults to the home directory of the user specified by *runas* (or the user under which Salt is running if *runas* is not specified).

- **stdin (str)** – A string of standard input can be specified for the command to be run using the *stdin* parameter. This can be useful in cases where sensitive information must be read from standard input.

- **runas (str)** – Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the *password* argument, and the target user account must be in the Administrators group.

- **password (str)** – Windows only. Required when specifying *runas*. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

- **group (str)** – Group to run script as. Not currently supported on Windows.

- **shell (str)** – Specify an alternate shell. Defaults to the system’s default shell.

- **python_shell (bool)** – If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.

- **env (dict)** – Environment variables to be set prior to execution.

  **Note:** When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```bash
salt myminion cmd.script_retcode 'some command' env="{"FOO": "bar"}
```

- **template (str)** – If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.

- **umask (str)** – The umask (in octal) to use when running the command.

- **output_encoding (str)** – Control the encoding used to decode the command’s output.

  **Note:** This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This
should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the `locale` line in the output of `test.versions_report`.

New in version 2018.3.0.

- **output_loglevel (str)** – Control the loglevel at which the output from the command is logged to the minion log.

  Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

- **ignore_retcode (bool)** – If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn’t necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.

- **timeout (int)** – If the command has not terminated after timeout seconds, send the subprocess `sigterm`, and if `sigterm` is ignored, follow up with `sigkill`

- **use_vt (bool)** – Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

- **success_retcodes (list)** –

  This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.

- **stdin_raw_newlines (bool)** –

  False If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

  New in version 2019.2.0.

CLI Example:

```bash
salt '*' cmd.script_retcode salt://scripts/runme.sh
salt '*' cmd.script_retcode salt://scripts/runme.sh 'arg1 arg2 "arg 3"'
salt '*' cmd.script_retcode salt://scripts/windows_task.ps1 args='-Input:\c:\tmp\infile.txt' shell='powershell'
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

```bash
salt '*' cmd.script_retcode salt://scripts/runme.sh stdin=
...'one\ntwo\nthree\nfour\nfive\n'
```
salt.modules.cmdmod.shell(cmd, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh', env=None, clean_env=False, template=None, rstrip=True, umask=None, output_encoding=None, output_loglevel='debug', log_callback=None, hide_output=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv='base', use_vt=False, bg=False, password=None, prepend_path=None, success_retcodes=None, **kwargs)

Execute the passed command and return the output as a string.

New in version 2015.5.0.

Parameters

- **cmd (str)** – The command to run. ex: ls -lart /home
- **cwd (str)** – The directory from which to execute the command. Defaults to the home directory of the user specified by runas (or the user under which Salt is running if runas is not specified).
- **stdin (str)** – A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas (str)** – Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the password argument, and the target user account must be in the Administrators group.

**Warning:** For versions 2018.3.3 and above on macOS while using runas, to pass special characters to the command you need to escape the characters on the shell.

Example:

```python
cmd.shell 'echo \"h="baz\"" \" runas=macuser
```

- **group (str)** – Group to run command as. Not currently supported on Windows.
- **password (str)** – Windows only. Required when specifying runas. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.

- **shell (int)** – Shell to execute under. Defaults to the system default shell.
- **bg (bool)** – If True, run command in background and do not await or deliver its results
- **env (dict)** – Environment variables to be set prior to execution.

**Note:** When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```python
salt myminion cmd.shell 'some command' env={"FOO": "bar"}
```

- **clean_env (bool)** – Attempt to clean out all other shell environment variables and set only those provided in the ‘env’ argument to this function.
- **prepend_path (str)** – $PATH segment to prepend (trailing ‘:’ not necessary) to $PATH

New in version 2018.3.0.
• **template** *(str)* – If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.

• **rstrip** *(bool)* – Strip all whitespace off the end of output before it is returned.

• **umask** *(str)* – The umask (in octal) to use when running the command.

• **output_encoding** *(str)* – Control the encoding used to decode the command’s output.

**Note:** This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the `locale` line in the output of `test.versions_report`.

New in version 2018.3.0.

• **output_loglevel** *(str)* – Control the loglevel at which the output from the command is logged to the minion log.

**Note:** The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

• **ignore_retcode** *(bool)* – If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn’t necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.

• **hide_output** *(bool)* – If `True`, suppress stdout and stderr in the return data.

**Note:** This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

• **timeout** *(int)* – A timeout in seconds for the executed process to return.

• **use_vt** *(bool)* – Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

**Warning:** This passes the `cmd` argument directly to the shell without any further processing! Be absolutely sure that you have properly sanitized the command passed to this function and do not use untrusted inputs.

**Parameters**

• **success_retcodes** *(list)* – This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.
• `stdin_raw_newlines (bool)` –
  False If True, Salt will not automatically convert the characters \n present in the stdin value to newlines.

  New in version 2019.2.0.

  CLI Example:

  ```
  salt '*' cmd.shell "ls -l | awk '/foo/{print \$2}"
  ```

  The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

  ```
  salt '*' cmd.shell template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/{print \n \$2}"
  ```

Specify an alternate shell with the shell parameter:

  ```
  salt '*' cmd.shell "Get-ChildItem C:\" shell='powershell'
  ```

A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input.

  ```
  salt '*' cmd.shell "grep f" stdin='one
two
three
four
five
'
  ```

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format key=val. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

  ```
  salt '*' cmd.shell cmd='sed -e s/=/:/g'
  ```

salt.modules.cmdmod.shell_info (shell, list_modules=False)

  New in version 2016.11.0.

  Provides information about a shell or script languages which often use #!. The values returned are dependent on the shell or scripting languages all return the installed, path, version, version_raw

  Parameters

  • `shell (str)` – Name of the shell. Support shells/script languages include
  • `cmd, perl, php, powershell, python, ruby and zsh (bash,)`–
  • `list_modules (bool)` – True to list modules available to the shell.
  • `only lists powershell modules. (Currently)`–

  Returns A dictionary of information about the shell

  Return type dict

  ```
  {'version': '<2 or 3 numeric components dot-separated>',
   'version_raw': '<full version string>',
   'path': '<full path to binary>',
   'installed': '<True, False or None>,
   '<attribute>': '<attribute value>'}
  ```

  Note:
- `installed` is always returned, if `None` or `False` also returns error and may also return `stdout` for diagnostics.

- `version` is for use in determine if a shell/script language has a particular feature set, not for package management.

- The shell must be within the executable search path.

CLI Example:

```
salt '*' cmd.shell_info bash
salt '*' cmd.shell_info powershell
```

**Codeauthor** Damon Atkins <https://github.com/damon-atkins>

salt.modules.cmdmod.shells()
Lists the valid shells on this system via the `/etc/shells` file

New in version 2015.5.0.

CLI Example:

```
salt '*' cmd.shells
```

salt.modules.cmdmod.tty(device, echo='')
Echo a string to a specific tty

CLI Example:

```
salt '*' cmd.tty tty0 'This is a test'
salt '*' cmd.tty pts3 'This is a test'
```

salt.modules.cmdmod.which(cmd)
Returns the path of an executable available on the minion, None otherwise

CLI Example:

```
salt '*' cmd.which cat
```

salt.modules.cmdmod.which_bin(cmds)
Returns the first command found in a list of commands

CLI Example:

```
salt '*' cmd.which_bin '[pip2, pip, pip-python]'`

21.9.83 salt.modules.composer

Use composer to install PHP dependencies for a directory

salt.modules.composer.did_composer_install(dir)
Test to see if the vendor directory exists in this directory

- `dir` Directory location of the composer.json file

CLI Example:
salt 'salt' composer.did_composer_install /var/www/application

salt.modules.composer.install(directory, composer=None, php=None, runas=None, prefer_source=None, prefer_dist=None, no_scripts=None, no_plugins=None, optimize=None, no_dev=None, quiet=False, composer_home='/root', env=None)

Install composer dependencies for a directory.

If composer has not been installed globally making it available in the system PATH & making it executable, the composer and php parameters will need to be set to the location of the executables.

directory  Directory location of the composer.json file.

composer Location of the composer.phar file. If not set composer will just execute "composer" as if it is installed globally. (i.e. /path/to/composer.phar)

php  Location of the php executable to use with composer. (i.e. /usr/bin/php)

runas Which system user to run composer as.

prefer_source –prefer-source option of composer.

prefer_dist –prefer-dist option of composer.

no_scripts –no-scripts option of composer.

no_plugins –no-plugins option of composer.

optimize –optimize-autoloader option of composer. Recommended for production.

no_dev –no-dev option for composer. Recommended for production.

quiet –quiet option for composer. Whether or not to return output from composer.

composer_home $COMPOSER_HOME environment variable

eenv A list of environment variables to be set prior to execution.

CLI Example:
salt 'salt' composer.install /var/www/application

salt 'salt' composer.install /var/www/application

no_dev=True

optimize=True

salt.modules.composer.selfupdate(composer=None, php=None, runas=None, quiet=False, composer_home='/root')

Update composer itself.

If composer has not been installed globally making it available in the system PATH & making it executable, the composer and php parameters will need to be set to the location of the executables.

composer Location of the composer.phar file. If not set composer will just execute "composer" as if it is installed globally. (i.e. /path/to/composer.phar)

php  Location of the php executable to use with composer. (i.e. /usr/bin/php)

runas Which system user to run composer as.

quiet –quiet option for composer. Whether or not to return output from composer.

composer_home $COMPOSER_HOME environment variable

CLI Example:
salt 'salt' composer.selfupdate

salt.modules.composer.update(directory, composer=None, php=None, runas=None, prefer_source=None, prefer_dist=None, no_scripts=None, no_plugins=None, optimize=None, no_dev=None, quiet=False, composer_home='/root', env=None)

Update composer dependencies for a directory.

If composer install has not yet been run, this runs composer install instead.

If composer has not been installed globally making it available in the system PATH & making it executable, the composer and php parameters will need to be set to the location of the executables.

directory Directory location of the composer.json file.

composer Location of the composer.phar file. If not set composer will just execute "composer" as if it is installed globally. (i.e. /path/to/composer.phar)

php Location of the php executable to use with composer. (i.e. /usr/bin/php)

runas Which system user to run composer as.

prefer_source –prefer-source option of composer.

prefer_dist –prefer-dist option of composer.

no_scripts –no-scripts option of composer.

no_plugins –no-plugins option of composer.

optimize –optimize-autoloader option of composer. Recommended for production.

no_dev –no-dev option for composer. Recommended for production.

quiet –quiet option for composer. Whether or not to return output from composer.

composer_home $COMPOSER_HOME environment variable

env A list of environment variables to be set prior to execution.

CLI Example:

salt 'salt' composer.update /var/www/application

salt 'salt' composer.update /var/www/application no_dev=True

→ optimize=True

21.9.84 salt.modules.config

Return config information

salt.modules.config.backup_mode(backup=“)

Return the backup mode

CLI Example:

salt 'salt' config.backup_mode

salt.modules.config.dot_vals(value)

Pass in a configuration value that should be preceded by the module name and a dot, this will return a list of all read key/value pairs

CLI Example:
salt '*' config.dot_vals host

salt.modules.config.gather_bootstrap_script(bootstrap=None)
Download the salt-bootstrap script, and return its location

**bootstrap** URL of alternate bootstrap script

CLI Example:
salt '*' config.gather_bootstrap_script

salt.modules.config.get(key, default='', delimiter=':', merge=None, omit_opts=False, omit_pillar=False, omit_master=False, omit_grains=False)
Attempt to retrieve the named value from the minion config file, pillar, grains or the master config. If the named value is not available, return the value specified by the **default** argument. If this argument is not specified, **default** falls back to an empty string.

Values can also be retrieved from nested dictionaries. Assume the below data structure:

```python
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the **apache** key, in the sub-dictionary corresponding to the **pkg** key, the following command can be used:

```bash
salt myminion config.get pkg:apache
```

The : (colon) is used to represent a nested dictionary level.

Changed in version 2015.5.0: The **delimiter** argument was added, to allow delimiters other than : to be used.

This function traverses these data stores in this order, returning the first match found:

- Minion configuration
- Minion’s grains
- Minion’s pillar data
- Master configuration (requires pillar_opts to be set to True in Minion config file in order to work)

This means that if there is a value that is going to be the same for the majority of minions, it can be configured in the Master config file, and then overridden using the grains, pillar, or Minion config file.

Adding config options to the Master or Minion configuration file is easy:

```yaml
my-config-option: value
cafe-menu:
  - egg and bacon
  - egg sausage and bacon
  - egg and spam
  - egg bacon and spam
  - egg bacon sausage and spam
  - spam bacon sausage and spam
  - spam egg spam bacon and spam
  - spam sausage spam spam bacon spam tomato and spam
```

**Note:** Minion configuration options built into Salt (like those defined here) will always be defined in the Minion configuration and thus cannot be overridden by grains or pillar data. However, additional (user-defined)

21.9. execution modules
configuration options (as in the above example) will not be in the Minion configuration by default and thus can be overridden using grains/pillar data by leaving the option out of the minion config file.

Arguments

delimiter  New in version 2015.5.0.

Override the delimiter used to separate nested levels of a data structure.

merge  New in version 2015.5.0.

If passed, this parameter will change the behavior of the function so that, instead of traversing each data store above in order and returning the first match, the data stores are first merged together and then searched. The pillar data is merged into the master config data, then the grains are merged, followed by the Minion config data. The resulting data structure is then searched for a match. This allows for configurations to be more flexible.

Note: The merging described above does not mean that grain data will end up in the Minion’s pillar data, or pillar data will end up in the master config data, etc. The data is just combined for the purposes of searching an amalgam of the different data stores.

The supported merge strategies are as follows:

- **recurse** - If a key exists in both dictionaries, and the new value is not a dictionary, it is replaced. Otherwise, the sub-dictionaries are merged together into a single dictionary, recursively on down, following the same criteria. For example:

  ```python
  >>> dict1 = {'foo': {'bar': 1, 'qux': True},
              'hosts': ['a', 'b', 'c'],
              'only_x': None}
  >>> dict2 = {'foo': {'baz': 2, 'qux': False},
              'hosts': ['d', 'e', 'f'],
              'only_y': None}
  >>> merged
  {'foo': {'bar': 1, 'baz': 2, 'qux': False},
   'hosts': ['d', 'e', 'f'],
   'only_dict1': None,
   'only_dict2': None}
  ```

- **overwrite** - If a key exists in the top level of both dictionaries, the new value completely overwrites the old. For example:

  ```python
  >>> dict1 = {'foo': {'bar': 1, 'qux': True},
              'hosts': ['a', 'b', 'c'],
              'only_x': None}
  >>> dict2 = {'foo': {'baz': 2, 'qux': False},
              'hosts': ['d', 'e', 'f'],
              'only_y': None}
  >>> merged
  {'foo': {'baz': 2, 'qux': False},
   'hosts': ['d', 'e', 'f'],
   'only_dict1': None,
   'only_dict2': None}
  ```

CLI Example:
salt ' '*' config.get pkg:apache
salt ' '*' config.get lxc.container_profile:centos merge=recursion

salt.modules.config.items()
Return the complete config from the currently running minion process. This includes defaults for values not set in the config file.

CLI Example:
salt ' '*' config.items

salt.modules.config.manage_mode(mode)
Return a mode value, normalized to a string

CLI Example:
salt ' '*' config.manage_mode

salt.modules.config.merge(value, default="", omit_opts=False, omit_master=False, omit_pillar=False)
Retrieves an option based on key, merging all matches.
Same as option() except that it merges all matches, rather than taking the first match.

CLI Example:
salt ' '*' config.merge schedule

salt.modules.config.option(value, default=None, omit_opts=False, omit_grains=False, omit_pillar=False, omit_master=False, omit_all=False, wildcard=False)
Returns the setting for the specified config value. The priority for matches is the same as in config.get, only this function does not recurse into nested data structures. Another difference between this function and config.get is that it comes with a set of "sanedefaults". To view these, you can run the following command:
salt ' '*' config.option ' '*' omit_all=True wildcard=True

default The default value if no match is found. If not specified, then the fallback default will be an empty string, unless wildcard=True, in which case the return will be an empty dictionary.

omit_opts [False] Pass as True to exclude matches from the minion configuration file
omit_grains [False] Pass as True to exclude matches from the grains
omit_pillar [False] Pass as True to exclude matches from the pillar data
omit_master [False] Pass as True to exclude matches from the master configuration file
omit_all [True] Shorthand to omit all of the above and return matches only from the "sanedefaults".

New in version 3000.

wildcard [False] If used, this will perform pattern matching on keys. Note that this will also significantly change the return data. Instead of only a value being returned, a dictionary mapping the matched keys to their values is returned. For example, using wildcard=True with a key of 'foo.bar' could return a dictionary like so:

{'foo.bar': True, 'foo.baz': False}

New in version 3000.

CLI Example:
salt '५' config.option redis.host

salt.modules.config.valid_fileproto(uri)
Returns a boolean value based on whether or not the URI passed has a valid remote file protocol designation
CLI Example:
salt '५' config.valid_fileproto salt://path/to/file

21.9.85 salt.modules.consul

Interact with Consul
https://www.consul.io

call.modules.consul.acl_clone(consul_url=None, token=None, **kwargs)
Information about an ACL token.

Parameters
- consul_url – The Consul server URL.
- id – Unique identifier for the ACL to update.

Returns Boolean, message of success or failure, and new ID of cloned ACL.

CLI Example:
salt '५' consul.acl_info id='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'

salt.modules.consul.acl_create(consul_url=None, token=None, **kwargs)
Create a new ACL token.

Parameters
- consul_url – The Consul server URL.
- name – Meaningful indicator of the ACL’s purpose.
- type – Type is either client or management. A management token is comparable to a root user and has the ability to perform any action including creating, modifying, and deleting ACLs.
- rules – The Consul server URL.

Returns Boolean & message of success or failure.

CLI Example:
salt '५' consul.acl_create

salt.modules.consul.acl_delete(consul_url=None, token=None, **kwargs)
Delete an ACL token.

Parameters
- consul_url – The Consul server URL.
- id – Unique identifier for the ACL to update.

Returns Boolean & message of success or failure.

CLI Example:
salt 'c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716' consul.acl_delete

salt.modules.consul.acl_info(consul_url=None, **kwargs)
Information about an ACL token.

Parameters
- consul_url – The Consul server URL.
- id – Unique identifier for the ACL to update.

Returns Information about the ACL requested.

CLI Example:
salt 'c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716' consul.acl_info

salt.modules.consul.acl_list(consul_url=None, token=None, **kwargs)
List the ACL tokens.

Parameters consul_url – The Consul server URL.

Returns List of ACLs

CLI Example:
salt consul.acl_list

salt.modules.consul.acl_update(consul_url=None, token=None, **kwargs)
Update an ACL token.

Parameters
- consul_url – The Consul server URL.
- name – Meaningful indicator of the ACL’s purpose.
- id – Unique identifier for the ACL to update.
- type – Type is either client or management. A management token is comparable to a root user and has the ability to perform any action including creating, modifying, and deleting ACLs.
- rules – The Consul server URL.

Returns Boolean & message of success or failure.

CLI Example:
salt consul.acl_update

salt.modules.consul.agent_check_deregister(consul_url=None, token=None, checkid=None)
The agent will take care of deregistering the check from the Catalog.

Parameters
- consul_url – The Consul server URL.
- checkid – The ID of the check to deregister from Consul.

Returns Boolean and message indicating success or failure.

CLI Example:
salt documentation, release 3000.2

salt '*' consul.agent_check_deregister checkid='Memory Utilization'
salt.modules.consul.agent_check_fail(consul_url=None, token=None, checkid=None, **kwargs)

This endpoint is used with a check that is of the TTL type. When this is called, the status of the check is set to critical and the TTL clock is reset.

Parameters

- **consul_url** – The Consul server URL.
- **checkid** – The ID of the check to deregister from Consul.
- **note** – A human-readable message with the status of the check.

Returns Boolean and message indicating success or failure.

CLI Example:
salt '*' consul.agent_check_fail checkid='redis_check1' note='Forcing check into critical state.'

salt.modules.consul.agent_check_pass(consul_url=None, token=None, checkid=None, **kwargs)

This endpoint is used with a check that is of the TTL type. When this is called, the status of the check is set to passing and the TTL clock is reset.

Parameters

- **consul_url** – The Consul server URL.
- **checkid** – The ID of the check to mark as passing.
- **note** – A human-readable message with the status of the check.

Returns Boolean and message indicating success or failure.

CLI Example:
salt '*' consul.agent_check_pass checkid='redis_check1' note='Forcing check into passing state.'

salt.modules.consul.agent_check_register(consul_url=None, token=None, **kwargs)

The register endpoint is used to add a new check to the local agent.

Parameters

- **consul_url** – The Consul server URL.
- **name** – The description of what the check is for.
- **id** – The unique name to use for the check, if not provided 'name' is used.
- **notes** – Human readable description of the check.
- **script** – If script is provided, the check type is a script, and Consul will evaluate that script based on the interval parameter.
- **http** – Check will perform an HTTP GET request against the value of HTTP (expected to be a URL) based on the interval parameter.
- **ttl** – If a TTL type is used, then the TTL update endpoint must be used periodically to update the state of the check.
- **interval** – Interval at which the check should run.
Returns Boolean and message indicating success or failure.

CLI Example:
```
salt '*' consul.agent_check_register name='Memory Utilization' script='/usr/local/bin/check_mem.py' interval='15s'
```

`salt.modules.consul.agent_check_warn(consul_url=None, token=None, checkid=None, **kwargs)`

This endpoint is used with a check that is of the TTL type. When this is called, the status of the check is set to warning and the TTL clock is reset.

Parameters
- **consul_url** – The Consul server URL.
- **checkid** – The ID of the check to deregister from Consul.
- **note** – A human-readable message with the status of the check.

Returns Boolean and message indicating success or failure.

CLI Example:
```
salt '*' consul.agent_check_warn checkid='redis_check1' note='Forcing check into warning state.'
```

`salt.modules.consul.agent_checks(consul_url=None, token=None)`

Returns the checks the local agent is managing.

Parameters **consul_url** – The Consul server URL.

Returns Returns the checks the local agent is managing

CLI Example:
```
salt '*' consul.agent_checks
```

`salt.modules.consul.agent_join(consul_url=None, token=None, address=None, **kwargs)`

Triggers the local agent to join a node.

Parameters
- **consul_url** – The Consul server URL.
- **address** – The address for the agent to connect to.
- **wan** – Causes the agent to attempt to join using the WAN pool.

Returns Boolean and message indicating success or failure.

CLI Example:
```
salt '*' consul.agent_join address='192.168.1.1'
```

`salt.modules.consul.agent_leave(consul_url=None, token=None, node=None)`

Used to instruct the agent to force a node into the left state.

Parameters
- **consul_url** – The Consul server URL.
- **node** – The node the agent will force into left state.

Returns Boolean and message indicating success or failure.
CLI Example:

```
salt '*' consul.agent_leave node='web1.example.com'
```

`salt.modules.consul.agent_maintenance(consul_url=None, token=None, **kwargs)`  
Manages node maintenance mode

**Parameters**

- `consul_url` – The Consul server URL.
- `enable` – The enable flag is required. Acceptable values are either true (to enter maintenance mode) or false (to resume normal operation).
- `reason` – If provided, its value should be a text string explaining the reason for placing the node into maintenance mode.

**Returns**  
Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_maintenance enable='False' reason='Upgrade in progress'
```

`salt.modules.consul.agent_members(consul_url=None, token=None, **kwargs)`  
Returns the members as seen by the local serf agent

**Parameters** `consul_url` – The Consul server URL.

**Returns**  
Returns the members as seen by the local serf agent

CLI Example:

```
salt '*' consul.agent_members
```

`salt.modules.consul.agent_self(consul_url=None, token=None)`  
Returns the local node configuration

**Parameters** `consul_url` – The Consul server URL.

**Returns**  
Returns the local node configuration

CLI Example:

```
salt '*' consul.agent_self
```

`salt.modules.consul.agent_service_deregister(consul_url=None, token=None, serviceid=None)`  
Used to remove a service.

**Parameters**

- `consul_url` – The Consul server URL.
- `serviceid` – A serviceid describing the service.

**Returns**  
Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_service_deregister serviceid='redis'
```

`salt.modules.consul.agent_service_maintenance(consul_url=None, token=None, serviceid=None, **kwargs)`  
Used to place a service into maintenance mode.
Parameters

- **consul_url** – The Consul server URL.
- **serviceid** – A name of the service.
- **enable** – Whether the service should be enabled or disabled.
- **reason** – A human readable message of why the service was enabled or disabled.

Returns Boolean and message indicating success or failure.

CLI Example:
```
salt '*' consul.agent_service_deregister serviceid='redis' enable='True' reason='Down for upgrade'
```

salt.modules.consul.agent_service_register(consul_url=None, token=None, **kwargs)
The used to add a new service, with an optional health check, to the local agent.

Parameters

- **consul_url** – The Consul server URL.
- **name** – A name describing the service.
- **address** – The address used by the service, defaults to the address of the agent.
- **port** – The port used by the service.
- **id** – Unique ID to identify the service, if not provided the value of the name parameter is used.
- **tags** – Identifying tags for service, string or list.
- **script** – If script is provided, the check type is a script, and Consul will evaluate that script based on the interval parameter.
- **http** – Check will perform an HTTP GET request against the value of HTTP (expected to be a URL) based on the interval parameter.
- **check_ttl** – If a TTL type is used, then the TTL update endpoint must be used periodically to update the state of the check.
- **check_interval** – Interval at which the check should run.

Returns Boolean and message indicating success or failure.

CLI Example:
```
salt '*' consul.agent_service_register name='redis' tags='["master", "v1"]' address='127.0.0.1' port='8080' check_script='/usr/local/bin/check_redis.py' interval='10s'
```

salt.modules.consul.agent_services(consul_url=None, token=None)
Returns the services the local agent is managing

Parameters **consul_url** – The Consul server URL.

Returns Returns the services the local agent is managing

CLI Example:
```
salt '*' consul.agent_services
```
salt.modules.consul.catalog_datacenters(consul_url=None, token=None)

Return list of available datacenters from catalog.

Parameters
consul_url – The Consul server URL.

Returns The list of available datacenters.

CLI Example:
salt '*' consul.catalog_datacenters

salt.modules.consul.catalog_deregister(consul_url=None, token=None, **kwargs)

Deregisters a node, service, or check

Parameters
• consul_url – The Consul server URL.
• node – The node to deregister.
• datacenter – By default, the datacenter of the agent is queried; however, the dc can be
  provided using the "dc" parameter.
• checkid – The ID of the health check to deregister.
• serviceid – The ID of the service to deregister.

Returns Boolean & message of success or failure.

CLI Example:
salt '*' consul.catalog_register node='node1' serviceid='redis_server1' checkid=
'redis_check1'

salt.modules.consul.catalog_node(consul_url=None, token=None, node=None, **kwargs)

Information about the registered node.

Parameters
• consul_url – The Consul server URL.
• node – The node to request information about.
• dc – By default, the datacenter of the agent is queried; however, the dc can be
  provided using the "dc" parameter.

Returns Information about the requested node.

CLI Example:
salt '*' consul.catalog_service service='redis'

salt.modules.consul.catalog_nodes(consul_url=None, token=None, **kwargs)

Return list of available nodes from catalog.

Parameters
• consul_url – The Consul server URL.
• dc – By default, the datacenter of the agent is queried; however, the dc can be provided
  using the "dc" parameter.

Returns The list of available nodes.

CLI Example:
The Salt documentation details the functionality of `consul.catalog_register` and `consul.catalog_service` modules.

### `salt.modules.consul.catalog_register`

Registers a new node, service, or check.

#### Parameters
- `consul_url` – The Consul server URL.
- `dc` – By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.
- `node` – The node to register.
- `address` – The address of the node.
- `service` – The service that will be registered.
- `service_address` – The address that the service listens on.
- `service_port` – The port for the service.
- `service_id` – A unique identifier for the service, if this is not provided "name" will be used.
- `service_tags` – Any tags associated with the service.
- `check` – The name of the health check to register.
- `check_status` – The initial status of the check, must be one of unknown, passing, warning, or critical.
- `check_service` – The service that the check is performed against.
- `check_id` – Unique identifier for the service.
- `check_notes` – An opaque field that is meant to hold human-readable text.

#### Returns
Boolean & message of success or failure.

#### CLI Example:
```
salt '*' consul.catalog_register node=node1 address=192.168.1.1 service=redis service_address=127.0.0.1 service_port=8080 service_id=redis_server1
```

### `salt.modules.consul.catalog_service`

Information about the registered service.

#### Parameters
- `consul_url` – The Consul server URL.
- `dc` – By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.
- `tag` – Filter returned services with tag parameter.

#### Returns
Information about the requested service.

#### CLI Example:
```
salt '*' consul.catalog_service service=redis
```

### `salt.modules.consul.catalog_services`

Return list of available services from catalog.

21.9. execution modules
Parameters

- **consul_url** – The Consul server URL.
- **dc** – By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

Returns The list of available services.

CLI Example:

```
salt '*' consul.catalog_services
```

```python
salt.modules.consul.delete(consul_url=None, token=None, key=None, **kwargs)
```
Delete values from Consul

Parameters

- **consul_url** – The Consul server URL.
- **key** – The key to use as the starting point for the list.
- **recurse** – Delete values recursively beginning at the value of key.
- **cas** – This flag is used to turn the DELETE into a Check-And-Set operation.

Returns Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.delete key='web'
salt '*' consul.delete key='web' recurse='True'
```

```python
salt.modules.consul.event_fire(consul_url=None, token=None, name=None, **kwargs)
```
List the ACL tokens.

Parameters

- **consul_url** – The Consul server URL.
- **name** – The name of the event to fire.
- **dc** – By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.
- **node** – Filter by node name.
- **service** – Filter by service name.
- **tag** – Filter by tag name.

Returns List of ACLs

CLI Example:

```
salt '*' consul.event_fire name='deploy'
```

```python
salt.modules.consul.event_list(consul_url=None, token=None, **kwargs)
```
List the recent events.

Parameters

- **consul_url** – The Consul server URL.
- **name** – The name of the event to fire.

Returns List of ACLs
CLI Example:

```
salt '*' consul.event_list
```

`salt.modules.consul.get` *(consul_url=*, key=*, token=*, recurse=*, decode=*, raw=*)

Get key from Consul

Parameters
- **consul_url** – The Consul server URL.
- **key** – The key to use as the starting point for the list.
- **recurse** – Return values recursively beginning at the value of key.
- **decode** – By default values are stored as Base64 encoded values, decode will return the whole key with the value decoded.
- **raw** – Simply return the decoded value of the key.

**Returns** The keys in Consul.

CLI Example:

```
salt '*' consul.get key='web/key1'
salt '*' consul.get key='web' recurse=True
salt '*' consul.get key='web' recurse=True decode=True
```

By default values stored in Consul are base64 encoded, passing the decode option will show them as the decoded values.

```
salt '*' consul.get key='web' recurse=True decode=True raw=True
```

By default Consult will return other information about the key, the raw option will return only the raw value.

`salt.modules.consul.health_checks` *(consul_url=*, token=*, service=*, **kwargs)*

Health information about the registered service.

Parameters
- **consul_url** – The Consul server URL.
- **service** – The service to request health information about.
- **dc** – By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

**Returns** Health information about the requested node.

CLI Example:

```
salt '*' consul.health_checks service='redis1'
```

`salt.modules.consul.health_node` *(consul_url=*, token=*, node=*, **kwargs)*

Health information about the registered node.

Parameters
- **consul_url** – The Consul server URL.
- **node** – The node to request health information about.
- **dc** – By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.
Returns  Health information about the requested node.

CLI Example:

```
salt '*' consul.health_node node='node1'
```

salt.modules.consul.health_service(consul_url=None, token=None, service=None, **kwargs)

Returns  Health information about the registered service.

Parameters

- **consul_url** – The Consul server URL.
- **service** – The service to request health information about.
- **dc** – By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.
- **tag** – Filter returned services with tag parameter.
- **passing** – Filter results to only nodes with all checks in the passing state.

Returns  Health information about the requested node.

CLI Example:

```
salt '*' consul.health_service service='redis1'
salt '*' consul.health_service service='redis1' passing='True'
```

salt.modules.consul.health_state(consul_url=None, token=None, state=None, **kwargs)

Returns the checks in the state provided on the path.

Parameters

- **consul_url** – The Consul server URL.
- **state** – The state to show checks for. The supported states are any, unknown, passing, warning, or critical. The any state is a wildcard that can be used to return all checks.
- **dc** – By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

Returns  The checks in the provided state.

CLI Example:

```
salt '*' consul.health_state state='redis1'
salt '*' consul.health_state service='redis1' passing='True'
```

salt.modules.consul.list_ (consul_url=None, token=None, key=None, **kwargs)

List keys in Consul

Parameters

- **consul_url** – The Consul server URL.
- **key** – The key to use as the starting point for the list.

Returns  The list of keys.

CLI Example:
salt '...' consul.list
salt '...' consul.list key='web'

```python
salt.modules.consul.put(consul_url=None, token=None, key=None, value=None, **kwargs)
```

Put values into Consul

**Parameters**

- **consul_url** – The Consul server URL.
- **key** – The key to use as the starting point for the list.
- **value** – The value to set the key to.
- **flags** – This can be used to specify an unsigned value between 0 and \(2^{64}-1\). Clients can choose to use this however makes sense for their application.
- **cas** – This flag is used to turn the PUT into a Check-And-Set operation.
- **acquire** – This flag is used to turn the PUT into a lock acquisition operation.
- **release** – This flag is used to turn the PUT into a lock release operation.

**Returns** Boolean & message of success or failure.

CLI Example:

```bash
salt '*' consul.put key='web/key1' value="Hello there"
salt '*' consul.put key='web/key1' value="Hello there" acquire='d5d371f4-c380-→5280-12fd-8810be175592'
salt '*' consul.put key='web/key1' value="Hello there" release='d5d371f4-c380-→5280-12fd-8810be175592'
```

```python
salt.modules.consul.session_create(consul_url=None, token=None, **kwargs)
```

Used to create a session.

**Parameters**

- **consul_url** – The Consul server URL.
- **lockdelay** – Duration string using a "s" suffix for seconds. The default is 15s.
- **node** – Must refer to a node that is already registered, if specified. By default, the agent’s own node name is used.
- **name** – A human-readable name for the session
- **checks** – A list of associated health checks. It is highly recommended that, if you override this list, you include the default "serfHealth".
- **behavior** – Can be set to either release or delete. This controls the behavior when a session is invalidated. By default, this is release, causing any locks that are held to be released. Changing this to delete causes any locks that are held to be deleted. delete is useful for creating ephemeral key/value entries.
- **ttl** – Session is invalidated if it is not renewed before the TTL expires

**Returns** Boolean and message indicating success or failure.

CLI Example:
salt '*' consul.session_create node='node1' name='my-session' behavior='delete' ttl='3600s'

salt.modules.consul.session_destroy(consul_url=None, token=None, session=None, **kwargs)
Destroy session

Parameters
- **consul_url** – The Consul server URL.
- **session** – The ID of the session to destroy.
- **dc** – By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

Returns Boolean & message of success or failure.

CLI Example:
salt '*' consul.session_destroy session='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'

salt.modules.consul.session_info(consul_url=None, token=None, session=None, **kwargs)
Information about a session

Parameters
- **consul_url** – The Consul server URL.
- **session** – The ID of the session to return information about.
- **dc** – By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

Returns Boolean & message of success or failure.

CLI Example:
salt '*' consul.session_info session='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'

salt.modules.consul.session_list(consul_url=None, token=None, return_list=False, **kwargs)
Used to list sessions.

Parameters
- **consul_url** – The Consul server URL.
- **dc** – By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.
- **return_list** – By default, all information about the sessions is returned, using the return_list parameter will return a list of session IDs.

Returns A list of all available sessions.

CLI Example:
salt '*' consul.session_list

salt.modules.consul.status_leader(consul_url=None, token=None)
Returns the current Raft leader

Parameters **consul_url** – The Consul server URL.

Returns The address of the Raft leader.
CLI Example:
```bash
salt '*' consul.status_leader
```

```
salt.modules.consul.status_peers(consul_url, token=None)
```

Returns the current Raft peer set

**Parameters**

- **consul_url** – The Consul server URL.

**Returns**

Retrieves the Raft peers for the datacenter in which the agent is running.

CLI Example:
```bash
salt '*' consul.status_peers
```

---

### 21.9.86 `salt.modules.container_resource`

Common resources for LXC and systemd-nspawn containers

New in version 2015.8.0.

These functions are not designed to be called directly, but instead from the `lxc, nspawn,` and `docker` execution modules. They provide for common logic to be re-used for common actions.

```
salt.modules.container_resource.cache_file(source)
```

Wrapper for `cp.cache_file` which raises an error if the file was unable to be cached.

CLI Example:
```bash
salt myminion container_resource.cache_file salt://foo/bar/baz.txt
```

```
salt.modules.container_resource.copy_to(name, source, dest, container_type=None, path=None, exec_driver=None, overwrite=False, makedirs=False)
```

Common logic for copying files to containers

**path**

path to the container parent (for LXC only) default: `/var/lib/lxc` (system default)

CLI Example:
```bash
salt myminion container_resource.copy_to mycontainer /local/file/path /container/
```

```
salt.modules.container_resource.run(name, cmd, container_type=None, exec_driver=None, output=None, no_start=False, stdin=None, python_shell=True, output_loglevel='debug', ignore_retcode=False, path=None, use_vt=False, keep_env=None)
```

Common logic for running shell commands in containers

**path**

path to the container parent (for LXC only) default: `/var/lib/lxc` (system default)

CLI Example:
```bash
salt myminion container_resource.run mycontainer 'ps aux' container_type=docker
```

---
21.9.87 `salt.modules.cp`

Minion side functions for salt-cp

```python
salt.modules.cp.cache_dir(path, saltenv='base', include_empty=False, include_pat=None, exclude_pat=None)
```

Download and cache everything under a directory from the master

- **include_pat** [None] Glob or regex to narrow down the files cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.
  - New in version 2014.7.0.

- **exclude_pat** [None] Glob or regex to exclude certain files from being cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.
  - New in version 2014.7.0.

**Note:** If used with `include_pat`, files matching this pattern will be excluded from the subset of files defined by `include_pat`.

CLI Examples:

```bash
salt '*' cp.cache_dir salt://path/to/dir
salt '*' cp.cache_dir salt://path/to/dir include_pat='E@*.py$'
```

```python
salt.modules.cp.cache_file(path, saltenv='base', source_hash=None)
```

Used to cache a single file on the Minion

- **source_hash** If name is an http(s) or ftp URL and the file exists in the minion’s file cache, this option can be passed to keep the minion from re-downloading the file if the cached copy matches the specified hash.
  - New in version 2018.3.0.

CLI Example:

```bash
salt '*' cp.cache_file salt://path/to/file
```

There are two ways of defining the fileserver environment (a.k.a. `saltenv`) from which to cache the file. One is to use the `saltenv` parameter, and the other is to use a querystring syntax in the `salt://` URL. The below two examples are equivalent:

```bash
salt '*' cp.cache_file salt://foo/bar.conf saltenv=config
salt '*' cp.cache_file salt://foo/bar.conf?saltenv=config
```

If the path being cached is a `salt://` URL and the path does not exist, then `False` will be returned.

**Note:** It may be necessary to quote the URL when using the querystring method, depending on the shell being used to run the command.

```python
salt.modules.cp.cache_files(paths, saltenv='base')
```

Used to gather many files from the Master, the gathered files will be saved in the minion cachedir reflective to the paths retrieved from the Master

CLI Example:
There are two ways of defining the fileserver environment (a.k.a. saltenv) from which to cache the files. One is to use the saltenv parameter, and the other is to use a querystring syntax in the salt:// URL. The below two examples are equivalent:

```bash
salt '*' cp.cache_files salt://foo/bar.conf,salt://foo/baz.conf
```

```bash
salt '*' cp.cache_files salt://foo/bar.conf?saltenv=config
```

The querystring method is less useful when all files are being cached from the same environment, but is a good way of caching files from multiple different environments in the same command. For example, the below command will cache the first file from the config1 environment, and the second one from the config2 environment.

```bash
salt '*' cp.cache_files salt://foo/bar.conf?saltenv=config1,salt://foo/bar.conf?saltenv=config2
```

Note: It may be necessary to quote the URL when using the querystring method, depending on the shell being used to run the command.

salt.modules.cp.cache_local_file(path)
Cache a local file on the minion in the localfiles cache

CLI Example:

```bash
salt '*' cp.cache_local_file /etc/hosts
```

salt.modules.cp.cache_master(saltenv='base')
Retrieve all of the files on the master and cache them locally

CLI Example:

```bash
salt '*' cp.cache_master
```

salt.modules.cp.envs()
List available environments for fileserver

CLI Example

```bash
salt '*' cp.envs
```

salt.modules.cp.get_dir(path, dest, saltenv='base', template=None, gzip=None, **kwargs)
Used to recursively copy a directory from the salt master

CLI Example:

```bash
salt '*' cp.get_dir salt://path/to/dir/ /minion/dest
```

get_dir supports the same template and gzip arguments as get_file.

salt.modules.cp.get_file(path, dest, saltenv='base', makedirs=False, template=None, gzip=None, **kwargs)
Changed in version 2018.3.0: dest can now be a directory

Used to get a single file from the salt master

CLI Example:
Template rendering can be enabled on both the source and destination file names like so:

```bash
salt '*' cp.get_file "salt://{{grains.os}}/vimrc" /etc/vimrc template=jinja
```

This example would instruct all Salt minions to download the vimrc from a directory with the same name as their os grain and copy it to /etc/vimrc.

For larger files, the cp.get_file module also supports gzip compression. Because gzip is CPU-intensive, this should only be used in scenarios where the compression ratio is very high (e.g. pretty-printed JSON or YAML files).

Use the `gzip` named argument to enable it. Valid values are 1..9, where 1 is the lightest compression and 9 the heaviest. 1 uses the least CPU on the master (and minion), 9 uses the most.

There are two ways of defining the fileserver environment (a.k.a. `saltenv`) from which to retrieve the file. One is to use the `saltenv` parameter, and the other is to use a querystring syntax in the `salt://` URL. The below two examples are equivalent:

```bash
salt '*' cp.get_file salt://foo/bar.conf /etc/foo/bar.conf saltenv=config
salt '*' cp.get_file salt://foo/bar.conf?saltenv=config /etc/foo/bar.conf
```

**Note:** It may be necessary to quote the URL when using the querystring method, depending on the shell being used to run the command.

salt.modules.cp.get_file_str(path, saltenv='base')

- **Description:** Download a file from a URL to the Minion cache directory and return the contents of that file.
- **Returns:** False if Salt was unable to cache a file from a URL.

**CLI Example:**

```bash
salt '*' cp.get_file_str salt://my/file
```

salt.modules.cp.get_template(path, dest, template='jinja', saltenv='base', makedirs=False, **kwargs)

- **Description:** Render a file as a template before setting it down. Warning, order is not the same as in fileclient.cp for non-breaking old API.

**CLI Example:**

```bash
salt '*' cp.get_template salt://path/to/template /minion/dest
```

salt.modules.cp.get_url(path, dest='', saltenv='base', makedirs=False, source_hash=None)

- **Description:** Used to get a single file from a URL.
- **path** A URL to download a file from. Supported URL schemes are: salt://, http://, https://, ftp://, s3://, swift:// and file:// (local filesystem). If no scheme was specified, this is equivalent of using file://. If a file:// URL is given, the function just returns absolute path to that file on a local filesystem. The function returns False if Salt was unable to fetch a file from a salt:// URL.
- **dest** The default behaviour is to write the fetched file to the given destination path. If this parameter is omitted or set as empty string (""), the function places the remote file on the local filesystem inside the Minion cache directory and returns the path to that file.

1576 Chapter 21. Salt Module Reference
Note: To simply return the file contents instead, set destination to None. This works with salt://, http://, https:// and file:// URLs. The files fetched by http:// and https:// will not be cached.

saltenv [base] Salt fileserver environment from which to retrieve the file. Ignored if path is not a salt:// URL.

source_hash If path is an http(s) or ftp URL and the file exists in the minion’s file cache, this option can be passed to keep the minion from re-downloading the file if the cached copy matches the specified hash.

New in version 2018.3.0.

CLI Example:

```
salt '*' cp.get_url salt://my/file /tmp/this_file_is_mine
salt '*' cp.get_url http://www.slashdot.org /tmp/index.html
```

salt.modules.cp.hash_file(path, saltenv='base')
Return the hash of a file, to get the hash of a file on the salt master file server prepend the path with salt://<file on server> otherwise, prepend the file with / for a local file.

CLI Example:

```
salt '*' cp.hash_file salt://path/to/file
```

salt.modules.cp.is_cached(path, saltenv='base')
Returns the full path to a file if it is cached locally on the minion otherwise returns a blank string

CLI Example:

```
salt '*' cp.is_cached salt://path/to/file
```

salt.modules.cp.list_master(saltenv='base', prefix='')
List all of the files stored on the master

CLI Example:

```
salt '*' cp.list_master
```

salt.modules.cp.list_master_dirs(saltenv='base', prefix='')
List all of the directories stored on the master

CLI Example:

```
salt '*' cp.list_master_dirs
```

salt.modules.cp.list_master_symlinks(saltenv='base', prefix='')
List all of the symlinks stored on the master

CLI Example:

```
salt '*' cp.list_master_symlinks
```

salt.modules.cp.list_minion(saltenv='base')
List all of the files cached on the minion

CLI Example:
salt.modules.cp.list_minion

salt.modules.cp.list_states(saltenv='base')
List all of the available state modules in an environment

CLI Example:

```
salt '*' cp.list_minion
```

salt.modules.cp.push(path, keep_symlinks=False, upload_path=None, remove_source=False)
WARNING Files pushed to the master will have global read permissions.

Push a file from the minion up to the master, the file will be saved to the salt master in the master’s minion files cachedir (defaults to /var/cache/salt/master/minions/minion-id/files)

Since this feature allows a minion to push a file up to the master server it is disabled by default for security purposes. To enable, set file_recv to True in the master configuration file, and restart the master.

**keep_symlinks** Keep the path value without resolving its canonical form

**upload_path** Provide a different path inside the master’s minion files cachedir

**remove_source** Remove the source file on the minion

New in version 2016.3.0.

CLI Example:

```
salt '*' cp.push /etc/fstab
salt '*' cp.push /etc/system-release keep_symlinks=True
salt '*' cp.push /etc/fstab upload_path="/new/path/fstab"
salt '*' cp.push /tmp/filename remove_source=True
```

salt.modules.cp.push_dir(path, glob=None, upload_path=None)
Push a directory from the minion up to the master, the files will be saved to the salt master in the master’s minion files cachedir (defaults to /var/cache/salt/master/minions/minion-id/files). It also has a glob for matching specific files using globbing.

New in version 2014.7.0.

Since this feature allows a minion to push files up to the master server it is disabled by default for security purposes. To enable, set file_recv to True in the master configuration file, and restart the master.

**upload_path** Provide a different path and directory name inside the master’s minion files cachedir

CLI Example:

```
salt '*' cp.push /usr/lib/mysql
salt '*' cp.push /usr/lib/mysql upload_path="/newmysql/path"
salt '*' cp.push_dir /etc/modprobe.d/ glob='*.conf'
```

salt.modules.cp.recv(files, dest)
Used with salt-cp, pass the files dict, and the destination.

This function receives small fast copy files from the master via salt-cp. It does not work via the CLI.

salt.modules.cp.recv_chunked(dest, chunk, append=False, compressed=True, mode=None)
This function receives files copied to the minion using salt-cp and is not intended to be used directly on the CLI.
salt.modules.cp.stat_file(path, saltenv='base', octal=True)

Return the permissions of a file, to get the permissions of a file on the salt master file server prepend the path with salt://<file on server> otherwise, prepend the file with / for a local file.

CLI Example:

```python
salt '*' cp.stat_file salt://path/to/file
```

### 21.9.88 salt.modules.cpan

Manage Perl modules using CPAN

New in version 2015.5.0.

salt.modules.cpan.install(module)

Install a Perl module from CPAN

CLI Example:

```python
salt '*' cpan.install Template::Alloy
```

salt.modules.cpan.list()

List installed Perl modules, and the version installed

CLI Example:

```python
salt '*' cpan.list
```

salt.modules.cpan.remove(module, details=False)

Attempt to remove a Perl module that was installed from CPAN. Because the cpan command doesn’t actually support “uninstall”-like functionality, this function will attempt to do what it can, with what it has from CPAN.

Until this function is declared stable, USE AT YOUR OWN RISK!

CLI Example:

```python
salt '*' cpan.remove Old::Package
```

salt.modules.cpan.show(module)

Show information about a specific Perl module

CLI Example:

```python
salt '*' cpan.show Template::Alloy
```

salt.modules.cpan.show_config()

Return a dict of CPAN configuration values

CLI Example:

```python
salt '*' cpan.show_config
```

### 21.9.89 salt.modules.cron

Work with cron

---

21.9. execution modules 1579
Note: Salt does not escape cron metacharacters automatically. You should backslash-escape percent characters and any other metacharacters that might be interpreted incorrectly by the shell.

salt.modules.cron.list_tab(user)
Return the contents of the specified user’s crontab

CLI Example:
```
salt '*' cron.list_tab root
```

salt.modules.cron.ls(user)
This function is an alias of list_tab.

Return the contents of the specified user’s crontab

CLI Example:
```
salt '*' cron.list_tab root
```

salt.modules.cron.raw_cron(user)
Return the contents of the user's crontab

CLI Example:
```
salt '*' cron.raw_cron root
```

salt.modules.cron.rm(user, cmd, minute=None, hour=None, daymonth=None, month=None, dayweek=None, identifier=None)
This function is an alias of rm_job.

Remove a cron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.

CLI Example:
```
salt '*' cron.rm_job root /usr/local/weekly
salt '*' cron.rm_job root /usr/bin/foo dayweek=1
```

salt.modules.cron.rm_env(user, name)
Remove cron environment variable for a specified user.

CLI Example:
```
salt '*' cron.rm_env root MAILTO
```

salt.modules.cron.rm_job(user, cmd, minute=None, hour=None, daymonth=None, month=None, dayweek=None, identifier=None)
Remove a cron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.

CLI Example:
```
salt '*' cron.rm_job root /usr/local/weekly
salt '*' cron.rm_job root /usr/bin/foo dayweek=1
```

salt.modules.cron.rm_special(user, cmd, special=None, identifier=None)
Remove a special cron job for a specified user.

CLI Example:
salt 'root' cron.rm_special root /usr/bin/foo

salt.modules.cron.set_env(user, name, value=None)
Set up an environment variable in the crontab.

CLI Example:
salt 'root' cron.set_env root MAILTO user@example.com

salt.modules.cron.set_job(user, minute, hour, daymonth, month, dayweek, cmd, commented=False, comment=None, identifier=None)
Sets a cron job up for a specified user.

CLI Example:
salt 'root' cron.set_job root '*/1 * * * * /usr/local/weekly'

salt.modules.cron.set_special(user, special, cmd, commented=False, comment=None, identifier=None)
Set up a special command in the crontab.

CLI Example:
salt 'root' cron.set_special root @hourly 'echo foobar'

salt.modules.cron.write_cron_file(user, path)
Writes the contents of a file to a user’s crontab

CLI Example:
salt 'root' cron.write_cron_file root /tmp/new_cron

Changed in version 2015.8.9.

Note: Some OS’ do not support specifying user via the crontab command i.e. (Solaris, AIX)

salt.modules.cron.write_cron_file_verbose(user, path)
Writes the contents of a file to a user’s crontab and return error message on error

CLI Example:
salt 'root' cron.write_cron_file_verbose root /tmp/new_cron

Changed in version 2015.8.9.

Note: Some OS’ do not support specifying user via the crontab command i.e. (Solaris, AIX)

21.9.90  salt.modules.csf

Support for Config Server Firewall (CSF)

maintainer  Mostafa Hussein <mostafa.hussein91@gmail.com>
maturity  new
platform Linux

salt.modules.csf.allow(ip, port=None, proto='tcp', direction='in', port_origin='d', ip_origin='s', ttl=None, comment="")

Add an rule to csf allowed hosts See _access_rule().
CLI Example:
```
salt '*' csf.allow 127.0.0.1
salt '*' csf.allow 127.0.0.1 comment="Allow localhost"
```

salt.modules.csf.allow_port(port, proto='tcp', direction='both')

Like allow_ports, but it will append to the existing entry instead of replacing it. Takes a single port instead of a list of ports.

CLI Example:
```
salt '*' csf.allow_port 22 proto='tcp' direction='in'
```

salt.modules.csf.allow_ports(ports, proto='tcp', direction='in')

Fully replace the incoming or outgoing ports line in the csf.conf file - e.g. TCP_IN, TCP_OUT, UDP_IN, UDP_OUT, etc.

CLI Example:
```
salt '*' csf.allow_ports ports="[22,80,443,4505,4506]" proto='tcp' direction='in'
```

salt.modules.csf.build_directions(direction)

salt.modules.csf.deny(ip, port=None, proto='tcp', direction='in', port_origin='d', ip_origin='d', ttl=None, comment="")

Add an rule to csf denied hosts See _access_rule().
CLI Example:
```
salt '*' csf.deny 127.0.0.1
salt '*' csf.deny 127.0.0.1 comment="Too localhosty"
```

salt.modules.csf.disable()

Disable csf permanently
CLI Example:
```
salt '*' csf.disable
```

salt.modules.csf.disable_testing_mode()

salt.modules.csf.enable()

Activate csf if not running
CLI Example:
```
salt '*' csf.enable
```

salt.modules.csf.enable_testing_mode()

salt.modules.csf.exists(method, ip, port=None, proto='tcp', direction='in', port_origin='d', ip_origin='d', ttl=None, comment="")

Returns true a rule for the ip already exists based on the method supplied. Returns false if not found.
CLI Example:
```
salt '*' csf.exists allow 1.2.3.4
salt '*' csf.exists tempdeny 1.2.3.4
```

salt.modules.csf.get_option(option)

salt.modules.csf.get_ports(proto='tcp', direction='in')

Lists ports from csf.conf based on direction and protocol. e.g. - TCP_IN, TCP_OUT, UDP_IN, UDP_OUT, etc.
CLI Example:
```
salt '*' csf.allow_port 22 proto='tcp' direction='in'
```

```
salt.modules.csf.get_skipped_nics(ipv6=False)
salt.modules.csf.get_testing_status()
salt.modules.csf.reload()
```

```
salt.modules.csf.remove_rule( method, ip, port=None, proto='tcp', direction='in', port_origin='d', ip_origin='s', ttl=None, comment='')
salt.modules.csf.remove_temp_rule(ip)
salt.modules.csf.running()
```

```
salt.modules.csf.set_option(option, value)
salt.modules.csf.skip_nic(nic, ipv6=False)
salt.modules.csf.skip_nics(nics, ipv6=False)
salt.modules.csf.split_option(option)
```

```
salt.modules.csf.tempallow(ip=None, ttl=None, port=None, direction=None, comment='')
```

```
salt.modules.csf.tempdeny(ip=None, ttl=None, port=None, direction=None, comment='')
```

```
salt.modules.csf.unallow(ip)
salt.modules.csf.undeny(ip)
```

21.9.91 salt.modules.cyg

Manage cygwin packages.

Module file to accompany the cyg state.
salt.modules.cyg.check_valid_package(package, cyg_arch='x86_64', mirrors=None)
Check if the package is valid on the given mirrors.

Parameters

- **package** – The name of the package
- **cyg_arch** – The cygwin architecture
- **mirrors** – any mirrors to check

Returns (bool): True if Valid, otherwise False

CLI Example:

```
salt '*' cyg.check_valid_package <package name>
```

salt.modules.cyg.install(packages=None, cyg_arch='x86_64', mirrors=None)
Install one or several packages.

- **packages** [None] The packages to install
- **cyg_arch** [x86_64] Specify the architecture to install the package under Current options are x86 and x86_64

CLI Example:

```
salt '*' cyg.install dos2unix
salt '*' cyg.install dos2unix mirrors="[{'http://mirror': 'http://url/to/public/ →key}]
```

salt.modules.cyg.list_(package=", cyg_arch='x86_64'
List locally installed packages.

- **package** ["] package name to check. else all
- **cyg_arch**: Cygwin architecture to use Options are x86 and x86_64

CLI Example:

```
salt '*' cyg.list
```

salt.modules.cyg.uninstall(packages, cyg_arch='x86_64', mirrors=None)
Uninstall one or several packages.

- **packages** The packages to uninstall.
- **cyg_arch** [x86_64] Specify the architecture to remove the package from Current options are x86 and x86_64

CLI Example:

```
salt '*' cyg.uninstall dos2unix
salt '*' cyg.uninstall dos2unix mirrors="[{'http://mirror': 'http://url/to/public/ →key}]
```

salt.modules.cyg.update(cyg_arch='x86_64', mirrors=None)
Update all packages.

- **cyg_arch** [x86_64] Specify the cygwin architecture update Current options are x86 and x86_64

CLI Example:

```
salt '*' cyg.update
salt '*' cyg.update dos2unix mirrors="[{'http://mirror': 'http://url/to/public/ →key}]
```
21.9.92 salt.modules.daemontools

daemontools service module. This module will create daemontools type service watcher.

This module is compatible with the service states, so it can be used to maintain services using the provider argument:

```yaml
myservice:
  service.running:
    - provider: daemontools
```

salt.modules.daemontools.available(name)

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```
salt '*' daemontools.available foo
```

salt.modules.daemontools.disabled(name)

Return True if the named service is enabled, false otherwise

New in version 2015.5.6.

CLI Example:

```
salt '*' daemontools.disabled <service name>
```

salt.modules.daemontools.enabled(name, **kwargs)

Return True if the named service is enabled, false otherwise A service is considered enabled if in your service directory: - an executable ./run file exist - a file named "down" does not exist

New in version 2015.5.7.

name  Service name

CLI Example:

```
salt '*' daemontools.enabled <service name>
```

salt.modules.daemontools.full_restart(name)

Calls daemontools.restart() function

CLI Example:

```
salt '*' daemontools.full_restart <service name>
```

salt.modules.daemontools.get_all()

Return a list of all available services

CLI Example:

```
salt '*' daemontools.get_all
```

salt.modules.daemontools.missing(name)

The inverse of daemontools.available. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' daemontools.missing foo
```
salt.modules.daemontools.reload_(name)
   Wrapper for term()
   CLI Example:
   
   ```
   salt '*' daemontools.reload <service name>
   ```

salt.modules.daemontools.restart(name)
   Restart service via daemontools. This will stop/start service
   CLI Example:
   
   ```
   salt '*' daemontools.restart <service name>
   ```

salt.modules.daemontools.start(name)
   Starts service via daemontools
   CLI Example:
   
   ```
   salt '*' daemontools.start <service name>
   ```

salt.modules.daemontools.status(name, sig=None)
   Return the status for a service via daemontools, return pid if running
   CLI Example:
   
   ```
   salt '*' daemontools.status <service name>
   ```

salt.modules.daemontools.stop(name)
   Stops service via daemontools
   CLI Example:
   
   ```
   salt '*' daemontools.stop <service name>
   ```

salt.modules.daemontools.term(name)
   Send a TERM to service via daemontools
   CLI Example:
   
   ```
   salt '*' daemontools.term <service name>
   ```

21.9.93 salt.modules.data

Manage a local persistent data structure that can hold any arbitrary data specific to the minion

salt.modules.data.cas(key, value, old_value)
   Check and set a value in the minion datastore
   CLI Example:
   
   ```
   salt '*' data.cas <key> <value> <old_value>
   ```

salt.modules.data.clear()
   Clear out all of the data in the minion datastore, this function is destructive!
   CLI Example:
salt '*' data.clear

salt.modules.data.dump(new_data)
Replace the entire datastore with a passed data structure
CLI Example:
```
salt '*' data.dump '{'eggs': 'spam'}'
```

salt.modules.data.get(key, default=None)
Get a (list of) value(s) from the minion datastore
New in version 2015.8.0.
CLI Example:
```
salt '*' data.get key
salt '*' data.get ['"key1", "key2"]
```

salt.modules.data.has_key(key)
Check if key is in the minion datastore
New in version 2015.8.0.
CLI Example:
```
salt '*' data.has_key <mykey>
```

salt.modules.data.items()
Get items from the minion datastore
New in version 2015.8.0.
CLI Example:
```
salt '*' data.items
```

salt.modules.data.keys()
Get all keys from the minion datastore
New in version 2015.8.0.
CLI Example:
```
salt '*' data.keys
```

salt.modules.data.load()
Return all of the data in the minion datastore
CLI Example:
```
salt '*' data.load
```

salt.modules.data.pop(key, default=None)
Pop (return & delete) a value from the minion datastore
New in version 2015.5.2.
CLI Example:
salt '∗' data.pop <key> "there was no val"

salt.modules.data.update(<key>, <value>)
Update a key with a value in the minion datastore

CLI Example:
```
salt '∗' data.update <key> <value>
```

salt.modules.data.values()

Get values from the minion datastore

New in version 2015.8.0.

CLI Example:
```
salt '∗' data.values
```

### 21.9.94 salt.modules.datadog_api

An execution module that interacts with the Datadog API

The following parameters are required for all functions.

- **api_key**  The datadog API key
- **app_key**  The datadog application key

Full argument reference is available on the Datadog API reference page [https://docs.datadoghq.com/api/](https://docs.datadoghq.com/api/)

salt.modules.datadog_api.cancel_downtime(<api_key=None, app_key=None, scope=None, id=None>)

Cancel a downtime by id or by scope.

CLI Example:
```
salt-call datadog.cancel_downtime scope='host:app01' \  
    api_key='0123456789' \  
    app_key='9876543210'
```

Arguments - Either scope or id is required.

**Parameters**
- **id**  – The downtime ID
- **scope**  – The downtime scope

salt.modules.datadog_api.post_event(<api_key=None, app_key=None, title=None, text=None,  
    date_happened=None, priority=None, host=None,  
    tags=None, alert_type=None, aggregation_key=None,  
    source_type_name=None>)

Post an event to the Datadog stream.

CLI Example
```
salt-call datadog.post_event api_key='0123456789' \  
    app_key='9876543210' \  
    title='Salt Highstate'
```

(continues on next page)
Required arguments

Parameters

- **title** – The event title. Limited to 100 characters.
- **text** – The body of the event. Limited to 4000 characters. The text supports markdown.

Optional arguments

Parameters

- **date_happened** – POSIX timestamp of the event.
- **priority** – The priority of the event (‘normal’ or ‘low’).
- **host** – Host name to associate with the event.
- **tags** – A list of tags to apply to the event.
- **alert_type** – "error", "warning", "info" or "success".
- **aggregation_key** – An arbitrary string to use for aggregation, max length of 100 characters.
- **source_type_name** – The type of event being posted.

salt.modules.datadog_api.schedule_downtime (scope, api_key=None, app_key=None, monitor_id=None, start=None, end=None, message=None, recurrence=None, timezone=None, test=False)

Schedule downtime for a scope of monitors.

CLI Example:

salt-call datadog.schedule_downtime 'host:app2' \
   stop=$(date --date='30 minutes' +%s) \
   app_key='0123456789' \
   api_key='9876543210'

Optional arguments

Parameters

- **monitor_id** – The ID of the monitor
- **start** – Start time in seconds since the epoch
- **end** – End time in seconds since the epoch
- **message** – A message to send in a notification for this downtime
- **recurrence** – Repeat this downtime periodically
- **timezone** – Specify the timezone

21.9.95 salt.modules.ddns

Support for RFC 2136 dynamic DNS updates.
depends
  • dnspython Python module

configuration If you want to use TSIG authentication for the server, there are a couple of optional
configuration parameters made available to support this (the keyname is only needed if the keyring
contains more than one key):

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>keyfile</td>
<td>keyring file (default=None)</td>
</tr>
<tr>
<td>keyname</td>
<td>key name in file (default=None)</td>
</tr>
<tr>
<td>keyalgorithm</td>
<td>algorithm used to create the key</td>
</tr>
<tr>
<td></td>
<td>(default='HMAC-MD5.SIG-ALG.REG.INT'). Other</td>
</tr>
<tr>
<td></td>
<td>possible values: hmac-sha1, hmac-sha224, hmac-sha256,</td>
</tr>
<tr>
<td></td>
<td>hmac-sha384, hmac-sha512</td>
</tr>
</tbody>
</table>

The keyring file needs to be in json format and the key name needs to end with an extra period in
the file, similar to this:

```json
{"keyname.": "keycontent"}
```

```
salt.modules.ddns.add_host(zone, name, ttl, ip, nameserver='127.0.0.1', replace=True, timeout=5, port=53, **kwargs)
```

Add, replace, or update the A and PTR (reverse) records for a host.

CLI Example:

```
salt ns1 ddns.add_host example.com host1 60 10.1.1.1
```

```
salt.modules.ddns.delete(zone, name, rdtype=None, data=None, nameserver='127.0.0.1', timeout=5, port=53, **kwargs)
```

Delete a DNS record.

CLI Example:

```
salt ns1 ddns.delete example.com host1 A
```

```
salt.modules.ddns.delete_host(zone, name, nameserver='127.0.0.1', timeout=5, port=53, **kwargs)
```

Delete the forward and reverse records for a host.

Returns true if any records are deleted.

CLI Example:

```
salt ns1 ddns.delete_host example.com host1
```

```
salt.modules.ddns.update(zone, name, ttl, rdtype, data, nameserver='127.0.0.1', timeout=5, replace=False, port=53, **kwargs)
```

Add, replace, or update a DNS record. nameserver must be an IP address and the minion running this module
must have update privileges on that server. If replace is true, first deletes all records for this name and type.

CLI Example:

```
salt ns1 ddns.update example.com host1 60 A 10.0.0.1
```

21.9.96 salt.modules.deb_apache

Support for Apache
Please note: The functions in here are Debian-specific. Placing them in this separate file will allow them to load only on Debian-based systems, while still loading under the `apache` namespace.

**salt.modules.deb_apache.a2disconf** *(conf)*

New in version 2016.3.0.

Runs `a2disconf` for the given conf.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2disconf security
```

**salt.modules.deb_apache.a2dismod** *(mod)*

Runs `a2dismod` for the given mod.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2dismod vhost_alias
```

**salt.modules.deb_apache.a2dissite** *(site)*

Runs `a2dissite` for the given site.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2dissite example.com
```

**salt.modules.deb_apache.a2enconf** *(conf)*

New in version 2016.3.0.

Runs `a2enconf` for the given conf.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2enconf security
```

**salt.modules.deb_apache.a2enmod** *(mod)*

Runs `a2enmod` for the given mod.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2enmod vhost_alias
```

**salt.modules.deb_apache.a2ensite** *(site)*

Runs `a2ensite` for the given site.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2ensite example.com
```
salt.modules.deb_apache.check_conf_enabled(conf)
New in version 2016.3.0.
Checks to see if the specific conf symlink is in /etc/apache2/conf-enabled.
This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).
CLI Examples:

```
salt '*' apache.check_conf_enabled security
salt '*' apache.check_conf_enabled security.conf
```

salt.modules.deb_apache.check_mod_enabled(mod)
Checks to see if the specific mod symlink is in /etc/apache2/mods-enabled.
This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).
CLI Examples:

```
salt '*' apache.check_mod_enabled status
salt '*' apache.check_mod_enabled status.load
salt '*' apache.check_mod_enabled status.conf
```

salt.modules.deb_apache.check_site_enabled(site)
Checks to see if the specific site symlink is in /etc/apache2/sites-enabled.
This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).
CLI Examples:

```
salt '*' apache.check_site_enabled example.com
salt '*' apache.check_site_enabled example.com.conf
```

21.9.97 salt.modules.deb_postgres

Module to provide Postgres compatibility to salt for debian family specific tools.
salt.modules.deb_postgres.cluster_create(version, name='main', port=None, locale=None, encoding=None, datadir=None)
   Adds a cluster to the Postgres server.
   CLI Example:
```
salt '*' postgres.cluster_create '9.3'
salt '*' postgres.cluster_create '9.3' 'main'
salt '*' postgres.cluster_create '9.3' locale='fr_FR'
```

salt.modules.deb_postgres.cluster_exists(version, name='main')
Checks if a given version and name of a cluster exists.
CLI Example:
```
salt '*' postgres.cluster_exists '9.3'
salt '*' postgres.cluster_exists '9.3' 'main'
```

salt.modules.deb_postgres.cluster_list(verbos= False)
Return a list of cluster of Postgres server (tuples of version and name).
21.9.98 salt.modules.debuild_pkgbuild

Debian Package builder system

New in version 2015.8.0.

This system allows for all of the components to build debs safely in chrooted environments. This also provides a function to generate debian repositories

This module implements the pkgbuild interface

```python
class Pkgbuild(object):
    # Implementation details...
```

salt.modules.debuild_pkgbuild.build(runas, tgt, dest_dir, spec, sources, deps, env, template, saltenv='base', log_dir='/var/log/salt/pkgbuild')

Given the package destination directory, the tarball containing debian files (e.g. control) and package sources, use pbuilder to safely build the platform package

CLI Example:

Debian

```bash
salt '*' pkgbuild.make_src_pkg deb-8-x86_64 /var/www/html
   https://raw.githubusercontent.com/saltstack/libnacl/master/pkg/deb/python-
   → libnacl.control
   https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```

This example command should build the libnacl package for Debian using pbuilder and place it in /var/www/html/ on the minion

salt.modules.debuild_pkgbuild.make_repo(repodir, keyid=None, use_passphrase=False, gnupghome='/etc/salt/gpgkeys', runas='root', timeout=15.0)

Make a package repository and optionally sign it and packages present

Given the repodir (directory to create repository in), create a Debian repository and optionally sign it and packages present. This state is best used with onchanges linked to your package building states.

repodir The directory to find packages that will be in the repository.

keyid Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. This consists of the last 8 hex digits of the GPG key ID.
Utilizes Public and Private keys associated with keyid which have been loaded into the minion’s Pillar data. Leverages gpg-agent and gpg-preset-passphrase for caching keys, etc. These pillar values are assumed to be filenames which are present in gnupghome. The pillar keys shown below have to match exactly.

For example, contents from a Pillar data file with named Public and Private keys as follows:

<table>
<thead>
<tr>
<th>Pillar Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>gpg_pkg_priv_keyname</td>
<td>gpg_pkg_key.pem</td>
</tr>
<tr>
<td>gpg_pkg_pub_keyname</td>
<td>gpg_pkg_key.pub</td>
</tr>
</tbody>
</table>

**env** Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository.

**use_passphrase** [False] New in version 2016.3.0.

Use a passphrase with the signing key presented in keyid. Passphrase is received from Pillar data which could be passed on the command line with pillar parameter. For example:

```
pillar='{ "gpg_passphrase" : "my_passphrase" }'
```

**gnupghome** [/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with keyid.

**runas** [root] New in version 2016.3.0.

User to create the repository as, and optionally sign packages.

**Note:** Ensure the user has correct permissions to any files and directories which are to be utilized.

**timeout** [15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

CLI Example:

```
salt '*' pkgbuild.make_repo /var/www/html
```

salt.modules.debuild_pkgbuild.make_src_pkg(dest_dir, spec, sources, env=None, saltenv='base', runas='root')

Create a platform specific source package from the given platform spec/control file and sources

CLI Example:

Debian

```
salt '*' pkgbuild.make_src_pkg /var/www/html/
https://raw.githubusercontent.com/saltstack/libnacl/master/pkg/deb/python-
libnacl.control.tar.xz
https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```

This example command should build the libnacl SOURCE package and place it in /var/www/html/ on the minion

**dest_dir** Absolute path for directory to write source package

**spec** Absolute path to spec file or equivalent

**sources** Absolute path to source files to build source package from

**env** [None] A list or dictionary of environment variables to be set prior to execution. Example:
Warning: The above illustrates a common PyYAML pitfall, that yes, no, on, off, true, and false are all loaded as boolean True and False values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found here.

saltenv: base
Salt environment variables

User to create the files and directories

Note: Ensure the user has correct permissions to any files and directories which are to be utilized.

21.9.99 salt.modules.debconfmod
Support for Debconf

salt.modules.debconfmod.get_selections(fetchempty=True)
Answers to debconf questions for all packages in the following format:

```
{'package': [['question', 'type', 'value'], ...]}  
```

CLI Example:

```
salt '*' debconf.get_selections  
```

salt.modules.debconfmod.set_(package, question, type, value, "extra")
Set answers to debconf questions for a package.

CLI Example:

```
salt '*' debconf.set <package> <question> <type> <value> [<value> ...]  
```

salt.modules.debconfmod.set_file(path, saltenv='base', **kwargs)
Set answers to debconf questions from a file.

CLI Example:

```
salt '*' debconf.set_file salt://path/to/pkg.selections  
```

salt.modules.debconfmod.set_template(path, template, context, defaults, saltenv='base', **kwargs)
Set answers to debconf questions from a template.

path  location of the file containing the package selections
template  template format
context  variables to add to the template environment
default  default values for the template environment
CLI Example:

```bash
salt '*' debconf.set_template salt://path/to/pkg.selections.jinja jinja None None
```

**salt.modules.debconfmod.show(name)**

Answers to debconf questions for a package in the following format:

```bash
[['question', 'type', 'value'], ...]
```

If debconf doesn’t know about a package, we return None.

CLI Example:

```bash
salt '*' debconf.show <package name>
```

### 21.9.100 salt.modules.debian_ip

The networking module for Debian-based distros

References:

**salt.modules.debian_ip.apply_network_settings(**"settings"

Apply global network configuration.

CLI Example:

```bash
salt '*' ip.apply_network_settings
```

**salt.modules.debian_ip.build_bond(iface, **settings)**

Create a bond script in /etc/modprobe.d with the passed settings and load the bonding kernel module.

CLI Example:

```bash
salt '*' ip.build_bond bond0 mode=balance-alb
```

**salt.modules.debian_ip.build_interface(iface, iface_type, enabled, **settings)**

Build an interface script for a network interface.

CLI Example:

```bash
salt '*' ip.build_interface eth0 eth <settings>
```

**salt.modules.debian_ip.build_network_settings(**"settings"

Build the global network script.

CLI Example:

```bash
salt '*' ip.build_network_settings <settings>
```

**salt.modules.debian_ip.build_routes(iface, **settings)**

Add route scripts for a network interface using up commands.

CLI Example:

```bash
salt '*' ip.build_routes eth0 <settings>
```
salt.modules.debian_ip.down(iface, iface_type)
   Shutdown a network interface
   CLI Example:
   salt '*' ip.down eth0 eth

salt.modules.debian_ip.get_bond(iface)
   Return the content of a bond script
   CLI Example:
   salt '*' ip.get_bond bond0

salt.modules.debian_ip.get_interface(iface)
   Return the contents of an interface script
   CLI Example:
   salt '*' ip.get_interface eth0

salt.modules.debian_ip.get_network_settings()
   Return the contents of the global network script.
   CLI Example:
   salt '*' ip.get_network_settings

salt.modules.debian_ip.get_routes(iface)
   Return the routes for the interface
   CLI Example:
   salt '*' ip.get_routes eth0

salt.modules.debian_ip.up(iface, iface_type)
   Start up a network interface
   CLI Example:
   salt '*' ip.up eth0 eth

21.9.101 salt.modules.debian_service

Service support for Debian systems (uses update-rc.d and /sbin/service)

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see here.

salt.modules.debian_service.available(name)
   Returns True if the specified service is available, otherwise returns False.
   CLI Example:
   salt '*' service.available sshd
salt.modules.debian_service.disable(name, **kwargs)
    Disable the named service to start at boot
    CLI Example:
    
    ```
    salt '*' service.disable <service name>
    ```

salt.modules.debian_service.disabled(name)
    Return True if the named service is disabled, false otherwise
    CLI Example:
    
    ```
    salt '*' service.disabled <service name>
    ```

salt.modules.debian_service.enable(name, **kwargs)
    Enable the named service to start at boot
    CLI Example:
    
    ```
    salt '*' service.enable <service name>
    ```

salt.modules.debian_service.enabled(name, **kwargs)
    Return True if the named service is enabled, false otherwise
    CLI Example:
    
    ```
    salt '*' service.enabled <service name>
    ```

salt.modules.debian_service.force_reload(name)
    Force-reload the named service
    CLI Example:
    
    ```
    salt '*' service.force_reload <service name>
    ```

salt.modules.debian_service.get_all()
    Return all available boot services
    CLI Example:
    
    ```
    salt '*' service.get_all
    ```

salt.modules.debian_service.get_disabled()
    Return a set of services that are installed but disabled
    CLI Example:
    
    ```
    salt '*' service.get_disabled
    ```

salt.modules.debian_service.get_enabled()
    Return a list of service that are enabled on boot
    CLI Example:
    
    ```
    salt '*' service.get_enabled
    ```

salt.modules.debian_service.missing(name)
    The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.
    CLI Example:
salt '*' service.missing sshd

salt.modules.debian_service.reload_(name)
    Reload the named service
    CLI Example:
    ```
salt '*' service.reload <service name>
    ```

salt.modules.debian_service.restart(name)
    Restart the named service
    CLI Example:
    ```
salt '*' service.restart <service name>
    ```

salt.modules.debian_service.start(name)
    Start the specified service
    CLI Example:
    ```
salt '*' service.start <service name>
    ```

salt.modules.debian_service.status(name, sig=None)
    Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.
    Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

    Parameters
    • name (str) – The name of the service to check
    • sig (str) – Signature to use to find the service via ps

    Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise

    Return type bool
    CLI Example:
    ```
salt '*' service.status <service name> [service signature]
    ```

salt.modules.debian_service.stop(name)
    Stop the specified service
    CLI Example:
    ```
salt '*' service.stop <service name>
    ```

21.9.102  salt.modules.defaults

Module to work with salt formula defaults files

salt.modules.defaults.deepcopy(source)
    Allows deep copy of objects in formulas.

    By default, Python does not copy objects, it creates bindings between a target and an object.

    It is more typical to use this in a templating language in formulas, instead of directly on the command-line.
salt.modules.defaults.get(key, default="")
defaults.get is used much like pillar.get except that it will read a default value for a pillar from defaults.json or defaults.yaml files that are stored in the root of a salt formula.

CLI Example:

```
salt '*' defaults.get core:users:root
```

The defaults is computed from pillar key. The first entry is considered as the formula namespace.

For example, querying `core:users:root` will try to load `salt://core/defaults.yaml` and `salt://core/defaults.json`.

salt.modules.defaults.merge(dest, src, merge_lists=False, in_place=True)
Allows deep merging of dicts in formulas.

- **merge_lists** [False] If True, it will also merge lists instead of replace their items.
- **in_place** [True] If True, it will merge into dest dict, if not it will make a new copy from that dict and return it.

CLI Example: .. code-block:: bash

```
salt '*' default.merge a=b d=e
```

It is more typical to use this in a templating language in formulas, instead of directly on the command-line.

salt.modules.defaults.update(dest, defaults, merge_lists=True, in_place=True)
Allows to set defaults for group of data set e.g. group for nodes.

This function is a combination of defaults.merge and defaults.deepcopy to avoid redundant in jinja.

Example:

```
group01:
defaults:
    enabled: True
defaults:
extra:
    - test
    - stage
nodes:
    host01:
        index: foo
        upstream: bar
    host02:
        index: foo2
        upstream: bar2
%
```

```
{% do salt['defaults.update'](group01.nodes, group01.defaults) %}
```

Each node will look like the following:

```
host01:
    enabled: True
    index: foo
    upstream: bar
    extra:
    - test
    - stage
```

- **merge_lists** [True] If True, it will also merge lists instead of replace their items.
**in_place**  [True] If True, it will merge into dest dict. if not it will make a new copy from that dict and return it.

It is more typical to use this in a templating language in formulas, instead of directly on the command-line.

### 21.9.103 salt.modules.devmap

Device-Mapper module

**salt.modules.devmap.multipath_flush**(device)

Device-Mapper Multipath flush

CLI Example:

```bash
salt '*' devmap.multipath_flush mpath1
```

**salt.modules.devmap.multipath_list()**

Device-Mapper Multipath list

CLI Example:

```bash
salt '*' devmap.multipath_list
```

### 21.9.104 salt.modules.dig

Compendium of generic DNS utilities. The 'dig' command line tool must be installed in order to use this module.

**salt.modules.dig.A**(host, nameserver=None)

Return the A record for host.

Always returns a list.

CLI Example:

```bash
salt ns1 dig.A www.google.com
```

**salt.modules.dig.AAAA**(host, nameserver=None)

Return the AAAA record for host.

Always returns a list.

CLI Example:

```bash
salt ns1 dig.AAAA www.google.com
```

**salt.modules.dig.MX**(domain, resolve=False, nameserver=None)

Return a list of lists for the MX of domain.

If the resolve argument is True, resolve IPs for the servers.

It’s limited to one IP, because although in practice it’s very rarely a round robin, it is an acceptable configuration and pulling just one IP lets the data be similar to the non-resolved version. If you think an MX has multiple IPs, don’t use the resolver here, resolve them in a separate step.

CLI Example:

```bash
salt ns1 dig.MX google.com
```
salt.modules.dig.NS(domain, resolve=True, nameserver=None)
    Return a list of IPs of the nameservers for domain
    If resolve is False, don't resolve names.
    CLI Example:
    salt ns1 dig.NS google.com

salt.modules.dig.SPF(domain, record='SPF', nameserver=None)
    Return the allowed IPv4 ranges in the SPF record for domain.
    If record is SPF and the SPF record is empty, the TXT record will be searched automatically. If you know the
domain uses TXT and not SPF, specifying that will save a lookup.
    CLI Example:
    salt ns1 dig.SPF google.com

salt.modules.dig.TXT(host, nameserver=None)
    Return the TXT record for host.
    Always returns a list.
    CLI Example:
    salt ns1 dig.TXT google.com

salt.modules.dig.check_ip(addr)
    Check if address is a valid IP. returns True if valid, otherwise False.
    CLI Example:
    salt ns1 dig.check_ip 127.0.0.1

21.9.105 salt.modules.disk

Module for managing disks and blockdevices

salt.modules.disk.blkid(device=None, token=None)
    Return block device attributes: UUID, LABEL, etc. This function only works on systems where blkid is avail-
    able.
    device Device name from the system
    token Any valid token used for the search
    CLI Example:
    salt '*' disk.blkid
    salt '*' disk.blkid /dev/sda
    salt '*' disk.blkid token='UUID=6a38ee5-7235-44e7-8b22-816a403bad5d'
    salt '*' disk.blkid token='TYPE=ext4'

salt.modules.disk.dump(device, args=None)
    Return all contents of dumpe2fs for a specified device
    CLI Example: .. code-block:: bash
    salt '*' disk.dump /dev/sda1
salt.modules.disk.format_(device, fs_type='ext4', inode_size=None, lazy_table_init=None, fat=None, force=False)

Format a filesystem onto a device

New in version 2016.11.0.

device The device in which to create the new filesystem

fs_type The type of filesystem to create

inode_size Size of the inodes

This option is only enabled for ext and xfs filesystems

lazy_table_init If enabled and the uninit_bg feature is enabled, the inode table will not be fully initialized by mke2fs. This speeds up filesystem initialization noticeably, but it requires the kernel to finish initializing the filesystem in the background when the filesystem is first mounted. If the option value is omitted, it defaults to 1 to enable lazy inode table zeroing.

This option is only enabled for ext filesystems

fat FAT size option. Can be 12, 16 or 32, and can only be used on fat or vfat filesystems.

force Force mke2fs to create a filesystem, even if the specified device is not a partition on a block special device. This option is only enabled for ext and xfs filesystems

This option is dangerous, use it with caution.

CLI Example:

```
salt '*' disk.format /dev/sdX1
```

salt.modules.disk.fstype(device)

Return the filesystem name of the specified device

New in version 2016.11.0.

device The name of the device

CLI Example:

```
salt '*' disk.fstype /dev/sdX1
```

salt.modules.disk.hdparms(disks, args=None)

Retrieve all info’s for all disks parse ‘em into a nice dict (which, considering hdparm output, is quite a hassle)

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' disk.hdparms /dev/sda
```

salt.modules.disk.hpa(disks, size=None)

Get/set Host Protected Area settings

T13 INCITS 346-2001 (1367D) defines the BEER (Boot Engineering Extension Record) and PARTIES (Protected Area Run Time Interface Extension Services), allowing for a Host Protected Area on a disk.

It’s often used by OEMs to hide parts of a disk, and for overprovisioning SSD’s

[Warning]: Setting the HPA might clobber your data, be very careful with this on active disks!
New in version 2016.3.0.

**CLI Example:**
```
salt '*' disk.hpa /dev/sda
salt '*' disk.hpa /dev/sda 5%
salt '*' disk.hpa /dev/sda 10543256
```

**salt.modules.disk.inodeusage(args=None)**
Return inode usage information for volumes mounted on this minion

**CLI Example:**
```
salt '*' disk.inodeusage
```

**salt.modules.disk.iostat(interval=1, count=5, disks=None)**
Gather and return (averaged) IO stats.
New in version 2016.3.0.
Changed in version 2016.11.4: Added support for AIX

**CLI Example:**
```
salt '*' disk.iostat 1 5 disks=sda
```

**salt.modules.disk.percent(args=None)**
Return partition information for volumes mounted on this minion

**CLI Example:**
```
salt '*' disk.percent /var
```

**salt.modules.disk.resize2fs(device)**
Resizes the filesystem.

**CLI Example:**
```
salt '*' disk.resize2fs /dev/sda1
```

**salt.modules.disk.smart_attributes(dev, attributes=None, values=None)**
Fetch SMART attributes Providing attributes will deliver only requested attributes Providing values will deliver only requested values for attributes

Default is the Backblaze recommended set ([https://www.backblaze.com/blog/hard-drive-smart-stats/](https://www.backblaze.com/blog/hard-drive-smart-stats/)):
(5,187,188,197,198)

New in version 2016.3.0.

**CLI Example:**
```
salt '*' disk.smart_attributes /dev/sda
salt '*' disk.smart_attributes /dev/sda attributes=(5,187,188,197,198)
```

**salt.modules.disk.tune(device, **kwargs)**
Set attributes for the specified device

**CLI Example:**
```
salt '*' disk.tune /dev/sda1 read-ahead=1024 read-write=True
```
Valid options are: read-ahead, filesystem-read-ahead, read-only, read-write.

See the blockdev(8) manpage for a more complete description of these options.

`salt.modules.disk.usage(ARGS=None)`
Return usage information for volumes mounted on this minion

Changed in version 2019.2.0: Default for SunOS changed to 1 kilobyte blocks

CLI Example:

```
salt '*' disk.usage
```

`salt.modules.disk.wipe(DEVICE)`
Remove the filesystem information

CLI Example:

```
salt '*' disk.wipe /dev/sda1
```

21.9.106 `salt.modules.djangomod`

Manage Django sites

`salt.modules.djangomod.collectstatic(SETTINGS_MODULE, BIN_ENV=None, NO_POST_PROCESS=False, IGNORE=None, DRY_RUN=False, CLEAR=False, LINK=False, NO_DEFAULTIGNORE=False, PYTHONPATH=None, ENV=None, RUNAS=None)`
Collect static files from each of your applications into a single location that can easily be served in production.

CLI Example:

```
salt '*' django.collectstatic <settings_module>
```

`salt.modules.djangomod.command(SETTINGS_MODULE, COMMAND, BIN_ENV=None, PYTHONPATH=None, ENV=None, RUNAS=None, *ARGS, **kwargs)`
Run arbitrary django management command

CLI Example:

```
salt '*' django.command <settings_module> <command>
```

`salt.modules.djangomod.createsuperuser(SETTINGS_MODULE, USERNAME, EMAIL, BIN_ENV=None, DATABASE=None, PYTHONPATH=None, ENV=None, RUNAS=None)`
Create a super user for the database. This function defaults to use the --noinput flag which prevents the creation of a password for the superuser.

CLI Example:

```
salt '*' django.createsuperuser <settings_module> user user@example.com
```

`salt.modules.djangomod.loaddata(SETTINGS_MODULE, FIXTURES, BIN_ENV=None, DATABASE=None, PYTHONPATH=None, ENV=None)`
Load fixture data

**Fixtures:** comma separated list of fixtures to load

CLI Example:
salt '*' django.loaddata <settings_module> <comma delimited list of fixtures>

```
salt.modules.djangomod.migrate(  
    settings_module,  
    app_label=None,  
    migration_name=None,  
    bin_env=None,  
    database=None,  
    pythonpath=None,  
    env=None,  
    noinput=True,  
    runas=None  
)
```

Run migrate

Execute the Django-Admin migrate command (requires Django 1.7 or higher).

New in version 3000.

**settings_module** Specifies the settings module to use. The settings module should be in Python package syntax, e.g. mysite.settings. If this isn’t provided, django-admin will use the DJANGO_SETTINGS_MODULE environment variable.

**app_label** Specific app to run migrations for, instead of all apps. This may involve running other apps’ migrations too, due to dependencies.

**migration_name** Named migration to be applied to a specific app. Brings the database schema to a state where the named migration is applied, but no later migrations in the same app are applied. This may involve unapplying migrations if you have previously migrated past the named migration. Use the name zero to unapply all migrations for an app.

**bin_env** Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. /usr/bin/pip-2.7 or /usr/bin/pip-2.6. If a directory path is specified, it is assumed to be a virtualenv.

**database** Database to migrate. Defaults to ’default’.

**pythonpath** Adds the given filesystem path to the Python import search path. If this isn’t provided, django-admin will use the PYTHONPATH environment variable.

**env** A list of environment variables to be set prior to execution.

Example:

```
module.run:
  - name: django.migrate
  - settings_module: my_django_app.settings
  - env:
    - DATABASE_USER: 'mydbuser'
```

**noinput** Suppresses all user prompts. Defaults to True.

**runas** The user name to run the command as.

CLI Example:

```
salt '*' django.migrate <settings_module>
salt '*' django.migrate <settings_module> <app_label>
salt '*' django.migrate <settings_module> <app_label> <migration_name>
```

```
salt.modules.djangomod.syncdb(  
    settings_module,  
    bin_env=None,  
    migrate=False,  
    database=None,  
    pythonpath=None,  
    env=None,  
    noinput=True,  
    runas=None  
)
```

Run syncdb

Execute the Django-Admin syncdb command, if South is available on the minion the migrate option can be passed as True calling the migrations to run after the syncdb completes

NOTE: The syncdb command was deprecated in Django 1.7 and removed in Django 1.9. For Django versions 1.9 or higher use the migrate command instead.
CLI Example:

```
salt '*' django.syncdb <settings_module>
```

21.9.107 salt.modules.dnsmasq

Module for managing dnsmasq

salt.modules.dnsmasq.fullversion()

Shows installed version of dnsmasq and compile options.

CLI Example:

```
salt '*' dnsmasq.fullversion
```

salt.modules.dnsmasq.get_config(config_file='/etc/dnsmasq.conf')

Dumps all options from the config file.

**config_file** The location of the config file from which to obtain contents. Defaults to /etc/dnsmasq.conf.

CLI Examples:

```
salt '*' dnsmasq.get_config
salt '*' dnsmasq.get_config config_file=/etc/dnsmasq.conf
```

salt.modules.dnsmasq.set_config(config_file='/etc/dnsmasq.conf', follow=True, **kwargs)

Sets a value or a set of values in the specified file. By default, if conf-dir is configured in this file, salt will attempt to set the option in any file inside the conf-dir where it has already been enabled. If it does not find it inside any files, it will append it to the main config file. Setting follow to False will turn off this behavior.

If a config option currently appears multiple times (such as dhcp-host, which is specified at least once per host), the new option will be added to the end of the main config file (and not to any includes). If you need an option added to a specific include file, specify it as the config_file.

**Parameters**

- **config_file** *(string)* – config file where settings should be updated / added.
- **follow** *(bool)* – attempt to set the config option inside any file within the conf-dir where it has already been enabled.
- **kwargs** – key value pairs that contain the configuration settings that you want set.

CLI Examples:

```
salt '*' dnsmasq.set_config domain=mydomain.com
salt '*' dnsmasq.set_config follow=False domain=mydomain.com
salt '*' dnsmasq.set_config config_file=/etc/dnsmasq.conf domain=mydomain.com
```

salt.modules.dnsmasq.version()

Shows installed version of dnsmasq.

CLI Example:

```
salt '*' dnsmasq.version
```
21.9.108 salt.modules.dnsutil

Compendium of generic DNS utilities.

Note: Some functions in the dnsutil execution module depend on dig.

salt.modules.dnsutil.A(host, nameserver=None)
Return the A record(s) for host.
Always returns a list.
CLI Example:
```
salt ns1 dnsutil.A www.google.com
```

salt.modules.dnsutil.AAAA(host, nameserver=None)
Return the AAAA record(s) for host.
Always returns a list.
New in version 2014.7.5.
CLI Example:
```
salt ns1 dnsutil.AAAA www.google.com
```

salt.modules.dnsutil.MX(domain, resolve=False, nameserver=None)
Return a list of lists for the MX of domain.
If the 'resolve' argument is True, resolve IPs for the servers.
It’s limited to one IP, because although in practice it’s very rarely a round robin, it is an acceptable configuration and pulling just one IP lets the data be similar to the non-resolved version. If you think an MX has multiple IPs, don’t use the resolver here, resolve them in a separate step.
CLI Example:
```
salt ns1 dnsutil.MX google.com
```

salt.modules.dnsutil.NS(domain, resolve=True, nameserver=None)
Return a list of IPs of the nameservers for domain
If ‘resolve’ is False, don’t resolve names.
CLI Example:
```
salt ns1 dnsutil.NS google.com
```

salt.modules.dnsutil.SPF(domain, record='SPF', nameserver=None)
Return the allowed IPv4 ranges in the SPF record for domain.
If record is SPF and the SPF record is empty, the TXT record will be searched automatically. If you know the domain uses TXT and not SPF, specifying that will save a lookup.
CLI Example:
```
salt ns1 dnsutil.SPF google.com
```

salt.modules.dnsutil.check_ip(ip_addr)
Check that string ip_addr is a valid IP
salt.modules.dnsutil.hosts_append(hostsfile='/etc/hosts', ip_addr=None, entries=None)
Append a single line to the /etc/hosts file.

CLI Example:
```
salt '*' dnsutil.hosts_append /etc/hosts 127.0.0.1 ad1.yuk.co,ad2.yuk.co
```

salt.modules.dnsutil.hosts_remove(hostsfile='/etc/hosts', entries=None)
Remove a host from the /etc/hosts file. If doing so will leave a line containing only an IP address, then the line
will be deleted. This function will leave comments and blank lines intact.

CLI Examples:
```
salt '*' dnsutil.hosts_remove /etc/hosts ad1.yuk.co
salt '*' dnsutil.hosts_remove /etc/hosts ad2.yuk.co,ad1.yuk.co
```

salt.modules.dnsutil.parse_hosts(hostsfile='/etc/hosts', hosts=None)
Parse /etc/hosts file.

CLI Example:
```
salt '*' dnsutil.parse_hosts
```

salt.modules.dnsutil.parse_zone(zonefile=None, zone=None)
Parses a zone file. Can be passed raw zone data on the API level.

CLI Example:
```
salt ns1 dnsutil.parse_zone /var/lib/named/example.com.zone
```

salt.modules.dnsutil.serial(zone='', update=False)
Return, store and update a dns serial for your zone files.
zone: a keyword for a specific zone
update: store an updated version of the serial in a grain
If update is False, the function will retrieve an existing serial or return the current date if no serial is stored.
Nothing will be stored
If update is True, the function will set the serial to the current date if none exist or if the existing serial is for
a previous date. If a serial for greater than the current date is already stored, the function will increment it.
This module stores the serial in a grain, you can explicitly set the stored value as a grain named
dnsserial_<zone_name>.

CLI Example:
```
salt ns1 dnsutil.serial example.com
```

21.9.109 salt.modules.dockercompose module

Module to import docker-compose via saltstack
New in version 2016.3.0.
**Introduction**

This module allows one to deal with docker-compose file in a directory. This is a first version only, the following commands are missing at the moment but will be built later on if the community is interested in this module:

- run
- logs
- port
- scale

**Installation Prerequisites**

This execution module requires at least version 1.4.0 of both docker-compose and Docker. docker-compose can easily be installed using `pip install`:

```
salt myminion pip.install docker-compose>=1.5.0
```

**How to use this module?**

In order to use the module if you have no docker-compose file on the server you can issue the command create, it takes two arguments the path where the docker-compose.yml will be stored and the content of this latter:

```
# salt-call -l debug dockercompose.create /tmp/toto '
database:
    image: mongo:3.0
    command: mongod --smallfiles --quiet --logpath=/dev/null
'',
```

Then you can execute a list of method defined at the bottom with at least one argument (the path where the docker-compose.yml will be read) and an optional python list which corresponds to the services names:

```
# salt-call -l debug dockercompose.up /tmp/toto
# salt-call -l debug dockercompose.restart /tmp/toto '[database]'
# salt-call -l debug dockercompose.stop /tmp/toto
# salt-call -l debug dockercompose.rm /tmp/toto
```

**Docker-compose method supported**

- up
- restart
- stop
• start
• pause
• unpause
• kill
• rm
• ps
• pull
• build

Functions

• docker-compose.yml management
  - dockercompose.create
  - dockercompose.get

• Manage containers
  - dockercompose.restart
  - dockercompose.stop
  - dockercompose.pause
  - dockercompose.unpause
  - dockercompose.start
  - dockercompose.kill
  - dockercompose.rm
  - dockercompose.up

• Manage containers image:
  - dockercompose.pull
  - dockercompose.build

• Gather information about containers:
  - dockercompose.ps

• Manage service definitions:
  - dockercompose.service_create
  - dockercompose.service_upsert
  - dockercompose.service_remove
  - dockercompose.service_set_tag
Detailed Function Documentation

salt.modules.dockercompose.build(path, service_names=None)
Build image for containers in the docker-compose file. service_names is a python list, if omitted build images for all containers. Please note that at the moment the module does not allow you to upload your Dockerfile, nor any other file you could need with your docker-compose.yml, you will have to make sure the files you need are actually in the directory specified in the build keyword.

- **path** Path where the docker-compose file is stored on the server
- **service_names** If specified will pull only the image for the specified services

CLI Example:
```
salt myminion dockercompose.build /path/where/docker-compose/stored
salt myminion dockercompose.build /path/where/docker-compose/stored 'janus'
```

salt.modules.dockercompose.create(path, docker_compose)
Create and validate a docker-compose file into a directory

- **path** Path where the docker-compose file will be stored on the server
- **docker_compose** docker_compose file

CLI Example:
```
salt myminion dockercompose.create /path/where/docker-compose/stored content
```

salt.modules.dockercompose.get(path)
Get the content of the docker-compose file into a directory

- **path** Path where the docker-compose file is stored on the server

CLI Example:
```
salt myminion dockercompose.get /path/where/docker-compose/stored
```

salt.modules.dockercompose.kill(path, service_names=None)
Kill containers in the docker-compose file, service_names is a python list, if omitted kill all containers

- **path** Path where the docker-compose file is stored on the server
- **service_names** If specified will kill only the specified services

CLI Example:
```
salt myminion dockercompose.kill /path/where/docker-compose/stored
salt myminion dockercompose.kill /path/where/docker-compose/stored 'janus'
```

salt.modules.dockercompose.pause(path, service_names=None)
Pause running containers in the docker-compose file, service_names is a python list, if omitted pause all containers

- **path** Path where the docker-compose file is stored on the server
- **service_names** If specified will pause only the specified services

CLI Example:
```
salt myminion dockercompose.pause /path/where/docker-compose/stored
salt myminion dockercompose.pause /path/where/docker-compose/stored 'janus'
```
salt.modules.dockercompose.ps(path)
List all running containers and report some information about them

  path  Path where the docker-compose file is stored on the server

CLI Example:
```
salt myminion dockercompose.ps /path/where/docker-compose/stored
```

salt.modules.dockercompose.pull(path, service_names=None)
Pull image for containers in the docker-compose file, service_names is a python list, if omitted pull all images

  path  Path where the docker-compose file is stored on the server

  service_names  If specified will pull only the image for the specified services

CLI Example:
```
salt myminion dockercompose.pull /path/where/docker-compose/stored
salt myminion dockercompose.pull /path/where/docker-compose/stored '[janus]'
```

salt.modules.dockercompose.restart(path, service_names=None)
Restart container(s) in the docker-compose file, service_names is a python list, if omitted restart all containers

  path  Path where the docker-compose file is stored on the server

  service_names  If specified will restart only the specified services

CLI Example:
```
salt myminion dockercompose.restart /path/where/docker-compose/stored
salt myminion dockercompose.restart /path/where/docker-compose/stored '[janus]'
```

salt.modules.dockercompose.rm(path, service_names=None)
Remove stopped containers in the docker-compose file, service_names is a python list, if omitted remove all stopped containers

  path  Path where the docker-compose file is stored on the server

  service_names  If specified will remove only the specified stopped services

CLI Example:
```
salt myminion dockercompose.rm /path/where/docker-compose/stored
salt myminion dockercompose.rm /path/where/docker-compose/stored '[janus]'
```

salt.modules.dockercompose.service_create(path, service_name, definition)
Create the definition of a docker-compose service This fails when the service already exists This does not pull or up the service This will re-write your yaml file. Comments will be lost. Indentation is set to 2 spaces

  path  Path where the docker-compose file is stored on the server

  service_name  Name of the service to create

  definition  Service definition as yaml or json string

CLI Example:
```
salt myminion dockercompose.service_create /path/where/docker-compose/stored
  --service_name definition
```
salt.modules.dockercompose.service_remove(path, service_name)
Remove the definition of a docker-compose service. This does not rm the container. This will re-write your yaml file. Comments will be lost. Indentation is set to 2 spaces
path Path where the docker-compose file is stored on the server
service_name Name of the service to remove

CLI Example:
```
salt myminion dockercompose.service_remove /path/where/docker-compose/stored
←service_name
```

salt.modules.dockercompose.service_set_tag(path, service_name, tag)
Change the tag of a docker-compose service. This does not pull or up the service. This will re-write your yaml file. Comments will be lost. Indentation is set to 2 spaces
path Path where the docker-compose file is stored on the server
service_name Name of the service to remove
tag Name of the tag (often used as version) that the service image should have

CLI Example:
```
salt myminion dockercompose.service_set_tag /path/where/docker-compose/stored
←service_name_tag
```

salt.modules.dockercompose.service_upsert(path, service_name, definition)
Create or update the definition of a docker-compose service. This does not pull or up the service. This will re-write your yaml file. Comments will be lost. Indentation is set to 2 spaces
path Path where the docker-compose file is stored on the server
service_name Name of the service to create
definition Service definition as yaml or json string

CLI Example:
```
salt myminion dockercompose.service_upsert /path/where/docker-compose/stored
←service_name_definition
```

salt.modules.dockercompose.start(path, service_names=None)
Start containers in the docker-compose file. service_names is a python list, if omitted start all containers
path Path where the docker-compose file is stored on the server
service_names If specified will start only the specified services

CLI Example:
```
salt myminion dockercompose.start /path/where/docker-compose/stored
salt myminion dockercompose.start /path/where/docker-compose/stored "[janus]"
```

salt.modules.dockercompose.stop(path, service_names=None)
Stop running containers in the docker-compose file. service_names is a python list, if omitted stop all containers
path Path where the docker-compose file is stored on the server
service_names If specified will stop only the specified services

CLI Example:
salt.myminion dockercompose.stop /path/where/docker-compose/stored
salt.myminion dockercompose.stop /path/where/docker-compose/stored '[janus]'
Grains

Pillar data

Master config file (requires pillar_opts to be set to True in Minion config file in order to work)

Important: Versions prior to 3000 require that Docker credentials are configured in Pillar data. Be advised that Pillar data is still recommended though, because this keeps the configuration from being stored on the Minion. Also, keep in mind that if one gets your ~/.docker/config.json, the password can be decoded from its contents.

The configuration schema is as follows:

```
docker-registries:
  <registry_url>:
  username: <username>
  password: <password>
```

For example:

```
docker-registries:
  hub:
  username: foo
  password: s3cr3t
```

Note: As of the 2016.3.7, 2016.11.4, and 2017.7.0 releases of Salt, credentials for the Docker Hub can be configured simply by specifying hub in place of the registry URL. In earlier releases, it is necessary to specify the actual registry URL for the Docker Hub (i.e. https://index.docker.io/v1/).

More than one registry can be configured. Salt will look for Docker credentials in the docker-registries Pillar key, as well as any key ending in -docker-registries. For example:

```
docker-registries:
  'https://mydomain.tld/registry:5000':
  username: foo
  password: s3cr3t

foo-docker-registries:
  https://index.foo.io/v1/:
  username: foo
  password: s3cr3t

bar-docker-registries:
  https://index.bar.io/v1/:
  username: foo
  password: s3cr3t
```

To login to the configured registries, use the docker.login function. This only needs to be done once for a given registry, and it will store/update the credentials in ~/.docker/config.json.

Note: For Salt releases before 2016.3.7 and 2016.11.4, docker.login is not available. Instead, Salt will try to authenticate using each of your configured registries for each push/pull, behavior which is not correct and has been resolved in newer releases.
Configuration Options

The following configuration options can be set to fine-tune how Salt uses Docker:

- `docker.url`: URL to the docker service (default: local socket).
- `docker.version`: API version to use (should not need to be set manually in the vast majority of cases).
- `docker.exec_driver`: Execution driver to use, one of `nsenter`, `lxc-attach`, or `docker-exec`. See the Executing Commands Within a Running Container section for more details on how this config parameter is used.

These configuration options are retrieved using `config.get` (click the link for further information).

Executing Commands Within a Running Container

**Note:** With the release of Docker 1.13.1, the Execution Driver has been removed. Starting in versions 2016.3.6, 2016.11.4, and 2017.7.0, Salt defaults to using `docker exec` to run commands in containers, however for older Salt releases it will be necessary to set the `docker.exec_driver` config option to either `docker-exec` or `nsenter` for Docker versions 1.13.1 and newer.

Multiple methods exist for executing commands within Docker containers:

- **lxc-attach**: Default for older versions of docker
- **nsenter**: Enters container namespace to run command
- **docker-exec**: Native support for executing commands in Docker containers (added in Docker 1.3)

Adding a configuration option (see `config.get`) called `docker.exec_driver` will tell Salt which execution driver to use:

```
docker.exec_driver: docker-exec
```

If this configuration option is not found, Salt will use the appropriate interface (either `nsenter` or `lxc-attach`) based on the Execution Driver value returned from `docker info`. `docker-exec` will not be used by default, as it is presently (as of version 1.6.2) only able to execute commands as the effective user of the container. Thus, if a USER directive was used to run as a non-privileged user, `docker-exec` would be unable to perform the action as root. Salt can still use `docker-exec` as an execution driver, but must be explicitly configured (as in the example above) to do so at this time.

If possible, try to manually specify the execution driver, as it will save Salt a little work.

This execution module provides functions that shadow those from the `cmd` module. They are as follows:

- `docker.retcode`
- `docker.run`
- `docker.run_all`
- `docker.run_stderr`
- `docker.run_stdout`
- `docker.script`
- `docker.script_retcode`
Detailed Function Documentation

**class** `salt.modules.dockermod.DockerJSONDecoder(*, object_hook=None, parse_float=None, parse_int=None, parse_constant=None, strict=True, object_pairs_hook=None)`

`decode(s, _w=None)`

Return the Python representation of `s` (a `str` instance containing a JSON document).

`salt.modules.dockermod.apply_(name, mods=None, **kwargs)`

New in version 2019.2.0.

Apply states! This function will call highstate or state.sls based on the arguments passed in, apply is intended to be the main gateway for all state executions.

CLI Example:

```bash
salt 'docker' docker.apply web01
salt 'docker' docker.apply web01 test
salt 'docker' docker.apply web01 test,pkgs
```

`salt.modules.dockermod.build(path=None, repository=None, tag=None, cache=True, rm=True, api_response=False, fileobj=None, dockerfile=None, buildargs=None)`

Changed in version 2018.3.0: If the built image should be tagged, then the repository and tag must now be passed separately using the `repository` and `tag` arguments, rather than together in the (now deprecated) `image` argument.

Builds a docker image from a Dockerfile or a URL

- **path**: Path to directory on the Minion containing a Dockerfile
- **repository**: Optional repository name for the image being built
- **tag**: [latest] Tag name for the image (required if `repository` is passed)
- **cache**: [True] Set to `False` to force the build process not to use the Docker image cache, and pull all required intermediate image layers
- **rm**: [True] Remove intermediate containers created during build
- **api_response**: [False] If `True`: an `API_Response` key will be present in the return data, containing the raw output from the Docker API.
- **fileobj**: Allows for a file-like object containing the contents of the Dockerfile to be passed in place of a file `path` argument. This argument should not be used from the CLI, only from other Salt code.
- **dockerfile**: Allows for an alternative Dockerfile to be specified. Path to alternative Dockerfile is relative to the build path for the Docker container.
- **buildargs**: A dictionary of build arguments provided to the docker build process.

**RETURN DATA**

A dictionary containing one or more of the following keys:

- `Id`: ID of the newly-built image
- **Time_Elapsed** - Time in seconds taken to perform the build
- **Intermediate_Containers** - IDs of containers created during the course of the build process
  (Only present if rm=False)
- **Images** - A dictionary containing one or more of the following keys:
  - **Already_Pulled** - Layers that that were already present on the Minion
  - **Pulled** - Layers that that were pulled
  (Only present if the image specified by the "repository" and "tag" arguments was not present on the Minion, or if cache=False)
- **Status** - A string containing a summary of the pull action (usually a message saying that an image was downloaded, or that it was up to date).
  (Only present if the image specified by the "repository" and "tag" arguments was not present on the Minion, or if cache=False)

CLI Example:

```bash
salt myminion docker.build /path/to/docker/build/dir
salt myminion docker.build https://github.com/myuser/myrepo.git
  →repository=myimage tag=latest
salt myminion docker.build /path/to/docker/build/dir dockerfile=Dockerfile.
  →different repository=myimage tag=dev
```

**salt.modules.dockermod.call** *(name, function, *args, **kwargs)*

Executes a Salt function inside a running container

New in version 2016.11.0.

The container does not need to have Salt installed, but Python is required.

- **name** Container name or ID
- **function** Salt execution module function

CLI Example:

```bash
salt myminion docker.call test.ping
salt myminion test.arg arg1 arg2 key1=val1
salt myminion dockerng.call compassionate_mirzakhani test.arg arg1 arg2 key1=val1
```

**salt.modules.dockermod.commit** *(name, repository, tag='latest', message=None, author=None)*

Commits a container, thereby promoting it to an image. Equivalent to running the docker commit Docker CLI command.

- **name** Container name or ID to commit
- **repository** Repository name for the image being committed
  
  New in version 2018.3.0.
- **tag** [latest] Tag name for the image
  
  New in version 2018.3.0.
- **image** Deprecated since version 2018.3.0: Use both repository and tag instead
- **message** Commit message (Optional)
author  Author name (Optional)

RETURN DATA
A dictionary containing the following keys:
  • Id - ID of the newly-created image
  • Image - Name of the newly-created image
  • Time_Elapsed - Time in seconds taken to perform the commit

CLI Example:
salt myminion docker.commit mycontainer myuser/myimage mytag

salt.modules.dockermod.compare_container(first, second, ignore=None)
This function is an alias of compare_containers.

New in version 2017.7.0.
Changed in version 2018.3.0: Renamed from docker.compare_container to docker.compare_containers (old function name remains as an alias)

Compare two containers’ Config and and HostConfig and return any differences between the two.

first  Name or ID of first container
second  Name or ID of second container
ignore  A comma-separated list (or Python list) of keys to ignore when comparing. This is useful when comparing two otherwise identical containers which have different hostnames.

CLI Examples:
salt myminion docker.compare_containers foo bar
salt myminion docker.compare_containers foo bar ignore=Hostname

salt.modules.dockermod.compare_container_networks(first, second)
New in version 2018.3.0.

Returns the differences between two containers’ networks. When a network is only present one of the two containers, that network’s diff will simply be represented with True for the side of the diff in which the network is present) and False for the side of the diff in which the network is absent.

This function works by comparing the contents of both containers’ Networks keys (under NetworkSettings) in the return data from docker.inspect_container. Because each network contains some items that either A) only set at runtime, B) naturally varying from container to container, or both, by default the following keys in each network are examined:
  • Aliases
  • Links
  • IPAMConfig

The exception to this is if IPAMConfig is unset (i.e. null) in one container but not the other. This happens when no static IP configuration is set, and automatic IP configuration is in effect. So, in order to report on changes between automatic IP configuration in one container and static IP configuration in another container (as we need to do for the docker_container.running state), automatic IP configuration will also be checked in these cases.

This function uses the docker.compare_container_networks minion config option to determine which keys to examine. This provides flexibility in the event that features added in a future Docker release
necessitate changes to how Salt compares networks. In these cases, rather than waiting for a new Salt release
one can just set `docker.compare_container_networks`.

Changed in version 3000: This config option can now also be set in pillar data and grains. Additionally, it can
be set in the master config file, provided that `pillar_opts` is enabled on the minion.

---

**Note:** The checks for automatic IP configuration described above only apply if `IPAMConfig` is among the
keys set for static IP checks in `docker.compare_container_networks`.

```html
first  Name or ID of first container (old)
second Name or ID of second container (new)

CLI Example:
salt myminion docker.compare_container_networks foo bar
```

```html
salt.modules.dockermod.compare_containers(first, second, ignore=None)
New in version 2017.7.0.

Changed in version 2018.3.0: Renamed from `docker.compare_container` to `docker.compare_containers` (old function name remains as an alias)

Compare two containers' Config and and HostConfig and return any differences between the two.

```html
first  Name or ID of first container
second Name or ID of second container
ignore  A comma-separated list (or Python list) of keys to ignore when comparing. This is useful when com-

paring two otherwise identical containers which have different hostnames.

CLI Examples:
salt myminion docker.compare_containers foo bar
salt myminion docker.compare_containers foo bar ignore=Hostname

```html
salt.modules.dockermod.compare_networks(first, second, ignore=['Name, Id, Created, Containers'])
New in version 2018.3.0.

Compare two networks and return any differences between the two

```html
first  Name or ID of first container
second Name or ID of second container
ignore  [Name,Id, Created,Containers] A comma-separated list (or Python list) of keys to ignore when com-

paring.

CLI Example:
salt myminion docker.compare_network foo bar

```html
salt.modules.dockermod.connect_container_to_network(container, net_id, **kwargs)
New in version 2015.8.3.

Changed in version 2017.7.0: Support for `ipv4_address` argument added

Changed in version 2018.3.0: All arguments are now passed through to `connect_container_to_network()`, al-

lowing for any new arguments added to this function to be supported automagically.
Connect container to network. See the `connect_container_to_network()` docs for information on supported arguments.

**container** Container name or ID

**net_id** Network name or ID

CLI Examples:

```
salt myminion docker.connect_container_to_network web-1 mynet
salt myminion docker.connect_container_to_network web-1 mynet ipv4_address=10.20.0.10
salt myminion docker.connect_container_to_network web-10
```

salt.modules.dockermod.connected(name, verbose=False)

New in version 2018.3.0.

Return a list of running containers attached to the specified network

**name** Network name

**verbose** [False] If True, return extended info about each container (IP configuration, etc.)

CLI Example:

```
salt myminion docker.connected net_name
```

salt.modules.dockermod.copy_from(name, source, dest, overwrite=False, makedirs=False)

Copy a file from inside a container to the Minion

**name** Container name

**source** Path of the file on the container’s filesystem

**dest** Destination on the Minion. Must be an absolute path. If the destination is a directory, the file will be copied into that directory.

**overwrite** [False] Unless this option is set to True, then if a file exists at the location specified by the dest argument, an error will be raised.

**makedirs** [False] Create the parent directory on the container if it does not already exist.

RETURN DATA

A boolean (True if successful, otherwise False)

CLI Example:

```
salt myminion docker.copy_from mycontainer /var/log/nginx/access.log /home/myuser
```

salt.modules.dockermod.copy_to(name, source, dest, exec_driver=None, overwrite=False, makedirs=False)

Copy a file from the host into a container

**name** Container name

**source** File to be copied to the container. Can be a local path on the Minion or a remote file from the Salt fileserver.

**dest** Destination on the container. Must be an absolute path. If the destination is a directory, the file will be copied into that directory.

**exec_driver** [None] If not passed, the execution driver will be detected as described above.
overwrite [False] Unless this option is set to True, then if a file exists at the location specified by the dest argument, an error will be raised.

makedirs [False] Create the parent directory on the container if it does not already exist.

RETURN DATA
A boolean (True if successful, otherwise False)

CLI Example:
```
salt myminion docker.copy_to mycontainer /tmp/foo /root/foo
```

```
salt.modules.dockermod.create(image, name=None, start=False, skip_translate=None, ignore_collisions=False, validate_ip_addrs=True, client_timeout=60, **kwargs)
```

Create a new container

- **image** Image from which to create the container
- **name** Name for the new container. If not provided, Docker will randomly generate one for you (it will be included in the return data).
- **start** [False] If True, start container after creating it

New in version 2018.3.0.

**skip_translate** This function translates Salt CLI or SLS input into the format which docker-py expects. However, in the event that Salt’s translation logic fails (due to potential changes in the Docker Remote API, or to bugs in the translation code), this argument can be used to exert granular control over which arguments are translated and which are not.

Pass this argument as a comma-separated list (or Python list) of arguments, and translation for each passed argument name will be skipped. Alternatively, pass True and all translation will be skipped.

Skipping translation allows for arguments to be formatted directly in the format which docker-py expects. This allows for API changes and other issues to be more easily worked around. An example of using this option to skip translation would be:
```
salt myminion docker.create image=centos:7.3.1611 skip_translate=environment
 → environment="{'FOO': 'bar'}"
```

See the following links for more information:
- docker-py Low-level API
- Docker Engine API

**ignore_collisions** [False] Since many of docker-py’s arguments differ in name from their CLI counterparts (with which most Docker users are more familiar), Salt detects usage of these and aliases them to the docker-py version of that argument. However, if both the alias and the docker-py version of the same argument (e.g. env and environment) are used, an error will be raised. Set this argument to True to suppress these errors and keep the docker-py version of the argument.

**validate_ip_addrs** [True] For parameters which accept IP addresses as input, IP address validation will be performed. To disable, set this to False

**client_timeout** [60] Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

**Note:** This is only used if Salt needs to pull the requested image.
CONTAINER CONFIGURATION ARGUMENTS

**auto_remove (or rm)** [False] Enable auto-removal of the container on daemon side when the container’s process exits (analogous to running a docker container with `--rm` on the CLI).

Examples:
- auto_remove=True
- rm=True

**binds** Files/directories to bind mount. Each bind mount should be passed in one of the following formats:

- `<host_path>::<container_path>` - `host_path` is mounted within the container as `container_path` with read-write access.
- `<host_path>::<container_path>::<selinux_context>` - `host_path` is mounted within the container as `container_path` with read-write access. Additionally, the specified selinux context will be set within the container.
- `<host_path>::<container_path>::<read_only>` - `host_path` is mounted within the container as `container_path`, with the read-only or read-write setting explicitly defined.
- `<host_path>::<container_path>::<read_only>,<selinux_context>` - `host_path` is mounted within the container as `container_path`, with the read-only or read-write setting explicitly defined. Additionally, the specified selinux context will be set within the container.

- `<read_only>` can be either `ro` for read-write access, or `ro` for read-only access. When omitted, it is assumed to be read-write.
- `<selinux_context>` can be `z` if the volume is shared between multiple containers, or `Z` if the volume should be private.

**Note:** When both `<read_only>` and `<selinux_context>` are specified, there must be a comma before `<selinux_context>`.

Binds can be expressed as a comma-separated list or a Python list, however in cases where both `ro/rw` and an selinux context are specified, the binds must be specified as a Python list.

Examples:
- binds=/srv/www:/var/www:ro
- binds=/srv/www:/var/www:rw
- binds=/srv/www:/var/www
- binds=["/srv/www:/var/www:ro,Z"]
- binds=["/srv/www:/var/www:rw,Z"]
- binds=/srv/www:/var/www:Z

**Note:** The second and third examples above are equivalent to each other, as are the last two examples.

**blkio_weight** Block IO weight (relative weight), accepts a weight value between 10 and 1000.

Example: blkio_weight=100
**blkio_weight_device**  Block IO weight (relative device weight), specified as a list of expressions in the format

```
PATH:WEIGHT
```

Example: `blkio_weight_device=/dev/sda:100`

**cap_add**  List of capabilities to add within the container. Can be passed as a comma-separated list or a Python list. Requires Docker 1.2.0 or newer.

Examples:
```
• cap_add=SYS_ADMIN,MKNOD
• cap_add="[SYS_ADMIN, MKNOD]"
```

**cap_drop**  List of capabilities to drop within the container. Can be passed as a comma-separated string or a Python list. Requires Docker 1.2.0 or newer.

Examples:
```
• cap_drop=SYS_ADMIN,MKNOD
• cap_drop="[SYS_ADMIN, MKNOD]"
```

**command (or cmd)**  Command to run in the container

Example: `command=bash` or `cmd=bash`

Changed in version 2015.8.1: `cmd` is now also accepted

**cpuset_cpus (or cpuset)**  CPUs on which which to allow execution, specified as a string containing a range (e.g. `0-3`) or a comma-separated list of CPUs (e.g. `0,1`).

Examples:
```
• cpuset_cpus="0-3"
• cpuset="0,1"
```

**cpuset_mems**  Memory nodes on which which to allow execution, specified as a string containing a range (e.g. `0-3`) or a comma-separated list of MEMs (e.g. `0,1`). Only effective on NUMA systems.

Examples:
```
• cpuset_mems="0-3"
• cpuset_mems="0,1"
```

**cpu_group**  The length of a CPU period in microseconds

Example: `cpu_group=100000`

**cpu_period**  Microseconds of CPU time that the container can get in a CPU period

Example: `cpu_period=50000`

**cpu_shares**  CPU shares (relative weight), specified as an integer between 2 and 1024.

Example: `cpu_shares=512`

**detach**  [False] If True, run the container's command in the background (daemon mode)

Example: `detach=True`

**devices**  List of host devices to expose within the container

Examples:
```
• devices="/dev/net/tun,/dev/xvda1:/dev/xvda1,/dev/xvdb1:/dev/xvdb1:r"
```
devices="['/dev/net/tun', '/dev/xvda1', '/dev/xvdb1:r']"

device_read_bps  Limit read rate (bytes per second) from a device, specified as a list of expressions in the format PATH:RATE, where RATE is either an integer number of bytes, or a string ending in kb, mb, or gb.

Examples:
- device_read_bps="/dev/sda:1mb,/dev/sdb:5mb"
- device_read_bps="['/dev/sda:100mb', '/dev/sdb:5mb']"

device_read_iops  Limit read rate (I/O per second) from a device, specified as a list of expressions in the format PATH:RATE, where RATE is a number of I/O operations.

Examples:
- device_read_iops="/dev/sda:1000,/dev/sdb:500"
- device_read_iops="['/dev/sda:1000', '/dev/sdb:500']"

device_write_bps  Limit write rate (bytes per second) from a device, specified as a list of expressions in the format PATH:RATE, where RATE is either an integer number of bytes, or a string ending in kb, mb or gb.

Examples:
- device_write_bps="/dev/sda:100mb,/dev/sdb:50mb"
- device_write_bps="['/dev/sda:100mb', '/dev/sdb:50mb']"

device_read_iops  Limit write rate (I/O per second) from a device, specified as a list of expressions in the format PATH:RATE, where RATE is a number of I/O operations.

Examples:
- device_read_iops="/dev/sda:1000,/dev/sdb:500"
- device_read_iops="['/dev/sda:1000', '/dev/sdb:500']"

dns  List of DNS nameservers. Can be passed as a comma-separated list or a Python list.

Examples:
- dns=8.8.8.8,8.8.4.4
- dns="[8.8.8.8, 8.8.4.4]"

Note: To skip IP address validation, use validate_ip_addrs=False

dns_opt  Additional options to be added to the container's resolv.conf file

Example: dns_opt=ndots:9

dns_search  List of DNS search domains. Can be passed as a comma-separated list or a Python list.

Examples:
- dns_search=foo1.domain.tld,foo2.domain.tld
- dns_search="[foo1.domain.tld, foo2.domain.tld]"

domainname  The domain name to use for the container

Example: domainname=domain.tld
**entrypoint**  Entrypoint for the container. Either a string (e.g. "mycmd --arg1 --arg2") or a Python list (e.g. "['mycmd', '--arg1', '--arg2']")

Examples:
- `entrypoint="cat access.log"`
- `entrypoint="['cat', 'access.log']"`

**environment (or env)**  Either a dictionary of environment variable names and their values, or a Python list of strings in the format `VARNAME=value`.

Examples:
- `environment='VAR1=value,VAR2=value'
- `environment="['VAR1=value', 'VAR2=value']"
- `environment="{'VAR1': 'value', 'VAR2': 'value'}"

**extra_hosts**  Additional hosts to add to the container's /etc/hosts file. Can be passed as a comma-separated list or a Python list. Requires Docker 1.3.0 or newer.

Examples:
- `extra_hosts=web1:10.9.8.7,web2:10.9.8.8`
- `extra_hosts="['web1:10.9.8.7', 'web2:10.9.8.8']"
- `extra_hosts="{'web1': '10.9.8.7', 'web2': '10.9.8.8'}"

---

**group_add**  List of additional group names and/or IDs that the container process will run as

Examples:
- `group_add=web,network`
- `group_add="['web', 'network']"

**hostname**  Hostname of the container. If not provided, and if a `name` has been provided, the hostname will default to the name that was passed.

Example: `hostname=web1`

**Warning:** If the container is started with `network_mode=host`, the hostname will be overridden by the hostname of the Minion.

**interactive (or stdin_open): False**  Leave stdin open, even if not attached

Examples:
- `interactive=True`
- `stdin_open=True`

**ipc_mode (or ipc)**  Set the IPC mode for the container. The default behavior is to create a private IPC namespace for the container, but this option can be used to change that behavior:

- `container:<container_name_or_id>` reuses another container shared memory, semaphores and message queues
• host: use the host's shared memory, semaphores and message queues

Examples:
• ipc_mode=container:foo
• ipc=host

**Warning:** Using host gives the container full access to local shared memory and is therefore considered insecure.

**isolation**  Specifies the type of isolation technology used by containers

Example: isolation=hyperv

**Note:** The default value on Windows server is process, while the default value on Windows client is hyperv. On Linux, only default is supported.

**labels (or label)**  Add metadata to the container. Labels can be set both with and without values:

Examples:
• labels=foo,bar=baz
• labels="['foo', 'bar=baz']"

Changed in version 2018.3.0: Labels both with and without values can now be mixed. Earlier releases only permitted one method or the other.

**links**  Link this container to another. Links should be specified in the format `<container_name_or_id>:<link_alias>`. Multiple links can be passed, ether as a comma separated list or a Python list.

Examples:
• links=web1:link1,web2:link2,
• links="['web1:link1', 'web2:link2']"
• links="{"web1': 'link1', 'web2': 'link2'}"

**log_driver**  Set container's logging driver. Requires Docker 1.6 or newer.

Example:
• log_driver=syslog

**Note:** The logging driver feature was improved in Docker 1.13 introducing option name changes. Please see Docker's Configure logging drivers documentation for more information.

**log_opt**  Config options for the log_driver config option. Requires Docker 1.6 or newer.

Example:
• log_opt="syslog-address=tcp://192.168.0.42,syslog-facility=daemon"
• log_opt="['syslog-address=tcp://192.168.0.42',
  'syslog-facility=daemon']"
• log_opt="{'syslog-address': 'tcp://192.168.0.42',
  'syslog-facility': 'daemon'}"
**lxc_conf** Additional LXC configuration parameters to set before starting the container.

Examples:

- `lxc_conf="lxc.utsname=docker,lxc.arch=x86_64"
- `lxc_conf="['lxc.utsname=docker', 'lxc.arch=x86_64']"
- `lxc_conf="{'lxc.utsname': 'docker', 'lxc.arch': 'x86_64'}"

**Note:** These LXC configuration parameters will only have the desired effect if the container is using the LXC execution driver, which has been deprecated for some time.

**mac_address** MAC address to use for the container. If not specified, a random MAC address will be used.

Example: `mac_address=01:23:45:67:89:0a`

**mem_limit (or memory)** [0] Memory limit. Can be specified in bytes or using single-letter units (i.e. 512M, 2G, etc.). A value of 0 (the default) means no memory limit.

Examples:

- `mem_limit=512M`
- `memory=1073741824`

**mem_swappiness** Tune a container’s memory swappiness behavior. Accepts an integer between 0 and 100.

Example: `mem_swappiness=60`

**memswap_limit (or memory_swap)** [-1] Total memory limit (memory plus swap). Set to -1 to disable swap. A value of 0 means no swap limit.

Examples:

- `memswap_limit=1G`
- `memory_swap=2147483648`

**network_disabled** [False] If True, networking will be disabled within the container.

Example: `network_disabled=True`

**network_mode** [bridge] One of the following:

- `bridge` - Creates a new network stack for the container on the docker bridge
- `none` - No networking (equivalent of the Docker CLI argument `--net=none`). Not to be confused with Python’s `None`.
- `container:<name_or_id>` - Reuses another container’s network stack
- `host` - Use the host’s network stack inside the container

**Warning:** Using `host` mode gives the container full access to the host’s system’s services (such as D-Bus), and is therefore considered insecure.

Examples:

- `network_mode=null`
- `network_mode=container:web1`
oom_kill_disable  Whether to disable OOM killer
    Example: oom_kill_disable=False

oom_score_adj  An integer value containing the score given to the container in order to tune OOM killer preferences
    Example: oom_score_adj=500

pid_mode  Set to host to use the host container’s PID namespace within the container. Requires Docker 1.5.0 or newer.
    Example: pid_mode=host

pids_limit  Set the container’s PID limit. Set to -1 for unlimited.
    Example: pids_limit=2000

port_bindings (or publish): Bind exposed ports which were exposed using the ports argument to docker. create. These should be passed in the same way as the --publish argument to the docker run CLI command:
    • ip:hostPort:containerPort - Bind a specific IP and port on the host to a specific port within the container.
    • ip::containerPort - Bind a specific IP and an ephemeral port to a specific port within the container.
    • hostPort:containerPort - Bind a specific port on all of the host’s interfaces to a specific port within the container.
    • containerPort - Bind an ephemeral port on all of the host’s interfaces to a specific port within the container.

Multiple bindings can be separated by commas, or passed as a Python list. The below two examples are equivalent:
    • port_bindings="5000:5000,2123:2123/udp,8080"
    • port_bindings="["5000:5000", "2123:2123/udp", 8080]"

Port bindings can also include ranges:
    • port_bindings="14505-14506:4505-4506"

Note: When specifying a protocol, it must be passed in the containerPort value, as seen in the examples above.

ports  A list of ports to expose on the container. Can be passed as comma-separated list or a Python list. If the protocol is omitted, the port will be assumed to be a TCP port.
    Examples:
        • ports=1111,2222/udp
        • ports="[1111, '2222/udp']"

privileged  [False] If True, runs the exec process with extended privileges
    Example: privileged=True

publish_all_ports (or publish_all): False  Publish all ports to the host
    Example: publish_all_ports=True
read_only  [False] If True, mount the container’s root filesystem as read only

Example: read_only=True

restart_policy (or restart) Set a restart policy for the container. Must be passed as a string in the format
policy[:retry_count] where policy is one of always, unless-stopped, or on-failure, and retry_count is an optional limit to the number of retries. The retry count is ignored when using the always or unless-stopped restart policy.

Examples:
  • restart_policy=on-failure:5
  • restart_policy=always

security_opt  Security configuration for MLS systems such as SELinux and AppArmor. Can be passed as a comma-separated list or a Python list.

Examples:
  • security_opt=apparmor:unconfined,param2:value2
  • security_opt='["apparmor:unconfined", "param2:value2"]'

**Important:** Some security options can contain commas. In these cases, this argument must be passed as a Python list, as splitting by comma will result in an invalid configuration.

Note: See the documentation for security_opt at https://docs.docker.com/engine/reference/run/#security-configuration

shm_size  Size of /dev/shm

Example: shm_size=128M

stop_signal  The signal used to stop the container. The default is SIGTERM.

Example: stop_signal=SIGRTMIN+3

stop_timeout  Timeout to stop the container, in seconds

Example: stop_timeout=5

storage_opt  Storage driver options for the container

Examples:
  • storage_opt='dm.basesize=40G'
  • storage_opt='["dm.basesize=40G"]'
  • storage_opt='{"dm.basesize": "40G"}''

sysctls (or sysctl)  Set sysctl options for the container

Examples:
  • sysctl='fs.nr_open=1048576,kernel.pid_max=32768'
  • sysctls=['fs.nr_open=1048576', 'kernel.pid_max=32768']
  • sysctls=['{"fs.nr_open": "1048576", "kernel.pid_max": "32768"}']
tmpfs A map of container directories which should be replaced by tmpfs mounts, and their corresponding mount options. Can be passed as Python list of PATH:VALUE mappings, or a Python dictionary. However, since commas usually appear in the values, this option cannot be passed as a comma-separated list.

Examples:
- `tmpfs=["'/run:rw,noexec,nosuid,size=65536k', '/var/lib/mysql:rw, noexec,nosuid,size=600m'"]`
- `tmpfs=["'/run': 'rw,noexec,nosuid,size=65536k', '/var/lib/mysql': 'rw,noexec,nosuid,size=600m'"]`

Tty [False] Attach TTys

Example: `tty=True`

ulimits (or ulimit) List of ulimits. These limits should be passed in the format `<ulimit_name>:<soft_limit>:<hard_limit>`, with the hard limit being optional. Can be passed as a comma-separated list or a Python list.

Examples:
- `ulimits="nofile=1024:1024,nproc=60"
- `ulimits=["nofile=1024:1024", "nproc=60"]`

User User under which to run exec process

Example: `user=foo`

usersns_mode (or user_ns_mode) Sets the user namespace mode, when the user namespace remapping option is enabled.

Example: `usersns_mode=host`

Volumes (or volume) List of directories to expose as volumes. Can be passed as a comma-separated list or a Python list.

Examples:
- `volumes=/mnt/vol1,/mnt/vol2`
- `volume=["/mnt/vol1", "/mnt/vol2"]`

Volumes_from Container names or IDs from which the container will get volumes. Can be passed as a comma-separated list or a Python list.

Example: `volumes_from=foo,volumes_from=foo,bar,volumes_from=["foo, bar"]`

Volume_driver Sets the container’s volume driver

Example: `volume_driver=foobar`

Working_dir (or workdir) Working directory inside the container

Examples:
- `working_dir=/var/log/nginx`
- `workdir=/var/www/myapp`

RETURN DATA
A dictionary containing the following keys:
- `Id` - ID of the newly-created container
- **Name** - Name of the newly-created container

**CLI Example:**

```bash
# Create a data-only container
salt myminion docker.create myuser/mycontainer volumes="/mnt/vol1,/mnt/vol2"
# Create a CentOS 7 container that will stay running once started
salt myminion docker.create centos:7 name=mycent7 interactive=True tty=True
```

salt.modules.dockermod.create_network(name, skip_translate=None, ignore_collisions=False, validate_ip_addrs=True, client_timeout=60, **kwargs)

Changed in version 2018.3.0: Support added for network configuration options other than `driver` and `driver_opts`, as well as IPAM configuration.

Create a new network

**Note:** This function supports all arguments for network and IPAM pool configuration which are available for the release of docker-py installed on the minion. For that reason, the arguments described below in the `NETWORK CONFIGURATION ARGUMENTS` and `IP ADDRESS MANAGEMENT (IPAM)` sections may not accurately reflect what is available on the minion. The `docker.get_client_args` function can be used to check the available arguments for the installed version of docker-py (they are found in the `network_config` and `ipam_config` sections of the return data), but Salt will not prevent a user from attempting to use an argument which is unsupported in the release of Docker which is installed. In those cases, network creation be attempted but will fail.

**name**  Network name

**skip_translate**  This function translates Salt CLI or SLS input into the format which docker-py expects. However, in the event that Salt’s translation logic fails (due to potential changes in the Docker Remote API, or to bugs in the translation code), this argument can be used to exert granular control over which arguments are translated and which are not.

Pass this argument as a comma-separated list (or Python list) of arguments, and translation for each passed argument name will be skipped. Alternatively, pass `True` and all translation will be skipped.

Skipping translation allows for arguments to be formatted directly in the format which docker-py expects. This allows for API changes and other issues to be more easily worked around. See the following links for more information:

- docker-py Low-level API
- Docker Engine API

New in version 2018.3.0.

**ignore_collisions**  [False] Since many of docker-py’s arguments differ in name from their CLI counterparts (with which most Docker users are more familiar), Salt detects usage of these and aliases them to the docker-py version of that argument. However, if both the alias and the docker-py version of the same argument (e.g. `options` and `driver_opts`) are used, an error will be raised. Set this argument to `True` to suppress these errors and keep the docker-py version of the argument.

New in version 2018.3.0.

**validate_ip_addrs**  [True] For parameters which accept IP addresses as input, IP address validation will be performed. To disable, set this to `False`

**Note:** When validating subnets, whether or not the IP portion of the subnet is a valid subnet boundary
will not be checked. The IP will portion will be validated, and the subnet size will be checked to confirm it is a valid number (1-32 for IPv4, 1-128 for IPv6).

New in version 2018.3.0.

**NETWORK CONFIGURATION ARGUMENTS**

**driver** Network driver

Example: `driver=macvlan`

**driver_opts (or driver_opt, or options)** Options for the network driver. Either a dictionary of option names and values or a Python list of strings in the format `varname=value`.

Examples:

- `driver_opts='macvlan_mode=bridge,parent=eth0'
- `driver_opts="[macvlan_mode=bridge, 'parent'=eth0"]`
- `driver_opts="{macvlan_mode': 'bridge', 'parent': 'eth0'}"

**check_duplicate** [True] If True, checks for networks with duplicate names. Since networks are primarily keyed based on a random ID and not on the name, and network name is strictly a user-friendly alias to the network which is uniquely identified using ID, there is no guaranteed way to check for duplicates. This option provides a best effort, checking for any networks which have the same name, but it is not guaranteed to catch all name collisions.

Example: `check_duplicate=False`

**internal** [False] If True, restricts external access to the network

Example: `internal=True`

**labels** Add metadata to the network. Labels can be set both with and without values:

Examples (with values):

- `labels="label1=value1,label2=value2"
- `labels="[label1=value1, 'label2'=value2']"
- `labels="{label1': 'value1', 'label2': 'value2'}"

Examples (without values):

- `labels=label1,label2`
- `labels="[label1', 'label2']"

**enable_ipv6 (or ipv6)** [False] Enable IPv6 on the network

Example: `enable_ipv6=True`

**Note:** While it should go without saying, this argument must be set to True to configure an IPv6 subnet. Also, if this option is turned on without an IPv6 subnet explicitly configured, you will get an error unless you have set up a fixed IPv6 subnet. Consult the Docker IPv6 docs for information on how to do this.

**attachable** [False] If True, and the network is in the global scope, non-service containers on worker nodes will be able to connect to the network.

Example: `attachable=True`
Note: While support for this option was added in API version 1.24, its value was not added to the inspect results until API version 1.26. The version of Docker which is available for CentOS 7 runs API version 1.24, meaning that while Salt can pass this argument to the API, it has no way of knowing the value of this config option in an existing Docker network.

**scope** Specify the network’s scope (local, global or swarm)

Example: `scope=local`

**ingress** [False] If True, create an ingress network which provides the routing-mesh in swarm mode

Example: `ingress=True`

**IP ADDRESS MANAGEMENT (IPAM)**

This function supports networks with either IPv4, or both IPv4 and IPv6. If configuring IPv4, then you can pass the IPAM arguments as shown below, as individual arguments on the Salt CLI. However, if configuring IPv4 and IPv6, the arguments must be passed as a list of dictionaries, in the `ipam_pools` argument. See the **CLI Examples** below. These docs also have more information on these arguments.

**IPAM ARGUMENTS**

- **ipam_driver** IPAM driver to use, if different from the default one
  
  Example: `ipam_driver=foo`

- **ipam_opts** Options for the IPAM driver. Either a dictionary of option names and values or a Python list of strings in the format `varname=value`.

  Examples:
  
  - `ipam_opts='foo=bar,baz=qux'`
  
  - `ipam_opts="["foo=bar", "baz=qux"]"`
  
  - `ipam_opts="{"foo": "bar", "baz": "qux"}"`

**IPAM POOL ARGUMENTS**

- **subnet** Subnet in CIDR format that represents a network segment

  Example: `subnet=192.168.50.0/25`

- **iprange (or ip_range)** Allocate container IP from a sub-range within the subnet

  Subnet in CIDR format that represents a network segment

  Example: `iprange=192.168.50.64/26`

- **gateway** IPv4 gateway for the master subnet

  Example: `gateway=192.168.50.1`

- **aux_addresses (or aux_address)** A dictionary of mapping container names to IP addresses which should be allocated for them should they connect to the network. Either a dictionary of option names and values or a Python list of strings in the format `host=ipaddr`.

  Examples:

  - `aux_addresses='foo.bar.tld=192.168.50.10,hello.world.tld=192.168.50.11'`

  - `aux_addresses=('["foo.bar.tld=192.168.50.10", "hello.world.tld=192.168.50.11"]'`
aux_addresses="{'foo.bar.tld': '192.168.50.10', 'hello.world.tld': '192.168.50.11'}"

CLI Examples:

```bash
salt myminion docker.create_network web_network driver=bridge
# IPv4
salt myminion docker.create_network macvlan_network driver=macvlan driver_opts="{→'parent': 'eth0'}" gateway=172.20.0.1 subnet=172.20.0.0/24
# IPv4 and IPv6
salt myminion docker.create_network mynet ipam_pools=['{"subnet": "10.0.0.0/24", →"gateway": "10.0.0.1"}, {"subnet": "fe3f:2180:26:1::60/123", "gateway": →"fe3f:2180:26:1::61"}']
```

**salt.modules.dockermod.create_volume**(name, driver=None, driver_opts=None)

Create a new volume

New in version 2015.8.4.

- **name**  name of volume
- **driver**  Driver of the volume
- **driver_opts**  Options for the driver volume

CLI Example:

```bash
salt myminion docker.create_volume my_volume driver=local
```

**salt.modules.dockermod.dangling**(prune=False, force=False)

Return top-level images (those on which no other images depend) which do not have a tag assigned to them. These include:

- Images which were once tagged but were later untagged, such as those which were superseded by committing a new copy of an existing tagged image.
- Images which were loaded using `docker.load` (or the `docker load` Docker CLI command), but not tagged.

- **prune**  [False] Remove these images
- **force**  [False] If True, and if prune=True, then forcibly remove these images.

**RETURN DATA**

If prune=False, the return data will be a list of dangling image IDs.

If prune=True, the return data will be a dictionary with each key being the ID of the dangling image, and the following information for each image:

- **Comment** - Any error encountered when trying to prune a dangling image  
  *(Only present if prune failed)*
- **Removed** - A boolean (True if prune was successful, False if not)

CLI Example:

```bash
salt myminion docker.dangling
salt myminion docker.dangling prune=True
```

**salt.modules.dockermod.depends**(name)

Returns the containers and images, if any, which depend on the given image
name  Name or ID of image

RETURN DATA
A dictionary containing the following keys:

- **Containers** - A list of containers which depend on the specified image
- **Images** - A list of IDs of images which depend on the specified image

CLI Example:

```bash
salt myminion docker.depends myimage
salt myminion docker.depends 0123456789ab
```

**salt.modules.dockermod.diff(name)**

Get information on changes made to container’s filesystem since it was created. Equivalent to running the `docker diff` Docker CLI command.

**name**  Container name or ID

RETURN DATA
A dictionary containing any of the following keys:

- **Added** - A list of paths that were added.
- **Changed** - A list of paths that were changed.
- **Deleted** - A list of paths that were deleted.

These keys will only be present if there were changes, so if the container has no differences the return dict will be empty.

CLI Example:

```bash
salt myminion docker.diff mycontainer
```

**salt.modules.dockermod.disconnect_all_containers_from_network(network_id)**

New in version 2018.3.0.

Runs `docker.disconnect_container_from_network` on all containers connected to the specified network, and returns the names of all containers that were disconnected.

**network_id**  Network name or ID

CLI Examples:

```bash
salt myminion docker.disconnect_all_containers_from_network mynet
salt myminion docker.disconnect_all_containers_from_network1f9d2454d0872b68d9e8744c6e7a4c66b86f10abaccc21e14f7f014f729b2bc
```

**salt.modules.dockermod.disconnect_container_from_network(container, network_id)**

New in version 2015.8.3.

Disconnect container from network

**container**  Container name or ID

**network_id**  Network name or ID

CLI Examples:

```bash
salt myminion docker.disconnect_container_from_network web-1 mynet
salt myminion docker.disconnect_container_from_network web-1f9d2454d0872b68d9e8744c6e7a4c66b86f10abaccc21e14f7f014f729b2bc
```

(continues on next page)
salt.modules.dockermod.exists(name)
Check if a given container exists

name  Container name or ID

RETURN DATA
A boolean (True if the container exists, otherwise False)

CLI Example:
salt myminion docker.exists mycontainer

salt.modules.dockermod.export(name, path, overwrite=False, makedirs=False, compression=None, **kwargs)
Exports a container to a tar archive. It can also optionally compress that tar archive, and push it up to the Master.

name  Container name or ID
path  Absolute path on the Minion where the container will be exported
overwrite  [False] Unless this option is set to True, then if a file exists at the location specified by the path argument, an error will be raised.
makedirs  [False] If True, then if the parent directory of the file specified by the path argument does not exist, Salt will attempt to create it.
compression  [None] Can be set to any of the following:
- gzip or gz for gzip compression
- bzip2 or bz2 for bzip2 compression
- xz or lzma for XZ compression (requires xz-utils, as well as the lzma module from Python 3.3, available in Python 2 and Python 3.0-3.2 as backports.lzma)

This parameter can be omitted and Salt will attempt to determine the compression type by examining the filename passed in the path parameter.

push  [False] If True, the container will be pushed to the master using cp.push.

Note: This requires file_recv to be set to True on the Master.

RETURN DATA
A dictionary will containing the following keys:
- Path - Path of the file that was exported
- Push - Reports whether or not the file was successfully pushed to the Master
  (Only present if push=True)
- Size - Size of the file, in bytes
- Size_Human - Size of the file, in human-readable units
- Time_Elapsed - Time in seconds taken to perform the export

CLI Examples:
salt.modules.dockermod.get_client_args(limit=None)

New in version 2016.3.6, 2016.11.4, 2017.7.0.

Changed in version 2017.7.0: Replaced the container config args with the ones from the API's create_container function.

Changed in version 2018.3.0: Added ability to limit the input to specific client functions

Many functions in Salt have been written to support the full list of arguments for a given function in the docker-py Low-level API. However, depending on the version of docker-py installed on the minion, the available arguments may differ. This function will get the arguments for various functions in the installed version of docker-py, to be used as a reference.

**limit**

An optional list of categories for which to limit the return. This is useful if only a specific set of arguments is desired, and also keeps other function’s argspecs from needlessly being examined.

**AVAILABLE LIMITS**

- create_container - arguments accepted by create_container() (used by docker.create)
- host_config - arguments accepted by create_host_config() (used to build the host config for docker.create)
- connect_container_to_network - arguments used by connect_container_to_network() to construct an endpoint config when connecting to a network (used by docker.connect_container_to_network)
- create_network - arguments accepted by create_network() (used by docker.create_network)
- ipam_config - arguments used to create an IPAM pool (used by docker.create_network in the process of constructing an IPAM config dictionary)

**CLI Example:**

```
salt myminion docker.get_client_args
salt myminion docker.get_client_args logs
salt myminion docker.get_client_args create_container,connect_container_to_network
```

salt.modules.dockermod.highstate(name, saltenv='base', **kwargs)

Apply a highstate to the running container

New in version 2019.2.0.

The container does not need to have Salt installed, but Python is required.

**name** Container name or ID

**saltenv** [base] Specify the environment from which to retrieve the SLS indicated by the **mods** parameter.

**CLI Example:**

```
salt myminion docker.highstate compassionate_mirzakhani
```

salt.modules.dockermod.history(name, quiet=False)

Return the history for an image. Equivalent to running the docker history Docker CLI command.

**name** Container name or ID

**quiet** [False] If True, the return data will simply be a list of the commands run to build the container.

---

21.9. execution modules
RETURN DATA

If quiet=False, the return value will be a list of dictionaries containing information about each step taken to build the image. The keys in each step include the following:

- **Command** - The command executed in this build step
- **Id** - Layer ID
- **Size** - Cumulative image size, in bytes
- **Size_Human** - Cumulative image size, in human-readable units
- **Tags** - Tag(s) assigned to this layer
- **Time_Created_Epoch** - Time this build step was completed (Epoch time)
- **Time_Created_Local** - Time this build step was completed (Minion’s local timezone)

CLI Example:

```shell
salt myminion docker.exists mycontainer
```

salt.modules.dockermod.images(verbos=False, **kwargs)

Returns information about the Docker images on the Minion. Equivalent to running the `docker images` Docker CLI command.

- **all** [False] If True, untagged images will also be returned
- **verbose** [False] If True, a `docker inspect` will be run on each image returned.

RETURN DATA

A dictionary with each key being an image ID, and each value some general info about that image (time created, size, tags associated with the image, etc.)

CLI Example:

```shell
salt myminion docker.images
salt myminion docker.images all=True
```
salt.modules.dockermod.import_

[source, repository, tag='latest', api_response=False]

Changed in version 2018.3.0: The repository and tag must now be passed separately using the repository and tag arguments, rather than together in the (now deprecated) image argument.

Imports content from a local tarball or a URL as a new docker image

**source** Content to import (URL or absolute path to a tarball). URL can be a file on the Salt fileserver (i.e. salt://path/to/rootfs/tarball.tar.xz). To import a file from a saltenv other than base (e.g. dev), pass it at the end of the URL (ex. salt://path/to/rootfs/tarball.tar.xz?saltenv=dev).

**repository** Repository name for the image being imported

New in version 2018.3.0.

**tag** [latest] Tag name for the image

New in version 2018.3.0.

**image** Deprecated since version 2018.3.0: Use both repository and tag instead

**api_response** [False] If True an api_response key will be present in the return data, containing the raw output from the Docker API.

**RETURN DATA**

A dictionary containing the following keys:

- **Id** - ID of the newly-created image
- **Image** - Name of the newly-created image
- **Time_Elapsed** - Time in seconds taken to perform the commit

CLI Example:

```
salt myminion docker.import /tmp/cent7-minimal.tar.xz myuser/centos
salt myminion docker.import /tmp/cent7-minimal.tar.xz myuser/centos:7
salt myminion docker.import salt://dockerimages/cent7-minimal.tar.xz myuser/...centos:7
```

salt.modules.dockermod.info()

Returns a dictionary of system-wide information. Equivalent to running the docker info Docker CLI command.

CLI Example:

```
salt myminion docker.info
```

salt.modules.dockermod.inspect(name)

Changed in version 2017.7.0: Volumes and networks are now checked, in addition to containers and images.

This is a generic container/image/volume/network inspecton function. It will run the following functions in order:

- `docker.inspect_container`
- `docker.inspect_image`
- `docker.inspect_volume`
- `docker.inspect_network`

The first of these to find a match will be returned.

**name** Container/image/volume/network name or ID
RETURN DATA
A dictionary of container/image/volume/network information

CLI Example:

```
salt myminion docker.inspect mycontainer
salt myminion docker.inspect busybox
```

```
salt.modules.dockermod.inspect_container(name)
Retrieves container information. Equivalent to running the docker inspect Docker CLI command, but will only look for container information.

name  Container name or ID

RETURN DATA
A dictionary of container information

CLI Example:

```
salt myminion docker.inspect_container mycontainer
salt myminion docker.inspect_container 0123456789ab
```

```
salt.modules.dockermod.inspect_image(name)
Retrieves image information. Equivalent to running the docker inspect Docker CLI command, but will only look for image information.

name  Image name or ID

RETURN DATA
A dictionary of image information

CLI Examples:

```
salt myminion docker.inspect_image busybox
salt myminion docker.inspect_image centos:6
salt myminion docker.inspect_image 0123456789ab
```

```
salt.modules.dockermod.inspect_network(network_id)
Inspect Network

network_id  ID of network

CLI Example:

```
salt myminion docker.inspect_network0
-1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abacc21e14f7014f729b2bc
```

```
salt.modules.dockermod.inspect_volume(name)
Inspect Volume

New in version 2015.8.4.

name  Name of volume
```
CLI Example:

```
salt myminion docker.inspect_volume my_volume
```

```
salt.modules.dockermod.kill(name)
```
Kill all processes in a running container instead of performing a graceful shutdown

*name* Container name or ID

**RETURN DATA**
A dictionary will be returned, containing the following keys:

- **status** - A dictionary showing the prior state of the container as well as the new state
- **result** - A boolean noting whether or not the action was successful
- **comment** - Only present if the container cannot be killed

CLI Example:

```
salt myminion docker.kill mycontainer
```

```
salt.modules.dockermod.layers(name)
```
Returns a list of the IDs of layers belonging to the specified image, with the top-most layer (the one corresponding to the passed name) appearing last.

*name* Image name or ID

CLI Example:

```
salt myminion docker.layers centos:7
```

```
salt.modules.dockermod.list_containers(**kwargs)
```
Returns a list of containers by name. This is different from `docker.ps` in that `docker.ps` returns its results organized by container ID.

*all* [False] If True, stopped containers will be included in return data

CLI Example:

```
salt myminion docker.inspect_image <image>
```

```
salt.modules.dockermod.list_tags()
```
Returns a list of tagged images

CLI Example:

```
salt myminion docker.list_tags
```

```
salt.modules.dockermod.load(path, repository=None, tag=None)
```
Changed in version 2018.3.0: If the loaded image should be tagged, then the repository and tag must now be passed separately using the repository and tag arguments, rather than together in the (now deprecated) image argument.

Load a tar archive that was created using `docker.save` (or via the Docker CLI using `docker save`).

*path* Path to docker tar archive. Path can be a file on the Minion, or the URL of a file on the Salt fileserver (i.e. `salt://path/to/docker/saved/image.tar`). To load a file from a saltenv other than base (e.g. dev), pass it at the end of the URL (ex. `salt://path/to/rootfs/tarball.tar.xz?saltenv=dev`).
repository  If specified, the topmost layer of the newly-loaded image will be tagged with the specified repo using `docker.tag`. If a repository name is provided, then the tag argument is also required.

   New in version 2018.3.0.

tag  Tag name to go along with the repository name, if the loaded image is to be tagged.

   New in version 2018.3.0.

image  Deprecated since version 2018.3.0: Use both repository and tag instead

RETURN DATA

A dictionary will be returned, containing the following keys:

- Path  - Path of the file that was saved
- Layers  - A list containing the IDs of the layers which were loaded. Any layers in the file that was loaded, which were already present on the Minion, will not be included.
- Image  - Name of tag applied to topmost layer
   (Only present if tag was specified and tagging was successful)
- Time_Elapsed  - Time in seconds taken to load the file
- Warning  - Message describing any problems encountered in attempt to tag the topmost layer
   (Only present if tag was specified and tagging failed)

CLI Example:

```
salt myminion docker.load /path/to/image.tar
salt myminion docker.load salt://path/to/docker/saved/image.tar repository=myuser/→myimage tag=mytag
```

salt.modules.dockermod.login(*registries)

   New in version 2016.3.7,2016.11.4,2017.7.0.

   Performs a docker login to authenticate to one or more configured repositories. See the documentation at the top of this page to configure authentication credentials.

   Multiple registry URLs (matching those configured in Pillar) can be passed, and Salt will attempt to login to just those registries. If no registry URLs are provided, Salt will attempt to login to all configured registries.

RETURN DATA

A dictionary containing the following keys:

- Results  - A dictionary mapping registry URLs to the authentication result. True means a successful login, False means a failed login.
- Errors  - A list of errors encountered during the course of this function.

CLI Example:

```
salt myminion docker.login
salt myminion docker.login hub
salt myminion docker.login hub https://mydomain.tld/registry/
```

salt.modules.dockermod.logs(name, **kwargs)

   Changed in version 2018.3.0: Support for all of docker-py’s logs() function’s arguments, with the exception of stream.

   Returns the logs for the container. An interface to docker-py’s logs() function.
name  Container name or ID
stdout [True] Return stdout lines
stderr [True] Return stdout lines
timestamps [False] Show timestamps
tail [all] Output specified number of lines at the end of logs. Either an integer number of lines or the string all.
since  Show logs since the specified time, passed as a UNIX epoch timestamp. Optionally, if timelib is installed on the minion the timestamp can be passed as a string which will be resolved to a date using timelib.strtodatetime().
follow [False] If True, this function will block until the container exits and return the logs when it does. The default behavior is to return what is in the log at the time this function is executed.

CLI Examples:

```bash
# All logs
salt myminion docker.logs mycontainer
# Last 100 lines of log
salt myminion docker.logs mycontainer tail=100
# Just stderr
salt myminion docker.logs mycontainer stdout=False
# Logs since a specific UNIX timestamp
salt myminion docker.logs mycontainer since=1511688459
# Flexible format for "since" argument (requires timelib)
salt myminion docker.logs mycontainer since='1 hour ago'
salt myminion docker.logs mycontainer since='1 week ago'
salt myminion docker.logs mycontainer since='1 fortnight ago'
```

```
salt.modules.dockermod.networks(names=None, ids=None)
```

Changed in version 2017.7.0: The names and ids can be passed as a comma-separated list now, as well as a Python list.

List existing networks

names  Filter by name
ids  Filter by id

CLI Example:

```bash
salt myminion docker.networks names=network-web
salt myminion docker.networks ids=1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abaccc21e14f7f014f729b2bc
```

```
salt.modules.dockermod.pause(name)
```

Pauses a container

name  Container name or ID

RETURN DATA

A dictionary will be returned, containing the following keys:

- status - A dictionary showing the prior state of the container as well as the new state
- result - A boolean noting whether or not the action was successful
- comment - Only present if the container cannot be paused
salt.modules.dockermod.pid(name)
Returns the PID of a container

name   Container name or ID

CLI Example:

```
salt myminion docker.pid mycontainer
salt myminion docker.pid @123456789ab
```

salt.modules.dockermod.port(name, private_port=None)
Returns port mapping information for a given container. Equivalent to running the `docker port` Docker CLI command.

name   Container name or ID

Changed in version 2019.2.0: This value can now be a pattern expression (using the pattern-matching characters defined in `fnmatch`). If a pattern expression is used, this function will return a dictionary mapping container names which match the pattern to the mappings for those containers. When no pattern expression is used, a dictionary of the mappings for the specified container name will be returned.

private_port   [None] If specified, get information for that specific port. Can be specified either as a port number (i.e. 5000), or as a port number plus the protocol (i.e. 5000/udp).

If this argument is omitted, all port mappings will be returned.

RETURN DATA
A dictionary of port mappings, with the keys being the port and the values being the mapping(s) for that port.

CLI Examples:

```
salt myminion docker.port mycontainer
salt myminion docker.port mycontainer 5000
salt myminion docker.port mycontainer 5000/udp
```

salt.modules.dockermod.prune(containers=False, networks=False, images=False, build=False, volumes=False, system=None, **filters)
New in version 2019.2.0.
Prune Docker's various subsystems

Note: This requires docker-py version 2.1.0 or later.

containers   [False] If True, prunes stopped containers (documentation)
images   [False] If True, prunes unused images (documentation)
networks   [False] If False, prunes unreferenced networks (documentation)
build   [False] If True, clears the builder cache

Note: Only supported in Docker 17.07.x and newer. Additionally, filters do not apply to this argument.

volumes   [False] If True, prunes unreferenced volumes (documentation)
system If True, prunes containers, images, networks, and builder cache. Assumed to be True if none of containers, images, networks, or build are set to True.

Note: volumes=True must still be used to prune volumes

filters

- dangling=True (images only) - remove only dangling images
- until=<timestamp> - only remove objects created before given timestamp. Not applicable to volumes. See the documentation links above for examples of valid time expressions.
- label - only remove objects matching the label expression. Valid expressions include labelname or labelname=value.

CLI Examples:

```
salt myminion docker.prune system=True
salt myminion docker.prune system=True until=12h
salt myminion docker.prune images=True dangling=True
salt myminion docker.prune images=True label=foo,bar=baz
```

salt.modules.dockermod.ps_(filters=None, **kwargs)

Returns information about the Docker containers on the Minion. Equivalent to running the docker ps Docker CLI command.

all [False] If True, stopped containers will also be returned

host: False If True, local host’s network topology will be included

verbose [False] If True, a docker inspect will be run on each container returned.

filters: None A dictionary of filters to be processed on the container list. Available filters:

- exited (int): Only containers with specified exit code
- status (str): One of restarting, running, paused, exited
- label (str): format either "key" or "key=value"

RETURN DATA

A dictionary with each key being an container ID, and each value some general info about that container (time created, name, command, etc.)

CLI Example:

```
salt myminion docker.ps
salt myminion docker.ps all=True
salt myminion docker.ps filters="{'label': 'role=web'}"
```

salt.modules.dockermod.pull(image, insecure_registry=False, api_response=False, client_timeout=60)

Changed in version 2018.3.0: If no tag is specified in the image argument, all tags for the image will be pulled. For this reason it is recommended to pass image using the repo:tag notation.

Pulls an image from a Docker registry

image Image to be pulled

insecure_registry [False] If True, the Docker client will permit the use of insecure (non-HTTPS) registries.
api_response  [False] If True, an API_Response key will be present in the return data, containing the raw output from the Docker API.

Note: This may result in a lot of additional return data, especially for larger images.

client_timeout  Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

RETURN DATA
A dictionary will be returned, containing the following keys:
- **Layers** - A dictionary containing one or more of the following keys:
  - **Already_Pulled** - Layers that were already present on the Minion
  - **Pulled** - Layers that were pulled
- **Status** - A string containing a summary of the pull action (usually a message saying that an image was downloaded, or that it was up to date).
- **Time_Elapsed** - Time in seconds taken to perform the pull

CLI Example:
```
salt myminion docker.pull centos
salt myminion docker.pull centos:6
```

salt.modules.dockermod.push(image, insecure_registry=False, api_response=False, client_timeout=60)

Changed in version 2015.8.4: The Id and Image keys are no longer present in the return data. This is due to changes in the Docker Remote API.

Pushes an image to a Docker registry. See the documentation at top of this page to configure authentication credentials.

image  Image to be pushed. If just the repository name is passed, then all tagged images for the specified repo will be pushed. If the image name is passed in repo:tag notation, only the specified image will be pushed.

insecure_registry  [False] If True, the Docker client will permit the use of insecure (non-HTTPS) registries.

api_response  [False] If True, an API_Response key will be present in the return data, containing the raw output from the Docker API.

client_timeout  Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

RETURN DATA
A dictionary will be returned, containing the following keys:
- **Layers** - A dictionary containing one or more of the following keys:
  - **Already_Pushed** - Layers that were already present on the Minion
  - **Pushed** - Layers that were pushed
- **Time_Elapsed** - Time in seconds taken to perform the push

CLI Example:
salt modules.dockermod.remove_network(network_id)
Remove a network

network_id  Network name or ID

CLI Examples:

```
salt myminion docker.remove_network mynet
salt myminion docker.remove_network 1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abaccc21e14f7f014f729b2bc
```

salt modules.dockermod.remove_volume(name)
Remove a volume

New in version 2015.8.4.

name  Name of volume

CLI Example:

```
salt myminion docker.remove_volume my_volume
```

salt modules.dockermod.rename(name, new_name)
New in version 2017.7.0.

Renames a container. Returns True if successful, and raises an error if the API returns one. If unsuccessful and the API returns no error (should not happen), then False will be returned.

name  Name or ID of existing container

new_name  New name to assign to container

CLI Example:

```
salt myminion docker.rename foo bar
```

salt modules.dockermod.resolve_image_id(name)
New in version 2018.3.0.

Given an image name (or partial image ID), return the full image ID. If no match is found among the locally-pulled images, then False will be returned.

CLI Examples:

```
salt myminion docker.resolve_image_id foo
salt myminion docker.resolve_image_id foo:bar
salt myminion docker.resolve_image_id 36540f359ca3
```

salt modules.dockermod.resolve_tag(name, **kwargs)
New in version 2017.7.2.

Changed in version 2018.3.0: Instead of matching against pulled tags using docker.list_tags, this function now simply inspects the passed image name using docker.inspect_image and returns the first matching tag. If no matching tags are found, it is assumed that the passed image is an untagged image ID, and the full ID is returned.

Inspects the specified image name and returns the first matching tag in the inspect results. If the specified image is not pulled locally, this function will return False.
name  Image name to resolve. If the image is found but there are no tags, this means that the image name passed was an untagged image. In this case the image ID will be returned.

all  [False] If True, a list of all matching tags will be returned. If the image is found but there are no tags, then a list will still be returned, but it will simply contain the image ID.

New in version 2018.3.0.

tags  Deprecated since version 2018.3.0.

CLI Examples:

```
salt myminion docker.resolve_tag busybox
salt myminion docker.resolve_tag centos:7 all=True
salt myminion docker.resolve_tag c9f378ac27d9
```

```
salt.modules.dockermod.restart(name, timeout=10)
```

Restarts a container

name  Container name or ID

timeout  [10] Timeout in seconds after which the container will be killed (if it has not yet gracefully shut down)

RETURN DATA

A dictionary will be returned, containing the following keys:

- status - A dictionary showing the prior state of the container as well as the new state
- result - A boolean noting whether or not the action was successful
- restarted - If restart was successful, this key will be present and will be set to True.

CLI Examples:

```
salt myminion docker.restart mycontainer
salt myminion docker.restart mycontainer timeout=20
```

```
salt.modules.dockermod.retcode(name, cmd, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)
```

Run cmd.retcode within a container

name  Container name or ID in which to run the command

cmd  Command to run

exec_driver  [None] If not passed, the execution driver will be detected as described above.

stdin  [None] Standard input to be used for the command

output_loglevel  [debug] Level at which to log the output from the command. Set to quiet to suppress logging.

use_vt  [False] Use SaltStack’s utils.vt to stream output to console.

keep_env  [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container’s host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.retcode mycontainer '/ls -l /etc'
```
**salt.modules.dockermod.rm**(*name*, *force=False*, *volumes=False*, **kwargs*)

Removes a container

- **name** Container name or ID
- **force** [False] If True, the container will be killed first before removal, as the Docker API will not permit a running container to be removed. This option is set to False by default to prevent accidental removal of a running container.
- **stop** [False] If True, the container will be stopped first before removal, as the Docker API will not permit a running container to be removed. This option is set to False by default to prevent accidental removal of a running container.

New in version 2017.7.0.

- **timeout** Optional timeout to be passed to *docker.stop* if stopping the container.

New in version 2018.3.0.

- **volumes** [False] Also remove volumes associated with container

**RETURN DATA**

A list of the IDs of containers which were removed

**CLI Example:**

```bash
salt myminion docker.rm mycontainer
salt myminion docker.rm mycontainer force=True
```

**salt.modules.dockermod.rmi**(*names*, **kwargs*)

Removes an image

- **name** Name (in repo:tag notation) or ID of image.
- **force** [False] If True, the image will be removed even if the Minion has containers created from that image
- **prune** [True] If True, untagged parent image layers will be removed as well, set this to False to keep them.

**RETURN DATA**

A dictionary will be returned, containing the following two keys:
- **Layers** - A list of the IDs of image layers that were removed
- **Tags** - A list of the tags that were removed
- **Errors** - A list of any errors that were encountered

**CLI Examples:**

```bash
salt myminion docker.rmi busybox
salt myminion docker.rmi busybox force=True
salt myminion docker.rmi foo bar baz
```

**salt.modules.dockermod.run**(*name*, *cmd*, *exec_driver=None*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *ignore_retcode=False*, *keep_env=None*)

Run *cmd.run* within a container

- **name** Container name or ID in which to run the command
- **cmd** Command to run
- **exec_driver** [None] If not passed, the execution driver will be detected as described above.
stdin [None] Standard input to be used for the command

output_loglevel [debug] Level at which to log the output from the command. Set to quiet to suppress logging.

use_vt [False] Use SaltStack’s utils.vt to stream output to console.

keep_env [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container’s host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.run mycontainer 'ls -l /etc'
```

salt.modules.dockermod.run_all(name, cmd, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)

Run cmd.run_all within a container

**Note:** While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

name Container name or ID in which to run the command

cmd Command to run

exec_driver [None] If not passed, the execution driver will be detected as described above.

stdin [None] Standard input to be used for the command

output_loglevel [debug] Level at which to log the output from the command. Set to quiet to suppress logging.

use_vt [False] Use SaltStack’s utils.vt to stream output to console.

keep_env [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container’s host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.run_all mycontainer 'ls -l /etc'
```

salt.modules.dockermod.run_container(image, name=None, skip_translate=None, ignore_collisions=False, validate_ip_addrs=True, client_timeout=60, bg=False, replace=False, force=False, networks=None, **kwargs)

New in version 2018.3.0.

Equivalent to docker run on the Docker CLI. Runs the container, waits for it to exit, and returns the container’s logs when complete.

**Note:** Not to be confused with docker.run, which provides a cmd.run-like interface for executing commands in a running container.

This function accepts the same arguments as docker.create, with the exception of start. In addition, it accepts the arguments from docker.logs, with the exception of follow, to control how logs are returned.
Finally, the bg argument described below can be used to optionally run the container in the background (the default behavior is to block until the container exits).

bg [False] If True, this function will not wait for the container to exit and will not return its logs. It will however return the container's name and ID, allowing for docker.logs to be used to view the logs.

Note: The logs will be inaccessible once the container exits if auto_remove is set to True, so keep this in mind.

replace [False] If True, and if the named container already exists, this will remove the existing container. The default behavior is to return a False result when the container already exists.

force [False] If True, and the named container already exists, and replace is also set to True, then the container will be forcibly removed. Otherwise, the state will not proceed and will return a False result.

networks Networks to which the container should be connected. If automatic IP configuration is being used, the networks can be a simple list of network names. If custom IP configuration is being used, then this argument must be passed as a dictionary.

CLI Examples:

```bash
salt myminion docker.run_container myuser/myimage command=/usr/local/bin/myscript.
  → sh
# Run container in the background
salt myminion docker.run_container myuser/myimage command=/usr/local/bin/myscript.
  → sh bg=True
# Connecting to two networks using automatic IP configuration
salt myminion docker.run_container myuser/myimage command='perl /scripts/sync.py'
  → networks=net1,net2
# net1 using automatic IP, net2 using static IPv4 address
salt myminion docker.run_container myuser/myimage command='perl /scripts/sync.py'
  → networks='{"net1": {}, "net2": {"ipv4_address": "192.168.27.12"}}'
```

Run cmd.run_stderr within a container

```bash
salt.modules.dockermod.run_stderr(name, cmd, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)
```

Run cmd.run_stderr within a container

- **name** Container name or ID in which to run the command
- **cmd** Command to run
- **exec_driver** [None] If not passed, the execution driver will be detected as described above.
- **stdin** [None] Standard input to be used for the command
- **output_loglevel** [debug] Level at which to log the output from the command. Set to quiet to suppress logging.
- **use_vt** [False] Use SaltStack's utils.vt to stream output to console.
- **keep_env** [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```bash
salt myminion docker.run_stderr mycontainer 'ls -l /etc'
```
salt.modules.dockermod.run_stdout(name, cmd, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)

Run `cmd.run_stdout` within a container.

- **name**: Container name or ID in which to run the command
- **cmd**: Command to run
- **exec_driver**: [None] If not passed, the execution driver will be detected as described above.
- **stdin**: [None] Standard input to be used for the command
- **output_loglevel**: [debug] Level at which to log the output from the command. Set to quiet to suppress logging.
- **use_vt**: [False] Use SaltStack’s utils.vt to stream output to console.
- **keep_env**: [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container’s host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.run_stdout mycontainer 'ls -l /etc'
```

salt.modules.dockermod.save(name, path, overwrite=False, makedirs=False, compression=None, **kwargs)

Saves an image and to a file on the minion. Equivalent to running the `docker save` Docker CLI command, but unlike `docker save` this will also work on named images instead of just images IDs.

- **name**: Name or ID of image. Specify a specific tag by using the `repo:tag` notation.
- **path**: Absolute path on the Minion where the image will be exported
- **overwrite**: [False] Unless this option is set to True, then if the destination file exists an error will be raised.
- **makedirs**: [False] If True, then if the parent directory of the file specified by the `path` argument does not exist, Salt will attempt to create it.
- **compression**: [None] Can be set to any of the following:
  - `gzip` or `gz` for gzip compression
  - `bzip2` or `bz2` for bzip2 compression
  - `xz` or `lzma` for XZ compression (requires `xz-utils`, as well as the `lzma` module from Python 3.3, available in Python 2 and Python 3.0-3.2 as `backports.lzma`)

This parameter can be omitted and Salt will attempt to determine the compression type by examining the filename passed in the `path` parameter.

**Note**: Since the Docker API does not support `docker save`, compression will be a bit slower with this function than with `docker.export` since the image(s) will first be saved and then the compression done afterwards.

- **push**: [False] If True, the container will be pushed to the master using `cp.push`.

**Note**: This requires `file_recv` to be set to True on the Master.
RETURN DATA

A dictionary will be returned, containing the following keys:

- **Path** - Path of the file that was saved
- **Push** - Reports whether or not the file was successfully pushed to the Master
  
  *(Only present if push=True)*
- **Size** - Size of the file, in bytes
- **Size_Human** - Size of the file, in human-readable units
- **Time_Elapsed** - Time in seconds taken to perform the save

CLI Examples:

```
salt myminion docker.save centos:7 /tmp/cent7.tar
salt myminion docker.save 0123456789ab cdef01234567 /tmp/saved.tar
```

```python
salt.modules.dockermod.script(name, source, saltenv='base', args=None, template=None, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', ignore_retcode=False, use_vt=False, keep_env=None)
```

Run `cmd.script` within a container

**Note:** While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

- **name** Container name or ID
- **source** Path to the script. Can be a local path on the Minion or a remote file from the Salt fileserver.
- **args** A string containing additional command-line options to pass to the script.
- **template** [None] Templating engine to use on the script before running.
- **exec_driver** [None] If not passed, the execution driver will be detected as described above.
- **stdin** [None] Standard input to be used for the script
- **output_loglevel** [debug] Level at which to log the output from the script. Set to quiet to suppress logging.
- **use_vt** [False] Use SaltStack’s utils.vt to stream output to console.
- **keep_env** [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container’s host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.script mycontainer salt://docker_script.py
salt myminion docker.script mycontainer salt://scripts/runme.sh 'arg1 arg2 "arg 3"
salt myminion docker.script mycontainer salt://scripts/runme.sh stdin="'one\ntwo\nthree\nfour\nfive\n' output_loglevel='quiet
```
salt.modules.dockermod.script_retcode(name, source, saltenv='base', args=None, template=None, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', ignore_retcode=False, use_vt=False, keep_env=None)

Run cmd.script_retcode within a container

**name** Container name or ID

**source** Path to the script. Can be a local path on the Minion or a remote file from the Salt fileserver.

**args** A string containing additional command-line options to pass to the script.

**template** [None] Templating engine to use on the script before running.

**exec_driver** [None] If not passed, the execution driver will be detected as described above.

**stdin** [None] Standard input to be used for the script

**output_loglevel** [debug] Level at which to log the output from the script. Set to quiet to suppress logging.

**use_vt** [False] Use SaltStack’s utils.vt to stream output to console.

**keep_env** [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container’s host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```bash
salt myminion docker.script_retcode mycontainer salt://docker_script.py
salt myminion docker.script_retcode mycontainer salt://scripts/runme.sh 'arg1' →'arg2 "arg 3"

salt myminion docker.script_retcode mycontainer salt://scripts/runme.sh stdin=←'one\ntwo\nthree\nfour\nfive\n' output_loglevel=quiet
```

salt.modules.dockermod.search(name, official=False, trusted=False)

Searches the registry for an image

**name** Search keyword

**official** [False] Limit results to official builds

**trusted** [False] Limit results to trusted builds

**RETURN DATA**

A dictionary with each key being the name of an image, and the following information for each image:

- **Description** - Image description
- **Official** - A boolean (True if an official build, False if not)
- **Stars** - Number of stars the image has on the registry
- **Trusted** - A boolean (True if a trusted build, False if not)

CLI Example:

```bash
salt myminion docker.search centos
salt myminion docker.search centos official=True
```

salt.modules.dockermod.signal_(name, signal)

Send a signal to a container. Signals can be either strings or numbers, and are defined in the Standard Signals section of the signal(7) manpage. Run man 7 signal on a Linux host to browse this manpage.

**name** Container name or ID
signal  Signal to send to container

**RETURN DATA**

If the signal was successfully sent, `True` will be returned. Otherwise, an error will be raised.

CLI Example:

```
salt myminion docker.signal mycontainer SIGHUP
```

salt.modules.dockermod.sls(*name*, *mods=None, **kwargs*)

Apply the states defined by the specified SLS modules to the running container.

New in version 2016.11.0.

The container does not need to have Salt installed, but Python is required.

- **name**  Container name or ID
- **mods**  [None] A string containing comma-separated list of SLS with defined states to apply to the container.
- **saltenv**  [base] Specify the environment from which to retrieve the SLS indicated by the `mods` parameter.
- **pillarenv**  Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.
  
  New in version 2018.3.0.

- **pillar**  Custom Pillar values, passed as a dictionary of key-value pairs.

  **Note:** Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

  New in version 2018.3.0.

CLI Example:

```
salt myminion docker.sls compassionate_mirzakhani mods=rails,web
```

salt.modules.dockermod.sls_build(*repository*, *tag='latest', base='opensuse/python', *mods=None, dryrun=False, **kwargs*)

Changed in version 2018.3.0: The repository and tag must now be passed separately using the `repository` and `tag` arguments, rather than together in the (now deprecated) `image` argument.

Build a Docker image using the specified SLS modules on top of base image.

New in version 2016.11.0.

The base image does not need to have Salt installed, but Python is required.

- **repository**  Repository name for the image to be built.
  
  New in version 2018.3.0.

- **tag**  [latest] Tag name for the image to be built.
  
  New in version 2018.3.0.

- **name**  Deprecated since version 2018.3.0: Use both `repository` and `tag` instead.
- **base**  [opensuse/python] Name or ID of the base image.
- **mods**  A string containing comma-separated list of SLS with defined states to apply to the base image.
saltenv [base] Specify the environment from which to retrieve the SLS indicated by the `mods` parameter.

pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

New in version 2018.3.0.

pillar Custom Pillar values, passed as a dictionary of key-value pairs

Note: Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

New in version 2018.3.0.

dryrun: False when set to True the container will not be committed at the end of the build. The dryrun succeed also when the state contains errors.

RETURN DATA
A dictionary with the ID of the new container. In case of a dryrun, the state result is returned and the container gets removed.

CLI Example:
```
salt myminion docker.sls_build imgname base=mybase mods=rails,web
```

```
salt.modules.dockermod.start_(name)
Start a container
name Container name or ID

RETURN DATA
A dictionary will be returned, containing the following keys:

- `status` - A dictionary showing the prior state of the container as well as the new state
- `result` - A boolean noting whether or not the action was successful
- `comment` - Only present if the container cannot be started

CLI Example:
```
salt myminion docker.start mycontainer
```

```
salt.modules.dockermod.state(name)
Returns the state of the container
name Container name or ID

RETURN DATA
A string representing the current state of the container (either `running`, `paused`, or `stopped`)

CLI Example:
```
salt myminion docker.state mycontainer
```

```
salt.modules.dockermod.stop(name, timeout=None, **kwargs)
Stops a running container
name Container name or ID
```
unpause [False] If True and the container is paused, it will be unpaused before attempting to stop the container.

timeout Timeout in seconds after which the container will be killed (if it has not yet gracefully shut down)

Changed in version 2017.7.0: If this argument is not passed, then the container’s configuration will be checked. If the container was created using the stop_timeout argument, then the configured timeout will be used, otherwise the timeout will be 10 seconds.

RETURN DATA
A dictionary will be returned, containing the following keys:

- status - A dictionary showing the prior state of the container as well as the new state
- result - A boolean noting whether or not the action was successful
- comment - Only present if the container can not be stopped

CLI Examples:

```bash
salt myminion docker.stop mycontainer
salt myminion docker.stop mycontainer unpause=True
salt myminion docker.stop mycontainer timeout=20
```

salt.modules.dockermod.tag_(name, repository, tag='latest', force=False)

Changed in version 2018.3.0: The repository and tag must now be passed separately using the repository and tag arguments, rather than together in the (now deprecated) image argument.

Tag an image into a repository and return True. If the tag was unsuccessful, an error will be raised.

name ID of image
repository Repository name for the image to be built

New in version 2018.3.0.
tag [latest] Tag name for the image to be built

New in version 2018.3.0.
image Deprecated since version 2018.3.0: Use both repository and tag instead
force [False] Force apply tag

CLI Example:

```bash
salt myminion docker.tag 0123456789ab myrepo/mycontainer mytag
```

salt.modules.dockermod.top(name)

Runs the docker top command on a specific container

name Container name or ID

CLI Example:

RETURN DATA
A list of dictionaries containing information about each process

```bash
salt myminion docker.top mycontainer
salt myminion docker.top 0123456789ab
```

salt.modules.dockermod.unpause(name)

Unpauses a container
**name**  Container name or ID

**RETURN DATA**
A dictionary will be returned, containing the following keys:

- **status** - A dictionary showing the prior state of the container as well as the new state
- **result** - A boolean noting whether or not the action was successful
- **comment** - Only present if the container can not be unpaused

**CLI Example:**
```
salt myminion docker.pause mycontainer
```

salt.modules.dockermod.version()
Returns a dictionary of Docker version information. Equivalent to running the docker version Docker CLI command.

**CLI Example:**
```
salt myminion docker.version
```

salt.modules.dockermod.volumes(filters=None)
List existing volumes
New in version 2015.8.4.

- **filters**  There is one available filter: dangling=true

**CLI Example:**
```
salt myminion docker.volumes filters="{"dangling": True}"
```

salt.modules.dockermod.wait(name, ignore_already_stopped=False, fail_on_exit_status=False)
Wait for the container to exit gracefully, and return its exit code

**Note:**  This function will block until the container is stopped.

**name**  Container name or ID

**ignore_already_stopped**  Boolean flag that prevents execution to fail, if a container is already stopped.

**fail_on_exit_status**  Boolean flag to report execution as failure if exit_status is different than 0.

**RETURN DATA**
A dictionary will be returned, containing the following keys:

- **status** - A dictionary showing the prior state of the container as well as the new state
- **result** - A boolean noting whether or not the action was successful
- **exit_status** - Exit status for the container
- **comment** - Only present if the container is already stopped

**CLI Example:**
```
salt myminion docker.wait mycontainer
```
21.9.111 salt.modules.dpkg_lowpkg

Support for DEB packages

```
salt.modules.dpkg_lowpkg.bin_pkg_info(path, saltenv='base')
```

New in version 2015.8.0.

Parses RPM metadata and returns a dictionary of information about the package (name, version, etc.).

- **path** Path to the file. Can either be an absolute path to a file on the minion, or a salt fileserver URL (e.g. `salt://path/to/file.rpm`). If a salt fileserver URL is passed, the file will be cached to the minion so that it can be examined.

- **saltenv** [base] Salt fileserver environment from which to retrieve the package. Ignored if `path` is a local file path on the minion.

*CLI Example:*

```
salt '*' lowpkg.bin_pkg_info /root/foo-1.2.3-1ubuntu1_all.deb
salt '*' lowpkg.bin_pkg_info salt://foo-1.2.3-1ubuntu1_all.deb
```

```
salt.modules.dpkg_lowpkg.file_dict(*packages)
```

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system’s package database (not generally recommended).

*CLI Examples:*

```
salt '*' lowpkg.file_list httpd
salt '*' lowpkg.file_list httpd postfix
salt '*' lowpkg.file_list
```

```
salt.modules.dpkg_lowpkg.file_list(*packages)
```

List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system’s package database (not generally recommended).

*CLI Examples:*

```
salt '*' lowpkg.file_list httpd
salt '*' lowpkg.file_list httpd postfix
salt '*' lowpkg.file_list
```

```
salt.modules.dpkg_lowpkg.info(*packages, **kwargs)
```

Returns a detailed summary of package information for provided package names. If no packages are specified, all packages will be returned.

- **packages** The names of the packages for which to return information.

- **failhard** Whether to throw an exception if none of the packages are installed. Defaults to True.

  New in version 2016.11.3.

*CLI example:*

```
salt '*' lowpkg.info
salt '*' lowpkg.info apache2 bash
salt '*' lowpkg.info 'php5*' failhard=false
```

```
salt.modules.dpkg_lowpkg.list_pkgs(*packages)
```

List the packages currently installed in a dict:
Virtual package resolution requires aptitude. Because this function uses dpkg, virtual packages will be reported as not installed.

```python
salt '*' lowpkg.list_pkgs
salt '*' lowpkg.list_pkgs httpd
```

```python
salt.modules.dpkg_lowpkg.unpurge('packages')
Change package selection for each package specified to 'install'
```

```python
salt '*' lowpkg.unpurge curl
```

### 21.9.112 salt.modules.drac

Manage Dell DRAC

```python
salt.modules.drac.change_password(username, password, uid=None)
Change users password
```

CLI Example:

```bash
salt dell drac.change_password [USERNAME] [PASSWORD] [UID - optional]
salt dell drac.change_password diana secret
```

```python
salt.modules.drac.create_user(username, password, permissions, users=None)
Create user accounts
```

CLI Example:

```bash
salt dell drac.create_user [USERNAME] [PASSWORD] [PRIVILEGES]
salt dell drac.create_user diana secret login,test_alerts,clear_logs
```

**DRAC Privileges**

- login : Login to iDRAC
- drac : Configure iDRAC
- user_management : Configure Users
- clear_logs : Clear Logs
- server_control_commands : Execute Server Control Commands
- console_redirection : Access Console Redirection
- virtual_media : Access Virtual Media
- test_alerts : Test Alerts
- debug_commands : Execute Debug Commands
salt.modules.drac.delete_user(username, uid=None)
    Delete a user
    CLI Example:
    ```
salt dell drac.delete_user [USERNAME] [UID - optional]
salt dell drac.delete_user diana 4
    ```

salt.modules.drac.email_alerts(action)
    Enable/Disable email alerts
    CLI Example:
    ```
salt dell drac.email_alerts True
salt dell drac.email_alerts False
    ```

salt.modules.drac.list_users()
    List all DRAC users
    CLI Example:
    ```
salt dell drac.list_users
    ```

salt.modules.drac.nameservers("ns")
    Configure the nameservers on the DRAC
    CLI Example:
    ```
salt dell drac.nameservers [NAMESERVERS]
salt dell drac.nameservers ns1.example.com ns2.example.com
    ```

salt.modules.drac.network_info()
    Return Network Configuration
    CLI Example:
    ```
salt dell drac.network_info
    ```

salt.modules.drac.server_hardreset()
    Performs a reset (reboot) operation on the managed server.
    CLI Example:
    ```
salt dell drac.server_hardreset
    ```

salt.modules.drac.server_poweroff()
    Powers down the managed server.
    CLI Example:
    ```
salt dell drac.server_poweroff
    ```

salt.modules.drac.server_poweron()
    Powers up the managed server.
    CLI Example:
    ```
salt dell drac.server_poweron
    ```
salt.modules.drac.server_pxe()
Configure server to PXE perform a one off PXE boot

CLI Example:
salt dell drac.server_pxe

salt.modules.drac.server_reboot()
Issues a power-cycle operation on the managed server. This action is similar to pressing the power button on the system’s front panel to power down and then power up the system.

CLI Example:
salt dell drac.server_reboot

salt.modules.drac.set_network(ip, netmask, gateway)
Configure Network

CLI Example:
salt dell drac.set_network \[DRAC IP\] \[NETMASK\] \[GATEWAY\]
salt dell drac.set_network 192.168.0.2 255.255.255.0 192.168.0.1

salt.modules.drac.set_permissions(username, permissions, uid=None)
Configure users permissions

CLI Example:
salt dell drac.set_permissions \[USERNAME\] \[PRIVILEGES\] \[USER INDEX - optional\]
salt dell drac.set_permissions diana login,test_alerts,clear_logs 4

DRAC Privileges

• login : Login to iDRAC
• drac : Configure iDRAC
• user_management : Configure Users
• clear_logs : Clear Logs
• server_control_commands : Execute Server Control Commands
• console redirection : Access Console Redirection
• virtual_media : Access Virtual Media
• test_alerts : Test Alerts
• debug_commands : Execute Debug Commands

salt.modules.drac.set_snmp(community)
Configure SNMP community string

CLI Example:
salt dell drac.set_snmp \[COMMUNITY\]
salt dell drac.set_snmp public

salt.modules.drac.syslog(server, enable=True)
Configure syslog remote logging, by default syslog will automatically be enabled if a server is specified. However, if you want to disable syslog you will need to specify a server followed by False
21.9.113 `salt.modules.dracr`

Manage Dell DRAC.

New in version 2015.8.2.

CLI Example:

```
salt dell dracr.bare_rac_cmd(cmd, host=None, admin_username=None, admin_password=None)
salt.modules.dracr.change_password(username, password, uid=None, host=None, admin_username=None, admin_password=None, module=None)
```

Change user’s password

CLI Example:

```
salt dell dracr.change_password [USERNAME] [PASSWORD] uid=[OPTIONAL]
    host=<remote DRAC> admin_username=<DRAC user>
    admin_password=<DRAC PW>
salt dell dracr.change_password diana secret
```

Note that if only a username is specified then this module will look up details for all 16 possible DRAC users. This is time consuming, but might be necessary if one is not sure which user slot contains the one you want. Many late-model Dell chassis have 'root' as UID 1, so if you can depend on that then setting the password is much quicker. Raises an error if the supplied password is greater than 20 chars.

CLI Example:

```
salt dell dracr.create_user [USERNAME] [PASSWORD] [PRIVILEGES]
salt dell dracr.create_user diana secret login,test_alerts,clear_logs
```

DRAC Privileges

- login: Login to iDRAC
- drac: Configure iDRAC
- user_management: Configure Users
- clear_logs: Clear Logs
- server_control_commands: Execute Server Control Commands
- console_redirection: Access Console Redirection

---

CLI Example:

```
salt dell drac.syslog [SYSLOG IP] [ENABLE/DISABLE]
salt dell drac.syslog 0.0.0.0 False
```
• virtual_media: Access Virtual Media
• test_alerts: Test Alerts
• debug_commands: Execute Debug Commands

salt.modules.dracr.delete_user(username, uid=None, host=None, admin_username=None, admin_password=None)

Delete a user

CLI Example:
```
salt dell dracr.delete_user [USERNAME] [UID - optional]
salt dell dracr.delete_user diana 4
```

salt.modules.dracr.deploy_password(username, password, host=None, admin_username=None, admin_password=None, module=None)

Change the QuickDeploy password, used for switches as well

CLI Example:
```
salt dell dracr.deploy_password [USERNAME] [PASSWORD]
  host=<remote DRAC> admin_username=<DRAC user>
  admin_password=<DRAC PW>
salt dell dracr.change_password diana secret
```

Note that if only a username is specified then this module will look up details for all 16 possible DRAC users. This is time consuming, but might be necessary if one is not sure which user slot contains the one you want. Many late-model Dell chassis have ‘root’ as UID 1, so if you can depend on that then setting the password is much quicker.

salt.modules.dracr.deploy_snmp(snmp, host=None, admin_username=None, admin_password=None, module=None)

Change the QuickDeploy SNMP community string, used for switches as well

CLI Example:
```
salt dell dracr.deploy_snmp SNMP_STRING
  host=<remote DRAC or CMC> admin_username=<DRAC user>
  admin_password=<DRAC PW>
salt dell dracr.deploy_snmp diana secret
```

salt.modules.dracr.email_alerts(action, host=None, admin_username=None, admin_password=None)

Enable/Disable email alerts

CLI Example:
```
salt dell dracr.email_alerts True
salt dell dracr.email_alerts False
```

salt.modules.dracr.get_chassis_datacenter(host=None, admin_username=None, admin_password=None)

Get the datacenter of the chassis.

host The chassis host.
admin_username The username used to access the chassis.
admin_password The password used to access the chassis.

CLI Example:
salt '*' dracr.set_chassis_location host=111.222.333.444
   admin_username=root admin_password=secret

salt.modules.dracr.get_chassis_location(host=None, admin_username=None, admin_password=None)
Get the location of the chassis.

   host  The chassis host.

   admin_username  The username used to access the chassis.

   admin_password  The password used to access the chassis.

   CLI Example:
   
salt '*' dracr.set_chassis_location host=111.222.333.444
   admin_username=root admin_password=secret

salt.modules.dracr.get_chassis_name(host=None, admin_username=None, admin_password=None)
Get the name of a chassis.

   host  The chassis host.

   admin_username  The username used to access the chassis.

   admin_password  The password used to access the chassis.

   CLI Example:
   
salt '*' dracr.get_chassis_name host=111.222.333.444
   admin_username=root admin_password=secret

salt.modules.dracr.get_dns_dracname(host=None, admin_username=None, admin_password=None)
salt.modules.dracr.get_general(cfg_sec, cfg_var, host=None, admin_username=None, admin_password=None)
salt.modules.dracr.get_slotname(slot, host=None, admin_username=None, admin_password=None)
Get the name of a slot number in the chassis.

   slot  The number of the slot for which to obtain the name.

   host  The chassis host.

   admin_username  The username used to access the chassis.

   admin_password  The password used to access the chassis.

   CLI Example:
   
salt-call --local dracr.get_slotname 0 host=111.222.333.444
   admin_username=root admin_password=secret

salt.modules.dracr.idrac_general(blade_name, command, idrac_password=None, host=None, admin_username=None, admin_password=None)
Run a generic racadm command against a particular blade in a chassis. Blades are usually named things like 'server-1', 'server-2', etc. If the iDRAC has a different password than the CMC, then you can pass it with the idrac_password kwarg.

   Parameters

21.9. execution modules
• **blade_name** – Name of the blade to run the command on
• **command** – Command like to pass to racadm
• **idrac_password** – Password for the iDRAC if different from the CMC
• **host** – Chassis hostname
• **admin_username** – CMC username
• **admin_password** – CMC password

**Returns**  stdout if the retcode is 0, otherwise a standard cmd.run_all dictionary

CLI Example:
```
salt fx2 chassis.cmd idrac_general server-1 'get BIOS.SysProfileSettings'
```

salt.modules.dracr.

inventory

**(host=None, admin_username=None, admin_password=None)**

salt.modules.dracr.

list_slotnames

**(host=None, admin_username=None, admin_password=None)**

List the names of all slots in the chassis.

**host**  The chassis host.

**admin_username**  The username used to access the chassis.

**admin_password**  The password used to access the chassis.

CLI Example:
```
salt-call --local dracr.list_slotnames host=111.222.333.444
       admin_username=root admin_password=secret
```

salt.modules.dracr.

list_users

**(host=None, admin_username=None, admin_password=None, module=None)**

List all DRAC users

CLI Example:
```
salt dell dracr.list_users
```

salt.modules.dracr.

nameservers

**ns**, **host=None, admin_username=None, admin_password=None, module=None**

Configure the nameservers on the DRAC

CLI Example:
```
salt dell dracr.nameservers [NAMESERVERS]
salt dell dracr.nameservers ns1.example.com ns2.example.com
       admin_username=root admin_password=calvin module=server-1
       host=192.168.1.1
```

salt.modules.dracr.

network_info

**(host=None, admin_username=None, admin_password=None, module=None)**

Return Network Configuration

CLI Example:
```
salt dell dracr.network_info
```

1668  Chapter 21. Salt Module Reference
salt.modules.dracr.server_hardreset(host=None, admin_username=None, admin_password=None, module=None)

Performs a reset (reboot) operation on the managed server.

- **host**: The chassis host.
- **admin_username**: The username used to access the chassis.
- **admin_password**: The password used to access the chassis.
- **module**: The element to hard reset on the chassis such as a blade. If not provided, the chassis will be reset.

CLI Example:

```
salt dell dracr.server_hardreset
salt dell dracr.server_hardreset module=server-1
```

salt.modules.dracr.server_power(status, host=None, admin_username=None, admin_password=None, module=None)

- **status**: One of 'powerup', 'powerdown', 'powercycle', 'hardreset', 'graceshutdown'
- **host**: The chassis host.
- **admin_username**: The username used to access the chassis.
- **admin_password**: The password used to access the chassis.
- **module**: The element to reboot on the chassis such as a blade. If not provided, the chassis will be rebooted.

CLI Example:

```
salt dell dracr.server_reboot
salt dell dracr.server_reboot module=server-1
```

salt.modules.dracr.server_poweroff(host=None, admin_username=None, admin_password=None, module=None)

Powers down the managed server.

- **host**: The chassis host.
- **admin_username**: The username used to access the chassis.
- **admin_password**: The password used to access the chassis.
- **module**: The element to power off on the chassis such as a blade. If not provided, the chassis will be powered off.

CLI Example:

```
salt dell dracr.server_poweroff
salt dell dracr.server_poweroff module=server-1
```

salt.modules.dracr.server_poweron(host=None, admin_username=None, admin_password=None, module=None)

Powers up the managed server.

- **host**: The chassis host.
- **admin_username**: The username used to access the chassis.
- **admin_password**: The password used to access the chassis.
- **module**: The element to power on located on the chassis such as a blade. If not provided, the chassis will be powered on.
CLI Example:

```
salt dell dracr.server_poweron
salt dell dracr.server_poweron module=server-1
```

```
salt.modules.dracr.server_powerstatus(host=None, admin_username=None, admin_password=None, module=None)
```

return the power status for the passed module

CLI Example:

```
salt dell dracr.server_powerstatus
```

```
salt.modules.dracr.server_pxe(host=None, admin_username=None, admin_password=None)
```

Configure server to PXE perform a one off PXE boot

CLI Example:

```
salt dell dracr.server_pxe
```

```
salt.modules.dracr.server_reboot(host=None, admin_username=None, admin_password=None, module=None)
```

Issues a power-cycle operation on the managed server. This action is similar to pressing the power button on the system’s front panel to power down and then power up the system.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

module The element to reboot on the chassis such as a blade. If not provided, the chassis will be rebooted.

CLI Example:

```
salt dell dracr.server_reboot
salt dell dracr.server_reboot module=server-1
```

```
salt.modules.dracr.set_chassis_datacenter(location, host=None, admin_username=None, admin_password=None)
```

Set the location of the chassis.

location The name of the datacenter to be set on the chassis.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_chassis_datacenter datacenter-name host=111.222.333.444
admin_username=root admin_password=secret
```

```
salt.modules.dracr.set_chassis_location(location, host=None, admin_username=None, admin_password=None)
```

Set the location of the chassis.

location The name of the location to be set on the chassis.

host The chassis host.

admin_username The username used to access the chassis.
**admin_password**  The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_chassis_location location-name host=111.222.333.444
    admin_username=root admin_password=secret
```

```
salt.modules.dracr.set_chassis_name(name, host=None, admin_username=None, admin_password=None)
```

Set the name of the chassis.

- **name**  The name to be set on the chassis.
- **host**  The chassis host.
- **admin_username**  The username used to access the chassis.
- **admin_password**  The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_chassis_name my-chassis host=111.222.333.444
    admin_username=root admin_password=secret
```

```
salt.modules.dracr.set_dns_dracname(name, host=None, admin_username=None, admin_password=None)
```

```
salt.modules.dracr.set_general(cfg_sec, cfg_var, val, host=None, admin_username=None, admin_password=None)
```

```
salt.modules.dracr.set_network(ip, netmask, gateway, host=None, admin_username=None, admin_password=None)
```

Configure Network on the CMC or individual iDRAC. Use `set_niccfg` for blade and switch addresses.

CLI Example:

```
salt dell dracr.set_network DRAC IP NETMASK GATEWAY
salt dell dracr.set_network 192.168.0.2 255.255.255.0 192.168.0.1
    admin_username=root admin_password=calvin host=192.168.1.1
```

```
salt.modules.dracr.set_niccfg(ip=None, netmask=None, gateway=None, dhcp=False, host=None, admin_username=None, admin_password=None, module=None)
```

```
salt.modules.dracr.set_nicvlan(vlan=None, host=None, admin_username=None, admin_password=None, module=None)
```

```
salt.modules.dracr.set_permissions(username, permissions, uid=None, host=None, admin_username=None, admin_password=None)
```

Configure users permissions

CLI Example:

```
salt dell dracr.set_permissions USERNAME PRIVILEGES [USER INDEX - optional]
salt dell dracr.set_permissions diana login,test_alerts,clear_logs 4
```

**DRAC Privileges**

- **login** : Login to iDRAC
- **drac** : Configure iDRAC
- **user_management** : Configure Users
• clear_logs : Clear Logs
• server_control_commands : Execute Server Control Commands
• console_redirection : Access Console Redirection
• virtual_media : Access Virtual Media
• test_alerts : Test Alerts
• debug_commands : Execute Debug Commands

`salt.modules.dracr.set_slotname(slot, name, host=None, admin_username=None, admin_password=None)`

Set the name of a slot in a chassis.

- **slot**  The slot number to change.
- **name**  The name to set. Can only be 15 characters long.
- **host**  The chassis host.
- **admin_username**  The username used to access the chassis.
- **admin_password**  The password used to access the chassis.

CLI Example:
```
salt '*' dracr.set_slotname 2 my-slotname host=111.222.333.444 admin_username=root admin_password=secret
```

`salt.modules.dracr.set_snmp(community, host=None, admin_username=None, admin_password=None)`

Configure CMC or individual iDRAC SNMP community string. Use `deploy_snmp` for configuring chassis switch SNMP.

CLI Example:
```
salt dell dracr.set_snmp [COMMUNITY]
salt dell dracr.set_snmp public
```

`salt.modules.dracr.syslog(server, enable=True, host=None, admin_username=None, admin_password=None, module=None)`

Configure syslog remote logging, by default syslog will automatically be enabled if a server is specified. However, if you want to disable syslog you will need to specify a server followed by False

CLI Example:
```
salt dell dracr.syslog [SYSLOG IP] [ENABLE/DISABLE]
salt dell dracr.syslog 0.0.0.0 False
```

`salt.modules.dracr.system_info(host=None, admin_username=None, admin_password=None, module=None)`

Return System information

CLI Example:
```
salt dell dracr.system_info
```

`salt.modules.dracr.update_firmware(filename, host=None, admin_username=None, admin_password=None)`

Updates firmware using local firmware file
salt dell dracr.update_firmware firmware.exe

This executes the following command on your FX2 (using username and password stored in the pillar data)

```
racadm update -f firmware.exe -u user -p pass
```

salt.modules.dracr.update_firmware_nfs_or_cifs(filename, share, host=None, admin_username=None, admin_password=None)

Executes the following for CIFS (using username and password stored in the pillar data)

```
racadm update -f <updatefile> -u user -p pass -l //IP-Address/share
```

Or for NFS (using username and password stored in the pillar data)

```
racadm update -f <updatefile> -u user -p pass -l IP-address:/share
```

Salt command for CIFS:

```
salt dell dracr.update_firmware_nfs_or_cifs firmware.exe //IP-Address/→share
```

Salt command for NFS:

```
salt dell dracr.update_firmware_nfs_or_cifs firmware.exe IP-address:/→share
```

21.9.114 salt.modules.drbd

DRBD administration module

```
salt.modules.drbd.overview()
```

Show status of the DRBD devices, support two nodes only.

CLI Example:

```
salt \\
'\*' drbd.overview
```

21.9.115 salt.modules.dummyproxy_pkg module

Package support for the dummy proxy used by the test suite

```
salt.modules.dummyproxy_pkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)
salt.modules.dummyproxy_pkg.installed(name, version=None, refresh=False, fromrepo=None, skip_verify=False, pkgs=None, sources=None, **kwargs)
salt.modules.dummyproxy_pkg.list_pkgs(versions_as_list=False, **kwargs)
salt.modules.dummyproxy_pkg.remove(name=None, pkgs=None, **kwargs)
salt.modules.dummyproxy_pkg.upgrade(name=None, pkgs=None, refresh=True, skip_verify=True, normalize=True, **kwargs)
```

21.9. execution modules 1673
salt.modules.dummyproxy_pkg.version(*names, **kwargs)
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:
```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

21.9.116 salt.modules.dummyproxy_service module

Provide the service module for the dummy proxy used in integration tests

salt.modules.dummyproxy_service.enabled(name, sig=None)
Only the ‘redbull’ service is ‘enabled’ in the test
New in version 2016.11.3.

salt.modules.dummyproxy_service.get_all()
Return a list of all available services
New in version 2016.11.3.

CLI Example:
```
salt '*' service.get_all
```

salt.modules.dummyproxy_service.list_()
Return a list of all available services.
New in version 2016.11.3.

CLI Example:
```
salt '*' service.list
```

salt.modules.dummyproxy_service.restart(name, sig=None)
Restart the specified service with dummy.
New in version 2016.11.3.

CLI Example:
```
salt '*' service.restart <service name>
```

salt.modules.dummyproxy_service.running(name, sig=None)
Return whether this service is running.
New in version 2016.11.3.

salt.modules.dummyproxy_service.start(name, sig=None)
Start the specified service on the dummy
New in version 2016.11.3.

CLI Example:
```
salt '*' service.start <service name>
```
salt.modules.dummyproxy_service.status(name, sig=None)

Return the status for a service via dummy, returns a bool whether the service is running.

New in version 2016.11.3.

CLI Example:

```
salt '*' service.status <service name>
```

salt.modules.dummyproxy_service.stop(name, sig=None)

Stop the specified service on the dummy

New in version 2016.11.3.

CLI Example:

```
salt '*' service.stop <service name>
```

21.9.117 salt.modules.ebuildpkg

Support for Portage

**Important**: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install’ is not available*), see [here](#).

**optdepends**

- portage Python adapter

For now all package names **MUST** include the package category, i.e. *'vim'* will not work, *'app-editors/vim'* will.

salt.modules.ebuildpkg.check_db(*names*, **kwargs)

New in version 0.17.0.

Returns a dict containing the following information for each specified package:

1. A key *found*, which will be a boolean value denoting if a match was found in the package database.
2. If *found* is False, then a second key called *suggestions* will be present, which will contain a list of possible matches. This list will be empty if the package name was specified in *category/pkgname* format, since the suggestions are only intended to disambiguate ambiguous package names (ones submitted without a category).

CLI Examples:

```
salt '*' pkg.check_db <package1> <package2> <package3>
```

salt.modules.ebuildpkg.check_extra_requirements(pkgname, pkgver)

Check if the installed package already has the given requirements.

CLI Example:

```
salt '*' pkg.check_extra_requirements 'sys-devel/gcc' '->[4.1.2:4.1::gentoo[nls, _fortran]]'
```

salt.modules.ebuildpkg.depclean(name=None, slot=None, fromrepo=None, pkgs=None)

Portage has a function to remove unused dependencies. If a package is provided, it will only removed the package if no other package depends on it.

21.9. execution modules
name The name of the package to be cleaned.

slot Restrict the remove to a specific slot. Ignored if name is None.

fromrepo Restrict the remove to a specific slot. Ignored if name is None.

pkgs Clean multiple packages. slot and fromrepo arguments are ignored if this argument is present. Must be passed as a python list.

Return a list containing the removed packages:

CLI Example:

```
salt '*' pkg.depclean <package name>
```

salt.modules.ebuildpkg.ex_mod_init(low)

If the config option ebuild.enforce_nice_config is set to True, this module will enforce a nice tree structure for /etc/portage/package.* configuration files.

New in version 0.17.0: Initial automatic enforcement added when pkg is used on a Gentoo system.

Changed in version 2014.1.0-Hydrogen: Configure option added to make this behaviour optional, defaulting to off.

See also:

ebuild.ex_mod_init is called automatically when a state invokes a pkg state on a Gentoo system. salt.states.pkg.mod_init()

ebuild.ex_mod_init uses portage_config.enforce_nice_config to do the lifting. salt.modules.portage_config.enforce_nice_config()

CLI Example:

```
salt '*' pkg.ex_mod_init
```

salt.modules.ebuildpkg.install(name=None, refresh=False, pkgs=None, sources=None, slot=None, fromrepo=None, uses=None, binhost=None, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon’s control group. This is done to keep systemd from killing any emerge commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Install the passed package(s), add refresh=True to sync the portage tree before package is installed.

name The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to emerge a package from the portage tree. To install a tbz2 package manually, use the "sources" option described below.

CLI Example:

```
salt '*' pkg.install <package name>
```

refresh Whether or not to sync the portage tree before installing.

version Install a specific version of the package, e.g. 1.0.9-r1. Ignored if "pkgs" or "sources" is passed.

slot Similar to version, but specifies a valid slot to be installed. It will install the latest available version in the specified slot. Ignored if "pkgs" or "sources" or "version" is passed.

CLI Example:
salt '*' pkg.install sys-devel/gcc slot='4.4'

fromrepo Similar to slot, but specifies the repository from the package will be installed. It will install the latest available version in the specified repository. Ignored if "pkgs" or "sources" or "version" is passed.

CLI Example:

salt '*' pkg.install salt fromrepo='gentoo'

uses Similar to slot, but specifies a list of use flag. Ignored if "pkgs" or "sources" or "version" is passed.

CLI Example:

salt '*' pkg.install sys-devel/gcc uses='["nptl", "-nossp"]'

Multiple Package Installation Options:

pkgs A list of packages to install from the portage tree. Must be passed as a python list.

CLI Example:

salt '*' pkg.install pkgs='["foo", "bar", "-category/{package:slot::repository[use]}"]'

sources A list of tbz2 packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

salt '*' pkg.install sources='[{"foo": "salt://foo.tbz2"},{"bar": "salt://bar.tbz2"}]'

binhost has two options try and force. try - tells emerge to try and install the package from a configured binhost. force - forces emerge to install the package from a binhost otherwise it fails out.

Returns a dict containing the new package names and versions:

```
{
'<package>': {
'old': '<old-version>',
'new': '<new-version>'
}}
```

salt.modules.ebuildpkg.latest_version(*names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...

salt.modules.ebuildpkg.list_pkgs(versions_as_list=False, **kwargs)

List the packages currently installed in a dict:

```
{
'<package_name>': '<version>'
}
```

CLI Example:

salt '*' pkg.list_pkgs

salt.modules.ebuildpkg.list_upgrades(refresh=True, backtrack=3, **kwargs)

List all available package upgrades.
refresh Whether or not to sync the portage tree before checking for upgrades.

backtrack Specifies an integer number of times to backtrack if dependency calculation fails due to a conflict or an unsatisfied dependency (default: ‘3’).

CLI Example:

```bash
salt '*' pkg.list_upgrades
```

salt.modules.ebuildpkg.porttree_matches(name)

Returns a list containing the matches for a given package name from the portage tree. Note that the specific version of the package will not be provided for packages that have several versions in the portage tree, but rather the name of the package (i.e. “dev-python/paramiko”).

salt.modules.ebuildpkg.purge(name=None, slot=None, fromrepo=None, pkgs=None, **kwargs)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon’s control group. This is done to keep systemd from killing any emerge commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Portage does not have a purge, this function calls remove followed by depclean to emulate a purge process

name The name of the package to be deleted.

slot Restrict the remove to a specific slot. Ignored if name is None.

fromrepo Restrict the remove to a specific slot. Ignored if name is None.

Multiple Package Options:

pkgs Uninstall multiple packages. slot and fromrepo arguments are ignored if this argument is present. Must be passed as a python list.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```bash
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package name> slot=4.4
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs=['"foo", "bar"]'
```

salt.modules.ebuildpkg.refresh_db()

Update the portage tree using the first available method from the following list:

- emaint sync
- eix-sync
- emerge-webrsync
- emerge --sync

To prevent the portage tree from being synced within one day of the previous sync, add the following pillar data for this minion:

```yaml
portage:
  sync_wait_one_day: True
```

CLI Example:
salt 'salt '*' pkg.refresh_db

salt.modules.ebuildpkg.remove(name=None, slot=None, fromrepo=None, pkgs=None, **kwargs)
    Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon’s control group. This is done to keep systemd from killing any emerge commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Remove packages via emerge –unmerge.

**name** The name of the package to be deleted.

**slot** Restrict the remove to a specific slot. Ignored if name is None.

**fromrepo** Restrict the remove to a specific slot. Ignored if name is None.

Multiple Package Options:

**pkgs** Uninstall multiple packages. slot and fromrepo arguments are ignored if this argument is present. Must be passed as a python list.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt 'salt '*' pkg.remove <package name>
salt 'salt '*' pkg.remove <package name> sl=4.4 fromrepo=gentoo
salt 'salt '*' pkg.remove <package>,<package2>,<package3
salt 'salt '*' pkg.remove pkgs=["foo", "bar"]
```

salt.modules.ebuildpkg.update(pkg, slot=None, fromrepo=None, refresh=False, binhost=None)
    Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon’s control group. This is done to keep systemd from killing any emerge commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Updates the passed package (emerge –update package)

**slot** Restrict the update to a particular slot. It will update to the latest version within the slot.

**fromrepo** Restrict the update to a particular repository. It will update to the latest version within the repository.

**binhost** has two options try and force. try - tells emerge to try and install the package from a configured binhost. force - forces emerge to install the package from a binhost otherwise it fails out.

Returns a dict containing the new package names and versions:

```
{ '<package>': { 'old': '<old-version>',
                  'new': '<new-version>' }}
```

CLI Example:

```
salt 'salt '*' pkg.update <package name>
```
salt.modules.ebuildpkg.upgrade(refresh=True, binhost=None, backtrack=3)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any emerge commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Run a full system upgrade (emerge -uDN @world)

binhost has two options try and force. try - tells emerge to try and install the package from a configured binhost. force - forces emerge to install the package from a binhost otherwise it fails out.

backtrack Specifies an integer number of times to backtrack if dependency calculation fails due to a conflict or an unsatisfied dependency (default: '3').

Returns a dictionary containing the changes:

```
{<package>: {'old': '<old-version>', 'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

salt.modules.ebuildpkg.upgrade_available(name)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.ebuildpkg.version(*names, **kwargs)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

salt.modules.ebuildpkg.version_clean(version)

Clean the version string removing extra data.

CLI Example:

```
salt '*' pkg.version_clean <version_string>
```

salt.modules.ebuildpkg.version_cmp(pkg1, pkg2, **kwargs)

Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

CLI Example:

```
salt '*' pkg.version_cmp '0.2.4-0' '0.2.4.1-0'
```

21.9.118 salt.modules.eix

Support for Eix
salt.modules.eix.sync()
    Sync portage/overlay trees and update the eix database

    CLI Example:
    ```
salt '*' eix.sync
    ```

salt.modules.eix.update()
    Update the eix database

    CLI Example:
    ```
salt '*' eix.update
    ```

21.9.119 salt.modules.elasticsearch

Elasticsearch - A distributed RESTful search and analytics server

Module to provide Elasticsearch compatibility to Salt (compatible with Elasticsearch version 1.5.2+)

New in version 2015.8.0.

**depends** elasticsearch-py

**configuration** This module accepts connection configuration details either as parameters or as configuration settings in /etc/salt/minion on the relevant minions:

```
elasticsearch:
    host: '10.10.10.100:9200'

elasticsearch-cluster:
    hosts:
        - '10.10.10.100:9200'
        - '10.10.101:9200'
        - '10.10.102:9200'

elasticsearch-extra:
    hosts:
        - '10.10.10.100:9200'
    use_ssl: True
    verify_certs: True
    ca_certs: /path/to/custom_ca_bundle.pem
    number_of_shards: 1
    number_of_replicas: 0
    functions_blacklist:
        - saltutil.find_job
        - pillar.items
        - grains.items
    proxies:
        - http: http://proxy:3128
        - https: http://proxy:1080
```

When specifying proxies the requests backend will be used and the `proxies` data structure is passed as-is to that module.

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

Some functionality might be limited by elasticsearch-py and Elasticsearch server versions.
salt.modules.elasticsearch.alias_create(indices, alias, hosts=None, body=None, profile=None, source=None)

Create an alias for a specific index/indices

indices Single or multiple indices separated by comma, use _all to perform the operation on all indices.

alias Alias name

body Optional definition such as routing or filter as defined in https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-aliases.html

source URL of file specifying optional definition such as routing or filter. Cannot be used in combination with body.

CLI example:
```
salt myminion elasticsearch.alias_create testindex_v1 testindex
```

salt.modules.elasticsearch.alias_delete(indices, aliases, hosts=None, body=None, profile=None, source=None)

Delete an alias of an index

indices Single or multiple indices separated by comma, use _all to perform the operation on all indices.

aliases Alias names separated by comma

CLI example:
```
salt myminion elasticsearch.alias_delete testindex_v1 testindex
```

salt.modules.elasticsearch.alias_exists(aliases, indices=None, hosts=None, profile=None)

Return a boolean indicating whether given alias exists

indices Single or multiple indices separated by comma, use _all to perform the operation on all indices.

aliases Alias names separated by comma

CLI example:
```
salt myminion elasticsearch.alias_exists None testindex
```

salt.modules.elasticsearch.alias_get(indices=None, aliases=None, hosts=None, profile=None)

Check for the existence of an alias and if it exists, return it

indices Single or multiple indices separated by comma, use _all to perform the operation on all indices.

aliases Alias names separated by comma

CLI example:
```
salt myminion elasticsearch.alias_get testindex
```

salt.modules.elasticsearch.cluster_get_settings(flat_settings=False, include_defaults=False, hosts=None, profile=None)

New in version 3000.

Return Elasticsearch cluster settings.

flat_settings Return settings in flat format.

include_defaults Whether to return all default clusters setting.

CLI example:
```
salt myminion elasticsearch.cluster_get_settings
```

```
salt.modules.elasticsearch.cluster_health(index=None, level='cluster', local=False, hosts=None, profile=None)
```
New in version 2017.7.0.
Return Elasticsearch cluster health.

- **index** Limit the information returned to a specific index
- **level** Specify the level of detail for returned information, default ‘cluster’, valid choices are: ‘cluster’, ‘indices’, ‘shards’
- **local** Return local information, do not retrieve the state from master node

CLI example:
```
salt myminion elasticsearch.cluster_health
```

```
salt.modules.elasticsearch.cluster_put_settings(body=None, flat_settings=False, hosts=None, profile=None)
```
New in version 3000.
Set Elasticsearch cluster settings.

- **flat_settings** Return settings in flat format.

CLI example:
```
salt myminion elasticsearch.cluster_put_settings '{"persistent": {"indices.
→recovery.max_bytes_per_sec": "50mb"}}'
salt myminion elasticsearch.cluster_put_settings '{"transient": {"indices.
→recovery.max_bytes_per_sec": "50mb"}}'
```

```
salt.modules.elasticsearch.cluster_stats(nodes=None, hosts=None, profile=None)
```
New in version 2017.7.0.
Return Elasticsearch cluster stats.

- **nodes** List of cluster nodes (id or name) to display stats for. Use _local for connected node, empty for all

CLI example:
```
salt myminion elasticsearch.cluster_stats
```

```
salt.modules.elasticsearch.document_create(index, doc_type, body=None, id=None, hosts=None, profile=None, source=None)
```
Create a document in a specified index

- **index** Index name where the document should reside
- **doc_type** Type of the document
- **body** Document to store
- **source** URL of file specifying document to store. Cannot be used in combination with body.
- **id** Optional unique document identifier for specified doc_type (empty for random)

CLI example:
salt myminion elasticsearch.document_create testindex doctype1 '{}'

```python
salt.modules.elasticsearch.document_delete(index, doc_type, id, hosts=None, profile=None)
```
Delete a document from an index

- **index**  Index name where the document resides
- **doc_type**  Type of the document
- **id**  Document identifier

CLI example:
```bash
salt myminion elasticsearch.document_delete testindex doctype1 AUx-384m0Bug_8U80wQZ
```

```python
salt.modules.elasticsearch.document_exists(index, id, doc_type='_all', hosts=None, profile=None)
```
Return a boolean indicating whether given document exists

- **index**  Index name where the document resides
- **id**  Document identifier
- **doc_type**  Type of the document, use _all to fetch the first document matching the ID across all types

CLI example:
```bash
salt myminion elasticsearch.document_exists testindex AUx-384m0Bug_8U80wQZ
```

```python
salt.modules.elasticsearch.document_get(index, id, doc_type='_all', hosts=None, profile=None)
```
Check for the existence of a document and if it exists, return it

- **index**  Index name where the document resides
- **id**  Document identifier
- **doc_type**  Type of the document, use _all to fetch the first document matching the ID across all types

CLI example:
```bash
salt myminion elasticsearch.document_get testindex AUx-384m0Bug_8U80wQZ
```

```python
salt.modules.elasticsearch.flush_synced(hosts=None, profile=None, **kwargs)
```
New in version 3000.

- **index**  (Optional, string) A comma-separated list of index names; use _all or empty string for all indices. Defaults to '_all'.
- **ignore_unavailable**  (Optional, boolean) If true, missing or closed indices are not included in the response. Defaults to false.
- **allow_no_indices**  (Optional, boolean) If true, the request does not return an error if a wildcard expression or _all value retrieves only missing or closed indices. This parameter also applies to index aliases that point to a missing or closed index.
- **expand_wildcards**  (Optional, string) Controls what kind of indices that wildcard expressions can expand to.

Valid values are:
The defaults settings for the above parameters depend on the API being used.

CLI example:

```
salt myminion elasticsearch.flush_synced index='index1,index2' ignore_unavailable=True allow_no_indices=True expand_wildcards='all'
```

New in version 2017.7.0.

### index_close

Close specified index.

- **index** | Index to be closed
- **allow_no_indices** | Whether to ignore if a wildcard indices expression resolves into no concrete indices. (This includes _all string or when no indices have been specified)
- **expand_wildcards** | Whether to expand wildcard expression to concrete indices that are open, closed or both., default ‘open’, valid choices are: ‘open’, ‘closed’, ‘none’, ‘all’
- **ignore_unavailable** | Whether specified concrete indices should be ignored when unavailable (missing or closed)

CLI example:

```
salt myminion elasticsearch.index_close testindex
```

### index_create

Create an index

- **index** | Index name
- **body** | Index definition, such as settings and mappings as defined in [https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-create-index.html](https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-create-index.html)
- **source** | URL to file specifying index definition. Cannot be used in combination with body.

CLI example:

```
salt myminion elasticsearch.index_create testindex
salt myminion elasticsearch.index_create testindex2 '{"settings": {"index": { "number_of_shards": 3, "number_of_replicas": 2}}}'
```

### index_delete

Delete an index

- **index** | Index name

CLI example:

```
salt myminion elasticsearch.index_delete testindex
```

### index_exists

Return a boolean indicating whether given index exists
index  Index name

CLI example:

```
salt myminion elasticsearch.index_exists testindex
```

**salt.modules.elasticsearch.index_get** *(index, hosts=None, profile=None)*

Check for the existence of an index and if it exists, return it

**index**  Index name

CLI example:

```
salt myminion elasticsearch.index_get testindex
```

**salt.modules.elasticsearch.index_get_settings** *(hosts=None, profile=None, **kwargs)*

New in version 3000.

**index**  (Optional, string) A comma-separated list of index names; use _all or empty string for all indices. Defaults to `'_all'`.

**name**  (Optional, string) The name of the settings that should be included

**allow_no_indices**  (Optional, boolean) Whether to ignore if a wildcard indices expression resolves into no concrete indices. (This includes _all string or when no indices have been specified)

**expand_wildcards**  (Optional, string) Whether to expand wildcard expression to concrete indices that are open, closed or both. Valid choices are: ‘open’, ‘closed’, ‘none’, ‘all’

**flat_settings**  (Optional, boolean) Return settings in flat format

**ignore_unavailable**  (Optional, boolean) Whether specified concrete indices should be ignored when unavailable (missing or closed)

**include_defaults**  (Optional, boolean) Whether to return all default setting for each of the indices.

**local**  (Optional, boolean) Return local information, do not retrieve the state from master node

The defaults settings for the above parameters depend on the API version being used.

CLI example:

```
salt myminion elasticsearch.index_get_settings index=testindex
```

**salt.modules.elasticsearch.index_open** *(index, allow_no_indices=True, expand_wildcards='closed', ignore_unavailable=True, hosts=None, profile=None)*

New in version 2017.7.0.

Open specified index.

**index**  Index to be opened

**allow_no_indices**  Whether to ignore if a wildcard indices expression resolves into no concrete indices. (This includes _all string or when no indices have been specified)

**expand_wildcards**  Whether to expand wildcard expression to concrete indices that are open, closed or both., default ‘closed’, valid choices are: ‘open’, ‘closed’, ‘none’, ‘all’

**ignore_unavailable**  Whether specified concrete indices should be ignored when unavailable (missing or closed)
CLI example:
```
salt myminion elasticsearch.index_open testindex
```

```python
salt.modules.elasticsearch.index_put_settings(body=None, hosts=None, profile=None, source=None, **kwargs)
```

New in version 3000.

- **body** The index settings to be updated.
- **source** URL to file specifying index definition. Cannot be used in combination with **body**.
- **index** (Optional, string) A comma-separated list of index names; use _all or empty string to perform the operation on all indices
- **allow_no_indices** (Optional, boolean) Whether to ignore if a wildcard indices expression resolves into no concrete indices. (This includes _all string or when no indices have been specified)
- **expand_wildcards** (Optional, string) Whether to expand wildcard expression to concrete indices that are open, closed or both. Valid choices are: 'open', 'closed', 'none', 'all'
- **flat_settings** (Optional, boolean) Return settings in flat format (default: false)
- **ignore_unavailable** (Optional, boolean) Whether specified concrete indices should be ignored when unavailable (missing or closed)
- **master_timeout** (Optional, time units) Explicit operation timeout for connection to master node
- **preserve_existing** (Optional, boolean) Whether to update existing settings. If set to true existing settings on an index remain unchanged, the default is false

The defaults settings for the above parameters depend on the API version being used.

.. note:: Elasticsearch time units can be found here: https://www.elastic.co/guide/en/elasticsearch/reference/current/common-options.html#time-units

CLI example:
```
salt myminion elasticsearch.index_put_settings index=testindex body='{"settings" : {"index" : {"number_of_replicas" : 2}}}'
```

```python
salt.modules.elasticsearch.index_template_create(name, body=None, hosts=None, profile=None, source=None)
```

Create an index template

- **name** Index template name
- **source** URL to file specifying template definition. Cannot be used in combination with **body**.

CLI example:
```
salt myminion elasticsearch.index_template_create testindex_testtmpl '{ "template": "logstash-*", "order": 1, "settings": { "number_of_shards": 1 } }'
```

```python
salt.modules.elasticsearch.index_template_delete(name, hosts=None, profile=None)
```

Delete an index template (type) along with its data

- **name** Index template name
CLI example:
```
salt myminion elasticsearch.index_template_delete testindex_template user
```

```
salt.modules.elasticsearch.index_template_delete(name, hosts=None, profile=None)
```
Return a boolean indicating whether given index template exists

- **name**: Index template name

CLI example:
```
salt myminion elasticsearch.index_template_delete testindex_template
```

```
salt.modules.elasticsearch.index_template_exists(name, hosts=None, profile=None)
```
Retrieve template definition of index or index/type

- **name**: Index template name

CLI example:
```
salt myminion elasticsearch.index_template_exists testindex_template
```

```
salt.modules.elasticsearch.index_template_get(name, hosts=None, profile=None)
```
Retrieve mapping definition of index or index/type

- **name**: Index template name

CLI example:
```
salt myminion elasticsearch.index_template_get testindex_template
```

```
salt.modules.elasticsearch.info(hosts=None, profile=None)
```
New in version 2017.7.0.

Return Elasticsearch information.

CLI example:
```
salt myminion elasticsearch.info
```
```
salt myminion elasticsearch.info profile=elasticsearch-extra
```

```
salt.modules.elasticsearch.mapping_create(index, doc_type, body=None, hosts=None, profile=None, source=None)
```
Create a mapping in a given index

- **index**: Index for the mapping
- **doc_type**: Name of the document type
- **source**: URL to file specifying mapping definition. Cannot be used in combination with body.

CLI example:
```
salt myminion elasticsearch.mapping_create testindex user '{ "user": { "properties": { "message": { "type": "string", "store": true } } } }
```

```
salt.modules.elasticsearch.mapping_delete(index, doc_type, hosts=None, profile=None)
```
Delete a mapping (type) along with its data. As of Elasticsearch 5.0 this is no longer available.

- **index**: Index for the mapping
- **doc_type**: Name of the document type

CLI example:
```
salt myminion elasticsearch.mapping_delete testindex user
```

```
salt.modules.elasticsearch.mapping_get(index, doc_type, hosts=None, profile=None)
```
Retrieve mapping definition of index or index/type
salt modules.elasticsearch

node_info(nodes=None, flat_settings=False, hosts=None, profile=None)

New in version 2017.7.0.

Return Elasticsearch node information.

| nodes       | List of cluster nodes (id or name) to display stats for. Use _local for connected node, empty for all |
| flat_settings | Flatten settings keys |

CLI example:

```
salt myminion elasticsearch.node_info flat_settings=True
```

ping(allow_failure=False, hosts=None, profile=None)

New in version 2017.7.0.

Test connection to Elasticsearch instance. This method does not fail if not explicitly specified.

| allow_failure | Throw exception if ping fails |

CLI example:

```
salt myminion elasticsearch.ping allow_failure=True
salt myminion elasticsearch.ping profile=elasticsearch-extra
```

pipeline_create(id, body, hosts=None, profile=None)

New in version 2017.7.0.

Create Ingest pipeline by supplied definition. Available since Elasticsearch 5.0.

| id     | Pipeline id |

CLI example:

```
salt myminion elasticsearch.pipeline_create mypipeline '{"description": "my custom pipeline", "processors": ["set": {"field": "collector_timestamp_millis", "value": "{{_ingest.timestamp}}"}]}
```

pipeline_delete(id, hosts=None, profile=None)

New in version 2017.7.0.

Delete Ingest pipeline. Available since Elasticsearch 5.0.

| id  | Pipeline id |

CLI example:

```
salt myminion elasticsearch.pipeline_delete mypipeline
```

pipeline_get(id, hosts=None, profile=None)

New in version 2017.7.0.
Retrieve Ingest pipeline definition. Available since Elasticsearch 5.0.

**id** Pipeline id

**CLI example:**
```bash
click myminion elasticsearch
```

**salt.modules.elasticsearch.pipeline_get**(id, body, verbose=False, hosts=None, profile=None)

New in version 2017.7.0.

Simulate existing Ingest pipeline on provided data. Available since Elasticsearch 5.0.

**id** Pipeline id

**body** Pipeline definition as specified in https://www.elastic.co/guide/en/elasticsearch/reference/master/pipeline.html

**verbose** Specify if the output should be more verbose

**CLI example:**
```bash
click myminion elasticsearch
```

```json
{
  "docs": [
    {
      "_index": "index", 
      "_id": "id", 
      "_type": "type", 
      "_source": {
        "foo": "bar"
      }
    },
    {
      "_index": "index", 
      "_id": "id", 
      "_type": "type", 
      "_source": {
        "foo": "rab"
      }
    }
  ]
}
```

**salt.modules.elasticsearch.pipeline_simulate**(id, body, verbose=False, hosts=None, profile=None)

New in version 2017.7.0.

Create repository for storing snapshots. Note that shared repository paths have to be specified in path.repo Elasticsearch configuration option.

**name** Repository name

**CLI example:**
```bash
click myminion elasticsearch
```

```json
{
  "type": "fs",
  "settings": {
    "location": "/tmp/test",
    "compress": true
  }
}
```

**salt.modules.elasticsearch.repository_create**(name, body, hosts=None, profile=None)

New in version 2017.7.0.

Delete existing repository.

**name** Repository name

**CLI example:**
```bash
click myminion elasticsearch
```

**salt.modules.elasticsearch.repository_delete**(name, hosts=None, profile=None)

New in version 2017.7.0.

Get existing repository details.

**name** Repository name

**local** Retrieve only local information, default is false

**CLI example:**
salt myminion elasticsearch.repository_get testrepo

salt.modules.elasticsearch.repository_verify(name, hosts=None, profile=None)
   New in version 2017.7.0.
   Obtain list of cluster nodes which successfully verified this repository.
   name  Repository name
   CLI example:
   salt myminion elasticsearch.repository_verify testrepo

salt.modules.elasticsearch.search_template_create(id, body=None, hosts=None, profile=None)
   New in version 2017.7.0.
   Create search template by supplied definition
   id  Template ID
   body  Search template definition
   CLI example:
   salt myminion elasticsearch.search_template_create mytemplate '{"template":{"query_ref":{"match":{"title":{{{query_string}}}}}}}'}

salt.modules.elasticsearch.search_template_delete(id, hosts=None, profile=None)
   New in version 2017.7.0.
   Delete existing search template definition.
   id  Template ID
   CLI example:
   salt myminion elasticsearch.search_template_delete mytemplate

salt.modules.elasticsearch.search_template_get(id, hosts=None, profile=None)
   New in version 2017.7.0.
   Obtain existing search template definition.
   id  Template ID
   CLI example:
   salt myminion elasticsearch.search_template_get mytemplate

salt.modules.elasticsearch.snapshot_create(repository, snapshot, body=None, hosts=None, profile=None)
   New in version 2017.7.0.
   Create snapshot in specified repository by supplied definition.
   repository  Repository name
   snapshot  Snapshot name
   CLI example:
salt.modules.elasticsearch.snapshot_create(repository, snapshot, hosts=None, profile=None)

salt.modules.elasticsearch.snapshot_delete(repository, snapshot, hosts=None, profile=None)

New in version 2017.7.0.
Delete snapshot from specified repository.
repository  Repository name
snapshot  Snapshot name
CLI example:
salt myminion elasticsearch.snapshot_delete testrepo testsnapshot

salt.modules.elasticsearch.snapshot_get(repository, snapshot, ignore_unavailable=False, hosts=None, profile=None)

New in version 2017.7.0.
Obtain snapshot residing in specified repository.
repository  Repository name
snapshot  Snapshot name, use _all to obtain all snapshots in specified repository
ignore_unavailable  Ignore unavailable snapshots
CLI example:
salt myminion elasticsearch.snapshot_get testrepo testsnapshot

salt.modules.elasticsearch.snapshot_restore(repository, snapshot, body=None, hosts=None, profile=None)

New in version 2017.7.0.
Restore existing snapshot in specified repository by supplied definition.
repository  Repository name
snapshot  Snapshot name
CLI example:
salt myminion elasticsearch.snapshot_restore testrepo testsnapshot '{"indices": ["index_1,index_2"],"ignore_unavailable":true,"include_global_state":true}'

salt.modules.elasticsearch.snapshot_status(repository=None, snapshot=None, ignore_unavailable=False, hosts=None, profile=None)

New in version 2017.7.0.
Obtain status of all currently running snapshots.
repository  Particular repository to look for snapshots
snapshot  Snapshot name
ignore_unavailable  Ignore unavailable snapshots
CLI example:
21.9.120 salt.modules.environ

Support for getting and setting the environment variables of the current salt process.

salt.modules.environ.get(key, default='')

Get a single salt process environment variable.
- **key**  String used as the key for environment lookup.
- **default**  If the key is not found in the environment, return this value. Default: 

CLI Example:

```
salt '*' environ.get foo
salt '*' environ.get baz default=False
```

salt.modules.environ.has_value(key, value=None)

Determine whether the key exists in the current salt process environment dictionary. Optionally compare the current value of the environment against the supplied value string.
- **key**  Must be a string. Used as key for environment lookup.
- **value**  Optional. If key exists in the environment, compare the current value with this value. Return True if they are equal.

CLI Example:

```
salt '*' environ.has_value foo
```

salt.modules.environ.item(keys, default='')

Get one or more salt process environment variables. Returns a dict.
- **keys**  Either a string or a list of strings that will be used as the keys for environment lookup.
- **default**  If the key is not found in the environment, return this value. Default: 

CLI Example:

```
salt '*' environ.item foo
salt '*' environ.item ['foo', 'baz'] default=None
```

salt.modules.environ.items()

Return a dict of the entire environment set for the salt process

CLI Example:

```
salt '*' environ.items
```

salt.modules.environ.setenv(environ, false_unsets=False, clear_all=False, update_minion=False, permanent=False)

Set multiple salt process environment variables from a dict. Returns a dict.
- **environ**  Must be a dict. The top-level keys of the dict are the names of the environment variables to set. Each key’s value must be a string or False. Refer to the 'false_unsets' parameter for behavior when a value set to False.
false_unsets If a key’s value is False and false_unsets is True, then the key will be removed from the salt processes environment dict entirely. If a key’s value is False and false_unsets is not True, then the key’s value will be set to an empty string. Default: False

clear_all USE WITH CAUTION! This option can unset environment variables needed for salt to function properly. If clear_all is True, then any environment variables not defined in the environ dict will be deleted. Default: False

update_minion If True, apply these environ changes to the main salt-minion process. If False, the environ changes will only affect the current salt subprocess. Default: False

permanent On Windows minions this will set the environment variable in the registry so that it is always added as an environment variable when applications open. If you want to set the variable to HKLM instead of HKCU just pass in "HKLM" for this parameter. On all other minion types this will be ignored. Note: This will only take affect on applications opened after this has been set.

CLI Example:
```
salt '*' environ.setenv '{{"foo": "bar", "baz": "quux"}}'
salt '*' environ.setenv '{{"a": "b", "c": False}' false_unsets=True
```

```
salt.modules.environ.setval(key, val, false_unsets=False, permanent=False)
```
Set a single salt process environment variable. Returns True on success.

key The environment key to set. Must be a string.

val The value to set. Must be a string or False. Refer to the 'false_unsets' parameter for behavior when set to False.

false_unsets If val is False and false_unsets is True, then the key will be removed from the salt processes environment dict entirely. If val is False and false_unsets is not True, then the key’s value will be set to an empty string. Default: False.

permanent On Windows minions this will set the environment variable in the registry so that it is always added as an environment variable when applications open. If you want to set the variable to HKLM instead of HKCU just pass in "HKLM" for this parameter. On all other minion types this will be ignored. Note: This will only take affect on applications opened after this has been set.

CLI Example:
```
salt '*' environ.setval foo bar
salt '*' environ.setval baz val=False false_unsets=True
salt '*' environ.setval baz bar permanent=True
salt '*' environ.setval baz bar permanent=HKLM
```

21.9.121 salt.modules.eselect
Support for eselect, Gentoo’s configuration and management tool.

```
salt.modules.eselect.exec_action(module, action, module_parameter=None, action_parameter=None, state_only=False)
```
Execute an arbitrary action on a module.

module name of the module to be executed
action name of the module’s action to be run
module_parameter additional params passed to the defined module
action_parameter additional params passed to the defined action
state_only  don’t return any output but only the success/failure of the operation

CLI Example (updating the php implementation used for apache2):

```
salt '*' eselect.exec_action php update action_parameter='apache2'
```

`salt.modules.eselect.get_current_target(module, module_parameter=None, action_parameter=None)`

Get the currently selected target for the given module.

- **module**  name of the module to be queried for its current target
- **module_parameter**  additional params passed to the defined module
- **action_parameter**  additional params passed to the 'show' action

CLI Example (current target of system-wide java-vm):

```
salt '*' eselect.get_current_target java-vm action_parameter='system'
```

CLI Example (current target of kernel symlink):

```
salt '*' eselect.get_current_target kernel
```

`salt.modules.eselect.get_modules()`

List available `eselect` modules.

CLI Example:

```
salt '*' eselect.get_modules
```

`salt.modules.eselect.get_target_list(module, action_parameter=None)`

List available targets for the given module.

- **module**  name of the module to be queried for its targets
- **action_parameter**  additional params passed to the defined action

New in version 2016.11.0.

CLI Example:

```
salt '*' eselect.get_target_list kernel
```

`salt.modules.eselect.set_target(module, target, module_parameter=None, action_parameter=None)`

Set the target for the given module. Target can be specified by index or name.

- **module**  name of the module for which a target should be set
- **target**  name of the target to be set for this module
- **module_parameter**  additional params passed to the defined module
- **action_parameter**  additional params passed to the defined action

CLI Example (setting target of system-wide java-vm):

```
salt '*' eselect.set_target java-vm icedtea-bin-7 action_parameter='system'
```

CLI Example (setting target of kernel symlink):

```
salt '*' eselect.set_target kernel
```
21.9.122 salt.modules.esxi

Glues the VMware vSphere Execution Module to the VMware ESXi Proxy Minions to the esxi proxymodule. New in version 2015.8.4.

Depends: vSphere Remote Execution Module (salt.modules.vsphere)

For documentation on commands that you can direct to an ESXi host via proxy, look in the documentation for salt.modules.vsphere.

This execution module calls through to a function in the ESXi proxy module called ch_config, which looks up the function passed in the command parameter in salt.modules.vsphere and calls it.

To execute commands with an ESXi Proxy Minion using the vSphere Execution Module, use the esxi.cmd <vsphere-function-name> syntax. Both args and kwargs needed for various vsphere execution module functions must be passed through in a kwarg- type manor.

```
salt 'esxi-proxy' esxi.cmd system_info
salt 'esxi-proxy' esxi.cmd get_service_policy service_name='ssh'
```

salt.modules.esxi.cmd(command, *args, **kwargs)
salt.modules.esxi.get_details()

21.9.123 salt.modules.etcd_mod

Execution module to work with etcd

depends

  * python-etcd

Configuration

To work with an etcd server you must configure an etcd profile. The etcd config can be set in either the Salt Minion configuration file or in pillar:

```
my_etd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

It is technically possible to configure etcd without using a profile, but this is not considered to be a best practice, especially when multiple etcd servers or clusters are available.

```
etcd.host: 127.0.0.1
etcd.port: 4001
```

Note: The etcd configuration can also be set in the Salt Master config file, but in order to use any etcd configurations defined in the Salt Master config, the pillar_opts must be set to True.

Be aware that setting pillar_opts to True has security implications as this makes all master configuration settings available in all minion’s pillars.
**salt.modules.etcd_mod.get**(key, recurse=False, profile=None, **kwargs)

New in version 2014.7.0.

Get a value from etcd, by direct path. Returns None on failure.

CLI Examples:

```bash
salt myminion etcd.get /path/to/key
salt myminion etcd.get /path/to/key profile=my_etcd_config
salt myminion etcd.get /path/to/key recurse=True profile=my_etcd_config
salt myminion etcd.get /path/to/key host=127.0.0.1 port=2379
```

**salt.modules.etcd_mod.ls**(path='/', profile=None, **kwargs)

New in version 2014.7.0.

Return all keys and dirs inside a specific path. Returns an empty dict on failure.

CLI Example:

```bash
salt myminion etcd.ls /path/to/dir/
salt myminion etcd.ls /path/to/dir/ profile=my_etcd_config
salt myminion etcd.ls /path/to/dir/ host=127.0.0.1 port=2379
```

**salt.modules.etcd_mod.rm**(key, recurse=False, profile=None, **kwargs)

New in version 2014.7.0.

Delete a key from etcd. Returns True if the key was deleted, False if it was not and None if there was a failure.

CLI Example:

```bash
salt myminion etcd.rm /path/to/key
salt myminion etcd.rm /path/to/key profile=my_etcd_config
salt myminion etcd.rm /path/to/key host=127.0.0.1 port=2379
```

**salt.modules.etcd_mod.set**(key, value, profile=None, ttl=None, directory=False, **kwargs)

New in version 2014.7.0.

Set a key in etcd by direct path. Optionally, create a directory or set a TTL on the key. Returns None on failure.

CLI Example:

```bash
salt myminion etcd.set /path/to/key value
salt myminion etcd.set /path/to/key value profile=my_etcd_config
salt myminion etcd.set /path/to/key host=127.0.0.1 port=2379
salt myminion etcd.set /path/to/dir '' directory=True
salt myminion etcd.set /path/to/key value ttl=5
```

**salt.modules.etcd_mod.tree**(path='/', profile=None, **kwargs)

New in version 2014.7.0.

Recurse through etcd and return all values. Returns None on failure.

CLI Example:

```bash
salt myminion etcd.tree
salt myminion etcd.tree profile=my_etcd_config
salt myminion etcd.tree host=127.0.0.1 port=2379
salt myminion etcd.tree /path/to/keys profile=my_etcd_config
```

**salt.modules.etcd_mod.update**(fields, path='/', profile=None, **kwargs)

New in version 2016.3.0.
Sets a dictionary of values in one call. Useful for large updates in syndic environments. The dictionary can contain a mix of formats such as:

```python
{
    '/some/example/key': 'bar',
    '/another/example/key': 'baz'
}
```

Or it may be a straight dictionary, which will be flattened to look like the above format:

```python
{
    'some': {
        'example': {
            'key': 'bar'
        }
    },
    'another': {
        'example': {
            'key': 'baz'
        }
    }
}
```

You can even mix the two formats and it will be flattened to the first format. Leading and trailing '/' will be removed.

Empty directories can be created by setting the value of the key to an empty dictionary.

The ‘path’ parameter will optionally set the root of the path to use.

CLI Example:

```
salt myminion etcd.update "{"/path/to/key": 'baz', '/another/key': 'bar'}"
```

```
salt myminion etcd.update "{"/path/to/key": 'baz', '/another/key': 'bar'}"
```  

```
profile=my_etcd_config
```

```
host=127.0.0.1 port=2379
```

```
salt myminion etcd.update "{"/path/to/key": 'baz', '/another/key': 'bar'}" path='/'
```  

```
some/root'
```

salt.modules.etcd_mod.watch(key, recurse=False, profile=None, timeout=0, index=None, **kwargs)

New in version 2016.3.0.

Makes a best effort to watch for a key or tree change in etcd. Returns a dict containing the new key value ( or None if the key was deleted ), the modifiedIndex of the key, whether the key changed or not, the path to the key that changed and whether it is a directory or not.

If something catastrophic happens, returns {}.

CLI Example:

```
salt myminion etcd.watch /path/to/key
```

```
salt myminion etcd.watch /path/to/key timeout=10
```

```
salt myminion etcd.watch /path/to/key profile=my_etcd_config index=10
```

```
salt myminion etcd.watch /path/to/key host=127.0.0.1 port=2379
```

21.9.124 salt.modules.ethtool module

Module for running ethtool command
New in version 2016.3.0.

codeauthor Krzysztof Pawlowski <msciciel@msciciel.eu>
maturity new
depends python-ethtool
platform linux

salt.modules.ethtool.set_coalesce(devname, **kwargs)
Changes the coalescing settings of the specified network device
CLI Example:
```
salt '*' ethtool.set_coalesce <devname> [adaptive_rx=on|off] [adaptive_tx=on|off] [rx_usecs=N] [rx_frames=N] [rx_usecs_irq=N] [rx_frames_irq=N] [tx_usecs=N] [tx_frames=N] [tx_usecs_irq=N] [tx_frames_irq=N] [stats_block_usecs=N] [pkt_rate_low=N] [rx_usecs_low=N] [rx_frames_low=N] [tx_usecs_low=N] [tx_frames_low=N] [sample_interval=N]
```

salt.modules.ethtool.set_offload(devname, **kwargs)
Changes the offload parameters and other features of the specified network device
CLI Example:
```
salt '*' ethtool.set_offload <devname> tcp_segmentation_offload=on
```

salt.modules.ethtool.set_ring(devname, **kwargs)
Changes the rx/tx ring parameters of the specified network device
CLI Example:
```
salt '*' ethtool.set_ring <devname> [rx=N] [rx_mini=N] [rx_jumbo=N] [tx=N]
```

salt.modules.ethtool.show_coalesce(devname)
Queries the specified network device for coalescing information
CLI Example:
```
salt '*' ethtool.show_coalesce <devname>
```

salt.modules.ethtool.show_driver(devname)
Queries the specified network device for associated driver information
CLI Example:
```
salt '*' ethtool.show_driver <devname>
```

salt.modules.ethtool.show_offload(devname)
Queries the specified network device for the state of protocol offload and other features
CLI Example:
```
salt '*' ethtool.show_offload <devname>
```

salt.modules.ethtool.show_ring(devname)
Queries the specified network device for rx/tx ring parameter information
21.9.125 salt.modules.event

Use the Salt Event System to fire events from the master to the minion and vice-versa.

`salt.modules.event.fire(data, tag)`
Fire an event on the local minion event bus. Data must be formed as a dict.

CLI Example:
```
salt '*' event.fire '{"data":"my event data"}' 'tag'
```

`salt.modules.event.fire_master(data, tag, preload=None)`
Fire an event off up to the master server

CLI Example:
```
salt '*' event.fire_master '{"data":"my event data"}' 'tag'
```

`salt.modules.event.send(tag, data=None, preload=None, with_env=False, with_grains=False, with_pillar=False, with_env_opts=False, **kwargs)`
Send an event to the Salt Master

New in version 2014.7.0.

Parameters

- **tag** – A tag to give the event. Use slashes to create a namespace for related events. E.g., myco/build/buildserver1/start, myco/build/buildserver1/success, myco/build/buildserver1/failure.

- **data** – A dictionary of data to send in the event. This is free-form. Send any data points that are needed for whoever is consuming the event. Arguments on the CLI are interpreted as YAML so complex data structures are possible.

- **with_env** (Specify `True` to include all environment variables, or specify a list of strings of variable names to include.) – Include environment variables from the current shell environment in the event data as `environ`. This is a short-hand for working with systems that seed the environment with relevant data such as Jenkins.

- **with_grains** (Specify `True` to include all grains, or specify a list of strings of grain names to include.) – Include grains from the current minion in the event data as `grains`.

- **with_pillar** (Specify `True` to include all Pillar values, or specify a list of strings of Pillar keys to include. It is a best-practice to only specify a relevant subset of Pillar data.) – Include Pillar values from the current minion in the event data as `pillar`. Remember Pillar data is often sensitive data so be careful. This is useful for passing ephemeral Pillar values through an event. Such as passing the `pillar={}` kwarg in `state.sls` from the Master, through an event on the Minion, then back to the Master.

- **with_env_opts** (Specify `True` to include saltenv and pillarenv values or `False` to omit them.) – Include `saltenv` and `pillarenv` set on minion at the moment when event is send into event data.

- **kwargs** – Any additional keyword arguments passed to this function will be interpreted as key-value pairs and included in the event data. This provides a convenient alternative to YAML for simple values.
CLI Example:

```bash
salt-call event.send myco/mytag foo=Foo bar=Bar
salt-call event.send 'myco/mytag' '{foo: Foo, bar: Bar}'
```

A convenient way to allow Jenkins to execute `salt-call` is via sudo. The following rule in sudoers will allow the jenkins user to run only the following command.

**/etc/sudoers (allow preserving the environment):**

```bash
jenkins ALL=(ALL) NOPASSWD:SETENV: /usr/bin/salt-call event.send*
```

Call Jenkins via sudo (preserve the environment):

```bash
sudo -E salt-call event.send myco/jenkins/build/success with_env=[BUILD_ID, BUILD_URL, GIT_BRANCH, GIT_COMMIT]
```

### 21.9.126 saltnodes.extfs

Module for managing ext2/3/4 file systems

**salt.modules.extfs.attributes**

`attributes(device, args=None)`

Return attributes from dumpe2fs for a specified device

CLI Example:

```bash
salt '*' extfs.attributes /dev/sda1
```

**salt.modules.extfs.blocks**

`blocks(device, args=None)`

Return block and inode info from dumpe2fs for a specified device

CLI Example:

```bash
salt '*' extfs.blocks /dev/sda1
```

**salt.modules.extfs.dump**

`dump(device, args=None)`

Return all contents of dumpe2fs for a specified device

CLI Example:

```bash
salt '*' extfs.dump /dev/sda1
```

**salt.modules.extfs.mkfs**

`mkfs(device, fs_type,**kwargs)`

Create a file system on the specified device

CLI Example:

```bash
salt '*' extfs.mkfs /dev/sda1 fs_type=ext4 opts='acl, noexec'
```

Valid options are:

- **block_size**: 1024, 2048 or 4096
- **check**: check for bad blocks
- **direct**: use direct IO
- **ext_opts**: extended file system options (comma-separated)
- **fragment_size**: size of fragments

21.9. execution modules
- **force**: setting force to True will cause mke2fs to specify the -F option twice (it is already set once); this is truly dangerous

- **blocks_per_group**: number of blocks in a block group

- **number_of_groups**: ext4 option for a virtual block group

- **bytes_per_inode**: set the bytes/inode ratio

- **inode_size**: size of the inode

- **journal**: set to True to create a journal (default on ext3/4)

- **journal_opts**: options for the fs journal (comma separated)

- **blocks_file**: read bad blocks from file

- **label**: label to apply to the file system

- **reserved**: percentage of blocks reserved for super-user

- **last_dir**: last mounted directory

- **test**: set to True to not actually create the file system (mkefs -n)

- **number_of_inodes**: override default number of inodes

- **creator_os**: override "creator operating system" field

- **opts**: mount options (comma separated)

- **revision**: set the filesystem revision (default 1)

- **super**: write superblock and group descriptors only

- **fs_type**: set the filesystem type (REQUIRED)

- **usage_type**: how the filesystem is going to be used

- **uuid**: set the UUID for the file system

See the mke2fs(8) manpage for a more complete description of these options.

```python
salt.modules.extfs.tune(device, **kwargs)
```
Set attributes for the specified device (using tune2fs)

CLI Example:

```
salt '*' extfs.tune /dev/sda1 force=True label=wildstallyns opts='acl,noexec'
```

Valid options are:

- **max**: max mount count

- **count**: mount count

- **error**: error behavior

- **extended_opts**: extended options (comma separated)

- **force**: force, even if there are errors (set to True)

- **group**: group name or gid that can use the reserved blocks

- **interval**: interval between checks

- **journal**: set to True to create a journal (default on ext3/4)

- **journal_opts**: options for the fs journal (comma separated)
• **label**: label to apply to the file system
• **reserved**: percentage of blocks reserved for super-user
• **last_dir**: last mounted directory
• **opts**: mount options (comma separated)
• **feature**: set or clear a feature (comma separated)
• **mmp_check**: mmp check interval
• **reserved**: reserved blocks count
• **quota_opts**: quota options (comma separated)
• **time**: time last checked
• **user**: user or uid who can use the reserved blocks
• **uuid**: set the UUID for the file system

See the `mke2fs(8)` manpage for a more complete description of these options.

## 21.9.127 `salt.modules.file`

Manage information about regular files, directories, and special files on the minion, set/read user, group, mode, and data

**class** `salt.modules.file.AttrChanges(added, removed)`

- **added**: Alias for field number 0
- **removed**: Alias for field number 1

**salt.modules.file.access(path, mode)**

New in version 2014.1.0.

Test whether the Salt process has the specified access to the file. One of the following modes must be specified:

CLI Example:

```
salt '*' file.access /path/to/file f
salt '*' file.access /path/to/file x
```

**salt.modules.file.append(path, *args, **kwargs)**

New in version 0.9.5.

Append text to the end of a file

- **path**: path to file
- ***args**: strings to append to file

CLI Example:

```
salt '*' file.append /etc/motd
   "With all thine offerings thou shalt offer salt."
   "Salt is what makes things taste bad when it isn't in them."
```
Attention

If you need to pass a string to append and that string contains an equal sign, you must include the argument name, args. For example:

```bash
salt '*' file.append /etc/motd args='cheese=spam'
salt '*' file.append /etc/motd args="[\'cheese=spam\',\'spam=cheese\']"
```

```
salt.modules.file.apply_template_on_contents( contents, template, context, defaults, saltenv)
```

Return the contents after applying the templating engine

- **contents** template string
- **template** template format
- **context** Overrides default context variables passed to the template.
- **defaults** Default context passed to the template.

CLI Example:

```bash
salt '*' file.apply_template_on_contents "
 contents='This is a {{ template }} string.'
 template=jinja
 "context={}
 "defaults={'template': 'cool'}
 saltenv=base
```

```
salt.modules.file.basename(path)
```

Returns the final component of a pathname

New in version 2015.5.0.

This can be useful at the CLI but is frequently useful when scripting.

```bash
{% set filename = salt['file.basename'](source_file) %}
```

CLI Example:

```bash
salt '*' file.basename 'test/test.config'
```

```
salt.modules.file.blockreplace(path, marker_start="#– start managed zone –", marker_end="#– end managed zone –", content="", append_if_not_found=False, prepend_if_not_found=False, backup='.bak', dry_run=False, show_changes=True, append_newline=False)
```

New in version 2014.1.0.

Replace content of a text block in a file, delimited by line markers

A block of content delimited by comments can help you manage several lines entries without worrying about old entries removal.

**Note:** This function will store two copies of the file in-memory (the original version and the edited version) in order to detect changes and only edit the targeted file if necessary.

- **path** Filesystem path to the file to be edited
**marker_start** The line content identifying a line as the start of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output.

**marker_end** The line content identifying the end of the content block. As of versions 2017.7.5 and 2018.3.1, everything up to the text matching the marker will be replaced, so it’s important to ensure that your marker includes the beginning of the text you wish to replace.

**content** The content to be used between the two lines identified by marker_start and marker_stop.

**append_if_not_found**: False If markers are not found and set to True then, the markers and content will be appended to the file.

**prepend_if_not_found**: False If markers are not found and set to True then, the markers and content will be prepended to the file.

**backup** The file extension to use for a backup of the file if any edit is made. Set to False to skip making a backup.

**dry_run**: False If True, do not make any edits to the file and simply return the changes that would be made.

**show_changes**: True Controls how changes are presented. If True, this function will return a unified diff of the changes made. If False, then it will return a boolean (True if any changes were made, otherwise False).

**append_newline**: False Controls whether or not a newline is appended to the content block. If the value of this argument is True then a newline will be added to the content block. If it is False, then a newline will not be added to the content block. If it is None then a newline will only be added to the content block if it does not already end in a newline.

New in version 2016.3.4.

Changed in version 2017.7.5,2018.3.1: New behavior added when value is None.

Changed in version 2019.2.0: The default value of this argument will change to None to match the behavior of the file.blockreplace state

CLI Example:

```shell
salt '.*' file.blockreplace /etc/hosts '#-- start managed zone foobar : DO NOT EDIT --'
  '#-- end managed zone foobar --'

salt.modules.file.chattr('files', **kwargs)
```

New in version 2018.3.0.

Change the attributes of files. This function accepts one or more files and the following options:

**operator** Can be either add or remove. Determines whether attributes should be added or removed from files

**attributes** One or more of the following characters: aAccDDeijPsStTu, representing attributes to add to/remove from files

**version** A version number to assign to the file(s)

**flags** One or more of the following characters: RVf, representing flags to assign to chattr (recurse, verbose, suppress most errors)

CLI Example:

```shell
salt '.*' file.chattr foo1.txt foo2.txt operator=add attributes=ai
salt '.*' file.chattr foo3.txt operator=remove attributes=i version=2
```
salt.modules.file.check_file_meta\(name, sfn, source, source_sum, user, group, mode, attrs, saltenv, contents=None)\)

Check for the changes in the file metadata.

CLI Example:
```
salt '*' file.check_file_meta /etc/httpd/conf.d/httpd.conf salt://httpd.conf → '{hash_type: 'md5', 'hsum': <md5sum>}' root, root, '755' base
```

**Note:** Supported hash types include sha512, sha384, sha256, sha224, sha1, and md5.

- **name** Path to file destination
- **sfn** Template-processed source file contents
- **source** URL to file source
- **source_sum** File checksum information as a dictionary
  ```
  {hash_type: md5, hsum: <md5sum>}
  ```
- **user** Destination file user owner
- **group** Destination file group owner
- **mode** Destination file permissions mode
- **attrs** Destination file attributes
  - New in version 2018.3.0.
- **saltenv** Salt environment used to resolve source files
- **contents** File contents

salt.modules.file.check_hash\(path, file_hash)\)

Check if a file matches the given hash string

Returns True if the hash matches, otherwise False.

- **path** Path to a file local to the minion.
- **hash** The hash to check against the file specified in the path argument.
  - Changed in version 2016.11.4.
  - For this and newer versions the hash can be specified without an accompanying hash type (e.g. e138491e9d5b97023cea823fe17bac22), but for earlier releases it is necessary to also specify the hash type in the format <hash_type>=<hash_value> (e.g. md5=e138491e9d5b97023cea823fe17bac22).

CLI Example:
```
salt '*' file.check_hash /etc/fstab e138491e9d5b97023cea823fe17bac22
salt '*' file.check_hash /etc/fstab md5=e138491e9d5b97023cea823fe17bac22
```

salt.modules.file.check_managed\(name, source, source_hash, source_hash_name, user, group, mode, attrs, template, context, defaults, saltenv, contents=None, skip_verify=False, **kwargs)\)

Check to see what changes need to be made for a file

CLI Example:
salt.modules.file.check_managed_changes

Return a dictionary of what changes need to be made for a file

CLI Example:

```bash
salt '*' file.check_managed_changes /etc/httpd/conf.d/httpd.conf salt://http/httpd.conf '{hash_type: 'md5', 'hsum': <md5sum>}' root, root, '755' jinja True None None
```

salt.modules.file.check_perms

Check the permissions on files, modify attributes and chown if needed. File attributes are only verified if lsattr(1) is installed.

changed in version 2014.1.3: follow_symlinks option added

CLI Example:

```bash
salt '*' file.check_perms /etc/sudoers '{}' root root 400 ai
```

salt.modules.file.chgrp

Change the group of a file

CLI Example:

```bash
salt '*' file.chgrp /etc/passwd root
```

salt.modules.file.chown

Chown a file, pass the file the desired user and group

CLI Example:

```bash
salt '*' file.chown /etc/passwd root root
```

salt.modules.file.comment

Deprecated since version 0.17.0: Use replace() instead.

Comment out specified lines in a file

CLI Example:

```bash
salt '*' file.comment /etc/passwd path regex char='#'; backup='bak'
```

21.9. execution modules
backup: .bak  The file will be backed up before edit with this file extension

**Warning:**  This backup will be overwritten each time sed / comment / uncomment is called. Meaning the backup will only be useful after the first invocation.

CLI Example:

```
salt '*' file.comment /etc/modules pcspkr
```

salt.modules.file.comment_line(path, regex, char='#', cmnt=True, backup='.bak')

Comment or Uncomment a line in a text file.

**Parameters**

- **path** – string The full path to the text file.
- **regex** – string A regex expression that begins with ^ that will find the line you wish to comment. Can be as simple as ^color =
- **char** – string The character used to comment a line in the type of file you’re referencing. Default is #
- **cmnt** – boolean True to comment the line. False to uncomment the line. Default is True.
- **backup** – string The file extension to give the backup file. Default is .bak Set to False/None to not keep a backup.

**Returns**  boolean Returns True if successful, False if not

CLI Example:

The following example will comment out the pcspkr line in the /etc/modules file using the default # character and create a backup file named modules.bak

```
salt '*' file.comment_line '/etc/modules' '^pcspkr'
```

The following example will uncomment the log_level setting in minion config file if it is set to either warning, info, or debug using the # character and create a backup file named minion.bk

```
salt '*' file.comment_line 'C:\salt\conf\minion' '^log_level: (warning|info|debug)' → ' #' False '.bk'
```

salt.modules.file.contains(path, text)

Deprecated since version 0.17.0: Use search() instead.

Return True if the file at path contains text

CLI Example:

```
salt '*' file.contains /etc/crontab 'mymaintenance.sh'
```

salt.modules.file.contains_glob(path, glob_expr)

Deprecated since version 0.17.0: Use search() instead.

Return True if the given glob matches a string in the named file

CLI Example:
salt '*

salt.modules.file.contains_glob(/etc/foobar '*cheese*'*)

salt.modules.file.contains_regex(path, regex, lchar="")

Deprecated since version 0.17.0: Use search() instead.

Return True if the given regular expression matches on any line in the text of a given file.

If the lchar argument (leading char) is specified, it will strip lchar from the left side of each line before trying to match.

CLI Example:

```python
class 'salt' file.contains_regex /etc/crontab
```

salt.modules.file.copy(src, dst, recurse=False, remove_existing=False)

Copy a file or directory from source to dst

In order to copy a directory, the recurse flag is required, and will by default overwrite files in the destination with the same path, and retain all other existing files. (similar to cp -r on unix)

remove_existing will remove all files in the target directory, and then copy files from the source.

**Note:** The copy function accepts paths that are local to the Salt minion. This function does not support salt://, http://, or the other additional file paths that are supported by states.file.managed and states.file.recurse.

CLI Example:

```python
class 'salt' file.copy /path/to/src /path/to/dst
salt '*

class 'salt' file.copy /path/to/src_dir /path/to/dst_dir
``` remove_existing=True

salt.modules.file.delete_backup(path, backup_id)

New in version 0.17.0.

Delete a previous version of a file that was backed up using Salt’s file state backup system.

path The path on the minion to check for backups

backup_id The numeric id for the backup you wish to delete, as found using file.list_backups

CLI Example:

```python
class 'salt' file.delete_backup /var/cache/salt/minion/file_backup/home/foo/bar/baz.txt 0
```

salt.modules.file.directory_exists(path)

Tests to see if path is a valid directory. Returns True/False.

CLI Example:

```python
class 'salt' file.directory_exists /etc
```

salt.modules.file.dirname(path)

Returns the directory component of a pathname

New in version 2015.5.0.

This can be useful at the CLI but is frequently useful when scripting.
{% from salt['file.dirname'](tpldir) + '/vars.jinja' import parent_vars %}

CLI Example:
salt '*' file.dirname 'test/path/filename.config'

salt.modules.file.diskusage(path)
Recursively calculate disk usage of path and return it in bytes

CLI Example:
salt '*' file.diskusage /path/to/check

salt.modules.file.extract_hash(hash_fn, hash_type='sha256', file_name=None, source=None, source_hash_name=None)

Changed in version 2016.3.5: Prior to this version, only the file_name argument was considered for filename matches in the hash file. This would be problematic for cases in which the user was relying on a remote checksum file that they do not control, and they wished to use a different name for that file on the minion from the filename on the remote server (and in the checksum file). For example, managing /tmp/myfile.tar.gz when the remote file was at https://mydomain.tld/different_name.tar.gz. The file.managed state now also passes this function the source URI as well as the source_hash_name (if specified). In cases where source_hash_name is specified, it takes precedence over both the file_name and source. When it is not specified, file_name takes precedence over source. This allows for better capability for matching hashes.

Changed in version 2016.11.0: File name and source URI matches are no longer disregarded when source_hash_name is specified. They will be used as fallback matches if there is no match to the source_hash_name value.

This routine is called from the file.managed state to pull a hash from a remote file. Regular expressions are used line by line on the source_hash file, to find a potential candidate of the indicated hash type. This avoids many problems of arbitrary file layout rules. It specifically permits pulling hash codes from debian *.dsc files.

If no exact match of a hash and filename are found, then the first hash found (if any) will be returned. If no hashes at all are found, then None will be returned.

For example:

```
openerp_7.0-latest-1.tar.gz:
  file.managed:
    - name: /tmp/openerp_7.0-20121227-075624-1_all.deb
    - source: http://nightly.openerp.com/7.0/nightly/deb/openerp_7.0-20121227-
      075624-1.tar.gz
    - source_hash: http://nightly.openerp.com/7.0/nightly/deb/openerp_7.0-
      20121227-075624-1.dsc
```

CLI Example:
salt '*' file.extract_hash /path/to/hash/file sha512 /etc/foo

salt.modules.file.file_exists(path)
Tests to see if path is a valid file. Returns True/False.

CLI Example:
salt '*' file.file_exists /etc/passwd
salt.modules.file.find(path, *args, **kwargs)

Approximate the Unix find(1) command and return a list of paths that meet the specified criteria.

The options include match criteria:

- **name** = path-glob # case sensitive
- **iname** = path-glob # case insensitive
- **regex** = path-regex # case sensitive
- **iregex** = path-regex # case insensitive
- **type** = file-types # match any listed type
- **user** = users # match any listed user
- **group** = groups # match any listed group
- **size** = [+-]number[size-unit] # default unit = byte
- **mtime** = interval # modified since date
- **grep** = regex # search file contents

and/or actions:

- **delete** [= file-types] # default type = 'f'
- **exec** = command [arg ...] # where {} is replaced by pathname
- **print** [= print-opts]

and/or depth criteria:

- **maxdepth** = maximum depth to transverse in path
- **mindepth** = minimum depth to transverse before checking files or directories

The default action is **print=path**

**path-glob**:

- * = match zero or more chars
- ? = match any char
- [abc] = match a, b, or c
- ![abc] or ^[abc] = match anything except a, b, and c
- [x-y] = match chars x through y
- ![x-y] or ^[x-y] = match anything except chars x through y
- {a,b,c} = match a or b or c

**path-regex**: a Python Regex (regular expression) pattern to match pathnames

**file-types**: a string of one or more of the following:

- a: all file types
- b: block device
- c: character device
- d: directory
- p: FIFO (named pipe)
- f: plain file
- l: symlink
- s: socket

**users**: a space and/or comma separated list of user names and/or uids

**groups**: a space and/or comma separated list of group names and/or gids

**size-unit**:
interval:

```
[<num>w] [<num>d] [<num>h] [<num>m] [<num>s]
```

where:
- w: week
- d: day
- h: hour
- m: minute
- s: second

print-opts: a comma and/or space separated list of one or more of the following:

- group: group name
- md5: MD5 digest of file contents
- mode: file permissions (as integer)
- mtime: last modification time (as time_t)
- name: file basename
- path: file absolute path
- size: file size in bytes
- type: file type
- user: user name

CLI Examples:

```
salt '*' file.find / type=f name=\*.bak size=+10m
salt '*' file.find /var mtime=+30d size=+10m print=path,size,mtime
salt '*' file.find /var/log name=\*.[0-9] mtime=+30d size=+10m delete
```

salt.modules.file.get_devmm(name)
Get major/minor info from a device

CLI Example:

```
salt '*' file.get_devmm /dev/chr
```

salt.modules.file.get_diff(file1, file2, saltenv='base', show_filenames=True, show_changes=True, template=False, source_hash_file1=None, source_hash_file2=None)
Return unified diff of two files

- **file1** The first file to feed into the diff utility
  
  Changed in version 2018.3.0: Can now be either a local or remote file. In earlier releases, this had to be a file local to the minion.

- **file2** The second file to feed into the diff utility
  
  Changed in version 2018.3.0: Can now be either a local or remote file. In earlier releases, this had to be a file on the salt fileserver (i.e. `salt://somefile.txt`)

- **show_filenames**: True Set to False to hide the filenames in the top two lines of the diff.

- **show_changes**: True If set to False, and there are differences, then instead of a diff a simple message stating that show_changes is set to False will be returned.
template: False Set to True if two templates are being compared. This is not useful except for within states, with the obfuscate_templates option set to True.

New in version 2018.3.0.

source_hash_file1 If file1 is an http(s)/ftp URL and the file exists in the minion’s file cache, this option can be passed to keep the minion from re-downloading the archive if the cached copy matches the specified hash.

New in version 2018.3.0.

source_hash_file2 If file2 is an http(s)/ftp URL and the file exists in the minion’s file cache, this option can be passed to keep the minion from re-downloading the archive if the cached copy matches the specified hash.

New in version 2018.3.0.

CLI Examples:

```
salt '*' file.get_diff /home/fred/.vimrc salt://users/fred/.vimrc
salt '*' file.get_diff /tmp/foo.txt /tmp/bar.txt
```

salt.modules.file.get_gid(path, follow_symlinks=True)

Return the id of the group that owns a given file

path file or directory of which to get the gid
follow_symlinks indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_gid /etc/passwd
```

Changed in version 0.16.4: follow_symlinks option added

salt.modules.file.get_group(path, follow_symlinks=True)

Return the group that owns a given file

path file or directory of which to get the group
follow_symlinks indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_group /etc/passwd
```

Changed in version 0.16.4: follow_symlinks option added

salt.modules.file.get_hash(path, form='sha256', chunk_size=65536)

Get the hash sum of a file

This is better than get_sum for the following reasons:

- It does not read the entire file into memory.
- It does not return a string on error. The returned value of get_sum cannot really be trusted since it is vulnerable to collisions: get_sum(..., 'xyz') == 'Hash xyz not supported'

path path to the file or directory
form desired sum format
chunk_size amount to sum at once
CLI Example:

```
salt '*' file.get_hash /etc/shadow
```

salt.modules.file.get_managed(name, template, source, source_hash, source_hash_name, user, group, mode, attrs, saltenv, context, defaults, skip_verify=False, **kwargs)

Return the managed file data for file.managed

**name** location where the file lives on the server

**template** template format

**source** managed source file

**source_hash** hash of the source file

**source_hash_name** When source_hash refers to a remote file, this specifies the filename to look for in that file.

New in version 2016.3.5.

**user** Owner of file

**group** Group owner of file

**mode** Permissions of file

**attrs** Attributes of file

New in version 2018.3.0.

**context** Variables to add to the template context

**defaults** Default values of for context_dict

**skip_verify** If True, hash verification of remote file sources (http://, https://, ftp://) will be skipped, and the source_hash argument will be ignored.

New in version 2016.3.0.

CLI Example:

```
salt '*' file.get_managed /etc/httpd/conf.d/httpd.conf jinja salt://http/httpd.~conf '{hash_type: 'md5', 'hsum': <md5sum>}' None root root '755' base None None
```

salt.modules.file.get_mode(path, follow_symlinks=True)

Return the mode of a file

**path** file or directory of which to get the mode

**follow_symlinks** indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_mode /etc/passwd
```

Changed in version 2014.1.0: follow_symlinks option added

salt.modules.file.get_selinux_context(path)

Get an SELinux context from a given path

CLI Example:

```
salt '*' file.get_selinux_context /etc/hosts
```
salt.modules.file.get_source_sum(file_name=", source=", source_hash=None, source_hash_name=None, saltenv='base')

New in version 2016.11.0.

Used by file.get_managed to obtain the hash and hash type from the parameters specified below.

file_name  Optional file name being managed, for matching with file.extract_hash.

source  Source file, as used in file and other states. If source_hash refers to a file containing hashes, then this filename will be used to match a filename in that file. If the source_hash is a hash expression, then this argument will be ignored.

directory  Hash file/expression, as used in file and other states. If this value refers to a remote URL or absolute path to a local file, it will be cached and file.extract_hash will be used to obtain a hash from it.

source_hash_name  Specific file name to look for when source_hash refers to a remote file, used to disambiguate ambiguous matches.

saltenv: base  Salt fileserver environment from which to retrieve the source_hash. This value will only be used when source_hash refers to a file on the Salt fileserver (i.e. one beginning with salt://).

CLI Example:

```
salt '*' file.get_source_sum /tmp/foo.tar.gz source=http://mydomain.tld/foo.tar.gz
→ source_hash=499ae16dca71eeb7c3a30c75ea7a166
salt '*' file.get_source_sum /tmp/foo.tar.gz source=http://mydomain.tld/foo.tar.gz
→ source_hash=https://mydomain.tld/foohashes.md5
salt '*' file.get_source_sum /tmp/foo.tar.gz source=https://mydomain.tld/foohashes.md5
→ source_hash_name=./dir2/foo.tar.gz
```

salt.modules.file.get_sum(path, form='sha256')

Return the checksum for the given file. The following checksum algorithms are supported:

- md5
- sha1
- sha224
- sha256 (default)
- sha384
- sha512

path  path to the file or directory

form  desired sum format

CLI Example:

```
salt '*' file.get_sum /etc/passwd sha512
```

salt.modules.file.get_uid(path, follow_symlinks=True)

Return the id of the user that owns a given file

path  file or directory of which to get the uid

follow_symlinks  indicated if symlinks should be followed

CLI Example:
salt '*' file.get_uid /etc/passwd

Changed in version 0.16.4: follow_symlinks option added

salt.modules.file.get_user(path, follow_symlinks=True)
Return the user that owns a given file

path file or directory of which to get the user
follow_symlinks indicated if symlinks should be followed

CLI Example:
salt '*' file.get_user /etc/passwd

Changed in version 0.16.4: follow_symlinks option added

salt.modules.file.gid_to_group(gid)
Convert the group id to the group name on this system

gid gid to convert to a group name

CLI Example:
salt '*' file.gid_to_group 0

salt.modules.file.grep(path, pattern, *opts)
Grep for a string in the specified file

Note: This function’s return value is slated for refinement in future versions of Salt

path Path to the file to be searched

Note: Globbing is supported (i.e. */var/log/foo/*.log, but if globbing is being used then the path should be quoted to keep the shell from attempting to expand the glob expression.

pattern Pattern to match. For example: test, or a[0-5]

opts Additional command-line flags to pass to the grep command. For example: -v, or -i -B2

Note: The options should come after a double-dash (as shown in the examples below) to keep Salt’s own argument parser from interpreting them.

CLI Example:
salt '*' file.grep /etc/passwd nobody
salt '*' file.grep /etc/sysconfig/network-scripts/ifcfg-eth0 ipaddr -- -i
salt '*' file.grep /etc/sysconfig/network-scripts/ifcfg-eth0 ipaddr -- -i -B2
salt '*' file.grep "/etc/sysconfig/network-scripts/*" ipaddr -- -i -l

salt.modules.file.group_to_gid(group)
Convert the group to the gid on this system

group group to convert to its gid

CLI Example:
salt '届' file.group_to_gid root

salt.modules.file.is_blkdev(name)
    Check if a file exists and is a block device.
    CLI Example:
    ```sh
    salt '届' file.is_blkdev /dev/blk
    ```

salt.modules.file.is_chrdev(name)
    Check if a file exists and is a character device.
    CLI Example:
    ```sh
    salt '届' file.is_chrdev /dev/chr
    ```

salt.modules.file.is_fifo(name)
    Check if a file exists and is a FIFO.
    CLI Example:
    ```sh
    salt '届' file.is_fifo /dev/fifo
    ```

salt.modules.file.is_hardlink(path)
    Check if the path is a hard link by verifying that the number of links is larger than 1
    CLI Example:
    ```sh
    salt '届' file.is_hardlink /path/to/link
    ```

salt.modules.file.is_link(path)
    Check if the path is a symbolic link
    CLI Example:
    ```sh
    salt '届' file.is_link /path/to/link
    ```

salt.modules.file.join(*args)
    Return a normalized file system path for the underlying OS
    New in version 2014.7.0.
    This can be useful at the CLI but is frequently useful when scripting combining path variables:
    ```sh
    {% set www_root = '/var' %
    {% set app_dir = 'myapp' %
    myapp_config:
        file:
            - managed
            - name: {{ salt['file.join'](www_root, app_dir, 'config.yaml') }}
    ```
    CLI Example:
    ```sh
    salt '届' file.join '/usr' 'local' 'bin'
    ```

salt.modules.file.lchown(path, user, group)
    Chown a file, pass the file the desired user and group without following symlinks.
    path    path to the file or directory
user user owner

group group owner

CLI Example:

```
salt '*' file.chown /etc/passwd root root
```

```
salt.modules.file.line(path, content=None, match=None, mode=None, location=None, before=None, after=None, show_changes=True, backup=False, quiet=False, indent=True)
```

New in version 2015.8.0.

Edit a line in the configuration file. The path and content arguments are required, as well as passing in one of the mode options.

**path** Files system path to the file to be edited.

**content** Content of the line. Allowed to be empty if mode=delete.

**match** Match the target line for an action by a fragment of a string or regular expression.

If neither before nor after are provided, and match is also None, match becomes the content value.

**mode** Defines how to edit a line. One of the following options is required:

- **ensure** If line does not exist, it will be added. This is based on the content argument.
- **replace** If line already exists, it will be replaced.
- **delete** Delete the line, once found.
- **insert** Insert a line.

**Note:** If mode=insert is used, at least one of the following options must also be defined: location, before, or after. If location is used, it takes precedence over the other two options.

**location** Defines where to place content in the line. Note this option is only used when mode=insert is specified. If a location is passed in, it takes precedence over both the before and after kwargs. Valid locations are:

- **start** Place the content at the beginning of the file.
- **end** Place the content at the end of the file.

**before** Regular expression or an exact case-sensitive fragment of the string. This option is only used when either the ensure or insert mode is defined.

**after** Regular expression or an exact case-sensitive fragment of the string. This option is only used when either the ensure or insert mode is defined.

**show_changes** Output a unified diff of the old file and the new file. If False return a boolean if any changes were made. Default is True

**Note:** Using this option will store two copies of the file in-memory (the original version and the edited version) in order to generate the diff.

**backup** Create a backup of the original file with the extension: "Year-Month-Day-Hour-Minutes-Seconds".

**quiet** Do not raise any exceptions. E.g. ignore the fact that the file that is tried to be edited does not exist and nothing really happened.
indent  Keep indentation with the previous line. This option is not considered when the delete mode is specified.

CLI Example:

```bash
salt '...' file.line /etc/nsswitch.conf "networks: files dns" after="hosts:. ->.*?" mode='ensure'
```

Note: If an equal sign (=) appears in an argument to a Salt command, it is interpreted as a keyword argument in the format of key=val. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '...' file.line /path/to/file content="CREATEMAIL_SPOOL=no" match="CREATE_MAIL_ SPOOL=yes" mode="replace"
```

salt.modules.file.link(src, path)
New in version 2014.1.0.
Create a hard link to a file

CLI Example:

```
salt '...' file.link /path/to/file /path/to/link
```

salt.modules.file.list_backups(path, limit=None)
New in version 0.17.0.
Lists the previous versions of a file backed up using Salt’s file state backup system.

- **path**  The path on the minion to check for backups
- **limit**  Limit the number of results to the most recent N backups

CLI Example:

```
salt '...' file.list_backups /foo/bar/baz.txt
```

salt.modules.file.list_backups_dir(path, limit=None)
Lists the previous versions of a directory backed up using Salt’s file state backup system.

- **path**  The directory on the minion to check for backups
- **limit**  Limit the number of results to the most recent N backups

CLI Example:

```
salt '...' file.list_backups_dir /foo/bar/baz/
```

salt.modules.file.lsattr(path)
New in version 2018.3.0.

- Changed in version 2018.3.1: If lsattr is not installed on the system, None is returned.
- Changed in version 2018.3.4: If on AIX, None is returned even if in filesystem as lsattr on AIX is not the same thing as the linux version.

Obtain the modifiable attributes of the given file. If path is to a directory, an empty list is returned.

- **path**  path to file to obtain attributes of. File/directory must exist.

CLI Example:
salt 'x' file.lsattr foo1.txt

salt.modules.file.lstat(path)
New in version 2014.1.0.
Returns the lstat attributes for the given file or dir. Does not support symbolic links.

CLI Example:
salt 'x' file.lstat /path/to/file

salt.modules.file.makedirs_(path, user=None, group=None, mode=None)
Ensure that the directory containing this path is available.

Note: The path must end with a trailing slash otherwise the directory/directories will be created up to the parent directory. For example if path is /opt/code, then it would be treated as /opt/ but if the path ends with a trailing slash like /opt/code/, then it would be treated as /opt/code/.

CLI Example:
salt 'x' file.makedirs /opt/code/

salt.modules.file.makedirs_perms(name, user=None, group=None, mode='0755')
Taken and modified from os.makedirs to set user, group and mode for each directory created.

CLI Example:
salt 'x' file.makedirs_perms /opt/code

salt.modules.file.manage_file(name, sfn, ret, source, source_sum, user, group, mode, attrs, saltenv, backup, makedirs=False, template=None, show_changes=True, contents=None, dir_mode=None, follow_symlinks=False, skip_verify=False, keep_mode=False, encoding=None, encoding_errors='strict', **kwargs)
Checks the destination against what was retrieved with get_managed and makes the appropriate modifications (if necessary).

name location to place the file
sfn location of cached file on the minion

This is the path to the file stored on the minion. This file is placed on the minion using cp.cache_file. If the hash sum of that file matches the source_sum, we do not transfer the file to the minion again.

This file is then grabbed and if it has template set, it renders the file to be placed into the correct place on the system using salt.files.utils.copyfile()

ret The initial state return data structure. Pass in None to use the default structure.
source file reference on the master
source_sum sum hash for source
user user owner
group group owner
backup backup_mode
**attrs** attributes to be set on file: " " means remove all of them

New in version 2018.3.0.

**makedirs** make directories if they do not exist

**template** format of templating

**show_changes** Include diff in state return

**contents** contents to be placed in the file

**dir_mode** mode for directories created with makedirs

**skip_verify**: False If True, hash verification of remote file sources (http://, https://, ftp://) will be skipped, and the source_hash argument will be ignored.

New in version 2016.3.0.

**keep_mode**: False If True, and the source is a file from the Salt filesrver (or a local file on the minion), the mode of the destination file will be set to the mode of the source file.

Note: keep_mode does not work with salt-ssh.

As a consequence of how the files are transferred to the minion, and the inability to connect back to the master with salt-ssh, salt is unable to stat the file as it exists on the filesrver and thus cannot mirror the mode on the salt-ssh minion

**encoding** If specified, then the specified encoding will be used. Otherwise, the file will be encoded using the system locale (usually UTF-8). See https://docs.python.org/3/library/codecs.html#standard-encodings for the list of available encodings.

New in version 2017.7.0.

**encoding_errors**: 'strict' Default is 'strict'. See https://docs.python.org/2/library/codecs.html#codec-base-classes for the error handling schemes.

New in version 2017.7.0.

CLI Example:

```
```

Changed in version 2014.7.0: follow_symlinks option added

**salt.modules.file.mkdir( dir_path, user=None, group=None, mode=None)**

Ensure that a directory is available.

CLI Example:

```
salt '*' file.mkdir /opt/jetty/context
```

**salt.modules.file.mknod( name, ntype, major=0, minor=0, user=None, group=None, mode='0600' )**

New in version 0.17.0.

Create a block device, character device, or fifo pipe. Identical to the gnu mknod.

CLI Examples:

```
salt '*' file.mknod /dev/chr c 180 31
salt '*' file.mknod /dev/blk b 8 999
salt '*' file.mknod /dev/fifo p
```
salt.modules.file.mknod_blkdev(name, major, minor, user=None, group=None, mode='0660')
    New in version 0.17.0.
    Create a block device.
    CLI Example:
    salt '*' file.mknod_blkdev /dev/blk 8 999

salt.modules.file.mknod_chrdev(name, major, minor, user=None, group=None, mode='0660')
    New in version 0.17.0.
    Create a character device.
    CLI Example:
    salt '*' file.mknod_chrdev /dev/chr 180 31

salt.modules.file.mknod_fifo(name, user=None, group=None, mode='0660')
    New in version 0.17.0.
    Create a FIFO pipe.
    CLI Example:
    salt '*' file.mknod_fifo /dev/fifo

salt.modules.file.move(src, dst)
    Move a file or directory
    CLI Example:
    salt '*' file.move /path/to/src /path/to/dst

salt.modules.file.normpath(path)
    Returns Normalize path, eliminating double slashes, etc.
    New in version 2015.5.0.
    This can be useful at the CLI but is frequently useful when scripting.
    CLI Example:
    salt '*' file.normpath 'a/b/c/.'

salt.modules.file.open_files(by_pid=False)
    Return a list of all physical open files on the system.
    CLI Examples:
    salt '*' file.open_files
    salt '*' file.open_files by_pid=True

salt.modules.file.pardir()
    Return the relative parent directory path symbol for underlying OS
    New in version 2014.7.0.
    This can be useful when constructing Salt Formulas.
CLI Example:
```
salt '*' file.pardir
```

```py
{% set pardir = salt['file.pardir']() %}
{% set final_path = salt['file.join']('subdir', pardir, 'confdir') %}
```

salt.modules.file.patch(\texttt{originalfile, patchfile, options=}, \texttt{dry\_run=False})

Apply a patch to a file or directory.

Equivalent to:
```
patch \texttt{<options>} -i \texttt{<patchfile>} \texttt{<originalfile>}
```

Or, when a directory is patched:
```
patch \texttt{<options>} -i \texttt{<patchfile>} -d \texttt{<originalfile>} -p0
```

\texttt{originalfile} The full path to the file or directory to be patched

\texttt{patchfile} A patch file to apply to \texttt{originalfile}

\texttt{options} Options to pass to patch.

CLI Example:
```
salt '*' file.patch /opt/file.txt /tmp/file.txt.patch
```

salt.modules.file.path_exists_glob(\texttt{path})

Tests to see if path after expansion is a valid path (file or directory). Expansion allows usage of \texttt{?}, \texttt{*}, and character ranges [\texttt{]}]. Tilde expansion is not supported. Returns True/False.

New in version 2014.7.0.

CLI Example:
```
salt '*' file.path_exists_glob /etc/pam*/pass*
```

salt.modules.file.prepend(\texttt{path, *args, **kwargs})

Prepend text to the beginning of a file

\texttt{path} path to file

*\texttt{args} strings to prepend to the file

CLI Example:
```
salt '*' file.prepend /etc/motd
   "With all thine offerings thou shalt offer salt."
   "Salt is what makes things taste bad when it isn't in them."
```

\textbf{Attention}

If you need to pass a string to append and that string contains an equal sign, you \textbf{must} include the argument name, \texttt{args}. For example:

```
salt '*' file.append /etc/motd
   "With all thine offerings thou shalt offer salt."
   "Salt is what makes things taste bad when it isn't in them."
```

\section*{21.9. execution modules}
salt 'files' fileprepend /etc/motd args='cheese=spam'
salt 'files' fileprepend /etc/motd args=['cheese=spam','spam=cheese']

salt.modules.file.psed(path, before, after, limit='', backup='.bak', flags='gMS', escape_all=False, multi=False)

Deprecated since version 0.17.0: Use replace() instead.

Make a simple edit to a file (pure Python version)

Equivalent to:

```
sed <backup> <options> "'/<limit>/ s/<before>/<after>/<flags> <file>"
```

**path**  The full path to the file to be edited

**before**  A pattern to find in order to replace with **after**

**after**  Text that will replace **before**

**limit:**  An initial pattern to search for before searching for **before**

**backup:**  The file will be backed up before edit with this file extension; **WARNING:** each time `sed/comment/uncomment` is called will overwrite this backup

**flags:**  `gMS`

Flags to modify the search. Valid values are:

- `g`: Replace all occurrences of the pattern, not just the first.
- `i`: Ignore case.
- `L`: Make \w, \W, \b, \B, \s and \S dependent on the locale.
- `M`: Treat multiple lines as a single line.
- `S`: Make . match all characters, including newlines.
- `U`: Make \w, \W, \b, \B, \d, \D, \s and \S dependent on Unicode.
- `X`: Verbose (whitespace is ignored).

**multi:** False If True, treat the entire file as a single line

Forward slashes and single quotes will be escaped automatically in the **before** and **after** patterns.

CLI Example:

```
salt 'files' file.sed /etc/httpd/httpd.conf 'LogLevel warn' 'LogLevel info'
```

salt.modules.file.read(path, binary=False)

New in version 2017.7.0.

Return the content of the file.

CLI Example:

```
salt 'files' file.read /path/to/file
```
salt.modules.file.readdir(path)
New in version 2014.1.0.
Return a list containing the contents of a directory

CLI Example:
```
salt '*' file.readdir /path/to/dir/
```

salt.modules.file.readlink(path, canonicalize=False)
New in version 2014.1.0.
Return the path that a symlink points to If canonicalize is set to True, then it return the final target

CLI Example:
```
salt '*' file.readlink /path/to/link
```

salt.modules.file.remove(path)
Remove the named file. If a directory is supplied, it will be recursively deleted.

CLI Example:
```
salt '*' file.remove /tmp/foo
```

Changed in version 3000: The method now works on all types of file system entries, not just files, directories and symlinks.

salt.modules.file.rename(src, dst)
Rename a file or directory

CLI Example:
```
salt '*' file.rename /path/to/src /path/to/dst
```

salt.modules.file.replace(path, pattern, repl, count=0, flags=8, bufsize=1, append_if_not_found=False, prepend_if_not_found=False, not_found_content=None, backup='.bak', dry_run=False, search_only=False, show_changes=True, ignore_if_missing=False, preserve_inode=True, backslash_literal=False)
New in version 0.17.0.
Replace occurrences of a pattern in a file. If show_changes is True, then a diff of what changed will be returned, otherwise a True will be returned when changes are made, and False when no changes are made.

This is a pure Python implementation that wraps Python’s sub().

path Filesystem path to the file to be edited. If a symlink is specified, it will be resolved to its target.

pattern A regular expression, to be matched using Python’s search().

repl The replacement text

count: 0 Maximum number of pattern occurrences to be replaced. If count is a positive integer n, only n occurrences will be replaced, otherwise all occurrences will be replaced.

flags (list or int) A list of flags defined in the re module documentation from the Python standard library. Each list item should be a string that will correlate to the human-friendly flag name. E.g., ['IGNORECASE', 'MULTILINE']. Optionally, flags may be an int, with a value corresponding to the XOR (|) of all the desired flags. Defaults to 8 (which supports 'MULTILINE').
bufsize (int or str) How much of the file to buffer into memory at once. The default value 1 processes one line at a time. The special value file may be specified which will read the entire file into memory before processing.

append_if_not_found: False  New in version 2014.7.0.
    If set to True, and pattern is not found, then the content will be appended to the file.

prepend_if_not_found: False  New in version 2014.7.0.
    If set to True and pattern is not found, then the content will be prepended to the file.

not_found_content  New in version 2014.7.0.
    Content to use for append/prepend if not found. If None (default), uses repl. Useful when repl uses references to group in pattern.

backup: .bak The file extension to use for a backup of the file before editing. Set to False to skip making a backup.

dry_run: False  If set to True, no changes will be made to the file, the function will just return the changes that would have been made (or a True/False value if show_changes is set to False).

search_only: False  If set to true, this no changes will be performed on the file, and this function will simply return True if the pattern was matched, and False if not.

show_changes: True  If True, return a diff of changes made. Otherwise, return True if changes were made, and False if not.

Note: Using this option will store two copies of the file in memory (the original version and the edited version) in order to generate the diff. This may not normally be a concern, but could impact performance if used with large files.

ignore_if_missing: False  New in version 2015.8.0.
    If set to True, this function will simply return False if the file doesn’t exist. Otherwise, an error will be thrown.

preserve_inode: True  New in version 2015.8.0.
    Preserve the inode of the file, so that any hard links continue to share the inode with the original filename. This works by copying the file, reading from the copy, and writing to the file at the original inode. If False, the file will be moved rather than copied, and a new file will be written to a new inode, but using the original filename. Hard links will then share an inode with the backup, instead (if using backup to create a backup copy).

backslash_literal: False  New in version 2016.11.7.
    Interpret backslashes as literal backslashes for the repl and not escape characters. This will help when using append/prepend so that the backslashes are not interpreted for the repl on the second run of the state.

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format key=val. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' file.replace /path/to/file pattern='=' repl=':'
salt '*' file.replace /path/to/file pattern="bind-address\s*=" repl='bind-address:\n'
```

CLI Examples:
salt.modules.file.restore_backup(path, backup_id)
New in version 0.17.0.
Restore a previous version of a file that was backed up using Salt’s file state backup system.
path The path on the minion to check for backups
backup_id The numeric id for the backup you wish to restore, as found using file.list_backups
CLI Example:
salt '*' file.restore_backup /foo/bar/baz.txt 0

salt.modules.file.restorecon(path, recursive=False)
Reset the SELinux context on a given path
CLI Example:
salt '*' file.restorecon /home/user/.ssh/authorized_keys

salt.modules.file.rmdir(path)
New in version 2014.1.0.
Remove the specified directory. Fails if a directory is not empty.
CLI Example:
salt '*' file.rmdir /tmp/foo/

salt.modules.file.search(path, pattern, flags=8, bufsize=1, ignore_if_missing=False, multi-line=False)
New in version 0.17.0.
Search for occurrences of a pattern in a file
Except for multiline, params are identical to replace().
multiline If true, inserts 'MULTILINE' into flags and sets bufsize to 'file'.
New in version 2015.8.0.
CLI Example:
salt '*' file.search /etc/crontab 'mymaintenance.sh'

salt.modules.file.sed(path, before, after, limit=", backup=\'.bak', options='r e', flags='g', escape_all=False, negate_match=False)
 Deprecated since version 0.17.0: Use replace() instead.
Make a simple edit to a file
Equivalent to:
sed <backup> <options> "/<limit>/ s/<before>/<after>/<flags> <file>"
path The full path to the file to be edited
**before** A pattern to find in order to replace with **after**

**after** Text that will replace **before**

**limit:** '' An initial pattern to search for before searching for **before**

**backup:** .bak The file will be backed up before edit with this file extension; **WARNING:** each time sed/comment/uncomment is called will overwrite this backup

**options:** -r -e Options to pass to sed

**flags:** g Flags to modify the sed search; e.g., i for case-insensitive pattern matching

**negate_match:** False Negate the search command (!)

New in version 0.17.0.

Forward slashes and single quotes will be escaped automatically in the **before** and **after** patterns.

CLI Example:

```shell
salt '*' file.sed /etc/httpd/httpd.conf 'LogLevel warn' 'LogLevel info'
```

**salt.modules.file.sed_contains** *(path, text, limit='', flags='g')*

Deprecated since version 0.17.0: Use **search()** instead.

Return True if the file at **path** contains **text**. Utilizes sed to perform the search (line-wise search).

Note: the p flag will be added to any flags you pass in.

CLI Example:

```shell
salt '*' file.contains /etc/crontab 'mymaintenance.sh'
```

**salt.modules.file.seek_read** *(path, size, offset)*

New in version 2014.1.0.

Seek to a position on a file and read it

**path** path to file

**seek** amount to read at once

**offset** offset to start into the file

CLI Example:

```shell
salt '*' file.seek_read /path/to/file 4096 0
```

**salt.modules.file.seek_write** *(path, data, offset)*

New in version 2014.1.0.

Seek to a position on a file and write to it

**path** path to file

**data** data to write to file

**offset** position in file to start writing

CLI Example:

```shell
salt '*' file.seek_write /path/to/file 'some data' 4096
```

**salt.modules.file.set_mode** *(path, mode)*

Set the mode of a file
**path**  file or directory of which to set the mode

**mode**  mode to set the path to

CLI Example:

```bash
salt '*' file.set_mode /etc/passwd 0644
```

**salt.modules.file.set_selinux_context**  
Set a specific SELinux label on a given path

CLI Example:

```bash
salt '*' file.set_selinux_context path <user> <role> <type> <range>
salt '*' file.set_selinux_context /etc/yum.repos.d/epel.repo system_u object_r\→system_conf_t s0
```

**salt.modules.file.source_list**  
Check the source list and return the source to use

CLI Example:

```bash
salt '*' file.source_list salt://http/httpd.conf '{hash_type: 'md5', 'hsum': →<md5sum>}' base
```

**salt.modules.file.stats**  
Return a dict containing the stats for a given file

CLI Example:

```bash
salt '*' file.stats /etc/passwd
```

**salt.modules.file.statvfs**  
New in version 2014.1.0.  
Perform a statvfs call against the filesystem that the file resides on

CLI Example:

```bash
salt '*' file.statvfs /path/to/file
```

**salt.modules.file.symlink**  
Create a symbolic link (symlink, soft link) to a file

CLI Example:

```bash
salt '*' file.symlink /path/to/file /path/to/link
```

**salt.modules.file.touch**  
New in version 0.9.5.  
Just like the `touch` command, create a file if it doesn’t exist or simply update the atime and mtime if it already does.

**atime**: Access time in Unix epoch time

**mtime**: Last modification in Unix epoch time

CLI Example:

```bash
salt '*' file.touch /var/log/emptyfile
```
salt.modules.file.truncate(path, length)
New in version 2014.1.0.
    Seek to a position on a file and delete everything after that point
    path  path to file
    length  offset into file to truncate
    CLI Example:
    
```
salt '*' file.truncate /path/to/file 512
```

salt.modules.file.uid_to_user(uid)
Convert a uid to a user name
    uid  uid to convert to a username
    CLI Example:
    
```
salt '*' file.uid_to_user 0
```

salt.modules.file.uncomment(path, regex, char='#', backup='.bak')
Deprecated since version 0.17.0: Use replace() instead.
    Uncomment specified commented lines in a file
    path  The full path to the file to be edited
    regex  A regular expression used to find the lines that are to be uncommented. This regex should not include
            the comment character. A leading ^ character will be stripped for convenience (for easily switching
            between comment() and uncomment()).
    char:  #  The character to remove in order to uncomment a line
    backup: .bak  The file will be backed up before edit with this file extension; WARNING: each time
                 sed/comment/uncomment is called will overwrite this backup
    CLI Example:
    
```
salt '*' file.uncomment /etc/hosts.deny 'ALL: PARANOID'
```

salt.modules.file.user_to_uid(user)
Convert user name to a uid
    user  user name to convert to its uid
    CLI Example:
    
```
salt '*' file.user_to_uid root
```

salt.modules.file.write(path, *args, **kwargs)
New in version 2014.7.0.
    Write text to a file, overwriting any existing contents.
    path  path to file
    *args  strings to write to the file
    CLI Example:
    
```
salt '*' file.write /etc/motd \
    "With all thine offerings thou shalt offer salt."
```
Attention

If you need to pass a string to append and that string contains an equal sign, you must include the argument name, args. For example:

```python
salt '*' file.write /etc/motd args='cheese=spam'
salt '*' file.write /etc/motd args=['cheese=spam','spam=cheese']
```

21.9.128 salt.modules.firewalld

Support for firewalld.

New in version 2015.2.0.

**salt.modules.firewalld.add_interface** *(zone, interface, permanent=True)*

Bind an interface to a zone

New in version 2016.3.0.

CLI Example:

```python
salt '*' firewalld.add_interface zone eth0
```

**salt.modules.firewalld.add_masquerade** *(zone=None, permanent=True)*

Enable masquerade on a zone. If zone is omitted, default zone will be used.

New in version 2015.8.0.

CLI Example:

```python
salt '*' firewalld.add_masquerade
```

To enable masquerade on a specific zone

```python
salt '*' firewalld.add_masquerade dmz
```

**salt.modules.firewalld.add_port** *(zone, port, permanent=True, force_masquerade=False)*

Allow specific ports in a zone.

New in version 2015.8.0.

CLI Example:

```python
salt '*' firewalld.add_port internal 443/tcp
```

**force_masquerade** when a zone is created ensure masquerade is also enabled on that zone.

**salt.modules.firewalld.add_port_fwd** *(zone, src, dest, proto='tcp', dstaddr='', permanent=True, force_masquerade=False)*

Add port forwarding.

New in version 2015.8.0.

CLI Example:
force_masquerade  when a zone is created ensure masquerade is also enabled on that zone.

```
salt '*' firewalld.add_port_fwd public 80 443 tcp
```

```
salt.modules.firewalld.add_rich_rule(zone, rule, permanent=True)
```
Add a rich rule to a zone
New in version 2016.11.0.

CLI Example:
```
salt '*' firewalld.add_rich_rule zone 'rule'
```

```
salt.modules.firewalld.add_service(service, zone=None, permanent=True)
```
Add a service for zone. If zone is omitted, default zone will be used.

CLI Example:
```
salt '*' firewalld.add_service ssh
```
To assign a service to a specific zone:
```
salt '*' firewalld.add_service ssh my_zone
```

```
salt.modules.firewalld.add_service_port(service, port)
```
Add a new port to the specified service.
New in version 2016.11.0.

CLI Example:
```
salt '*' firewalld.add_service_port zone 80
```

```
salt.modules.firewalld.add_service_protocol(service, protocol)
```
Add a new protocol to the specified service.
New in version 2016.11.0.

CLI Example:
```
salt '*' firewalld.add_service_protocol zone ssh
```

```
salt.modules.firewalld.add_source(zone, source, permanent=True)
```
Bind a source to a zone
New in version 2016.3.0.

CLI Example:
```
salt '*' firewalld.add_source zone 192.168.1.0/24
```

```
salt.modules.firewalld.allow_icmp(zone, icmp, permanent=True)
```
Allow a specific ICMP type on a zone
New in version 2015.8.0.

CLI Example:
```
salt '*' firewalld.allow_icmp zone echo-reply
```
salt.modules.firewalld.block_icmp(zone, icmp, permanent=True)
Block a specific ICMP type on a zone
New in version 2015.8.0.
CLI Example:
```
salt '*' firewalld.block_icmp zone echo-reply
```

salt.modules.firewalld.default_zone()
Print default zone for connections and interfaces
CLI Example:
```
salt '*' firewalld.default_zone
```

salt.modules.firewalld.delete_service(name, restart=True)
Delete an existing service
CLI Example:
```
salt '*' firewalld.delete_service my_service
```
By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False
```
salt '*' firewalld.delete_service my_service False
```

salt.modules.firewalld.delete_zone(zone, restart=True)
Delete an existing zone
CLI Example:
```
salt '*' firewalld.delete_zone my_zone
```
By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False
```
salt '*' firewalld.delete_zone my_zone False
```

salt.modules.firewalld.get_icmp_types(permanent=True)
Print predefined icmptypes
CLI Example:
```
salt '*' firewalld.get_icmp_types
```

salt.modules.firewalld.get_interfaces(zone, permanent=True)
List interfaces bound to a zone
New in version 2016.3.0.
CLI Example:
```
salt '*' firewalld.get_interfaces zone
```

salt.modules.firewalld.get_masquerade(zone=None, permanent=True)
Show if masquerading is enabled on a zone. If zone is omitted, default zone will be used.
CLI Example:
```
salt '*' firewalld.get_masquerade zone
```
salt.modules.firewalld.get_rich_rules(zone, permanent=True)
List rich rules bound to a zone
New in version 2016.11.0.
CLI Example:
```
salt '*' firewalld.get_rich_rules zone
```

salt.modules.firewalld.get_service_ports(service)
List ports of a service.
New in version 2016.11.0.
CLI Example:
```
salt '*' firewalld.get_service_ports zone
```

salt.modules.firewalld.get_service_protocols(service)
List protocols of a service.
New in version 2016.11.0.
CLI Example:
```
salt '*' firewalld.get_service_protocols zone
```

salt.modules.firewalld.get_services(permanent=True)
Print predefined services
CLI Example:
```
salt '*' firewalld.get_services
```

salt.modules.firewalld.get_sources(zone, permanent=True)
List sources bound to a zone
New in version 2016.3.0.
CLI Example:
```
salt '*' firewalld.get_sources zone
```

salt.modules.firewalld.get_zones(permanent=True)
Print predefined zones
CLI Example:
```
salt '*' firewalld.get_zones
```

salt.modules.firewalld.list_all(zone=None, permanent=True)
List everything added for or enabled in a zone
CLI Example:
```
salt '*' firewalld.list_all
```
List a specific zone
```
salt '*' firewalld.list_all my_zone
```
salt.modules.firewalld.list_icmp_block(zone, permanent=True)
List ICMP blocks on a zone
New in version 2015.8.0.
CLI Example:
salt '*' firewalld.list_icmp_block zone

salt.modules.firewalld.list_port_fwd(zone, permanent=True)
List port forwarding
New in version 2015.8.0.
CLI Example:
salt '*' firewalld.list_port_fwd public

salt.modules.firewalld.list_ports(zone, permanent=True)
List all ports in a zone.
New in version 2015.8.0.
CLI Example:
salt '*' firewalld.list_ports

salt.modules.firewalld.list_services(zone=None, permanent=True)
List services added for zone as a space separated list. If zone is omitted, default zone will be used.
CLI Example:
salt '*' firewalld.list_services

salt.modules.firewalld.list_zones(permanent=True)
List everything added for or enabled in all zones
CLI Example:
salt '*' firewalld.list_zones

salt.modules.firewalld.make_permanent()
Make current runtime configuration permanent.
New in version 2016.3.0.
CLI Example:
salt '*' firewalld.make_permanent

salt.modules.firewalld.new_service(name, restart=True)
Add a new service
CLI Example:
salt '*' firewalld.new_service my_service

By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False
salt '*' firewalld.new_service my_service False

salt.modules.firewalld.new_zone(zone, restart=True)
Add a new zone

CLI Example:
salt '*' firewalld.new_zone my_zone

By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False

salt '*' firewalld.new_zone my_zone False

salt.modules.firewalld.reload_rules()
Reload the firewall rules, which makes the permanent configuration the new runtime configuration without losing state information.

New in version 2016.11.0.

CLI Example:
salt '*' firewalld.reload

salt.modules.firewalld.remove_interface(zone, interface, permanent=True)
Remove an interface bound to a zone

New in version 2016.3.0.

CLI Example:
salt '*' firewalld.remove_interface zone eth0

salt.modules.firewalld.remove_masquerade(zone=None, permanent=True)
Remove masquerade on a zone. If zone is omitted, default zone will be used.

New in version 2015.8.0.

CLI Example:
salt '*' firewalld.remove_masquerade

To remove masquerade on a specific zone

salt '*' firewalld.remove_masquerade dmz

salt.modules.firewalld.remove_port(zone, port, permanent=True)
Remove a specific port from a zone.

New in version 2015.8.0.

CLI Example:
salt '*' firewalld.remove_port internal 443/tcp

salt.modules.firewalld.remove_port_fwd(zone, src, destproto="tcp", dstaddr=", permanent=True)

Remove Port Forwarding.

New in version 2015.8.0.

CLI Example:
```python
salt '*' firewalld.remove_port_fwd public 80 443 tcp
```

salt.modules.firewalld.remove_rich_rule(zone, rule, permanent=True)

Add a rich rule to a zone

New in version 2016.11.0.

CLI Example:

```python
salt '*' firewalld.remove_rich_rule zone 'rule'
```

salt.modules.firewalld.remove_service(service, zone=None, permanent=True)

Remove a service from zone. This option can be specified multiple times. If zone is omitted, default zone will be used.

CLI Example:

```python
salt '*' firewalld.remove_service ssh
```

To remove a service from a specific zone

```python
salt '*' firewalld.remove_service ssh dmz
```

salt.modules.firewalld.remove_service_port(service, port)

Remove a port from the specified service.

New in version 2016.11.0.

CLI Example:

```python
salt '*' firewalld.remove_service_port zone 80
```

salt.modules.firewalld.remove_service_protocol(service, protocol)

Remove a protocol from the specified service.

New in version 2016.11.0.

CLI Example:

```python
salt '*' firewalld.remove_service_protocol zone ssh
```

salt.modules.firewalld.remove_source(zone, source, permanent=True)

Remove a source bound to a zone

New in version 2016.3.0.

CLI Example:

```python
salt '*' firewalld.remove_source zone 192.168.1.0/24
```

salt.modules.firewalld.set_default_zone(zone)

Set default zone

CLI Example:

```python
salt '*' firewalld.set_default_zone damian
```

salt.modules.firewalld.version()

Return version from firewall-cmd

CLI Example:
21.9.129 salt.modules.freebsd_sysctl

Module for viewing and modifying sysctl parameters

salt.modules.freebsd_sysctl.assign(name, value)
Assign a single sysctl parameter for this minion

CLI Example:
salt '*' sysctl.assign net.inet.icmp.icmplim 50

salt.modules.freebsd_sysctl.get(name)
Return a single sysctl parameter for this minion

CLI Example:
salt '*' sysctl.get hw.physmem

salt.modules.freebsd_sysctl.persist(name, value, config='/etc/sysctl.conf')
Assign and persist a simple sysctl parameter for this minion

CLI Example:
salt '*' sysctl.persist net.inet.icmp.icmplim 50
salt '*' sysctl.persist coretemp_load NO config=/boot/loader.conf

salt.modules.freebsd_sysctl.show(config_file=False)
Return a list of sysctl parameters for this minion

CLI Example:
salt '*' sysctl.show

21.9.130 salt.modules.freebsd_update module

Support for freebsd-update utility on FreeBSD.

New in version 2017.7.0.

maintainer George Mamalakis <mamalos@gmail.com>
maturity new
platform FreeBSD

salt.modules.freebsd_update.fetch(**kwargs)
New in version 2016.3.4.
freebsd-update fetch wrapper. Based on the currently installed world and the configuration options set, fetch all available binary updates.

kwargs: Parameters of freebsd-update command.

salt.modules.freebsd_update.ids(**kwargs)
New in version 2016.3.4.
freebsd-update IDS wrapper function. Compares the system against a "known good" index of the installed release.

**kwargs:** Parameters of freebsd-update command.

```python
salt.modules.freebsd_update.install(**kwargs)
```

New in version 2016.3.4.

freebsd-update install wrapper. Install the most recently fetched updates or upgrade.

**kwargs:** Parameters of freebsd-update command.

```python
salt.modules.freebsd_update.rollback(**kwargs)
```

New in version 2016.3.4.

freebsd-update rollback wrapper. Uninstalls the most recently installed updates.

**kwargs:** Parameters of freebsd-update command.

```python
salt.modules.freebsd_update.update(**kwargs)
```

New in version 2016.3.4.

Command that simplifies freebsd-update by running freebsd-update fetch first and then freebsd-update install.

**kwargs:** Parameters of freebsd-update command.

```python
salt.modules.freebsd_update.upgrade(**kwargs)
```

New in version 2016.3.4.

Dummy function used only to print a message that upgrade is not available. The reason is that upgrade needs manual intervention and reboot, so even if used with:

```
yes | freebsd-upgrade -r VERSION
```

the additional freebsd-update install that needs to run after the reboot cannot be implemented easily.

**kwargs:** Parameters of freebsd-update command.

### 21.9.131 salt.modules.freebsdjail

The jail module for FreeBSD

```python
salt.modules.freebsdjail.fstab(jail)
```

Display contents of a fstab(5) file defined in specified jail's configuration. If no file is defined, return False.

CLI Example:

```
salt '*' jail.fstab <jail name>
```

```python
salt.modules.freebsdjail.get_enabled()
```

Return which jails are set to be run

CLI Example:

```
salt '*' jail.get_enabled
```

```python
salt.modules.freebsdjail.is_enabled()
```

See if jail service is actually enabled on boot

CLI Example:

```
salt '*' jail.is_enabled <jail name>
```

### 21.9. execution modules 1739
salt.modules.freebsdjail.restart(jail="")
    Restart the specified jail or all, if none specified
    CLI Example:
    ```
salt '*' jail.restart [jail name]
    ```

salt.modules.freebsdjail.show_config(jail)
    Display specified jail's configuration
    CLI Example:
    ```
salt '*' jail.show_config <jail name>
    ```

salt.modules.freebsdjail.start(jail="")
    Start the specified jail or all, if none specified
    CLI Example:
    ```
salt '*' jail.start [jail name]
    ```

salt.modules.freebsdjail.status(jail)
    See if specified jail is currently running
    CLI Example:
    ```
salt '*' jail.status <jail name>
    ```

salt.modules.freebsdjail.stop(jail="")
    Stop the specified jail or all, if none specified
    CLI Example:
    ```
salt '*' jail.stop [jail name]
    ```

salt.modules.freebsdjail.sysctl()
    Dump all jail related kernel states (sysctl)
    CLI Example:
    ```
salt '*' jail.sysctl
    ```

21.9.132 salt.modules.freebsdkmod

Module to manage FreeBSD kernel modules

salt.modules.freebsdkmod.available()
    Return a list of all available kernel modules
    CLI Example:
    ```
salt '*' kmod.available
    ```

salt.modules.freebsdkmod.check_available(mod)
    Check to see if the specified kernel module is available
    CLI Example:
```
salt '*' kmod.check_available vmm
```

```
salt.modules.freebsdkmod.is_loaded(mod)
    Check to see if the specified kernel module is loaded
    CLI Example:
    ```
salt '*' kmod.is_loaded vmm
    ```
```

```
salt.modules.freebsdkmod.load(mod, persist=False)
    Load the specified kernel module
    mod  Name of the module to add
    persist  Write the module to sysrc kld_modules to make it load on system reboot
    CLI Example:
    ```
salt '*' kmod.load bhyve
    ```
```

```
salt.modules.freebsdkmod.lsmod()
    Return a dict containing information about currently loaded modules
    CLI Example:
    ```
salt '*' kmod.lsmod
    ```
```

```
salt.modules.freebsdkmod.mod_list(only_persist=False)
    Return a list of the loaded module names
    CLI Example:
    ```
salt '*' kmod.mod_list
    ```
```

```
salt.modules.freebsdkmod.remove(mod, persist=False, comment=True)
    Remove the specified kernel module
    mod  Name of module to remove
    persist  Also remove module from /boot/loader.conf
    comment  If persist is set don’t remove line from /boot/loader.conf but only comment it
    CLI Example:
    ```
salt '*' kmod.remove vmm
    ```
```

### 21.9.133 salt.modules.freebsdpkg

Remote package support using `pkg_add(1)`

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.
Warning: This module has been completely rewritten. Up to and including version 0.17.0, it supported pkg_add(1), but checked for the existence of a pkgng local database and, if found, would provide some of pkgng’s functionality. The rewrite of this module has removed all pkgng support, and moved it to the pkgng execution module. For versions <= 0.17.0, the documentation here should not be considered accurate. If your Minion is running one of these versions, then the documentation for this module can be viewed using the sys.doc function:

```
salt bsdminion sys.doc pkg
```

This module acts as the default package provider for FreeBSD 9 and older. If you need to use pkgng on a FreeBSD 9 system, you will need to override the pkg provider by setting the providers parameter in your Minion config file, in order to use pkgng.

**providers:**

```
  pkg: pkgng
```

More information on pkgng support can be found in the documentation for the pkgng module.

This module will respect the PACKAGEROOT and PACKAGESITE environment variables, if set, but these values can also be overridden in several ways:

1. **Salt configuration parameters.** The configuration parameters freebsdpkg.PACKAGERoot and freebsdpkg.PACKAGESITE are recognized. These config parameters are looked up using config.get and can thus be specified in the Master config file, Grains, Pillar, or in the Minion config file. Example:

```
```

2. **CLI arguments.** Both the packageroot (used interchangeably with fromrepo for API compatibility) and packagesite CLI arguments are recognized, and override their config counterparts from section 1 above.

```
salt -G 'os:FreeBSD' pkg.install zsh fromrepo=ftp://ftp2.freebsd.org/
```

.. note::

   These arguments can also be passed through in states:

   ```yaml
   zsh:
     pkg.installed:
   ```

**salt.modules.freebsdpkg.file_dict('packages')**

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system’s package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```
salt.modules.freebsdpkg.file_list("*packages")

List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```python
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

code

salt.modules.freebsdpkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)

Install package(s) using pkg_add(1)

name The name of the package to be installed.

refresh Whether or not to refresh the package database before installing.

fromrepo or packageroot Specify a package repository from which to install. Overrides the system default, as well as the PACKAGEROOT environment variable.

packagesite Specify the exact directory from which to install the remote package. Overrides the PACKAGESITE environment variable, if present.

Multiple Package Installation Options:

pkgs A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```python
salt '*' pkg.install pkgs='["foo", "bar"]'
```

code

sources A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```python
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"}, {"bar": "salt://bar.deb"}]'
```

code

Return a dict containing the new package names and versions:

```python
{"<package>": {"old": '<old-version>', 'new': '<new-version>'}}
```

code

CLI Example:

```python
salt '*' pkg.install <package name>
```

code

salt.modules.freebsdpkg.latest_version("names", **kwargs)

pkg_add(1) is not capable of querying for remote packages, so this function will always return results as if there is no package available for install or upgrade.

CLI Example:

```python
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

code

code

salt.modules.freebsdpkg.list_pkgs(versions_as_list=False, with_origin=False, **kwargs)

List the packages currently installed as a dict:
['<package_name>': '<version>']

with_origin [False] Return a nested dictionary containing both the origin name and version for each installed package.
New in version 2014.1.0.

CLI Example:
salt '*' pkg.list_pkgs

salt.modules.freebsdpkg.refresh_db()
pkg_add(1) does not use a local database of available packages, so this function simply returns True. it exists merely for API compatibility.

CLI Example:
salt '*' pkg.refresh_db

salt.modules.freebsdpkg.remove(name=None, pkgs=None, **kwargs)
Remove packages using pkg_delete(1)

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.
New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'

salt.modules.freebsdpkg.version(*names, **kwargs)
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

with_origin [False] Return a nested dictionary containing both the origin name and version for each specified package.
New in version 2014.1.0.

CLI Example:
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...

21.9.134 salt.modules.freebsdports
Install software from the FreeBSD ports(7) system
New in version 2014.1.0.
This module allows you to install ports using `BATCH=yes` to bypass configuration prompts. It is recommended to use the `ports state` to install ports, but it is also possible to use this module exclusively from the command line.

```
salt minion-id ports.config security/nmap IPV6=off
salt minion-id ports.install security/nmap
```

```python
salt.modules.freebsdports.config(name, reset=False, **kwargs)
```
Modify configuration options for a given port. Multiple options can be specified. To see the available options for a port, use `ports.showconfig`.

- `name` The port name, in `category/name` format
- `reset` [False] If True, runs a `make rmconfig` for the port, clearing its configuration before setting the desired options

CLI Examples:
```
salt '*' ports.config security/nmap IPV6=off
```

```python
salt.modules.freebsdports.deinstall(name)
```
De-install a port.

CLI Example:
```
salt '*' ports.deinstall security/nmap
```

```python
salt.modules.freebsdports.install(name, clean=True)
```
Install a port from the ports tree. Installs using `BATCH=yes` for non-interactive building. To set config options for a given port, use `ports.config`.

- `clean` [True] If True, cleans after installation. Equivalent to running `make install clean BATCH=yes`.

**Note:** It may be helpful to run this function using the `-t` option to set a higher timeout, since compiling a port may cause the Salt command to exceed the default timeout.

CLI Example:
```
salt -t 1200 '*' ports.install security/nmap
```

```python
salt.modules.freebsdports.list_all()
```
Lists all ports available.

CLI Example:
```
salt '*' ports.list_all
```

**Warning:** Takes a while to run, and returns a LOT of output

```python
salt.modules.freebsdports.rmconfig(name)
```
Clear the cached options for the specified port; run a `make rmconfig`

- `name` The name of the port to clear

CLI Example:
salt '-packages' ports.rmconfig security/nmap

salt.modules.freebsdports.search(name)
Search for matches in the ports tree. Globs are supported, and the category is optional

CLI Examples:
salt '*' ports.search 'security/*'
salt '*' ports.search 'security/n'*
salt '*' ports.search nmap

Warning: Takes a while to run

salt.modules.freebsdports.showconfig(name, default=False, dict_return=False)
Show the configuration options for a given port.

default [False] Show the default options for a port (not necessarily the same as the current configuration)
dict_return [False] Instead of returning the output of make showconfig, return the data in a dictionary

CLI Example:
salt '*' ports.showconfig security/nmap
salt '*' ports.showconfig security/nmap default=True

salt.modules.freebsdports.update(extract=False)
Update the ports tree
extract [False] If True, runs portsnap extract after fetching, should be used for first-time installation of the ports tree.

CLI Example:
salt '*' ports.update

21.9.135 salt.modules.freebsdservice

The service module for FreeBSD

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see here.

salt.modules.freebsdservice.available(name, jail=None)
Check that the given service is available.

Changed in version 2016.3.4.
jail: optional jid or jail name

CLI Example:
salt '*' service.available sshd

salt.modules.freebsdservice.disable(name, **kwargs)
Disable the named service to start at boot
Arguments the same as for enable()

Changed in version 2016.3.4.

**jail** *(optional keyword argument)*  the jail’s id or name

**chroot** *(optional keyword argument)*  the jail’s chroot, if the jail’s /etc is not mounted read-write

CLI Example:

```bash
salt '*' service.disable <service name>
```

salt.modules.freebsdservice.disabled(*name*, **kwargs)
Return True if the named service is enabled, false otherwise

CLI Example:

```bash
salt '*' service.disabled <service name>
```

salt.modules.freebsdservice.enable(*name*, **kwargs)
Enable the named service to start at boot

**name**  service name

**config**  [/etc/rc.conf]  Config file for managing service. If config value is empty string, then

```
/etc/rc.conf.d/<service>
```

used. See man rc.conf(5) for details.

Also service.config variable can be used to change default.

Changed in version 2016.3.4.

**jail** *(optional keyword argument)*  the jail’s id or name

**chroot** *(optional keyword argument)*  the jail’s chroot, if the jail’s /etc is not mounted read-write

CLI Example:

```bash
salt '*' service.enable <service name>
```

salt.modules.freebsdservice.enabled(*name*, **kwargs)
Return True if the named service is enabled, false otherwise

**name**  Service name

Changed in version 2016.3.4.

Support for jail (representing jid or jail name) keyword argument in kwargs

CLI Example:

```bash
salt '*' service.enabled <service name>
```

salt.modules.freebsdservice.get_all(*jid*=`None`)
Return a list of all available services

Changed in version 2016.3.4.

**jid**  optional jid or jail name

CLI Example:

```bash
salt '*' service.get_all
```
salt.modules.freebsdservice.get_disabled(jail=None)
Return what services are available but not enabled to start at boot

- Changed in version 2016.3.4.
- Support for jail (representing jid or jail name) keyword argument in kwargs

CLI Example:
```
salt '*' service.get_disabled
```

salt.modules.freebsdservice.get_enabled(jail=None)
Return what services are set to run on boot

- Changed in version 2016.3.4.
- Support for jail (representing jid or jail name) keyword argument in kwargs

CLI Example:
```
salt '*' service.get_enabled
```

salt.modules.freebsdservice.missing(name, jail=None)
The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.

- Changed in version 2016.3.4.
- jail: optional jid or jail name

CLI Example:
```
salt '*' service.missing ss hd
```

salt.modules.freebsdservice.reload_(name, jail=None)
Restart the named service

- Changed in version 2016.3.4.
- jail: optional jid or jail name

CLI Example:
```
salt '*' service.reload <service name>
```

salt.modules.freebsdservice.restart(name, jail=None)
Restart the named service

- Changed in version 2016.3.4.
- jail: optional jid or jail name

CLI Example:
```
salt '*' service.restart <service name>
```

salt.modules.freebsdservice.start(name, jail=None)
Start the specified service

- Changed in version 2016.3.4.
- jail: optional jid or jail name

CLI Example:
salt '*' service.start <service name>

salt.modules.freebsdservice.status(name, sig=None, jail=None)

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2016.3.4.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

Parameters

- name (str) – The name of the service to check
- sig (str) – Signature to use to find the service via ps

Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type bool

CLI Example:

salt '*' service.status <service name> [service signature]

salt.modules.freebsdservice.stop(name, jail=None)

Stop the specified service

Changed in version 2016.3.4.

jail: optional jid or jail name

CLI Example:

salt '*' service.stop <service name>

21.9.136 salt.modules.gem

Manage ruby gems.

salt.modules.gem.install(gems, ruby=None, gem_bin=None, runas=None, version=None, rdoc=False, ri=False, pre_releases=False, proxy=None, source=None)

Installs one or several gems.

Parameters

- gems – string The gems to install
- gem_bin – string : None Full path to gem binary to use.
- ruby – string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if gem_bin is specified.
- runas – string : None The user to run gem as.
- version – string : None Specify the version to install for the gem. Doesn’t play nice with multiple gems at once
- rdoc – boolean : False Generate RDoc documentation for the gem(s). For rubygems > 3 this is interpreted as the –no-document arg and the ri option will then be ignored
- ri – boolean : False Generate RI documentation for the gem(s). For rubygems > 3 this is interpreted as the –no-document arg and the rdoc option will then be ignored
- **pre_releases** – boolean: False Include pre-releases in the available versions
- **proxy** – string: None Use the specified HTTP proxy server for all outgoing traffic. Format: http://hostname[:port]

**source** [None] Use the specified HTTP gem source server to download gem. Format: http://hostname[:port]

CLI Example:

```
salt '*' gem.install vagrant
salt '*' gem.install redphone gem_bin=/opt/sensu/embedded/bin/gem
```

**salt.modules.gem.list**(prefix=", ruby=None, runas=None, gem_bin=None)
List locally installed gems.

**Parameters**

- **prefix** – string: Only list gems when the name matches this prefix.
- **gem_bin** – string: None Full path to gem binary to use.
- **ruby** – string: None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if gem_bin is specified.
- **runas** – string: None The user to run gem as.

CLI Example:

```
salt '*' gem.list
```

**salt.modules.gem.list_upgrades**(ruby=None, runas=None, gem_bin=None)
New in version 2015.8.0.

Check if an upgrade is available for installed gems

gem_bin [None] Full path to gem binary to use.

ruby [None] If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if gem_bin is specified.

runas [None] The user to run gem as.

CLI Example:

```
salt '*' gem.list_upgrades
```

**salt.modules.gem.sources_add**(source_uri, ruby=None, runas=None, gem_bin=None)
Add a gem source.

**Parameters**

- **source_uri** – string The source URI to add.
- **gem_bin** – string: None Full path to gem binary to use.
- **ruby** – string: None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if gem_bin is specified.
- **runas** – string: None The user to run gem as.

CLI Example:
```
salt '*' gem.sources_add http://rubygems.org/
```

salt.modules.gem.sources_list(ruby=None, runas=None, gem_bin=None)
List the configured gem sources.

Parameters

- **gem_bin** – string : None Full path to `gem` binary to use.
- **ruby** – string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** – string : None The user to run gem as.

CLI Example:
```
salt '*' gem.sources_list
```

salt.modules.gem.sources_remove(source_uri, ruby=None, runas=None, gem_bin=None)
Remove a gem source.

Parameters

- **source_uri** – string The source URI to remove.
- **gem_bin** – string : None Full path to `gem` binary to use.
- **ruby** – string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** – string : None The user to run gem as.

CLI Example:
```
salt '*' gem.sources_remove http://rubygems.org/
```

salt.modules.gem.uninstall(gems, ruby=None, runas=None, gem_bin=None)
Uninstall one or several gems.

Parameters

- **gems** – string The gems to uninstall.
- **gem_bin** – string : None Full path to `gem` binary to use.
- **ruby** – string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** – string : None The user to run gem as.

CLI Example:
```
salt '*' gem.uninstall vagrant
```

salt.modules.gem.update(gems, ruby=None, runas=None, gem_bin=None)
Update one or several gems.

Parameters

- **gems** – string The gems to update.
- **gem_bin** – string : None Full path to `gem` binary to use.
- **ruby** – string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
• **runas** – string : None The user to run gem as.

CLI Example:
```
salt '*' gem.update vagrant
```

`salt.modules.gem.update_system(version=", ruby=None, runas=None, gem_bin=None)`
Update rubygems.

**Parameters**

• **version** – string : (newest) The version of rubygems to install.

• **gem_bin** – string : None Full path to gem binary to use.

• **ruby** – string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if gem_bin is specified.

• **runas** – string : None The user to run gem as.

CLI Example:
```
salt '*' gem.update_system
```

`salt.modules.gem.version(ruby=None, runas=None, gem_bin=None)`
Print out the version of gem

**Parameters**

• **gem_bin** – string : None Full path to gem binary to use.

• **ruby** – string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if gem_bin is specified.

• **runas** – string : None The user to run gem as.

CLI Example:
```
salt '*' gem.version
```

### 21.9.137 salt.modules.genesis

Module for managing container and VM images

New in version 2014.7.0.

`salt.modules.genesis.avail_platforms()`
Return which platforms are available

CLI Example:
```
salt myminion genesis.avail_platforms
```

`salt.modules.genesis.bootstrap(platform, root, img_format='dir', fs_format='ext2', fs_opts=None, arch=None, flavor=None, repo_url=None, static_gemu=None, img_size=None, mount_dir=None, pkg_cache=None, pkgs=None, exclude_pkgs=None, epel_url='http://download.fedoraproject.org/pub/epel/6/i386/epel-release-6-8.noarch.rpm')`

Create an image for a specific platform.

Please note that this function **MUST** be run as root, as images that are created make files belonging to root.
platform  Which platform to use to create the image. Currently supported platforms are rpm, deb and pacman.

root  Local path to create the root of the image filesystem.

img_format  Which format to create the image in. By default, just copies files into a directory on the local filesystem (dir). Future support will exist for sparse.

fs_format  When using a non-dir img_format, which filesystem to format the image to. By default, ext2.

fs_opts  When using a non-dir img_format, a dict of opts may be specified.

arch  Architecture to install packages for, if supported by the underlying bootstrap tool. Currently only used for deb.

flavor  Which flavor of operating system to install. This correlates to a specific directory on the distribution repositories. For instance, wheezy on Debian.

repo_url  Mainly important for Debian-based repos. Base URL for the mirror to install from. (e.x.: http://ftp.debian.org/debian/)

static_qemu  Local path to the static qemu binary required for this arch. (e.x.: /usr/bin/qemu-amd64-static)

pkg_confs  The location of the conf files to copy into the image, to point the installer to the right repos and configuration.

img_size  If img_format is not dir, then the size of the image must be specified.

mount_dir  If img_format is not dir, then the image must be mounted somewhere. If the mount_dir is not specified, then it will be created at /opt/salt- genesis.<random_uuid>. This directory will be unmounted and removed when the process is finished.

pkg_cache  This points to a directory containing a cache of package files to be copied to the image. It does not need to be specified.

pkgs  A list of packages to be installed on this image. For RedHat, this will include yum, centos-release and iputils by default.

exclude_pkgs  A list of packages to be excluded. If you do not want to install the defaults, you need to include them in this list.

epel_url  The URL to download the EPEL release package from.

CLI Examples:

```
salt myminion genesis.bootstrap pacman /root/arch
salt myminion genesis.bootstrap rpm /root/redhat
salt myminion genesis.bootstrap deb /root/wheezy arch=amd64 ±
  flavor=wheezy static_qemu=/usr/bin/qemu-x86_64-static
```

**salt.modules.genesis.ldd_deps** *(filename, ret=None)*

Recurse through a set of dependencies reported by `ldd`, to find associated dependencies.

Please note that this does not necessarily resolve all (non-package) dependencies for a file; but it does help.

CLI Example:

```
salt myminion genesis.ldd_deps bash salt myminion genesis.ldd_deps /bin/bash
```

**salt.modules.genesis.mksls** *(fmt, src, dst=None)*

Convert an installation file/script to an SLS file. Currently supports kickstart, preseed, and autoyast.

CLI Examples:

```
salt <minion> genesis.mksls kickstart /path/to/kickstart.cfg salt <minion> genesis.mksls kickstart
  /path/to/kickstart.cfg /path/to/dest.sls
```
New in version Beryllium.

**salt.modules.genesis.pack**

Pack up a directory structure, into a specific format

**CLI Examples:**

```
salt myminion genesis.pack centos /root/centos
salt myminion genesis.pack centos /root/centos pack_format='tar'
```

**salt.modules.genesis.unpack**

Unpack an image into a directory structure

**CLI Example:**

```
salt myminion genesis.unpack centos /root/centos
```

### 21.9.138 salt.modules.gentoo_service

Top level package command wrapper, used to translate the os detected by grains to the correct service manager

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see here.

**salt.modules.gentoo_service.available**(name)

Returns True if the specified service is available, otherwise returns False.

**CLI Example:**

```
salt '*' service.available sshd
```

**salt.modules.gentoo_service.disable**(name, **kwargs)

Disable the named service to start at boot

**CLI Example:**

```
salt '*' service.disable <service name> <runlevels=single-runlevel>
salt '*' service.disable <service name> <runlevels=[runlevel1,runlevel2]>
```

**salt.modules.gentoo_service.disabled**(name)

Return True if the named service is enabled, false otherwise

**CLI Example:**

```
salt '*' service.disabled <service name> <runlevels=[runlevel]>
```

**salt.modules.gentoo_service.enable**(name, **kwargs)

Enable the named service to start at boot

**CLI Example:**

```
salt '*' service.enable <service name> <runlevels=single-runlevel>
salt '*' service.enable <service name> <runlevels=[runlevel1,runlevel2]>
```

**salt.modules.gentoo_service.enabled**(name, **kwargs)

Return True if the named service is enabled, false otherwise

**CLI Example:**
salt '*/' service.enabled <service name> <runlevels=single-runlevel>
salt '*/' service.enabled <service name> <runlevels=[runlevel1,runlevel2]>

salt.modules.gentoo_service.get_all()
    Return all available boot services
    CLI Example:
    
salt '*/' service.get_all

salt.modules.gentoo_service.get_disabled()
    Return a set of services that are installed but disabled
    CLI Example:
    
salt '*/' service.get_disabled

salt.modules.gentoo_service.get_enabled()
    Return a list of service that are enabled on boot
    CLI Example:
    
salt '*/' service.get_enabled

salt.modules.gentoo_service.missing(name)
    The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.
    CLI Example:
    
salt '*/' service.missing sshd

salt.modules.gentoo_service.reload_(name)
    Reload the named service
    CLI Example:
    
salt '*/' service.reload <service name>

salt.modules.gentoo_service.restarts(name)
    Restart the named service
    CLI Example:
    
salt '*/' service.restart <service name>

salt.modules.gentoo_service.start(name)
    Start the specified service
    CLI Example:
    
salt '*/' service.start <service name>

salt.modules.gentoo_service.status(name, sig=None)
    Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.
    Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)
    Parameters
• **name** (*str*) – The name of the service to check

• **sig** (*str*) – Signature to use to find the service via ps

**Returns**  True if running, False otherwise

**dict:** Maps service name to True if running, False otherwise

**Return type**  *bool*

**CLI Example:**
```
salt '*' service.status <service name> [service signature]
```

**salt.modules.gentoo_service**.**stop**(name)

Stop the specified service

**CLI Example:**
```
salt '*' service.stop <service name>
```

**salt.modules.gentoo_service**.**zap**(name)

Resets service state

**CLI Example:**
```
salt '*' service.zap <service name>
```

**21.9.139 salt.modules.gentoolkitmod**

Support for Gentoolkit

**salt.modules.gentoolkitmod**.**eclean_dist**(destructive=False,  
package_names=False,  
size_limit=0,  
time_limit=0,  
fetch_restricted=False,  
exclude_file='/etc/eclean/distfiles.exclude')

Clean obsolete portage sources

**destructive**  Only keep minimum for reinstallation

**package_names**  Protect all versions of installed packages. Only meaningful if used with destructive=True

**size_limit** <size>  Don’t delete distfiles bigger than <size>. <size> is a size specification: "10M" is "ten megabytes", "200K" is "two hundreds kilobytes", etc. Units are: G, M, K and B.

**time_limit** <time>  Don’t delete distfiles files modified since <time> <time> is an amount of time: "1y" is "one year", "2w" is "two weeks", etc. Units are: y (years), m (months), w (weeks), d (days) and h (hours).

**fetch_restricted**  Protect fetch-restricted files. Only meaningful if used with destructive=True

**exclude_file**  Path to exclusion file. Default is /etc/eclean/distfiles.exclude This is the same default eclean-dist uses. Use None if this file exists and you want to ignore.

**Returns**  a dict containing the cleaned, saved, and deprecated dists:

```
{
'deleted': {<dist file>: <size>},
'deprecated': {<package>: <dist file>},
'saved': {<package>: <dist file>},
'total_cleaned': <size>}
```

**CLI Example:**
salt 'salt '*' gentoolkit.eclean_dist' destructive=True

salt.modules.gentoolkitmod.eclean_pkg( destructive=False, package_names=False, time_limit=0, exclude_file='/etc/eclean/packages.exclude')

- `destructive` Only keep minimum for reinstallation
- `package_names` Protect all versions of installed packages. Only meaningful if used with destructive=True
- `time_limit <time>` Don’t delete distfiles files modified since <time> is an amount of time: "1y" is "one year", "2w" is "two weeks", etc. Units are: y (years), m (months), w (weeks), d (days) and h (hours).
- `exclude_file` Path to exclusion file. Default is /etc/eclean/packages.exclude This is the same default eclean-pkg uses. Use None if this file exists and you want to ignore.

Returns a dict containing the cleaned binary packages:

```python
{'cleaned': {'dist file': <size>}, 'total_cleaned': <size>}
```

CLI Example:

```
salt '*' gentoolkit.eclean_pkg destructive=True
```

salt.modules.gentoolkitmod.glsa_check_list(glsa_list)

- `glsa_list` can contain an arbitrary number of GLSA ids, filenames containing GLSAs or the special identifiers 'all' and 'affected'

Returns a dict containing glsa ids with a description, status, and CVEs:

```python
{<glsa_id>: {'description': <glsa_description>, 'status': <glsa status>, 'CVEs': [<list of CVEs>]}}
```

CLI Example:

```
salt '*' gentoolkit.glsa_check_list 'affected'
```

salt.modules.gentoolkitmod.revdep_rebuild(lib=None)

- `lib` Search for reverse dependencies for a particular library rather than every library on the system. It can be a full path to a library or basic regular expression.

CLI Example:

```
salt '*' gentoolkit.revdep_rebuild
```

21.9.140 salt.modules.git

Support for the Git SCM

salt.modules.git.add(cwd, filename, opts=", git_opts=", user=None, password=None, ignore_retcode=False, output_encoding=None)

Changed in version 2015.8.0: The --verbose command line argument is now implied

Interface to git-add(1)

21.9. execution modules
cwd  The path to the git checkout
filename  The location of the file/directory to add, relative to cwd
opts  Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with opts= (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

git_opts  Any additional options to add to git command itself (not the add subcommand), in a single string. This is useful for passing -c to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user  User under which to run the git command. By default, the command is run by the user under which the minion is running.

password  Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode  [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:
salt myminion git.add /path/to/repo foo/bar.py
salt myminion git.add /path/to/repo foo/bar.py opts='--dry-run'

salt.modules.git.archive(cwd, output, rev='HEAD', prefix=None, git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None, **kwargs)
Changed in version 2015.8.0: Returns True if successful, raises an error if not.

Interface to git-archive(1), exports a tarball/zip file of the repository

cwd  The path to be archived

Note: git archive permits a partial archive to be created. Thus, this path does not need to be the root of the git repository. Only the files within the directory specified by cwd (and its subdirectories)
will be in the resulting archive. For example, if there is a git checkout at /tmp/foo, then passing /tmp/foo/bar as the cwd will result in just the files underneath /tmp/foo/bar to be exported as an archive.

**output**  The path of the archive to be created

**overwrite**  [False] Unless set to True, Salt will overwrite an existing archive at the path specified by the output argument.

New in version 2015.8.0.

**rev**  [HEAD] The revision from which to create the archive

**format**  Manually specify the file format of the resulting archive. This argument can be omitted, and git archive will attempt to guess the archive type (and compression) from the filename. zip, tar, .gz, and .tgz are extensions that are recognized automatically, and git can be configured to support other archive types with the addition of git configuration keys.

See the git-archive(1) manpage explanation of the --format argument (as well as the CONFIGURATION section of the manpage) for further information.

New in version 2015.8.0.

**prefix**  Prepend <prefix> to every filename in the archive. If unspecified, the name of the directory at the top level of the repository will be used as the prefix (e.g. if cwd is set to /foo/bar/baz, the prefix will be baz, and the resulting archive will contain a top-level directory by that name).

Note: The default behavior if the --prefix option for git archive is not specified is to not prepend a prefix, so Salt's behavior differs slightly from git archive in this respect. Use prefix='' to create an archive with no prefix.

Changed in version 2015.8.0: The behavior of this argument has been changed slightly. As of this version, it is necessary to include the trailing slash when specifying a prefix, if the prefix is intended to create a top-level directory.

**git_opts**  Any additional options to add to git command itself (not the archive subcommand), in a single string. This is useful for passing -c to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

**user**  User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**  Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode**  [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output_encoding**  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.
Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.archive /path/to/repo /path/to/archive.tar
```

```
salt.modules.git.branch(cwd, name=None, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None)
```

Interface to `git-branch(1)`

cwd The path to the git checkout

name Name of the branch on which to operate. If not specified, the current branch will be assumed.

opts Any additional options to add to the command line, in a single string

Note: To create a branch based on something other than HEAD, pass the name of the revision as `opts`. If the revision is in the format `remotename/branch`, then this will also set the remote tracking branch.

Additionally, on the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

```
git_opts Any additional options to add to git command itself (not the branch subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:
```bash
# Set remote tracking branch
salt myminion git.branch /path/to/repo mybranch opts='--set-upstream-to origin/mybranch'

# Create new branch
salt myminion git.branch /path/to/repo mybranch upstream/somebranch

# Delete branch
salt myminion git.branch /path/to/repo mybranch opts='--delete'

# Rename branch (2015.8.0 and later)
salt myminion git.branch /path/to/repo newbranch opts='--set-upstream-to origin/newbranch'
```

`salt.modules.git.checkout(cwd, rev=None, force=False, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None)`

**Interface to** `git-checkout(1)`

**cwd**  The path to the git checkout

**opts**  Any additional options to add to the command line, in a single string

---

**Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

**git_opts**  Any additional options to add to git command itself (not the `checkout` subcommand), in a single string. This is useful for passing `--c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

**rev**  The remote branch or revision to checkout.

Changed in version 2015.8.0: Optional when using `-b` or `-B` in `opts`.

**force**  [False] Force a checkout even if there might be overwritten changes

**user**  User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode**  [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output_encoding**  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:
Salt Documentation, Release 3000.2

# Checking out local local revisions
salt myminion git.checkout /path/to/repo somebranch user=jeff
salt myminion git.checkout /path/to/repo opts='testbranch -- conf/file1 file2'
salt myminion git.checkout /path/to/repo rev=origin/mybranch opts='--track'

# Checking out remote revision into new branch
salt myminion git.checkout /path/to/repo upstream/master opts='--b newbranch'

# Checking out current revision into new branch (2015.8.0 and later)
salt myminion git.checkout /path/to/repo opts='--b newbranch'

salt.modules.git.clone(cwd, url=None, name=None, opts='', git_opts='', user=None, password=None, identity=None, https_user=None, https_pass=None, ignore_retcode=False, saltenv='base', output_encoding=None)

Interface to git-clone(1)

cwd Location of git clone

Changed in version 2015.8.0: If name is passed, then the clone will be made within this directory.

url The URL of the repository to be cloned

Changed in version 2015.8.0: Argument renamed from repository to url

name Optional alternate name for the top-level directory to be created by the clone

New in version 2015.8.0.

opts Any additional options to add to the command line, in a single string

git_opts Any additional options to add to git command itself (not the clone subcommand), in a single string. This is useful for passing -c to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity Path to a private key to use for ssh URLs

Warning: Unless Salt is invoked from the minion using salt-call, the key(s) must be passphrase-less. For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the authorized_keys file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using salt-call, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file

Changed in version 2016.3.0.
https_user  Set HTTP Basic Auth username. Only accepted for HTTPS URLs.
   New in version 20515.5.0.
https_pass   Set HTTP Basic Auth password. Only accepted for HTTPS URLs.
   New in version 2015.5.0.
ignore_retcode  [False] If True, do not log an error to the minion log if the git command returns a nonzero 
   exit status.
   New in version 2015.8.0.
saltenv        The default salt environment to pull sls files from 
   New in version 2016.3.1.
output_encoding  Use this option to specify which encoding to use to decode the output from any git com-
   New in version 2018.3.1.
   Note: This should only be needed if the files in the repository were created with filenames using an 
   encoding other than UTF-8 to handle Unicode characters.
CLI Example:
salt myminion git.clone /path/to/repo_parent_dir git://github.com/saltstack/salt.
   → git

salt.modules.git.commit(cwd, message, opts="", git_opts="", user=None, password=None, file-
   name=None, ignore_retcode=False, output_encoding=None)

Interface to git-commit(1)
cwd     The path to the git checkout
message  Commit message
opts     Any additional options to add to the command line, in a single string. These opts will be added to the 
   end of the git command being run.
   Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with opts=
   (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.
   The −m option should not be passed here, as the commit message will be defined by the message argu-
   ment.

git_opts     Any additional options to add to git command itself (not the commit subcommand), in a single 
   string. This is useful for passing −c to run git with temporary changes to the git configuration.
   New in version 2017.7.0.
   Note: This is only supported in git 1.7.2 and newer.
user     User under which to run the git command. By default, the command is run by the user under which the 
   minion is running.
password
Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

filename The location of the file/directory to commit, relative to cwd. This argument is optional, and can be used to commit a file without first staging it.

Note: This argument only works on files which are already tracked by the git repository.

New in version 2015.8.0.

ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.commit /path/to/repo 'The commit message'
salt myminion git.commit /path/to/repo 'The commit message' filename=foo/bar.py
```

salt.modules.git.config_get(*key*, *cwd=None*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*, **kwargs)

Get the value of a key in the git configuration file

key The name of the configuration key to get

Changed in version 2015.8.0: Argument renamed from setting_name to key

cwd The path to the git checkout

Changed in version 2015.8.0: Now optional if global is set to True

global [False] If True, query the global git configuration. Otherwise, only the local git configuration will be queried.

New in version 2015.8.0.

all [False] If True, return a list of all values set for key. If the key does not exist, None will be returned.

New in version 2015.8.0.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.
ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.config_get user.name cwd=/path/to/repo
salt myminion git.config_get user.email global=True
c
```

salt.modules.git.config_get_regexp(key, value_regex=None, cwd=None, user=None, password=None, ignore_retcode=False, output_encoding=None, **kwargs)

New in version 2015.8.0.

Get the value of a key or keys in the git configuration file using regexes for more flexible matching. The return data is a dictionary mapping keys to lists of values matching the value_regex. If no values match, an empty dictionary will be returned.

- **key** Regex on which key names will be matched
- **value_regex** If specified, return all values matching this regex. The return data will be a dictionary mapping keys to lists of values matching the regex.

Important: Only values matching the value_regex will be part of the return data. So, if key matches a multivar, then it is possible that not all of the values will be returned. To get all values set for a multivar, simply omit the value_regex argument.

- **cwd** The path to the git checkout
- **global** [False] If True, query the global git configuration. Otherwise, only the local git configuration will be queried.
- **user** User under which to run the git command. By default, the command is run by the user under which the minion is running.
- **password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.
New in version 2018.3.1.

CLI Examples:

```bash
# Matches any values for key 'foo.bar'
salt myminion git.config_get_regexp /path/to/repo foo.bar
# Matches any value starting with 'baz' set for key 'foo.bar'
salt myminion git.config_get_regexp /path/to/repo foo.bar 'baz.*'
# Matches any key starting with 'user.'
salt myminion git.config_get_regexp '^user\.'
global=True
```

salt.modules.git.config_set(key, value=None, multivar=None, cwd=None, user=None, password=None, ignore_retcode=False, output_encoding=None, **kwargs)

Changed in version 2015.8.0: Return the value(s) of the key being set

Set a key in the git configuration file

- **cwd** The path to the git checkout. Must be an absolute path, or the word `global` to indicate that a global key should be set.
  
  Changed in version 2014.7.0: Made `cwd` argument optional if `is_global=True`

- **key** The name of the configuration key to set
  
  Changed in version 2015.8.0: Argument renamed from `setting_name` to `key`

- **value** The value to set for the specified key. Incompatible with the `multivar` argument.
  
  Changed in version 2015.8.0: Argument renamed from `setting_value` to `value`

- **add** [False] Add a value to a key, creating/updating a multivar
  
  New in version 2015.8.0.

- **multivar** Set a multivar all at once. Values can be comma-separated or passed as a Python list. Incompatible with the `value` argument.
  
  New in version 2015.8.0.

- **user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

- **password**

  Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.
  
  New in version 2016.3.4.

- **ignore_retcode** [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.
  
  New in version 2015.8.0.

- **global** [False] If `True`, set a global variable

- **output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.
Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```bash
salt myminion git.config_set user.email me@example.com cwd=/path/to/repo
salt myminion git.config_set user.email foo@bar.com global=True
```

```python
salt.modules.git.config_unset(key, value_regex=None, cwd=None, user=None, password=None, ignore_retcode=False, output_encoding=None, **kwargs)
```

New in version 2015.8.0.

Unset a key in the git configuration file

- **cwd** The path to the git checkout. Must be an absolute path, or the word `global` to indicate that a global key should be unset.
- **key** The name of the configuration key to unset
- **value_regex** Regular expression that matches exactly one key, used to delete a single value from a multivar. Ignored if `all` is set to `True`.
- **all** [False] If `True` unset all values for a multivar. If `False`, and `key` is a multivar, an error will be raised.
- **global** [False] If `True`, unset set a global variable. Otherwise, a local variable will be unset.
- **user** User under which to run the git command. By default, the command is run by the user under which the minion is running.
- **password** Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

- **ignore_retcode** [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.
- **output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```bash
salt myminion git.config_unset /path/to/repo foo.bar
salt myminion git.config_unset /path/to/repo foo.bar all=True
```

```python
salt.modules.git.current_branch(cwd, user=None, password=None, ignore_retcode=False, output_encoding=None)
```

Returns the current branch name of a local checkout. If HEAD is detached, return the SHA1 of the revision which is currently checked out.

- **cwd** The path to the git checkout
**user**  User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**  
Windows only. Required when specifying **user**. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode**  [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output_encoding**  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```bash
salt myminion git.current_branch /path/to/repo
```

**salt.modules.git.describe**  
Returns the *git-describe(1)* string (or the SHA1 hash if there are no tags) for the given revision.

**cwd**  The path to the git checkout

**rev**  [HEAD] The revision to describe

**user**  User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**  
Windows only. Required when specifying **user**. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode**  [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output_encoding**  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:
New in version 2015.8.12, 2016.3.3, 2016.11.0.

Interface to `git-diff(1)`

cwd  The path to the git checkout

item1 and item2  Revision(s) to pass to the `git diff` command. One or both of these arguments may be ignored if some of the options below are set to `True`. When `cached` is `False`, and no revisions are passed to this function, then the current working tree will be compared against the index (i.e. unstaged changes). When two revisions are passed, they will be compared to each other.

opts  Any additional options to add to the command line, in a single string

**Note:** On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

**git_opts**  Any additional options to add to git command itself (not the `diff` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

user  User under which to run the git command. By default, the command is run by the user under which the minion is running.

password  Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**no_index**  [False] When it is necessary to diff two files in the same repo against each other, and not diff two different revisions, set this option to `True`. If this is left `False` in these instances, then a normal `git diff` will be performed against the index (i.e. unstaged changes), and files in the `paths` option will be used to narrow down the diff output.

**Note:** Requires Git 1.5.1 or newer. Additionally, when set to `True`, `item1` and `item2` will be ignored.

**cached**  [False] If `True`, compare staged changes to `item1` (if specified), otherwise compare them to the most recent commit.

**Note:** `item2` is ignored if this option is is set to `True`.

**paths**  File paths to pass to the `git diff` command. Can be passed as a comma-separated list or a Python list.

**output_encoding**  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.
Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```bash
# Perform diff against the index (staging area for next commit)
salt myminion git.diff /path/to/repo
# Compare staged changes to the most recent commit
salt myminion git.diff /path/to/repo cached=True
# Compare staged changes to a specific revision
salt myminion git.diff /path/to/repo mybranch cached=True
# Perform diff against the most recent commit (includes staged changes)
salt myminion git.diff /path/to/repo HEAD
# Diff two commits
salt myminion git.diff /path/to/repo abcdef1 aabbccd
# Diff two commits, only showing differences in the specified paths
salt myminion git.diff /path/to/repo abcdef1 aabbccd paths=path/to/file1,path/to/file2
# Diff two files with one being outside the working tree
salt myminion git.diff /path/to/repo no_index=True paths=path/to/file1,/absolute/path/to/file2
```

`salt.modules.git.discard_local_changes`(`cwd`, `path`=`'.'`, `user`=`None`, `password`=`None`, `ignore_retcode`=`False`, `output_encoding`=`None`)

New in version 2019.2.0.

Runs a `git checkout -- <path>` from the directory specified by `cwd`.

- **cwd** The path to the git checkout
- **path** path relative to `cwd` (defaults to `.`)
- **user** User under which to run the git command. By default, the command is run by the user under which the minion is running.
- **password** Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.
- **ignore_retcode** [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.
- **output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

CLI Example:

```bash
salt myminion git.discard_local_changes /path/to/repo
salt myminion git.discard_local_changes /path/to/repo path=foo
```

`salt.modules.git.fetch`(`cwd`, `remote`=`None`, `force`=`False`, `refspecs`=`None`, `opts`=`""`, `git_opts`=`""`, `user`=`None`, `password`=`None`, `identity`=`None`, `ignore_retcode`=`False`, `saltenv`=`'base'`, `output_encoding`=`None`)

Changed in version 2015.8.2: Return data is now a dictionary containing information on branches and tags
that were added/updated

Interface to `git-fetch(1)`

- **cwd** The path to the git checkout

  New in version 2015.8.0.

- **remote** Optional remote name to fetch. If not passed, then git will use its default behavior (as detailed in `git-fetch(1)`).

  New in version 2015.8.0.

- **force** Force the fetch even when it is not a fast-forward.

  New in version 2015.8.0.

- **refspecs** Override the refspec(s) configured for the remote with this argument. Multiple refspecs can be passed, comma-separated.

  New in version 2015.8.0.

- **opts** Any additional options to add to the command line, in a single string

  **Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

- **git_opts** Any additional options to add to git command itself (not the `fetch` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

  New in version 2017.7.0.

  **Note:** This is only supported in git 1.7.2 and newer.

- **user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

- **password** Windows only. Required when specifying **user**. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.4.

- **identity** Path to a private key to use for ssh URLs

  **Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphrase-less. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

  Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

  Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

  Changed in version 2016.3.0.

- **ignore_retcode** [False] If **True**, do not log an error to the minion log if the git command returns a nonzero exit status.

  New in version 2015.8.0.
saltenv The default salt environment to pull sls files from
New in version 2016.3.1.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:
salt myminion git.fetch /path/to/repo upstream
salt myminion git.fetch /path/to/repo identity=/root/.ssh/id_rsa

salt.modules.git.init(cwd, bare=False, template=None, separate_git_dir=None, shared=None, opts=None, git_opts=None, user=None, password=None, ignore_retcode=False, output_encoding=None)
Interface to git-init(1)
cwd The path to the directory to be initialized
bare [False] If True, init a bare repository
New in version 2015.8.0.
template Set this argument to specify an alternate template directory
New in version 2015.8.0.
separate_git_dir Set this argument to specify an alternate $GIT_DIR
New in version 2015.8.0.
shared Set sharing permissions on git repo. See git-init(1) for more details.
New in version 2015.8.0.
opts Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with opts= (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

git_opts Any additional options to add to git command itself (not the init subcommand), in a single string.
This is useful for passing -c to run git with temporary changes to the git configuration.
New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password
Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.
New in version 2016.3.4.

**ignore_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.init /path/to/repo
   # Init a bare repo (before 2015.8.0)
salt myminion git.init /path/to/bare/repo.git opts='--bare'
   # Init a bare repo (2015.8.0 and later)
salt myminion git.init /path/to/bare/repo.git bare=True
```

```
salt.modules.git.is_worktree(cwd, user=None, password=None, output_encoding=None)
```

New in version 2015.8.0.

This function will attempt to determine if `cwd` is part of a worktree by checking its `.git` to see if it is a file containing a reference to another gitdir.

- **cwd** path to the worktree to be removed
- **user** User under which to run the git command. By default, the command is run by the user under which the minion is running.
- **password**
  Windows only. Required when specifying **user**. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Example:

```
salt myminion git.is_worktree /path/to/repo
```

```
salt.modules.git.list_branches(cwd, remote=False, user=None, password=None, ignore_retcode=False, output_encoding=None)
```

New in version 2015.8.0.

- **Return a list of branches**
- **cwd** The path to the git checkout
remote  [False] If True, list remote branches. Otherwise, local branches will be listed.

Warning: This option will only return remote branches of which the local checkout is aware, use `git.fetch` to update remotes.

user  User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode  [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.list_branches /path/to/repo
salt myminion git.list_branches /path/to/repo remote=True
```

salt.modules.git.list_tags(cwd, user=None, password=None, ignore_retcode=False, output_encoding=None)

New in version 2015.8.0.

Return a list of tags

cwd  The path to the git checkout

user  User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode  [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.
Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

CLI Examples:

```
salt myminion git.list_tags /path/to/repo
```

salt.modules.git.list_worktrees(cwd, stale=False, user=None, password=None, output_encoding=None, **kwargs)

New in version 2015.8.0.

Returns information on worktrees

Changed in version 2015.8.4: Version 2.7.0 added the list subcommand to `git-worktree(1)` which provides a lot of additional information. The return data has been changed to include this information, even for pre-2.7.0 versions of git. In addition, if a worktree has a detached head, then any tags which point to the worktree's HEAD will be included in the return data.

Note: By default, only worktrees for which the worktree directory is still present are returned, but this can be changed using the all and stale arguments (described below).

cwd The path to the git checkout

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

all [False] If True, then return all worktrees tracked under $GIT_DIR/worktrees, including ones for which the gitdir is no longer present.

stale [False] If True, return only worktrees whose gitdir is no longer present.

Note: Only one of all and stale can be set to True.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:
salt myminion git.list_worktrees /path/to/repo
salt myminion git.list_worktrees /path/to/repo all=True
salt myminion git.list_worktrees /path/to/repo stale=True

salt.modules.git.ls_remote(cwd=None, remote='origin', ref=None, opts='', git_opts='', user=None, password=None, identity=None, https_user=None, https_pass=None, ignore_retcode=False, output_encoding=None, saltenv='base')

Interface to `git-ls-remote(1)`. Returns the upstream hash for a remote reference.

cwd The path to the git checkout. Optional (and ignored if present) when `remote` is set to a URL instead of a remote name.

remote [origin] The name of the remote to query. Can be the name of a git remote (which exists in the git checkout defined by the `cwd` parameter), or the URL of a remote repository.

Changed in version 2015.8.0: Argument renamed from `repository` to `remote`

ref The name of the ref to query. Optional, if not specified, all refs are returned. Can be a branch or tag name, or the full name of the reference (for example, to get the hash for a Github pull request number 1234, `ref` can be set to `refs/pull/1234/head`

Changed in version 2015.8.0: Argument renamed from `branch` to `ref`

Changed in version 2015.8.4: Defaults to returning all refs instead of master.

opts Any additional options to add to the command line, in a single string

New in version 2015.8.0.

git_opts Any additional options to add to git command itself (not the `ls-remote` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity Path to a private key to use for ssh URLs

Warning: Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphrase-less. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.
https_user  Set HTTP Basic Auth username. Only accepted for HTTPS URLs.
   New in version 2015.5.0.

https_pass Set HTTP Basic Auth password. Only accepted for HTTPS URLs.
   New in version 2015.5.0.

ignore_retcode  [False] If True, do not log an error to the minion log if the git command returns a nonzero
   exit status.
   New in version 2015.8.0.

saltenv  The default salt environment to pull sls files from
   New in version 2016.3.1.

output_encoding  Use this option to specify which encoding to use to decode the output from any git com-
   mands which are run. This should not be needed in most cases.

   Note:  This should only be needed if the files in the repository were created with filenames using an
   encoding other than UTF-8 to handle Unicode characters.
   New in version 2018.3.1.

CLI Example:

```
salt myminion git.ls_remote /path/to/repo origin master
salt myminion git.ls_remote remote=https://mydomain.tld/repo.git ref=mytag opts='--tags'
```

salt.modules.git.merge(cwd, rev=None, opts='', git_opts='', user=None, password=None, identity=None,
   ignore_retcode=False, output_encoding=None, **kwargs)

Interface to git-merge(1)

**cwd**  The path to the git checkout

**rev**  Revision to merge into the current branch. If not specified, the remote tracking branch will be merged.
   New in version 2015.8.0.

**opts**  Any additional options to add to the command line, in a single string

   Note:  On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with opts=
   (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

**git_opts**  Any additional options to add to git command itself (not the merge subcommand), in a single string.
   This is useful for passing -c to run git with temporary changes to the git configuration.
   New in version 2017.7.0.

   Note:  This is only supported in git 1.7.2 and newer.

**user**  User under which to run the git command. By default, the command is run by the user under which the
   minion is running.

**password**
Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**identity** Path to a private key to use for ssh URLs. Salt will not attempt to use passphrase-protected keys unless invoked from the minion using salt-call, to prevent blocking waiting for user input. Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file.

**Note:** For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the authorized_keys file.

New in version 2018.3.5, 2019.2.1, 3000.

**ignore_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
# Fetch first...
salt myminion git.fetch /path/to/repo
# ... then merge the remote tracking branch
salt myminion git.merge /path/to/repo
# .. or merge another rev
salt myminion git.merge /path/to/repo rev=upstream/foo
```

salt.modules.git.merge_base(cwd, refs=None, octopus=False, is_ancestor=False, independent=False, fork_point=None, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None, **kwargs)

New in version 2015.8.0.

Interface to git-merge-base(1).

**cwd** The path to the git checkout

**refs** Any refs/commits to check for a merge base. Can be passed as a comma-separated list or a Python list.

**all** [False] Return a list of all matching merge bases. Not compatible with any of the below options except for octopus.

**octopus** [False] If True, then this function will determine the best common ancestors of all specified commits, in preparation for an n-way merge. See here for a description of how these bases are determined.

Set all to True with this option to return all computed merge bases, otherwise only the “best” will be returned.

**is_ancestor** [False] If True, then instead of returning the merge base, return a boolean telling whether or not the first commit is an ancestor of the second commit.
Note: This option requires two commits to be passed.

Changed in version 2015.8.2: Works properly in git versions older than 1.8.0, where the --is-ancestor CLI option is not present.

independent [False] If True, this function will return the IDs of the refs/commits passed which cannot be reached by another commit.

fork_point If passed, then this function will return the commit where the commit diverged from the ref specified by fork_point. If no fork point is found, None is returned.

Note: At most one commit is permitted to be passed if a fork_point is specified. If no commits are passed, then HEAD is assumed.

opts Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with opts= (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

This option should not be necessary unless new CLI arguments are added to git-merge-base(1) and are not yet supported in Salt.

git_opts Any additional options to add to git command itself (not the merge-base subcommand), in a single string. This is useful for passing -c to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] if True, do not log an error to the minion log if the git command returns a nonzero exit status.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:
salt.myminion.git.merge_base /path/to/repo HEAD upstream/mybranch
salt.myminion.git.merge_base /path/to/repo 8f2e542,4ad8cab,cdec9886 octopus=True
salt.myminion.git.merge_base /path/to/repo refs=8f2e542,4ad8cab,cdec9886 --independent=True
salt.myminion.git.merge_base /path/to/repo refs=8f2e542,4ad8cab is_ancestor=True
salt.myminion.git.merge_base /path/to/repo fork_point=upstream/master
salt.myminion.git.merge_base /path/to/repo refs=mybranch fork_point=upstream/master

salt.modules.git.merge_tree(cwd, ref1, ref2, base=None, user=None, password=None, ignore_retcode=False, output_encoding=None)

New in version 2015.8.0.

Interface to git-merge-tree(1), shows the merge results and conflicts from a 3-way merge without touching the index.

cwd The path to the git checkout
ref1 First ref/commit to compare
ref2 Second ref/commit to compare
base The base tree to use for the 3-way-merge. If not provided, then {git.merge_base} will be invoked on ref1 and ref2 to determine the merge base to use.
user User under which to run the git command. By default, the command is run by the user under which the minion is running.
password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] if True, do not log an error to the minion log if the git command returns a nonzero exit status.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

salt.myminion.git.merge_tree /path/to/repo HEAD upstream/dev
salt.myminion.git.merge_tree /path/to/repo HEAD upstream/dev base=aaf3c3d

salt.modules.git.pull(cwd, opts='', git_opts='', user=None, password=None, identity=None, ignore_retcode=False, saltenv='base', output_encoding=None)

Interface to git-pull(1)

cwd The path to the git checkout

opts Any additional options to add to the command line, in a single string
Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

**git_opts** Any additional options to add to git command itself (not the pull subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**identity** Path to a private key to use for ssh URLs

Warning: Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphrase-less. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

**ignore_retcode** [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**saltenv** The default salt environment to pull sls files from

New in version 2016.3.1.

**output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.pull /path/to/repo opts='--rebase origin master'
```
salt.modules.git.push(cwd, remote=None, ref=None, opts="", git_opts="", user=None, password=None, identity=None, ignore_retcode=False, saltenv='base', output_encoding=None, **kwargs)

Interface to git-push(1)

cwd  The path to the git checkout

remote  Name of the remote to which the ref should being pushed

    New in version 2015.8.0.

ref  [master] Name of the ref to push

    Note: Being a refspec, this argument can include a colon to define local and remote ref names.

opts  Any additional options to add to the command line, in a single string

    Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with opts=
(as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

git_opts  Any additional options to add to git command itself (not the push subcommand), in a single string.
    This is useful for passing -c to run git with temporary changes to the git configuration.

    New in version 2017.7.0.

    Note: This is only supported in git 1.7.2 and newer.

user  User under which to run the git command. By default, the command is run by the user under which which the
minion is running.

password

    Windows only. Required when specifying user. This parameter will be ignored on non-
    Windows platforms.

    New in version 2016.3.4.

identity  Path to a private key to use for ssh URLs

    Warning: Unless Salt is invoked from the minion using salt-call, the key(s) must be passphrase-
    less. For greater security with passphraseless private keys, see the sshd(8) manpage for information
    on securing the keypair from the remote side in the authorized_keys file.

    Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked
    from the minion using salt-call, to prevent blocking waiting for user input.

    Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file

    Changed in version 2016.3.0.

ignore_retcode  [False] If True, do not log an error to the minion log if the git command returns a nonzero
exit status.

    New in version 2015.8.0.
salt.env  The default salt environment to pull sls files from

   New in version 2016.3.1.

output_encoding  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

   Note:  This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

   New in version 2018.3.1.

CLI Example:

```bash
# Push master as origin/master
salt myminion git.push /path/to/repo origin master
# Push issue21 as upstream/develop
salt myminion git.push /path/to/repo upstream issue21:develop
# Delete remote branch 'upstream/temp'
salt myminion git.push /path/to/repo upstream :temp
```

salt.modules.git.rebase(cwd, rev='master', opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None)

Interface to git-rebase(1)

cwd  The path to the git checkout

rev  [master] The revision to rebase onto the current branch

opts  Any additional options to add to the command line, in a single string

   Note:  On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with opts= (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

git_opts  Any additional options to add to git command itself (not the rebase subcommand), in a single string. This is useful for passing -c to run git with temporary changes to the git configuration.

   New in version 2017.7.0.

   Note:  This is only supported in git 1.7.2 and newer.

user  User under which to run the git command. By default, the command is run by the user under which the minion is running.

password  

   Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

   New in version 2016.3.4.

ignore_retcode  [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

   New in version 2015.8.0.

output_encoding  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.
Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.rebase /path/to/repo master
salt myminion git.rebase /path/to/repo 'origin master'
salt myminion git.rebase /path/to/repo origin/master opts='--onto newbranch'
```

```
salt.modules.git.remote_get(cwd, remote='origin', user=None, password=None, redact_auth=True, ignore_retcode=False, output_encoding=None)
```

Get the fetch and push URL for a specific remote

- `cwd` The path to the git checkout
- `remote` [origin] Name of the remote to query
- `user` User under which to run the git command. By default, the command is run by the user under which the minion is running.
- `password` Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

- `redact_auth` [True] Set to `False` to include the username/password if the remote uses HTTPS Basic Auth. Otherwise, this information will be redacted.

Warning: Setting this to `False` will not only reveal any HTTPS Basic Auth that is configured, but the return data will also be written to the job cache. When possible, it is recommended to use SSH for authentication.

New in version 2015.5.6.

- `ignore_retcode` [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

- `output_encoding` Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.remote_get /path/to/repo
salt myminion git.remote_get /path/to/repo upstream
```
salt.modules.git.remote.refs(\texttt{url, heads=False, tags=False, user=None, password=None, identity=None, https_user=None, https_pass=None, ignore_retcode=False, output_encoding=None, saltenv='base', **kwargs})

New in version 2015.8.0.

Return the remote refs for the specified URL by running \texttt{git ls-remote}.

\texttt{url} URL of the remote repository

\texttt{filter} Optionally provide a ref name to \texttt{git ls-remote}. This can be useful to make this function run faster on repositories with many branches/tags.

New in version 2019.2.0.

\texttt{heads} [\texttt{False}] Restrict output to heads. Can be combined with \texttt{tags}.

\texttt{tags} [\texttt{False}] Restrict output to tags. Can be combined with \texttt{heads}.

\texttt{user} User under which to run the git command. By default, the command is run by the user under which the minion is running.

\texttt{password} Windows only. Required when specifying \texttt{user}. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

\texttt{identity} Path to a private key to use for ssh URLs

\begin{quote}
\textbf{Warning:} Unless Salt is invoked from the minion using \texttt{salt-call}, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the \texttt{sshd(8)} manpage for information on securing the keypair from the remote side in the \texttt{authorized_keys} file.
\end{quote}

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using \texttt{salt-call}, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. \texttt{salt://location/identity_file}

Changed in version 2016.3.0.

\texttt{https_user} Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

\texttt{https_pass} Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

\texttt{ignore_retcode} [\texttt{False}] If \texttt{True}, do not log an error to the minion log if the git command returns a nonzero exit status.

\texttt{saltenv} The default salt environment to pull sls files from

New in version 2016.3.1.

\texttt{output_encoding} Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

\begin{quote}
\textbf{Note:} This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.
\end{quote}

New in version 2018.3.1.

CLI Example:
salt.modules.git.remote_set(cwd, url, remote='origin', user=None, password=None, https_user=None, https_pass=None, push_url=None, push_https_user=None, push_https_pass=None, ignore_retcode=False, output_encoding=None)

cwd  The path to the git checkout
url  Remote URL to set
remote  [origin] Name of the remote to set
push_url  If unset, the push URL will be identical to the fetch URL.
            New in version 2015.8.0.
user  User under which to run the git command. By default, the command is run by the user under which the
      minion is running.
password
            Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.
            New in version 2016.3.4.
https_user  Set HTTP Basic Auth username. Only accepted for HTTPS URLs.
            New in version 2015.5.0.
https_pass  Set HTTP Basic Auth password. Only accepted for HTTPS URLs.
            New in version 2015.5.0.
push_https_user  Set HTTP Basic Auth user for push_url. Ignored if push_url is unset. Only accepted for HTTPS URLs.
            New in version 2015.8.0.
push_https_pass  Set HTTP Basic Auth password for push_url. Ignored if push_url is unset. Only accepted for HTTPS URLs.
            New in version 2015.8.0.
ignore_retcode  [False] If True, do not log an error to the minion log if the git command returns a nonzero
exit status.
            New in version 2015.8.0.
output_encoding  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note:  This should only be needed if the files in the repository were created with filenames using an
encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:
salt myminion git.remote_set /path/to/repo git@github.com:user/repo.git
salt myminion git.remote_set /path/to/repo git@github.com:user/repo.git
    --remote=upstream
salt myminion git.remote_set /path/to/repo https://github.com/user/repo.git
    --remote=upstream push_url=git@github.com:user/repo.git

salt.modules.git.remotes(cwd, user=None, password=None, redact_auth=True, ignore_retcode=False, output_encoding=None)
Get fetch and push URLs for each remote in a git checkout

cwd  The path to the git checkout

user  User under which to run the git command. By default, the command is run by the user under which the
       minion is running.

password
       Windows only. Required when specifying user. This parameter will be ignored on non-
       Windows platforms.

   New in version 2016.3.4.

redact_auth  [True] Set to False to include the username/password for authenticated remotes in the return
              data. Otherwise, this information will be redacted.

   Warning: Setting this to False will not only reveal any HTTPS Basic Auth that is configured, but
            the return data will also be written to the job cache. When possible, it is recommended to use SSH
            for authentication.

   New in version 2015.5.6.

ignore_retcode  [False] If True, do not log an error to the minion log if the git command returns a nonzero
                 exit status.

   New in version 2015.8.0.

output_encoding  Use this option to specify which encoding to use to decode the output from any git com-
                   mands which are run. This should not be needed in most cases.

   Note: This should only be needed if the files in the repository were created with filenames using an
          encoding other than UTF-8 to handle Unicode characters.

   New in version 2018.3.1.

CLI Example:
salt myminion git.remotes /path/to/repo

salt.modules.git.reset(cwd, opts=", git_opts=", user=None, password=None, identity=None, ignore_retcode=False, output_encoding=None)
Interface to git-reset(1), returns the stdout from the git command

cwd  The path to the git checkout

opts  Any additional options to add to the command line, in a single string

21.9. execution modules 1787
Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

**git_opts** Any additional options to add to git command itself (not the `reset` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**identity** Path to a private key to use for ssh URLs. Salt will not attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input. Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`.

Note: For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

New in version 2018.3.5, 2019.2.1, 3000.

**ignore_retcode** [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
# Soft reset to a specific commit ID
salt myminion git.reset /path/to/repo ac3ee5c

# Hard reset
salt myminion git.reset /path/to/repo opts='--hard origin/master'
```

salt.modules.git.rev_parse(cwd, rev=None, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None)

New in version 2015.8.0.

Interface to `git-rev-parse(1)`

**cwd** The path to the git checkout
**rev** Revision to parse. See the SPECIFYING REVISIONS section of the git-rev-parse(1) manpage for details on how to format this argument.

This argument is optional when using the options in the OPTIONS FOR FILES section of the git-rev-parse(1) manpage.

**opts** Any additional options to add to the command line, in a single string

**git_opts** Any additional options to add to the git command itself (not the rev-parse subcommand), in a single string. This is useful for passing -c to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying **user**. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

**output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
# Get the full SHA1 for HEAD
salt myminion git.rev_parse /path/to/repo HEAD
# Get the short SHA1 for HEAD
salt myminion git.rev_parse /path/to/repo HEAD opts='--short'
# Get the develop branch's upstream tracking branch
salt myminion git.rev_parse /path/to/repo 'develop@{upstream}' opts='--abbrev-ref'
# Get the SHA1 for the commit corresponding to tag v1.2.3
salt myminion git.rev_parse /path/to/repo 'v1.2.3^{commit}'
# Find out whether or not the repo at /path/to/repo is a bare repository
salt myminion git.rev_parse /path/to/repo opts='--is-bare-repository'
```

salt.modules.git.revision(cwd, rev='HEAD', short=False, user=None, password=None, ignore_retcode=False, output_encoding=None)

Returns the SHA1 hash of a given identifier (hash, branch, tag, HEAD, etc.)

**cwd** The path to the git checkout

**rev** [HEAD] The revision

**short** [False] If True, return an abbreviated SHA1 git hash
user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.revision /path/to/repo mybranch
```

```
salt.modules.git.rm_ (cwd, filename, opts=", git_opts=", user=None, password=None, ignore_retcode=False, output_encoding=None)
```

Interface to `git-rm(1)`

cwd The path to the git checkout

filename The location of the file/directory to remove, relative to cwd

Note: To remove a directory, -r must be part of the opts parameter.

opts Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with opts= (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts Any additional options to add to git command itself (not the rm subcommand), in a single string. This is useful for passing -c to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.
New in version 2016.3.4.

**ignore_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```bash
salt myminion git.rm /path/to/repo foo/bar.py
salt myminion git.rm /path/to/repo foo/bar.py opts='--dry-run'
salt myminion git.rm /path/to/repo foo/baz opts='--'
```

**salt.modules.git.stash**(cwd, action='save', opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None)

Interface to `git-stash(1)`, returns the stdout from the git command

**cwd** The path to the git checkout

**opts** Any additional options to add to the command line, in a single string. Use this to complete the git stash command by adding the remaining arguments (i.e. `save <stash comment>`, 'apply stash@{2}', 'show', etc.). Omitting this argument will simply run `git stash`.

**git_opts** Any additional options to add to git command itself (not the stash subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying **user**. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.
New in version 2018.3.1.

CLI Examples:

```bash
salt myminion git.stash /path/to/repo save opts='work in progress'
salt myminion git.stash /path/to/repo apply opts='stash@{1}"
salt myminion git.stash /path/to/repo drop opts='stash@{1}"
salt myminion git.stash /path/to/repo list
```

```python
salt.modules.git.status(cwd, user=None, password=None, ignore_retcode=False, output_encoding=None)
```

Changed in version 2015.8.0: Return data has changed from a list of lists to a dictionary

Returns the changes to the repository

**cwd**  
The path to the git checkout

**user**  
User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**  
Windows only. Required when specifying **user**. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode**  
[False]  
If **True**, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output_encoding**  
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note:  
This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```bash
salt myminion git.status /path/to/repo
```

```python
salt.modules.git.submodule(cwd, command, opts=", git_opts=", user=None, password=None, identity=None, ignore_retcode=False, saltenv='base', output_encoding=None, **kwargs)
```

Changed in version 2015.8.0: Added the **command** argument to allow for operations other than update to be run on submodules, and deprecated the **init** argument. To do a submodule update with **init=True** moving forward, use **command=update opts='--init'**

Interface to `git-submodule(1)`

**cwd**  
The path to the submodule

**command**  
Submodule command to run, see `git-submodule(1) <git submodule>` for more information. Any additional arguments after the command (such as the URL when adding a submodule) must be passed in the **opts** parameter.

New in version 2015.8.0.
opts  Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts  Any additional options to add to git command itself (not the submodule subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

init  [False] If True, ensures that new submodules are initialized

Deprecated since version 2015.8.0: Pass init as the command parameter, or include `--init` in the opts param with command set to update.

user  User under which to run the git command. By default, the command is run by the user under which the minion is running.

password  

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity  Path to a private key to use for ssh URLs

Warning: Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphrase-less. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

ignore_retcode  [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

saltenv  The default salt environment to pull sls files from

New in version 2016.3.1.

output_encoding  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.
CLI Example:

```bash
# Update submodule and ensure it is initialized (before 2015.8.0)
salt myminion git.submodule /path/to/repo/subrepo init=True

# Update submodule and ensure it is initialized (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/subrepo update opts='--init'

# Rebase submodule (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/subrepo update opts='--rebase'

# Add submodule (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/subrepo add opts='https://mydomain.tld/repo.git'

# Unregister submodule (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/subrepo deinit
```

`salt.modules.git.symbolic_ref(cwd, ref, value=None, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None)`

New in version 2015.8.0.

Interface to `git-symbolic-ref(1)`

cwd  The path to the git checkout

ref  Symbolic ref to read/modify

value  If passed, then the symbolic ref will be set to this value and an empty string will be returned.

If not passed, then the ref to which ref points will be returned, unless --delete is included in opts (in which case the symbolic ref will be deleted).

opts  Any additional options to add to the command line, in a single string

git_opts  Any additional options to add to git command itself (not the symbolic-refs subcommand), in a single string. This is useful for passing -c to run git with temporary changes to the git configuration.

New in version 2017.7.0.

`Note:` This is only supported in git 1.7.2 and newer.

user  User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode  [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.
Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```bash
# Get ref to which HEAD is pointing
salt myminion git.symbolic_ref /path/to/repo HEAD
# Set/overwrite symbolic ref 'FOO' to local branch 'foo'
salt myminion git.symbolic_ref /path/to/repo FOO refs/heads/foo
# Delete symbolic ref 'FOO'
salt myminion git.symbolic_ref /path/to/repo FOO opts='--delete'
```

salt.modules.git.tag(cwd, name, ref='HEAD', message=None, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None)

New in version 2018.3.4.

Interface to `git-tag(1)`, adds and removes tags.

cwd  The path to the main git checkout or a linked worktree

name  Name of the tag

ref  [HEAD] Which ref to tag (defaults to local clone’s HEAD)

Note: This argument is ignored when either `-d` or `--delete` is present in the `opts` passed to this function.

message  Optional message to include with the tag. If provided, an annotated tag will be created.

opts  Any additional options to add to the command line, in a single string

Note: Additionally, on the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

git_opts  Any additional options to add to git command itself (not the `worktree` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

Note: This is only supported in git 1.7.2 and newer.

user  User under which to run the git command. By default, the command is run by the user under which the minion is running.

password  Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

ignore_retcode  [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

output_encoding  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.
Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

CLI Example:

```bash
# Create an non-annotated tag
salt myminion git.tag /path/to/repo v1.2
# Create an annotated tag
salt myminion git.tag /path/to/repo v1.2 message='Version 1.2'
# Delete the tag
salt myminion git.tag /path/to/repo v1.2 opts='--delete'
```

**salt.modules.git.version** *(versioninfo=False)*

New in version 2015.8.0.

Returns the version of Git installed on the minion.

**versioninfo** [False] If True, return the version in a versioninfo list (e.g. [2, 5, 0])

CLI Example:

```bash
salt myminion git.version
```

**salt.modules.git.worktree_add** *(cwd, worktree_path, ref=None, reset_branch=None, force=False, detach=False, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None, **kwargs)*

New in version 2015.8.0.

Interface to **git-worktree(1)**, adds a worktree

**cwd** The path to the git checkout

**worktree_path** Path to the new worktree. Can be either absolute, or relative to **cwd**.

**branch** Name of new branch to create. If omitted, will be set to the basename of the **worktree_path**. For example, if the **worktree_path** is /foo/bar/baz, then **branch** will be baz.

**ref** Name of the ref on which to base the new worktree. If omitted, then HEAD is use, and a new branch will be created, named for the basename of the **worktree_path**. For example, if the **worktree_path** is /foo/bar/baz then a new branch baz will be created, and pointed at HEAD.

**reset_branch** [False] If False, then **git-worktree(1)** will fail to create the worktree if the targeted branch already exists. Set this argument to True to reset the targeted branch to point at **ref**, and checkout the newly-reset branch into the new worktree.

**force** [False] By default, **git-worktree(1)** will not permit the same branch to be checked out in more than one worktree. Set this argument to True to override this.

**opts** Any additional options to add to the command line, in a single string

**git_opts** Any additional options to add to git command itself (not the **worktree** subcommand), in a single string. This is useful for passing -c to run git with temporary changes to the git configuration.
New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

**user**  User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying **user**. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode**  [False] If **True**, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output_encoding**  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.worktree_add /path/to/repo/main ../hotfix ref=origin/master
salt myminion git.worktree_add /path/to/repo/main ../hotfix branch=hotfix21\n   -> ref=v2.1.9.3
```

salt.modules.git.worktree_prune(cwd, dry_run=False, verbose=True, expire=None, opts=",
   git_opts="); user=None, password=None, ignore_retcode=False,
   output_encoding=None)

New in version 2015.8.0.

Interface to **git-worktree(1)**, prunes stale worktree administrative data from the gitdir

**cwd**  The path to the main git checkout or a linked worktree

**dry_run**  [False] If **True**, then this function will report what would have been pruned, but no changes will be made.

**verbose**  [True] Report all changes made. Set to **False** to suppress this output.

**expire**  Only prune unused worktree data older than a specific period of time. The date format for this parameter is described in the documentation for the **gc.pruneWorktreesExpire** config param in the
   **git-config(1)** manpage.

**opts**  Any additional options to add to the command line, in a single string

**Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with **opts=** to avoid causing errors with Salt’s own argument parsing.

All CLI options for pruning worktrees as of Git 2.5.0 are already supported by this function as of Salt 2015.8.0, so using this argument is unnecessary unless new CLI arguments are added to **git-worktree(1)**
and are not yet supported in Salt.

**git_opts** Any additional options to add to git command itself (not the `worktree` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying **user**. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.worktree_prune /path/to/repo
dsalt myminion git.worktree_prune /path/to/repo dry_run=True
dsalt myminion git.worktree_prune /path/to/repo expire=1.day.ago
```

salt.modules.git.**worktree_rm**(cwd, user=None, output_encoding=None)

New in version 2015.8.0.

Recursively removes the worktree located at **cwd**, returning True if successful. This function will attempt to determine if **cwd** is actually a worktree by invoking `git.is_worktree`. If the path does not correspond to a worktree, then an error will be raised and no action will be taken.

**Warning:** There is no undoing this action. Be **VERY** careful before running this function.

**cwd** Path to the worktree to be removed

**user** Used for path expansion when **cwd** is not an absolute path. By default, when **cwd** is not absolute, the path will be assumed to be relative to the home directory of the user under which the minion is running. Setting this option will change the home directory from which path expansion is performed.

**output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.
Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.worktree_rm /path/to/worktree
```

### 21.9.141 salt.modules.github module

Module for interacting with the GitHub v3 API.

New in version 2016.3.0.

depends PyGithub python module

#### Configuration

Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the `github` key by default, if defined.

For example:

```yaml
github:
    token: abc1234
    org_name: my_organization

# optional: some functions require a repo_name, which
# can be set in the config file, or passed in at the CLI.
repo_name: my_repo

# optional: it can be dangerous to change the privacy of a repository
# in an automated way. set this to True to allow privacy modifications
allow_repo_privacy_changes: False
```

salt.modules.github.add_repo(name, description=None, homepage=None, private=None, has_issues=None, has_wiki=None, has_downloads=None, auto_init=None, gitignore_template=None, license_template=None, profile='github')

Create a new github repository.

- **name** The name of the team to be created.
- **description** The description of the repository.
- **homepage** The URL with more information about the repository.
- **private** The visibility of the repository. Note that private repositories require a paid GitHub account.
- **has_issues** Whether to enable issues for this repository.
- **has_wiki** Whether to enable the wiki for this repository.
- **has_downloads** Whether to enable downloads for this repository.
- **auto_init** Whether to create an initial commit with an empty README.
**gitignore_template** The desired language or platform for a `.gitignore`, e.g. "Haskell".

**license_template** The desired LICENSE template to apply, e.g. "mit" or "mozilla".

**profile** The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```bash
salt myminion github.add_repo 'repo_name'
```

New in version 2016.11.0.

**salt.modules.github.add_team**(name, description=None, repo_names=None, privacy=None, permission=None, profile='github')

Create a new Github team within an organization.

- **name** The name of the team to be created.
- **description** The description of the team.
- **repo_names** The names of repositories to add the team to.
- **privacy** The level of privacy for the team, can be 'secret' or 'closed'.
- **permission** The default permission for new repositories added to the team, can be 'pull', 'push' or 'admin'.
- **profile** The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```bash
salt myminion github.add_team 'team_name'
```

New in version 2016.11.0.

**salt.modules.github.add_team_member**(name, team_name, profile='github')

Adds a team member to a team with `team_name`.

- **name** The name of the team member to add.
- **team_name** The name of the team of which to add the user.
- **profile** The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```bash
salt myminion github.add_team_member 'user_name' 'team_name'
```

New in version 2016.11.0.

**salt.modules.github.add_team_repo**(repo_name, team_name, profile='github', permission=None)

Adds a repository to a team with `team_name`.

- **repo_name** The name of the repository to add.
- **team_name** The name of the team of which to add the repository.
- **profile** The name of the profile configuration to use. Defaults to `github`.
- **permission** The permission for team members within the repository, can be 'pull', 'push' or 'admin'. If not specified, the default permission specified on the team will be used.

New in version 2017.7.0.

CLI Example:

```bash
salt myminion github.add_team_repo 'my_repo' 'team_name'
```
New in version 2016.11.0.

**salt.modules.github.add_user**(name, profile='github')

Add a GitHub user.

- **name**: The user for which to obtain information.
- **profile**: The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```bash
salt myminion github.add_user github-handle
```

**salt.modules.github.edit_repo**(name, description=None, homepage=None, private=None, has_issues=None, has_wiki=None, has_downloads=None, profile='github')

Updates an existing Github repository.

- **name**: The name of the team to be created.
- **description**: The description of the repository.
- **homepage**: The URL with more information about the repository.
- **private**: The visibility of the repository. Note that private repositories require a paid GitHub account.
- **has_issues**: Whether to enable issues for this repository.
- **has_wiki**: Whether to enable the wiki for this repository.
- **has_downloads**: Whether to enable downloads for this repository.
- **profile**: The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```bash
salt myminion github.add_repo 'repo_name'
```

New in version 2016.11.0.

**salt.modules.github.edit_team**(name, description=None, privacy=None, permission=None, profile='github')

Updates an existing Github team.

- **name**: The name of the team to be edited.
- **description**: The description of the team.
- **privacy**: The level of privacy for the team, can be 'secret' or 'closed'.
- **permission**: The default permission for new repositories added to the team, can be 'pull', 'push' or 'admin'.
- **profile**: The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```bash
salt myminion github.edit_team 'team_name' description='Team description'
```

New in version 2016.11.0.

**salt.modules.github.get_issue**(issue_number, repo_name=None, profile='github', output='min')

Return information about a single issue in a named repository.

- **issue_number**: The number of the issue to retrieve.
repo_name  The name of the repository from which to get the issue. This argument is required, either passed via the CLI, or defined in the configured profile. A repo_name passed as a CLI argument will override the repo_name defined in the configured profile, if provided.

profile  The name of the profile configuration to use. Defaults to github.

output  The amount of data returned by each issue. Defaults to min. Change to full to see all issue output.

CLI Example:

```bash
salt myminion github.get_issue 514
salt myminion github.get_issue 514 repo_name=salt
```

salt.modules.github.get_issue_comments(issue_number, repo_name=None, profile='github', since=None, output='min')

Return information about the comments for a given issue in a named repository.

New in version 2016.11.0.

issue_number  The number of the issue for which to retrieve comments.

repo_name  The name of the repository to which the issue belongs. This argument is required, either passed via the CLI, or defined in the configured profile. A repo_name passed as a CLI argument will override the repo_name defined in the configured profile, if provided.

profile  The name of the profile configuration to use. Defaults to github.

since  Only comments updated at or after this time are returned. This is a timestamp in ISO 8601 format: YYYY-MM-DDTHH:MM:SSZ.

output  The amount of data returned by each issue. Defaults to min. Change to full to see all issue output.

CLI Example:

```bash
salt myminion github.get_issue_comments 514
salt myminion github.get_issue 514 repo_name=salt
```

salt.modules.github.get_issues(repo_name=None, profile='github', milestone=None, state='open', assignee=None, creator=None, mentioned=None, labels=None, sort='created', direction='desc', since=None, output='min', per_page=None)

Returns information for all issues in a given repository, based on the search options.

New in version 2016.11.0.

repo_name  The name of the repository for which to list issues. This argument is required, either passed via the CLI, or defined in the configured profile. A repo_name passed as a CLI argument will override the repo_name defined in the configured profile, if provided.

profile  The name of the profile configuration to use. Defaults to github.

milestone  The number of a GitHub milestone, or a string of either * or none.

If a number is passed, it should refer to a milestone by its number field. Use the github.get_milestone function to obtain a milestone’s number.

If the string * is passed, issues with any milestone are accepted. If the string none is passed, issues without milestones are returned.

state  Indicates the state of the issues to return. Can be either open, closed, or all. Default is open.

assignee  Can be the name of a user. Pass in None (as a string) for issues with no assigned user or * for issues assigned to any user.
creator The user that created the issue.

mentioned A user that’s mentioned in the issue.

labels A string of comma separated label names. For example, bug, ui, @high.

sort What to sort results by. Can be either created, updated, or comments. Default is created.

direction The direction of the sort. Can be either asc or desc. Default is desc.

since Only issues updated at or after this time are returned. This is a timestamp in ISO 8601 format:

YYYY-MM-DDTHH:MM:SSZ.

output The amount of data returned by each issue. Defaults to min. Change to full to see all issue output.

per_page GitHub paginates data in their API calls. Use this value to increase or decrease the number of issues
gathered from GitHub, per page. If not set, GitHub defaults are used. Maximum is 100.

CLI Example:

```
salt myminion github.get_issues my-github-repo
```

**salt.modules.github.get_milestone**

```
(number=None, name=None, repo_name=None, profile='github', output='min')
```

Return information about a single milestone in a named repository.

New in version 2016.11.0.

**number** The number of the milestone to retrieve. If provided, this option will be favored over **name**.

**name** The name of the milestone to retrieve.

**repo_name** The name of the repository for which to list issues. This argument is required, either passed via
the CLI, or defined in the configured profile. A **repo_name** passed as a CLI argument will override the
**repo_name** defined in the configured profile, if provided.

**profile** The name of the profile configuration to use. Defaults to github.

**output** The amount of data returned by each issue. Defaults to min. Change to full to see all issue output.

CLI Example:

```
salt myminion github.get_milestone 72
salt myminion github.get_milestone name=my_milestone
```

**salt.modules.github.get_milestones**

```
(repo_name=None, profile='github', state='open', sort='due_on', direction='asc', output='min', per_page=None)
```

Return information about milestones for a given repository.

New in version 2016.11.0.

**repo_name** The name of the repository for which to list issues. This argument is required, either passed via
the CLI, or defined in the configured profile. A **repo_name** passed as a CLI argument will override the
**repo_name** defined in the configured profile, if provided.

**profile** The name of the profile configuration to use. Defaults to github.

**state** The state of the milestone. Either open, closed, or all. Default is open.

**sort** What to sort results by. Either due_on or completeness. Default is due_on.

**direction** The direction of the sort. Either asc or desc. Default is asc.

**output** The amount of data returned by each issue. Defaults to min. Change to full to see all issue output.
per_page GitHub paginates data in their API calls. Use this value to increase or decrease the number of issues
gathered from GitHub, per page. If not set, GitHub defaults are used.

CLI Example:

```
salt myminion github.get_milestones
```

```
salt.modules.github.get_prs(repo_name=None, profile='github', state='open',
                          head=None, base=None, sort='created', direction='desc', output='min',
                          per_page=None)
```

Returns information for all pull requests in a given repository, based on the search options provided.

New in version 2017.7.0.

repo_name The name of the repository for which to list pull requests. This argument is required, either passed
via the CLI, or defined in the configured profile. A repo_name passed as a CLI argument will override
the repo_name defined in the configured profile, if provided.

profile The name of the profile configuration to use. Defaults to github.

state Indicates the state of the pull requests to return. Can be either open, closed, or all. Default is open.

head Filter pull requests by head user and branch name in the format of user:ref-name. Example: 'github:new-script-format'. Default is None.

base Filter pulls by base branch name. Example: gh-pages. Default is None.

sort What to sort results by. Can be either created, updated, popularity (comment count), or
long-running (age, filtering by pull requests updated within the last month). Default is created.

direction The direction of the sort. Can be either asc or desc. Default is desc.

output The amount of data returned by each pull request. Defaults to min. Change to full to see all pull
request output.

per_page GitHub paginates data in their API calls. Use this value to increase or decrease the number of pull
requests gathered from GitHub, per page. If not set, GitHub defaults are used. Maximum is 100.

CLI Example:

```
salt myminion github.get_prs
salt myminion github.get_prs base=2016.11
```

```
salt.modules.github.get_repo_info(repo_name, profile='github', ignore_cache=False)
```

Return information for a given repo.

New in version 2016.11.0.

repo_name The name of the repository.

profile The name of the profile configuration to use. Defaults to github.

CLI Example:

```
salt myminion github.get_repo_info salt
salt myminion github.get_repo_info salt profile='my-github-profile'
```

```
salt.modules.github.get_repo_teams(repo_name, profile='github')
```

Return teams belonging to a repository.

New in version 2017.7.0.

repo_name The name of the repository from which to retrieve teams.

profile The name of the profile configuration to use. Defaults to github.
CLI Example:
```bash
salt myminion github.get_repo_teams salt
salt myminion github.get_repo_teams salt profile='my-github-profile'
```

salt.modules.github.get_team(name, profile='github')
Returns the team details if a team with the given name exists, or None otherwise.

- **name** The team name for which to obtain information.
- **profile** The name of the profile configuration to use. Defaults to github.

CLI Example:
```bash
salt myminion github.get_team 'team_name'
```

salt.modules.github.get_user(name, profile='github', user_details=False)
Get a GitHub user by name.

- **name** The user for which to obtain information.
- **profile** The name of the profile configuration to use. Defaults to github.
- **user_details** Prints user information details. Defaults to False. If the user is already in the organization and user_details is set to False, the get_user function returns True. If the user is not already present in the organization, user details will be printed by default.

CLI Example:
```bash
salt myminion github.get_user github-handle
salt myminion github.get_user github-handle user_details=true
```

salt.modules.github.is_team_member(name, team_name, profile='github')
Returns True if the github user is in the team with team_name, or False otherwise.

- **name** The name of the user whose membership to check.
- **team_name** The name of the team to check membership in.
- **profile** The name of the profile configuration to use. Defaults to github.

CLI Example:
```bash
salt myminion github.is_team_member 'user_name' 'team_name'
```

New in version 2016.11.0.

salt.modules.github.list_members_without_mfa(profile='github', ignore_cache=False)
List all members (in lower case) without MFA turned on.

- **profile** The name of the profile configuration to use. Defaults to github.
- **ignore_cache** Bypasses the use of cached team repos.

CLI Example:
```bash
salt myminion github.list_members_without_mfa
```

New in version 2016.11.0.

salt.modules.github.list_private_repos(profile='github')
List private repositories within the organization. Dependent upon the access rights of the profile token.

New in version 2016.11.0.
profile The name of the profile configuration to use. Defaults to github.

CLI Example:
```
salt myminion github.list_private_repos
salt myminion github.list_private_repos profile='my-github-profile'
```

salt.modules.github.list_public_repos(profile='github')
List public repositories within the organization.

New in version 2016.11.0.

profile The name of the profile configuration to use. Defaults to github.

CLI Example:
```
salt myminion github.list_public_repos
salt myminion github.list_public_repos profile='my-github-profile'
```

salt.modules.github.list_repos(profile='github')
List all repositories within the organization. Includes public and private repositories within the organization. Dependent upon the access rights of the profile token.

New in version 2016.11.0.

profile The name of the profile configuration to use. Defaults to github.

CLI Example:
```
salt myminion github.list_repos
salt myminion github.list_repos profile='my-github-profile'
```

salt.modules.github.list_team_members(team_name, profile='github', ignore_cache=False)
Gets the names of team members in lower case.

team_name The name of the team from which to list members.

profile The name of the profile configuration to use. Defaults to github.

ignore_cache Bypasses the use of cached team members.

CLI Example:
```
salt myminion github.list_team_members 'team_name'
```

New in version 2016.11.0.

sicl.modules.github.list_team_repos(team_name, profile='github', ignore_cache=False)
Gets the repo details for a given team as a dict from repo_name to repo details. Note that repo names are always in lower case.

team_name The name of the team from which to list repos.

profile The name of the profile configuration to use. Defaults to github.

ignore_cache Bypasses the use of cached team repos.

CLI Example:
```
salt myminion github.list_team_repos 'team_name'
```

New in version 2016.11.0.
salt.modules.github.list_teams(profile='github', ignore_cache=False)
Lists all teams with the organization.

profile  The name of the profile configuration to use. Defaults to github.
ignore_cache  Bypasses the use of cached teams.

CLI Example:

```
salt myminion github.list_teams
```
New in version 2016.11.0.

salt.modules.github.list_users(profile='github', ignore_cache=False)
List all users within the organization.

profile  The name of the profile configuration to use. Defaults to github.
ignore_cache  Bypasses the use of cached users.

New in version 2016.11.0.

CLI Example:

```
salt myminion github.list_users
salt myminion github.list_users profile='my-github-profile'
```

salt.modules.github.remove_repo(name, profile='github')
Remove a Github repository.

name  The name of the repository to be removed.
profile  The name of the profile configuration to use. Defaults to github.

CLI Example:

```
salt myminion github.remove_repo 'my-repo'
```
New in version 2016.11.0.

salt.modules.github.remove_team(name, profile='github')
Remove a github team.

name  The name of the team to be removed.
profile  The name of the profile configuration to use. Defaults to github.

CLI Example:

```
salt myminion github.remove_team 'team_name'
```
New in version 2016.11.0.

salt.modules.github.remove_team_member(name, team_name, profile='github')
Removes a team member from a team with team_name.

name  The name of the team member to remove.
team_name  The name of the team from which to remove the user.
profile  The name of the profile configuration to use. Defaults to github.

CLI Example:
New in version 2016.11.0.
salt.modules.github.remove_team_repo(repo_name, team_name, profile='github')
Removes a repository from a team with team_name.
  repo_name  The name of the repository to remove.
  team_name  The name of the team of which to remove the repository.
  profile   The name of the profile configuration to use. Defaults to github.
cli Example:
salt myminion github.remove_team_repo 'my_repo' 'team_name'

New in version 2016.11.0.
salt.modules.github.remove_user(name, profile='github')
Remove a Github user by name.
  name      The user for which to obtain information.
  profile   The name of the profile configuration to use. Defaults to github.
cli Example:
salt myminion github.remove_user github-handle

21.9.142  salt.modules.glance
Module for handling openstack glance calls.

  optdepends
        •   glanceclient Python adapter

  configuration  This module is not usable until the following are specified either in a pillar or in the
                  minion's config file:

                  keystone.user: admin
                  keystone.password: verybadpass
                  keystone.tenant: admin
                  keystone.insecure: False  #(optional)
                  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/

                  If configuration for multiple openstack accounts is required, they can be set up as different config-
                  uration profiles: For example:

                  openstack1:
                      keystone.user: admin
                      keystone.password: verybadpass
                      keystone.tenant: admin
                      keystone.auth_url: 'http://127.0.0.1:5000/v2.0/

                  openstack2:
                      keystone.user: admin
                      keystone.password: verybadpass

                  (continues on next page)
With this configuration in place, any of the glance functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' glance.image_list profile=openstack1
```

salt.modules.glance.image_create(name, location=None, profile=None, visibility=None, container_format='bare', disk_format='raw', protected=None)

Create an image (glance image-create)

CLI Example, old format:

```
salt '*' glance.image_create name=f16-jeos disk_format=qcow2 container_format=ovf
```

CLI Example, new format resembling Glance API v2:

```
salt '*' glance.image_create name=f16-jeos visibility=public disk_format=qcow2 container_format=ovf
```

The parameter ‘visibility’ defaults to ‘public’ if not specified.

salt.modules.glance.image_delete(id=None, name=None, profile=None)

Delete an image (glance image-delete)

CLI Examples:

```
salt '*' glance.image_delete c2eb2eb0-53e1-4a80-b990-8ec887eae7df
salt '*' glance.image_delete id=c2eb2eb0-53e1-4a80-b990-8ec887eae7df
salt '*' glance.image_delete name=f16-jeos
```

salt.modules.glance.image_list(id=None, profile=None, name=None)

Return a list of available images (glance image-list)

CLI Example:

```
salt '*' glance.image_list
```

salt.modules.glance.image_schema(profile=None)

Returns names and descriptions of the schema ”image”’s properties for this profile’s instance of glance

CLI Example:

```
salt '*' glance.image_schema
```

salt.modules.glance.image_show(id=None, name=None, profile=None)

Return details about a specific image (glance image-show)

CLI Example:

```
salt '*' glance.image_show
```

salt.modules.glance.image_update(id=None, name=None, profile=None, **kwargs)

Update properties of given image. Known to work for: - min_ram (in MB) - protected (bool) - visibility (‘public’ or ‘private’)

CLI Example:
salt 'salt' glance.image_update id=c2eb2eb0-53e1-4a80-b990-8ec887eae7df
salt 'salt' glance.image_update name=f16-jeos

salt.modules.glance.schema_get(name, profile=None)

Known valid names of schemas are:
- image
- images
- member
- members

CLI Example:
salt 'salt' glance.schema_get name=f16-jeos

21.9.143 salt.modules.glanceng

Glance module for interacting with OpenStack Glance

New in version 2018.3.0.
:depends: shade

Example configuration

```yaml
[glance]
  cloud: default
```

salt.modules.glanceng.compare_changes(obj, **kwargs)

Compare two dicts returning only keys that exist in the first dict and are different in the second one

salt.modules.glanceng.get_openstack_cloud(auth=None)

Return an openstack_cloud

salt.modules.glanceng.get_operator_cloud(auth=None)

Return an operator_cloud

salt.modules.glanceng.image_create(auth=None, **kwargs)

Create an image

CLI Example:

```bash
salt 'salt' glanceng.image_create name=cirros file=cirros.raw disk_format=raw
salt 'salt' glanceng.image_create name=cirros file=cirros.raw disk_format=raw hw_−scsi_model=virtio−scsi hw_disk_bus=scsi
```
salt.modules.glanceng.image_delete(auth=None, **kwargs)
Delete an image

CLI Example:
```
salt '*' glanceng.image_delete name=image1
salt '*' glanceng.image_delete name=0e4febc2a5ab4f2c8f374b054162506d
```

salt.modules.glanceng.image_get(auth=None, **kwargs)
Get a single image

CLI Example:
```
salt '*' glanceng.image_get name=image1
salt '*' glanceng.image_get name=0e4febc2a5ab4f2c8f374b054162506d
```

salt.modules.glanceng.image_list(auth=None, **kwargs)
List images

CLI Example:
```
salt '*' glanceng.image_list
tsalt '*' glanceng.image_list
```

salt.modules.glanceng.image_search(auth=None, **kwargs)
Search for images

CLI Example:
```
salt '*' glanceng.image_search name=image1
tsalt '*' glanceng.image_search
```

salt.modules.glanceng.setup_clouds(auth=None)
Call functions to create Shade cloud objects in __context__ to take advantage of Shade's in-memory caching across several states

salt.modules.glanceng.update_image_properties(auth=None, **kwargs)
Update properties for an image

CLI Example:
```
salt '*' glanceng.update_image_properties name=image1 hw_scsi_model=virtio-scsi
    hw_disk_bus=scsi
salt '*' glanceng.update_image_properties name=0e4febc2a5ab4f2c8f374b054162506d
    min_ram=1024
```

21.9.144 salt.modules.glusterfs

Manage a glusterfs pool

salt.modules.glusterfs.add_volume_bricks(name, bricks)
Add brick(s) to an existing volume

name  Volume name
bricks  List of bricks to add to the volume

CLI Example:
salt 'host1' glusterfs.add_volume_bricks <volume> <bricks>

salt.modules.glusterfs.create_volume(name, bricks, stripe=False, replica=False, device_vg=False, transport='tcp', start=False, force=False, arbiter=False)

Create a glusterfs volume

- **name**: Name of the gluster volume
- **bricks**: Bricks to create volume from, in `<peer>:<brick path>` format. For multiple bricks use list format: `['<peer1>:<brick1>', '<peer2>:<brick2>']`
- **stripe**: Stripe count, the number of bricks should be a multiple of the stripe count for a distributed striped volume
- **replica**: Replica count, the number of bricks should be a multiple of the replica count for a distributed replicated volume
- **arbiter**: If true, specifies volume should use arbiter brick(s). Valid configuration limited to "replica 3 arbiter 1" per Gluster documentation. Every third brick in the brick list is used as an arbiter brick.
  - New in version 2019.2.0.
- **device_vg**: If true, specifies volume should use block backend instead of regular posix backend. Block device backend volume does not support multiple bricks
- **transport**: Transport protocol to use, can be 'tcp', 'rdma' or 'tcp,rdma'
- **start**: Start the volume after creation
- **force**: Force volume creation, this works even if creating in root FS

CLI Examples:

```shell
salt host1 glusterfs.create newvolume host1:/brick
salt gluster1 glusterfs.create vol2 ['gluster1:/export/vol2/brick', 'gluster2:/export/vol2/brick'] replica=2 start=True
```

salt.modules.glusterfs.delete_volume(target, stop=True)

Deletes a gluster volume

- **target**: Volume to delete
- **stop**: [True] If True, stop volume before delete

CLI Example:

```shell
salt 'host1' glusterfs.delete_volume <volume>
```

salt.modules.glusterfs.disable_quota_volume(name)

Disable quota on a glusterfs volume.

- **name**: Name of the gluster volume

CLI Example:

```shell
salt 'host1' glusterfs.disable_quota_volume <volume>
```

salt.modules.glusterfs.enable_quota_volume(name)

Enable quota on a glusterfs volume.

- **name**: Name of the gluster volume
CLI Example:

```
salt '*' glusterfs.enable_quota_volume <volume>
```

```
salt.modules.glusterfs.get_max_op_version()
```
New in version 2019.2.0.
Returns the glusterfs volume’s max op-version value Requires Glusterfs version > 3.9
CLI Example: .. code-block:: bash
```
salt '*' glusterfs.get_max_op_version
```

```
salt.modules.glusterfs.get_op_version(name)
```
New in version 2019.2.0.
Returns the glusterfs volume op-version
name Name of the glusterfs volume
CLI Example:
```
salt '*' glusterfs.get_op_version <volume>
```

```
salt.modules.glusterfs.get_version()
```
New in version 2019.2.0.
Returns the version of glusterfs. CLI Example: .. code-block:: bash
```
salt '*' glusterfs.get_version
```

```
salt.modules.glusterfs.info(name=None)
```
New in version 2015.8.4.
Return gluster volume info.
name Optional name to retrieve only information of one volume
CLI Example:
```
salt '*' glusterfs.info
```

```
salt.modules.glusterfs.list_quota_volume(name)
```
List quotas of glusterfs volume
name Name of the gluster volume
CLI Example:
```
salt '*' glusterfs.list_quota_volume <volume>
```

```
salt.modules.glusterfs.list_volumes()
```
List configured volumes
CLI Example:
```
salt '*' glusterfs.list_volumes
```

```
salt.modules.glusterfs.peer(name)
```
Add another node into the peer list.
name The remote host to probe.
CLI Example:
GLUSTER direct CLI example (to show what salt is sending to gluster):

```bash
salt 'one.gluster.*' glusterfs.peer two
```

GLUSTER CLI 3.4.4 return example (so we know what we are parsing):

# if the "peer" is the local host: peer probe: success: on localhost not needed
# if the peer was just added: peer probe: success
# if the peer was already part of the cluster: peer probe: success: host ftp2 port 24007 already in peer list

```
salt.modules.glusterfs.peer_status()
Return peer status information
The return value is a dictionary with peer UUIDs as keys and dicts of peer information as values. Hostnames are listed in one list. GlusterFS separates one of the hostnames but the only reason for this seems to be which hostname happens to be used first in peering.
CLI Example:
```
```bash
salt '*' glusterfs.peer_status
```

GLUSTER direct CLI example (to show what salt is sending to gluster):

```bash
$ gluster peer status
```

GLUSTER CLI 3.4.4 return example (so we know what we are parsing):

```
Number of Peers: 2
Hostname: ftp2 Port: 24007 Uuid: cbcb256b-e66e-4ec7-a718-21082d396c24 State: Peer in Cluster (Connected)
Hostname: ftp3 Uuid: 5ea10457-6cb2-427b-a770-7897509625e9 State: Peer in Cluster (Connected)
```

```
salt.modules.glusterfs.set_op_version(version)
New in version 2019.2.0.
Set the glusterfs volume op-version
version Version to set the glusterfs volume op-version
CLI Example:
```
```bash
salt '*' glusterfs.set_op_version <volume>
```

```
salt.modules.glusterfs.set_quota_volume(name, path, size, enable_quota=False)
Set quota to glusterfs volume.
name Name of the gluster volume
path Folder path for restriction in volume ("/"
size Hard-limit size of the volume (MB/GB)
enable_quota Enable quota before set up restriction
CLI Example:
```
```bash
salt '*' glusterfs.set_quota_volume <volume> <path> <size> enable_quota=True
```
salt.modules.glusterfs.start_volume(name, force=False)
Start a gluster volume
name Volume name
force Force the volume start even if the volume is started .. versionadded:: 2015.8.4
CLI Example:
salt '*' glusterfs.start mycluster

salt.modules.glusterfs.status(name)
Check the status of a gluster volume.
name Volume name
CLI Example:
salt '*' glusterfs.status myvolume

salt.modules.glusterfs.stop_volume(name, force=False)
Stop a gluster volume
name Volume name
force Force stop the volume
    New in version 2015.8.4.
CLI Example:
salt '*' glusterfs.stop_volume mycluster

salt.modules.glusterfs.unset_quota_volume(name, path)
Unset quota on glusterfs volume
name Name of the gluster volume
path Folder path for restriction in volume
CLI Example:
salt '*' glusterfs.unset_quota_volume <volume> <path>

21.9.145 salt.modules.gnomedesktop

GNOME implementations

salt.modules.gnomedesktop.get(schema=’None’, key=’None’, user=’None’, **kwargs)
Get key in a particular GNOME schema
CLI Example:
salt '*' gnome.get user=<username> schema=org.gnome.desktop.screensaver key=idle-activation-enabled

salt.modules.gnomedesktop.getClockFormat(**kwargs)
Return the current clock format, either 12h or 24h format.
CLI Example:
salt '*' gnome.getClockFormat user=<username>

salt.modules.gnomedesktop.getClockShowDate(**kwargs)
Return the current setting, if the date is shown in the clock
CLI Example:
salt '*' gnome.getClockShowDate user=<username>

salt.modules.gnomedesktop.getIdleActivation(**kwargs)
Get whether the idle activation is enabled
CLI Example:
salt '*' gnome.getIdleActivation user=<username>

salt.modules.gnomedesktop.getIdleDelay(**kwargs)
Return the current idle delay setting in seconds
CLI Example:
salt '*' gnome.getIdleDelay user=<username>

salt.modules.gnomedesktop.ping(**kwargs)
A test to ensure the GNOME module is loaded
CLI Example:
salt '*' gnome.ping user=<username>

salt.modules.gnomedesktop.setClockFormat(clockFormat, **kwargs)
Set the clock format, either 12h or 24h format.
CLI Example:
salt '*' gnome.setClockFormat <12h|24h> user=<username>

salt.modules.gnomedesktop.setClockShowDate(kvalue, **kwargs)
Set whether the date is visible in the clock
CLI Example:
salt '*' gnome.setClockShowDate <True|False> user=<username>

salt.modules.gnomedesktop.setIdleActivation(kvalue, **kwargs)
Set whether the idle activation is enabled
CLI Example:
salt '*' gnome.setIdleActivation <True|False> user=<username>

salt.modules.gnomedesktop.setIdleDelay(delaySeconds, **kwargs)
Set the current idle delay setting in seconds
CLI Example:
salt '*' gnome.setIdleDelay <seconds> user=<username>
salt.modules.gnomedesktop.set_(schema=None, key=None, user=None, value=None, **kwargs)
Set key in a particular GNOME schema

CLI Example:
```bash
salt '*' gnome.set user=<username> schema=org.gnome.desktop.screensaver key=idle-activation-enabled value=False
```

21.9.146 salt.modules.google_chat

Module for sending messages to google chat.

New in version 2019.2.0.

To use this module you need to configure a webhook in the google chat room where you would like the message to be sent, see:

https://developers.google.com/hangouts/chat/how-tos/webhooks

salt.modules.google_chat.send_message(url, message)
Send a message to the google chat room specified in the webhook url.

```bash
salt '*' google_chat.send_message "https://chat.googleapis.com/v1/spaces/example_space/messages?key=example_key" "This is a test message"
```

21.9.147 salt.modules.gpg

Manage a GPG keychains, add keys, create keys, retrieve keys from keyservers. Sign, encrypt and sign plus encrypt text and files.

New in version 2015.5.0.

Note: The python-gnupg library and gpg binary are required to be installed.

salt.modules.gpg.create_key(key_type='RSA', key_length=1024, name_real='Autogenerated Key', name_comment='Generated by SaltStack', name_email=None, subkey_type=None, subkey_length=None, expire_date=None, use_passphrase=False, user=None, gnupghome=None)
Create a key in the GPG keychain

Note: GPG key generation requires a lot of entropy and randomness. Difficult to do over a remote connection, consider having another process available which is generating randomness for the machine. Also especially difficult on virtual machines, consider the rng-tools package.

The create_key process takes awhile so increasing the timeout may be necessary, e.g. -t 15.

key_type The type of the primary key to generate. It must be capable of signing, 'RSA' or 'DSA'.
key_length The length of the primary key in bits.
name_real The real name of the user identity which is represented by the key.
name_comment A comment to attach to the user id.
nname_email An email address for the user.
subkey_type The type of the secondary key to generate.

subkey_length The length of the secondary key in bits.

expire_date The expiration date for the primary and any secondary key. You can specify an ISO date, a number of days/weeks/months/years, an epoch value, or 0 for a non-expiring key.

use_passphrase Whether to use a passphrase with the signing key. Passphrase is received from Pillar.

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.

gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:

salt -t 15 '*' gpg.create_key

salt.modules.gpg.decrypt( 
    user=None, text=None, filename=None, output=None, 
    use_passphrase=False, gnupghome=None, bare=False)

Decrypt a message or file

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.

text The encrypted text to decrypt.

filename The encrypted filename to decrypt.

output The filename where the decrypted data will be written, default is standard out.

use_passphrase Whether to use a passphrase with the signing key. Passphrase is received from Pillar.

gnupghome Specify the location where GPG keyring and related files are stored.

bare If True, return the (armored) decrypted block as a string without the standard comment/res dict.

CLI Example:

salt '*' gpg.decrypt filename='/path/to/important.file.gpg'

salt '*' gpg.decrypt filename='/path/to/important.file.gpg' use_passphrase=True

salt.modules.gpg.delete_key(keyid=None, fingerprint=None, delete_secret=False, user=None, 
gnupghome=None)

Get a key from the GPG keychain

keyid The keyid of the key to be deleted.

fingerprint The fingerprint of the key to be deleted.

delete_secret Whether to delete a corresponding secret key prior to deleting the public key. Secret keys must be deleted before deleting any corresponding public keys.

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.

gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:

salt '*' gpg.delete_key keyid=3FAD9F1E

salt '*' gpg.delete_key fingerprint=53C96788253E58416D20BCD352952C84C3252192

(continues on next page)
salt '***' gpg.delete_key keyid=3FAD9F1E user=username
salt '***' gpg.delete_key keyid=3FAD9F1E user=username delete_secret=True

salt.modules.gpg.encrypt(user=None, recipients=None, text=None, filename=None, output=None, sign=None, use_passphrase=False, gnupghome=None, bare=False)

Encrypt a message or file

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.

recipients The fingerprints for those recipient whom the data is being encrypted for.

text The text to encrypt.

filename The filename to encrypt.

output The filename where the signed file will be written, default is standard out.

sign Whether to sign, in addition to encrypt, the data. True to use default key or fingerprint to specify a different key to sign with.

use_passphrase Whether to use a passphrase with the signing key. Passphrase is received from Pillar.

gnupghome Specify the location where GPG keyring and related files are stored.

bare If True, return the (armored) encrypted block as a string without the standard comment/res dict.

CLI Example:

```
salt '***' gpg.encrypt text='Hello there. How are you?'
salt '***' gpg.encrypt filename='/path/to/important.file'
salt '***' gpg.encrypt filename='/path/to/important.file' use_passphrase=True
```

salt.modules.gpg.export_key(keyids=None, secret=False, user=None, gnupghome=None)

Export a key from the GPG keychain

keyids The key ID(s) of the key(s) to be exported. Can be specified as a comma separated string or a list. Anything which GnuPG itself accepts to identify a key - for example, the key ID or the fingerprint could be used.

secret Export the secret key identified by the keyids information passed.

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.

gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt '***' gpg.export_key keyids=3FAD9F1E
salt '***' gpg.export_key keyids=3FAD9F1E secret=True
salt '***' gpg.export_key keyids="['3FAD9F1E','3FBD8F1E']" user=username
```

salt.modules.gpg.get_key(keyid=None, fingerprint=None, user=None, gnupghome=None)

Get a key from the GPG keychain
keyid  The key ID (short or long) of the key to be retrieved.

fingerprint  The fingerprint of the key to be retrieved.

user  Which user’s keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.

gnupghome  Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt '*' gpg.get_key keyid=3FAD9F1E
salt '*' gpg.get_key fingerprint=53C96788253E58416D20BCD352952C84C3252192
salt '*' gpg.get_key keyid=3FAD9F1E user=username
```

salt.modules.gpg.get_secret_key(*keyid=None, fingerprint=None, user=None, gnupghome=None*)

Get a key from the GPG keychain

keyid  The key ID (short or long) of the key to be retrieved.

fingerprint  The fingerprint of the key to be retrieved.

user  Which user’s keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.

gnupghome  Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt '*' gpg.get_secret_key keyid=3FAD9F1E
salt '*' gpg.get_secret_key fingerprint=53C96788253E58416D20BCD352952C84C3252192
salt '*' gpg.get_secret_key keyid=3FAD9F1E user=username
```

salt.modules.gpg.import_key(*text=None, filename=None, user=None, gnupghome=None*)

Import a key from text or file

text  The text containing to import.

filename  The filename containing the key to import.

user  Which user’s keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.

gnupghome  Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt '*' gpg.import_key text='-----BEGIN PGP PUBLIC KEY BLOCK-----
...
-----END PGP PUBLIC KEY BLOCK-----'
salt '*' gpg.import_key filename='/path/to/public-key-file'
```

salt.modules.gpg.list_keys(*user=None, gnupghome=None*)

List keys in GPG keychain

user  Which user’s keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.

gnupghome  Specify the location where GPG keyring and related files are stored.

CLI Example:
salt 'salt '*' gpg.list_keys

salt.modules.gpg.list_secret_keys(user=None, gnuphome=None)
List secret keys in GPG keychain

user Which user’s keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.

gnuphomed Specify the location where GPG keyring and related files are stored.

CLI Example:
salt 'salt '*' gpg.list_secret_keys

salt.modules.gpg.receive_keys(keyserver=None, keys=None, user=None, gnuphome=None)
Receive key(s) from keyserver and add them to keychain

keyserver Keyserver to use for searching for GPG keys, defaults to pgp.mit.edu

keys The keyID(s) to retrieve from the keyserver. Can be specified as a comma separated string or a list.

user Which user’s keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.

gnuphomed Specify the location where GPG keyring and related files are stored.

CLI Example:
salt 'salt '*' gpg.receive_keys keys='3FAD9F1E'
salt 'salt '*' gpg.receive_keys keys='[3FAD9F1E', '3FBF9F2E']''
salt 'salt '*' gpg.receive_keys keys=3FAD9F1E user=username

salt.modules.gpg.search_keys(text, keyserver=None, user=None)
Search keys from keyserver

text Text to search the keyserver for, e.g. email address, keyID or fingerprint.

keyserver Keyserver to use for searching for GPG keys, defaults to pgp.mit.edu.

user Which user’s keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.

CLI Example:
salt 'salt '*' gpg.search_keys user@example.com
salt 'salt '*' gpg.search_keys user@example.com keyserver=keyserver.ubuntu.com
salt 'salt '*' gpg.search_keys user@example.com keyserver=keyserver.ubuntu.com
user=username

salt.modules.gpg.sign(user=None, keyid=None, text=None, filename=None, output=None, use_passphrase=False, gnuphomed=None)
Sign message or file

user Which user’s keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.

keyid The keyid of the key to set the trust level for, defaults to first key in the secret keyring.

text The text to sign.
filename  The filename to sign.

output  The filename where the signed file will be written, default is standard out.

use_passphrase  Whether to use a passphrase with the signing key. Passphrase is received from Pillar.

gnupghome  Specify the location where GPG keyring and related files are stored.

CLI Example:

```bash
salt '*' gpg.sign text='Hello there. How are you?'
salt '*' gpg.sign filename='/path/to/important.file'
salt '*' gpg.sign filename='/path/to/important.file' use_passphrase=True
```

salt.modules.gpg.trust_key(keyid=None, fingerprint=None, trust_level=None, user=None)

Set the trust level for a key in GPG keychain

- **keyid**  The keyid of the key to set the trust level for.
- **fingerprint**  The fingerprint of the key to set the trust level for.
- **trust_level**  The trust level to set for the specified key, must be one of the following: expired, unknown, not_trusted, marginally, fully, ultimately
- **user**  Which user’s keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.

CLI Example:

```bash
salt '*' gpg.trust_key keyid='3FAD9F1E' trust_level='marginally'
salt '*' gpg.trust_key fingerprint='53C9678B253E58416D20BCD529S2C84C3252192' trust_level='not_trusted'
salt '*' gpg.trust_key keys='3FAD9F1E' trust_level='ultimately' user='username'
```

salt.modules.gpg.verify(text=None, user=None, filename=None, gnupghome=None, signature=None, trustmodel=None)

Verify a message or file

- **text**  The text to verify.
- **filename**  The filename to verify.
- **user**  Which user’s keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.
- **gnupghome**  Specify the location where GPG keyring and related files are stored.
- **signature**  Specify the filename of a detached signature.
- **trustmodel**  Explicitly define the used trust model. One of:
  - pgp
  - classic
  - tofu
  - tofu+pgp
  - direct
• always
• auto

New in version 2019.2.0.

CLI Example:

```
salt '*' gpg.verify text='Hello there. How are you?'
salt '*' gpg.verify filename='/path/to/important.file'
salt '*' gpg.verify filename='/path/to/important.file' use_passphrase=True
salt '*' gpg.verify filename='/path/to/important.file' trustmodel=direct
```

21.9.148 salt.modules.grafana4 module

Module for working with the Grafana v4 API

New in version 2017.7.0.

depends requests

configuration This module requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the 'grafana' key by default, if defined.

For example:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_user: admin
  grafana_password: admin
  grafana_timeout: 3
```

salt.modules.grafana4.create_datasource(orgname=None, profile='grafana', **kwargs)

Create a new datasource in an organisation.

ame Name of the data source.
type Type of the datasource (‘graphite’, ’influxdb’ etc.).
access Use proxy or direct.
url The URL to the data source API.
user Optional - user to authenticate with the data source.
password Optional - password to authenticate with the data source.
database Optional - database to use with the data source.
basicAuth Optional - set to True to use HTTP basic auth to authenticate with the data source.
basicAuthUser Optional - HTTP basic auth username.
basicAuthPassword Optional - HTTP basic auth password.
jsonData Optional - additional json data to post (eg. ”timeInterval”).
isDefault Optional - set data source as default.
withCredentials Optional - Whether credentials such as cookies or auth headers should be sent with cross-site requests.
typeLogoUrl Optional - Logo to use for this datasource.
orgname Name of the organization in which the data source should be created.
profile  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.create_datasource
```

salt.modules.grafana4.create_org(profile='grafana', **kwargs)
Create a new organization.

name  Name of the organization.

profile  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.create_org <name>
```

salt.modules.grafana4.create_org_user( orgname=None, profile='grafana', **kwargs)
Add user to the organization.

loginOrEmail  Login or email of the user.

role  Role of the user for this organization. Should be one of:

- Admin
- Editor
- Read Only Editor
- Viewer

orgname  Name of the organization in which users are added.

profile  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.create_org_user <orgname> loginOrEmail=<loginOrEmail> role=<role>
```

salt.modules.grafana4.create_update_dashboard( orgname=None, profile='grafana', **kwargs)
Create or update a dashboard.

dashboard  A dict that defines the dashboard to create/update.

overwrite  Whether the dashboard should be overwritten if already existing.

orgname  Name of the organization.

profile  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.create_update_dashboard dashboard=<dashboard> overwrite=True orgname=<orgname>
```

salt.modules.grafana4.create_user(profile='grafana', **kwargs)
Create a new user.

login  Login of the new user.

password  Password of the new user.
**email**  Email of the new user.

**name**  Optional - Full name of the new user.

**profile**  Configuration profile used to connect to the Grafana instance. Default is ‘grafana’.

CLI Example:
```
salt '*' grafana4.create_user login=<login> password=<password> email=<email>
```

salt.modules.grafana4.delete_dashboard(slug, orgname=None, profile='grafana')  Delete a dashboard.

- **slug**  Slug (name) of the dashboard.
- **orgname**  Name of the organization.
- **profile**  Configuration profile used to connect to the Grafana instance. Default is ‘grafana’.

CLI Example:
```
salt '*' grafana4.delete_dashboard <slug>
```

salt.modules.grafana4.delete_datasource(datasourceid, orgname=None, profile='grafana')  Delete a datasource.

- **datasourceid**  Id of the datasource.
- **profile**  Configuration profile used to connect to the Grafana instance. Default is ‘grafana’.

CLI Example:
```
salt '*' grafana4.delete_datasource <datasource_id>
```

salt.modules.grafana4.delete_org(orgid, profile='grafana')  Delete an organization.

- **orgid**  Id of the organization.
- **profile**  Configuration profile used to connect to the Grafana instance. Default is ‘grafana’.

CLI Example:
```
salt '*' grafana4.delete_org <org_id>
```

salt.modules.grafana4.delete_org_user(userid, orgname=None, profile='grafana')  Remove user from the organization.

- **userid**  Id of the user.
- **orgname**  Name of the organization in which users are updated.
- **profile**  Configuration profile used to connect to the Grafana instance. Default is ‘grafana’.

CLI Example:
```
salt '*' grafana4.delete_org_user <user_id> <orgname>
```

salt.modules.grafana4.delete_user(userid, profile='grafana')  Delete a user.

- **userid**  Id of the user.
- **profile**  Configuration profile used to connect to the Grafana instance. Default is ‘grafana’.

21.9. execution modules 1825
CLI Example:

```
salt '*' grafana4.delete_user <user_id>
```

salt.modules.grafana4.delete_user_org(userid, orgid, profile='grafana')
Remove a user from an organization.

- **userid** Id of the user.
- **orgid** Id of the organization.
- **profile** Configuration profile used to connect to the Grafana instance. Default is ‘grafana’.

CLI Example:

```
salt '*' grafana4.delete_user_org <user_id> <org_id>
```

salt.modules.grafana4.get_dashboard(slug, orgname=None, profile='grafana')
Get a dashboard.

- **slug** Slug (name) of the dashboard.
- **orgname** Name of the organization.
- **profile** Configuration profile used to connect to the Grafana instance. Default is ‘grafana’.

CLI Example:

```
salt '*' grafana4.get_dashboard <slug>
```

salt.modules.grafana4.get_datasource(name, orgname=None, profile='grafana')
Show a single datasource in an organisation.

- **name** Name of the datasource.
- **orgname** Name of the organization.
- **profile** Configuration profile used to connect to the Grafana instance. Default is ‘grafana’.

CLI Example:

```
salt '*' grafana4.get_datasource <name> <orgname>
```

salt.modules.grafana4.get_datasources(orgname=None, profile='grafana')
List all datasources in an organisation.

- **orgname** Name of the organization.
- **profile** Configuration profile used to connect to the Grafana instance. Default is ‘grafana’.

CLI Example:

```
salt '*' grafana4.get_datasources <orgname>
```

salt.modules.grafana4.get_org(name, profile='grafana')
Show a single organization.

- **name** Name of the organization.
- **profile** Configuration profile used to connect to the Grafana instance. Default is ‘grafana’.

CLI Example:
salt 'salt '*' grafana4.get_org <name>

salt.modules.grafana4.get_org_address( orgname=None, profile='grafana')
Get the organization address.

orgname Name of the organization in which users are updated.
profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
salt 'salt '*' grafana4.get_org_address <orgname>

salt.modules.grafana4.get_org_prefs( orgname=None, profile='grafana')
Get the organization preferences.

orgname Name of the organization in which users are updated.
profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
salt 'salt '*' grafana4.get_org_prefs <orgname>

salt.modules.grafana4.get_org_users( orgname=None, profile='grafana')
Get the list of users that belong to the organization.

orgname Name of the organization.
profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
salt 'salt '*' grafana4.get_org_users <orgname>

salt.modules.grafana4.get_orgs( profile='grafana')
List all organizations.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
salt 'salt '*' grafana4.get_orgs

salt.modules.grafana4.get_user( login, profile='grafana')
Show a single user.

login Login of the user.
profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
salt 'salt '*' grafana4.get_user <login>

salt.modules.grafana4.get_user_data( userid, profile='grafana')
Get user data.

userid Id of the user.
profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
Salt Documentation, Release 3000.2

```
salt '*' grafana4.get_user_data <user_id>
```

```
salt.modules.grafana4.get_user_orgs(userid, profile='grafana')
Get the list of organisations a user belong to.
```

```
userid  Id of the user.
profile  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.
```

```
CLI Example:
salt '*' grafana4.get_user_orgs <user_id>
```

```
salt.modules.grafana4.get_users(profile='grafana')
List all users.
```

```
profile  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.
```

```
CLI Example:
salt '*' grafana4.get_users
```

```
salt.modules.grafana4.switch_org(orgname=None, profile='grafana', **kwargs)
Switch the current organization.
```

```
orgname  Name of the organization to switch to.
profile  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.
```

```
CLI Example:
salt '*' grafana4.switch_org <name>
```

```
salt.modules.grafana4.update_datasource(datasourceid, orgname=None, profile='grafana', **kwargs)
Update a datasource.
```

```
datasourceid  Id of the datasource.
name  Name of the data source.
type  Type of the datasource ('graphite', 'influxdb' etc.).
access  Use proxy or direct.
url  The URL to the data source API.
user  Optional - user to authenticate with the data source.
password  Optional - password to authenticate with the data source.
database  Optional - database to use with the data source.
basicAuth  Optional - set to True to use HTTP basic auth to authenticate with the data source.
basicAuthUser  Optional - HTTP basic auth username.
basicAuthPassword  Optional - HTTP basic auth password.
jsonData  Optional - additional json data to post (eg. "timeInterval").
isDefault  Optional - set data source as default.
withCredentials  Optional - Whether credentials such as cookies or auth headers should be sent with cross-site requests.
```

1828 Chapter 21. Salt Module Reference
typeLogoUrl  Optional - Logo to use for this datasource.

profile  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
```
salt '*' grafana4.update_datasource <datasourceid>
```

salt.modules.grafana4.update_org(orgid, profile='grafana', **kwargs)
Update an existing organization.

orgid  Id of the organization.

name  New name of the organization.

profile  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
```
salt '*' grafana4.update_org <org_id> name=<name>
```

salt.modules.grafana4.update_org_address(orgname=None, profile='grafana', **kwargs)
Update the organization address.

orgname  Name of the organization in which users are updated.

address1  Optional - address1 of the org.

address2  Optional - address2 of the org.

city  Optional - city of the org.

zip_code  Optional - zip_code of the org.

country  Optional - country of the org.

profile  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
```
salt '*' grafana4.update_org_address <orgname> country=<country>
```

salt.modules.grafana4.update_org_prefs(orgname=None, profile='grafana', **kwargs)
Update the organization preferences.

orgname  Name of the organization in which users are updated.

theme  Selected theme for the org.

homeDashboardId  Home dashboard for the org.

timezone  Timezone for the org (one of: "browser", "utc", or ").

profile  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
```
salt '*' grafana4.update_org_prefs <orgname> theme=<theme> timezone=<timezone>
```

salt.modules.grafana4.update_org_user(userid, orgname=None, profile='grafana', **kwargs)
Update user role in the organization.

userid  Id of the user.

loginOrEmail  Login or email of the user.
role

Role of the user for this organization. Should be one of:

- Admin
- Editor
- Read Only Editor
- Viewer

orgname Name of the organization in which users are updated.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.update_org_user <user_id> <orgname> loginOrEmail=<loginOrEmail> role=<role>
```

salt.modules.grafana4.update_user(userid, profile='grafana', **kwargs)

Update an existing user.

userid Id of the user.

login Optional - Login of the user.

email Optional - Email of the user.

name Optional - Full name of the user.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.update_user <user_id> login=<login> email=<email>
```

salt.modules.grafana4.update_user_password(userid, profile='grafana', **kwargs)

Update a user password.

userid Id of the user.

password New password of the user.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.update_user_password <user_id> password=<password>
```

salt.modules.grafana4.update_user_permissions(userid, profile='grafana', **kwargs)

Update a user permission.

userid Id of the user.

isGrafanaAdmin Whether user is a Grafana admin.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.update_user_permissions <user_id> isGrafanaAdmin=<true|false>
```
21.9.149 salt.modules.grains

Return/control aspects of the grains data

Grains set or altered with this module are stored in the 'grains' file on the minions. By default, this file is located at:/etc/salt/grains

**Note:** This does NOT override any grains set in the minion config file.

**salt.modules.grains.append**(key, val, convert=False, delimiter=':')

New in version 0.17.0.

Append a value to a list in the grains config file. If the grain doesn’t exist, the grain key is added and the value is appended to the new grain as a list item.

- **key**: The grain key to be appended to
- **val**: The value to append to the grain key
- **convert**: If convert is True, convert non-list contents into a list. If convert is False and the grain contains non-list contents, an error is given. Defaults to False.
- **delimiter**: The key can be a nested dict key. Use this parameter to specify the delimiter you use, instead of the default : . You can now append values to a list in nested dictionary grains. If the list doesn’t exist at this level, it will be created.

New in version 2014.7.6.

CLI Example:

```
salt '*' grains.append key val
```

**salt.modules.grains.delkey**(key)

New in version 2017.7.0.

Remove a grain completely from the grain system, this will remove the grain key and value

- **key**: The grain key from which to delete the value.

CLI Example:

```
salt '*' grains.delkey key
```

**salt.modules.grains.delval**(key, destructive=False)

New in version 0.17.0.

Delete a grain value from the grains config file. This will just set the grain value to None. To completely remove the grain, run grains.delkey or pass destructive=True to grains.delval.

- **key**: The grain key from which to delete the value.
- **destructive**: Delete the key, too. Defaults to False.

CLI Example:

```
salt '*' grains.delval key
```

**salt.modules.grains.equals**(key, value)

Used to make sure the minion’s grain key/value matches.

Returns True if matches otherwise False.
New in version 2017.7.0.

CLI Example:

```bash
salt '*' grains.equals fqdn <expected_fqdn>
salt '*' grains.equals systemd:version 219
```

salt.modules.grains.fetch(key, default=None, delimiter=':', ordered=True)

Attempt to retrieve the named value from grains, if the named value is not available return the passed default. The default return is an empty string.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in grains looks like this:

```python
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the apache key in the pkg dict this key can be passed:

```bash
pkg:apache
```

**Parameters**

- **delimiter** – Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

  New in version 2014.7.0.

- **ordered** – Outputs an ordered dict if applicable (default: True)

  New in version 2016.11.0.

CLI Example:

```bash
salt '*' grains.get pkg:apache
salt '*' grains.get abc::def|ghi delimiter='|'
```

salt.modules.grains.filter_by(lookup_dict, grain='os_family', merge=None, default='default', base=None)

New in version 0.17.0.

Look up the given grain in a given dictionary for the current OS and return the result.

Although this may occasionally be useful at the CLI, the primary intent of this function is for use in Jinja to make short work of creating lookup tables for OS-specific data. For example:

```jinja
{% set apache = salt['grains.filter_by']({
    'Debian': {'pkg': 'apache2', 'srv': 'apache2'},
    'RedHat': {'pkg': 'httpd', 'srv': 'httpd'},
}, default='Debian') %}

myapache:
  pkg.installed:
    - name: {{ apache.pkg }}
  service.running:
    - name: {{ apache.srv }}
```

Values in the lookup table may be overridden by values in Pillar. An example Pillar to override values in the example above could be as follows:
The call to `filter_by()` would be modified as follows to reference those Pillar values:

```
{% set apache = salt['grains.filter_by']({
    ...,
    merge=salt['pillar.get']('apache:lookup')) %}
```

**Parameters**

- **lookup_dict** – A dictionary, keyed by a grain, containing a value or values relevant to systems matching that grain. For example, a key could be the grain for an OS and the value could be the name of a package on that particular OS.

  Changed in version 2016.11.0: The dictionary key could be a globbing pattern. The function will return the corresponding `lookup_dict` value where grain value matches the pattern. For example:

  ```
  # this will render 'got some salt' if Minion ID begins from 'salt'
  salt '*'.grains.filter_by '{salt*: got some salt, default: salt is not here}' id
  ```

- **grain** – The name of a grain to match with the current system’s grains. For example, the value of the "os_family" grain for the current system could be used to pull values from the `lookup_dict` dictionary.

  Changed in version 2016.11.0: The grain value could be a list. The function will return the `lookup_dict` value for a first found item in the list matching one of the `lookup_dict` keys.

- **merge** – A dictionary to merge with the results of the grain selection from `lookup_dict`. This allows Pillar to override the values in the `lookup_dict`. This could be useful, for example, to override the values for non-standard package names such as when using a different Python version from the default Python version provided by the OS (e.g., `python26-mysql` instead of `python-mysql`).

- **default** – default `lookup_dict`’s key used if the grain does not exist or if the grain value has no match on `lookup_dict`. If unspecified the value is "default".

  New in version 2014.1.0.

- **base** – A `lookup_dict` key to use for a base dictionary. The grain-selected `lookup_dict` is merged over this and then finally the `merge` dictionary is merged. This allows common values for each case to be collected in the base and overridden by the grain selection dictionary and the merge dictionary. Default is unset.

  New in version 2015.5.0.

**CLI Example:**

```
salt '*'.grains.filter_by '{Debian: Debheads rule, RedHat: I love my hat}'
# this one will render {D: {E: I, G: H}, J: K}
# next one renders {A: {B: G}, D: J}
```
salt '!' grains.filter_by '{default: {A: {B: C}, D: E}, F: {A: {B: G}}, H: {D: I}}
→ 'xxx' '{D: J}' 'F' 'default'
# next same as above when default='H' instead of 'F' renders {A: {B: C}, D: J}

salt.modules.grains.get(key, default='", delimiter=':', ordered=True)
 Attempt to retrieve the named value from grains, if the named value is not available return the passed default.
 The default return is an empty string.
 The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict
 in grains looks like this:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the apache key in the pkg dict this key can be passed:

```
 pkg:apache
```

Parameters

- **delimiter** – Specify an alternate delimiter to use when traversing a nested dict. This is
  useful for when the desired key contains a colon. See CLI example below for usage.
  New in version 2014.7.0.
- **ordered** – Outputs an ordered dict if applicable (default: True)
  New in version 2016.11.0.

CLI Example:

```
salt '!' grains.get pkg:apache
salt '!' grains.get abc::def|ghi delimiter='|
```

salt.modules.grains.get_or_set_hash(name, length=8, chars='abcdefghijklmnopqrstuvwxyz0123456789!@#$%^&*(-_=+)')
 Perform a one-time generation of a hash and write it to the local grains. If that grain has already been set
 return the value instead.

This is useful for generating passwords or keys that are specific to a single minion that don’t need to be stored
 somewhere centrally.

State Example:

```
some_mysql_user:
 mysql_user:
   - present
   - host: localhost
   - password: {{ salt['grains.get_or_set_hash']('mysql:some_mysql_user') }}
```

CLI Example:

```
salt '!' grains.get_or_set_hash 'django:SECRET_KEY' 50
```

**Warning:** This function could return strings which may contain characters which are reserved as direc-
tives by the YAML parser, such as strings beginning with %. To avoid issues when using the output of this
function in an SLS file containing YAML+Jinja, surround the call with single quotes.
salt.modules.grains.has_value(key)
Determine whether a key exists in the grains dictionary.

Given a grains dictionary that contains the following structure:

```python
{'pkg': {'apache': 'httpd'}}
```

One would determine if the apache key in the pkg dict exists by:

```
pkg:apache
```

CLI Example:

```
salt '*' grains.has_value pkg:apache
```

salt.modules.grains.item(*args, **kwargs)
Return one or more grains

CLI Example:

```
salt '*' grains.item os
salt '*' grains.item os osrelease oscodename
```

Sanitized CLI Example:

```
salt '*' grains.item host sanitize=True
```

salt.modules.grains.items(sanitize=False)
Return all of the minion’s grains

CLI Example:

```
salt '*' grains.items
```

Sanitized CLI Example:

```
salt '*' grains.items sanitize=True
```

salt.modules.grains.ls()
Return a list of all available grains

CLI Example:

```
salt '*' grains.ls
```

salt.modules.grains.remove(key, val, delimiter=': ')
New in version 0.17.0.

Remove a value from a list in the grains config file

- **key** The grain key to remove.
- **val** The value to remove.
- **delimiter** The key can be a nested dict key. Use this parameter to specify the delimiter you use, instead of the default `.`. You can now append values to a list in nested dictionary grains. If the list doesn’t exist at this level, it will be created.

   New in version 2015.8.2.

CLI Example:
The `grains.set` function allows you to set a key to an arbitrary value. It is used like `setval` but works with nested keys. This function is conservative. It will only overwrite an entry if its value and the given one are not a list or a dict. The `force` parameter is used to allow overwriting in all cases. New in version 2015.8.0.

**Parameters**

- **force** – Force writing over existing entry if given or existing values are list or dict. Defaults to False.
- **destructive** – If an operation results in a key being removed, delete the key, too. Defaults to False.
- **delimiter** – Specify an alternate delimiter to use when traversing a nested dict, the default being `:`.

**CLI Example:**

```bash
salt '*' grains.set 'apps:myApp:port' 2209
salt '*' grains.set 'apps:myApp' '{port: 2209}'
```

The `grains.setval` function sets a grains value in the grains config file.

**Parameters**

- **key** The grain key to be set.
- **val** The value to set the grain key to.
- **destructive** If an operation results in a key being removed, delete the key, too. Defaults to False.

**CLI Example:**

```bash
salt '*' grains.setval key val
salt '*' grains.setval key "{{sub-key}: 'val', 'sub-key2': 'val2'}}"
```

The `grains.setvals` function sets new grains values in the grains config file.

**Parameters**

- **grains** Set new grains values.
- **destructive** If an operation results in a key being removed, delete the key, too. Defaults to False.

**CLI Example:**

```bash
salt '*' grains.setvals "{{key1}: 'val1', 'key2': 'val2'}}"
```

### 21.9.150 salt.modules.groupadd

Manage groups on Linux, OpenBSD and NetBSD

**Important:** If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to ‘group.info’ is not available), see here.

```bash
salt.modules.groupadd.add(name, gid=None, system=False, root=None)
```

Add the specified group
**name**  Name of the new group

**gid**  Use GID for the new group

**system**  Create a system account

**root**  Directory to chroot into

CLI Example:

```
salt '*' group.add foo 3456
```

group.add

The add function is used to add a new group.

**name**  Name of the new group

**root**  Directory to chroot into

CLI Example:

```
salt '*' group.add foo 3456
```

**salt.modules.groupadd.adduser**(name, username, root=None)

Add a user in the group.

**name**  Name of the group to modify

**username**  Username to add to the group

**root**  Directory to chroot into

CLI Example:

```
salt '*' group.adduser foo bar
```

Verifies if a valid username 'bar' as a member of an existing group 'foo', if not then adds it.

**salt.modules.groupadd.chgid**(name, gid, root=None)

Change the gid for a named group

**name**  Name of the group to modify

**gid**  Change the group ID to GID

**root**  Directory to chroot into

CLI Example:

```
salt '*' group.chgid foo 4376
```

**salt.modules.groupadd.delete**(name, root=None)

Remove the named group

**name**  Name group to delete

**root**  Directory to chroot into

CLI Example:

```
salt '*' group.delete foo
```

**salt.modules.groupadd.deluser**(name, username, root=None)

Remove a user from the group.

**name**  Name of the group to modify

**username**  Username to delete from the group

**root**  Directory to chroot into

CLI Example:

```
salt '*' group.deluser foo bar
```

Removes a member user 'bar' from a group 'foo'. If group is not present then returns True.
salt.modules.groupadd.getent\((refresh=False, root=None)\)
Return info on all groups
    refresh Force a refresh of group information
    root Directory to chroot into
CLI Example:
```
salt '*' group.getent
```

salt.modules.groupadd.info\((name, root=None)\)
Return information about a group
    name Name of the group
    root Directory to chroot into
CLI Example:
```
salt '*' group.info foo
```

salt.modules.groupadd.members\((name, members_list, root=None)\)
Replaces members of the group with a provided list.
    name Name of the group to modify
    members_list Username list to set into the group
    root Directory to chroot into
CLI Example:
```
salt '*' group.members foo 'user1,user2,user3,...'
```

Replaces a membership list for a local group 'foo'. foo:x:1234:user1,user2,user3, ...

21.9.151 salt.modules.grub_legacy

Support for GRUB Legacy

salt.modules.grub_legacy.conf\()\)
Parse GRUB conf file
CLI Example:
```
salt '*' grub.conf
```

salt.modules.grub_legacy.version\()\)
Return server version from grub –version
CLI Example:
```
salt '*' grub.version
```

21.9.152 salt.modules.guestfs

Interact with virtual machine images via libguestfs
    depends
libguestfs

```python
salt.modules.guestfs.mount(location, access='rw', root=None)
```

Mount an image

CLI Example:

```bash
salt '*' guest.mount /srv/images/fedora.qcow
```

21.9.153 salt.modules.hadoop

Support for hadoop

- maintainer Yann Jouanin <yann.jouanin@intelunix.fr>
- maturity new
- depends
- platform linux

```python
salt.modules.hadoop.dfs(command=None, *args)
```

Execute a command on DFS

CLI Example:

```bash
salt '*' hadoop.dfs ls /
```

```python
salt.modules.hadoop.dfs_absent(path)
```

Check if a file or directory is absent on the distributed FS.

CLI Example:

```bash
salt '*' hadoop.dfs_absent /some_random_file
```

Returns True if the file is absent

```python
salt.modules.hadoop.dfs_present(path)
```

Check if a file or directory is present on the distributed FS.

CLI Example:

```bash
salt '*' hadoop.dfs_present /some_random_file
```

Returns True if the file is present

```python
salt.modules.hadoop.dfsadmin_report(arg=None)
```

New in version 2019.2.0.

Reports basic filesystem information and statistics. Optional flags may be used to filter the list of displayed DataNodes.

- arg [live] [dead] [decommissioning]

CLI Example:

```bash
salt '*' hadoop.dfsadmin -report
```

```python
salt.modules.hadoop.namenode_format(force=None)
```

Format a namenode
```bash
salt '*' hadoop.namenode_format force=True
```

```python
salt.modules.hadoop.version()
    Return version from hadoop version
    CLI Example:
    salt '*' hadoop.version
```

### 21.9.154 salt.modules.haproxyconn

Support for haproxy

New in version 2014.7.0.

```python
salt.modules.haproxyconn.disable_server(name, backend, socket="/var/run/haproxy.sock")
    Disable server in haproxy.
    name  Server to disable
    backend haproxy backend, or all backends if "*" is supplied
    socket haproxy stats socket, default /var/run/haproxy.sock
    CLI Example:
    salt '*' haproxy.disable_server db1.example.com mysql
```

```python
salt.modules.haproxyconn.enable_server(name, backend, socket="/var/run/haproxy.sock")
    Enable Server in haproxy
    name  Server to enable
    backend haproxy backend, or all backends if "*" is supplied
    socket haproxy stats socket, default /var/run/haproxy.sock
    CLI Example:
    salt '*' haproxy.enable_server web1.example.com www
```

```python
salt.modules.haproxyconn.get_backend(backend, socket="/var/run/haproxy.sock")
    Receive information about a specific backend.
    backend haproxy backend
    socket haproxy stats socket, default /var/run/haproxy.sock
    CLI Example:
    salt '*' haproxy.get_backend mysql
```

```python
salt.modules.haproxyconn.get_sessions(name, backend, socket="/var/run/haproxy.sock")
    New in version 2016.11.0.
    Get number of current sessions on server in backend (scur)
    name  Server name
    backend haproxy backend
    socket haproxy stats socket, default /var/run/haproxy.sock
```
CLI Example:
```
salt '*' haproxy.get_sessions web1.example.com www
```

```python
class haproxyconn:
    @staticmethod
    def get_weight(name, backend, socket='/var/run/haproxy.sock'):
        # Get server weight
        pass
```

**get_weight**

Get server weight

- **name**: Server name
- **backend**: haproxy backend
- **socket**: haproxy stats socket, default /var/run/haproxy.sock

CLI Example:
```
salt '*' haproxy.get_weight web1.example.com www
```

```python
class haproxyconn:
    @staticmethod
    def list_backends(servers=True, socket='/var/run/haproxy.sock'):
        # List HaProxy Backends
        pass
```

**list_backends**

List HaProxy Backends

- **servers**: list backends with servers
- **socket**: haproxy stats socket, default /var/run/haproxy.sock

CLI Example:
```
salt '*' haproxy.list_backends
```

```python
class haproxyconn:
    @staticmethod
    def list_frontends(socket='/var/run/haproxy.sock'):
        # List HaProxy frontends
        pass
```

**list_frontends**

List HaProxy frontends

- **socket**: haproxy stats socket, default /var/run/haproxy.sock

CLI Example:
```
salt '*' haproxy.list_frontends
```

```python
class haproxyconn:
    @staticmethod
    def list_servers(backend, socket='/var/run/haproxy.sock', objectify=False):
        # List servers in haproxy backend.
        pass
```

**list_servers**

List servers in haproxy backend.

- **backend**: haproxy backend
- **socket**: haproxy stats socket, default /var/run/haproxy.sock

CLI Example:
```
salt '*' haproxy.list_servers mysql
```

```python
class haproxyconn:
    @staticmethod
    def set_state(name, backend, state, socket='/var/run/haproxy.sock'):
        # Force a server’s administrative state to a new state. This can be useful to disable load balancing and/or any traffic to a server. Setting the state to "ready" puts the server in normal mode, and the command is the equivalent of the "enable server" command. Setting the state to "maint" disables any traffic to the server as well as any health checks. This is the equivalent of the "disable server" command. Setting the mode to "drain" only removes the server from load balancing but still allows it to be checked and to accept new persistent connections. Changes are propagated to tracking servers if any.
        pass
```

**set_state**

Force a server’s administrative state to a new state. This can be useful to disable load balancing and/or any traffic to a server. Setting the state to "ready" puts the server in normal mode, and the command is the equivalent of the "enable server" command. Setting the state to "maint" disables any traffic to the server as well as any health checks. This is the equivalent of the "disable server" command. Setting the mode to "drain" only removes the server from load balancing but still allows it to be checked and to accept new persistent connections. Changes are propagated to tracking servers if any.

- **name**: Server name
- **backend**: haproxy backend
- **state**: A string of the state to set. Must be 'ready', 'drain', or 'maint'
socket  haproxy stats socket, default /var/run/haproxy.sock

CLI Example:
```
salt '*' haproxy.set_state my_proxy_server my_backend ready
```

salt.modules.haproxyconn.set_weight(name, backend, weight=0, socket='/var/run/haproxy.sock')

Set server weight

name  Server name

backend  haproxy backend

weight  Server Weight

socket  haproxy stats socket, default /var/run/haproxy.sock

CLI Example:
```
salt '*' haproxy.set_weight web1.example.com www 13
```

salt.modules.haproxyconn.show_backends(socket='/var/run/haproxy.sock')

Show HaProxy Backends

socket  haproxy stats socket, default /var/run/haproxy.sock

CLI Example:
```
salt '*' haproxy.show_backends
```

salt.modules.haproxyconn.show_frontends(socket='/var/run/haproxy.sock')

Show HaProxy frontends

socket  haproxy stats socket, default /var/run/haproxy.sock

CLI Example:
```
salt '*' haproxy.show_frontends
```

salt.modules.haproxyconn.wait_state(backend, server, value='up', timeout=300, socket='/var/run/haproxy.sock')

Wait for a specific server state

backend  haproxy backend

server  targeted server

value  state value

timeout  timeout before giving up state value, default 5 min

socket  haproxy stats socket, default /var/run/haproxy.sock

CLI Example:
```
salt '*' haproxy.wait_state mysql server01 up 60
```

21.9.155  salt.modules.hashutil

A collection of hashing and encoding functions
salt.modules.hashutil.base64_b64decode(instr)
Decode a base64-encoded string using the "modern" Python interface

New in version 2016.3.0.
CLI Example:
salt '*' hashutil.base64_b64decode 'Z2V0IHNhbHRlZA=='

salt.modules.hashutil.base64_b64encode(instr)
Encode a string as base64 using the "modern" Python interface.

Among other possible differences, the "modern" encoder does not include newline ('n') characters in the encoded output.

New in version 2016.3.0.
CLI Example:
salt '*' hashutil.base64_b64encode 'get salted'

salt.modules.hashutil.base64_decodefile(instr, outfile)
Decode a base64-encoded string and write the result to a file

New in version 2016.3.0.
CLI Example:
salt '*' hashutil.base64_decodefile instr='Z2V0IHNhbHRlZAo=' outfile='/path/to/binary_file'

salt.modules.hashutil.base64_decodestring(instr)
Decode a base64-encoded byte-like object using the "modern" Python interface

New in version 3000.
CLI Example:
salt '*' hashutil.base64_decodestring instr='Z2V0IHNhbHRlZAo='

salt.modules.hashutil.base64_encodefile(fname)
Read a file from the file system and return as a base64 encoded string

New in version 2016.3.0.
Pillar example:

```yaml
path:
  to:
    data: |
      {{ salt.hashutil.base64_encodefile('/path/to/binary_file') | indent(6) }}
```

The file.decode state function can be used to decode this data and write it to disk.
CLI Example:
salt '*' hashutil.base64_encodefile /path/to/binary_file

salt.modules.hashutil.base64_encodestring(instr)
Encode a byte-like object as base64 using the "modern" Python interface.

Among other possible differences, the "modern" encoder includes a newline ('n') character after every 76 characters and always at the end of the encoded byte-like object.

21.9. execution modules
New in version 3000.

CLI Example:
```
salt '*' hashutil.base64_encodestring 'get salted'
```

salt.modules.hashutil.digest(instr, checksum='md5')
Return a checksum digest for a string

`instr` A string

CLI Example:
```
salt '*' hashutil.digest 'get salted'
```

salt.modules.hashutil.digest_file(infile, checksum='md5')
Return a checksum digest for a file

`infile` A file path

`checksum` [md5] The hashing algorithm to use to generate checksums. Wraps the `hashutil.digest` execution function.

CLI Example:
```
salt '*' hashutil.digest_file /path/to/file
```

salt.modules.hashutil.github_signature(string, shared_secret, challenge_hmac)
Verify a challenging hmac signature against a string / shared-secret for github webhooks.

New in version 2017.7.0.

Returns a boolean if the verification succeeded or failed.

CLI Example:
```
salt '*' hashutil.github_signature '{"ref":....} ' shared_secret' →'sha1=bc6550fc290acf5b42283fa8deaf55cea8f8c206'
```

salt.modules.hashutil.hmac_compute(string, shared_secret)
New in version 3000.

Compute a HMAC SHA256 digest using a string and secret.

CLI Example:
```
salt '*' hashutil.hmac_compute 'get salted' shared secret'
```

salt.modules.hashutil.hmac_signature(string, shared_secret, challenge_hmac)
Verify a challenging hmac signature against a string / shared-secret

New in version 2014.7.0.

Returns a boolean if the verification succeeded or failed.

CLI Example:
```
salt '*' hashutil.hmac_signature 'get salted' 'shared secret' →'eBWf9bstXg+NIP5AOwppB5HMvZiYMPzEM9W5YMm/AmQ='"
salt.modules.hashutil.md5_digest\(\text{instr}\)
Generate an md5 hash of a given string
New in version 2014.7.0.
CLI Example:
```
salt '*\' hashutil.md5_digest 'get salted'
```

salt.modules.hashutil.sha256_digest\(\text{instr}\)
Generate an sha256 hash of a given string
New in version 2014.7.0.
CLI Example:
```
salt '*\' hashutil.sha256_digest 'get salted'
```

salt.modules.hashutil.sha512_digest\(\text{instr}\)
Generate an sha512 hash of a given string
New in version 2014.7.0.
CLI Example:
```
salt '*\' hashutil.sha512_digest 'get salted'
```

### 21.9.156 salt.modules.heat module

Module for handling OpenStack Heat calls
New in version 2017.7.0.

**depends**
- heatclient Python module

**configuration** This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion’s config file. For example:

```python
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.insecure: False  # (optional)
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
# Optional
keystone.region_name: 'RegionOne'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```python
openstack1:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/

openstack2:
  keystone.user: admin
```

(continues on next page)
With this configuration in place, any of the heat functions can make use of a configuration profile by declaring it explicitly. For example:

```bash
salt '*' heat.flavor_list profile=openstack1
```

salt.modules.heat.create_stack(name=None, template_file=None, environment=None, parameters=None, poll=0, rollback=False, timeout=60, profile=None)

Create a stack (heat stack-create)

- **name**: Name of the new stack
- **template_file**: File of template
- **environment**: File of environment
- **parameters**: Parameter dict used to create the stack
- **poll**: Poll and report events until stack complete
- **rollback**: Enable rollback on create failure
- **timeout**: Stack creation timeout in minutes
- **profile**: Profile to build on

CLI Example:

```bash
salt '*' heat.create_stack name=mystack \
    template_file=salt://template.yaml \
    environment=salt://environment.yaml \
    parameters="{"image": "Debian 8", "flavor": "m1.small"}"
    poll=5 rollback=False timeout=60 profile=openstack1
```

New in version 2017.7.5,2018.3.1: The spelling mistake in parameter `enviroment` was corrected to `environment`. The `enviroent` spelling mistake has been removed in Salt 3000.

salt.modules.heat.delete_stack(name=None, poll=0, timeout=60, profile=None)

Delete a stack (heat stack-delete)

- **name**: Name of the stack
- **poll**: Poll and report events until stack complete
- **timeout**: Stack creation timeout in minutes
- **profile**: Profile to use

CLI Examples:

```bash
salt '*' heat.delete_stack name=mystack poll=5 \
    profile=openstack1
```

salt.modules.heat.list_stack(profile=None)

Return a list of available stack (heat stack-list)

- **profile**: Profile to use

CLI Example:
salt 'salt '*'heat.list_stack profile=openstack1

```python
salt.modules.heat.show_stack(name=None, profile=None)
```

Return details about a specific stack (heat stack-show)

- **name**: Name of the stack
- **profile**: Profile to use

CLI Example:

```
salt '*' heat.show_stack name=mystack profile=openstack1
```

```python
salt.modules.heat.template_stack(name=None, profile=None)
```

Return template a specific stack (heat stack-template)

- **name**: Name of the stack
- **profile**: Profile to use

CLI Example:

```
salt '*' heat.template_stack name=mystack profile=openstack1
```

```python
salt.modules.heat.update_stack(name=None, template_file=None, environment=None, parameters=None, poll=0, rollback=False, timeout=60, profile=None)
```

Update a stack (heat stack-template)

- **name**: Name of the stack
- **template_file**: File of template
- **environment**: File of environment
- **parameters**: Parameter dict used to update the stack
- **poll**: Poll and report events until stack complete
- **rollback**: Enable rollback on update failure
- **timeout**: Stack creation timeout in minutes
- **profile**: Profile to build on

CLI Example:

```
salt '*' heat.update_stack name=mystack \template_file=salt://template.yaml \environment=salt://environment.yaml \parameters="{"image": "Debian 8", "flavor": "m1.small"}" \poll=5 rollback=False timeout=60 profile=openstack1
```

New in version 2017.7.5,2018.3.1: The spelling mistake in parameter envirionment was corrected to environment. The envirionment spelling mistake has been removed in Salt 3000.

### 21.9.157 salt.modules.hg

Support for the Mercurial SCM

```python
salt.modules.hg.archive(cwd, output, rev='tip', fmt=None, prefix=None, user=None)
```

Export a tarball from the repository
cwd  The path to the Mercurial repository
output  The path to the archive tarball
rev:  tip  The revision to create an archive from
fmt:  None  Format of the resulting archive. Mercurial supports: tar, tbz2, tgz, zip, uzip, and files formats.
prefix  [None] Prepend <prefix>/ to every filename in the archive
user  [None] Run hg as a user other than what the minion runs as
If prefix is not specified it defaults to the basename of the repo directory.
CLI Example:

```bash
salt '*' hg.archive /path/to/repo output=/tmp/archive.tgz fmt=tgz
```

salt.modules.hg.clone(cwd, repository, opts=None, user=None, identity=None)
Clone a new repository

cwd  The path to the Mercurial repository
repository  The hg URI of the repository
opts  [None] Any additional options to add to the command line
user  [None] Run hg as a user other than what the minion runs as
identity  [None] Private SSH key on the minion server for authentication (ssh://)

New in version 2015.5.0.
CLI Example:

```bash
salt '*' hg.clone /path/to/repo https://bitbucket.org/birkenfeld/sphinx
```

salt.modules.hg.describe(cwd, rev='tip', user=None)
Mimic git describe and return an identifier for the given revision

cwd  The path to the Mercurial repository
rev:  tip  The path to the archive tarball
user  [None] Run hg as a user other than what the minion runs as
CLI Example:

```bash
salt '*' hg.describe /path/to/repo
```

salt.modules.hg.pull(cwd, opts=None, user=None, identity=None, repository=None)
Perform a pull on the given repository

cwd  The path to the Mercurial repository
repository  [None] Perform pull from the repository different from .hg/hgrc:[paths]:default
opts  [None] Any additional options to add to the command line
user  [None] Run hg as a user other than what the minion runs as
identity  [None] Private SSH key on the minion server for authentication (ssh://)

New in version 2015.5.0.
CLI Example:
```bash
salt '*' hg.pull /path/to/repo opts=-u
```

**salt.modules.hg.revision(cwd, rev='tip', short=False, user=None)**

Returns the long hash of a given identifier (hash, branch, tag, HEAD, etc)

- **cwd** The path to the Mercurial repository
- **rev**: tip The revision
- **short**: False Return an abbreviated commit hash
- **user** [None] Run hg as a user other than what the minion runs as

**CLI Example:**
```
salt '*' hg.revision /path/to/repo mybranch
```

**salt.modules.hg.status(cwd, opts=None, user=None)**

Show changed files of the given repository

- **cwd** The path to the Mercurial repository
- **opts** [None] Any additional options to add to the command line
- **user** [None] Run hg as a user other than what the minion runs as

**CLI Example:**
```
salt '*' hg.status /path/to/repo
```

**salt.modules.hg.update(cwd, rev, force=False, user=None)**

Update to a given revision

- **cwd** The path to the Mercurial repository
- **rev** The revision to update to
- **force** [False] Force an update
- **user** [None] Run hg as a user other than what the minion runs as

**CLI Example:**
```
salt devserver1 hg.update /path/to/repo somebranch
```

### 21.9.158 salt.modules.hosts

Manage the information in the hosts file

**salt.modules.hosts.add_host(ip, alias)**

Add a host to an existing entry, if the entry is not in place then create it with the given host

**CLI Example:**
```
salt '*' hosts.add_host <ip> <alias>
```

**salt.modules.hosts.get_alias(ip)**

Return the list of aliases associated with an ip

Aliases (host names) are returned in the order in which they appear in the hosts file. If there are no aliases associated with the IP, an empty list is returned.
**CLI Example:**
```bash
salt '*' hosts.get_alias <ip addr>
```

`salt.modules.hosts.get_ip(host)`
Return the ip associated with the named host

**CLI Example:**
```bash
salt '*' hosts.get_ip <hostname>
```

`salt.modules.hosts.has_pair(ip, alias)`
Return true if the alias is set

**CLI Example:**
```bash
salt '*' hosts.has_pair <ip> <alias>
```

`salt.modules.hosts.list_hosts()`
Return the hosts found in the hosts file in this format:
```json
{'<ip addr>': ['alias1', 'alias2', ...]}
```

**CLI Example:**
```bash
salt '*' hosts.list_hosts
```

`salt.modules.hosts.rm_host(ip, alias)`
Remove a host entry from the hosts file

**CLI Example:**
```bash
salt '*' hosts.rm_host <ip> <alias>
```

`salt.modules.hosts.set_host(ip, alias)`
Set the host entry in the hosts file for the given ip, this will overwrite any previous entry for the given ip

Changed in version 2016.3.0: If alias does not include any host names (it is the empty string or contains only whitespace), all entries for the given IP address are removed.

**CLI Example:**
```bash
salt '*' hosts.set_host <ip> <alias>
```

## 21.9.159 `salt.modules.http`

Module for making various web calls. Primarily designed for webhooks and the like, but also useful for basic http testing.

New in version 2015.5.0.

`salt.modules.http.query(url, **kwargs)`
New in version 2015.5.0.
Query a resource, and decode the return data
Passes through all the parameters described in the `utils.http.query` function:
salt.utils.http.query(url, method='GET', params=None, data=None, data_file=None, header_dict=None, header_list=None, header_file=None, username=None, password=None, auth=None, decode=False, decode_type='auto', status=False, headers=False, text=False, cookies=None, cookie_jar=None, cookie_format='lwp', persist_session=False, session_cookie_jar=None, data_render=False, data_renderer=None, header_render=False, header_renderer=None, template_dict=None, test=False, test_url=None, node='minion', port=80, opts=None, backend=None, ca_bundle=None, verify_ssl=None, cert=None, text_out=None, headers_out=None, decode_out=None, stream=False, streaming_callback=None, header_callback=None, handle=False, agent='Salt/3000.2', hide_fields=None, raise_error=True, formdata=False, formdata_fieldname=None, formdata_filename=None, **kwargs)

Query a resource, and decode the return data

raise_error [True] If False, and if a connection cannot be made, the error will be suppressed and the body of the return will simply be None.

CLI Example:

```
salt '*' http.query http://somelink.com/
salt '*' http.query http://somelink.com/ method=POST  
  → 'key1=val1&key2=val2'
salt '*' http.query http://somelink.com/ method=POST data='<xml>
  → somecontent'</xml>'
```

salt.modules.http.update_ca_bundle(target=None, source=None, merge_files=None)

Update the local CA bundle file from a URL

New in version 2015.5.0.

CLI Example:

```
salt '*' http.update_ca_bundle
salt '*' http.update_ca_bundle target=/path/to/cacerts.pem
salt '*' http.update_ca_bundle source=https://example.com/cacerts.pem
```

If the target is not specified, it will be pulled from the ca_cert configuration variable available to the minion. If it cannot be found there, it will be placed at <<FILE_ROOTS>>/cacerts.pem.

If the source is not specified, it will be pulled from the ca_cert_url configuration variable available to the minion. If it cannot be found, it will be downloaded from the cURL website, using an http (not https) URL. USING THE DEFAULT URL SHOULD BE AVOIDED!

merge_files may also be specified, which includes a string or list of strings representing a file or files to be appended to the end of the CA bundle, once it is downloaded.

CLI Example:

```
salt '*' http.update_ca_bundle merge_files=/path/to/mycert.pem
```

salt.modules.http.wait_for_successful_query(url, wait_for=300, **kwargs)

Query a resource until a successful response, and decode the return data

CLI Example:

```
salt '*' http.wait_for_successful_query http://somelink.com/ wait_for=160 request_
  → interval=1
```
21.9.160  salt.modules.ifttt

Support for IFTTT

New in version 2015.8.0.

Requires an api_key in /etc/salt/minion:

```
ifttt:
  secret_key: '280d4699-a817-4719-ba6f-ca56e573e44f'
```

salt.modules.ifttt.trigger_event(event=None, **kwargs)

Trigger a configured event in IFTTT.

**Parameters**

- `event` – The name of the event to trigger.

**Returns**

A dictionary with status, text, and error if result was failure.

21.9.161  salt.modules.ilo

Manage HP ILO

**depends**  hponcfg (SmartStart Scripting Toolkit Linux Edition)

salt.modules.ilo.change_password(username, password)

Reset a users password

CLI Example:

```
salt '*' ilo.change_password damianMyerscough
```

salt.modules.ilo.change_username(old_username, new_username)

Change a username

CLI Example:

```
salt '*' ilo.change_username damian diana
```

salt.modules.ilo.configure_network(ip, netmask, gateway)

Configure Network Interface

CLI Example:

```
salt '*' ilo.configure_network [IP ADDRESS] [NETMASK] [GATEWAY]
```

salt.modules.ilo.configure_snmp(community, snmp_port=161, snmp_trapport=161)

Configure SNMP

CLI Example:

```
salt '*' ilo.configure_snmp [COMMUNITY STRING] [SNMP PORT] [SNMP TRAP PORT]
```

salt.modules.ilo.create_user(name, password, *privileges)

Create user

CLI Example:

```
salt '*' ilo.create_user damian secretagent VIRTUAL_MEDIA_PRIV
```
If no permissions are specify the user will only have a read-only account.

Supported privileges:

- ADMIN_PRIV Enables the user to administer user accounts.
- REMOTE_CONS_PRIV Enables the user to access the Remote Console functionality.
- RESET_SERVER_PRIV Enables the user to remotely manipulate the server power setting.
- VIRTUAL_MEDIA_PRIV Enables the user permission to access the virtual media functionality.
- CONFIG_ILO_PRIV Enables the user to configure iLO settings.

```
salt.modules.ilo.delete_ssh_key(username)
  Delete a users SSH key from the ILO
  CLI Example:
  salt '*' ilo.delete_user_sshkey damian
```

```
salt.modules.ilo.delete_user(username)
  Delete a user
  CLI Example:
  salt '*' ilo.delete_user damian
```

```
salt.modules.ilo.disable_dhcp()
  Disable DHCP
  CLI Example:
  salt '*' ilo.disable_dhcp
```

```
salt.modules.ilo.disable_ssh()
  Disable the SSH daemon
  CLI Example:
  salt '*' ilo.disable_ssh
```

```
salt.modules.ilo.enable_dhcp()
  Enable DHCP
  CLI Example:
  salt '*' ilo.enable_dhcp
```

```
salt.modules.ilo.enable_ssh()
  Enable the SSH daemon
  CLI Example:
  salt '*' ilo.enable_ssh
```

```
salt.modules.ilo.get_user(username)
  Returns local user information, excluding the password
  CLI Example:
  salt '*' ilo.get_user damian
```
salt.modules.ilo.global_settings()  
Show global settings  
CLI Example:  
salt '*' ilo.global_settings

salt.modules.ilo.list_users()  
List all users  
CLI Example:  
salt '*' ilo.list_users

salt.modules.ilo.list_users_info()  
List all users in detail  
CLI Example:  
salt '*' ilo.list_users_info

salt.modules.ilo.network()  
Grab the current network settings  
CLI Example:  
salt '*' ilo.network

salt.modules.ilo.set_http_port(port=80)  
Configure the port HTTP should listen on  
CLI Example:  
salt '*' ilo.set_http_port 8080

salt.modules.ilo.set_https_port(port=443)  
Configure the port HTTPS should listen on  
CLI Example:  
salt '*' ilo.set_https_port 4334

salt.modules.ilo.set_ssh_key(public_key)  
Configure SSH public keys for specific users  
CLI Example:  
salt '*' ilo.set_ssh_key "ssh-dss AAAAB3NzaC1kc3MAAAACBA... damian"

The SSH public key needs to be DSA and the last argument in the key needs to be the username (case-sensitive) of the ILO username.

salt.modules.ilo.set_ssh_port(port=22)  
Enable SSH on a user defined port  
CLI Example:  
salt '*' ilo.set_ssh_port 2222
21.9.162  salt.modules.icinga2 module

Module to provide icinga2 compatibility to salt.

New in version 2017.7.0.

depends
  • icinga2 server

salt.modules.icinga2.generate_cert(domain)
  Generate an icinga2 client certificate and key.
  
  Returns: icinga2 pki new-cert -cn domain.tld -key /etc/icinga2/pki/domain.tld.key -cert /etc/icinga2/pki/domain.tld.crt
  
  CLI Example:
  
  ```
  salt '*' icinga2.generate_cert domain.tld
  ```

salt.modules.icinga2.generate_ticket(domain)
  Generate and save an icinga2 ticket.

  Returns: icinga2 pki ticket -cn domain.tld
  
  CLI Example:
  
  ```
  salt '*' icinga2.generate_ticket domain.tld
  ```

salt.modules.icinga2.node_setup(domain, master, ticket)
  Setup the icinga2 node.

  Returns: icinga2 nodetup -ticket TICKET_ID -endpoint master.domain.tld -zone domain.tld -master_host master.domain.tld -trustedcert /etc/icinga2/pki/trusted-master.crt
  
  CLI Example:
  
  ```
  salt '*' icinga2.node_setup domain.tld master.domain.tld TICKET_ID
  ```

salt.modules.icinga2.request_cert(domain, master, ticket, port)
  Request CA cert from master icinga2 node.

  Returns: icinga2 pki request -host master.domain.tld -port 5665 -ticket TICKET_ID -key /etc/icinga2/pki/domain.tld.key -cert /etc/icinga2/pki/domain.tld.crt -trustedcert /etc/icinga2/pki/trusted-master.crt -ca /etc/icinga2/pki/ca.crt
  
  CLI Example:
  
  ```
  salt '*' icinga2.request_cert domain.tld master.domain.tld TICKET_ID
  ```

salt.modules.icinga2.save_cert(domain, master)
  Save the certificate for master icinga2 node.

  Returns: icinga2 pki save-cert -key /etc/icinga2/pki/domain.tld.key -cert /etc/icinga2/pki/domain.tld.crt -trustedcert /etc/icinga2/pki/trusted-master.crt -host master.domain.tld
  
  CLI Example:
  
  ```
  salt '*' icinga2.save_cert domain.tld master.domain.tld
  ```
21.9.163 salt.modules.incron

Work with incron

salt.modules.incron.list_tab(user)
Return the contents of the specified user’s incrontab

CLI Example:

```
salt '*' incron.list_tab root
```

salt.modules.incron.ls(user)
This function is an alias of list_tab.
Return the contents of the specified user’s incrontab

CLI Example:

```
salt '*' incron.ls root
```

salt.modules.incron.raw_incron(user)
Return the contents of the user’s incrontab

CLI Example:

```
salt '*' incron.raw_incron root
```

salt.modules.incron.raw_system_incron()
Return the contents of the system wide incrontab

CLI Example:

```
salt '*' incron.raw_system_incron
```

salt.modules.incron.rm(user, path, mask, cmd)
This function is an alias of rm_job.
Remove a incron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.

CLI Example:

```
salt '*' incron.rm root /path
```

salt.modules.incron.rm_job(user, path, mask, cmd)
Remove a incron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.

CLI Example:

```
salt '*' incron.rm_job root /path
```

salt.modules.incron.set_job(user, path, mask, cmd)
Sets an incron job up for a specified user.

CLI Example:

```
salt '*' incron.set_job root '/root' 'IN_MODIFY' 'echo "$$ $@ $# $% $&"
```
salt.modules.incron.write_incron_file\(user, path\)

Writes the contents of a file to a user’s incrontab

CLI Example:

```
salt '*' incron.write_incron_file root /tmp/new_incron
```

salt.modules.incron.write_incron_file_verbose\(user, path\)

Writes the contents of a file to a user’s incrontab and return error message on error

CLI Example:

```
salt '*' incron.write_incron_file_verbose root /tmp/new_incron
```

### 21.9.164 salt.modules.influxdbmod

InfluxDB - A distributed time series database

Module to provide InfluxDB compatibility to Salt (compatible with InfluxDB version 0.9+)

**depends**

- influxdb Python module (>= 3.0.0)

**configuration** This module accepts connection configuration details either as parameters or as configuration settings in /etc/salt/minion on the relevant minions:

```
influxdb.host: 'localhost'
influxdb.port: 8086
influxdb.user: 'root'
influxdb.password: 'root'
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

Most functions in this module allow you to override or provide some or all of these settings via keyword arguments:

```
salt '*' influxdb.foo_function influxdb_user='influxadmin' influxdb_--password='s3cr1t'
```

would override user and password while still using the defaults for host and port.

salt.modules.influxdbmod.alter_retention_policy\(database, name, duration, replication, default=False, **client_args\)

Modify an existing retention policy.

**name** Name of the retention policy to modify.

**database** Name of the database for which the retention policy was defined.

**duration** New duration of given retention policy.

- Durations such as 1h, 90m, 12h, 7d, and 4w, are all supported and mean 1 hour, 90 minutes, 12 hours, 7 day, and 4 weeks, respectively. For infinite retention – meaning the data will never be deleted – use ‘INF’ for duration. The minimum retention period is 1 hour.

**replication** New replication of given retention policy.

- This determines how many independent copies of each data point are stored in a cluster.

**default** [False] Whether or not to set the modified policy as default.
CLI Example:
```
salt '*' influxdb.alter_retention_policy metrics default 1d 1
```

```
salt.modules.influxdbmod.continuous_query_exists(database, name, **client_args)
```
Check if continuous query with given name exists on the database.

```
database  Name of the database for which the continuous query was defined.
name  Name of the continuous query to check.
```

CLI Example:
```
salt '*' influxdb.continuous_query_exists metrics default
```

```
salt.modules.influxdbmod.create_continuous_query(database, name, query, resample_time=None, coverage_period=None, **client_args)
```
Create a continuous query.

```
database  Name of the database for which the continuous query will be created on.
name  Name of the continuous query to create.
query  The continuous query string.
resample_time [None] Duration between continuous query resampling.
coverage_period [None] Duration specifying time period per sample.
```

CLI Example:
```
salt '*' influxdb.create_continuous_query mydb cq_month 'SELECT mean(*) INTO mydb.a_month.:MEASUREMENT FROM mydb.a_week./.* GROUP BY time(5m), *'
```

```
salt.modules.influxdbmod.create_db(name, **client_args)
```
Create a database.

```
name  Name of the database to create.
```

CLI Example:
```
salt '*' influxdb.create_db <name>
```

```
salt.modules.influxdbmod.create_retention_policy(database, name, duration, replication, default=False, **client_args)
```
Create a retention policy.

```
database  Name of the database for which the retention policy will be created.
name  Name of the new retention policy.
duration  Duration of the new retention policy.
```

```
Durations such as 1h, 90m, 12h, 7d, and 4w, are all supported and mean 1 hour, 90 minutes, 12 hours, 7 day, and 4 weeks, respectively. For infinite retention – meaning the data will never be deleted – use 'INF' for duration. The minimum retention period is 1 hour.
```

```
replication  Replication factor of the retention policy.
```

```
This determines how many independent copies of each data point are stored in a cluster.
default [False] Whether or not the policy as default will be set as default.
```

CLI Example:
salt '*' influxdb.create_retention_policy metrics default 1d 1

salt.modules.influxdbmod.create_user(name, passwd, admin=False, **client_args)
Create a user.

name Name of the user to create.

passwd Password of the new user.

admin [False] Whether the user should have cluster administration privileges or not.

CLI Example:

```bash
salt '*' influxdb.create_user <name> <password>
salt '*' influxdb.create_user <name> <password> admin=True
```

salt.modules.influxdbmod.db_exists(name, **client_args)
Checks if a database exists in InfluxDB.

name Name of the database to check.

CLI Example:

```bash
salt '*' influxdb.db_exists <name>
```

salt.modules.influxdbmod.drop_continuous_query(database, name, **client_args)
Drop a continuous query.

database Name of the database for which the continuous query will be drop from.

name Name of the continuous query to drop.

CLI Example:

```bash
salt '*' influxdb.drop_continuous_query mydb my_cq
```

salt.modules.influxdbmod.drop_db(name, **client_args)
Drop a database.

name Name of the database to drop.

CLI Example:

```bash
salt '*' influxdb.drop_db <name>
```

salt.modules.influxdbmod.drop_retention_policy(database, name, **client_args)
Drop a retention policy.

database Name of the database for which the retention policy will be dropped.

name Name of the retention policy to drop.

CLI Example:

```bash
salt '*' influxdb.drop_retention_policy mydb mypr
```

salt.modules.influxdbmod.get_continuous_query(database, name, **client_args)
Get an existing continuous query.

database Name of the database for which the continuous query was defined.

name Name of the continuous query to get.
CLI Example:

```
salt '*' influxdb.get_continuous_query mydb cq_month
```

`salt.modules.influxdbmod.get_retention_policy(database, name, **client_args)`
Get an existing retention policy.

- **database** Name of the database for which the retention policy was defined.
- **name** Name of the retention policy.

CLI Example:

```
salt '*' influxdb.get_retention_policy metrics default
```

`salt.modules.influxdbmod.grant_admin_privileges(name, **client_args)`
Grant cluster administration privileges to a user.

- **name** Name of the user to whom admin privileges will be granted.

CLI Example:

```
salt '*' influxdb.grant_admin_privileges <name>
```

`salt.modules.influxdbmod.grant_privilege(database, privilege, username, **client_args)`
Grant a privilege on a database to a user.

- **database** Name of the database to grant the privilege on.
- **privilege** Privilege to grant. Can be one of 'read', 'write' or 'all'.
- **username** Name of the user to grant the privilege to.

`salt.modules.influxdbmod.list_dbs(**client_args)`
List all InfluxDB databases.

CLI Example:

```
salt '*' influxdb.list_dbs
```

`salt.modules.influxdbmod.list_privileges(name, **client_args)`
List privileges from a user.

- **name** Name of the user from whom privileges will be listed.

CLI Example:

```
salt '*' influxdb.list_privileges <name>
```

`salt.modules.influxdbmod.list_users(**client_args)`
List all users.

CLI Example:

```
salt '*' influxdb.list_users
```

`salt.modules.influxdbmod.query(database, query, **client_args)`
Execute a query.

- **database** Name of the database to query on.
- **query** InfluxQL query string.
salt.modules.influxdbmod.remove_user(name, **client_args)
    Remove a user.
    name  Name of the user to remove

    CLI Example:
    salt '*' influxdb.remove_user <name>

salt.modules.influxdbmod.retention_policy_exists(database, name, **client_args)
    Check if retention policy with given name exists.
    database  Name of the database for which the retention policy was defined.
    name  Name of the retention policy to check.

    CLI Example:
    salt '*' influxdb.retention_policy_exists metrics default

salt.modules.influxdbmod.revoke_admin_privileges(name, **client_args)
    Revoke cluster administration privileges from a user.
    name  Name of the user from whom admin privileges will be revoked.

    CLI Example:
    salt '*' influxdb.revoke_admin_privileges <name>

salt.modules.influxdbmod.revoke_privilege(database, privilege, username, **client_args)
    Revoke a privilege on a database from a user.
    database  Name of the database to grant the privilege on.
    privilege  Privilege to grant. Can be one of 'read', 'write' or 'all'.
    username  Name of the user to grant the privilege to.

salt.modules.influxdbmod.set_user_password(name, passwd, **client_args)
    Change password of a user.
    name  Name of the user for whom to set the password.
    passwd  New password of the user.

    CLI Example:
    salt '*' influxdb.set_user_password <name> <password>

salt.modules.influxdbmod.user_exists(name, **client_args)
    Check if a user exists.
    name  Name of the user to check.

    CLI Example:
    salt '*' influxdb.user_exists <name>

salt.modules.influxdbmod.user_info(name, **client_args)
    Get information about given user.
    name  Name of the user for which to get information.

    CLI Example:
21.9.165 `salt.modules.influxdb08mod`

InfluxDB - A distributed time series database

Module to provide InfluxDB compatibility to Salt (compatible with InfluxDB version 0.5-0.8)

New in version 2014.7.0.

**depends**

- influxdb Python module (>= 1.0.0)

**configuration** This module accepts connection configuration details either as parameters or as configuration settings in `/etc/salt/minion` on the relevant minions:

```python
influxdb08.host: 'localhost'
influxdb08.port: 8086
influxdb08.user: 'root'
influxdb08.password: 'root'
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

**salt.modules.influxdb08mod.db_create**

Create a database

* `name` Database name to create
* `user` The user to connect as
* `password` The password of the user
* `host` The host to connect to
* `port` The port to connect to

CLI Example:

```bash
salt '*' influxdb08.db_create <name>
salt '*' influxdb08.db_create <name> <user> <password> <host> <port>
```

**salt.modules.influxdb08mod.db_exists**

Checks if a database exists in Influxdb

* `name` Database name to create
* `user` The user to connect as
* `password` The password of the user
* `host` The host to connect to
* `port` The port to connect to

CLI Example:

```bash
salt '*' influxdb08.db_exists <name>
salt '*' influxdb08.db_exists <name> <user> <password> <host> <port>
```
salt.modules.influxdb08mod.db_list(user=None, password=None, host=None, port=None)
List all InfluxDB databases

- user: The user to connect as
- password: The password of the user
- host: The host to connect to
- port: The port to connect to

CLI Example:
```
salt '*' influxdb08.db_list
salt '*' influxdb08.db_list <user> <password> <host> <port>
```

salt.modules.influxdb08mod.db_remove(name, user=None, password=None, host=None, port=None)
Remove a database

- name: Database name to remove
- user: The user to connect as
- password: The password of the user
- host: The host to connect to
- port: The port to connect to

CLI Example:
```
salt '*' influxdb08.db_remove <name>
salt '*' influxdb08.db_remove <name> <user> <password> <host> <port>
```

salt.modules.influxdb08mod.login_test(name, password, database=None, host=None, port=None)
Checks if a credential pair can log in at all.

If a database is specified: it will check for database user existence. If a database is not specified: it will check for cluster admin existence.

- name: The user to connect as
- password: The password of the user
- database: The database to try to log in to
- host: The host to connect to
- port: The port to connect to

CLI Example:
```
salt '*' influxdb08.login_test <name>
salt '*' influxdb08.login_test <name> <database>
salt '*' influxdb08.login_test <name> <database> <user> <password> <host> <port>
```

salt.modules.influxdb08mod.query(database, query, time_precision='s', chunked=False, user=None, password=None, host=None, port=None)
Querying data

- database: The database to query
- query: Query to be executed
The database to operate on.
name Name of the policy to modify.
duration How long InfluxDB keeps the data.
replication How many copies of the data are stored in the cluster.
default Whether this policy should be the default or not. Default is False.

CLI Example:
```
salt '*' influxdb08.retention_policy_add metrics default 1d 1
```

salt.modules.influxdb08mod.retain_policy_exists(database, name, user=None, password=None, host=None, port=None)

Check if a retention policy exists.
database The database to operate on.
name Name of the policy to modify.

CLI Example:
salt 'salt' influxdb08.retention_policy_exists metrics default

salt.modules.influxdb08mod.retenion_policy_get(database, name, user=None, password=None, host=None, port=None)

Get an existing retention policy.

- **database** The database to operate on.
- **name** Name of the policy to modify.

CLI Example:
salt '*' influxdb08.retention_policy_get metrics default

salt.modules.influxdb08mod.user_chpass(name, passwd, database=None, user=None, password=None, host=None, port=None)

Change password for a cluster admin or a database user.

If a database is specified: it will update database user password. If a database is not specified: it will update cluster admin password.

- **name** User name for whom to change the password
- **passwd** New password
- **database** The database on which to operate
- **user** The user to connect as
- **password** The password of the user
- **host** The host to connect to
- **port** The port to connect to

CLI Example:
salt '*' influxdb08.user_chpass <name> <passwd>
salt '*' influxdb08.user_chpass <name> <passwd> <database>
salt '*' influxdb08.user_chpass <name> <passwd> <database> <user> <password> ←<host> <port>

salt.modules.influxdb08mod.user_create(name, passwd, database=None, user=None, password=None, host=None, port=None)

Create a cluster admin or a database user.

If a database is specified: it will create database user. If a database is not specified: it will create a cluster admin.

- **name** User name for the new user to create
- **passwd** Password for the new user to create
- **database** The database to create the user in
- **user** The user to connect as
- **password** The password of the user
- **host** The host to connect to
- **port** The port to connect to

CLI Example:
salt.modules.influxdb08mod.user_create(name, passwd, database, user, password, host, port)

salt.modules.influxdb08mod.user_create(name, passwd, database, user, password, host, port)

salt.modules.influxdb08mod.user_create(name, passwd, database, user, password, host, port)

salt.modules.influxdb08mod.user_create(name, passwd, database, user, password, host, port)

salt.modules.influxdb08mod.user_exists(name, database=None, user=None, password=None, host=None, port=None)

Checks if a cluster admin or database user exists.

If a database is specified: it will check for database user existence. If a database is not specified: it will check for cluster admin existence.

name User name

database The database to check for the user to exist

user The user to connect as

password The password of the user

host The host to connect to

port The port to connect to

CLI Example:

salt '*' influxdb08.user_exists <name>
salt '*' influxdb08.user_exists <name> <database>
salt '*' influxdb08.user_exists <name> <database> <user> <password> <host> <port>

salt.modules.influxdb08mod.user_list(database=None, user=None, password=None, host=None, port=None)

List cluster admins or database users.

If a database is specified: it will return database users list. If a database is not specified: it will return cluster admins list.

database The database to list the users from

user The user to connect as

password The password of the user

host The host to connect to

port The port to connect to

CLI Example:
	salt '*' influxdb08.user_list
salt '*' influxdb08.user_list <database>
salt '*' influxdb08.user_list <database> <user> <password> <host> <port>

salt.modules.influxdb08mod.user_remove(name, database=None, user=None, password=None, host=None, port=None)

Remove a cluster admin or a database user.

If a database is specified: it will remove the database user. If a database is not specified: it will remove the cluster admin.

name User name to remove

database The database to remove the user from
user  User name for the new user to delete
user  The user to connect as
password  The password of the user
host  The host to connect to
port  The port to connect to

CLI Example:

```bash
salt '*' influxdb08.user_remove <name>
salt '*' influxdb08.user_remove <name> <database>
salt '*' influxdb08.user_remove <name> <database> <user> <password> <host> <port>
```

21.9.166  salt.modules.infoblox

This module have been tested on infoblox API v1.2.1, other versions of the API are likly workable.

depends  libinfoblox, https://github.com/steverweber/libinfoblox

libinfoblox can be installed using pip install libinfoblox

API documents can be found on your infoblox server at:

https://INFOBLOX/wapidoc

configuration  The following configuration defaults can be defined (pillar or config files '/etc/salt/master.d/infoblox.conf'):

```yaml
infoblox.config:
  api_sslverify: True
  api_url: 'https://INFOBLOX/wapi/v1.2.1'
  api_user: 'username'
  api_key: 'password'
```

Many of the functions accept api_opts to override the API config.

```bash
salt-call infoblox.get_host name=my.host.com api_url: 'https://INFOBLOX/wapi/v1.2.1' api_user=admin api_key=passs
```

salt.modules.infoblox.create_a(data, **api_opts)

Create A record.

This is a helper function to create_object. See your infoblox API for full data format.

CLI Example:

```bash
salt-call infoblox.create_a data =
  name: 'fastlinux.math.example.ca'
  ipv4addr: '127.0.0.1'
  view: 'External'
```

salt.modules.infoblox.create_cname(data, **api_opts)

Create a cname record.

CLI Example:
salt.modules.infoblox.create_cname(data="comment": "cname to example", "name": "example.example.com", "zone": "example.com", "view": "Internal", "canonical": "example-ha-0.example.com")

salt.modules.infoblox.create_host(data, **api_opts)
Add host record

Avoid race conditions, use func:nextavailableip for ipv[4,6]addrs:
• func:nextavailableip:network/ZG54dfgrDFEFSfsfzA:10.0.0.0/8/default
• func:nextavailableip:10.0.0.0/8
• func:nextavailableip:10.0.0.0/8,external
• func:nextavailableip:10.0.0.3-10.0.0.10

See your infoblox API for full data format.

CLI Example:

salt-call infoblox.create_host
  data =
    {'name': 'hostname.example.ca',
    'aliases': ['hostname.math.example.ca'],
    'extattrs': [{'Business Contact': {'value': 'example@example.ca'}],
    'ipv4addr': [{'configure_for_dhcp': True,
    'ipv4addr': 'func:nextavailableip:129.97.139.0/24',
    'mac': '00:50:56:84:6e:ae'}],
    'ipv6addr': []},

salt.modules.infoblox.create_ipv4_range(data, **api_opts)
Create a ipv4 range

This is a helper function to create_object See your infoblox API for full data format.

CLI Example:

salt-call infoblox.create_ipv4_range
  data={
    'start_addr': '129.97.150.160',
    'end_addr': '129.97.150.170'}

salt.modules.infoblox.create_object(object_type, data, **api_opts)
Create raw infoblox object. This is a low level api call.

CLI Example:

salt-call infoblox.update_object
  object_type=record:host
  data={}

salt.modules.infoblox.delete_a(name=None, ipv4addr=None, allow_array=False, **api_opts)
Delete A record

If the A record is used as a round robin you can set allow_array=True to delete all records for the host-name.

CLI Examples:
salt-call infoblox.delete_a name=abc.example.com
salt-call infoblox.delete_a ipv4addr=192.168.3.5
salt-call infoblox.delete_a name=acname.example.com allow_array=True

salt.modules.infoblox.delete_cname(name=None, canonical=None, **api_opts)
Delete CNAME. This is a helper call to delete_object.
If record is not found, return True

CLI Examples:
salt-call infoblox.delete_cname name=example.example.com
salt-call infoblox.delete_cname canonical=example-ha-0.example.com

salt.modules.infoblox.delete_host(name=None, mac=None, ipv4addr=None, **api_opts)
Delete host

CLI Example:
salt-call infoblox.delete_host name=example.domain.com
salt-call infoblox.delete_host ipv4addr=123.123.122.12
salt-call infoblox.delete_host ipv4addr=123.123.122.12 mac=00:50:56:84:6e:ae

salt.modules.infoblox.delete_ipv4_range(start_addr=None, end_addr=None, **api_opts)
Delete ip range.

CLI Example:
salt-call infoblox.delete_ipv4_range start_addr=123.123.122.12

salt.modules.infoblox.delete_object(objref, **api_opts)
Delete infoblox object. This is a low level api call.

CLI Example:
salt-call infoblox.delete_object objref=[ref_of_object]

salt.modules.infoblox.diff_objects(obja, objb)
Diff two complex infoblox objects. This is used from salt states to detect changes in objects.
Using func:nextavailableip will not cause a diff if the ipaddress is in range

salt.modules.infoblox.get_a(name=None, ipv4addr=None, allow_array=True, **api_opts)
Get A record

CLI Examples:
salt-call infoblox.get_a name=abc.example.com
salt-call infoblox.get_a ipv4addr=192.168.3.5

salt.modules.infoblox.get_cname(name=None, canonical=None, return_fields=None, **api_opts)
Get CNAME information.

CLI Examples:
salt-call infoblox.get_cname name=example.example.com
salt-call infoblox.get_cname canonical=example-ha-0.example.com

salt.modules.infoblox.get_host(name=None, ipv4addr=None, mac=None, return_fields=None, **api_opts)
Get host information
CLI Examples:

```bash
salt-call infoblox.get_host hostname.domain.ca
salt-call infoblox.get_host_ipv4 addr=123.123.122.12
salt-call infoblox.get_host mac=00:50:56:84:6e:ae
```

**salt.modules.infoblox.get_host_advanced** *(name=None, ipv4addr=None, mac=None, **api_opts)*

Get all host information

CLI Example:

```bash
salt-call infoblox.get_host_advanced hostname.domain.ca
```

**salt.modules.infoblox.get_host_domainname** *(name, domains=None, **api_opts)*

Get host domain name

If no domains are passed, the hostname is checked for a zone in infoblox, if no zone split on first dot.

If domains are provided, the best match out of the list is returned.

If none are found the return is None

dots at end of names are ignored.

CLI Example:

```bash
salt-call uwl.get_host_domainname name=localhost.t.domain.com # returns: t.domain.com
```

**salt.modules.infoblox.get_host_hostname** *(name, domains=None, **api_opts)*

Get hostname

If no domains are passed, the hostname is checked for a zone in infoblox, if no zone split on first dot.

If domains are provided, the best match out of the list is truncated from the fqdn leaving the hostname.

If no matching domains are found the fqdn is returned.

dots at end of names are ignored.

CLI Examples:

```bash
salt-call infoblox.get_host_hostname fqdn=localhost.xxx.t.domain.com # returns: localhost.xxx
salt-call infoblox.get_host_hostname fqdn=localhost.xxx.t.domain.com # returns: localhost
```

**salt.modules.infoblox.get_host_ipv4** *(name=None, mac=None, allow_array=False, **api_opts)*

Get ipv4 address from host record.

Use `allow_array` to return possible multiple values.

CLI Examples:

```bash
salt-call infoblox.get_host_ipv4 host=localhost.domain.com
salt-call infoblox.get_host_ipv4 mac=00:50:56:84:6e:ae
```
**salt.modules.infoblox.get_host_ipv4addr_info**

Get host ipv4addr information

CLI Examples:

```bash
salt-call infoblox.get_ipv4addr ipv4addr=123.123.122.12
salt-call infoblox.get_ipv4addr mac=00:50:56:84:6e:ae
salt-call infoblox.get_ipv4addr mac=00:50:56:84:6e:ae return_fields=host return_
```

**salt.modules.infoblox.get_host_ipv6addr_info**

Get host ipv6addr information

CLI Example:

```bash
salt-call infoblox.get_host_ipv6addr_info ipv6addr=2001:db8:85a3:8d3:1349:8a2e:370:7348
```

**salt.modules.infoblox.get_host_mac**

Get mac address from host record.

Use `allow_array` to return possible multiple values.

CLI Example:

```bash
salt-call infoblox.get_host_mac host=localhost.domain.com
```

**salt.modules.infoblox.get_ipv4_range**

Get ip range

CLI Example:

```bash
salt-call infoblox.get_ipv4_range start_addr=123.123.122.12
```

**salt.modules.infoblox.get_network**

Get list of all networks. This is helpful when looking up subnets to use with func:nextavailableip

This call is often slow and not cached!

CLI Example:

```bash
salt-call infoblox.get_network
```

**salt.modules.infoblox.get_object**

Get raw infoblox object. This is a low level api call.

CLI Example:

```bash
salt-call infoblox.get_object objref=[_ref of object]
```

**salt.modules.infoblox.is_ipaddr_in_ipfunc_range**

Return true if the ipaddress is in the range of the nextavailableip function
CLI Example:

```
salt-call infoblox.is_ipaddr_in_ipfunc_range ipaddr="10.0.2.2" ipfunc="func:nextavailableip:10.0.0.0/8"
```

`salt.modules.infoblox.update_cname(name, data, **api_opts)`  
Update CNAME. This is a helper call to update_object.  
Find a CNAME _ref then call update_object with the record data.  

CLI Example:

```
salt-call infoblox.update_cname name=example.example.com data="{  
'canonical':"example-ha-0.example.com",  
'use_ttl':true,  
'ttl':200,  
'comment':"Salt managed CNAME"}"
```

`salt.modules.infoblox.update_host(name, data, **api_opts)`  
Update host record. This is a helper call to update_object.  
Find a hosts _ref then call update_object with the record data.  

CLI Example:

```
salt-call infoblox.update_host name=fqdn data={}
```

`salt.modules.infoblox.update_object(objref, data, **api_opts)`  
Update raw infoblox object. This is a low level api call.  

CLI Example:

```
salt-call infoblox.update_object objref=[ref_of_object] data={}
```

### 21.9.167 salt.modules.ini_manage

Edit ini files

- maintainer <akilesh1597@gmail.com>
- maturity new
- depends re
- platform all

(for example /etc/sysctl.conf)

`salt.modules.ini_manage.get_ini(file_name, separator='=')`  
Retrieve whole structure from an ini file and return it as dictionary.  

API Example:

```
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.get_ini',  
       [path_to_ini_file])
```

CLI Example:
salt 'x' ini.get_ini /path/to/ini

salt.modules.ini_manage.get_option(file_name, section, option, separator='=')
Get value of a key from a section in an ini file. Returns None if no matching key was found.

API Example:

```python
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.get_option',
       [path_to_ini_file, section_name, option])
```

CLI Example:

```
salt 'x' ini.get_option /path/to/ini section_name option_name
```

salt.modules.ini_manage.get_section(file_name, section, separator='=')
Retrieve a section from an ini file. Returns the section as dictionary. If the section is not found, an empty dictionary is returned.

API Example:

```python
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.get_section',
       [path_to_ini_file, section_name])
```

CLI Example:

```
salt 'x' ini.get_section /path/to/ini section_name
```

salt.modules.ini_manage.remove_option(file_name, section, option, separator='=')
Remove a key/value pair from a section in an ini file. Returns the value of the removed key, or None if nothing was removed.

API Example:

```python
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.remove_option',
       [path_to_ini_file, section_name, option])
```

CLI Example:

```
salt 'x' ini.remove_option /path/to/ini section_name option_name
```

salt.modules.ini_manage.remove_section(file_name, section, separator='=')
Remove a section in an ini file. Returns the removed section as dictionary, or None if nothing was removed.

API Example:

```python
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.remove_section',
       [path_to_ini_file, section_name])
```

CLI Example:
salt '*' ini.remove_section /path/to/ini section_name

salt.modules.ini_manage.set_option(file_name, sections=None, separator='=')
Edit an ini file, replacing one or more sections. Returns a dictionary containing the changes made.

file_name  path of ini file

sections  [None] A dictionary representing the sections to be edited ini file The keys are the section names and the values are the dictionary containing the options If the ini file does not contain sections the keys and values represent the options

separator  [=] A character used to separate keys and values. Standard ini files use the "=" character.

New in version 2016.11.0.

API Example:

```python
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.set_option',
       ['path_to_ini_file', '{"section_to_change": {"key": "value"}}'])
```

CLI Example:

```bash
salt '*' ini.set_option /path/to/ini '{section_foo: {key: value}}'
```

21.9.168 salt.modules.inspectlib package

Submodules

salt.modules.inspectlib.collector module

```python
class salt.modules.inspectlib.collector.Inspector(cachedir=None, piddir=None, pidfile-name=None)
```

DEFAULT_MINION_CONFIG_PATH = '/etc/salt/minion'

IGNORE_FS_TYPES = ['autofs', 'cifs', 'nfs', 'nfs4']

IGNORE_MOUNTS = ['proc', 'sysfs', 'devtmpfs', 'tmpfs', 'fuse.gvfs-fuse-daemon']

IGNORE_PATHS = ['/tmp', '/var/tmp', '/lost+found', '/var/run', '/var/lib/rpm', '/.snapshots', '/.zfs', '/etc/ssh', '/root', '/home']

MODE = ['configuration', 'payload', 'all']

build(format='qcow2', path='/tmp')
Build an image using Kiwi.

Parameters

- format -
- path -

Returns

create_snapshot()  
Open new snapshot.

Returns
**export** *(description, local=False, path='/.tmp', format='qcow2')*

Export description for Kiwi.

- **local** –
- **path** –

**request_snapshot** *(mode, priority=19, **kwargs)*

Take a snapshot of the system.

**reuse_snapshot()**

Open an existing, latest snapshot.

**snapshot**(mode)

Take a snapshot of the system.

salt.modules.inspectlib.collector.is_alive(pidfile)

Check if PID is still alive.

salt.modules.inspectlib.collector.main(dbfile, pidfile, mode)

Main analyzer routine.

**salt.modules.inspectlib.dbhandle module**

class salt.modules.inspectlib.dbhandle.DHHandle(path)

class salt.modules.inspectlib.dbhandle.DHHandleBase(path)

Handle for the volatile database, which serves the purpose of caching the inspected data. This database can be destroyed or corrupted, so it should be simply re-created from scratch.

- **close**()
  Close the database connection.

- **flush**(table)
  Flush the table.

- **open**(new=False)
  Init the database, if required.

- **purge**()
  Purge whole database.

**salt.modules.inspectlib.exceptions module**

exception salt.modules.inspectlib.exceptions.InspectorKiwiProcessorException

Kiwi builder/exporter exception.

exception salt.modules.inspectlib.exceptions.InspectorQueryException

Exception that is only for the inspector query.

exception salt.modules.inspectlib.exceptions.InspectorSnapshotException

Snapshot exception.

exception salt.modules.inspectlib.exceptions.SIException

System information exception.
salt.modules.inspectlib.query module

class salt.modules.inspectlib.query.Query(scope, cachedir=None)
Query the system. This class is actually puts all Salt features together, so there would be no need to pick it from various places.

SCOPES = ['changes', 'configuration', 'identity', 'system', 'software', 'services', 'payload', 'all']

class salt.modules.inspectlib.query.SysInfo(systype)
System information.

Module contents

class salt.modules.inspectlib.entities.AllowedDir
Allowed directories

class salt.modules.inspectlib.entities.IgnoredDir
Ignored directories

class salt.modules.inspectlib.entities.Package
Package.

class salt.modules.inspectlib.entities.PackageCfgFile
Config file, belongs to the package

class salt.modules.inspectlib.entities.PayloadFile
Payload file.

21.9.169 salt.modules.inspectlib.entities module

class salt.modules.inspectlib.entities.AllowedDir
Allowed directories

class salt.modules.inspectlib.entities.IgnoredDir
Ignored directories

class salt.modules.inspectlib.entities.Package
Package.

class salt.modules.inspectlib.entities.PackageCfgFile
Config file, belongs to the package

class salt.modules.inspectlib.entities.PayloadFile
Payload file.

21.9.170 salt.modules.inspectlib.fsdb module

codeauthor Bo Maryniuk <bo@suse.de>

class salt.modules.inspectlib.fsdb.CsvDB(path)
File-based CSV database. This database is in-memory operating relatively small plain text csv files.

   close()
Close the database.

   Returns

create_table_from_object(obj)
Create a table from the object. NOTE: This method doesn’t stores anything.

   Parameters obj –

   Returns
**delete**(*obj*, *matches=None*, *mt=None*, *lt=None*, *eq=None*)
Delete object from the database.

Parameters
- *obj*
- *matches*
- *mt*
- *lt*
- *eq*

Returns

**flush**(*table*)
Flush table.

Parameters *table* –

Returns

**get**(*obj*, *matches=None*, *mt=None*, *lt=None*, *eq=None*)
Get objects from the table.

Parameters
- *table_name*
- *matches* – Regexp.
- *mt* – More than.
- *lt* – Less than.
- *eq* – Equals.

Returns

**is_closed**()
Return if the database is closed.

Returns

**list**()
List all the databases on the given path.

Returns

**list_tables**()
Load existing tables and their descriptions.

Returns

**new**()
Create a new database and opens it.

Returns

**open**(dbname=None)
Open database from the path with the name or latest. If there are no yet databases, create a new implicitly.

Returns

**purge**(dbid)
Purge the database.
Parameters `dbid` -

Returns

`store(obj, distinct=False)`
Store an object in the table.

Parameters

- `obj` – An object to store
- `distinct` – Store object only if there is none identical of such. If at least one field is different, store it.

Returns

`update(obj, matches=None, mt=None, lt=None, eq=None)`
Update object(s) in the database.

Parameters

- `obj`
- `matches`
- `mt`
- `lt`
- `eq`

Returns

`class salt.modules.inspectlib.fsdb.CsvDBEntity`
Serializable object for the table.

21.9.171 `salt.modules.inspectlib.kiwiproc module`

`class salt.modules.inspectlib.kiwiproc.KiwiExporter(grains, format)`
Exports system description as Kiwi configuration.

`export(name)`
Export to the Kiwi config.xml as text.

Returns

`load(**descr)`
Load data by keys.

Parameters `data` -

Returns

21.9.172 `salt.modules.inspector module`

Module for full system inspection.

`salt.modules.inspector.build(format='qcow2', path='/tmp/')`
Build an image from a current system description. The image is a system image can be output in bootable ISO or QCOW2 formats.

Node uses the image building library Kiwi to perform the actual build.

Parameters:
- **format**: Specifies output format: "qcow2" or "iso". Default: qcow2.
- **path**: Specifies output path where to store built image. Default: /tmp.

CLI Example:
```
salt myminion inspector.build
salt myminion inspector.build format=iso path=/opt/builds/
```

salt.modules.inspector.delete(all=False, *databases)
Remove description snapshots from the system.

::parameter: all. Default: False. Remove all snapshots, if set to True.

CLI example:
```
salt myminion inspector.delete <ID> <ID1> <ID2>..
salt myminion inspector.delete all=True
```

salt.modules.inspector.export(local=False, path='/tmp', format='qcow2')
Export an image description for Kiwi.

Parameters:
- **local**: Specifies True or False if the export has to be in the local file. Default: False.
- **path**: If local=True, then specifies the path where file with the Kiwi description is written. Default: /tmp.

CLI Example:
```
salt myminion inspector.export
salt myminion inspector.export format=iso path=/opt/builds/
```

salt.modules.inspector.inspect(mode='all', priority=19, **kwargs)
Start node inspection and save the data to the database for further query.

Parameters:
- **mode**: Clarify inspection mode: configuration, payload, all (default)
- **payload**
  - filter: Comma-separated directories to track payload.
- **priority**: (advanced) Set priority of the inspection. Default is low priority.

CLI Example:
```
salt '*' inspector.inspect
salt '*' inspector.inspect configuration
salt '*' inspector.inspect payload filter=/opt,/ext/oracle
```

salt.modules.inspector.query(*args, **kwargs)
Query the node for specific information.

Parameters:
- **scope**: Specify scope of the query.
  - **System**: Return system data.
  - **Software**: Return software information.
  - **Services**: Return known services.
- Identity: Return user accounts information for this system.

  accounts Can be either 'local', 'remote' or 'all' (equal to "local,remote"). Remote accounts can-
  not be resolved on all systems, but only those, which supports 'passwd -S -a'.

  disabled True (or False, default) to return only disabled accounts.

- payload: Payload scope parameters:

  filter Include only results which path starts from the filter string.

  time Display time in Unix ticks or format according to the configured TZ (default) Values: ticks,
  tz (default)

  size Format size. Values: B, KB, MB, GB

  type Include payload type. Values (comma-separated): directory (or dir), link, file (default)
  Example (returns everything): type=directory,link,file

  owners Resolve UID/GID to an actual names or leave them numeric (default). Values: name
  (default), id

  brief Return just a list of payload elements, if True. Default: False.

- all: Return all information (default).

CLI Example:

```
salt '*' inspector.query scope=system
salt '*' inspector.query scope=payload type=file,link filter=/etc size=Kb
  -- brief=False
```

**salt.modules.inspector.snapshots()**

List current description snapshots.

CLI Example:

```
salt myminion inspector.snapshots
```

### Chapter 21. Salt Module Reference

**21.9.173 salt.modules.introspect**

Functions to perform introspection on a minion, and return data in a format usable by Salt States

**salt.modules.introspect.enabled_service_owners()**

Return which packages own each of the services that are currently enabled.

CLI Example:

```
salt myminion introspect.enabled_service_owners
```

**salt.modules.introspect.running_service_owners**(exclude=('/dev', '/home', '/media', '/proc',
  '/run', '/sys', '/tmp', '/var'))

Determine which packages own the currently running services. By default, excludes files whose full path starts
with /dev, /home, /media, /proc, /run, /sys, /tmp and /var. This can be overridden by passing in a
new list to exclude.

CLI Example:

```
salt myminion introspect.running_service_owners
```

**salt.modules.introspect.service_highstate**(requires=True)

Return running and enabled services in a highstate structure. By default also returns package dependencies
for those services, which means that package definitions must be created outside this function. To drop the package dependencies, set requires to False.

CLI Example:

```
salt myminion introspect.service_highstate salt myminion introspect.service_highstate requires=False
```

### 21.9.174 `salt.modules.iosconfig` module

Cisco IOS configuration manipulation helpers

New in version 2019.2.0.

This module provides a collection of helper functions for Cisco IOS style configuration manipulation. This module does not have external dependencies and can be used from any Proxy or regular Minion.

#### `salt.modules.iosconfig.clean` function

```
salt.modules.iosconfig.clean(config=None, path=None, saltenv='base')
```

Return a clean version of the config, without any special signs (such as ! as an individual line) or empty lines, but just lines with significant value in the configuration of the network device.

- **config**: The configuration sent as text. This argument is ignored when `path` is configured.
- **path**: Absolute or remote path from where to load the configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.
- **saltenv**: `base` Salt fileserver environment from which to retrieve the file. Ignored if `path` is not a `salt://` URL.

CLI Example:

```
salt '*' iosconfig.clean path=salt://path/to/my/config.txt
salt '*' iosconfig.clean path=https://bit.ly/2mAdq7z
```

#### `salt.modules.iosconfig.diff_text` function

```
salt.modules.iosconfig.diff_text(candidate_config=None, candidate_path=None, running_config=None, running_path=None, saltenv='base')
```

Return the diff, as text, between the candidate and the running config.

- **candidate_config**: The candidate configuration sent as text. This argument is ignored when `candidate_path` is set.
- **candidate_path**: Absolute or remote path from where to load the candidate configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.
- **running_config**: The running configuration sent as text. This argument is ignored when `running_path` is set.
- **running_path**: Absolute or remote path from where to load the running configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.
- **saltenv**: `base` Salt fileserver environment from which to retrieve the file. Ignored if `candidate_path` or `running_path` is not a `salt://` URL.

CLI Example:

```
salt '*' iosconfig.diff_text candidate_path=salt://path/to/candidate.cfg running_path=salt://path/to/running.cfg
```

#### `salt.modules.iosconfig.diff_tree` function

```
salt.modules.iosconfig.diff_tree(candidate_config=None, candidate_path=None, running_config=None, running_path=None, saltenv='base')
```

Return the diff, as Python dictionary, between the candidate and the running configuration.
candidate_config  The candidate configuration sent as text. This argument is ignored when candidate_path is set.

candidate_path  Absolute or remote path from where to load the candidate configuration text. This argument allows any URI supported by cp.get_url, e.g., salt://, https://, s3://, ftp://, etc.

running_config  The running configuration sent as text. This argument is ignored when running_path is set.

running_path  Absolute or remote path from where to load the running configuration text. This argument allows any URI supported by cp.get_url, e.g., salt://, https://, s3://, ftp://, etc.

saltenv: base  Salt fileserver environment from which to retrieve the file. Ignored if candidate_path or running_path is not a salt:// URL.

CLI Example:

```
salt '*' iosconfig.diff_tree candidate_path=salt://path/to/candidate.cfg running_path=salt://path/to/running.cfg
```

salt.modules.iosconfig.merge_diff(initial_config=None, initial_path=None, merge_config=None, merge_path=None, saltenv='base')

Return the merge diff as text, after merging the merge config into the initial config.

initial_config  The initial configuration sent as text. This argument is ignored when initial_path is set.

initial_path  Absolute or remote path from where to load the initial configuration text. This argument allows any URI supported by cp.get_url, e.g., salt://, https://, s3://, ftp://, etc.

merge_config  The config to be merged into the initial config, sent as text. This argument is ignored when merge_path is set.

merge_path  Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by cp.get_url, e.g., salt://, https://, s3://, ftp://, etc.

saltenv: base  Salt fileserver environment from which to retrieve the file. Ignored if initial_path or merge_path is not a salt:// URL.

CLI Example:

```
salt '*' iosconfig.merge_diff initial_path=salt://path/to/running.cfg merge_path=salt://path/to/merge.cfg
```

salt.modules.iosconfig.merge_text(initial_config=None, initial_path=None, merge_config=None, merge_path=None, saltenv='base')

Return the merge result of the initial_config with the merge_config as plain text.

initial_config  The initial configuration sent as text. This argument is ignored when initial_path is set.

initial_path  Absolute or remote path from where to load the initial configuration text. This argument allows any URI supported by cp.get_url, e.g., salt://, https://, s3://, ftp://, etc.

merge_config  The config to be merged into the initial config, sent as text. This argument is ignored when merge_path is set.

merge_path  Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by cp.get_url, e.g., salt://, https://, s3://, ftp://, etc.

saltenv: base  Salt fileserver environment from which to retrieve the file. Ignored if initial_path or merge_path is not a salt:// URL.

CLI Example:
salt.modules.iosconfig.merge_tree(initial_config=None, initial_path=None, merge_config=None, merge_path=None, saltenv='base')

Return the merge tree of the initial_config with the merge_config, as a Python dictionary.

initial_config The initial configuration sent as text. This argument is ignored when initial_path is set.

initial_path Absolute or remote path from where to load the initial configuration text. This argument allows any URI supported by cp.get_url), e.g., salt://, https://, s3://, ftp://, etc.

merge_config The config to be merged into the initial config, sent as text. This argument is ignored when merge_path is set.

merge_path Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by cp.get_url), e.g., salt://, https://, s3://, ftp://, etc.

saltenv: base Salt fileserver environment from which to retrieve the file. Ignored if initial_path or merge_path is not a salt:// URL.

CLI Example:

```
salt '*' iosconfig.merge_text initial_path=salt://path/to/running.cfg merge_path=salt://path/to/merge.cfg
```

salt.modules.iosconfig.tree(config=None, path=None, with_tags=False, saltenv='base')

Transform Cisco IOS style configuration to structured Python dictionary. Depending on the value of the with_tags argument, this function may provide different views, valuable in different situations.

config The configuration sent as text. This argument is ignored when path is configured.

path Absolute or remote path from where to load the configuration text. This argument allows any URI supported by cp.get_url), e.g., salt://, https://, s3://, ftp://, etc.

with_tags: False Whether this function should return a detailed view, with tags.

saltenv: base Salt fileserver environment from which to retrieve the file. Ignored if path is not a salt:// URL.

CLI Example:

```
salt '*' iosconfig.tree path=salt://path/to/my/config.txt
salt '*' iosconfig.tree path=https://bit.ly/2mAdq7z
```

21.9.175 salt.modules.ipmi

Support IPMI commands over LAN. This module does not talk to the local systems hardware through IPMI drivers. It uses a python module pyghmi.

depends Python module pyghmi. You can install pyghmi using pip:

```
pip install pyghmi
```

configuration The following configuration defaults can be define (pillar or config files):

```
ipmi.config:
    api_host: 127.0.0.1
    api_user: admin
```

(continues on next page)
Usage can override the config defaults:

```
salt-call ipmi.get_user api_host=myipmienabled.system api_user=admin api_pass=pass uid=1
```

**salt.modules.ipmi.create_user**(uid, name, password, channel=14, callback=False, link_auth=True, ipmi_msg=True, privilege_level='administrator', **kwargs)

create/ensure a user is created with provided settings.

**Parameters**

- **privilege_level** – User Privilege Limit. (Determines the maximum privilege level that the user is allowed to switch to on the specified channel.) * callback * user * operator * administrator * proprietary * no_access

- **kwargs** – 
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

**CLI Examples:**

```
salt-call ipmi.create_user uid=2 name=steverweber api_host=172.168.0.7 api_pass=nevertell
```

**salt.modules.ipmi.fast_connect_test(** kwargs **)**

Returns True if connection success. This uses an aggressive timeout value!

**Parameters** **kwargs** –

- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

**CLI Examples:**

```
salt-call ipmi.fast_connect_test api_host=172.168.0.9
```

**salt.modules.ipmi.get_bootdev(** kwargs **)**

Get current boot device override information.

Provides the current requested boot device. Be aware that not all IPMI devices support this. Even in BMCs that claim to, occasionally the BIOS or UEFI fail to honor it. This is usually only applicable to the next reboot.

**Parameters** **kwargs** –
- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

CLi Example:

```
salt-call ipmi.get_bootdev api_host=127.0.0.1 api_user=admin api_pass=pass
```

`salt.modules.ipmi.get_channel_access(channel=14, read_mode='non_volatile', **kwargs)

:param kwargs:
  api_host='127.0.0.1'
  api_user='admin'
  api_pass='example'
  api_port=623

Parameters

- **channel** – number [1:7]
- **read_mode** –
  - **non_volatile** = get non-volatile Channel Access
  - **volatile** = get present volatile (active) setting of Channel Access
- **kwargs** –
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Return Data

A Python dict with the following keys/values:

```
{
    'alerting':
    'per_msg_auth':
    'user_level_auth':
    'access_mode': { (ONE OF)
        0: 'disabled',
        1: 'pre_boot',
        2: 'always',
        3: 'shared'
    }
    'privilege_level': { (ONE OF)
        1: 'callback',
        2: 'user',
        3: 'operator',
        4: 'administrator',
        5: 'proprietary'
    }
}
```

CLI Examples:
salt.modules.ipmi.get_channel_info(channel=14, **kwargs)

Get channel info

Parameters

- **channel** – number [1:7]
- **kwargs** –
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Return Data  channel session supports

- no_session: channel is session-less
- single: channel is single-session
- multi: channel is multi-session
- auto: channel is session-based (channel could alternate between single- and multi-session operation, as can occur with a serial/modem channel that supports connection mode auto-detect)

CLI Examples:
salt-call ipmi.get_channel_info

salt.modules.ipmi.get_channel_max_user_count(channel=14, **kwargs)

Get max users in channel

Parameters

- **channel** – number [1:7]
- **kwargs** –
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Returns  int – often 16

CLI Examples:
salt-call ipmi.get_channel_max_user_count

salt.modules.ipmi.get_health(**kwargs)

Get Summarize health

This provides a summary of the health of the managed system. It additionally provides an iterable list of reasons for warning, critical, or failed assessments.
good health: {'badreadings': [], 'health': 0}

Parameters **kwargs –

- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

CLI Example:
```
salt-call ipmi.get_health api_host=127.0.0.1 api_user=admin api_pass=pass
```

`salt.modules.ipmi.get_power(**kwargs)`
Get current power state

The response, if successful, should contain ‘powerstate’ key and either ‘on’ or ‘off’ to indicate current state.

Parameters **kwargs –

- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

CLI Example:
```
salt-call ipmi.get_power api_host=127.0.0.1 api_user=admin api_pass=pass
```

`salt.modules.ipmi.get_sensor_data(**kwargs)`
Get sensor readings

Iterates sensor reading objects

Parameters **kwargs –

- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

CLI Example:
```
salt-call ipmi.get_sensor_data api_host=127.0.0.1 api_user=admin api_pass=pass
```

`salt.modules.ipmi.get_user(uid, channel=14, **kwargs)`
Get user from uid and access on channel

Parameters

- **uid** – user number [1:16]
- **channel** – number [1:7]
• **kwargs**
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Return Data

```python
name: (str)
uid: (int)
channel: (int)
access:
  - callback (bool)
  - link_auth (bool)
  - ipmi_msg (bool)
  - privilege_level: (str)[callback, user, operator administrator, proprietary, no_access]
```

CLI Examples:

```
salt-call ipmi.get_user uid=2
```

```python
salt.modules.ipmi.get_user_access(uid, channel=14, **kwargs)
```

Get user access

Parameters

- **uid** – user number [1:16]
- **channel** – number [1:7]
- **kwargs**
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Return Data

```python
channel_info:
  - max_user_count = maximum number of user IDs on this channel
  - enabled_users = count of User ID slots presently in use
  - users_with_fixed_names = count of user IDs with fixed names
access:
  - callback
  - link_auth
  - ipmi_msg
  - privilege_level: [reserved, callback, user, operator administrator, proprietary, no_access]
```

CLI Examples:
salt-call ipmi.get_user_access \texttt{uid}=2

\texttt{salt.modules.ipmi.get\_user\_name(} \texttt{uid, return\_none\_on\_error=True, \^{\texttt{**kwargs})}

Get user name

Parameters

- \texttt{uid} – user number [1:16]
- \texttt{return\_none\_on\_error} – return None on error
- \texttt{kwargs} –
  - \texttt{api\_host=127.0.0.1}
  - \texttt{api\_user=admin}
  - \texttt{api\_pass=example}
  - \texttt{api\_port=623}
  - \texttt{api\_kg=None}

CLI Examples:

\begin{verbatim}
salt-call ipmi.get_user_name \texttt{uid}=2
\end{verbatim}

\texttt{salt.modules.ipmi.get\_users(} \texttt{channel=14, \^{\texttt{**kwargs})}

get list of users and access information

Parameters

- \texttt{channel} – number [1:7]
- \texttt{kwargs} –
  - \texttt{api\_host=127.0.0.1}
  - \texttt{api\_user=admin}
  - \texttt{api\_pass=example}
  - \texttt{api\_port=623}
  - \texttt{api\_kg=None}

Returns

- name: (str)
- uid: (int)
- channel: (int)
- access:
  - callback (bool)
  - link\_auth (bool)
  - ipmi\_msg (bool)
  - privilege\_level: (str)[callback, user, operator\_administrator, proprietary, no\_access]

CLI Examples:

\begin{verbatim}
salt-call ipmi.get\_users \texttt{api\_host=172.168.0.7}
\end{verbatim}
salt.modules.ipmi.raw_command(netfn, command, bridge_request=None, data=(), retry=True, delay_xmit=None, **kwargs)

Send raw ipmi command

This allows arbitrary IPMI bytes to be issued. This is commonly used for certain vendor specific commands.

Parameters

- netfn – Net function number
- command – Command value
- bridge_request – The target slave address and channel number for the bridge request.
- data – Command data as a tuple or list
- kwargs –
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Returns dict – The response from IPMI device

CLI Examples:

```
salt-call ipmi.raw_command netfn=0x06 command=0x46 data=[0x02]
# this will return the name of the user with id 2 in bytes
```

salt.modules.ipmi.set_bootdev(bootdev='default', persist=False, uefiboott=False, **kwargs)

Set boot device to use on next reboot

Parameters

- bootdev –
  - network: Request network boot
  - hd: Boot from hard drive
  - safe: Boot from hard drive, requesting 'safe mode'
  - optical: boot from CD/DVD/BD drive
  - setup: Boot into setup utility
  - default: remove any IPMI directed boot device request
- persist – If true, ask that system firmware use this device beyond next boot. Be aware many systems do not honor this
- uefiboott – If true, request UEFI boot explicitly. Strictly speaking, the spec suggests that if not set, the system should BIOS boot and offers no "don’t care" option. In practice, this flag not being set does not preclude UEFI boot on any system I’ve encountered.
- kwargs –
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
- api_port=623
- api_kg=None

**Returns** dict or True – If callback is not provided, the response

CLI Examples:
```
salt-call ipmi.set_bootdev bootdev=network persist=True
```

```python
salt.modules.ipmi.set_channel_access(channel=14, access_update_mode='non_volatile',
                                      alerting=False, per_msg_auth=False,
                                      user_level_auth=False, access_mode='always',
                                      privilege_update_mode='non_volatile',
                                      privilege_level='administrator', **kwargs)
```

Set channel access

**Parameters**

- **channel** – number [1:7]
- **access_update_mode** –
  - 'dont_change' = don’t set or change Channel Access
  - 'non_volatile' = set non-volatile Channel Access
  - 'volatile' = set volatile (active) setting of Channel Access
- **alerting** – PEF Alerting Enable/Disable
  - True = enable PEF Alerting
  - False = disable PEF Alerting on this channel (Alert Immediate command can still be used to generate alerts)
- **per_msg_auth** – Per-message Authentication
  - True = enable
  - False = disable Per-message Authentication. [Authentication required to activate any session on this channel, but authentication not used on subsequent packets for the session.]
- **user_level_auth** – User Level Authentication Enable/Disable
  - True = enable User Level Authentication. All User Level commands are to be authenticated per the Authentication Type that was negotiated when the session was activated.
  - False = disable User Level Authentication. Allow User Level commands to be executed without being authenticated. If the option to disable User Level Command authentication is accepted, the BMC will accept packets with Authentication Type set to None if they contain user level commands. For outgoing packets, the BMC returns responses with the same Authentication Type that was used for the request.
- **access_mode** – Access Mode for IPMI messaging (PEF Alerting is enabled/disabled separately from IPMI messaging)
  - disabled = disabled for IPMI messaging
  - pre_boot = pre-boot only channel only available when system is in a powered down state or in BIOS prior to start of boot.
  - always = channel always available regardless of system mode. BIOS typically dedicates the serial connection to the BMC.
• *shared* = same as always available, but BIOS typically leaves the serial port available for software use.

- **privilege_update_mode** – Channel Privilege Level Limit. This value sets the maximum privilege level that can be accepted on the specified channel.
  - *dont_change* = don’t set or change channel Privilege Level Limit
  - *non_volatile* = non-volatile Privilege Level Limit according
  - *volatile* = volatile setting of Privilege Level Limit

- **privilege_level** – Channel Privilege Level Limit
  - *reserved* = unused
  - *callback*
  - *user*
  - *operator*
  - *administrator*
  - *proprietary* = used by OEM

- **kwargs** –
  - *api_host*=127.0.0.1
  - *api_user*=admin
  - *api_pass*=example
  - *api_port*=623
  - *api_kg*=None

CLI Examples:

```
salt-call ipmi.set_channel_access privilege_level='administrator'
```

salt.modules.ipmi.set_identify(*on=True, duration=600, **kwargs*)

Request identify light

Request the identify light to turn off, on for a duration, or on indefinitely. Other than error exceptions,

Parameters

- **on** – Set to True to force on or False to force off

- **duration** – Set if wanting to request turn on for a duration in seconds, None = indefinitely.

- **kwargs** –
  - *api_host*=127.0.0.1
  - *api_user*=admin
  - *api_pass*=example
  - *api_port*=623
  - *api_kg*=None

CLI Examples:
salt-call ipmi.set_identify

salt.modules.ipmi.set_power(state='power_on', wait=True, **kwargs)
Request power state change

Parameters

- **name**
  - power_on – system turn on
  - power_off – system turn off (without waiting for OS)
  - shutdown – request OS proper shutdown
  - reset – reset (without waiting for OS)
  - boot – If system is off, then 'on', else 'reset'
- **ensure** – If (bool True), do not return until system actually completes requested state change for 300 seconds. If a non-zero (int), adjust the wait time to the requested number of seconds
- **kwargs**
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Returns dict – A dict describing the response retrieved

CLI Examples:
salt-call ipmi.set_power state=shutdown wait=True

salt.modules.ipmi.set_user_access(uid, channel=14, callback=True, link_auth=True, ipmi_msg=True, privilege_level='administrator', **kwargs)
Set user access

Parameters

- **uid** – user number [1:16]
- **channel** – number [1:7]
- **callback** – User Restricted to Callback
  - False = User Privilege Limit is determined by the User Privilege Limit parameter, below, for both callback and non-callback connections.
  - True = User Privilege Limit is determined by the User Privilege Limit parameter for callback connections, but is restricted to Callback level for non-callback connections. Thus, a user can only initiate a Callback when they 'call in' to the BMC, but once the callback connection has been made, the user could potentially establish a session as an Operator.
- **link_auth** – User Link authentication enable/disable (used to enable whether this user’s name and password information will be used for link authentication, e.g. PPP CHAP) for
the given channel. Link authentication itself is a global setting for the channel and is
enabled/disabled via the serial/modem configuration parameters.

- **ipmi_msg** – User IPMI Messaging: (used to enable/disable whether this user’s name and password information will be used for IPMI Messaging. In this case, ‘IPMI Messaging’ refers to the ability to execute generic IPMI commands that are not associated with a particular payload type. For example, if IPMI Messaging is disabled for a user, but that user is enabled for activating the SOL payload type, then IPMI commands associated with SOL and session management, such as Get SOL Configuration Parameters and Close Session are available, but generic IPMI commands such as Get SEL Time are unavailable.)

- **privilege_level** – User Privilege Limit. (Determines the maximum privilege level that the user is allowed to switch to on the specified channel.)
  
  - callback
  - user
  - operator
  - administrator
  - proprietary
  - no_access

- **kwargs**

  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

**CLI Examples:**

```
salt-call ipmi.set_user_access uid=2 privilege_level='operator'
```

`salt.modules.ipmi.set_user_name(uid, name, **kwargs)`

Set user name

**Parameters**

- **uid** – user number [1:16]
- **name** – username (limit of 16bytes)

- **kwargs** –

  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

**CLI Examples:**

```
salt-call ipmi.set_user_name uid=2 name='steverweber'
```
salt.modules.ipmi.set_user_password(uid, mode='set_password', password=None, **kwargs)

Set user password and (modes)

Parameters

- **uid** – id number of user. see: get_names_uid()['name']
- **mode** –
  - disable = disable user connections
  - enable = enable user connections
  - set_password = set or ensure password
  - test_password = test password is correct
- **password** – max 16 char string (optional when mode is [disable or enable])
- **kwargs** –
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Returns  True on success when mode = test_password, return False on bad password

CLI Example:

```bash
salt-call ipmi.set_user_password api_host=127.0.0.1 api_user=admin api_pass=pass
uid=1 password=newPass
salt-call ipmi.set_user_password uid=1 mode=enable
```

salt.modules.ipmi.user_delete(uid, channel=14, **kwargs)

Delete user (helper)

Parameters

- **uid** – user number [1:16]
- **channel** – number [1:7]
- **kwargs** –
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

CLI Examples:

```bash
salt-call ipmi.user_delete uid=2
```
21.9.176 salt.modules.ipset

Support for ipset

salt.modules.ipset.add(setname=None, entry=None, family='ipv4', **kwargs)
Append an entry to the specified set.

CLI Example:
```
salt '*' ipset.add setname 192.168.1.26
```

salt.modules.ipset.check(set=None, entry=None, family='ipv4')
Check that an entry exists in the specified set.

- set The ipset name
- entry An entry in the ipset. This parameter can be a single IP address, a range of IP addresses, or a subnet block. Example:
  
  ```
  192.168.0.1
  192.168.0.2-192.168.0.19
  192.168.0.0/25
  ```

- family IP protocol version: ipv4 or ipv6

CLI Example:
```
salt '*' ipset.check setname '192.168.0.1 comment "Hello"'
```

salt.modules.ipset.check_set(set=None, family='ipv4')
Check that given ipset set exists.

New in version 2014.7.0.

CLI Example:
```
salt '*' ipset.check_set setname
```

salt.modules.ipset.delete(set=None, entry=None, family='ipv4', **kwargs)
Delete an entry from the specified set.

CLI Example:
```
```

salt.modules.ipset.delete_set(set=None, family='ipv4')
Delete ipset set.

New in version 2014.7.0.

CLI Example:
```
salt '*' ipset.delete_set custom_set
```

IPv6:
```
salt '*' ipset.delete_set custom_set family=ipv6
```

salt.modules.ipset.flush(set=None, family='ipv4')
Flush entries in the specified set, Flush all sets if set is not specified.
CLI Example:

```
salt '*' ipset.flush
salt '*' ipset.flush set
IPv6:
salt '*' ipset.flush
salt '*' ipset.flush set
```

```
salt.modules.ipset.list_sets(family='ipv4')
New in version 2014.7.0.
List all ipset sets.
CLI Example:

```
salt '*' ipset.list_sets
```

```
salt.modules.ipset.long_range(start, end)
```

```
salt.modules.ipset.new_set(set=None, set_type=None, family='ipv4', comment=False, **kwargs)
New in version 2014.7.0.
Create new custom set
CLI Example:

```
salt '*' ipset.new_set custom_set list:set
salt '*' ipset.new_set custom_set list:set comment=True
IPv6:
salt '*' ipset.new_set custom_set list:set family=ipv6
```

```
salt.modules.ipset.rename_set(set=None, new_set=None, family='ipv4')
New in version 2014.7.0.
Delete ipset set.
CLI Example:

```
salt '*' ipset.rename_set custom_set new_set=new_set_name
IPv6:
salt '*' ipset.rename_set custom_set new_set=new_set_name family=ipv6
```

```
salt.modules.ipset.test(set=None, entry=None, family='ipv4', **kwargs)
Test if an entry is in the specified set.
CLI Example:

```
salt '*' ipset.test setname 192.168.0.2
IPv6:
salt '*' ipset.test setname fd81:fc56:9ac7::/48
```

```
salt.modules.ipset.version()
Return version from ipset –version
CLI Example:
```
21.9.177 salt.modules.iptables

Support for iptables

Configuration Options

The following options can be set in the minion config, grains, pillar, or master config. The configuration is read using `config.get`.

- `iptables.save_filters`: List of REGEX strings to FILTER OUT matching lines
  
  This is useful for filtering out chains, rules, etc that you do not wish to persist, such as ephemeral Docker rules.

  The default is to not filter out anything.

```
iptables.save_filters:
  - "-j CATTLE_PREROUTING"
  - "-j DOCKER"
  - "-A POSTROUTING"
  - "-A CATTLE_POSTROUTING"
  - "-A FORWARD"
```

`salt.modules.iptables.append` *(table='filter', chain=None, rule=None, family='ipv4')*

Append a rule to the specified table/chain.

This function accepts a rule in a standard iptables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' iptables.append filter INPUT
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'
```

IPv6:

```
salt '*' iptables.append filter INPUT
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT' 
    family=ipv6
```

`salt.modules.iptables.build_rule` *(table='filter', chain=None, command=None, position='', full=None, family='ipv4', **kwargs)*

Build a well-formatted iptables rule based on kwargs. A `table` and `chain` are not required, unless `full` is True.

- If `full` is `True`, then `table`, `chain` and `command` are required. `command` may be specified as either a short option (`-I`) or a long option (`--insert`). This will return the iptables command, exactly as it would be used from the command line.

- If a position is required (as with `-I` or `-D`), it may be specified as `position`. This will only be useful if `full` is `True`.

- If `state` is passed, it will be ignored, use `connstate`. If `connstate` is passed in, it will automatically be changed to `state`.

- To pass in jump options that doesn’t take arguments, pass in an empty string.
Note: Whereas iptables will accept `-p, --proto[c[o[l]]]` as synonyms of `--protocol`, if `--proto` appears in an iptables command after the appearance of `-m policy`, it is interpreted as the `--proto` option of the policy extension (see the `iptables-extensions(8)` man page).

CLI Examples:

```
salt '*' iptables.build_rule match=state
    connstate=RELATED,ESTABLISHED jump=ACCEPT

gin 'salt '*' iptables.build_rule filter INPUT command=I position=3
    full=True match=state connstate=RELATED,ESTABLISHED jump=ACCEPT

gin 'salt '*' iptables.build_rule filter INPUT command=A
    full=True match=state connstate=RELATED,ESTABLISHED
    source='127.0.0.1' jump=ACCEPT

.. Invert Rules
salt '*' iptables.build_rule filter INPUT command=A
    full=True match=state connstate=RELATED,ESTABLISHED
    source='!127.0.0.1' jump=ACCEPT

gin 'salt '*' iptables.build_rule filter INPUT command=A
    full=True match=state connstate=RELATED,ESTABLISHED
    destination='!not 127.0.0.1' jump=ACCEPT

IPv6:
gin 'salt '*' iptables.build_rule match=state
    connstate=RELATED,ESTABLISHED jump=ACCEPT
    family=ipv6

gin 'salt '*' iptables.build_rule filter INPUT command=I position=3
    full=True match=state connstate=RELATED,ESTABLISHED
    family=ipv6
```

salt.modules.iptables.check(table='filter', chain=None, rule=None, family='ipv4')
Check for the existence of a rule in the table and chain

This function accepts a rule in a standard `iptables` command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' iptables.check filter INPUT
    rule='^-m state --state RELATED,ESTABLISHED -j ACCEPT'

IPv6:
salt '*' iptables.check filter INPUT
    rule='^-m state --state RELATED,ESTABLISHED -j ACCEPT'
    family=ipv6
```

salt.modules.iptables.check_chain(table='filter', chain=None, family='ipv4')
New in version 2014.1.0.
Check for the existence of a chain in the table

CLI Example:
salt 'salt '*' iptables.check_chain filter INPUT
IPv6:
salt 'salt '*' iptables.check_chain filter INPUT family=ipv6

salt.modules.iptables.delete(table=chain=None, position=None, rule=None, family='ipv4')

Delete a rule from the specified table/chain, specifying either the rule in its entirety, or the rule’s position in the chain.

This function accepts a rule in a standard iptables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Examples:

```
salt '*' iptables.delete filter INPUT position=3
salt '*' iptables.delete filter INPUT \  
   rule='^-m state --state RELATED,ESTABLISHED -j ACCEPT'
IPv6:
salt '*' iptables.delete filter INPUT position=3 family=ipv6
salt '*' iptables.delete filter INPUT \  
   rule='^-m state --state RELATED,ESTABLISHED -j ACCEPT' \  
   family=ipv6
```

salt.modules.iptables.delete_chain(table='filter', chain=None, family='ipv4')

New in version 2014.1.0.

Delete custom chain to the specified table.

CLI Example:

```
salt '*' iptables.delete_chain filter CUSTOM_CHAIN
IPv6:
salt '*' iptables.delete_chain filter CUSTOM_CHAIN family=ipv6
```

salt.modules.iptables.flush(table='filter', chain='', family='ipv4')

Flush the chain in the specified table, flush all chains in the specified table if not specified chain.

CLI Example:

```
salt '*' iptables.flush filter INPUT
IPv6:
salt '*' iptables.flush filter INPUT family=ipv6
```

salt.modules.iptables.get_policy(table='filter', chain=None, family='ipv4')

Return the current policy for the specified table/chain

CLI Example:

```
salt '*' iptables.get_policy filter INPUT
IPv6:
salt '*' iptables.get_policy filter INPUT family=ipv6
```

salt.modules.iptables.get_rules(family='ipv4')

Return a data structure of the current, in-memory rules
CLI Example:

```python
salt '*' iptables.get_rules
IPv6:
salt '*' iptables.get_rules family=ipv6
```

**salt.modules.iptables.get_saved_policy**(*table='filter', chain=None, conf_file=None, family='ipv4')

Return the current policy for the specified table/chain

CLI Examples:

```python
salt '*' iptables.get_saved_policy filter INPUT
salt '*' iptables.get_saved_policy filter INPUT \
    conf_file=/etc/iptables.saved
IPv6:
salt '*' iptables.get_saved_policy filter INPUT family=ipv6
salt '*' iptables.get_saved_policy filter INPUT \
    conf_file=/etc/iptables.saved family=ipv6
```

**salt.modules.iptables.get_saved_rules**(*conf_file=None, family='ipv4')

Return a data structure of the rules in the conf file

CLI Example:

```python
salt '*' iptables.get_saved_rules
IPv6:
salt '*' iptables.get_saved_rules family=ipv6
```

**salt.modules.iptables.insert**(*table='filter', chain=None, position=None, rule=None, family='ipv4')

Insert a rule into the specified table/chain, at the specified position.

This function accepts a rule in a standard iptables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

If the position specified is a negative number, then the insert will be performed counting from the end of the list. For instance, a position of -1 will insert the rule as the second to last rule. To insert a rule in the last position, use the append function instead.

CLI Examples:

```python
salt '*' iptables.insert filter INPUT position=3 \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'
IPv6:
salt '*' iptables.insert filter INPUT position=3 \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT' \
    family=ipv6
```

**salt.modules.iptables.new_chain**(*table='filter', chain=None, family='ipv4')

New in version 2014.1.0.

Create new custom chain to the specified table.

CLI Example:
salt '*>' iptables.new_chain filter CUSTOM_CHAIN

IPv6:
salt '*>' iptables.new_chain filter CUSTOM_CHAIN family=ipv6

```
salt.modules.iptables.save(filename=None, family='ipv4')
```
Save the current in-memory rules to disk

CLI Example:

```
salt '*>' iptables.save /etc/sysconfig/iptables
```

IPv6:
```
salt '*>' iptables.save /etc/sysconfig/iptables family=ipv6
```

```
salt.modules.iptables.set_policy(table='filter', chain=None, policy=None, family='ipv4')
```
Set the current policy for the specified table/chain

CLI Example:

```
salt '*>' iptables.set_policy filter INPUT ACCEPT
```

IPv6:
```
salt '*>' iptables.set_policy filter INPUT ACCEPT family=ipv6
```

```
salt.modules.iptables.version(family='ipv4')
```
Return version from `iptables --version`

CLI Example:

```
salt '*>' iptables.version
```

IPv6:
```
salt '*>' iptables.version family=ipv6
```

## 21.9.178 salt.modules.iwtools module

Support for Wireless Tools for Linux

```
salt.modules.iwtools.list_interfaces(style=None)
```
List all of the wireless interfaces

CLI Example:

```
salt minion iwtools.list_interfaces
```

```
salt.modules.iwtools.scan(iface, style=None)
```
List networks on a wireless interface

CLI Examples:

```
salt minion iwtools.scan wlp3s0 salt minion iwtools.scan wlp3s0 list
```

```
salt.modules.iwtools.set_mode(iface, mode)
```
List networks on a wireless interface

CLI Example:

```
salt minion iwtools.set_mode wlp3s0 Managed
```
21.9.179 salt.modules.jboss7

Module for managing JBoss AS 7 through the CLI interface.
New in version 2015.5.0.

In order to run each function, jboss_config dictionary with the following properties must be passed:
- cli_path: the path to jboss-cli script, for example: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
- controller: the IP address and port of controller, for example: 10.11.12.13:9999
- cli_user: username to connect to jboss administration console if necessary
- cli_password: password to connect to jboss administration console if necessary

Example:

```
  jboss_config:
    cli_path: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
    controller: 10.11.12.13:9999
    cli_user: 'jbossadm'
    cli_password: 'jbossadm'
```

**salt.modules.jboss7.create_datasource**(jboss_config, name, datasource_properties, profile=None)

Create datasource in running jboss instance

**jboss_config** Configuration dictionary with properties specified above.

**name** Datasource name

**datasource_properties**

A dictionary of datasource properties to be created:
- driver-name: mysql
- connection-url: 'jdbc:mysql://localhost:3306/sampleDatabase'
- jndi-name: 'java:jboss/datasources/sampleDS'
- user-name: sampleuser
- password: secret
- min-pool-size: 3
- use-java-context: True

**profile** The profile name (JBoss domain mode only)

CLI Example:

```
```

**salt.modules.jboss7.create_simple_binding**(jboss_config, binding_name, value, profile=None)

Create a simple jndi binding in the running jboss instance

**jboss_config** Configuration dictionary with properties specified above.
binding_name  Binding name to be created
value  Binding value
profile  The profile name (JBoss domain mode only)

CLI Example:

```text
salt '*' jboss7.create_simple_binding
    '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs",
     "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password":
     "jbossadm"'}
my_binding_name my_binding_value
```

salt.modules.jboss7.deploy(jboss_config, source_file)
Deploy the application on the jboss instance from the local file system where minion is running.

jboss_config  Configuration dictionary with properties specified above.
source_file  Source file to deploy from

CLI Example:

```text
salt '*' jboss7.deploy '{"cli_path": "integration.modules.sysmod.SysModuleTest.
    test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm",
    "cli_password": "jbossadm"'} /opt/deploy_files/my_deploy
```

salt.modules.jboss7.list_deployments(jboss_config)
List all deployments on the jboss instance

jboss_config  Configuration dictionary with properties specified above.

CLI Example:

```text
salt '*' jboss7.list_deployments '{"cli_path": "integration.modules.sysmod.
    SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
    "jbossadm", "cli_password": "jbossadm"'}
```

salt.modules.jboss7.read_datasource(jboss_config, name, profile=None)
Read datasource properties in the running jboss instance.

jboss_config  Configuration dictionary with properties specified above.
name  Datasource name
profile  Profile name (JBoss domain mode only)

CLI Example:

```text
salt '*' jboss7.read_datasource '{"cli_path": "integration.modules.sysmod.
    SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
    "jbossadm", "cli_password": "jbossadm"'}
```

salt.modules.jboss7.read_simple_binding(jboss_config, binding_name, profile=None)
Read jndi binding in the running jboss instance

jboss_config  Configuration dictionary with properties specified above.
binding_name  Binding name to be created
profile  The profile name (JBoss domain mode only)
### jboss7

#### read_simple_binding
```
```

**Syntax:**
```
salt.modules.jboss7.read_simple_binding (jboss_config, host=None)
```

**Usage:**
Reload running jboss instance.

**Arguments:**
- **jboss_config** (required): Configuration dictionary with properties specified above.
- **host** (required): The name of the host. JBoss domain mode only - and required if running in domain mode. The host name is the "name" attribute of the "host" element in host.xml.

#### reload
```
salt.modules.jboss7.reload (jboss_config, host=None)
```

**Usage:**
Remove an existing datasource from the running jboss instance.

**Arguments:**
- **jboss_config** (required): Configuration dictionary with properties specified above.
- **name** (required): Datasource name
- **profile** (required): The profile (JBoss domain mode only)

#### remove_datasource
```
salt.modules.jboss7.remove_datasource (jboss_config, name, profile=None)
```

**Usage:**
Get status of running jboss instance.

**Arguments:**
- **jboss_config** (required): Configuration dictionary with properties specified above.
- **host** (required): The name of the host. JBoss domain mode only - and required if running in domain mode. The host name is the "name" attribute of the "host" element in host.xml.
- **server_config** (required): The name of the Server Configuration. JBoss Domain mode only - and required if running in domain mode.

#### status
```
salt.modules.jboss7.status (jboss_config, host=None, server_config=None)
```

**Usage:**
Stop running jboss instance.

**Arguments:**
- **jboss_config** (required): Configuration dictionary with properties specified above.
- **host** (required): The name of the host. JBoss domain mode only - and required if running in domain mode. The host name is the "name" attribute of the "host" element in host.xml.

#### stop_server
```
salt.modules.jboss7.stop_server (jboss_config, host=None)
```

**Usage:**
Stop running jboss instance.

**Arguments:**
- **jboss_config** (required): Configuration dictionary with properties specified above.
- **host** (required): The name of the host. JBoss domain mode only - and required if running in domain mode. The host name is the "name" attribute of the "host" element in host.xml.
salt.modules.jboss7.undeploy(jboss_config, deployment)
Undeploy the application from jboss instance

jboss_config  Configuration dictionary with properties specified above.
deployment  Deployment name to undeploy

CLI Example:

salt.modules.jboss7.update_datasource(jboss_config, name, new_properties, profile=None)
Update an existing datasource in running jboss instance. If the property doesn’t exist if will be created, if it does, it will be updated with the new value

jboss_config  Configuration dictionary with properties specified above.
nname  Datasource name

new_properties
A dictionary of datasource properties to be updated. For example:

- driver-name: mysql
- connection-url: 'jdbc:mysql://localhost:3306/sampleDatabase'
- jndi-name: 'java:jboss/datasources/sampleDS'
- user-name: sampleuser
- password: secret
- min-pool-size: 3
- use-java-context: True

profile  The profile name (JBoss domain mode only)

CLI Example:

salt.modules.jboss7.update_simple_binding(jboss_config, binding_name, value, profile=None)
Update the simple jndi binding in the running jboss instance

jboss_config  Configuration dictionary with properties specified above.
binding_name  Binding name to be updated
value  New binding value

profile  The profile name (JBoss domain mode only)
21.9.180  salt.modules.jboss7_cli

Module for low-level interaction with JbossAS7 through CLI.

This module exposes two ways of interaction with the CLI, either through commands or operations.

Note: Following JBoss documentation (https://developer.jboss.org/wiki/CommandLineInterface): "Operations are considered a low level but comprehensive way to manage the AS controller, i.e. if it can’t be done with operations it can’t be done in any other way. Commands, on the other hand, are more user-friendly in syntax, although most of them still translate into operation requests and some of them even into a few composite operation requests, i.e. commands also simplify some management operations from the user’s point of view."

The difference between calling a command or operation is in handling the result. Commands return a zero return code if operation is successful or return non-zero return code and print an error to standard output in plain text, in case of an error.

Operations return a json-like structure, that contain more information about the result. In case of a failure, they also return a specific return code. This module parses the output from the operations and returns it as a dictionary so that an execution of an operation can then be verified against specific errors.

In order to run each function, jboss_config dictionary with the following properties must be passed:

- cli_path: the path to jboss-cli script, for example: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
- controller: the IP address and port of controller, for example: 10.11.12.13:9999
- cli_user: username to connect to jboss administration console if necessary
- cli_password: password to connect to jboss administration console if necessary

Example:

```
jboss_config:
    cli_path: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
    controller: 10.11.12.13:9999
    cli_user: 'jbossadm'
    cli_password: 'jbossadm'
```

salt.modules.jboss7_cli.run_command(jboss_config, command, fail_on_error=True)

Execute a command against jboss instance through the CLI interface.

- jboss_config Configuration dictionary with properties specified above.
- command Command to execute against jboss instance
- fail_on_error (default=True) Is true, raise CommandExecutionError exception if execution fails. If false, ‘success’ property of the returned dictionary is set to False

CLI Example:

```
salt '*' jboss7_cli.run_command '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm"}' my_command
```
salt.modules.jboss7_cli.run_operation

Execute an operation against jboss instance through the CLI interface.

Parameters:

- **jboss_config** Configuration dictionary with properties specified above.
- **operation** An operation to execute against jboss instance
- **fail_on_error** (default=True) If true, raise CommandExecutionError exception if execution fails. If false, ‘success’ property of the returned dictionary is set to False
- **retries** Number of retries in case of "JBAS012144: Could not connect to remote" error.

CLI Example:

```bash
salt '*' jboss7_cli.run_operation '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm"}' my_operation
```

21.9.181 salt.modules.jenkinsmod module

Module for controlling Jenkins

- **depends** python-jenkins

New in version 2016.3.0.

- **depends** python-jenkins Python module (not to be confused with jenkins)
- **configuration** This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```yaml
jenkins:
  api_key: peWcB1MOS9HRG15peWcB1MOS9HRG15
```

salt.modules.jenkinsmod.build_job

Initiate a build for the provided job.

Parameters:

- **name** – The name of the job is check if it exists.
- **parameters** – Parameters to send to the job.

Returns True is successful, otherwise raise an exception.

CLI Example:

```bash
salt '*' jenkins.build_job jobname
```

salt.modules.jenkinsmod.create_job

Return the configuration file.

Parameters:

- **name** – The name of the job is check if it exists.
- **config_xml** – The configuration file to use to create the job.
- **saltenv** – The environment to look for the file in.

Returns The configuration file used for the job.
CLI Example:

```
salt '*' jenkins.create_job jobname
salt '*' jenkins.create_job jobname config_xml='salt://jenkins/config.xml'
```

salt.modules.jenkinsmod.delete_job(name=None)
Return true is job is deleted successfully.

Parameters name – The name of the job to delete.

Returns Return true if job is deleted successfully.

CLI Example:

```
salt '*' jenkins.delete_job jobname
```

salt.modules.jenkinsmod.disable_job(name=None)
Return true is job is disabled successfully.

Parameters name – The name of the job to disable.

Returns Return true if job is disabled successfully.

CLI Example:

```
salt '*' jenkins.disable_job jobname
```

salt.modules.jenkinsmod.enable_job(name=None)
Return true is job is enabled successfully.

Parameters name – The name of the job to enable.

Returns Return true if job is enabled successfully.

CLI Example:

```
salt '*' jenkins.enable_job jobname
```

salt.modules.jenkinsmod.get_job_config(name=None)
Return the current job configuration for the provided job.

Parameters name – The name of the job to return the configuration for.

Returns The configuration for the job specified.

CLI Example:

```
salt '*' jenkins.get_job_config jobname
```

salt.modules.jenkinsmod.get_job_info(name=None)
Return information about the Jenkins job.

Parameters name – The name of the job is check if it exists.

Returns Information about the Jenkins job.

CLI Example:

```
salt '*' jenkins.get_job_info jobname
```

salt.modules.jenkinsmod.get_jobs()
Return the currently configured jobs.
Returns The currently configured jobs.

CLI Example:
```
salt '*' jenkins.get_jobs
```

```
salt.modules.jenkinsmod.get_version()
```
Return version of Jenkins

Returns The version of Jenkins

CLI Example:
```
salt '*' jenkins.get_version
```

```
salt.modules.jenkinsmod.job_exists(name=None)
Check whether the job exists in configured Jenkins jobs.

Parameters name – The name of the job is check if it exists.

Returns True if job exists, False if job does not exist.

CLI Example:
```
salt '*' jenkins.job_exists jobname
```

```
salt.modules.jenkinsmod.job_status(name=None)
Return the current status, enabled or disabled, of the job.

Parameters name – The name of the job to return status for

Returns Return true if enabled or false if disabled.

CLI Example:
```
salt '*' jenkins.job_status jobname
```

```
salt.modules.jenkinsmod.plugin_installed(name)
New in version 2016.11.0.

Return if the plugin is installed for the provided plugin name.

Parameters name – The name of the parameter to confirm installation.

Returns True if plugin exists, False if plugin does not exist.

CLI Example:
```
salt '*' jenkins.plugin_installed pluginName
```

```
salt.modules.jenkinsmod.run(script)
New in version 2017.7.0.

Execute a script on the jenkins master

Parameters script – The script

CLI Example:
```
salt '*' jenkins.run 'Jenkins.instance.doSafeRestart()'
```

```
salt.modules.jenkinsmod.update_job(name=None, config_xml=None, saltenv='base')
Return the updated configuration file.
Parameters

- **name** – The name of the job is check if it exists.
- **config_xml** – The configuration file to use to create the job.
- **saltenv** – The environment to look for the file in.

Returns

The configuration file used for the job.

CLI Example:

```bash
salt '*' jenkins.update_job jobname
salt '*' jenkins.update_job jobname config_xml='salt://jenkins/config.xml'
```

21.9.182 salt.modules.jinja

Module for checking jinja maps and verifying the result of loading JSON/YAML files

New in version 3000.

**salt.modules.jinja.import_json(path)**

Loads JSON data from the specified path

CLI Example:

```bash
salt myminion jinja.import_JSON myformula/foo.json
```

**salt.modules.jinja.import_yaml(path)**

Loads YAML data from the specified path

CLI Example:

```bash
salt myminion jinja.import_yaml myformula/foo.yaml
```

**salt.modules.jinja.load_map(path, value)**

Loads the map at the specified path, and returns the specified value from that map.

CLI Example:

```bash
# Assuming the map is loaded in your formula SLS as follows:
#
# {% from "myformula/map.jinja" import myformula with context %}
#
# the following syntax can be used to load the map and check the results:
salt myminion jinja.load_map myformula/map.jinja myformula
```

21.9.183 salt.modules.jira_mod module

**JIRA Execution module**

New in version 2019.2.0.

Execution module to manipulate JIRA tickets via Salt.

This module requires the jira Python library to be installed.

Configuration example:
salt.modules.jira_mod.add_comment(issue_key, comment, visibility=None, is_internal=False, server=None, username=None, password=None)

Add a comment to an existing ticket. Return True when it successfully added the comment.

**issue_key**  The issue ID to add the comment to.

**comment**  The body of the comment to be added.

**visibility:**  None  A dictionary having two keys:

- **type:**  is role (or group if the JIRA server has configured comment visibility for groups).
- **value:**  the name of the role (or group) to which viewing of this comment will be restricted.

**is_internal:**  False  Whether a comment has to be marked as Internal in Jira Service Desk.

CLI Example:

```
salt '*' jira.add_comment NE-123 'This is a comment'
```

salt.modules.jira_mod.assign_issue(issue_key, assignee, server=None, username=None, password=None)

Assign the issue to an existing user. Return True when the issue has been properly assigned.

**issue_key**  The JIRA ID of the ticket to manipulate.

**assignee**  The name of the user to assign the ticket to.

CLI Example:

```
salt '*' jira.assign_issue NET-123 example_user
```

salt.modules.jira_mod.create_issue(project, summary, description, template_engine='jinja', context=None, defaults=None, saltenv='base', issuetype='Bug', priority='Normal', labels=None, assignee=None, server=None, username=None, password=None, **kwargs)

Create a JIRA issue using the named settings. Return the JIRA ticket ID.

**project**  The name of the project to attach the JIRA ticket to.

**summary**  The summary (title) of the JIRA ticket. When the template_engine argument is set to a proper value of an existing Salt template engine (e.g., jinja, mako, etc.) it will render the summary before creating the ticket.

**description**  The full body description of the JIRA ticket. When the template_engine argument is set to a proper value of an existing Salt template engine (e.g., jinja, mako, etc.) it will render the description before creating the ticket.

**template_engine:**  jinja  The name of the template engine to be used to render the values of the summary and description arguments. Default: jinja.

**context:**  None  The context to pass when rendering the summary and description. This argument is ignored when template_engine is set as None

**defaults:**  None  Default values to pass to the Salt rendering pipeline for the summary and description arguments. This argument is ignored when template_engine is set as None.

**saltenv:**  base  The Salt environment name (for the rendering system).

```

```
issue type: **Bug**  The type of the JIRA ticket. Default: **Bug**.
priority: **Normal**  The priority of the JIRA ticket. Default: **Normal**.
lables: **None**  A list of labels to add to the ticket.
assignee: **None**  The name of the person to assign the ticket to.

**CLI Examples:**

```shell
salt '*' jira.create_issue NET 'Ticket title' 'Ticket description'
salt '*' jira.create_issue NET 'Issue on {{ opts.id }}' 'Error detected on {{ opts.id }}' template_engine=jinja
```

salt.modules.jira_mod.issue_closed(issue_key, server=None, username=None, password=None)
Check if the issue is closed.

**issue key**  The JIRA iD of the ticket to close.

**Returns:**
- **True:** the ticket exists and it is closed.
- **False:** the ticket exists and it has not been closed.
- **None:** the ticket does not exist.

**CLI Example:**

```shell
salt '*' jira.issue_closed NE-123
```

### 21.9.184  **salt.modules.junos**

Module to interact with Junos devices.

- **maturity** new
- **dependencies** junos-eznc, jxmlease

---

**Note:**  Those who wish to use junos-eznc (PyEZ) version >= 2.1.0, must use the latest salt code from github until the next release.

Refer to **junos** for information on connecting to junos proxy.

salt.modules.junos.cli(command=None, **kwargs)
Executes the CLI commands and returns the output in specified format. (default is text) The output can also be stored in a file.

- **command (required)**  The command to execute on the Junos CLI
- **format**  [text] Format in which to get the CLI output (either text or xml)
- **dev_timeout**  [30] The NETCONF RPC timeout (in seconds)
- **dest**  Destination file where the RPC output is stored. Note that the file will be stored on the proxy minion. To push the files to the master use `cp.push`.

**CLI Examples:**
salt modules.junos.commit(**kwargs)
To commit the changes loaded in the candidate configuration.

dev_timeout [30] The NETCONF RPC timeout (in seconds)

comment Provide a comment for the commit

confirm Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.

sync [False] When True, on dual control plane systems, requests that the candidate configuration on one control plane be copied to the other control plane, checked for correct syntax, and committed on both Routing Engines.

force_sync [False] When True, on dual control plane systems, force the candidate configuration on one control plane to be copied to the other control plane.

full When True, requires all the daemons to check and evaluate the new configuration.

detail When True, return commit detail

CLI Examples:

```
salt 'device_name' junos.commit comment='Commiting via saltstack' detail=True
salt 'device_name' junos.commit dev_timeout=60 confirm=10
salt 'device_name' junos.commit sync=True dev_timeout=90
```

salt.modules.junos.commit_check()
Perform a commit check on the configuration

CLI Example:

```
salt 'device_name' junos.commit_check
```

salt.modules.junos.diff(**kwargs)
Returns the difference between the candidate and the current configuration

id [0] The rollback ID value (0-49)

CLI Example:

```
salt 'device_name' junos.diff 3
```

salt.modules.junos.facts()
Displays the facts gathered during the connection. These facts are also stored in Salt grains.

CLI Example:

```
salt 'device_name' junos.facts
```

salt.modules.junos.facts_refresh()
Reload the facts dictionary from the device. Usually only needed if, the device configuration is changed by some other actor. This function will also refresh the facts stored in the salt grains.

CLI Example:
### salt.modules.junos

#### file_copy(src=None, dest=None)

Copies the file from the local device to the junos device.

- **src** The source path where the file is kept.
- **dest** The destination path on the where the file will be copied.

**CLI Example:**

```bash
salt 'device_name' junos.file_copy /home/m2/info.txt info_copy.txt
```

#### install_config(path=None, **kwargs)

Installs the given configuration file into the candidate configuration. Commits the changes if the commit checks or throws an error.

- **path** (required) Path where the configuration/template file is present. If the file has a `.conf` extension, the content is treated as text format. If the file has a `.xml` extension, the content is treated as XML format. If the file has a `.set` extension, the content is treated as Junos OS set commands.
- **mode** [exclusive] The mode in which the configuration is locked. Can be one of private, dynamic, batch, exclusive.
- **dev_timeout** [30] Set NETCONF RPC timeout. Can be used for commands which take a while to execute.
- **overwrite** [False] Set to `True` if you want this file is to completely replace the configuration file.
- **replace** [False] Specify whether the configuration file uses `replace:` statements. If `True`, only those statements under the `replace` tag will be changed.
- **format** Determines the format of the contents
- **update** [False] Compare a complete loaded configuration against the candidate configuration. For each hierarchy level or configuration object that is different in the two configurations, the version in the loaded configuration replaces the version in the candidate configuration. When the configuration is later committed, only system processes that are affected by the changed configuration elements parse the new configuration. This action is supported from PyEZ 2.1.
- **comment** Provide a comment for the commit
- **confirm** Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.
- **diffs_file** Path to the file where the diff (difference in old configuration and the committed configuration) will be stored. Note that the file will be stored on the proxy minion. To push the files to the master use `cp.push`.
- **template_vars** Variables to be passed into the template processing engine in addition to those present in pillar, the minion configuration, grains, etc. You may reference these variables in your template like so:

  ```
  {{ template_vars["var_name"] }}
  ```

**CLI Examples:**

```bash
salt 'device_name' junos.install_config 'salt://production/network/routers/config.
→set'
salt 'device_name' junos.install_config 'salt://templates/replace_config.conf'
→replace=True comment='Committed via SaltStack'
```

(continues on next page)
install_config

Installs the given image on the device. After the installation is complete the device is rebooted, if reboot=True is given as a keyworded argument.

**path (required)** Path where the image file is present on the proxy minion

**remote_path**: If the value of **path** is a file path on the local (Salt host’s) filesystem, then the image is copied from the local filesystem to the **remote_path**: directory on the target Junos device. The default is /var/tmp. If the value of **:path:** or is a URL, then the value of **:remote_path:** is unused.

**dev_timeout** [30] The NETCONF RPC timeout (in seconds). This argument was added since most of the time the "package add" RPC takes a significant amount of time. The default RPC timeout is 30 seconds. So this **:timeout:** value will be used in the context of the SW installation process. Defaults to 30 minutes (30*60=1800)

**reboot** [False] Whether to reboot after installation

**no_copy** [False] If True the software package will not be SCP’d to the device

**bool validate**: When True this method will perform a config validation against the new image

**bool issu**: When True allows unified in-service software upgrade (ISSU) feature enables you to upgrade between two different Junos OS releases with no disruption on the control plane and with minimal disruption of traffic.

**bool nssu**: When True allows nonstop software upgrade (NSSU) enables you to upgrade the software running on a Juniper Networks EX Series Virtual Chassis or a Juniper Networks EX Series Ethernet Switch with redundant Routing Engines with a single command and minimal disruption to network traffic.

**CLI Examples:**

```
salt 'device_name' junos.install_os 'salt://images/junos_image.tgz' reboot=True
salt 'device_name' junos.install_os 'salt://junos_16_1.tgz' dev_timeout=300
```

load

Loads the configuration from the file provided onto the device.

**path (required)** Path where the configuration/template file is present. If the file has a .conf extension, the content is treated as text format. If the file has a .xml extension, the content is treated as XML format. If the file has a .set extension, the content is treated as Junos OS set commands.

**overwrite** [False] Set to True if you want this file is to completely replace the configuration file.

**replace** [False] Specify whether the configuration file uses replace: statements. If True, only those statements under the replace tag will be changed.

**format** Determines the format of the contents

**update** [False] Compare a complete loaded configuration against the candidate configuration. For each hierarchy level or configuration object that is different in the two configurations, the version in the loaded configuration replaces the version in the candidate configuration. When the configuration is later committed, only system processes that are affected by the changed configuration elements parse the new configuration. This action is supported from PyEZ 2.1.

**template_vars** Variables to be passed into the template processing engine in addition to those present in pillar, the minion configuration, grains, etc. You may reference these variables in your template like so:
CLI Examples:

```python
salt 'device_name' junos.load 'salt://production/network/routers/config.set'
salt 'device_name' junos.load 'salt://templates/replace_config.conf' replace=True
salt 'device_name' junos.load 'salt://my_new_configuration.conf' overwrite=True
salt 'device_name' junos.load 'salt://syslog_template.conf' template_vars='{{
  "syslog_host": "10.180.222.7"
}}'
```

**salt.modules.junos.lock()**

Attempts an exclusive lock on the candidate configuration. This is a non-blocking call.

**Note:** When locking, it is important to remember to call `junos.unlock` once finished. If locking during orchestration, remember to include a step in the orchestration job to unlock.

CLI Example:

```python
salt 'device_name' junos.lock
```

**salt.modules.junos.ping(dest_ip=None, **kwargs)**

Send a ping RPC to a device

- **dest_ip** The IP of the device to ping
- **dev_timeout** [30] The NETCONF RPC timeout (in seconds)
- **rapid** [False] When True, executes ping at 100pps instead of 1pps
- **ttl** Maximum number of IP routers (IP hops) allowed between source and destination
- **routing_instance** Name of the routing instance to use to send the ping
- **interface** Interface used to send traffic
- **count** [5] Number of packets to send

CLI Examples:

```python
salt 'device_name' junos.ping '8.8.8.8' count=5
salt 'device_name' junos.ping '8.8.8.8' ttl=1 rapid=True
```

**salt.modules.junos.rollback(**kwargs**)**

Roll back the last committed configuration changes and commit

- **id** [0] The rollback ID value (0-49)
- **dev_timeout** [30] The NETCONF RPC timeout (in seconds)
- **comment** Provide a comment for the commit
- **confirm** Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.
- **diffs_file** Path to the file where the diff (difference in old configuration and the committed configuration) will be stored. Note that the file will be stored on the proxy minion. To push the files to the master use `cp.push`.

21.9. execution modules
**CLI Example:**

```shell
salt 'device_name' junos.rollback 10
```

```python
salt.modules.junos.rpc(cmd=None, dest=None, **kwargs)
```

This function executes the RPC provided as arguments on the junos device. The returned data can be stored in a file.

- **cmd** - The RPC to be executed
- **dest** - Destination file where the RPC output is stored. Note that the file will be stored on the proxy minion. To push the files to the master use `cp.push`.
- **format** - [xml] The format in which the RPC reply is received from the device
- **dev_timeout** - [30] The NETCONF RPC timeout (in seconds)
- **filter** - Used with the `get-config` RPC to get specific configuration
- **terse** - [False] Amount of information you want
- **interface_name** - Name of the interface to query

**CLI Example:**

```shell
salt 'device' junos.rpc get-config /var/log/config.txt format=text filter='
  →<configuration><system/></configuration>
' salt 'device' junos.rpc get-interface-information /home/user/interface.xml
  →interface_name='lo0' terse=True
salt 'device' junos.rpc get-chassis-inventory
```

```python
salt.modules.junos.set_hostname(hostname=None, **kwargs)
```

Set the device’s hostname

- **hostname** - The name to be set
- **dev_timeout** - [30] The NETCONF RPC timeout (in seconds)
- **comment** - Provide a comment to the commit
- **confirm** - Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.

**CLI Example:**

```shell
salt 'device_name' junos.set_hostname salt-device
```

```python
salt.modules.junos.shutdown(**kwargs)
```

Shut down (power off) or reboot a device running Junos OS. This includes all Routing Engines in a Virtual Chassis or a dual Routing Engine system.

**Note:** One of `shutdown` or `reboot` must be set to `True` or no action will be taken.

- **shutdown** - [False] Set this to `True` if you want to shutdown the machine. This is a safety mechanism so that the user does not accidentally shutdown the junos device.
- **reboot** - [False] If `True`, reboot instead of shutting down
- **at** - Used when rebooting, to specify the date and time the reboot should take place. The value of this option must match the JunOS CLI reboot syntax.
- **in_min** - Used when shutting down. Specify the delay (in minutes) before the device will be shut down.
CLI Examples:

```bash
salt 'device_name' junos.shutdown reboot=True
salt 'device_name' junos.shutdown shutdown=True in_min=10
salt 'device_name' junos.shutdown shutdown=True
```

salt.modules.junos.timeoutDecorator(function)

salt.modules.junos.unlock()

Unlock the candidate configuration.

CLI Example:

```bash
salt 'device_name' junos.unlock
```

salt.modules.junos.zeroize()

Resets the device to default factory settings

CLI Example:

```bash
salt 'device_name' junos.zeroize
```

21.9.185 salt.modules.k8s

Salt module to manage Kubernetes cluster

New in version 2016.3.0.

Roadmap:

- Add creation of K8S objects (pod, rc, service, ...)
- Add replace of K8S objects (pod, rc, service, ...)
- Add deletion of K8S objects (pod, rc, service, ...)
- Add rolling update
- Add (auto)scaling

salt.modules.k8s.create_namespace(name, apiserver_url=None)

New in version 2016.3.0.

Create kubernetes namespace from the name, similar to the functionality added to kubectl since v.1.2.0:

```bash
kubectl create namespace namespace-name
```

CLI Example:

```bash
salt '*' k8s.create_namespace namespace_name
salt '*' k8s.create_namespace namespace_name http://kube-master.cluster.local
```

salt.modules.k8s.create_secret(namespace, name, sources, apiserver_url=None, force=False, update=False, saltenv='base')

New in version 2016.3.0.

Create k8s secrets in the defined namespace from the list of files

CLI Example:
salt '*' k8s.create_secret namespace_name secret_name sources

salt '*' k8s.create_secret namespace_name secret_name sources http://kube-master.cluster.local

sources are either dictionary of {name: path, name1: path} pairs or array of strings defining paths.

Example of paths array:

["/full/path/filename", "file:///full/path/filename", "salt://secret/storage/file.txt", "http://user:password@securesite.com/secret-file.json"]

Example of dictionaries:

{"name1": '/full/path/filename', name2: "salt://secret/storage/file.txt"}

optional parameters accepted:

update=[false] default value is false if set to false, and secret is already present on the cluster - warning will be returned and no changes to the secret will be done. In case it is set to "true" and secret is present but data is differ - secret will be updated.

force=[true] default value is true if the to False, secret will not be created in case one of the files is not valid kubernetes secret. e.g. capital letters in secret name or _ in case force is set to True, wrong files will be skipped but secret will be created any way.

saltenv=["base"] default value is base in case 'salt://' path is used, this parameter can change the visibility of files

salt.modules.k8s.delete_secret(namespace, name, apiserver_url=None, force=True)

New in version 2016.3.0.

Delete kubernetes secret in the defined namespace. Namespace is the mandatory parameter as well as name.

CLI Example:

salt '*' k8s.delete_secret namespace_name secret_name

salt '*' k8s.delete_secret namespace_name secret_name http://kube-master.cluster.local

salt.modules.k8s.get_labels(node=None, apiserver_url=None)

New in version 2016.3.0.

Get labels from the current node

CLI Example:

salt '*' k8s.get_labels

salt '*' k8s.get_labels kube-node.cluster.local http://kube-master.cluster.local

salt.modules.k8s.get_namespaces(namespace=None, apiserver_url=None)

New in version 2016.3.0.

Get one or all kubernetes namespaces.

If namespace parameter is omitted, all namespaces will be returned back to user, similar to following kubectl example:
kubectl get namespaces -o json

In case namespace is set by user, the output will be similar to the one from kubectl:

kubectl get namespaces namespace_name -o json

CLI Example:

salt '*' k8s.get_namespaces
salt '*' k8s.get_namespaces namespace_name http://kube-master.cluster.local

salt.modules.k8s.get_secrets(*, namespace=", name=", apiserver_url=None, decode=False, brief=False)
Get k8s namespaces

CLI Example:

salt '*' k8s.get_secrets namespace_name
salt '*' k8s.get_secrets namespace_name secret_name http://kube-master.cluster.local

salt.modules.k8s.label_absent(*, name=", node=None, apiserver_url=None)
Delete label to the current node

CLI Example:

salt '*' k8s.label_absent hw/disktype
salt '*' k8s.label_absent hw/disktype kube-node.cluster.local http://kube-master.cluster.local

salt.modules.k8s.label_folder_absent(*, name=", node=None, apiserver_url=None)
Delete label folder to the current node

CLI Example:

salt '*' k8s.label_folder_absent hw
salt '*' k8s.label_folder_absent hw/ kube-node.cluster.local http://kube-master.cluster.local

salt.modules.k8s.label_present(*, value=", node=None, apiserver_url=None)
Set label to the current node

CLI Example:

salt '*' k8s.label_present hw/disktype ssd
salt '*' k8s.label_present hw/disktype ssd kube-node.cluster.local http://kube-master.cluster.local

salt.modules.k8s.update_secret(*, namespace=", name=", sources=", apiserver_url=None, force=True, saltenv='base')

New in version 2016.3.0.

alias to k8s.create_secret with update=true

CLI Example:
**Kubernetes secret** namespace_name secret_name sources [apiserver_url] `*`

- [force=true] [update=false] [saltenv='base']

**Example of paths array:**

```
['/full/path/filename', "file:///full/path/filename", "salt://secret/storage/file.txt", 'http://user:password@securesite.com/secret-file.json']
```

**Example of dictionaries:**

```
{"nameit": '/full/path/filename', name2: "salt://secret/storage/file.txt"}
```

**optional parameters accepted:**

- force=[true] default value is true if the to False, secret will not be created in case one of the files is not valid kubernetes secret. e.g. capital letters in secret name or _ in case force is set to True, wrong files will be skipped but secret will be created any way.

- saltenv=[‘base’] default value is base in case ‘salt://’ path is used, this parameter can change the visibility of files

### 21.9.186 salt.modules.kapacitor module

Kapacitor execution module.

**configuration**

This module accepts connection configuration details either as parameters or as configuration settings in `/etc/salt/minion` on the relevant minions:

```
kapacitor.host: 'localhost'
kapacitor.port: 9092
```

New in version 2016.11.0.

Also protocol and SSL settings could be configured:

```
kapacitor.unsafe_ssl: 'false'
kapacitor.protocol: 'http'
```

New in version 2019.2.0.

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

**salt.modules.kapacitor.**define_task**(name, tick_script, task_type=’stream’, database=None, retention_policy=’default’, dbrps=None)**

Define a task. Serves as both create/update.

- name Name of the task.
- tick_script Path to the TICK script for the task. Can be a salt:// source.
- task_type Task type. Defaults to 'stream'
**dbbps** A list of databases and retention policies in "dbname"."rpname" format to fetch data from. For backward compatibility, the value of 'database' and 'retention_policy' will be merged as part of dbbps.

New in version 2019.2.0.

**database** Which database to fetch data from.

**retention_policy** Which retention policy to fetch data from. Defaults to 'default'.

CLI Example:
```
salt '*' kapacitor.define_task cpu salt://kapacitor/cpu.tick database=telegraf
```

```python
salt.modules.kapacitor.delete_task(name)
```
Delete a kapacitor task.

**name** Name of the task to delete.

CLI Example:
```
salt '*' kapacitor.delete_task cpu
```

```python
salt.modules.kapacitor.disable_task(name)
```
Disable a kapacitor task.

**name** Name of the task to disable.

CLI Example:
```
salt '*' kapacitor.disable_task cpu
```

```python
salt.modules.kapacitor.enable_task(name)
```
Enable a kapacitor task.

**name** Name of the task to enable.

CLI Example:
```
salt '*' kapacitor.enable_task cpu
```

```python
salt.modules.kapacitor.get_task(name)
```
Get a dict of data on a task.

**name** Name of the task to get information about.

CLI Example:
```
salt '*' kapacitor.get_task cpu
```

```python
salt.modules.kapacitor.version()
```
Get the kapacitor version.

21.9.187 **salt.modules.kerberos**

Manage Kerberos KDC

**configuration** In order to manage your KDC you will need to generate a keytab that can authenticate without requiring a password.

```
# ktadd -k /root/secure.keytab kadmin/admin kadmin/changepw
```
On the KDC minion you will need to add the following to the minion configuration file so Salt knows what keytab to use and what principal to authenticate as.

```
auth_keytab: /root/auth.keytab
auth_principal: kadmin/admin
```

salt.modules.kerberos.create_keytab(name, keytab, enctypes=None)
Create keytab
CLI Example:
```
salt 'kdc.example.com' kerberos.create_keytab host/host1.example.com host1.@example.com.keytab
```

salt.modules.kerberos.create_principal(name, enctypes=None)
Create Principal
CLI Example:
```
salt 'kdc.example.com' kerberos.create_principal host/example.com
```

current.modules.kerberos.delete_principal(name)
Delete Principal
CLI Example:
```
salt 'kdc.example.com' kerberos.delete_principal host/example.com@EXAMPLE.COM
```

current.modules.kerberos.get_policy(name)
Get policy details
CLI Example:
```
salt 'kdc.example.com' kerberos.get_policy my_policy
```

current.modules.kerberos.get_principal(name)
Get principal details
CLI Example:
```
salt 'kdc.example.com' kerberos.get_principal root/admin
```

current.modules.kerberos.get_privs()
Current privileges
CLI Example:
```
salt 'kdc.example.com' kerberos.get_privs
```

current.modules.kerberos.list_policies()
List policies
CLI Example:
```
salt 'kdc.example.com' kerberos.list_policies
```

current.modules.kerberos.list_principals()
Get all principals
CLI Example:
21.9.188 salt.modules.kernelpkg_linux_apt

Manage Linux kernel packages on APT-based systems

salt.modules.kernelpkg_linux_apt.active()
Return the version of the running kernel.

CLI Example:
salt '*' kernelpkg.active

salt.modules.kernelpkg_linux_apt.cleanup(keep_latest=True)
Remove all unused kernel packages from the system.

keep_latest [True] In the event that the active kernel is not the latest one installed, setting this to True will retain the latest kernel package, in addition to the active one. If False, all kernel packages other than the active one will be removed.

CLI Example:
salt '*' kernelpkg.cleanup

salt.modules.kernelpkg_linux_apt.latest_available()
Return the version of the latest kernel from the package repositories.

CLI Example:
salt '*' kernelpkg.latest_available

salt.modules.kernelpkg_linux_apt.latest_installed()
Return the version of the latest installed kernel.

CLI Example:
salt '*' kernelpkg.latest_installed

Note: This function may not return the same value as active() if a new kernel has been installed and the system has not yet been rebooted. The needs_reboot() function exists to detect this condition.

salt.modules.kernelpkg_linux_apt.list_installed()
Return a list of all installed kernels.

CLI Example:
salt '*' kernelpkg.list_installed

salt.modules.kernelpkg_linux_apt.needs_reboot()
Detect if a new kernel version has been installed but is not running. Returns True if a new kernel is installed, False otherwise.

CLI Example:
salt '*' kernelpkg.needs_reboot
salt.modules.kernelpkg_linux_apt.remove(release)
Remove a specific version of the kernel.

release The release number of an installed kernel. This must be the entire release number as returned by list_installed(), not the package name.

CLI Example:
```
salt '*' kernelpkg.remove 4.4.0-70-generic
```

salt.modules.kernelpkg_linux_apt.upgrade(reboot=False, at_time=None)
Upgrade the kernel and optionally reboot the system.

reboot [False] Request a reboot if a new kernel is available.

at_time [immediate] Schedule the reboot at some point in the future. This argument is ignored if reboot=False. See reboot() for more details on this argument.

CLI Example:
```
salt '*' kernelpkg.upgrade
salt '*' kernelpkg.upgrade reboot=True at_time=1
```

Note: An immediate reboot often shuts down the system before the minion has a chance to return, resulting in errors. A minimal delay (1 minute) is useful to ensure the result is delivered to the master.

salt.modules.kernelpkg_linux_apt.upgrade_available()
Detect if a new kernel version is available in the repositories. Returns True if a new kernel is available, False otherwise.

CLI Example:
```
salt '*' kernelpkg.upgrade_available
```

21.9.189 salt.modules.kernelpkg_linux_yum
Manage Linux kernel packages on YUM-based systems

salt.modules.kernelpkg_linux_yum.active()
Return the version of the running kernel.

CLI Example:
```
salt '*' kernelpkg.active
```

salt.modules.kernelpkg_linux_yum.cleanup(keep_latest=True)
Remove all unused kernel packages from the system.

keep_latest [True] In the event that the active kernel is not the latest one installed, setting this to True will retain the latest kernel package, in addition to the active one. If False, all kernel packages other than the active one will be removed.

CLI Example:
```
salt '*' kernelpkg.cleanup
```
salt.modules.kernelpkg_linux_yum.latest_available()

Return the version of the latest kernel from the package repositories.

CLI Example:

```
salt '*' kernelpkg.latest_available
```

salt.modules.kernelpkg_linux_yum.latest_installed()

Return the version of the latest installed kernel.

CLI Example:

```
salt '*' kernelpkg.latest_installed
```

Note: This function may not return the same value as `active()` if a new kernel has been installed and the system has not yet been rebooted. The `needs_reboot()` function exists to detect this condition.

salt.modules.kernelpkg_linux_yum.list_installed()

Return a list of all installed kernels.

CLI Example:

```
salt '*' kernelpkg.list_installed
```

salt.modules.kernelpkg_linux_yum.needs_reboot()

Detect if a new kernel version has been installed but is not running. Returns True if a new kernel is installed, False otherwise.

CLI Example:

```
salt '*' kernelpkg.needs_reboot
```

salt.modules.kernelpkg_linux_yum.remove(release)

Remove a specific version of the kernel.

release  The release number of an installed kernel. This must be the entire release number as returned by `list_installed()`, not the package name.

CLI Example:

```
salt '*' kernelpkg.remove 3.10.0-327.el7
```

salt.modules.kernelpkg_linux_yum.upgrade(reboot=False, at_time=None)

Upgrade the kernel and optionally reboot the system.

reboot  [False] Request a reboot if a new kernel is available.

at_time  [immediate] Schedule the reboot at some point in the future. This argument is ignored if `reboot=False`. See `reboot()` for more details on this argument.

CLI Example:

```
salt '*' kernelpkg.upgrade
salt '*' kernelpkg.upgrade reboot=True at_time=1
```

Note: An immediate reboot often shuts down the system before the minion has a chance to return, resulting in errors. A minimal delay (1 minute) is useful to ensure the result is delivered to the master.
salt.modules.kernelpkg_linux_yum.upgrade_available()
Detect if a new kernel version is available in the repositories. Returns True if a new kernel is available, False otherwise.

CLI Example:
```
salt '*' kernelpkg.upgrade_available
```

21.9.190  salt.modules.key

Functions to view the minion’s public key information

salt.modules.key.finger(hash_type=None)
Return the minion’s public key fingerprint

hash_type  The hash algorithm used to calculate the fingerprint

CLI Example:
```
salt '*' key.finger
```

salt.modules.key.finger_master(hash_type=None)
Return the fingerprint of the master’s public key on the minion.

hash_type  The hash algorithm used to calculate the fingerprint

CLI Example:
```
salt '*' key.finger_master
```

21.9.191  salt.modules.keyboard

Module for managing keyboards on supported POSIX-like systems using systemd, or such as Redhat, Debian and Gentoo.

salt.modules.keyboard.get_sys()
Get current system keyboard setting

CLI Example:
```
salt '*' keyboard.get_sys
```

salt.modules.keyboard.get_x()
Get current X keyboard setting

CLI Example:
```
salt '*' keyboard.get_x
```

salt.modules.keyboard.set_sys(layout)
Set current system keyboard setting

CLI Example:
```
salt '*' keyboard.set_sys dvorak
```
salt.modules.keyboard.set_x(layout)
Set current X keyboard setting

CLI Example:
```
salt '*' keyboard.set_x dvorak
```

21.9.192 salt.modules.keystone

Module for handling openstack keystone calls.

**optdepends**
- keystoneclient Python adapter

**configuration** This module is not usable until the following are specified either in a pillar or in the minion’s config file:

```yaml
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.tenant_id: f80919baedab48ec8931f200c65a50df
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
```

OR (for token based authentication)

```yaml
keystone.token: 'ADMIN'
keystone.endpoint: 'http://127.0.0.1:35357/v2.0'
```

If configuration for multiple openstack accounts is required, they can be set up as different configuration profiles. For example:

```yaml
openstack1:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.tenant_id: f80919baedab48ec8931f200c65a50df
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/

openstack2:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.tenant_id: f80919baedab48ec8931f200c65a50df
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/
```

With this configuration in place, any of the keystone functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' keystone.tenant_list profile=openstack1
```

salt.modules.keystone.api_version(profile=None, **connection_args)
Returns the API version derived from endpoint’s response.

CLI Example:
```
salt '*' keystone.api_version
```
salt.modules.keystone.auth(profile=None, **connection_args)

Set up keystone credentials. Only intended to be used within Keystone-enabled modules.

CLI Example:
```
salt '*' keystone.auth
```

salt.modules.keystone.ec2_credentials_create(user_id=None, name=None, tenant_id=None, tenant=None, profile=None, **connection_args)

Create EC2-compatible credentials for user per tenant

CLI Examples:
```
salt '*' keystone.ec2_credentials_create name=admin tenant=admin
```  
```
salt '*' keystone.ec2_credentials_create user_id=c965f79c4f864eaaa9c3b41904e67082 tenant_id=722787eb540849158668370dc627ec5f
```

salt.modules.keystone.ec2_credentials_delete(user_id=None, name=None, access_key=None, profile=None, **connection_args)

Delete EC2-compatible credentials

CLI Examples:
```
salt '*' keystone.ec2_credentials_delete 860f8c2c38ca4fab989f9bc56a061a6f43 access_key=5f66d2f24f604b8bb9cd28886106f442
```  
```
salt '*' keystone.ec2_credentials_delete name=admin access_key=5f66d2f24f604b8bb9cd28886106f442
```

salt.modules.keystone.ec2_credentials_get(user_id=None, name=None, access=None, profile=None, **connection_args)

Return ec2_credentials for a user (keystone ec2-credentials-get)

CLI Examples:
```
salt '*' keystone.ec2_credentials_get c965f79c4f864eaaa9c3b41904e67082 access=722787eb540849158668370
```  
```
salt '*' keystone.ec2_credentials_get user_id=c965f79c4f864eaaa9c3b41904e67082 access=722787eb540849158668370
```  
```
salt '*' keystone.ec2_credentials_get name=nova access=722787eb540849158668370dc627ec5f
```

salt.modules.keystone.ec2_credentials_list(user_id=None, name=None, profile=None, **connection_args)

Return a list of ec2_credentials for a specific user (keystone ec2-credentials-list)

CLI Examples:
```
salt '*' keystone.ec2_credentials_list 298ce377245c4ec9b70e1c639c89e654
```  
```
salt '*' keystone.ec2_credentials_list user_id=298ce377245c4ec9b70e1c639c89e654
```  
```
salt '*' keystone.ec2_credentials_list name=jack
```

salt.modules.keystone.endpoint_create(service, publicurl=None, internalurl=None, adminurl=None, region=None, profile=None, url=None, interface=None, **connection_args)

Create an endpoint for an Openstack service
CLI Examples:

```
salt 'v2' keystone.endpoint_create nova 'http://public/url' 'http://internal/url'
   region='http://adminurl/url'

salt 'v3' keystone.endpoint_create nova url='http://public/url' interface='public'
   region='RegionOne'
```

```python
salt.modules.keystone.endpoint_delete(service, region=None, profile=None, interface=None, **connection_args)
```

Delete endpoints of an Openstack service

CLI Examples:

```
salt 'v2' keystone.endpoint_delete nova [region=RegionOne]

salt 'v3' keystone.endpoint_delete nova interface=admin [region=RegionOne]
```

```python
salt.modules.keystone.endpoint_get(service, region=None, profile=None, interface=None, **connection_args)
```

Return a specific endpoint (keystone endpoint-get)

CLI Example:

```
salt 'v2' keystone.endpoint_get nova [region=RegionOne]

salt 'v3' keystone.endpoint_get nova interface=admin [region=RegionOne]
```

```python
salt.modules.keystone.endpoint_list(profile=None, **connection_args)
```

Return a list of available endpoints (keystone endpoints-list)

CLI Example:

```
salt '*' keystone.endpoint_list
```

```python
salt.modules.keystone.project_create(name, domain, description=None, enabled=True, profile=None, **connection_args)
```

Create a keystone project. Overrides keystone tenant_create form api V2. For keystone api V3.

New in version 2016.11.0.

- **name** The project name, which must be unique within the owning domain.
- **domain** The domain name.
- **description** The project description.
- **enabled** Enables or disables the project.
- **profile** Configuration profile - if configuration for multiple openstack accounts required.

CLI Examples:

```
salt '*' keystone.project_create nova default description='Nova Compute Project'
salt '*' keystone.project_create test default enabled=False
```

```python
salt.modules.keystone.project_delete(project_id=None, name=None, profile=None, **connection_args)
```

Delete a project (keystone project-delete). Overrides keystone tenant-delete form api V2. For keystone api V3 only.

New in version 2016.11.0.
project_id  The project id.
name  The project name.
profile  Configuration profile - if configuration for multiple openstack accounts required.

CLI Examples:

```
salt '*' keystone.project_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_delete project_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_delete name=demo
```

```
salt.modules.keystone.project_get(project_id=None, name=None, profile=None, **connection_args)
```

Return a specific projects (keystone project-get) Overrides keystone tenant-get form api V2. For keystone api V3 only.

New in version 2016.11.0.

```
project_id  The project id.
name  The project name.
profile  Configuration profile - if configuration for multiple openstack accounts required.
```

CLI Examples:

```
salt '*' keystone.project_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_get project_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_get name=nova
```

```
salt.modules.keystone.project_list(profile=None, **connection_args)
```

Return a list of available projects (keystone projects-list). Overrides keystone tenants-list form api V2. For keystone api V3 only.

New in version 2016.11.0.

```
profile  Configuration profile - if configuration for multiple openstack accounts required.
```

CLI Example:

```
salt '*' keystone.project_list
```

```
salt.modules.keystone.project_update(project_id=None, name=None, description=None, enabled=None, profile=None, **connection_args)
```

Update a tenant’s information (keystone project-update) The following fields may be updated: name, description, enabled. Can only update name if targeting by ID

Overrides keystone tenant_update form api V2. For keystone api V3 only.

New in version 2016.11.0.

```
project_id  The project id.
name  The project name, which must be unique within the owning domain.
description  The project description.
enabled  Enables or disables the project.
profile  Configuration profile - if configuration for multiple openstack accounts required.
```

CLI Examples:
salt.modules.keystone.role_create(name, profile=None, **connection_args)
Create a named role.

CLI Example:
```bash
salt '*' keystone.role_create admin
```

salt.modules.keystone.role_delete(role_id=None, name=None, profile=None, **connection_args)
Delete a role (keystone role-delete)

CLI Examples:
```bash
salt '*' keystone.role_delete c965f79c4f86489c3b41904e67082
salt '*' keystone.role_delete role_id=c965f79c4f86489c3b41904e67082
salt '*' keystone.role_delete name=admin
```

salt.modules.keystone.role_get(role_id=None, name=None, profile=None, **connection_args)
Return a specific role (keystone role-get)

CLI Examples:
```bash
salt '*' keystone.role_get c965f79c4f86489c3b41904e67082
salt '*' keystone.role_get role_id=c965f79c4f86489c3b41904e67082
salt '*' keystone.role_get name=nova
```

salt.modules.keystone.role_list(profile=None, **connection_args)
Return a list of available roles (keystone role-list)

CLI Example:
```bash
salt '*' keystone.role_list
```

salt.modules.keystone.service_create(name, service_type, description=None, profile=None, **connection_args)
Add service to Keystone service catalog

CLI Examples:
```bash
salt '*' keystone.service_create nova compute 'OpenStack Compute Service'
```

salt.modules.keystone.service_delete(service_id=None, name=None, profile=None, **connection_args)
Delete a service from Keystone service catalog

CLI Examples:
```bash
salt '*' keystone.service_delete c965f79c4f86489c3b41904e67082
salt '*' keystone.service_delete name=nova
```

salt.modules.keystone.service_get(service_id=None, name=None, profile=None, **connection_args)
Return a specific service (keystone service-get)

CLI Examples:
salt.modules.keystone.service_get(service_id=c965f79c4f864eaaa9c3b41904e67082)

salt.modules.keystone.service_get service_id=c965f79c4f864eaaa9c3b41904e67082

salt.modules.keystone.service_get(name=nova)

salt.modules.keystone.service_list(profile=None, **connection_args)

Return a list of available services (keystone services-list)

CLI Example:
salt '*' keystone.service_list

salt.modules.keystone.tenant_create(name=nova, description=None, enabled=True, profile=None, **connection_args)

Create a keystone tenant

CLI Examples:
salt '*' keystone.tenant_create nova description='nova tenant'
salt '*' keystone.tenant_create test enabled=False

salt.modules.keystone.tenant_delete(tenant_id=None, name=None, profile=None, **connection_args)

Delete a tenant (keystone tenant-delete)

CLI Examples:
salt '*' keystone.tenant_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_delete tenant_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_delete name=demo

salt.modules.keystone.tenant_get(tenant_id=None, name=None, profile=None, **connection_args)

Return a specific tenant's information (keystone tenant-get)

CLI Examples:
salt '*' keystone.tenant_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_get tenant_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_get name=nova

salt.modules.keystone.tenant_list(profile=None, **connection_args)

Return a list of available tenants (keystone tenants-list)

CLI Example:
salt '*' keystone.tenant_list

salt.modules.keystone.tenant_update(tenant_id=None, name=None, description=None, enabled=None, profile=None, **connection_args)

Update a tenant's information (keystone tenant-update) The following fields may be updated: name, description, enabled. Can only update name if targeting by ID

CLI Examples:
salt '*' keystone.tenant_update name=admin enabled=True
salt '*' keystone.tenant_update c965f79c4f864eaaa9c3b41904e67082 name=admin
email=admin@domain.com

salt.modules.keystone.token_get(profile=None, **connection_args)

Return the configured tokens (keystone token-get)
CLI Example:

```
salt '*' keystone.token_get c965f79c4f864eaaa9c3b41904e67082
```

```python
salt.modules.keystone.user_create(name, password, email, tenant_id=None, enabled=True, profile=None, project_id=None, description=None, **connection_args)
```
Create a user (keystone user-create)

CLI Examples:

```
salt '*' keystone.user_create name=jack password=zero email=jack@halloweentown.org tenant_id=a28a7b5a999a455f84b1f5210264375e enabled=True
```

```python
salt.modules.keystone.user_delete(user_id=None, name=None, profile=None, **connection_args)
```
Delete a user (keystone user-delete)

CLI Examples:

```
salt '*' keystone.user_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_delete user_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_delete name=nova
```

```python
salt.modules.keystone.user_get(user_id=None, name=None, profile=None, **connection_args)
```
Return a specific users (keystone user-get)

CLI Examples:

```
salt '*' keystone.user_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_get user_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_get name=nova
```

```python
salt.modules.keystone.user_list(profile=None, **connection_args)
```
Return a list of available users (keystone user-list)

CLI Example:

```
salt '*' keystone.user_list
```

```python
salt.modules.keystone.user_password_update(user_id=None, name=None, password=None, profile=None, **connection_args)
```
Update a user’s password (keystone user-password-update)

CLI Examples:

```
salt '*' keystone.user_password_update c965f79c4f864eaaa9c3b41904e67082 password=12345
salt '*' keystone.user_password_update user_id=c965f79c4f864eaaa9c3b41904e67082 password=12345
salt '*' keystone.user_password_update name=nova password=12345
```

```python
salt.modules.keystone.user_role_add(user_id=None, user=None, tenant_id=None, tenant=None, role_id=None, role=None, profile=None, project_id=None, project_name=None, **connection_args)
```
Add role for user in tenant (keystone user-role-add)

CLI Examples:
salt.modules.keystone.user_role_add

* user_id = 298ce377245c4ec9b70e1c639c89e654 tenant_id = 7167a092e84bae8ced4b9fd1b3b role_id = ce377245c4ec9b70e1c639c89e8ced4

salt.modules.keystone.user_role_list

Return a list of available user_roles (keystone user-roles-list)

CLI Examples:
salt '*' keystone.user_role_list user_id = 298ce377245c4ec9b70e1c639c89e654 tenant_id = 7167a092e84bae8ced4b9fd1b3b

salt.modules.keystone.user_role_remove

Remove role for user in tenant (keystone user-role-remove)

CLI Examples:
salt '*' keystone.user_role_remove user_id = 298ce377245c4ec9b70e1c639c89e654 tenant_id = 7167a092e84bae8ced4b9fd1b3b role_id = ce377245c4ec9b70e1c639c89e8ced4

salt.modules.keystone.user_update

Update a user's information (keystone user-update) The following fields may be updated: name, email, enabled, tenant. Because the name is one of the fields, a valid user id is required.

CLI Examples:
salt '*' keystone.user_update user_id = c965f79c4f864eaa9c3b41904e67082 name = newname email = newemail@domain.com

salt.modules.keystone.user_verify_password

Verify a user’s password

CLI Examples:
salt '*' keystone.user_verify_password name = test password = foobar
salt '*' keystone.user_verify_password user_id = c965f79c4f864eaa9c3b41904e67082 password = foobar

21.9.193 salt.modules.keystoneng

Keystone module for interacting with OpenStack Keystone

New in version 2018.3.0.
:depends: shade
Example configuration

```
keystone:
  cloud: default

keystone:
  auth:
    username: admin
    password: password123
    user_domain_name: mydomain
    project_name: myproject
    project_domain_name: myproject
    auth_url: https://example.org:5000/v3
    identity_api_version: 3
```

salt.modules.keystoneng.compare_changes(obj, **kwargs)

Compare two dicts returning only keys that exist in the first dict and are different in the second one

salt.modules.keystoneng.domain_create(auth=None, **kwargs)

Create a domain

CLI Example:

```
salt '*' keystoneng.domain_create name=domain1
```

salt.modules.keystoneng.domain_delete(auth=None, **kwargs)

Delete a domain

CLI Example:

```
salt '*' keystoneng.domain_delete name=domain1
salt '*' keystoneng.domain_delete name=b62e76fbee4f7f591cf211e
```

salt.modules.keystoneng.domain_get(auth=None, **kwargs)

Get a single domain

CLI Example:

```
salt '*' keystoneng.domain_get name=domain1
salt '*' keystoneng.domain_get name=b62e76fbee4f7f591cf211e
```

salt.modules.keystoneng.domain_list(auth=None, **kwargs)

List domains

CLI Example:

```
salt '*' keystoneng.domain_list
```

salt.modules.keystoneng.domain_search(auth=None, **kwargs)

Search domains

CLI Example:

```
salt '*' keystoneng.domain_search
salt '*' keystoneng.domain_search name=domain1
```

salt.modules.keystoneng.domain_update(auth=None, **kwargs)

Update a domain

CLI Example:
salt '*/' keystoneeng.domain_update name=domain1 new_name=newdomain
salt '*/' keystoneeng.domain_update name=domain1 enabled=True description='new'

salt.modules.keystoneng.endpoint_create(auth=None, **kwargs)
Create an endpoint

CLI Example:
salt '*/' keystoneeng.endpoint_create interface=admin service=glance url=https://
  example.org:9292
salt '*/' keystoneeng.endpoint_create interface=public service=glance
  region=RegionOne url=https://example.org:9292
salt '*/' keystoneeng.endpoint_create interface=admin service=glance url=https://
  example.org:9292 enabled=True

salt.modules.keystoneng.endpoint_delete(auth=None, **kwargs)
Delete an endpoint

CLI Example:
salt '*/' keystoneeng.endpoint_delete id=3bee4bd8c2b040ee966adfdaf0bfca9

salt.modules.keystoneng.endpoint_get(auth=None, **kwargs)
Get a single endpoint

CLI Example:
salt '*/' keystoneeng.endpoint_get id=02cfaa173b2460f98e40eda3748dae5

salt.modules.keystoneng.endpoint_list(auth=None, **kwargs)
List endpoints

CLI Example:
salt '*/' keystoneeng.endpoint_list

salt.modules.keystoneng.endpoint_search(auth=None, **kwargs)
Search endpoints

CLI Example:
salt '*/' keystoneeng.endpoint_search
salt '*/' keystoneeng.endpoint_search id=02cfaa173b2460f98e40eda3748dae5

salt.modules.keystoneng.endpoint_update(auth=None, **kwargs)
Update an endpoint

CLI Example:
salt '*/' keystoneeng.endpoint_update endpoint_id=4f961ad09d2d48948896b08c6a79717
  interface=public enabled=False
salt '*/' keystoneeng.endpoint_update endpoint_id=4f961ad09d2d48948896b08c6a79717
  region=newregion
salt '*/' keystoneeng.endpoint_update endpoint_id=4f961ad09d2d48948896b08c6a79717
  service_name_or_id=glance url=https://example.org:9292

salt.modules.keystoneng.get_entity(ent_type, **kwargs)
Attempt to query Keystone for more information about an entity
**salt.modules.keystoneng.get_openstack_cloud**(auth=None)

Return an openstack_cloud

**salt.modules.keystoneng.get_operator_cloud**(auth=None)

Return an operator_cloud

**salt.modules.keystoneng.group_create**(auth=None, **kwargs)

Create a group

CLI Example:

```
salt '*' keystoneng.group_create name=group1
salt '*' keystoneng.group_create name=group2 domain=domain1 description='my group2'
```

**salt.modules.keystoneng.group_delete**(auth=None, **kwargs)

Delete a group

CLI Example:

```
salt '*' keystoneng.group_delete name=group1
salt '*' keystoneng.group_delete name=group2 domain_id=b62e76fbee4f8fb77073f91cf211e
salt '*' keystoneng.group_delete name=0e4f8c2a5ab4f2c8f374b054162506d
```

**salt.modules.keystoneng.group_get**(auth=None, **kwargs)

Get a single group

CLI Example:

```
salt '*' keystoneng.group_get name=group1
salt '*' keystoneng.group_get name=group2 domain_id=b62e76fbee4f8fb77073f91cf211e
salt '*' keystoneng.group_get name=0e4f8c2a5ab4f2c8f374b054162506d
```

**salt.modules.keystoneng.group_list**(auth=None, **kwargs)

List groups

CLI Example:

```
salt '*' keystoneng.group_list
salt '*' keystoneng.group_list domain_id=b62e76fbee4f8fb77073f91cf211e
```

**salt.modules.keystoneng.group_search**(auth=None, **kwargs)

Search for groups

CLI Example:

```
salt '*' keystoneng.group_search name=group1
salt '*' keystoneng.group_search domain_id=b62e76fbee4f8fb77073f91cf211e
```

**salt.modules.keystoneng.group_update**(auth=None, **kwargs)

Update a group

CLI Example:

```
salt '*' keystoneng.group_update name=group1 description='new description'
salt '*' keystoneng.group_create name=group2 domain_id=b62e76fbee4f8fb77073f91cf211e new_name=newgroupname
salt '*' keystoneng.group_create name=0e4f8c2a5ab4f2c8f374b054162506d new_name=newgroupname
```
salt.modules.keystoneng.project_create(auth=None, **kwargs)
Create a project

CLI Example:
```
salt '*' keystoneng.project_create name=project1
salt '*' keystoneng.project_create name=project2 domain_id=b62e76fbee4e8f77073f591cf211e
salt '*' keystoneng.project_create name=project3 enabled=False description='my project3'
```

salt.modules.keystoneng.project_delete(auth=None, **kwargs)
Delete a project

CLI Example:
```
salt '*' keystoneng.project_delete name=project1
salt '*' keystoneng.project_delete name=project2 domain_id=b62e76fbee4e8f77073f591cf211e
salt '*' keystoneng.project_delete name=f315afcf12f24ad88c92b936c38f2d5a
```

salt.modules.keystoneng.project_get(auth=None, **kwargs)
Get a single project

CLI Example:
```
salt '*' keystoneng.project_get name=project1
salt '*' keystoneng.project_get name=project2 domain_id=b62e76fbee4e8f77073f591cf211e
salt '*' keystoneng.project_get name=f315afcf12f24ad88c92b936c38f2d5a
```

salt.modules.keystoneng.project_list(auth=None, **kwargs)
List projects

CLI Example:
```
salt '*' keystoneng.project_list
salt '*' keystoneng.project_list domain_id=b62e76fbee4e8f77073f591cf211e
```

salt.modules.keystoneng.project_search(auth=None, **kwargs)
Search projects

CLI Example:
```
salt '*' keystoneng.project_search
salt '*' keystoneng.project_search name=project1
salt '*' keystoneng.project_search domain_id=b62e76fbee4e8f77073f591cf211e
```

salt.modules.keystoneng.project_update(auth=None, **kwargs)
Update a project

CLI Example:
```
salt '*' keystoneng.project_update name=project1 new_name=newproject
salt '*' keystoneng.project_update name=project2 enabled=False description='new description'
```

salt.modules.keystoneng.role_assignment_list(auth=None, **kwargs)
List role assignments

CLI Example:
salt 'salt' keystoneng.role_assignment_list

salt.modules.keystoneng.role_create(auth=None, **kwargs)
Create a role

CLI Example:

salt 'salt' keystoneng.role_create
salt 'salt' keystoneng.role_create name=role1
domain_id=b62e76fbee4e8fb77073f591cf211e

salt.modules.keystoneng.role_delete(auth=None, **kwargs)
Delete a role

CLI Example:

salt 'salt' keystoneng.role_delete
salt 'salt' keystoneng.role_delete name=role1
domain_id=b62e76fbee4e8fb77073f591cf211e
salt 'salt' keystoneng.role_delete name=1eb6edd5525e4ac39af571adee673559

salt.modules.keystoneng.role_get(auth=None, **kwargs)
Get a single role

CLI Example:

salt 'salt' keystoneng.role_get
salt 'salt' keystoneng.role_get name=role1
domain_id=b62e76fbee4e8fb77073f591cf211e
salt 'salt' keystoneng.role_get name=1eb6edd5525e4ac39af571adee673559

salt.modules.keystoneng.role_grant(auth=None, **kwargs)
Grant a role in a project/domain to a user/group

CLI Example:

salt 'salt' keystoneng.role_grant
salt 'salt' keystoneng.role_grant name=role1
user=user1 project=project1
group=user1

salt.modules.keystoneng.role_revoke(auth=None, **kwargs)
Grant a role in a project/domain to a user/group

CLI Example:

salt 'salt' keystoneng.role_revoke
salt 'salt' keystoneng.role_revoke name=role1
user=user1 project=project1
group=user1
salt.modules.keystoneng.role_search(auth=None, **kwargs)
Search roles

CLI Example:
```
salt '*' keystoneng.role_search
salt '*' keystoneng.role_search name=role1
salt '*' keystoneng.role_search domain_id=b62e76fbee48e8b77673f591cf21e
```

salt.modules.keystoneng.role_update(auth=None, **kwargs)
Update a role

CLI Example:
```
salt '*' keystoneng.role_update name=role1 new_name=newrole
salt '*' keystoneng.role_update name=1eb6edd5525e4ac39af571adee673559 new_
   →name=newrole
```

salt.modules.keystoneng.service_create(auth=None, **kwargs)
Create a service

CLI Example:
```
salt '*' keystoneng.service_create name=glance type=image
salt '*' keystoneng.service_create name=glance type=image description="Image"
```

salt.modules.keystoneng.service_delete(auth=None, **kwargs)
Delete a service

CLI Example:
```
salt '*' keystoneng.service_delete name=glance
salt '*' keystoneng.service_delete name=39cc1327c744a815331554430e8e
```

salt.modules.keystoneng.service_get(auth=None, **kwargs)
Get a single service

CLI Example:
```
salt '*' keystoneng.service_get name=glance
salt '*' keystoneng.service_get name=75a5804638944b3ab547f7f8ec2350a
```

salt.modules.keystoneng.service_list(auth=None, **kwargs)
List services

CLI Example:
```
salt '*' keystoneng.service_list
```

salt.modules.keystoneng.service_search(auth=None, **kwargs)
Search services

CLI Example:
```
salt '*' keystoneng.service_search
salt '*' keystoneng.service_search name=glance
salt '*' keystoneng.service_search name=135f6403f8e544d9008c6793e860
```

salt.modules.keystoneng.service_update(auth=None, **kwargs)
Update a service
CLI Example:

```bash
salt '*' keystoneng.service_update name=cinder type=volumev2
salt '*' keystoneng.service_update name=cinder description='new description'
salt '*' keystoneng.service_update name=ab4d35e269f147b3ae2d849f77f5c88f enabled=False
```

```
salt.modules.keystoneng.setup_clouds(auth=None)
Call functions to create Shade cloud objects in __context__ to take advantage of Shade's in-memory caching across several states
```

```
salt.modules.keystoneng.user_create(auth=None, **kwargs)
Create a user
```

```
salt.modules.keystoneng.user_delete(auth=None, **kwargs)
Delete a user
```

```
salt.modules.keystoneng.user_get(auth=None, **kwargs)
Get a single user
```

```
salt.modules.keystoneng.user_list(auth=None, **kwargs)
List users
```

```
salt.modules.keystoneng.user_search(auth=None, **kwargs)
List users
```

```
salt.modules.keystoneng.user_update(auth=None, **kwargs)
Update a user
```

21.9. execution modules
21.9.194 salt.modules.keystore

Module to interact with keystores

salt.modules.keystore.add\(name, keystore, passphrase, certificate, private_key=None\)

Adds certificates to an existing keystore or creates a new one if necessary.

Parameters

- **name** – alias for the certificate
- **keystore** – The path to the keystore file to query
- **passphrase** – The passphrase to use to decode the keystore
- **certificate** – The PEM public certificate to add to keystore. Can be a string for file.
- **private_key** – (Optional for TrustedCert) The PEM private key to add to the keystore

CLI Example:

```bash
salt '*' keystore.add aliasname /tmp/test.store changeit /tmp/testcert.crt
salt '*' keystore.add aliasname /tmp/test.store changeit certificate="-----BEGIN CERTIFICATE-----SIb...BM=-----END CERTIFICATE-----"
salt '*' keystore.add keyname /tmp/test.store changeit /tmp/512.cert private_key=/tmp/512.key
```

salt.modules.keystore.list\(keystore, passphrase, alias=None, return_certs=False\)

Lists certificates in a keytool managed keystore.

Parameters

- **keystore** – The path to the keystore file to query
- **passphrase** – The passphrase to use to decode the keystore
- **alias** – (Optional) If found, displays details on only this key
- **return_certs** – (Optional) Also return certificate PEM.

**Warning:** There are security implications for using return_cert to return decrypted certificates.

CLI Example:

```bash
salt '*' keystore.list /usr/lib/jvm/java-8/jre/lib/security/cacerts changeit
dsalt '*' keystore.list /usr/lib/jvm/java-8/jre/lib/security/cacerts changeit debian:verisign_-_g5.pem
```

salt.modules.keystore.remove\(name, keystore, passphrase\)

Removes a certificate from an existing keystore. Returns True if remove was successful, otherwise False

Parameters

- **name** – alias for the certificate
- **keystore** – The path to the keystore file to query
• **passphrase** – The passphrase to use to decode the keystore

CLI Example:

```
salt '*' keystore.remove aliasname /tmp/test.store changeit
```

---

### 21.9.195 `salt.modules.kmod`

Module to manage Linux kernel modules

**`salt.modules.kmod.available()`**

Return a list of all available kernel modules

CLI Example:

```
salt '*' kmod.available
```

**`salt.modules.kmod.check_available(mod)`**

Check to see if the specified kernel module is available

CLI Example:

```
salt '*' kmod.check_available kvm
```

**`salt.modules.kmod.is_loaded(mod)`**

Check to see if the specified kernel module is loaded

CLI Example:

```
salt '*' kmod.is_loaded kvm
```

**`salt.modules.kmod.load(mod, persist=False)`**

Load the specified kernel module

- **mod** Name of module to add
- **persist** Write module to `/etc/modules` to make it load on system reboot

CLI Example:

```
salt '*' kmod.load kvm
```

**`salt.modules.kmod.lsmod()`**

Return a dict containing information about currently loaded modules

CLI Example:

```
salt '*' kmod.lsmod
```

**`salt.modules.kmod.mod_list(only_persist=False)`**

Return a list of the loaded module names

- **only_persist** Only return the list of loaded persistent modules

CLI Example:

```
salt '*' kmod.mod_list
```

**`salt.modules.kmod.remove(mod, persist=False, comment=True)`**

Remove the specified kernel module
**mod**  Name of module to remove

**persist**  Also remove module from /etc/modules

**comment**  If persist is set don’t remove line from /etc/modules but only comment it

CLI Example:

```
salt '*' kmod.remove kvm
```

### 21.9.196  `salt.modules.kubernetesmod`

Module for handling kubernetes calls.

**optdepends**
- kubernetes Python client

**configuration**  The k8s API settings are provided either in a pillar, in the minion’s config file, or in master’s config file:

```
kubernetes.kubeconfig: '/path/to/kubeconfig'
kubernetes.kubeconfig-data: '<base64 encoded kubeconfig content'
kubernetes.context: 'context'
```

These settings can be overridden by adding `context` and `kubeconfig` or `kubeconfig_data` parameters when calling a function.

The data format for `kubernetes.kubeconfig-data` value is the content of `kubeconfig` base64 encoded in one line.

Only `kubeconfig` or `kubeconfig-data` should be provided. In case both are provided `kubeconfig` entry is preferred.

```
salt '*' kubernetes.nodes kubeconfig=/etc/salt/k8s/kubeconfig context=minikube
```

Changed in version 2019.2.0.

**Warning:**  Configuration options changed in 2019.2.0. The following configuration options have been removed:
- kubernetes.user
- kubernetes.password
- kubernetes.api_url
- kubernetes.certificate-authority-data/file
- kubernetes.client-certificate-data/file
- kubernetes.client-key-data/file

Please use now:
- kubernetes.kubeconfig or kubernetes.kubeconfig-data
- kubernetes.context

```
salt.modules.kubernetesmod.configmaps(namespace='default', **kwargs)
```

Return a list of kubernetes configmaps defined in the namespace

CLI Examples:
salt.modules.kubernetesmod.create_configmap(name, namespace, data, source=None, template=None, saltenv='base', **kwargs)

Creates the kubernetes configmap as defined by the user.

CLI Examples:

```
salt '*' kubernetes.create_configmap settings default '
  →"example.conf": "# example file"'
salt '*' kubernetes.create_configmap name=settings
  →namespace=default data='{"example.conf": "# example file"}'
```

salt.modules.kubernetesmod.create_deployment(name, namespace, metadata, spec, source, template, saltenv, **kwargs)

Creates the kubernetes deployment as defined by the user.

salt.modules.kubernetesmod.create_namespace(name, **kwargs)

Creates a namespace with the specified name.

CLI Example: salt '*' kubernetes.create_namespace salt

salt.modules.kubernetesmod.create_pod(name, namespace, metadata, spec, source, template, saltenv, **kwargs)

Creates the kubernetes deployment as defined by the user.

salt.modules.kubernetesmod.create_secret(name, namespace='default', data=None, source=None, template=None, saltenv='base', **kwargs)

Creates the kubernetes secret as defined by the user.

CLI Examples:

```
salt '*' kubernetes.create_secret passwords default '{
  →"db": "letmein"}'
salt '*' kubernetes.create_secret name=passwords
  →namespace=default data='{"db": "letmein"}'
```

salt.modules.kubernetesmod.create_service(name, namespace, metadata, spec, source, template, saltenv, **kwargs)

Creates the kubernetes service as defined by the user.

salt.modules.kubernetesmod.delete_configmap(name, namespace='default', **kwargs)

Deletes the kubernetes configmap defined by name and namespace

CLI Examples:

```
salt '*' kubernetes.delete_configmap settings default
salt '*' kubernetes.delete_configmap name=settings namespace=default
```

salt.modules.kubernetesmod.delete_deployment(name, namespace='default', **kwargs)

Deletes the kubernetes deployment defined by name and namespace

CLI Examples:

```
salt '*' kubernetes.delete_deployment my-nginx
salt '*' kubernetes.delete_deployment name=my-nginx namespace=default
```
salt.modules.kubernetesmod.delete_namespace(name, **kwargs)
Deletes the kubernetes namespace defined by name

CLI Examples:
```
salt '*' kubernetes.delete_namespace salt
salt '*' kubernetes.delete_namespace name=salt
```

salt.modules.kubernetesmod.delete_pod(name, namespace='default', **kwargs)
Deletes the kubernetes pod defined by name and namespace

CLI Examples:
```
salt '*' kubernetes.delete_pod guestbook-708336848-5nl8c default
salt '*' kubernetes.delete_pod name=guestbook-708336848-5nl8c namespace=default
```

salt.modules.kubernetesmod.delete_secret(name, namespace='default', **kwargs)
Deletes the kubernetes secret defined by name and namespace

CLI Examples:
```
salt '*' kubernetes.delete_secret confidential default
salt '*' kubernetes.delete_secret name=confidential namespace=default
```

salt.modules.kubernetesmod.delete_service(name, namespace='default', **kwargs)
Deletes the kubernetes service defined by name and namespace

CLI Examples:
```
salt '*' kubernetes.delete_service my-nginx default
salt '*' kubernetes.delete_service name=my-nginx namespace=default
```

salt.modules.kubernetesmod.deployments(namespace='default', **kwargs)
Return a list of kubernetes deployments defined in the namespace

CLI Examples:
```
salt '*' kubernetes.deployments
salt '*' kubernetes.deployments namespace=default
```

salt.modules.kubernetesmod.namespaces(**kwargs)
Return the names of the available namespaces

CLI Examples:
```
salt '*' kubernetes.namespaces
salt '*' kubernetes.namespaces kubeconfig=/etc/salt/k8s/kubeconfig
    --context=minikube
```

salt.modules.kubernetesmod.node(name, **kwargs)
Return the details of the node identified by the specified name

CLI Examples:
```
salt '*' kubernetes.node name='minikube'
```

salt.modules.kubernetesmod.node_add_label(node_name, label_name, label_value, **kwargs)
Set the value of the label identified by label_name to label_value on the node identified by the name node_name. Creates the label if not present.

CLI Examples:
salt.modules.kubernetesmod.node_labels

Return the labels of the node identified by the specified name

CLI Examples:

salt '*' kubernetes.node_labels name="minikube"

salt.modules.kubernetesmod.node_remove_label

Removes the label identified by label_name from the node identified by the name node_name.

CLI Examples:

salt '*' kubernetes.node_remove_label node_name="minikube" label_name="foo"

salt.modules.kubernetesmod.nodes

Return the names of the nodes composing the kubernetes cluster

CLI Examples:

salt '*' kubernetes.nodes
salt '*' kubernetes.nodes kubeconfig=/etc/salt/k8s/kubeconfig context=minikube

salt.modules.kubernetesmod.ping

Checks connections with the kubernetes API server. Returns True if the connection can be established, False otherwise.

CLI Example: salt '*' kubernetes.ping

salt.modules.kubernetesmod.pods

Return a list of kubernetes pods defined in the namespace

CLI Examples:

salt '*' kubernetes.pods
salt '*' kubernetes.pods namespace=default

salt.modules.kubernetesmod.replace_configmap

Replaces an existing configmap with a new one defined by name and namespace with the specified data.

CLI Examples:

salt 'minion1' kubernetes.replace_configmap settings default '{
  "example.conf": "# example file"}'
salt 'minion2' kubernetes.replace_configmap name=settings namespace=default data='{"example.conf": "# example file"}'

salt.modules.kubernetesmod.replace_deployment

Replaces an existing deployment with a new one defined by name and namespace, having the specified metadata and spec.
salt.modules.kubernetesmod.replace_secret(name, data, source=None, template=None, saltenv='base', namespace='default', **kwargs)

Replaces an existing secret with a new one defined by name and namespace, having the specified data.

CLI Examples:

```
salt 'minion1' kubernetes.replace_secret name=passwords data='{"db": "letmein"}'
salt 'minion2' kubernetes.replace_secret name=passwords namespace=saltstack data='{"db": "passw0rd"}'
```

salt.modules.kubernetesmod.replace_service(name, metadata, spec, source, template, old_service, saltenv, namespace='default', **kwargs)

Replaces an existing service with a new one defined by name and namespace, having the specified metadata and spec.

salt.modules.kubernetesmod.secrets(namespace='default', **kwargs)

Return a list of kubernetes secrets defined in the namespace

CLI Examples:

```
salt '*' kubernetes.secrets
salt '*' kubernetes.secrets namespace=default
```

salt.modules.kubernetesmod.services(namespace='default', **kwargs)

Return a list of kubernetes services defined in the namespace

CLI Examples:

```
salt '*' kubernetes.services
salt '*' kubernetes.services namespace=default
```

salt.modules.kubernetesmod.show_configmap(name, namespace='default', **kwargs)

Return the kubernetes configmap defined by name and namespace.

 CLI Examples:

```
salt '*' kubernetes.show_configmap game-config default
salt '*' kubernetes.show_configmap name=game-config namespace=default
```

salt.modules.kubernetesmod.show_deployment(name, namespace='default', **kwargs)

Return the kubernetes deployment defined by name and namespace

CLI Examples:

```
salt '*' kubernetes.show_deployment my-nginx default
salt '*' kubernetes.show_deployment name=my-nginx namespace=default
```

salt.modules.kubernetesmod.show_namespace(name, **kwargs)

Return information for a given namespace defined by the specified name

CLI Examples:

```
salt '*' kubernetes.show_namespace kube-system
```

salt.modules.kubernetesmod.show_pod(name, namespace='default', **kwargs)

Return POD information for a given pod name defined in the namespace

CLI Examples:
salt.modules.kubernetesmod.show_secret(name, namespace='default', decode=False, **kwargs)
Return the kubernetes secret defined by name and namespace. The secrets can be decoded if specified by the user. Warning: this has security implications.

CLI Examples:
salt '*' kubernetes.show_secret confidential default
salt '*' kubernetes.show_secret name=confidential namespace=default
salt '*' kubernetes.show_secret name=confidential decode=True

salt.modules.kubernetesmod.show_service(name, namespace='default', **kwargs)
Return the kubernetes service defined by name and namespace

CLI Examples:
salt '*' kubernetes.show_service my-nginx default
salt '*' kubernetes.show_service name=my-nginx namespace=default

21.9.197 salt.modules.launchctl_service
Module for the management of MacOS systems that use launchd/launchctl

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see here.

depends
• plistlib Python module

salt.modules.launchctl_service.available(job_label)
Check that the given service is available.

CLI Example:
salt '*' service.available com.openssh.sshd

salt.modules.launchctl_service.disabled(job_label, runas=None)
Return True if the named service is disabled, false otherwise

CLI Example:
salt '*' service.disabled <service label>

salt.modules.launchctl_service.enabled(job_label, runas=None)
Return True if the named service is enabled, false otherwise

CLI Example:
salt '*' service.enabled <service label>

salt.modules.launchctl_service.get_all()
Return all installed services

CLI Example:
`salt '*' service.get_all`

salt.modules.launchctl_service.missing(job_label)
The inverse of service.available Check that the given service is not available.

CLI Example:

```
salt '*' service.missing com.openssh.sshd
```

salt.modules.launchctl_service.restart(job_label, runas=None)
Restart the named service

CLI Example:

```
salt '*' service.restart <service label>
```

salt.modules.launchctl_service.start(job_label, runas=None)
Start the specified service

CLI Example:

```
salt '*' service.start <service label>
salt '*' service.start org.ntp.ntpd
salt '*' service.start /System/Library/LaunchDaemons/org.ntp.ntpd.plist
```

salt.modules.launchctl_service.status(name, runas=None)
Return the status for a service via systemd. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

Parameters

- `name (str)` – The name of the service to check
- `runas (str)` – User to run launchctl commands

Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise.

Return type bool

CLI Example:

```
salt '*' service.status <service name>
```

salt.modules.launchctl_service.stop(job_label, runas=None)
Stop the specified service

CLI Example:

```
salt '*' service.stop <service label>
salt '*' service.stop org.ntp.ntpd
salt '*' service.stop /System/Library/LaunchDaemons/org.ntp.ntpd.plist
```

21.9.198 salt.modules.layman

Support for Layman
salt.modules.layman.add(overlay)
Add the given overlay from the cached remote list to your locally installed overlays. Specify 'ALL' to add all overlays from the remote list.

Return a list of the new overlay(s) added:

CLI Example:
```
salt '*' layman.add <overlay name>
```

salt.modules.layman.delete(overlay)
Remove the given overlay from the your locally installed overlays. Specify 'ALL' to remove all overlays.

Return a list of the overlays(s) that were removed:

CLI Example:
```
salt '*' layman.delete <overlay name>
```

salt.modules.layman.list_all()
List all overlays, including remote ones.

Return a list of available overlays:

CLI Example:
```
salt '*' layman.list_all
```

salt.modules.layman.list_local()
List the locally installed overlays.

Return a list of installed overlays:

CLI Example:
```
salt '*' layman.list_local
```

salt.modules.layman.sync(overlay='ALL')
Update the specified overlay. Use 'ALL' to synchronize all overlays. This is the default if no overlay is specified.

overlay Name of the overlay to sync. (Defaults to 'ALL')

CLI Example:
```
salt '*' layman.sync
```

21.9.199 salt.modules.ldap3

Query and modify an LDAP database (alternative interface)

New in version 2016.3.0.

This is an alternative to the ldap interface provided by the ldapmod execution module.

depends
- ldap Python module

exception salt.modules.ldap3.LDAPError(message, cause=None)
Base class of all LDAP exceptions raised by backends.
This is only used for errors encountered while interacting with the LDAP server; usage errors (e.g., invalid backend name) will have a different type.

**Variables**

- cause – backend exception object, if applicable

```python
salt.modules.ldap3.add(connect_spec, dn, attributes)
```

Add an entry to an LDAP database.

**Parameters**

- **connect_spec** – See the documentation for the `connect_spec` parameter for `connect()`.
- **dn** – Distinguished name of the entry.
- **attributes** – Non-empty dict mapping each of the new entry’s attributes to a non-empty iterable of values.

**Returns**

True if successful, raises an exception otherwise.

**CLI example:**

```bash
salt '*' ldap3.add "{
    'url': 'ldaps://ldap.example.com/",
    'bind': {
        'method': 'simple',
        'password': 'secret',
    },
}" "dn='dc=example,dc=com'" "attributes={'example': 'values'}"
```

```python
salt.modules.ldap3.change(connect_spec, dn, before, after)
```

Modify an entry in an LDAP database.

This does the same thing as `modify()`, but with a simpler interface. Instead of taking a list of directives, it takes a before and after view of an entry, determines the differences between the two, computes the directives, and executes them.

Any attribute value present in `before` but missing in `after` is deleted. Any attribute value present in `after` but missing in `before` is added. Any attribute value in the database that is not mentioned in either `before` or `after` is not altered. Any attribute value that is present in both `before` and `after` is ignored, regardless of whether that attribute value exists in the database.

**Parameters**

- **connect_spec** – See the documentation for the `connect_spec` parameter for `connect()`.
- **dn** – Distinguished name of the entry.
- **before** – The expected state of the entry before modification. This is a dict mapping each attribute name to an iterable of values.
- **after** – The desired state of the entry after modification. This is a dict mapping each attribute name to an iterable of values.

**Returns**

True if successful, raises an exception otherwise.

**CLI example:**

```bash
salt '*' ldap3.change "{
    'url': 'ldaps://ldap.example.com/",
    'bind': {
        'method': 'simple',
        'password': 'secret',
    },
}" "dn='dc=example,dc=com'" "attributes={'example': 'values'}"
```

(continues on next page)
Connect and optionally bind to an LDAP server.

Parameters `connect_spec` – This can be an LDAP connection object returned by a previous call to `connect()` (in which case the argument is simply returned), `None` (in which case an empty dict is used), or a dict with the following keys:

- 'backend' Optional; default depends on which Python LDAP modules are installed. Name of the Python LDAP module to use. Only 'ldap' is supported at the moment.
- 'url' Optional; defaults to 'ldapi:///'. URL to the LDAP server.
- 'bind' Optional; defaults to `None`. Describes how to bind an identity to the LDAP connection. If `None`, an anonymous connection is made. Valid keys:
  - 'method' Optional; defaults to `None`. The authentication method to use. Valid values include but are not necessarily limited to 'simple', 'sasl', and `None`. If `None`, an anonymous connection is made. Available methods depend on the chosen backend.
  - 'mechanism' Optional; defaults to 'EXTERNAL'. The SASL mechanism to use. Ignored unless the method is 'sasl'. Available methods depend on the chosen backend and the server’s capabilities.
  - 'credentials' Optional; defaults to `None`. An object specific to the chosen SASL mechanism and backend that represents the authentication credentials. Ignored unless the method is 'sasl'. For the 'ldap' backend, this is a dictionary. If `None`, an empty dict is used. Keys:
    - 'args' Optional; defaults to an empty list. A list of arguments to pass to the SASL mechanism constructor. See the SASL mechanism constructor documentation in the `ldap.sasl` Python module.
    - 'kwargs' Optional; defaults to an empty dict. A dict of keyword arguments to pass to the SASL mechanism constructor documentation in the `ldap.sasl` Python module.
  - 'dn' Optional; defaults to an empty string. The distinguished name to bind.
  - 'password' Optional; defaults to an empty string. Password for binding. Ignored if the method is 'sasl'.
- 'tls' Optional; defaults to `None`. A backend-specific object containing settings to override default TLS behavior.

For the 'ldap' backend, this is a dictionary. Not all settings in this dictionary are supported by all versions of `python-ldap` or the underlying TLS library. If `None`, an empty dict is used. Possible keys:

- 'starttls' If present, initiate a TLS connection using StartTLS. (The value associated with this key is ignored.)
- 'cacertdir' Set the path of the directory containing CA certificates.
- 'cacertfile' Set the pathname of the CA certificate file.
- 'certfile'  Set the pathname of the certificate file.
- 'cipher_suite'  Set the allowed cipher suite.
- 'crlcheck'  Set the CRL evaluation strategy. Valid values are 'none', 'peer', and 'all'.
- 'crlfile'  Set the pathname of the CRL file.
- 'dhfile'  Set the pathname of the file containing the parameters for Diffie-Hellman ephemeral key exchange.
- 'keyfile'  Set the pathname of the certificate key file.
- 'newctx'  If present, instruct the underlying TLS library to create a new TLS context. (The value associated with this key is ignored.)
- 'protocol_min'  Set the minimum protocol version.
- 'random_file'  Set the pathname of the random file when /dev/random and /dev/urandom are not available.
- 'require_cert'  Set the certificate validation policy. Valid values are 'never', 'hard', 'demand', 'allow', and 'try'.
- 'opts'  Optional; defaults to None. A backend-specific object containing options for the backend.

For the 'ldap' backend, this is a dictionary of OpenLDAP options to set. If None, an empty dict is used. Each key is a the name of an OpenLDAP option constant without the 'LDAP_OPT_' prefix, then converted to lower case.

Returns

an object representing an LDAP connection that can be used as the connect_spec argument to any of the functions in this module (to avoid the overhead of making and terminating multiple connections).

This object should be used as a context manager. It is safe to nest with statements.

CLI example:

```
salt '*' ldap3.connect "{
    'url': 'ldaps://ldap.example.com/',
    'bind': {
        'method': 'simple',
        'dn': 'cn=admin,dc=example,dc=com',
        'password': 'secret'
    }
}"
```

salt.modules.ldap3.delete(connect_spec, dn)

Delete an entry from an LDAP database.

Parameters

- connect_spec – See the documentation for the connect_spec parameter for connect().
- dn – Distinguished name of the entry.

Returns

True if successful, raises an exception otherwise.

CLI example:
salt.modules.ldap3.delete("{  'url': 'ldaps://ldap.example.com/',  'bind': {    'method': 'simple',    'password': 'secret'}}"  dn='cn=admin,dc=example,dc=com'

salt.modules.ldap3.modify(connect_spec, dn, directives)
Modify an entry in an LDAP database.

Parameters

- **connect_spec** – See the documentation for the connect_spec parameter for connect().
- **dn** – Distinguished name of the entry.
- **directives** – Iterable of directives that indicate how to modify the entry. Each directive is a tuple of the form \((op, attr, vals)\), where:
  - **op** identifies the modification operation to perform. One of:
    - 'add' to add one or more values to the attribute
    - 'delete' to delete some or all of the values from the attribute. If no values are specified with this operation, all of the attribute's values are deleted. Otherwise, only the named values are deleted.
    - 'replace' to replace all of the attribute's values with zero or more new values
  - **attr** names the attribute to modify
  - **vals** is an iterable of values to add or delete

Returns True if successful, raises an exception otherwise.

CLI example:
salt '*' ldap3.modify "{
  'url': 'ldaps://ldap.example.com/',
  'bind': {
    'method': 'simple',
    'password': 'secret'}
}" dn='cn=admin,dc=example,dc=com'
directives="('add', 'example', ['example_val'])"

salt.modules.ldap3.search(connect_spec, base, scope='subtree', filterstr='(objectClass=*)', attrlist=None, attrsonly=0)
Search an LDAP database.

Parameters

- **connect_spec** – See the documentation for the connect_spec parameter for connect().
- **base** – Distinguished name of the entry at which to start the search.
- **scope** – One of the following:
  - 'subtree' Search the base and all of its descendants.
  - 'base' Search only the base itself.
  - 'onelevel' Search only the base's immediate children.
- **filterstr** – String representation of the filter to apply in the search.
• **attrlist** – Limit the returned attributes to those in the specified list. If None, all attributes of each entry are returned.

• **attrsonly** – If non-zero, don’t return any attribute values.

**Returns** a dict of results. The dict is empty if there are no results. The dict maps each returned entry’s distinguished name to a dict that maps each of the matching attribute names to a list of its values.

**Returns**

```python
salt '*' ldap3.search "{
    'url': 'ldaps://ldap.example.com/',
    'bind': {
        'method': 'simple',
        'dn': 'cn=admin,dc=example,dc=com',
        'password': 'secret',
    },
}" "base='dc=example,dc=com'"
```

### 21.9.200 salt.modules.ldapmod

Salt interface to LDAP commands

**depends**

- ldap Python module

**configuration** In order to connect to LDAP, certain configuration is required in the minion config on the LDAP server. The minimum configuration items that must be set are:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>ldap.basedn</td>
<td>dc=acme,dc=com (example values, adjust to suit)</td>
</tr>
</tbody>
</table>

If your LDAP server requires authentication then you must also set:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>ldap.anonymous</td>
<td>False</td>
</tr>
<tr>
<td>ldap.binddn</td>
<td>admin</td>
</tr>
<tr>
<td>ldap.bindpw</td>
<td>password</td>
</tr>
</tbody>
</table>

In addition, the following optional values may be set:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>ldap.server</td>
<td>localhost (default=localhost, see warning below)</td>
</tr>
<tr>
<td>ldap.port</td>
<td>389 (default=389, standard port)</td>
</tr>
<tr>
<td>ldap.tls</td>
<td>False (default=False, no TLS)</td>
</tr>
<tr>
<td>ldap.no_verify</td>
<td>False (default=False, verify TLS)</td>
</tr>
<tr>
<td>ldap.anonymous</td>
<td>True (default=True, bind anonymous)</td>
</tr>
<tr>
<td>ldap.scope</td>
<td>2 (default=2, ldap.SCOPE_SUBTREE)</td>
</tr>
<tr>
<td>ldap.attrs</td>
<td>[saltAttr] (default=None, return all attributes)</td>
</tr>
</tbody>
</table>

**Warning**: At the moment this module only recommends connection to LDAP services listening on localhost. This is deliberate to avoid the potentially dangerous situation of multiple minions sending identical update commands to the same LDAP server. It’s easy enough to override this behavior, but badness may ensue - you have been warned.

**salt.modules.ldapmod.search**(filter, dn=None, scope=None, attrs=None, **kwargs)

Run an arbitrary LDAP query and return the results.

**CLI Example:**
salt 'ldaphost' ldap.search "filter=cn=myhost"

Return data:

```
{
    'myhost': {
        'count': 1,
        'results': [['saltKeyValue': ['ntpserver=ntp.acme.local',
                                   'foo=myfoo'],
                     'saltState': ['foo', 'bar']],
        'time': {'human': '1.2ms', 'raw': '0.00123'}}
}
```

Search and connection options can be overridden by specifying the relevant option as key=value pairs, for example:

```
salt 'ldaphost' ldap.search filter=cn=myhost dn=ou=hosts,o=acme,c=gb scope=1 attrs='' server='localhost' port='7393' tls=True bindpw='ssh'
```

### 21.9.201 salt.modules.libcloud_compute module

**Apache Libcloud Compute Management**

Connection module for Apache Libcloud Compute management for a full list of supported clouds, see [http://libcloud.readthedocs.io/en/latest/compute/supported_providers.html](http://libcloud.readthedocs.io/en/latest/compute/supported_providers.html)

Clouds include Amazon EC2, Azure, Google GCE, VMware, OpenStack Nova

New in version 2018.3.0.

**configuration** This module uses a configuration profile for one or multiple cloud providers

```
libcloud_compute:
  profile_test1:
    driver: google
    key: service-account@googlecloud.net
    secret: /path/to.key.json
  profile_test2:
    driver: arm
    key: 12345
    secret: mysecret
```

**depends** apache-libcloud

salt.modules.libcloud_compute.attach_volume(node_id, volume_id, profile, device=None, **libcloud_kwargs)

Attaches volume to node.

**Parameters**

- **node_id** (str) – Node ID to target
- **volume_id** (str) – Volume ID from which to attach
- **profile** (str) – The profile key
- **device** (str) – Where the device is exposed, e.g. '/dev/sdb'
- **libcloud_kwargs** (dict) – Extra arguments for the driver’s attach_volume method

**CLI Example:**
salt myminion libcloud_compute.detach_volume vol1 profile1

salt.modules.libcloud_compute.copy_image(source_region, image_id, name, profile, description=None, **libcloud_kwargs)
Copies an image from a source region to the current region.
Parameters
- **source_region** (str) – Region to copy the node from.
- **image_id** (str) – Image to copy.
- **name** (str) – name for new image.
- **profile** (str) – The profile key
- **description** – description for new image.
- **libcloud_kwargs** (dict) – Extra arguments for the driver’s copy_image method
CLI Example:
salt myminion libcloud_compute.copy_image us-east1 image1 'new image' profile1

salt.modules.libcloud_compute.create_image(node_id, name, profile, description=None, **libcloud_kwargs)
Create an image from a node
Parameters
- **node_id** (str) – Node to run the task on.
- **name** (str) – name for new image.
- **profile** (str) – The profile key
- **description** (description) – description for new image.
- **libcloud_kwargs** (dict) – Extra arguments for the driver’s create_image method
CLI Example:
salt myminion libcloud_compute.create_image server1 my_image profile1
salt myminion libcloud_compute.create_image server1 my_image profile1 description='test image'

salt.modules.libcloud_compute.create_key_pair(name, profile, **libcloud_kwargs)
Create a single key pair by name
Parameters
- **name** (str) – Name of the key pair to create.
- **profile** (str) – The profile key
- **libcloud_kwargs** (dict) – Extra arguments for the driver’s create_key_pair method
CLI Example:
salt myminion libcloud_compute.create_key_pair pair1 profile1

salt.modules.libcloud_compute.create_volume(size, name, profile, location_id=None, **libcloud_kwargs)
Create a storage volume
Parameters
- **size** (int) – Size of volume in gigabytes (required)
- **name** (str) – Name of the volume to be created
- **location_id** (str) – Which data center to create a volume in. If empty, undefined behavior will be selected. (optional)
- **profile** (str) – The profile key
- **libcloud_kwargs** (dict) – Extra arguments for the driver’s list_volumes method

CLI Example:

```python
salt myminion libcloud_compute.create_volume 1000 vol1 profile1
```

**salt.modules.libcloud_compute.create_volume_snapshot** *(volume_id, profile, name=None, **libcloud_kwargs)*

Create a storage volume snapshot

Parameters

- **volume_id** (str) – Volume ID from which to create the new snapshot.
- **profile** (str) – The profile key
- **name** (str) – Name of the snapshot to be created (optional)
- **libcloud_kwargs** (dict) – Extra arguments for the driver’s create_volume_snapshot method

CLI Example:

```python
salt myminion libcloud_compute.create_volume_snapshot vol1 profile1
```

**salt.modules.libcloud_compute.delete_image** *(image_id, profile, **libcloud_kwargs)*

Delete an image of a node

Parameters

- **image_id** (str) – Image to delete
- **profile** (str) – The profile key
- **libcloud_kwargs** (dict) – Extra arguments for the driver’s delete_image method

CLI Example:

```python
salt myminion libcloud_compute.delete_image image1 profile1
```

**salt.modules.libcloud_compute.delete_key_pair** *(name, profile, **libcloud_kwargs)*

Delete a key pair

Parameters

- **name** (str) – Key pair name.
- **profile** (str) – The profile key
- **libcloud_kwargs** (dict) – Extra arguments for the driver’s import_key_pair_from_xxx method

CLI Example:

```python
salt myminion libcloud_compute.delete_key_pair pair1 profile1
```

**salt.modules.libcloud_compute.destroy_node** *(node_id, profile, **libcloud_kwargs)*

Destroy a node in the cloud

Parameters
• **node_id** *(str)* – Unique ID of the node to destroy
• **profile** *(str)* – The profile key
• **libcloud_kwargs** *(dict)* – Extra arguments for the driver’s destroy_node method

CLI Example:
```
salt myminion libcloud_compute.destroy_node as-2346 profile1
```

salt.modules.libcloud_compute.destroy_volume(*volume_id, profile, **libcloud_kwargs*)
Destroy a volume.

Parameters

- **volume_id** *(str)* – Volume ID from which to destroy
- **profile** *(str)* – The profile key
- **libcloud_kwargs** *(dict)* – Extra arguments for the driver’s destroy_volume method

CLI Example:
```
salt myminion libcloud_compute.destroy_volume vol1 profile1
```

salt.modules.libcloud_compute.destroy_volume_snapshot(*volume_id, snapshot_id, profile, **libcloud_kwargs*)
Destroy a volume snapshot.

Parameters

- **volume_id** *(str)* – Volume ID from which the snapshot belongs
- **snapshot_id** *(str)* – Volume Snapshot ID from which to destroy
- **profile** *(str)* – The profile key
- **libcloud_kwargs** *(dict)* – Extra arguments for the driver’s destroy_volume_snapshot method

CLI Example:
```
salt myminion libcloud_compute.destroy_volume_snapshot snap1 profile1
```

salt.modules.libcloud_compute.detach_volume(*volume_id, profile, **libcloud_kwargs*)
Detaches a volume from a node.

Parameters

- **volume_id** *(str)* – Volume ID from which to detach
- **profile** *(str)* – The profile key
- **libcloud_kwargs** *(dict)* – Extra arguments for the driver’s detach_volume method

CLI Example:
```
salt myminion libcloud_compute.detach_volume vol1 profile1
```

salt.modules.libcloud_compute.extra(*method, profile, **libcloud_kwargs*)
Call an extended method on the driver

Parameters

- **method** *(str)* – Driver’s method name
- **profile** *(str)* – The profile key
• **libcloud_kwargs** (dict) – Extra arguments for the driver’s method

CLI Example:
```
salt myminion libcloud_compute.extra ex_get_permissions google container_name=my_container object_name=me.jpg --out=yaml
```

salt.modules.libcloud_compute.get_image(image_id, profile, **libcloud_kwargs)

Get an image of a node

Parameters

• **image_id** (str) – Image to fetch

• **profile** (str) – The profile key

• **libcloud_kwargs** (dict) – Extra arguments for the driver’s delete_image method

CLI Example:
```
salt myminion libcloud_compute.get_image image1 profile1
```

salt.modules.libcloud_compute.get_key_pair(name, profile, **libcloud_kwargs)

Get a single key pair by name

Parameters

• **name** (str) – Name of the key pair to retrieve.

• **profile** (str) – The profile key

• **libcloud_kwargs** (dict) – Extra arguments for the driver’s get_key_pair method

CLI Example:
```
salt myminion libcloud_compute.get_key_pair pair1 profile1
```

salt.modules.libcloud_compute.import_key_pair(name, key, profile, key_type=None, **libcloud_kwargs)

Import a new public key from string or a file path

Parameters

• **name** (str) – Key pair name.

• **key** (str or path str) – Public key material, the string or a path to a file

• **profile** (str) – The profile key

• **key_type** (str) – The key pair type, either FILE or STRING. Will detect if not provided and assume that if the string is a path to an existing path it is a FILE, else STRING.

• **libcloud_kwargs** (dict) – Extra arguments for the driver’s import_key_pair_from_xxx method

CLI Example:
```
salt myminion libcloud_compute.import_key_pair pair1 key_value_data123 profile1
salt myminion libcloud_compute.import_key_pair pair1 /path/to/key profile1
```

salt.modules.libcloud_compute.list_images(profile, location_id=None, **libcloud_kwargs)

Return a list of images for this cloud

Parameters

• **profile** (str) – The profile key
• `location_id` (str) – The location key, from list_locations

• `libcloud_kwargs` (dict) – Extra arguments for the driver’s list_images method

CLI Example:
```
salt myminion libcloud_compute.list_images profile1
```

```
salt.modules.libcloud_compute.list_key_pairs(profile, **libcloud_kwargs)
```

List all the available key pair objects.

Parameters

• `profile` (str) – The profile key

• `libcloud_kwargs` (dict) – Extra arguments for the driver’s list_key_pairs method

CLI Example:
```
salt myminion libcloud_compute.list_key_pairs profile1
```

```
salt.modules.libcloud_compute.list_locations(profile, **libcloud_kwargs)
```

Return a list of locations for this cloud

Parameters

• `profile` (str) – The profile key

• `libcloud_kwargs` (dict) – Extra arguments for the driver’s list_locations method

CLI Example:
```
salt myminion libcloud_compute.list_locations profile1
```

```
salt.modules.libcloud_compute.list_nodes(profile, **libcloud_kwargs)
```

Return a list of nodes

Parameters

• `profile` (str) – The profile key

• `libcloud_kwargs` (dict) – Extra arguments for the driver’s list_nodes method

CLI Example:
```
salt myminion libcloud_compute.list_nodes profile1
```

```
salt.modules.libcloud_compute.list_sizes(profile, location_id=None, **libcloud_kwargs)
```

Return a list of node sizes

Parameters

• `profile` (str) – The profile key

• `location_id` (str) – The location key, from list_locations

• `libcloud_kwargs` (dict) – Extra arguments for the driver’s list_sizes method

CLI Example:
```
salt myminion libcloud_compute.list_sizes profile1
salt myminion libcloud_compute.list_sizes profile1 us-east1
```

```
salt.modules.libcloud_compute.list_volume_snapshots(volume_id, profile, **libcloud_kwargs)
```

Return a list of storage volumes snapshots for this cloud

Parameters
- **volume_id** (str) – The volume identifier
- **profile** (str) – The profile key
- **libcloud_kwargs** (dict) – Extra arguments for the driver’s list_volume_snapshots method

**CLI Example:**
salt myminion libcloud_compute.list_volume_snapshots voll profile1

salt.modules.libcloud_compute.list_volumes(profile, **libcloud_kwargs)**

Return a list of storage volumes for this cloud

**Parameters**
- **profile** (str) – The profile key
- **libcloud_kwargs** (dict) – Extra arguments for the driver’s list_volumes method

**CLI Example:**
salt myminion libcloud_compute.list_volumes profile1

salt.modules.libcloud_compute.reboot_node(node_id, profile, **libcloud_kwargs)**

Reboot a node in the cloud

**Parameters**
- **node_id** (str) – Unique ID of the node to reboot
- **profile** (str) – The profile key
- **libcloud_kwargs** (dict) – Extra arguments for the driver’s reboot_node method

**CLI Example:**
salt myminion libcloud_compute.reboot_node as-2346 profile1

### 21.9.202 salt.modules.libcloud_dns module

**Apache Libcloud DNS Management**

Connection module for Apache Libcloud DNS management

New in version 2016.11.0.

**configuration** This module uses a configuration profile for one or multiple DNS providers

```yaml
libcloud_dns:
  profile_test1:
    driver: cloudflare
    key: 12345
    secret: mysecret
  profile_test2:
    driver: godaddy
    key: 12345
    secret: mysecret
    shopper_id: 12345
```

**depends** apache-libcloud

salt.modules.libcloud_dns.create_record(name, zone_id, type, data, profile)

Create a new record.
Parameters

- **name** (str) – Record name without the domain name (e.g. www). Note: If you want to create a record for a base domain name, you should specify empty string (") for this argument.
- **zone_id** (str) – Zone where the requested record is created.
- **type** (str) – DNS record type (A, AAAA, ...).
- **data** (str) – Data for the record (depends on the record type).
- **profile** (str) – The profile key

CLI Example:

```
salt myminion libcloud_dns.create_record www google.com A 12.32.12.2 profile1
```

```python
salt.modules.libcloud_dns.create_zone(domain, profile, type='master', ttl=None)
```
Create a new zone.

Parameters

- **domain** (str) – Zone domain name (e.g. example.com)
- **profile** (str) – The profile key
- **type** (str) – Zone type (master / slave).
- **ttl** (int) – TTL for new records. (optional)

CLI Example:

```
salt myminion libcloud_dns.create_zone google.com profile1
```

```python
salt.modules.libcloud_dns.delete_record(zone_id, record_id, profile)
```
Delete a record.

Parameters

- **zone_id** (str) – Zone to delete.
- **record_id** (str) – Record to delete.
- **profile** (str) – The profile key

CLI Example:

```
salt myminion libcloud_dns.delete_record google.com www profile1
```

```python
salt.modules.libcloud_dns.delete_zone(zone_id, profile)
```
Delete a zone.

Parameters

- **zone_id** (str) – Zone to delete.
- **profile** (str) – The profile key

CLI Example:

```
salt myminion libcloud_dns.delete_zone google.com profile1
```

```python
salt.modules.libcloud_dns.extra(method, profile, **libcloud_kwargs)
```
Call an extended method on the driver

Parameters

- **method** (str) – Driver’s method name
• **profile** (str) – The profile key
• **libcloud_kwargs** (dict) – Extra arguments for the driver’s delete_container method

CLI Example:

```bash
salt myminion libcloud_dns.extra ex_get_permissions google container_name=my_
--container object_name=me.jpg --out=yaml
```

**salt.modules.libcloud_dns.get_bind_data**(zone_id, profile)
Export Zone to the BIND compatible format.

Parameters

• **zone_id** (str) – Zone to export.
• **profile** (str) – The profile key

Returns Zone data in BIND compatible format.
Return type str

CLI Example:

```bash
salt myminion libcloud_dns.get_bind_data google.com profile1
```

**salt.modules.libcloud_dns.get_record**(zone_id, record_id, profile)
Get record information for the given zone_id on the given profile

Parameters

• **zone_id** (str) – Zone to export.
• **record_id** (str) – Record to delete.
• **profile** (str) – The profile key

CLI Example:

```bash
salt myminion libcloud_dns.get_record google.com www profile1
```

**salt.modules.libcloud_dns.get_zone**(zone_id, profile)
Get zone information for the given zone_id on the given profile

Parameters

• **zone_id** (str) – Zone to export.
• **profile** (str) – The profile key

CLI Example:

```bash
salt myminion libcloud_dns.get_zone google.com profile1
```

**salt.modules.libcloud_dns.list_record_types**(profile)
List available record types for the given profile, e.g. A, AAAA

Parameters **profile** (str) – The profile key

CLI Example:

```bash
salt myminion libcloud_dns.list_record_types profile1
```

**salt.modules.libcloud_dns.list_records**(zone_id, profile, type=None)
List records for the given zone_id on the given profile

Parameters

• **zone_id** (str) – Zone to export.
• **profile** (str) – The profile key
CLI Example:
```
salt myminion libcloud_dns.list_records google.com profile1
```

#### salt.modules.libcloud_dns.list_zones(profile)
List zones for the given profile

**Parameters**
- **profile** (str) – The profile key

**CLI Example:**
```
salt myminion libcloud_dns.list_zones profile1
```

#### salt.modules.libcloud_dns.update_zone(zone_id, domain, profile, type='master', ttl=None)
Update an existing zone.

**Parameters**
- **zone_id** (str) – Zone ID to update.
- **domain** (str) – Zone domain name (e.g. example.com)
- **profile** (str) – The profile key
- **type** (str) – Zone type (master / slave).
- **ttl** (int) – TTL for new records. (optional)

**CLI Example:**
```
salt myminion libcloud_dns.update_zone google.com google.com profile1 type=slave
```

## 21.9.203 salt.modules.libcloud_loadbalancer

### Apache Libcloud Load Balancer Management

Connection module for Apache Libcloud Storage load balancer management for a full list of supported clouds, see [http://libcloud.readthedocs.io/en/latest/loadbalancer/supported_providers.html](http://libcloud.readthedocs.io/en/latest/loadbalancer/supported_providers.html)

Clouds include Amazon ELB, ALB, Google, Aliyun, CloudStack, Softlayer

New in version 2018.3.0.

**configuration**  This module uses a configuration profile for one or multiple Storage providers

```yaml
libcloud_loadbalancer:
  profile_test1:
    driver: gce
    key: G00G0123456789ABCXYZ
    secret: mysecret
  profile_test2:
    driver: alb
    key: 12345
    secret: mysecret
```

**depends**  apache-libcloud

#### salt.modules.libcloud_loadbalancer.balancer_attach_member(balancer_id, ip, port, profile, **libcloud_kwargs)

Add a new member to the load balancer

**Parameters**
• **balancer_id** (str) – id of a load balancer you want to fetch
• **ip** (str) – IP address for the new member
• **port** (int) – Port for the new member
• **profile** (str) – The profile key
• **libcloud_kwargs** (dict) – Extra arguments for the driver’s balancer_attach_member method

CLI Example:
```bash
salt myminion libcloud_storage.balancer_attach_member balancer123 1.2.3.4 8000 profile1
```

salt.modules.libcloud_loadbalancer.balancer_detach_member(balancer_id, member_id, profile, **libcloud_kwargs)

Add a new member to the load balancer

Parameters
• **balancer_id** (str) – id of a load balancer you want to fetch
• **ip** (str) – IP address for the new member
• **port** (int) – Port for the new member
• **profile** (str) – The profile key
• **libcloud_kwargs** (dict) – Extra arguments for the driver’s balancer_detach_member method

CLI Example:
```bash
salt myminion libcloud_storage.balancer_detach_member balancer123 member123 profile1
```

salt.modules.libcloud_loadbalancer.create_balancer(name, port, protocol, profile, algorithm=None, members=None, **libcloud_kwargs)

Create a new load balancer instance

Parameters
• **name** (str) – Name of the new load balancer (required)
• **port** (str) – Port the load balancer should listen on, defaults to 80
• **protocol** (str) – Loadbalancer protocol, defaults to http.
• **algorithm** (str) – Load balancing algorithm, defaults to ROUND_ROBIN. See Algorithm type in Libcloud documentation for a full listing.
• **profile** (str) – The profile key
• **libcloud_kwargs** (dict) – Extra arguments for the driver’s create_balancer method

Returns The details of the new balancer

CLI Example:
```bash
salt myminion libcloud_storage.create_balancer my_balancer 80 http profile1
```

salt.modules.libcloud_loadbalancer.destroy_balancer(balancer_id, profile, **libcloud_kwargs)

Destroy a load balancer
Parameters

- **balancer_id** *(str)* – LoadBalancer ID which should be used
- **profile** *(str)* – The profile key
- **libcloud_kwargs** *(dict)* – Extra arguments for the driver's destroy_balancer method

Returns True if the destroy was successful, otherwise False.

Return type bool

CLI Example:

```sh
salt myminion libcloud_storage.destroy_balancer balancer_1 profile1
```

salt.modules.libcloud_loadbalancer.extras**(method, profile, **libcloud_kwargs)**

Call an extended method on the driver

Parameters

- **method** *(str)* – Driver’s method name
- **profile** *(str)* – The profile key
- **libcloud_kwargs** *(dict)* – Extra arguments for the driver’s method

CLI Example:

```sh
salt myminion libcloud_loadbalancer.extras ex_get_permissions google container_ →name=my_container object_name=me.jpg --out=yaml
```

salt.modules.libcloud_loadbalancer.get_balancer**(balancer_id, profile, **libcloud_kwargs)**

Get the details for a load balancer by ID

Parameters

- **balancer_id** *(str)* – id of a load balancer you want to fetch
- **profile** *(str)* – The profile key
- **libcloud_kwargs** *(dict)* – Extra arguments for the driver’s get_balancer method

Returns the load balancer details

CLI Example:

```sh
salt myminion libcloud_storage.get_balancer balancer123 profile1
```

salt.modules.libcloud_loadbalancer.get_balancer_by_name**(name, profile, **libcloud_kwargs)**

Get the details for a load balancer by name

Parameters

- **name** *(str)* – Name of a load balancer you want to fetch
- **profile** *(str)* – The profile key
- **libcloud_kwargs** *(dict)* – Extra arguments for the driver’s list_balancers method

Returns the load balancer details

CLI Example:

```sh
salt myminion libcloud_storage.get_balancer_by_name my_balancer profile1
```
salt.modules.libcloud_loadbalancer.list_balancer_members(balancer_id, profile, **libcloud_kwargs)

List the members of a load balancer

Parameters

- **balancer_id**(str) – id of a load balancer you want to fetch
- **profile**(str) – The profile key
- **libcloud_kwargs**(dict) – Extra arguments for the driver’s list_balancer_members method

CLI Example:

```sh
salt myminion libcloud_storage.list_balancer_members balancer123 profile1
```

salt.modules.libcloud_loadbalancer.list_balancers(profile, **libcloud_kwargs)

Return a list of load balancers.

Parameters

- **profile**(str) – The profile key
- **libcloud_kwargs**(dict) – Extra arguments for the driver’s list_balancers method

CLI Example:

```sh
salt myminion libcloud_storage.list_balancers profile1
```

salt.modules.libcloud_loadbalancer.list_protocols(profile, **libcloud_kwargs)

Return a list of supported protocols.

Parameters

- **profile**(str) – The profile key
- **libcloud_kwargs**(dict) – Extra arguments for the driver’s list_protocols method

Returns a list of supported protocols

Return type list of str

CLI Example:

```sh
salt myminion libcloud_storage.list_protocols profile1
```

salt.modules.libcloud_loadbalancer.list_supported_algorithms(profile, **libcloud_kwargs)

Get the supported algorithms for a profile

Parameters

- **profile**(str) – The profile key
- **libcloud_kwargs**(dict) – Extra arguments for the driver’s list_supported_algorithms method

Returns The supported algorithms

CLI Example:

```sh
salt myminion libcloud_storage.list_supported_algorithms profile1
```

21.9.204 salt.modules.libcloud_storage
Apache Libcloud Storage Management

Connection module for Apache Libcloud Storage (object/blob) management for a full list of supported clouds, see http://libcloud.readthedocs.io/en/latest/storage/supportProviders.html

Clouds include Amazon S3, Google Storage, Aliyun, Azure Blobs, Ceph, OpenStack swift

New in version 2018.3.0.

configuration This module uses a configuration profile for one or multiple Storage providers

```
libcloud_storage:
  profile_test1:
    driver: google_storage
    key: G00G0123456789ABCXYZ
    secret: mysecret
  profile_test2:
    driver: s3
    key: 12345
    secret: mysecret
```

depsends apache-libcloud

```
salt.modules.libcloud_storage.create_container(container_name, profile, **libcloud_kwargs)
```

Create a container in the cloud

Parameters

- `container_name` (str) – Container name
- `profile` (str) – The profile key
- `libcloud_kwargs` (dict) – Extra arguments for the driver’s create_container method

CLI Example:

```
salt myminion libcloud_storage.create_container MyFolder profile1
```

```
salt.modules.libcloud_storage.delete_container(container_name, profile, **libcloud_kwargs)
```

Delete an object container in the cloud

Parameters

- `container_name` (str) – Container name
- `profile` (str) – The profile key
- `libcloud_kwargs` (dict) – Extra arguments for the driver’s delete_container method

Returns True if an object container has been successfully deleted, False otherwise.

Return type bool

CLI Example:

```
salt myminion libcloud_storage.delete_container MyFolder profile1
```

```
salt.modules.libcloud_storage.delete_object(container_name, object_name, profile, **libcloud_kwargs)
```

Delete an object in the cloud

Parameters

- `container_name` (str) – Container name
• **object_name** (str) – Object name
• **profile** (str) – The profile key
• **libcloud_kwargs** (dict) – Extra arguments for the driver’s delete_object method

**Returns** True if an object has been successfully deleted, False otherwise.

**Return type** bool

CLI Example:
```
salt myminion libcloud_storage.delete_object MyFolder me.jpg profile1
```

salt.modules.libcloud_storage.download_object(container_name, object_name, destination_path, profile, overwrite_existing=False, delete_on_failure=True, **libcloud_kwargs)

Download an object to the specified destination path.

**Parameters**
• **container_name** (str) – Container name
• **object_name** (str) – Object name
• **destination_path** (str) – Full path to a file or a directory where the incoming file will be saved.
• **profile** (str) – The profile key
• **overwrite_existing** (bool) – True to overwrite an existing file, defaults to False.
• **delete_on_failure** (bool) – True to delete a partially downloaded file if the download was not successful (hash mismatch / file size).
• **libcloud_kwargs** (dict) – Extra arguments for the driver’s download_object method

**Returns** True if an object has been successfully downloaded, False otherwise.

**Return type** bool

CLI Example:
```
salt myminion libcloud_storage.download_object MyFolder me.jpg /tmp/me.jpg → profile1
```

salt.modules.libcloud_storage.extra(method, profile, **libcloud_kwargs)

Call an extended method on the driver

**Parameters**
• **method** (str) – Driver’s method name
• **profile** (str) – The profile key
• **libcloud_kwargs** (dict) – Extra arguments for the driver’s delete_container method

CLI Example:
```
salt myminion libcloud_storage.extra ex_get_permissions google container_name=my_container object_name=me.jpg --out=yaml
```

salt.modules.libcloud_storage.get_container(container_name, profile, **libcloud_kwargs)

List container details for the given container_name on the given profile

21.9. execution modules
Parameters

- **container_name** *(str)* – Container name
- **profile** *(str)* – The profile key
- **libcloud_kwargs** *(dict)* – Extra arguments for the driver’s get_container method

CLI Example:

```
salt myminion libcloud_storage.get_container MyFolder profile1
```

**salt.modules.libcloud_storage.get_container_object** *(container_name, object_name, profile, **libcloud_kwargs)*

Get the details for a container object (file or object in the cloud)

Parameters

- **container_name** *(str)* – Container name
- **object_name** *(str)* – Object name
- **profile** *(str)* – The profile key
- **libcloud_kwargs** *(dict)* – Extra arguments for the driver’s get_container_object method

CLI Example:

```
salt myminion libcloud_storage.get_container_object MyFolder MyFile.xyz profile1
```

**salt.modules.libcloud_storage.list_container_objects** *(container_name, profile, **libcloud_kwargs)*

List container objects (e.g. files) for the given container_id on the given profile

Parameters

- **container_name** *(str)* – Container name
- **profile** *(str)* – The profile key
- **libcloud_kwargs** *(dict)* – Extra arguments for the driver’s list_container_objects method

CLI Example:

```
salt myminion libcloud_storage.list_container_objects MyFolder profile1
```

**salt.modules.libcloud_storage.list_containers** *(profile, **libcloud_kwargs)*

Return a list of containers.

Parameters

- **profile** *(str)* – The profile key
- **libcloud_kwargs** *(dict)* – Extra arguments for the driver’s list_containers method

CLI Example:

```
salt myminion libcloud_storage.list_containers profile1
```

**salt.modules.libcloud_storage.upload_object** *(file_path, container_name, object_name, profile, extra=None, verify_hash=True, headers=None, **libcloud_kwargs)*

Upload an object currently located on a disk.

Parameters
- **file_path** *(str)* – Path to the object on disk.
- **container_name** *(str)* – Destination container.
- **object_name** *(str)* – Object name.
- **profile** *(str)* – The profile key
- **verify_hash** *(bool)* – Verify hash
- **extra** *(dict)* – Extra attributes (driver specific). (optional)
- **headers** *(dict)* – (optional) Additional request headers, such as CORS headers. For example: `headers = {'Access-Control-Allow-Origin': 'http://mozilla.com'}`
- **libcloud_kwargs** *(dict)* – Extra arguments for the driver’s upload_object method

**Returns** The object name in the cloud

**Return type** *(str)*

**CLI Example:**
```
salt myminion libcloud_storage.upload_object /file/to/me.jpg MyFolder me.jpg profile1
```

### 21.9.205 salt.modules.linux_acl

Support for Linux File Access Control Lists

The Linux ACL module requires the `getfacl` and `setfacl` binaries.

**salt.modules.linux_acl.delfacl** *(acl_type, acl_name=", *args, **kwargs)*
Remove specific FACL from the specified file(s)

**CLI Examples:**
```
salt '*' acl.delfacl user myuser /tmp/house/kitchen
salt '*' acl.delfacl default:group mygroup /tmp/house/kitchen
salt '*' acl.delfacl d:u myuser /tmp/house/kitchen
salt '*' acl.delfacl g myuser /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.delfacl user myuser /tmp/house/kitchen recursive=True
```

**salt.modules.linux_acl.getfacl** *("args, "**kwargs)*
Return (extremely verbose) map of FACLs on specified file(s)

**CLI Examples:**
```
salt '*' acl.getfacl /tmp/house/kitchen
salt '*' acl.getfacl /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.getfacl /tmp/house/kitchen /tmp/house/livingroom recursive=True
```

**salt.modules.linux_acl.modfacl** *(acl_type, acl_name=", perms=", "args, "**kwargs)*
Add or modify a FACL for the specified file(s)

**CLI Examples:**
```
salt '*' acl.modfacl user myuser rwx /tmp/house/kitchen
salt '*' acl.modfacl default:group mygroup rx /tmp/house/kitchen
salt '*' acl.modfacl d:u myuser 7 /tmp/house/kitchen
salt '*' acl.modfacl g mygroup 0 /tmp/house/kitchen /tmp/house/livingroom
```

(continues on next page)
salt.modules.linux_acl.version()
Return facl version from getfacl -version
CLI Example:
salt '*' acl.version

salt.modules.linux_acl.wipefacls(*args, **kwargs)
Remove all FACLs from the specified file(s)
CLI Examples:
salt '*' acl.wipefacls /tmp/house/kitchen
salt '*' acl.wipefacls /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.wipefacls /tmp/house/kitchen /tmp/house/livingroom recursive=True

21.9.206 salt.modules.linux_ip module
The networking module for Non-RH/Deb Linux distros
salt.modules.linux_ip.down(iface, iface_type=None)
Shutdown a network interface
CLI Example:
salt '*' ip.down eth0

salt.modules.linux_ip.get_interface(iface)
Return the contents of an interface script
CLI Example:
salt '*' ip.get_interface eth0

salt.modules.linux_ip.get_routes(iface=None)
Return the current routing table
CLI Examples:
salt '*' ip.get_routes
salt '*' ip.get_routes eth0

salt.modules.linux_ip.up(iface, iface_type=None)
Start up a network interface
CLI Example:
salt '*' ip.up eth0

21.9.207 salt.modules.linux_lvm
Support for Linux LVM2
salt.modules.linux_lvm.fullversion()
    Return all version info from lvm version
    CLI Example:
    ```
salt '*' lvm.fullversion
    ```

salt.modules.linux_lvm.lvcreate(lvname, vgname, size=None, extents=None, snapshot=None, pv=None, thinvolume=False, thinpool=False, force=False, **kwargs)
    Create a new logical volume, with option for which physical volume to be used
    CLI Examples:
    ```
salt '*' lvm.lvcreate new_volume_name vg_name size=10G
salt '*' lvm.lvcreate new_volume_name vg_name extents=100 pv=/dev/sdb
salt '*' lvm.lvcreate new_snapshot vg_name snapshot=volume_name size=3G
    ```

New in version to_complete.
Support for thin pools and thin volumes
CLI Examples:
```
salt '*' lvm.lvcreate new_thinpool_name vg_name size=20G
    → thinpool=True
salt '*' lvm.lvcreate new_thinvolume_name vg_name/thinpool_name size=10G
    → thinvolume=True
    ```

salt.modules.linux_lvm.lvdisplay(lvname='.', quiet=False)
    Return information about the logical volume(s)
    lvname   logical device name
    quiet    if the logical volume is not present, do not show any error
    CLI Examples:
    ```
salt '*' lvm.lvdisplay
salt '*' lvm.lvdisplay /dev/vg_myserver/root
    ```

salt.modules.linux_lvm.lvremove(lvname, vgname)
    Remove a given existing logical volume from a named existing volume group
    CLI Example:
    ```
salt '*' lvm.lvremove lvname vgname force=True
    ```

salt.modules.linux_lvm.lvresize(size=None, lvpath=None, extents=None)
    Return information about the logical volume(s)
    CLI Examples:
    ```
salt '*' lvm.lvresize +12M /dev/mapper/vg1-test
salt '*' lvm.lvresize lvpath=/dev/mapper/vg1-test extents=+100%FREE
    ```

salt.modules.linux_lvm.pvcreate(devices, override=True, **kwargs)
    Set a physical device to be used as an LVM physical volume
    override   Skip devices, if they are already LVM physical volumes
    CLI Examples:
salt.mymachine.lvm.pvcreate /dev/sdb1,/dev/sdb2
salt.mymachine.lvm.pvcreate /dev/sdb1 dataalignmentoffset=7s

salt.modules.linux_lvm.pvdisplay(pvname=", real=False, quiet=False)
Return information about the physical volume(s)
pvname  physical device name
real  dereference any symlinks and report the real device
quiet if the physical volume is not present, do not show any error

CLI Examples:
salt '*' lvm.pvdisplay
salt '*' lvm.pvdisplay /dev/md0

salt.modules.linux_lvm.pvremove(devices, override=True)
Remove a physical device being used as an LVM physical volume
override  Skip devices, if they are already not used as LVM physical volumes

CLI Examples:
salt mymachine lvm.pvremove /dev/sdb1,/dev/sdb2

salt.modules.linux_lvm.version()
Return LVM version from lvm version

CLI Example:
salt '*' lvm.version

salt.modules.linux_lvm.vgcreate(vgname, devices, **kwargs)
Create an LVM volume group

CLI Examples:
salt mymachine lvm.vgcreate my_vg /dev/sdb1,/dev/sdb2
salt mymachine lvm.vgcreate my_vg /dev/sdb1 clustered=y

salt.modules.linux_lvm.vgdisplay(vgname=", quiet=False)
Return information about the volume group(s)
vgname  volume group name
quiet if the volume group is not present, do not show any error

CLI Examples:
salt '*' lvm.vgdisplay
salt '*' lvm.vgdisplay nova-volumes

salt.modules.linux_lvm.vgextend(vgname, devices)
Add physical volumes to an LVM volume group

CLI Examples:
salt mymachine lvm.vgextend my_vg /dev/sdb1,/dev/sdb2
salt mymachine lvm.vgextend my_vg /dev/sdb1

salt.modules.linux_lvm.vgremove(vgname)
Remove an LVM volume group

CLI Examples:
21.9.208 `salt.modules.linux_sysctl`

Module for viewing and modifying sysctl parameters

`salt.modules.linux_sysctl.assign(name, value)`
Assign a single sysctl parameter for this minion

CLI Example:
```
salt '*' sysctl.assign net.ipv4.ip_forward 1
```

`salt.modules.linux_sysctl.default_config()`
Linux hosts using systemd 207 or later ignore `/etc/sysctl.conf` and only load from `/etc/sysctl.d/*.*.conf`. This function will do the proper checks and return a default config file which will be valid for the Minion. Hosts running systemd >= 207 will use `/etc/sysctl.d/99-salt.conf`.

CLI Example:
```
salt -G 'kernel:Linux' sysctl.default_config
```

`salt.modules.linux_sysctl.get(name)`
Return a single sysctl parameter for this minion

CLI Example:
```
salt '*' sysctl.get net.ipv4.ip_forward
```

`salt.modules.linux_sysctl.persist(name, value, config=None)`
Assign and persist a simple sysctl parameter for this minion. If `config` is not specified, a sensible default will be chosen using `sysctl.default_config`.

CLI Example:
```
salt '*' sysctl.persist net.ipv4.ip_forward 1
```

`salt.modules.linux_sysctl.show(config_file=False)`
Return a list of sysctl parameters for this minion

CLI Example:
```
salt '*' sysctl.show
```

21.9.209 `salt.modules.localemod`

Module for managing locales on POSIX-like systems

`salt.modules.localemod.avail(locale)`
Check if a locale is available.

New in version 2014.7.0.

CLI Example:
salt '*' locale.avail 'en_US.UTF-8'

salt.modules.localemod.gen_locale(locale, **kwargs)
Generate a locale. Options:

Parameters:
locale – Any locale listed in /usr/share/i18n/locales or /usr/share/i18n/SUPPORTED for Debian and Gentoo based distributions, which require the charmap to be specified as part of the locale when generating it.

verbose Show extra warnings about errors that are normally ignored.

CLI Example:
salt '*' locale.gen_locale en_US.UTF-8
salt '*' locale.gen_locale 'en_IE.UTF-8 UTF-8' # Debian/Gentoo only

salt.modules.localemod.get_locale()
Get the current system locale

CLI Example:
salt '*' locale.get_locale

salt.modules.localemod.list_avail()
Lists available (compiled) locales

CLI Example:
salt '*' locale.list_avail

salt.modules.localemod.set_locale(locale)
Sets the current system locale

CLI Example:
salt '*' locale.set_locale 'en_US.UTF-8'

21.9.210 salt.modules.locate

Module for using the locate utilities

salt.modules.locate.locate(pattern, database=", limit=0, **kwargs)
Performs a file lookup. Valid options (and their defaults) are:

<table>
<thead>
<tr>
<th>Option</th>
<th>Type</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>basename</td>
<td>boolean</td>
<td>False</td>
<td></td>
</tr>
<tr>
<td>count</td>
<td>boolean</td>
<td>False</td>
<td></td>
</tr>
<tr>
<td>existing</td>
<td>boolean</td>
<td>False</td>
<td></td>
</tr>
<tr>
<td>follow</td>
<td>boolean</td>
<td>True</td>
<td></td>
</tr>
<tr>
<td>ignore</td>
<td>boolean</td>
<td>False</td>
<td></td>
</tr>
<tr>
<td>nofollow</td>
<td>boolean</td>
<td>False</td>
<td></td>
</tr>
<tr>
<td>wholename</td>
<td>boolean</td>
<td>True</td>
<td></td>
</tr>
<tr>
<td>regex</td>
<td>boolean</td>
<td>False</td>
<td></td>
</tr>
<tr>
<td>database</td>
<td>string</td>
<td>&lt;locate's default database&gt;</td>
<td></td>
</tr>
<tr>
<td>limit</td>
<td>integer</td>
<td>not set by default</td>
<td></td>
</tr>
</tbody>
</table>

See the manpage for locate(1) for further explanation of these options.

CLI Example:
salt '*' locate.locate

salt.modules.locate.stats()
    Returns statistics about the locate database
    CLI Example:
    
salt '*' locate.stats

salt.modules.locate.updatedb()
    Updates the locate database
    CLI Example:
    
salt '*' locate.updatedb

salt.modules.locate.version()
    Returns the version of locate
    CLI Example:
    
salt '*' locate.version

21.9.211 salt.modules.logadm

Module for managing Solaris logadm based log rotations.

salt.modules.logadm.list_conf(conf_file='/etc/logadm.conf', log_file=None, include_unset=False)
    Show parsed configuration
    New in version 2018.3.0.
    conf_file [string] path to logadm.conf, defaults to /etc/logadm.conf
    log_file [string] optional show only one log file
    include_unset [boolean] include unset flags in output
    CLI Example:
    
salt '*' logadm.list_conf
salt '*' logadm.list_conf log=/var/log/syslog
salt '*' logadm.list_conf include_unset=False

salt.modules.logadm.remove(name, conf_file='/etc/logadm.conf')
    Remove log pattern from logadm
    CLI Example:
    
salt '*' logadm.remove myapplog

salt.modules.logadm.rotate(name, pattern=None, conf_file='/etc/logadm.conf', **kwargs)
    Set up pattern for logging.
    name [string] alias for entryname
    pattern [string] alias for log_file
    conf_file [string] optional path to alternative configuration file
    kwargs [boolean|string|int] optional additional flags and parameters
    
    Note: name and pattern were kept for backwards compatibility reasons.

21.9. execution modules
name is an alias for the entryname argument, pattern is an alias for log_file. These aliases will only be used if the entryname and log_file arguments are not passed.

For a full list of arguments see `logadm.show_args`.

CLI Example:

```
salt '*' logadm.rotate myapplog pattern='//var//log//myapp//*\.log' count=7
salt '*' logadm.rotate myapplog log_file='//var//log//myapp//*\.log' count=4
# owner=myappd mode='0700'
```

salt.modules.logadm.show_args()
Show which arguments map to which flags and options.
New in version 2018.3.0.

CLI Example:

```
salt '*' logadm.show_args
```

salt.modules.logadm.show_conf(conf_file='/etc/logadm.conf', name=None)
Show configuration
conf_file [string] path to logadm.conf, defaults to /etc/logadm.conf
name [string] optional show only a single entry

CLI Example:

```
salt '*' logadm.show_conf
salt '*' logadm.show_conf name=/var/log/syslog
```

### 21.9.212 salt.modules.logmod module

**On-demand logging**

New in version 2017.7.0.

The sole purpose of this module is logging messages in the (proxy) minion. It comes very handy when debugging complex Jinja templates, for example:

```
{% for var in range(10) %}
  {% do salt.log.info(var) %}
{% endfor %}
```

CLI Example:

```
salt '*' log.error "Please don't do that, this module is not for CLI use!"
```

salt.modules.logmod.critical(message)
Log message at level CRITICAL.

salt.modules.logmod.debug(message)
Log message at level DEBUG.

salt.modules.logmod.error(message)
Log message at level ERROR.

salt.modules.logmod.exception(message)
Log message at level EXCEPTION.
salt.modules.logmod.info(message)
    Log message at level INFO.

salt.modules.logmod.warning(message)
    Log message at level WARNING.

**21.9.213 salt.modules.logrotate**

Module for managing logrotate.

salt.modules.logrotate.get(key, value=None, conf_file='/etc/logrotate.conf')
    Get the value for a specific configuration line.
    **Parameters**
    - **key** *(str)* – The command or stanza block to configure.
    - **value** *(str)* – The command value or command of the block specified by the key parameter.
    - **conf_file** *(str)* – The logrotate configuration file.
    **Returns** The value for a specific configuration line.
    **Return type** bool|int|str

    CLI Example:
    ```
    salt '*' logrotate.get rotate
    salt '*' logrotate.get /var/log/wtmp rotate /etc/logrotate.conf
    ```

salt.modules.logrotate.set_(key, value, setting=None, conf_file='/etc/logrotate.conf')
    Set a new value for a specific configuration line.
    **Parameters**
    - **key** *(str)* – The command or block to configure.
    - **value** *(str)* – The command value or command of the block specified by the key parameter.
    - **setting** *(str)* – The command value for the command specified by the value parameter.
    - **conf_file** *(str)* – The logrotate configuration file.
    **Returns** A boolean representing whether all changes succeeded.
    **Return type** bool

    CLI Example:
    ```
    salt '*' logrotate.set rotate 2
    ```

Can also be used to set a single value inside a multiline configuration block. For instance, to change rotate in the following block:

```
/var/log/wtmp {
    monthly
    create 0664 root root
    rotate 1
}
```

Use the following command:
This module also has the ability to scan files inside an include directory, and make changes in the appropriate file.

```python
salt.modules.logrotate.show_conf(conf_file='/etc/logrotate.conf')
```

Show parsed configuration

**Parameters**

**Returns**

The parsed configuration.

**Return type**

`dict`

**CLI Example:**

```
salt '*' logrotate.show_conf
```

## 21.9.214 salt.modules.lvs

Support for LVS (Linux Virtual Server)

```python
salt.modules.lvs.add_server(protocol=None, service_address=None, server_address=None, packet_forward_method='dr', weight=1, **kwargs)
```

Add a real server to a virtual service.

**Parameters**

- `protocol` *(str)* – The service protocol (only support tcp, udp and fwmark service).
- `service_address` *(str)* – The LVS service address.
- `server_address` *(str)* – The real server address.
- `weight` *(int)* – The capacity of a server relative to the others in the pool.

**CLI Example:**

```
salt '*' lvs.add_server tcp 1.1.1.1:80 192.168.0.11:8080 nat 1
```

```python
salt.modules.lvs.add_service(protocol=None, service_address=None, scheduler='wlc', **kwargs)
```

Add a virtual service.

**Parameters**

- `protocol` *(str)* – The service protocol (only support tcp, udp and fwmark service).
- `service_address` *(str)* – The LVS service address.
- `scheduler` *(str)* – Algorithm for allocating TCP connections and UDP datagrams to real servers.

**CLI Example:**

```
salt '*' lvs.add_service tcp 1.1.1.1:80 rr
```

```python
salt.modules.lvs.check_server(protocol=None, service_address=None, server_address=None, **kwargs)
```

Check the real server exists in the specified service.

**CLI Example:**

```
salt '*' lvs.check_server tcp 1.1.1.1:80 192.168.0.11:8080
```

```python
salt.modules.lvs.check_service(protocol=None, service_address=None, **kwargs)
```

Check the virtual service exists.

**CLI Example:**

```
salt '*' lvs.check_service tcp 1.1.1.1:80
```
salt.modules.lvs.clear()
Clear the virtual server table

CLI Example:
```
salt '*' lvs.clear
```

salt.modules.lvs.delete_server(protocol=None, service_address=None, server_address=None)
Delete the realserver from the virtual service.
protocol The service protocol(only support tcp, udp and fwmark service).
service_address The LVS service address.
server_address The real server address.

CLI Example:
```
salt '*' lvs.delete_server tcp 1.1.1.1:80 192.168.0.11:8080
```

salt.modules.lvs.delete_service(protocol=None, service_address=None)
Delete the virtual service.
protocol The service protocol(only support tcp, udp and fwmark service).
service_address The LVS service address.

CLI Example:
```
salt '*' lvs.delete_service tcp 1.1.1.1:80
```

salt.modules.lvs.edit_server(protocol=None, service_address=None, server_address=None, packet_forward_method=None, weight=None, **kwargs)
Edit a real server to a virtual service.
protocol The service protocol(only support tcp, udp and fwmark service).
service_address The LVS service address.
server_address The real server address.
packet_forward_method The LVS packet forwarding method(dr for direct routing, tunnel for tunneling, nat for network access translation).
weight The capacity of a server relative to the others in the pool.

CLI Example:
```
salt '*' lvs.edit_server tcp 1.1.1.1:80 192.168.0.11:8080 nat 1
```

salt.modules.lvs.edit_service(protocol=None, service_address=None, scheduler=None)
Edit the virtual service.
protocol The service protocol(only support tcp, udp and fwmark service).
service_address The LVS service address.
scheduler Algorithm for allocating TCP connections and UDP datagrams to real servers.

CLI Example:
```
salt '*' lvs.edit_service tcp 1.1.1.1:80 rr
```

salt.modules.lvs.get_rules()
Get the virtual server rules

CLI Example:
```
salt '*' lvs.get_rules
```

salt.modules.lvs.list_(protocol=None, service_address=None)
List the virtual server table if service_address is not specified. If a service_address is selected, list this service only.

CLI Example:
salt '%%' lvs.list

salt.modules.lvs.zero(\protocol=None, service_address=None)  
Zero the packet, byte and rate counters in a service or all services.  

CLI Example: 
	salt '%%' lvs.zero

21.9.215 salt.modules.lxc

Control Linux Containers via Salt

**depends** lxc package for distribution

lxc >= 1.0 (even beta alpha) is required

salt.modules.lxc.add_veth(name, interface_name, bridge=None, path=None)  
Add a veth to a container. Note: this function doesn’t update the container config, just add the interface at runtime  
\name Name of the container  
\interface_name Name of the interface in the container  
\bridge Name of the bridge to attach the interface to (facultative)

CLI Examples:

	salt '%%' lxc.add_veth container_name eth1 br1
	salt '%%' lxc.add_veth container_name eth1

salt.modules.lxc.apply_network_profile(name, network_profile, nic_opts=None, path=None)  
New in version 2015.5.0.  
Apply a network profile to a container  
\network_profile profile name or default values (dict)  
\nic_opts values to override in defaults (dict) indexed by nic card names  
\path path to the container parent

New in version 2015.8.0.  

CLI Examples:

	salt 'minion' lxc.apply_network_profile web1 centos  
	salt 'minion' lxc.apply_network_profile web1 centos  
	\nic_opts="{"eth0": {"mac": 'xx:xx:xx:xx:xx:xx'}}"
	salt 'minion' lxc.apply_network_profile web1  
	\{"eth0": {"mac": 'xx:xx:xx:xx:xx:xx:yy'}}\}
	\nic_opts="{"eth0": {"mac": 'xx:xx:xx:xx:xx:xx'}}"

The special case to disable use of ethernet nics:

	salt 'minion' lxc.apply_network_profile web1 centos  
	{"eth0: {disable: true}}"

salt.modules.lxc.attachable(name, path=None)  
Return True if the named container can be attached to via the lxc-attach command  
\path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.  

CLI Example: 

salt 'minion' lxc.attachable ubuntu

salt.modules.lxc.bootstrap(name, config=None, approve_key=True, install=True, pub_key=None, priv_key=None, bootstrap_url=None, force_install=False, unconditional_install=False, path=None, bootstrap_delay=None, bootstrap_args=None, bootstrap_shell=None)

Install and configure salt in a container.

- `config`: Minion configuration options. By default, the master option is set to the target host's master.
- `approve_key`: Request a pre-approval of the generated minion key. Requires that the salt-master be configured to either auto-accept all keys or expect a signing request from the target host. Default: True
- `path`: path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

- `pub_key`: Explicit public key to pressed the minion with (optional). This can be either a filepath or a string representing the key
- `priv_key`: Explicit private key to pressed the minion with (optional). This can be either a filepath or a string representing the key
- `bootstrap_delay`: Delay in seconds between end of container creation and bootstrapping. Useful when waiting for container to obtain a DHCP lease.

New in version 2015.5.0.

- `bootstrap_url`: url, content or filepath to the salt bootstrap script
- `bootstrap_args`: salt bootstrap script arguments
- `bootstrap_shell`: shell to execute the script into
- `install`: Whether to attempt a full installation of salt-minion if needed.
- `force_install`: Force installation even if salt-minion is detected, this is the way to run vendor bootstrap scripts even if a salt minion is already present in the container
- `unconditional_install`: Run the script even if the container seems seeded

CLI Examples:

```
salt 'minion' lxc.bootstrap container_name [config=config_data] \[approve_key=(True|False)] [install=(True|False)]
```

salt.modules.lxc.clone(name, orig, profile=None, network_profile=None, nic_opts=None, **kwargs)

Create a new container as a clone of another container

- `name`: Name of the container
- `orig`: Name of the original container to be cloned
- `profile`: Profile to use in container cloning (see `lxc.get_container_profile`). Values in a profile will be overridden by the Container Cloning Arguments listed below.
- `network_profile`: Network profile to use for container

New in version 2015.8.0.

**Container Cloning Arguments**

- `snapshot`: Use Copy On Write snapshots (LVM)
- `size`: [1G] Size of the volume to create. Only applicable if backing=lvm.
- `backing`: The type of storage to use. Set to lvm to use an LVM group. Defaults to filesystem within /var/lib/lxc.

New in version 2015.8.0.

- `nic_opts`: give extra opts overriding network profile values

CLI Examples:

```
salt '*' lxc.clone myclone orig=orig_container
salt '*' lxc.clone myclone orig=orig_container snapshot=True
```
salt.modules.lxc.cloud_init(name, vm_=None, **kwargs)
Thin wrapper to lxc.init to be used from the saltcloud lxc driver

name Name of the container may be None and then guessed from saltcloud mapping
vm_ saltcloud mapping defaults for the vm

CLI Example:
salt '*' lxc.cloud_init foo

salt.modules.lxc.cloud_init_interface(name, vm_=None, **kwargs)
Interface between salt.cloud.lxc driver and lxc.init vm_ is a mapping of vm opts in the salt.cloud format as documented for the lxc driver.

This can be used either:
- from the salt cloud driver
- because you find the argument to give easier here than using directly lxc.init

Warning: BE REALLY CAREFUL CHANGING DEFAULTS‼ IT’S A RETRO COMPATIBLE INTERFACE WITH THE SALT CLOUD DRIVER (ask kiorky).

name name of the lxc container to create
pub_key public key to preseed the minion with. Can be the keycontent or a filepath
priv_key private key to preseed the minion with. Can be the keycontent or a filepath
path path to the container parent directory (default: /var/lib/lxc)

New in version 2015.8.0.

profile profile selection
network_profile network profile selection
nic_opts per interface settings compatibles with network profile (ipv4/ipv6/link/gateway/mac/netmask)

eg:

```
- {'eth0': {'mac': '00:16:3e:01:29:40',
  'gateway': None, (default)
  'link': 'br0', (default)
  'gateway': None, (default)
  'netmask': '', (default)
  'ip': '22.1.4.25'}}
```

unconditional_install given to lxc.bootstrap (see relative doc)
force_install given to lxc.bootstrap (see relative doc)
config any extra argument for the salt minion config
dnsservers list of DNS servers to set inside the container
dns_via_dhcp do not set the dns servers, let them be set by the dhcp.
autostart autostart the container at boot time
password administrative password for the container
bootstrap_delay delay before launching bootstrap script at Container init

Warning: Legacy but still supported options:

from_container which container we use as a template when running lxc.clone
image which template do we use when we are using lxc.create. This is the default mode unless you specify something in from_container
backing which backing store to use. Values can be: overlayfs, dir(default), lvm, zfs, btrfs
fstype When using a blockdevice level backing store, which filesystem to use on
**size**  When using a blockdevice level backing store, which size for the filesystem to use on

**snapshot**  Use snapshot when cloning the container source

**vgname**  if using LVM: vgname

**lvname**  if using LVM: lvname

**thinpool:**  if using LVM: thinpool

**ip**  ip for the primary nic

**mac**  mac address for the primary nic

**netmask**  netmask for the primary nic (24) = `vm_.get('netmask', '24')`

**bridge**  bridge for the primary nic (lxcbr0)

**gateway**  network gateway for the container

**additional_ips**  additional ips which will be wired on the main bridge (br0) which is connected to internet.

Be aware that you may use manual virtual mac addresses providen by you provider (online, ovh, etc). This is a list of mappings {ip: ", mac: ", netmask:"} Set gateway to None and an interface with a gateway to escape from another interface that eth0. eg:

```
{
    'mac': '00:16:3e:01:29:40',
    'gateway': None, (default)
    'link': 'br0', (default)
    'netmask': '', (default)
    'ip': '22.1.4.25'
}
```

**users**  administrative users for the container default: [root] and [root, ubuntu] on ubuntu

**default_nic**  name of the first interface, you should really not override this

---

**CLI Example:**

```
salt '*' lxc.cloud_init_interface foo
```

**salt.modules.lxc.copy_to**(*name*, *source*, *dest*, overwrite=False, makedirs=False, path=None)

Changed in version 2015.8.0: Function renamed from lxc.cp to lxc.copy_to for consistency with other container types. lxc.cp will continue to work, however. For versions 2015.2.x and earlier, use lxc.cp.

Copy a file or directory from the host into a container

**name**  Container name

**source**  File to be copied to the container

**path**  path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

**dest**  Destination on the container. Must be an absolute path.

Changed in version 2015.5.0: If the destination is a directory, the file will be copied into that directory.

**overwrite**  [False] Unless this option is set to True, then if a file exists at the location specified by the dest argument, an error will be raised.

New in version 2015.8.0.

**makedirs**  : False

Create the parent directory on the container if it does not already exist.

New in version 2015.5.0.

**CLI Example:**
salt 'minion' lxc.copy_to /tmp/foo /root/foo
salt 'minion' lxc.cp /tmp/foo /root/foo

```
salt.modules.lxc.create(name, config=None, profile=None, network_profile=None, nic_opts=None, **kwargs)
```

Create a new container.

- **name** Name of the container
- **config** The config file to use for the container. Defaults to system-wide config (usually in /etc/lxc/lxc.conf).
- **profile** Profile to use in container creation (see `lxc.get_container_profile`). Values in a profile will be overridden by the Container Creation Arguments listed below.
- **network_profile** Network profile to use for container

New in version 2015.5.0.

**Container Creation Arguments**

- **template** The template to use. For example, `ubuntu` or `fedora`. For a full list of available templates, check out the `lxc.templates` function.

  **Note:** The `download` template requires the following three parameters to be defined in `options`:
  - **dist** - The name of the distribution
  - **release** - Release name/version
  - **arch** - Architecture of the container

  The available images can be listed using the `lxc.images` function.

- **options** Template-specific options to pass to the lxc-create command. These correspond to the long options (ones beginning with two dashes) that the template script accepts. For example:

  ```
  options='{"dist": "centos", "release": "6", "arch": "amd64"}"
  ```

  For available template options, refer to the lxc template scripts which are usually located under `/usr/share/lxc/templates`, or run `lxc-create -t <template> -h`.

- **image** A tar archive to use as the rootfs for the container. Conflicts with the `template` argument.

- **backing** The type of storage to use. Set to `lvm` to use an LVM group. Defaults to filesystem within `/var/lib/lxc`.

- **fstype** Filesystem type to use on LVM logical volume

- **size** [1G] Size of the volume to create. Only applicable if `backing=lvm`.

- **vghname** [lxc] Name of the LVM volume group in which to create the volume for this container. Only applicable if `backing=lvm`.

- **lvname** Name of the LVM logical volume in which to create the volume for this container. Only applicable if `backing=lvm`.

- **thinpool** Name of a pool volume that will be used for thin-provisioning this container. Only applicable if `backing=lvm`.

- **nic_opts** give extra opts overriding network profile values

- **path** parent path for the container creation (default: `/var/lib/lxc`)

- **zfsroot** Name of the ZFS root in which to create the volume for this container. Only applicable if `backing=zfs`. (default: tank/lxc)

  New in version 2015.8.0.

```
salt.modules.lxc.destroy(name, stop=False, path=None)
```

Destroy the named container.

**Warning:** Destroys all data associated with the container.

---

1990 Chapter 21. Salt Module Reference
path  path to the container parent directory (default: /var/lib/lxc)

New in version 2015.8.0.

stop  [False] If True, the container will be destroyed even if it is running/frozen.

Changed in version 2015.5.0: Default value changed to False. This more closely matches the behavior of `lxc-destroy(1)`, and also makes it less likely that an accidental command will destroy a running container that was being used for important things.

CLI Examples:

```bash
salt '*' lxc.destroy foo
salt '*' lxc.destroy foo stop=True
```

salt.modules.lxc.edit_conf( conf_file, out_format='simple', read_only=False, lxc_config=None, **kwargs)

Edit an LXC configuration file. If a setting is already present inside the file, its value will be replaced. If it does not exist, it will be appended to the end of the file. Comments and blank lines will be kept in-tact if they already exist in the file.

**out_format**  Set to simple if you need backward compatibility (multiple items for a simple key is not supported)

**read_only**  return only the edited configuration without applying it to the underlying lxc configuration file

**lxc_config**  List of dict containing lxc configuration items For network configuration, you also need to add the device it belongs to, otherwise it will default to eth0. Also, any change to a network parameter will result in the whole network reconfiguration to avoid mismatchs, be aware of that !

After the file is edited, its contents will be returned. By default, it will be returned in simple format, meaning an unordered dict (which may not represent the actual file order). Passing in an out_format of commented will return a data structure which accurately represents the order and content of the file.

CLI Example:

```bash
salt 'minion' lxc.edit_conf /etc/lxc/mycontainer.conf
  out_format=commented
salt 'minion' lxc.edit_conf /etc/lxc/mycontainer.conf
  lxc_config="[{'lxc.network.name': 'eth0',
  'lxc.network.ipv4': '1.2.3.4'},
  {'lxc.network.name': 'eth2',
  'lxc.network.ipv4': '1.2.3.5'},
  {'lxc.network.gateway': '1.2.3.1']}
```

salt.modules.lxc.exists(name, path=None)

Returns whether the named container exists.

**path**  path to the container parent directory (default: /var/lib/lxc)

New in version 2015.8.0.

CLI Example:

```bash
salt '*' lxc.exists name
```

salt.modules.lxc.freeze(name, **kwargs)

Freeze the named container

**path**  path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

**start**  [False] If True and the container is stopped, the container will be started before attempting to freeze.

New in version 2015.5.0.

**use_vt**  run the command through VT
New in version 2015.8.0.

CLI Example:

```
salt 'x' lxc.freeze name
```

salt.modules.lxc.get_container_profile(name=None, **kwargs)

New in version 2015.5.0.

Gather a pre-configured set of container configuration parameters. If no arguments are passed, an empty profile is returned.

Profiles can be defined in the minion or master config files, or in pillar or grains, and are loaded using `config.get`. The key under which LXC profiles must be configured is `lxc.container_profile`. `profile_name`. An example container profile would be as follows:

```
lxc.container_profile:
    ubuntu:
        template: ubuntu
        backing: lvm
        vgnname: lxc
        size: 1G
```

Parameters set in a profile can be overridden by passing additional container creation arguments (such as the ones passed to `lxc.create`) to this function.

A profile can be defined either as the name of the profile, or a dictionary of variable names and values. See the LXC Tutorial for more information on how to use LXC profiles.

CLI Example:

```
salt-call lxc.get_container_profile centos
salt-call lxc.get_container_profile ubuntu template=ubuntu backing=overlayfs
```

salt.modules.lxc.get_network_profile(name=None, **kwargs)

New in version 2015.5.0.

Gather a pre-configured set of network configuration parameters. If no arguments are passed, the following default profile is returned:

```
{ 'eth0': { 'link': 'br0', 'type': 'veth', 'flags': 'up' } }
```

Profiles can be defined in the minion or master config files, or in pillar or grains, and are loaded using `config.get`. The key under which LXC profiles must be configured is `lxc.network_profile`. An example network profile would be as follows:

```
lxc.network_profile.centos:
    eth0:
        link: br0
        type: veth
        flags: up
```

To disable networking entirely:

```
lxc.network_profile.centos:
    eth0:
        disable: true
```

Parameters set in a profile can be overridden by passing additional arguments to this function.
A profile can be passed either as the name of the profile, or a dictionary of variable names and values. See the LXC Tutorial for more information on how to use network profiles.

**Warning:** The `ipv4`, `ipv6`, `gateway`, and `link` (bridge) settings in network profiles will only work if the container doesn’t redefine the network configuration (for example in `/etc/sysconfig/network-scripts/ifcfg-<interface_name>` on RHEL/CentOS, or `/etc/network/interfaces` on Debian/Ubuntu/etc.)

CLI Example:

```
salt-call lxc.get_network_profile default
```

```
salt.modules.lxc.get_parameter(name, parameter, path=None)
Retruns the value of a cgroup parameter for a container
path path to the container parent directory default: /var/lib/lxc (system)
    New in version 2015.8.0.
CLI Example:
```
salt '*' lxc.get_parameter container_name memory.limit_in_bytes
```

```
salt.modules.lxc.get_pid(name, path=None)
Retruns a container pid. Throw an exception if the container isn’t running.
CLI Example:
```
salt '*' lxc.get_pid name
```

```
salt.modules.lxc.get_root_path(path)
Get the configured lxc root for containers
New in version 2015.8.0.
CLI Example:
```
salt '*' lxc.get_root_path
```

```
salt.modules.lxc.images(dist=None)
New in version 2015.5.0.
   List the available images for LXC’s download template.
dist [None] Filter results to a single Linux distribution
CLI Examples:
```
salt myminion lxc.images
salt myminion lxc.images dist=centos
```

```
salt.modules.lxc.info(name, path=None)
Retruns information about a container
path path to the container parent directory default: /var/lib/lxc (system)
    New in version 2015.8.0.
CLI Example:
```
salt '*' lxc.info name
```
salt.modules.lxc.init(name, config=None, cpuset=None, cpushare=None, memory=None, profile=None, network_profile=None, nic_opts=None, cpu=None, autostart=True, password=None, password_encrypted=None, users=None, dnsservers=None, searchdomains=None, bridge=None, gateway=None, pub_key=None, priv_key=None, force_install=False, unconditional_install=False, bootstrap_delay=None, bootstrap_args=None, bootstrap_shell=None, bootstrap_url=None, **kwargs)

Initialize a new container.

This is a partial idempotent function as if it is already provisioned, we will reset a bit the lxc configuration file but much of the hard work will be escaped as markers will prevent re-execution of harmful tasks.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the container</td>
</tr>
<tr>
<td>image</td>
<td>A tar archive to use as the rootfs for the container. Conflicts with the template argument.</td>
</tr>
<tr>
<td>cpus</td>
<td>Select a random number of cpu cores and assign it to the cpuset, if the cpuset option is set then this option will be ignored</td>
</tr>
<tr>
<td>cpuset</td>
<td>Explicitly define the cpus this container will be bound to</td>
</tr>
<tr>
<td>cpushare</td>
<td>cgroups cpu shares</td>
</tr>
<tr>
<td>autostart</td>
<td>autostart container on reboot</td>
</tr>
<tr>
<td>memory</td>
<td>cgroups memory limit, in MB</td>
</tr>
<tr>
<td>gateway</td>
<td>the ipv4 gateway to use the default does nothing more than lxcutils does</td>
</tr>
<tr>
<td>bridge</td>
<td>the bridge to use the default does nothing more than lxcutils does</td>
</tr>
<tr>
<td>network_profile</td>
<td>Network profile to use for the container</td>
</tr>
<tr>
<td>nic_opts</td>
<td>Extra options for network interfaces, will override</td>
</tr>
<tr>
<td>users</td>
<td>Users for which the password defined in the password param should be set. Can be passed as a comma separated list or a python list. Defaults to just the root user.</td>
</tr>
<tr>
<td>password</td>
<td>Set the initial password for the users defined in the users parameter</td>
</tr>
<tr>
<td>password_encrypted</td>
<td>[False] Set to True to denote a password hash instead of a plaintext password</td>
</tr>
<tr>
<td>profile</td>
<td>A LXC profile (defined in config or pillar). This can be either a real profile mapping or a string to retrieve it in configuration</td>
</tr>
<tr>
<td>start</td>
<td>Start the newly-created container</td>
</tr>
<tr>
<td>dnsservers</td>
<td>list of dns servers to set in the container, default [] (no setting)</td>
</tr>
<tr>
<td>seed</td>
<td>Seed the container with the minion config. Default: True</td>
</tr>
<tr>
<td>install</td>
<td>If salt-minion is not already installed, install it. Default: True</td>
</tr>
<tr>
<td>config</td>
<td>Optional config parameters. By default, the id is set to the name of the container.</td>
</tr>
<tr>
<td>master</td>
<td>salt master (default to minion’s master)</td>
</tr>
<tr>
<td>master_port</td>
<td>salt master port (default to minion’s master port)</td>
</tr>
<tr>
<td>pub_key</td>
<td>Explicit public key to preseed the minion with (optional). This can be either a filepath or a string representing the key</td>
</tr>
<tr>
<td>priv_key</td>
<td>Explicit private key to preseed the minion with (optional). This can be either a filepath or a string representing the key</td>
</tr>
<tr>
<td>approve_key</td>
<td>If explicit preseeding is not used; Attempt to request key approval from the master. Default: True</td>
</tr>
</tbody>
</table>
path  path to the container parent directory default: /var/lib/lxc (system)

    New in version 2015.8.0.
clone_from  Original from which to use a clone operation to create the container. Default: None
bootstrap_delay  Delay in seconds between end of container creation and bootstrapping. Useful when waiting for container to obtain a DHCP lease.

    New in version 2015.5.0.
bootstrap_url  See lxc.bootstrap
bootstrap_shell  See lxc.bootstrap
bootstrap_args  See lxc.bootstrap
force_install  Force installation even if salt-minion is detected, this is the way to run vendor bootstrap scripts even if a salt minion is already present in the container
unconditional_install  Run the script even if the container seems seeded

CLI Example:

    salt 'minion' lxc.init name [cpuset=cgroups_cpuset] \
    [cpushare=cgroups_cpushare] [memory=cgroups_memory] \
    [nic=nic_profile] [profile=lxc_profile] \
    [nic_opts=nic_opts] [start=(True|False)] \
    [seed=(True|False)] [install=(True|False)] \
    [clone_from=original] [autostart=True] \
    [priv_key=/path_or_content] [pub_key=/path_or_content] \
    [bridge=lxcbr0] [gateway=10.0.3.1] \
    [dnsservers=dns1,dns2] \
    [users=[foo]] [password='secret'] \
    [password_encrypted=(True|False)]

salt.modules.lxc.list_(extra=False, limit=None, path=None)
List containers classified by state
extra  Also get per-container specific info. This will change the return data. Instead of returning a list of containers, a dictionary of containers and each container's output from lxc.info.
path  path to the container parent directory default: /var/lib/lxc (system)

    New in version 2015.8.0.
limit  Return output matching a specific state (frozen, running, or stopped).

    New in version 2015.5.0.

CLI Examples:

    salt '*' lxc.list
    salt '*' lxc.list extra=True
    salt '*' lxc.list limit=running

salt.modules.lxc.ls_(active=None, cache=True, path=None)
Return a list of the containers available on the minion
path  path to the container parent directory default: /var/lib/lxc (system)

    New in version 2015.8.0.
active  If True, return only active (i.e. running) containers

    New in version 2015.5.0.

CLI Example:

    salt '*' lxc.ls
    salt '*' lxc.ls active=True
salt.modules.lxc.read_conf(conf_file, out_format='simple')
Read in an LXC configuration file. By default returns a simple, unsorted dict, but can also return a more detailed structure including blank lines and comments.

**out_format:** set to ‘simple’ if you need the old and unsupported behavior. This won’t support the multiple lxc values (eg: multiple network nics)

CLI Examples:
```bash
salt 'minion' lxc.read_conf /etc/lxc/mycontainer.conf
salt 'minion' lxc.read_conf /etc/lxc/mycontainer.conf out_format=commented
```

salt.modules.lxc.reboot(name, path=None)
Reboot a container.

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Examples:
```bash
salt 'minion' lxc.reboot myvm
```

salt.modules.lxc.reconfigure(name, cpu=None, cpuset=None, cpushare=None, memory=None, profile=None, network_profile=None, nic_opts=None, bridge=None, gateway=None, autostart=None, utsname=None, rootfs=None, path=None, **kwargs)
Reconfigure a container.

This only applies to a few property

**name** Name of the container.

**utsname** utsname of the container.

New in version 2016.3.0.

**rootfs** rootfs of the container.

New in version 2016.3.0.

**cpu** Select a random number of cpu cores and assign it to the cpuset, if the cpuset option is set then this option will be ignored

**cpuset** Explicitly define the cpus this container will be bound to

**cpushare** cgroups cpu shares.

**autostart** autostart container on reboot

**memory** cgroups memory limit, in MB. (0 for nolimit, None for old default 1024MB)

**gateway** the ipv4 gateway to use the default does nothing more than lxcutils does

**bridge** the bridge to use the default does nothing more than lxcutils does

**nic** Network interfaces profile (defined in config or pillar).

**nic_opts** Extra options for network interfaces, will override

```json
{"eth0": {"mac": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1", "ipv6": "2001:db8::ff00:42:8329"}}
```

or

```json
{"eth0": {"mac": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1/24", "ipv6": "2001:db8::ff00:42:8329"}}
```

**path** path to the container parent

New in version 2015.8.0.

CLI Example:
```bash
salt-call -lall mc_lxc_fork.reconfigure foobar nic_opts="{"eth1": {"mac": 
  "00:16:3e:dd:ee:44"}}" memory=4
```
salt.modules.lxc.restart

New in version 2015.5.0.

Restart the named container. If the container was not running, the container will merely be started.

**name** The name of the container

**path** path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

**lxc_config** path to a lxc config file config file will be guessed from container name otherwise

New in version 2015.8.0.

**force** [False] If True, the container will be force-stopped instead of gracefully shut down

CLI Example:

```
salt myminion lxc.restart name
```

salt.modules.lxc.run

New in version 2015.8.0.

Run `cmd.run` within a container

```bash
salt myminion lxc.run name
```

salt.modules.lxc.retcode

New in version 2015.5.0.

Run `cmd.retcode` within a container

```bash
salt myminion lxc.retcode name
```

**Warning:** Many shell builtins do not work, failing with stderr similar to the following:

```bash
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in stderr if the command being run does not exist. If the retcode is nonzero and not what was expected, try using `lxc.run_stderr` or `lxc.run_all`.

**name** Name of the container in which to run the command

**cmd** Command to run

**no_start** [False] If the container is not running, don’t start it

**preserve_state** [True] After running the command, return the container to its previous state

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

**stdin** [None] Standard input to be used for the command

**output_loglevel** [debug] Level at which to log the output from the command. Set to quiet to suppress logging.

**use_vt** [False] Use SaltStack’s utils.vt to stream output to console output=all.

**keep_env** [http_proxy,https_proxy,no_proxy] A list of env vars to preserve. May be passed as comma-delimited list.

**chroot_fallback** if the container is not running, try to run the command using chroot default: false

CLI Example:

```
salt myminion lxc.run name
```

```bash
salt myminion lxc.run name
```

New in version 2015.8.0.

Run `cmd.run` within a container

```bash
salt myminion lxc.run name
```
Warning: Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in stderr if the command being run does not exist. If no output is returned using this function, try using `lxc.run_stderr` or `lxc.run_all`.

**name** Name of the container in which to run the command

**cmd** Command to run

**path** path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

**no_start** [False] If the container is not running, don’t start it

**preserve_state** [True] After running the command, return the container to its previous state

**stdin** [None] Standard input to be used for the command

**output_loglevel** [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

**use_vt** [False] Use SaltStack’s `utils.vt` to stream output to console. Assumes `output=all`.

**chroot_fallback** if the container is not running, try to run the command using chroot default: false

**keep_env** [http_proxy, https_proxy, no_proxy] A list of env vars to preserve. May be passed as comma-delimited list.

CLI Example:

```
salt myminion lxc.run mycontainer 'ifconfig -a'
```

**salt.modules.lxc.run_all(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, path=None, ignore_retcode=False, chroot_fallback=False, keep_env='http_proxy, https_proxy, no_proxy')**

New in version 2015.5.0.

Run `cmd.run_all` within a container

**Note:** While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.
keep_env  [http_proxy,https_proxy,no_proxy] A list of env vars to preserve. May be passed as comma-delimited list.

chroot_fallback if the container is not running, try to run the command using chroot default: false

CLI Example:

```
salt myminion lxc.run_all mycontainer
'ip addr show'
```

salt.modules.lxc.run_stderr(name, cmd, no_start=False, preserve_state=True, stdin=None, 
python_shell=True, output_loglevel='debug', use_vt=False, 
path=None, ignore_retcode=False, chroot_fallback=False, 
keep_env='http_proxy, https_proxy, no_proxy')

New in version 2015.5.0.

Run `cmd.run_stderr` within a container

**Warning:** Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed if the command being run does not exist.

name  Name of the container in which to run the command

**Warning:** Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed if the command being run does not exist.

**Warning:** Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed if the command being run does not exist. If no output is returned using this function, try using `lxc.run_stderr` or `lxc.run_all`.

name  Name of the container in which to run the command
cmd Command to run

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

no_start [False] If the container is not running, don’t start it

preserve_state [True] After running the command, return the container to its previous state

stdin [None] Standard input to be used for the command

output_loglevel [debug] Level at which to log the output from the command. Set to quiet to suppress logging.

use_vt [False] Use SaltStack’s utils.vt to stream output to console output=all.

keep_env [http_proxy,https_proxy,no_proxy] A list of env vars to preserve. May be passed as comma-delimited list.

chroot_fallback if the container is not running, try to run the command using chroot default: false

CLI Example:

```
salt myminion lxc.run_stdout mycontainer 'ifconfig -a'
```

```
salt.modules.lxc.running_systemd(name, cache=True, path=None)
```

Determine if systemD is running

path path to the container parent

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.running_systemd ubuntu
```

```
salt.modules.lxc.search_lxc_bridge()
```

Search the first bridge which is potentially available as LXC bridge

CLI Example:

```
salt '*' lxc.search_lxc_bridge
```

```
salt.modules.lxc.search_lxc Bridges()
```

Search which bridges are potentially available as LXC bridges

CLI Example:

```
salt '*' lxc.search_lxc_Bridges
```

```
salt.modules.lxc.set_dns(name, dnsservers=None, searchdomains=None, path=None)
```

Changed in version 2015.5.0: The dnsservers and searchdomains parameters can now be passed as a comma-separated list.

Update /etc/resolv.conf

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.set_dns ubuntu "['8.8.8.8', '4.4.4.4']"
```

```
salt.modules.lxc.set_parameter(name, parameter, value, path=None)
```

Set the value of a cgroup parameter for a container.

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.
CLI Example:

```bash
salt '*' lxc.set_parameter name parameter value
```

salt.modules.lxc.set_password(name, users, password, encrypted=True, path=None)

Changed in version 2015.5.0: Function renamed from `set_pass` to `set_password`. Additionally, this function now supports (and defaults to using) a password hash instead of a plaintext password.

Set the password of one or more system users inside containers.

- **users** Comma-separated list (or python list) of users to change password
- **password** Password to set for the specified user(s)
- **encrypted** [True] If true, `password` must be a password hash. Set to `False` to set a plaintext password (not recommended).
  - New in version 2015.5.0.
- **path** path to the container parent directory default: /var/lib/lxc (system)
  - New in version 2015.8.0.

CLI Example:

```bash
salt '*' lxc.set_pass container-name root $6$uJ2uAyLU$KoI67t8As/$6$uJ2uAYLU$KoI67t8As/$6$uJ2uAYLU$KoI67t8As/0fXtJOPcHKGXmUpcoYUcVR2K6x93waihShTCQvjRwq25y1k1CB0qgfbfdKQSFAso28/ek6716vEv1
salt '*' lxc.set_pass container-name root foo encrypted=False
```

salt.modules.lxc.start(name, **kwargs)

Start the named container.

- **path** path to the container parent directory default: /var/lib/lxc (system)
  - New in version 2015.8.0.
- **lxc_config** path to a lxc config file config file will be guessed from container name otherwise
  - New in version 2015.8.0.
- **use_vt** run the command through VT
  - New in version 2015.8.0.

CLI Example:

```bash
salt myminion lxc.start name
```

salt.modules.lxc.state(name, path=None)

Returns the state of a container.

- **path** path to the container parent directory (default: /var/lib/lxc)
  - New in version 2015.8.0.

CLI Example:

```bash
salt '*' lxc.state name
```

salt.modules.lxc.stop(name, kill=False, path=None, use_vt=None)

Stop the named container.

- **path** path to the container parent directory default: /var/lib/lxc (system)
  - New in version 2015.8.0.
- **kill** False Do not wait for the container to stop, kill all tasks in the container. Older LXC versions will stop containers like this irrespective of this argument.
  - Changed in version 2015.5.0: Default value changed to False
- **use_vt** run the command through VT
  - New in version 2015.8.0.
CLI Example:

```bash
salt myminion lxc.stop name
```

**salt.modules.lxc.systemd_running_state**(name, path=None)

Get the operational state of a systemd based container

- **path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```bash
salt myminion lxc.systemd_running_state ubuntu
```

**salt.modules.lxc.templates**()

New in version 2015.5.0.

List the available LXC template scripts installed on the minion

CLI Examples:

```bash
salt myminion lxc.templates
```

**salt.modules.lxc.test_bare_started_state**(name, path=None)

Test if a non systemd container is fully started For now, it consists only to test if the container is attachable

- **path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```bash
salt myminion lxc.test_bare_started_state ubuntu
```

**salt.modules.lxc.test_sd_started_state**(name, path=None)

Test if a systemd container is fully started

- **path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```bash
salt myminion lxc.test_sd_started_state ubuntu
```

**salt.modules.lxc.unfreeze**(name, path=None, use_vt=None)

Unfreeze the named container.

- **path** path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

- **use_vt** run the command through VT

New in version 2015.8.0.

CLI Example:

```bash
salt '*' lxc.unfreeze name
```

**salt.modules.lxc.update_lxc_conf**(name, lxc_conf, lxc_conf_unset, path=None)

Edit LXC configuration options

- **path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:
salt myminion lxc.update_lxc_conf ubuntu \
   lxc_conf="[{'network.ipv4.ip':'10.0.3.5'}]" \
   lxc_conf_unset=['lxc.utsname']"}

salt.modules.lxc.version()
Return the actual lxc client version

New in version 2015.8.0.

CLI Example:
salt '*' lxc.version

salt.modules.lxc.wait_started(name, path=None, timeout=300)
Check that the system has fully inited

This is actually very important for systemd based containers

see https://github.com/saltstack/salt/issues/23847

path  path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:
salt myminion lxc.wait_started ubuntu

salt.modules.lxc.write_conf(conf_file, conf)
Write out an LXC configuration file

This is normally only used internally. The format of the data structure must match that which is returned from
lxc.read_conf(), with out_format set to commented.

An example might look like:

[ ...
   {'lxc.utsname': '$CONTAINER_NAME'},
   '# This is a commented line
   
   {'lxc.mount': '$CONTAINER_FSTAB'},
   {'lxc.rootfs': {'comment': 'This is another test',
                   'value': 'This is another test'}},
   
   {'lxc.network.type': 'veth'},

]

CLI Example:
salt 'minion' lxc.write_conf /etc/lxc/mycontainer.conf \
   out_format=commented

21.9.216 salt.modules.lxd

Module for managing the LXD daemon and its containers.
New in version 2019.2.0.

**LXD(1)** is a container "hypervisor". This execution module provides several functions to help manage it and its containers.

**Note:**

- pylxd(2) version >=2.2.5 is required to let this work, currently only available via pip.

  To install on Ubuntu:

  ```
  $ apt-get install libssl-dev python-pip
  $ pip install -U pylxd
  ```

- you need lxd installed on the minion for the init() and version() methods.
- for the config_get() and config_get() methods you need to have lxd-client installed.

**maintainer** René Jochum <rene@jochums.at>

**maturity** new

**depends** python-pylxd

**platform** Linux

**salt.modules.lxd.authenticate**(remote_addr, password, cert, key, verify_cert=True)

Authenticate with a remote LXDaemon.

**remote_addr** : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

**Examples:**

```
https://myserver.lan:8443
```

**password** : The password of the remote.

**cert** : PEM Formatted SSL Certificate.

**Examples:**

```
~/.config/lxc/client.crt
```

**key** : PEM Formatted SSL Key.

**Examples:**

```
~/.config/lxc/client.key
```

**verify_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

**CLI Example:**

```
$ salt '* lxd.authenticate https://srv01:8443 <yourpass> ~/.config/lxc/client.crt ~/.config/lxc/client.key false
```

See the requests-docs for the SSL stuff.

**salt.modules.lxd.config_get**(key)

Get an LXD daemon config option

**key** : The key of the config value to retrieve

**CLI Examples:**

```
salt '* lxd.config_get core.https_address
```

**salt.modules.lxd.config_set**(key, value)

Set an LXD daemon config option

**CLI Examples:**

To listen on IPv4 and IPv6 port 8443, you can omit the :8443 its the default:

```
salt '* lxd.config_set core.https_address [::]:8443
```
To set the server trust password:

```
salt '*' lxd.config_set core.trust_password blah
```

```
salt.modules.lxd.container_config_delete(name, config_key, remote_addr=None, cert=None, key=None, verify_cert=True)
```

Delete a container config value

- **name**: Name of the container
- **config_key**: The config key to delete
- **remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  - Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
- **cert**: PEM Formatted SSL Certificate.
  - Examples: ~/.config/lxc/client.crt
- **key**: PEM Formatted SSL Key.
  - Examples: ~/.config/lxc/client.key
- **verify_cert**: [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

```
salt.modules.lxd.container_config_get(name, config_key, remote_addr=None, cert=None, key=None, verify_cert=True)
```

Get a container config value

- **name**: Name of the container
- **config_key**: The config key to retrieve
- **remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  - Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
- **cert**: PEM Formatted SSL Certificate.
  - Examples: ~/.config/lxc/client.crt
- **key**: PEM Formatted SSL Key.
  - Examples: ~/.config/lxc/client.key
- **verify_cert**: [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

```
salt.modules.lxd.container_config_set(name, config_key, config_value, remote_addr=None, cert=None, key=None, verify_cert=True)
```

Set a container config value

- **name**: Name of the container
- **config_key**: The config key to set
- **config_value**: The config value to set
- **remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  - Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
- **cert**: PEM Formatted SSL Certificate.
  - Examples: ~/.config/lxc/client.crt
- **key**: PEM Formatted SSL Key.
  - Examples: ~/.config/lxc/client.key
- **verify_cert**: [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

```
salt.modules.lxd.container_create(name, source, profiles=None, config=None, devices=None, architecture='x86_64', ephemeral=False, wait=True, remote_addr=None, cert=None, key=None, verify_cert=True, _raw=False)
```

Create a container

- **name**: The name of the container
source:
   Can be either a string containing an image alias: "xenial/amd64"
or an dict with type "image" with alias:

   {"type": "image", "alias": "xenial/amd64"}
or image with "fingerprint":

   {"type": "image", "fingerprint": "SHA-256"}
or image with "properties":

   {"type": "image",
    "properties": { "os": "ubuntu", "release": "14.04", "architecture": "x86_64"}}
or none: {"type": "none"}
or copy:

   {"type": "copy", "source": "my-old-container"}
profiles [["default"] List of profiles to apply on this container
config : A config dict or None (None = unset).
   Can also be a list:

   [[{'key': 'boot.autostart', 'value': 1}, {'key': 'security.privileged', 'value': '1'}]
devices : A device dict or None (None = unset).
architecture ['x86_64']
   Can be one of the following:
   
   • unknown
   • i686
   • x86_64
   • armv7l
   • aarch64
   • ppc
   • ppc64
   • ppc64le
   • s390x
ephemeral [False] Destroy this container after stop?
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and
   its a TCP Address!
   Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
   Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
   Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it
   off as LXD normaly uses self-signed certificates.
._raw [False] Return the raw pyxld object or a dict?
CLI Examples:

salt '*' lxd.container_create test xenial/amd64

See also the rest-api-docs.
salt.modules.lxd.container_delete(name, remote_addr=None, cert=None, key=None, verify_cert=True)

Delete a container
name : Name of the container to delete
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

salt.modules.lxd.container_device_add(name, device_name, device_type='disk', remote_addr=None, cert=None, key=None, verify_cert=True, **kwargs)

Add a container device
name : Name of the container
device_name : The device name to add
device_type : Type of the device
** kwargs : Additional device args
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

salt.modules.lxd.container_device_delete(name, device_name, remote_addr=None, cert=None, key=None, verify_cert=True)

Delete a container device
name : Name of the container
device_name : The device name to delete
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

salt.modules.lxd.container_device_get(name, device_name, remote_addr=None, cert=None, key=None, verify_cert=True)

Get a container device
name : Name of the container
device_name : The device name to retrieve
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key: PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

salt.modules.lxd.container_execute

(name, cmd, remote_addr=None, cert=None, key=None, verify_cert=True)

Execute a command list on a container.
name: Name of the container
cmd: Command to be executed (as a list)
Example: ["ls", "-l"]
remote_addr: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert: PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key: PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

CLI Example:
salt '*' lxd.container_execute <container name> ["ls", "-l"]

salt.modules.lxd.container_file_get

(name, src, dst, overwrite=False, mode=None, uid=None, gid=None, remote_addr=None, cert=None, key=None, verify_cert=True)

Get a file from a container
name: Name of the container
src: The source file or directory
dst: The destination file or directory
mode: Set file mode to octal number
uid: Set file uid (owner)
gid: Set file gid (group)
remote_addr: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert: PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key: PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

salt.modules.lxd.container_file_put

(name, src, dst, recursive=False, overwrite=False, mode=None, uid=None, gid=None, saltenv='base', remote_addr=None, cert=None, key=None, verify_cert=True)

Put a file into a container
name: Name of the container
src: The source file or directory
dst: The destination file or directory
recursive: Decent into src directory
overwrite: Replace destination if it exists
mode: Set file mode to octal number
uid : Set file uid (owner)
gid : Set file gid (group)
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and
its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it
off as LXD normaly uses self-signed certificates.

CLI Example:

```
salt '*' lxd.container_file_put <container name> /var/tmp/foo /var/tmp/
```

salt.modules.lxd.container_freeze(name, remote_addr=None, cert=None, key=None, verify_cert=True)

Freeze a container

name : Name of the container to freeze
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and
its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it
off as LXD normaly uses self-signed certificates.

salt.modules.lxd.container_get(name=None, remote_addr=None, cert=None, key=None, verify_cert=True, _raw=False)

Gets a container from the LXD

name : The name of the container to get.
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and
its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it
off as LXD normaly uses self-signed certificates.

_raw : Return the pylxd object, this is internal and by states in use.

salt.modules.lxd.container_list(list_names=False, remote_addr=None, cert=None, key=None, verify_cert=True)

Lists containers

list_names [False] Only return a list of names when True
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and
its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it
off as LXD normally uses self-signed certificates.

CLI Examples:

Full dict with all available informations:

```bash
salt '*' lxd.container_list
```

For a list of names:

```bash
salt '*' lxd.container_list true
```

See also `container-attributes`.

```
salt.modules.lxd.container_migrate(name, stop_and_start=False, remote_addr=None, cert=None, key=None, verify_cert=True, src_remote_addr=None, src_cert=None, src_key=None, src_verify_cert=None)
```

Migrate a container.

If the container is running, it either must be shut down first (use `stop_and_start=True`) or criu must be installed on the source and destination machines.

For this operation both certs need to be authenticated, use `lxd.authenticate <salt.modules.lxd.authenticate to authenticate your cert(s).`

- **name**: Name of the container to migrate
- **stop_and_start**: Stop the container on the source and start it on dest
- **remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  
  Examples: `https://myserver.lan:8443` `/var/lib/mysocket.sock`
- **cert**: PEM Formatted SSL Certificate.
  
  Examples: `~/.config/lxc/client.crt`
- **key**: PEM Formatted SSL Key.
  
  Examples: `~/.config/lxc/client.key`
- **verify_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```bash
# Authorize
salt '*' lxd.authenticate https://srv01:8443 <yourpass> ~/.config/lxc/client.crt ~/.config/lxc/client.key false
salt '*' lxd.authenticate https://srv02:8443 <yourpass> ~/.config/lxc/client.crt ~/.config/lxc/client.key false

# Migrate phpmyadmin from srv01 to srv02
```

```
salt.modules.lxd.container_rename(name, newname, remote_addr=None, cert=None, key=None, verify_cert=True)
```

Rename a container

- **name**: Name of the container to Rename
- **newname**: The new name of the container
- **remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  
  Examples: `https://myserver.lan:8443` `/var/lib/mysocket.sock`
- **cert**: PEM Formatted SSL Certificate.
  
  Examples: `~/.config/lxc/client.crt`
key : PEM Formatted SSL Key.  
   Examples: ~/.config/lxc/client.key  
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

```
salt.modules.lxd.container_restart(name, remote_addr=None, cert=None, key=None, verify_cert=True)
```

Restart a container

- name : Name of the container to restart
- remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!  
  Examples: https://myserver.lan:8443 /var/lib/mysocket.sock  
- cert : PEM Formatted SSL Certificate.  
  Examples: ~/.config/lxc/client.crt  
- key : PEM Formatted SSL Key.  
  Examples: ~/.config/lxc/client.key  
- verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

```
salt.modules.lxd.container_start(name, remote_addr=None, cert=None, key=None, verify_cert=True)
```

Start a container

- name : Name of the container to start
- remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!  
  Examples: https://myserver.lan:8443 /var/lib/mysocket.sock  
- cert : PEM Formatted SSL Certificate.  
  Examples: ~/.config/lxc/client.crt  
- key : PEM Formatted SSL Key.  
  Examples: ~/.config/lxc/client.key  
- verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

```
salt.modules.lxd.container_state(name=None, remote_addr=None, cert=None, key=None, verify_cert=True)
```

Get container state

- remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!  
  Examples: https://myserver.lan:8443 /var/lib/mysocket.sock  
- cert : PEM Formatted SSL Certificate.  
  Examples: ~/.config/lxc/client.crt  
- key : PEM Formatted SSL Key.  
  Examples: ~/.config/lxc/client.key  
- verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

```
salt.modules.lxd.container_stop(name, timeout=30, force=True, remote_addr=None, cert=None, key=None, verify_cert=True)
```

Stop a container

- name : Name of the container to stop
- remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!  
  Examples: https://myserver.lan:8443 /var/lib/mysocket.sock  
- cert : PEM Formatted SSL Certificate.  
  Examples: ~/.config/lxc/client.crt  
- key : PEM Formatted SSL Key.  
  Examples: ~/.config/lxc/client.key
**verify_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

```
salt.modules.lxd.container_unfreeze(name, remote_addr=None, cert=None, key=None, verify_cert=True)
```

Unfreeze a container

- **name**: Name of the container to unfreeze
- **remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  
  Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
- **cert**: PEM Formatted SSL Certificate.
  
  Examples: ~/.config/lxc/client.crt
- **key**: PEM Formatted SSL Key.
  
  Examples: ~/.config/lxc/client.key
- **verify_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

```
salt.modules.lxd.image_alias_add(image, alias, description=", remote_addr=None, cert=None, key=None, verify_cert=True)
```

Create an alias on the given image

- **image**: An image alias, a fingerprint or a image object
- **alias**: The alias to add
- **description**: Description of the alias
- **remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  
  Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
- **cert**: PEM Formatted SSL Certificate.
  
  Examples: ~/.config/lxc/client.crt
- **key**: PEM Formatted SSL Key.
  
  Examples: ~/.config/lxc/client.key
- **verify_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

CLI Examples:

```
$ salt '*' lxd.image_alias_add xenial/amd64 x "Short version of xenial/amd64"
```

```
salt.modules.lxd.image_alias_delete(image, alias, remote_addr=None, cert=None, key=None, verify_cert=True)
```

Delete an alias (this is currently not restricted to the image)

- **image**: An image alias, a fingerprint or a image object
- **alias**: The alias to delete
- **remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  
  Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
- **cert**: PEM Formatted SSL Certificate.
  
  Examples: ~/.config/lxc/client.crt
- **key**: PEM Formatted SSL Key.
  
  Examples: ~/.config/lxc/client.key
- **verify_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

CLI Examples:
salt.modules.lxd.image_add(xenial/amd64, "Short version of xenial/amd64")

salt.modules.lxd.image_copy_lxd(source, src_remote_addr, src_cert, src_key, src_verify_cert, remote_addr, cert, key, verify_cert=True, aliases=None, public=None, auto_update=None, _raw=False)

Copy an image from another LXD instance

source : An alias or a fingerprint of the source.
src_remote_addr : An URL to the source remote daemon
    Examples: https://mysourceserver.lan:8443
src_cert : PEM Formatted SSL Certificate for the source
    Examples: ~/.config/lxc/client.crt
src_key : PEM Formatted SSL Key for the source
    Examples: ~/.config/lxc/client.key
src_verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
remote_addr : Address of the destination daemon
    Examples: https://mydestserver.lan:8443
cert : PEM Formatted SSL Certificate for the destination
    Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key for the destination
    Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
aliases [] List of aliases to append to the copied image
public [None] Make this image public available, None = copy source
auto_update [None] Wherever to auto-update from the original source, None = copy source
_raw [False] Return the raw pylxd object or a dict of the destination image?

CLI Examples:

```bash
```

salt.modules.lxd.image_delete(image, remote_addr=None, cert=None, key=None, verify_cert=True)

Delete an image by an alias or fingerprint

image : The alias or fingerprint of the image to delete, can be an obj for the states.
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
    Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
    Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
    Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Examples:

```bash
$ salt '*' lxd.image_delete xenial/amd64
```

salt.modules.lxd.image_from_file(filename, remote_addr=None, cert=None, key=None, verify_cert=True, aliases=None, public=False, saltenv='base', _raw=False)

Create an image from a file
filename : The filename of the rootfs
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
   Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
   Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
   Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
aliases ["] List of aliases to append to the copied image
public [False] Make this image public available
saltenv [base] The saltenv to use for salt:// copies
_raw [False] Return the raw pylxd object or a dict of the image?
CLI Examples:
   ..code-block:: bash
      $ salt '*' lxd.image_from_file salt://lxd/files/busybox.tar.xz aliases=['"busybox-amd64"']

salt.modules.lxd.image_from_simplestreams(server, alias, remote_addr=None, cert=None, key=None, verify_cert=True, aliases=None, public=False, auto_update=False, _raw=False)

Create an image from simplestreams
server : Simplestreams server URI
alias : The alias of the image to retrieve
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
   Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
   Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
   Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
aliases ["] List of aliases to append to the copied image
public [False] Make this image public available
auto_update [False] Should LXD auto update that image?
_raw [False] Return the raw pylxd object or a dict of the image?
CLI Examples:
   ..code-block:: bash
      $ salt '*' lxd.image_from_simplestreams "https://cloud-images.ubuntu.com/releases" "trusty/amd64" aliases=["t", "trusty/amd64"] auto_update=True

salt.modules.lxd.image_from_url(url, remote_addr=None, cert=None, key=None, verify_cert=True, aliases=None, public=False, auto_update=False, _raw=False)

Create an image from an url
url : The URL from where to download the image
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
   Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
   Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
   Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it
off as LXD normally uses self-signed certificates.

**aliases** [[]] List of aliases to append to the copied image

**public** [False] Make this image public available

**auto_update** [False] Should LXD auto update that image?

**_raw** [False] Return the raw pylxd object or a dict of the image?

CLI Examples:

```bash
$ salt '*' lxd.image_from_url https://dl.stgraber.org/lxd aliases=['"busybox-amd64"']
```

```python
salt.modules.lxd.image_get(fingerprint, remote_addr=None, cert=None, key=None, verify_cert=True, _raw=False)
```

Get an image by its fingerprint

**fingerprint** : The fingerprint of the image to retrieve

**remote_addr** : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

**cert** : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

**key** : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

**verify_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

**_raw** [False] Return the raw pylxd object or a dict of it?

CLI Examples:

```bash
$ salt '*' lxd.image_get <fingerprint>
```

```python
salt.modules.lxd.image_get_by_alias(alias, remote_addr=None, cert=None, key=None, verify_cert=True, _raw=False)
```

Get an image by an alias

**alias** : The alias of the image to retrieve

**remote_addr** : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

**cert** : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

**key** : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

**verify_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

**_raw** [False] Return the raw pylxd object or a dict of it?

CLI Examples:

```bash
$ salt '*' lxd.image_get_by_alias xenial/amd64
```

```python
salt.modules.lxd.image_list(list_aliases=False, remote_addr=None, cert=None, key=None, verify_cert=True)
```

Lists all images from the LXD.

**list_aliases** :

Return a dict with the fingerprint as key and a list of aliases as value instead.

**remote_addr** : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
   Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
   Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Examples:

$ salt '*' lxd.image_list true --out=json
$ salt '*' lxd.image_list --out=json

salt.modules.lxd.init(storage_backend='dir', trust_password=None, network_address=None, network_port=None, storage_create_device=None, storage_create_loop=None, storage_pool=None)

Calls lxd init --auto -- opts
storage_backend : Storage backend to use (zfs or dir, default: dir)
trust_password : Password required to add new clients
network_address [None] Address to bind LXD to (default: none)
network_port [None] Port to bind LXD to (Default: 8443)
storage_create_device [None] Setup device based storage using this DEVICE
storage_create_loop [None] Setup loop based storage with this SIZE in GB
storage_pool [None] Storage pool to use or create

CLI Examples:

To listen on all IPv4/IPv6 Addresses:

salt '*' lxd.init dir PaSsW0rD [::]

To not listen on Network:

salt '*' lxd.init

salt.modules.lxd.normalize_input_values(config, devices)

normalize config input so returns can be put into mongodb, which doesn’t like .
This is not meant to be used on the commandline.

CLI Examples:

salt '*' lxd.normalize_input_values config={} devices={}

salt.modules.lxd.profile_config_delete(name, config_key, remote_addr=None, cert=None, key=None, verify_cert=True)

Delete a profile config item.
name : The name of the profile to delete the config item.
config_key : The config key for the value to retrieve.
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
   Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
   Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
   Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:
$ salt '*' lxd.profile_config_delete autostart boot.autostart.delay

salt.modules.lxd.profile_config_get(
    name, config_key, remote_addr=None, cert=None, key=None, verify_cert=True
)

Get a profile config item.

name : The name of the profile to get the config item from.
config_key : The key for the item to retrieve.
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
    Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
    Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
    Examples: ~/.config/lxc/client.key
verify_cert : [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

CLI Example:
$ salt '*' lxd.profile_config_get autostart boot.autostart

salt.modules.lxd.profile_config_set(
    name, config_key, config_value, remote_addr=None, cert=None, key=None, verify_cert=True
)

Set a profile config item.

name : The name of the profile to set the config item to.
config_key : The items key.
config_value : Its items value.
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
    Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
    Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
    Examples: ~/.config/lxc/client.key
verify_cert : [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

CLI Example:
$ salt '*' lxd.profile_config_set autostart boot.autostart 0

salt.modules.lxd.profile_create(
    name, config=None, devices=None, description=None, remote_addr=None, cert=None, key=None, verify_cert=True
)

Creates a profile.

name : The name of the profile to get.
config : A config dict or None (None = unset).
    Can also be a list:
        [{'key': 'boot.autostart', 'value': 1}, {'key': 'security.privileged', 'value': '1'}]
devices : A device dict or None (None = unset).
description : A description string or None (None = unset).
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
    Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
    Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Examples:

```bash
$ salt '*' lxd.profile_create autostart config="{boot.autostart: 1, boot.autostart.delay: 2, boot.autostart.priority: 1}"
$ salt '*' lxd.profile_create shared_mounts devices="{shared_mount: {type: 'disk', source: '/home/shared', path: '/home/shared'}}"
```

See the lxd-docs for the details about the config and devices dicts.

```
salt.modules.lxd.profile_delete(name, remote_addr=None, cert=None, key=None, verify_cert=True)
```

Delete a profile.

- **name**: The name of the profile to delete.
- **remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  
  **Examples**: https://myserver.lan:8443 /var/lib/mysocket.sock

- **cert**: PEM Formatted SSL Certificate.
  
  **Examples**: ~/.config/lxc/client.crt

- **key**: PEM Formatted SSL Key.
  
  **Examples**: ~/.config/lxc/client.key

- **verify_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```bash
$ salt '*' lxd.profile_delete shared_mounts
```

```
salt.modules.lxd.profile_device_delete(name, device_name, remote_addr=None, cert=None, key=None, verify_cert=True)
```

Delete a profile device.

- **name**: The name of the profile to delete the device.
- **device_name**: The name of the device to delete.
- **remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  
  **Examples**: https://myserver.lan:8443 /var/lib/mysocket.sock

- **cert**: PEM Formatted SSL Certificate.
  
  **Examples**: ~/.config/lxc/client.crt

- **key**: PEM Formatted SSL Key.
  
  **Examples**: ~/.config/lxc/client.key

- **verify_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```bash
$ salt '*' lxd.profile_device_delete autostart eth1
```

```
salt.modules.lxd.profile_device_get(name, device_name, remote_addr=None, cert=None, key=None, verify_cert=True)
```

Get a profile device.

- **name**: The name of the profile to get the device from.
- **device_name**: The name of the device to retrieve.
- **remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  
  **Examples**: https://myserver.lan:8443 /var/lib/mysocket.sock

- **cert**: PEM Formatted SSL Certificate.
Examples: `~/.config/lxc/client.crt`
key: PEM Formatted SSL Key.
Examples: `~/.config/lxc/client.key`
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```
$ salt '*' lxd.profile_device_get default eth0
```

```
salt.modules.lxd.profile_device_set(name, device_name, device_type='disk', remote_addr=None, cert=None, key=None, verify_cert=True, **kwargs)
```

Set a profile device.
name: The name of the profile to set the device to.
device_name: The name of the device to set.
remote_addr: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: `https://myserver.lan:8443` `/var/lib/mysocket.sock`
cert: PEM Formatted SSL Certificate.
Examples: `~/.config/lxc/client.crt`
key: PEM Formatted SSL Key.
Examples: `~/.config/lxc/client.key`
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```
$ salt '*' lxd.profile_device_set autostart eth1 nic nictype=bridged parent=lxdb0
```

```
salt.modules.lxd.profile_get(name, remote_addr=None, cert=None, key=None, verify_cert=True, _raw=False)
```

Gets a profile from the LXD
name: The name of the profile to get.
remote_addr: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: `https://myserver.lan:8443` `/var/lib/mysocket.sock`
cert: PEM Formatted SSL Certificate.
Examples: `~/.config/lxc/client.crt`
key: PEM Formatted SSL Key.
Examples: `~/.config/lxc/client.key`
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Examples:

```
$ salt '*' lxd.profile_get autostart
```

```
salt.modules.lxd.profile_list(list_names=False, remote_addr=None, cert=None, key=None, verify_cert=True)
```

Lists all profiles from the LXD.
list_names: Return a list of names instead of full blown dicts.
remote_addr: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: `https://myserver.lan:8443` `/var/lib/mysocket.sock`
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Examples:

```
salt '*' lxd.profile_list true --out=json
salt '*' lxd.profile_list --out=json
```

**salt.modules.lxd.pylxd_client_get**(remote_addr=None, cert=None, key=None, verify_cert=True)
Get an pylxd client, this is not ment to be runned over the CLI.
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
See the requests-docs for the SSL stuff.

**salt.modules.lxd.pylxd_save_object**(obj)
Saves an object (profile/image/container) and translate its excepction on failure
obj : The object to save
This is an internal method, no CLI Example.

**salt.modules.lxd.pylxd_version()**
Returns the actual pylxd version.

CLI Example:

```
salt '*' lxd.pylxd_version
```

**salt.modules.lxd.snapshots_all**(container, remote_addr=None, cert=None, key=None, verify_cert=True)
Get all snapshots for a container
container : The name of the container to get.
remote_addr : An URL to a remote server. The ‘cert’ and ‘key’ fields must also be provided if ‘remote_addr’ is defined.
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Verify the ssl certificate. Default: True
CLI Examples:

```
$ salt '*' lxd.snapshots_all test-container
```

**salt.modules.lxd.snapshots_create**(container, name=None, remote_addr=None, cert=None, key=None, verify_cert=True)
Create a snapshot for a container
container : The name of the container to get.
name : The name of the snapshot.
remote_addr : An URL to a remote server. The 'cert' and 'key' fields must also be provided if 'remote_addr'
is defined.
    Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
    Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
    Examples: ~/.config/lxc/client.key
verify_cert [True] Verify the ssl certificate. Default: True

CLI Examples:

```bash
$ salt '*' lxd.snapshots_create test-container test-snapshot
```

salt.modules.lxd.snapshots_delete

Delete a snapshot for a container

container : The name of the container to get.
name : The name of the snapshot.
remote_addr : An URL to a remote server. The 'cert' and 'key' fields must also be provided if 'remote_addr'
is defined.
    Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
    Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
    Examples: ~/.config/lxc/client.key
verify_cert [True] Verify the ssl certificate. Default: True

CLI Examples:

```bash
$ salt '*' lxd.snapshots_delete test-container test-snapshot
```

salt.modules.lxd.snapshots_get

Get information about snapshot for a container

container : The name of the container to get.
name : The name of the snapshot.
remote_addr : An URL to a remote server. The 'cert' and 'key' fields must also be provided if 'remote_addr'
is defined.
    Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
    Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
    Examples: ~/.config/lxc/client.key
verify_cert [True] Verify the ssl certificate. Default: True

CLI Examples:

```bash
$ salt '*' lxd.snapshots_get test-container test-snapshot
```

salt.modules.lxd.sync_config_devices

Syncs the given config and devices with the object (a profile or a container) returns a changes dict with all
changes made.

obj : The object to sync with / or just test with.
newconfig: The new config to check with the obj.
newdevices: The new devices to check with the obj.
test: Wherever to not change anything and give "Would change" message.

salt.modules.lxd.version()
Returns the actual lxd version.

CLI Example:

```
salt '*' lxd.version
```

21.9.217 salt.modules.mac_assistive module

This module allows you to manage assistive access on macOS minions with 10.9+

New in version 2016.3.0.

```
salt '*' assistive.install /usr/bin/osascript
```

**salt.modules.mac_assistive.enable**(app_id, enabled=True)

   Enable or disable an existing assistive access application.
   - app_id  The bundle ID or command to set assistive access status.
   - enabled  Sets enabled or disabled status. Default is True.

CLI Example:

```
salt '*' assistive.enable /usr/bin/osascript
salt '*' assistive.enable com.smileonmymac.textexpander enabled=False
```

**salt.modules.mac_assistive.enabled**(app_id)

   Check if a bundle ID or command is listed in assistive access and enabled.
   - app_id  The bundle ID or command to retrieve assistive access status.

CLI Example:

```
salt '*' assistive.enabled /usr/bin/osascript
salt '*' assistive.enabled com.smileonmymac.textexpander
```

**salt.modules.mac_assistive.install**(app_id, enable=True)

   Install a bundle ID or command as being allowed to use assistive access.
   - app_id  The bundle ID or command to install for assistive access.
   - enabled  Sets enabled or disabled status. Default is True.

CLI Example:

```
salt '*' assistive.install /usr/bin/osascript
salt '*' assistive.install com.smileonmymac.textexpander
```

**salt.modules.mac_assistive.installed**(app_id)

   Check if a bundle ID or command is listed in assistive access. This will not check to see if it’s enabled.
   - app_id  The bundle ID or command to check installed status.

CLI Example:

```
salt '*' assistive.installed /usr/bin/osascript
salt '*' assistive.installed com.smileonmymac.textexpander
```

**salt.modules.mac_assistive.remove**(app_id)

   Remove a bundle ID or command as being allowed to use assistive access.
   - app_id  The bundle ID or command to remove from assistive access list.

CLI Example:

```
salt '*' assistive.remove /usr/bin/osascript
salt '*' assistive.remove com.smileonmymac.textexpander
```
21.9.218  salt.modules.mac_brew_pkg

Homebrew for macOS

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

salt.modules.mac_brew_pkg.available_version(*names, **kwargs)

This function is an alias of latest_version.

Return the latest version of the named package available for upgrade or installation.

Currently chooses stable versions, falling back to devel if that does not exist.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

salt.modules.mac_brew_pkg.info_installed(*names)

Return the information of the named package(s) installed on the system.

New in version 2016.3.1.

names  The names of the packages for which to return information.

CLI example:

```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
```

salt.modules.mac_brew_pkg.install(name=None, pkgs=None, taps=None, options=None, **kwargs)

Install the passed package(s) with brew install

name  The name of the formula to be installed. Note that this parameter is ignored if "pkgs" is passed.

CLI Example:

```
salt '*' pkg.install <package name>
```

 taps  Unofficial GitHub repos to use when updating and installing formulas.

CLI Example:

```
salt '*' pkg.install <package name> tap='<tap>'
salt '*' pkg.install zlib taps='homebrew/dupes'
salt '*' pkg.install php54 taps=['josegonzalez/php", "homebrew/dupes"]'
```

options  Options to pass to brew. Only applies to initial install. Due to how brew works, modifying chosen options requires a full uninstall followed by a fresh install. Note that if "pkgs" is used, all options will be passed to all packages. Unrecognized options for a package will be silently ignored by brew.

CLI Example:

```
salt '*' pkg.install <package name> tap='<tap>'
salt '*' pkg.install php54 taps=['josegonzalez/php", "homebrew/dupes"]'
--options='["--with-fpm"]'
```

Multiple Package Installation Options:

pkgs  A list of formulas to install. Must be passed as a python list.

CLI Example:
```python
salt '* pkg.install pkgs='"foo","bar"'
```

Returns a dict containing the new package names and versions:

```python
{'<package>': { 'old': '<old-version>',
    'new': '<new-version>'}}
```

CLI Example:

```bash
salt '* pkg.install 'package package package'
```

```python
salt.modules.mac_brew_pkg.latest_version("names", **kwargs)
```

Return the latest version of the named package available for upgrade or installation

Currently chooses stable versions, falling back to devel if that does not exist.

CLI Example:

```bash
salt '* pkg.latest_version <package name>
salt '* pkg.latest_version <package1> <package2> <package3>
```

```python
salt.modules.mac_brew_pkg.list_pkgs(versions_as_list=False, **kwargs)
```

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```bash
salt '* pkg.list_pkgs
```

```python
salt.modules.mac_brew_pkg.list_upgrades(refresh=True, **kwargs)
```

Check whether or not an upgrade is available for all packages

CLI Example:

```bash
salt '* pkg.list_upgrades
```

```python
salt.modules.mac_brew_pkg.refresh_db()
```

Update the homebrew package repository.

CLI Example:

```bash
salt '* pkg.refresh_db
```

```python
salt.modules.mac_brew_pkg.remove(name=None, pkgs=None, **kwargs)
```

Removes packages with brew uninstall.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```bash
salt '* pkg.remove <package name>
salt '* pkg.remove <package1>,<package2>,<package3>
salt '* pkg.remove pkgs='"foo", "bar"'
```
salt.modules.mac_brew_pkg.upgrade(refresh=True)
Upgrade outdated, unpinned brews.
refresh  Fetch the newest version of Homebrew and all formulae from GitHub before installing.
Returns a dictionary containing the changes:

```yaml
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

CLI Example:
```
salt '*' pkg.upgrade
```

salt.modules.mac_brew_pkg.upgrade_available(pkg)
Check whether or not an upgrade is available for a given package
CLI Example:
```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.mac_brew_pkg.version("names", **kwargs)
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.
CLI Example:
```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3>
```

## 21.9.219 salt.modules.macdefaults

Set defaults on Mac OS

salt.modules.macdefaults.delete(domain, key, user=None)
Delete a default from the system
CLI Example:
```
salt '*' macdefaults.delete com.apple.CrashReporter DialogType
salt '*' macdefaults.delete NSGlobalDomain ApplePersistence
```

domain  The name of the domain to delete from
key  The key of the given domain to delete
user  The user to delete the defaults with

salt.modules.macdefaults.read(domain, key, user=None)
Write a default to the system
CLI Example:
```
salt '*' macdefaults.read com.apple.CrashReporter DialogType
salt '*' macdefaults.read NSGlobalDomain ApplePersistence
```

domain  The name of the domain to read from
key  The key of the given domain to read from
user  The user to write the defaults to
salt.modules.macdefaults.write(domain, key, value, type='string', user=None)
Write a default to the system

CLI Example:

```
salt '*' macdefaults.write com.apple.CrashReporter DialogType Server
salt '*' macdefaults.write NSGlobalDomain ApplePersistence True type=bool
```

domain  The name of the domain to write to
key     The key of the given domain to write to
value   The value to write to the given key
type    The type of value to be written, valid types are string, data, int[eger], float, bool[ean], date, array, array-
add, dict, dict-add
user    The user to write the defaults to

21.9.220  salt.modules.mac_desktop module

macOS implementations of various commands in the "desktop" interface

salt.modules.mac_desktop.get_output_volume()
Get the output volume (range 0 to 100)

CLI Example:

```
salt '*' desktop.get_output_volume
```

salt.modules.mac_desktop.lock()
Lock the desktop session

CLI Example:

```
salt '*' desktop.lock
```

salt.modules.mac_desktop.say(words)
Say some words.

words  The words to execute the say command with.

CLI Example:

```
salt '*' desktop.say <word0> <word1> ... <wordN>
```

salt.modules.mac_desktop.screensaver()
Launch the screensaver.

CLI Example:

```
salt '*' desktop.screensaver
```

salt.modules.mac_desktop.set_output_volume(volume)
Set the volume of sound.

volume  The level of volume. Can range from 0 to 100.

CLI Example:

```
salt '*' desktop.set_output_volume <volume>
```
21.9.221  salt.modules.mac_group

Manage groups on Mac OS 10.7+

salt.modules.mac_group.add(name, gid=None, **kwargs)
Add the specified group

CLI Example:

```
salt '*' group.add foo 3456
```

salt.modules.mac_group.adduser(group, name)
Add a user in the group.

CLI Example:

```
salt '*' group.adduser foo bar
```

Verifies if a valid username 'bar' as a member of an existing group 'foo', if not then adds it.

salt.modules.mac_group.chgid(name, gid)
Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

salt.modules.mac_group.delete(name)
Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

salt.modules.mac_group.deluser(group, name)
Remove a user from the group
New in version 2016.3.0.

CLI Example:

```
salt '*' group.deluser foo bar
```

Removes a member user 'bar' from a group 'foo'. If group is not present then returns True.

salt.modules.mac_group.getent(refresh=False)
Return info on all groups

CLI Example:

```
salt '*' group.getent
```

salt.modules.mac_group.info(name)
Return information about a group

CLI Example:

```
salt '*' group.info foo
```

salt.modules.mac_group.members(name, members_list)
Replaces members of the group with a provided list.
New in version 2016.3.0.

CLI Example:

salt '*' group.members foo 'user1,user2,user3,...'
Replaces a membership list for a local group 'foo'.

21.9.222 salt.modules.mac_keychain module

Install certificates into the keychain on Mac OS

New in version 2016.3.0.

salt.modules.mac_keychain.get_default_keychain(\n    user=None, domain='user')

Get the default keychain

user The user to check the default keychain of
domain The domain to use valid values are user|system|common|dynamic, the default is user

CLI Example:

salt '*' keychain.get_default_keychain

salt.modules.mac_keychain.get_friendly_name(cert, password)

Get the friendly name of the given certificate

cert The certificate to install
password The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section

Note: The password given here will show up as plaintext in the returned job info.

CLI Example:

salt '*' keychain.get_friendly_name /tmp/test.p12 test123

salt.modules.mac_keychain.get_hash(name, password=None)

Returns the hash of a certificate in the keychain.

name The name of the certificate (which you can get from keychain.get_friendly_name) or the location of a p12 file.
password The password that is used in the certificate. Only required if your passing a p12 file. Note: This will be outputted to logs

CLI Example:

salt '*' keychain.get_hash /tmp/test.p12 test123

salt.modules.mac_keychain.install(cert, password, keychain='Library/Keychains/System.keychain',
    allow_any=False, keychain_password=None)

Install a certificate

cert The certificate to install
password The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section.

Note: The password given here will show up as plaintext in the job returned info.

keychain The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain
allow_any Allow any application to access the imported certificate without warning

keychain_password If your keychain is likely to be locked pass the password and it will be unlocked before running the import

Note: The password given here will show up as plaintext in the returned job info.

CLI Example:
salt 'salt '*' keychain.install test.p12 test123

```
salt.modules.mac_keychain.list_certs(keychain="/Library/Keychains/System.keychain")
```
List all of the installed certificates

```
salt 'salt '*' keychain.list_certs
```

```
salt.modules.mac_keychain.set_default_keychain(keychain, domain='user', user=None)
```
Set the default keychain

```
salt 'salt '*' keychain.set_keychain /Users/fred/Library/Keychains/login.keychain
```

```
salt.modules.mac_keychain.uninstall(cert_name, keychain="/Library/Keychains/System.keychain");
```
Uninstall a certificate from a keychain

```
salt 'salt '*' keychain.uninstall test.p12 test123
```

```
salt.modules.mac_keychain.unlock_keychain(keychain, password)
```
Unlock the given keychain with the password

```
salt 'salt '*' keychain.unlock_keychain /tmp/test.p12 test123
```

---

21.9.223 salt.modules.macpackage

Install pkg, dmg and .app applications on macOS minions.

```
salt.modules.macpackage.get_mpkg_ids(mpkg)
```
Attempt to get the package IDs from a mounted .mpkg file

```
salt 'salt '*' macpackage.get_mpkg_ids /dev/disk2
```

---

21.9. execution modules
salt.modules.macpackage.get_pkg_id(pkg)
    Attempt to get the package ID from a .pkg file
    Parameters pkg (str) – The location of the pkg file
    Returns List of all of the package IDs
    Return type list
    CLI Example:
    ```
    salt '*' macpackage.get_pkg_id /tmp/test.pkg
    ```

salt.modules.macpackage.install(pkg, target='LocalSystem', store=False, allow_untrusted=False)
    Install a pkg file
    Parameters
    • pkg (str) – The package to install
    • target (str) – The target in which to install the package to
    • store (bool) – Should the package be installed as if it was from the store?
    • allow_untrusted (bool) – Allow the installation of untrusted packages?
    Returns A dictionary containing the results of the installation
    Return type dict
    CLI Example:
    ```
    salt '*' macpackage.install test.pkg
    ```

salt.modules.macpackage.install_app(app, target='/Applications/')
    Install an app file by moving it into the specified Applications directory
    Parameters
    • app (str) – The location of the .app file
    • target (str) – The target in which to install the package to Default is "/Applications/"
    Returns The results of the rsync command
    Return type str
    CLI Example:
    ```
    salt '*' macpackage.install_app /tmp/tmp.app /Applications/
    ```

salt.modules.macpackage.installed_pkgs()
    Return the list of installed packages on the machine
    Returns List of installed packages
    Return type list
    CLI Example:
    ```
    salt '*' macpackage.installed_pkgs
    ```

salt.modules.macpackage.mount(dmg)
    Attempt to mount a dmg file to a temporary location and return the location of the pkg file inside
    Parameters dmg (str) – The location of the dmg file to mount
    Returns Tuple containing the results of the command along with the mount point
    Return type tuple
    CLI Example:
    ```
    salt '*' macpackage.mount /tmp/software.dmg
    ```
salt.modules.macpackage.uninstall_app(app)
    Uninstall an app file by removing it from the Applications directory
    Parameters app (str) – The location of the .app file
    Returns True if successful, otherwise False
    Return type bool
    CLI Example:
    ```
    salt '*' macpackage.uninstall_app /Applications/app.app
    ```

salt.modules.macpackage.unmount(mountpoint)
    Attempt to unmount a dmg file from a temporary location
    Parameters mountpoint (str) – The location of the mount point
    Returns The results of the hdutil detach command
    Return type str
    CLI Example:
    ```
    salt '*' macpackage.unmount /dev/disk2
    ```

21.9.224 salt.modules.mac_pkgutil module

Installer support for macOS.

Installer is the native .pkg/.mpkg package manager for macOS.

salt.modules.mac_pkgutil.forget(package_id)
    New in version 2016.3.0.
    Remove the receipt data about the specified package. Does not remove files.
    
    Warning: DO NOT use this command to fix broken package design
    Parameters package_id (str) – The name of the package to forget
    Returns True if successful, otherwise False
    Return type bool
    CLI Example:
    ```
    salt '*' pkgutil.forget com.apple.pkg.gcc4.2Leo
    ```

salt.modules.mac_pkgutil.install(source, package_id)
    Install a .pkg from an URI or an absolute path.
    Parameters
    - source (str) – The path to a package.
    - package_id (str) – The package ID
    Returns True if successful, otherwise False
    Return type bool
    CLI Example:
    ```
    salt '*' pkgutil.install source=/vagrant/build_essentials.pkg package_id=com.
    →apple.pkg.gcc4.2Leo
    ```

salt.modules.mac_pkgutil.is_installed(package_id)
    Returns whether a given package id is installed.
    Returns True if installed, otherwise False
21.9.225 salt.modules.mac_portspkg

Support for MacPorts under macOS.

This module has some caveats.

1. Updating the database of available ports is quite resource-intensive. However, `refresh=True` is the default for all operations that need an up-to-date copy of available ports. Consider `refresh=False` when you are sure no db update is needed.

2. In some cases MacPorts doesn’t always realize when another copy of itself is running and will gleefully tromp all over the available ports database. This makes MacPorts behave in undefined ways until a fresh complete copy is retrieved.

Because of 1 and 2 it is possible to get the salt-minion into a state where `salt mac-machine pkg/something/` won’t want to return. Use `salt-run jobs.active` on the master to check for potentially long-running calls to `port`.

Finally, ports database updates are always handled with `port selfupdate` as opposed to `port sync`. This makes sense in the MacPorts user community but may confuse experienced Linux admins as Linux package managers don’t upgrade the packaging software when doing a package database update. In other words `salt mac-machine pkg.refresh_db` is more like `apt-get update; apt-get upgrade dpkg apt-get` than simply `apt-get update`.

salt.modules.mac_portspkg.available_version(*names, **kwargs)

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation

Options:
- `refresh` Update ports with `port selfupdate`  

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

salt.modules.mac_portspkg.install(name=None, refresh=False, pkgs=None, **kwargs)

Install the passed package(s) with `port install`

`name` The name of the formula to be installed. Note that this parameter is ignored if "pkgs" is passed.

CLI Example:

```
salt '*' pkg.install <package name>
```
version Specify a version to pkg to install. Ignored if pkgs is specified.

CLI Example:

```
salt '*' pkg.install <package name>
salt '*' pkg.install git-core version='1.8.5.5'
```

variant Specify a variant to pkg to install. Ignored if pkgs is specified.

CLI Example:

```
salt '*' pkg.install <package name>
salt '*' pkg.install git-core version='1.8.5.5' variant='+credential_
→osxkeychain+doc+pcre'
```

Multiple Package Installation Options:

pkgs A list of formulas to install. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo","bar"]'
salt '*' pkg.install pkgs='["foo@1.2","bar"]'
salt '*' pkg.install pkgs='["foo@1.2+ssl","bar@2.3"]'
```

Returns a dict containing the new package names and versions:

```
{
  '<package>': {
    'old': '<old-version>',
    'new': '<new-version>'
  }
}
```

CLI Example:

```
salt '*' pkg.install 'package package package'
```

salt.modules.mac_portspkg.latest_version("names", **kwargs)
Return the latest version of the named package available for upgrade or installation

Options:
refresh Update ports with port selfupdate

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

salt.modules.mac_portspkg.list_pkgs(versions_as_list=False, **kwargs)
List the packages currently installed in a dict:

```
{
  '<package_name>': '<version>'
}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

salt.modules.mac_portspkg.list_upgrades(refresh=True, **kwargs)
Check whether or not an upgrade is available for all packages

Options:
refresh Update ports with port selfupdate

CLI Example:

```
salt '*' pkg.list_upgrades
```
salt.modules.mac_portspkg.refresh_db()
Update ports with port selfupdate

CLI Example:
salt mac pkg.refresh_db

salt.modules.mac_portspkg.remove(name=None, pkgs=None, **kwargs)
Removes packages with port uninstall.
- name: The name of the package to be deleted.
- Multiple Package Options:
  - pkgs: A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.
- New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'

salt.modules.mac_portspkg.upgrade(refresh=True)
Run a full upgrade using MacPorts 'port upgrade outdated'

Options:
- refresh: Update ports with port selfupdate
- Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

CLI Example:
salt '*' pkg.upgrade

salt.modules.mac_portspkg.upgrade_available(pkg, refresh=True)
Check whether or not an upgrade is available for a given package

CLI Example:
salt '*' pkg.upgrade_available <package name>

salt.modules.mac_portspkg.version(*names, **kwargs)
 Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3>

21.9.226 salt.modules.mac_power module

Module for editing power settings on macOS

- New in version 2016.3.0.
salt.modules.mac_power.get_computer_sleep()
    Display the amount of idle time until the computer sleeps.
    Returns A string representing the sleep settings for the computer
    Return type str
    CLI Example:
        ..code-block:: bash
            salt '*' power.get_computer_sleep

salt.modules.mac_power.get_display_sleep()
    Display the amount of idle time until the display sleeps.
    Returns A string representing the sleep settings for the display
    Return type str
    CLI Example:
        ..code-block:: bash
            salt '*' power.get_display_sleep

salt.modules.mac_power.get_harddisk_sleep()
    Display the amount of idle time until the hard disk sleeps.
    Returns A string representing the sleep settings for the hard disk
    Return type str
    CLI Example:
        ..code-block:: bash
            salt '*' power.get_harddisk_sleep

salt.modules.mac_power.get_restart_freeze()
    Displays whether 'restart on freeze' is on or off if supported
    Returns A string value representing the "restart on freeze" settings
    Return type string
    CLI Example:
        salt '*' power.get_restart_freeze

salt.modules.mac_power.get_restart_power_failure()
    Displays whether 'restart on power failure' is on or off if supported
    Returns A string value representing the "restart on power failure" settings
    Return type string
    CLI Example:
        salt '*' power.get_restart_power_failure

salt.modules.mac_power.get_sleep()
    Displays the amount of idle time until the machine sleeps. Settings for Computer, Display, and Hard Disk are displayed.
    Returns A dictionary containing the sleep status for Computer, Display, and Hard Disk
    Return type dict
    CLI Example:
        salt '*' power.get_sleep

salt.modules.mac_power.get_sleep_on_power_button()
    Displays whether 'allow power button to sleep computer' is on or off if supported
    Returns A string value representing the "allow power button to sleep computer" settings
    Return type string
    CLI Example:
salt '*' power.get_sleep_on_power_button

salt.modules.mac_power.get_wake_on_modem()
   Displays whether 'wake on modem' is on or off if supported
   Returns A string value representing the "wake on modem" settings
   Return type str
   CLI Example:
   salt '*' power.get_wake_on_modem

salt.modules.mac_power.get_wake_on_network()
   Displays whether 'wake on network' is on or off if supported
   Returns A string value representing the "wake on network" settings
   Return type string
   CLI Example:
   salt '*' power.get_wake_on_network

salt.modules.mac_power.set_computer_sleep(minutes)
   Set the amount of idle time until the computer sleeps. Pass "Never" of "Off" to never sleep.
   Parameters minutes – Can be an integer between 1 and 180 or "Never" or "Off"
   Ptype int, str
   Returns True if successful, False if not
   Return type bool
   CLI Example:
   salt '*' power.set_computer_sleep 120
   salt '*' power.set_computer_sleep off

salt.modules.mac_power.set_display_sleep(minutes)
   Set the amount of idle time until the display sleeps. Pass "Never" of "Off" to never sleep.
   Parameters minutes – Can be an integer between 1 and 180 or "Never" or "Off"
   Ptype int, str
   Returns True if successful, False if not
   Return type bool
   CLI Example:
   salt '*' power.set_display_sleep 120
   salt '*' power.set_display_sleep off

salt.modules.mac_power.set_harddisk_sleep(minutes)
   Set the amount of idle time until the harddisk sleeps. Pass "Never" of "Off" to never sleep.
   Parameters minutes – Can be an integer between 1 and 180 or "Never" or "Off"
   Ptype int, str
   Returns True if successful, False if not
   Return type bool
   CLI Example:
   salt '*' power.set_harddisk_sleep 120
   salt '*' power.set_harddisk_sleep off

salt.modules.mac_power.set_restart_freeze(enabled)
   Specifies whether the server restarts automatically after a system freeze. This setting doesn’t seem to be editable. The command completes successfully but the setting isn’t actually updated. This is probably a macOS.
   The functions remains in case they ever fix the bug.
Parameters `enabled (bool)` – True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Returns bool

CLI Example:

```
salt '*' power.set_restart_freeze True
```

`salt.modules.mac_power.set_restart_power_failure (enabled)`

Set whether or not the computer will automatically restart after a power failure.

Parameters `enabled (bool)` – True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Returns bool

CLI Example:

```
salt '*' power.set_restart_power_failure True
```

`salt.modules.mac_power.set_sleep (minutes)`

Sets the amount of idle time until the machine sleeps. Sets the same value for Computer, Display, and Hard Disk. Pass "Never" or "Off" for computers that should never sleep.

Parameters `minutes` – Can be an integer between 1 and 180 or "Never" or "Off"

Return type int, str

CLI Example:

```
salt '*' power.set_sleep 120
salt '*' power.set_sleep never
```

`salt.modules.mac_power.set_sleep_on_power_button (enabled)`

Set whether or not the power button can sleep the computer.

Parameters `enabled (bool)` – True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Returns bool

CLI Example:

```
salt '*' power.set_sleep_on_power_button True
```

`salt.modules.mac_power.set_wake_on_modem (enabled)`

Set whether or not the computer will wake from sleep when modem activity is detected.

Parameters `enabled (bool)` – True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Returns bool

CLI Example:

```
salt '*' power.set_wake_on_modem True
```

`salt.modules.mac_power.set_wake_on_network (enabled)`

Set whether or not the computer will wake from sleep when network activity is detected.

Parameters `enabled (bool)` – True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Returns bool
CLI Example:

```
salt '*' power.set_wake_on_network True
```

## 21.9.227 salt.modules.mac_service module

The service module for macOS

New in version 2016.3.0.

This module has support for services in the following locations.

```
/System/Library/LaunchDaemons/
/System/Library/LaunchAgents/
/Library/LaunchDaemons/
/Library/LaunchAgents/

# As of version "2019.2.0" support for user-specific services were added.
/Users/foo/Library/LaunchAgents/
```

**Note:** As of the 2019.2.0 release, if a service is located in a LaunchAgent path and a `runas` user is NOT specified, the current console user will be used to properly interact with the service.

### `salt.modules.mac_service.available(name)`

Check that the given service is available.

- **Parameters**
  - `name (str)` – The name of the service
- **Returns**
  - True if the service is available, otherwise False
- **Return type**
  - bool

CLI Example:

```
salt '*' service.available com.openssh.sshd
```

### `salt.modules.mac_service.disable(name, runas=None)`

Disable a launchd service. Raises an error if the service fails to be disabled.

- **Parameters**
  - `name (str)` – Service label, file name, or full path
  - `runas (str)` – User to run launchctl commands
- **Returns**
  - True if successful or if the service is already disabled
- **Return type**
  - bool

CLI Example:

```
salt '*' service.disable org.cups.cupsd
```

### `salt.modules.mac_service.disabled(name, runas=None, domain='system')`

Check if the specified service is not enabled. This is the opposite of `service.enabled`

- **Parameters**
  - `name (str)` – The name to look up
  - `runas (str)` – User to run launchctl commands
  - `domain (str)` – domain to check for disabled services. Default is system.
- **Returns**
  - True if the specified service is NOT enabled, otherwise False
- **Return type**
  - bool
salt.modules.mac_service.enable(name, runas=None)
Enable a launchd service. Raises an error if the service fails to be enabled.

Parameters
- **name** (str) – Service label, file name, or full path
- **runas** (str) – User to run launchctl commands

Returns
- True if successful or if the service is already enabled

Return type
- bool

CLI Example:
salt '*' service.enable org.cups.cupsd

salt.modules.mac_service.enabled(name, runas=None)
Check if the specified service is enabled.

Parameters
- **name** (str) – The name of the service to look up
- **runas** (str) – User to run launchctl commands

Returns
- True if the specified service enabled, otherwise False

Return type
- bool

CLI Example:
salt '*' service.enabled org.cups.cupsd

salt.modules.mac_service.get_all(runas=None)
Return a list of services that are enabled or available. Can be used to find the name of a service.

Parameters
- **runas** (str) – User to run launchctl commands

Returns
- A list of all the services available or enabled

Return type
- list

CLI Example:
salt '*' service.get_all

salt.modules.mac_service.get_enabled(runas=None)
Return a list of all services that are enabled. Can be used to find the name of a service.

Parameters
- **runas** (str) – User to run launchctl commands

Returns
- A list of all the services enabled on the system

Return type
- list

CLI Example:
salt '*' service.get_enabled

salt.modules.mac_service.launchctl(sub_cmd, *args, **kwargs)
Run a launchctl command and raise an error if it fails.

Parameters
- **sub_cmd** (str) – Sub command supplied to launchctl
- **args** (tuple) – Tuple containing additional arguments to pass to launchctl
- **kwargs** (dict) – Dictionary containing arguments to pass to cmd.run_all
- **return_stdout** (bool) – A keyword argument. If true return the stdout of the launchctl command
Returns True if successful, raise CommandExecutionError if not, or the stdout of the launchctl command if requested

Return type bool, str

CLI Example:
```
salt '*' service.launchctl debug org.cups.cupsd
```

```
salt.modules.mac_service.list_(name=None, runas=None)
```
Run launchctl list and return the output

Parameters
- **name** (str) – The name of the service to list
- **runas** (str) – User to run launchctl commands

Returns If a name is passed returns information about the named service, otherwise returns a list of all services and pids

Return type str

CLI Example:
```
salt '*' service.list
salt '*' service.list org.cups.cupsd
```

```
salt.modules.mac_service.missing(name)
```
The inverse of service.available Check that the given service is not available.

Parameters **name** (str) – The name of the service

Returns True if the service is not available, otherwise False

Return type bool

CLI Example:
```
salt '*' service.missing com.openssh.sshd
```

```
salt.modules.mac_service.restart(name, runas=None)
```
Unloads and reloads a launchd service. Raises an error if the service fails to reload.

Parameters
- **name** (str) – Service label, file name, or full path
- **runas** (str) – User to run launchctl commands

Returns True if successful

Return type bool

CLI Example:
```
salt '*' service.restart org.cups.cupsd
```

```
salt.modules.mac_service.show(name)
```
Show properties of a launchctl service

Parameters **name** (str) – Service label, file name, or full path

Returns The service information if the service is found

Return type dict

CLI Example:
```
salt '*' service.show org.cups.cupsd # service label
salt '*' service.show org.cups.cupsd.plist # file name
salt '*' service.show /System/Library/LaunchDaemons/org.cups.cupsd.plist # full path
```

```
salt.modules.mac_service.start(name, runas=None)
```
Start a launchd service. Raises an error if the service fails to start
Note: To start a service in macOS the service must be enabled first. Use `service.enable` to enable the service.

### Parameters
- **name** *(str)* – Service label, file name, or full path
- **runas** *(str)* – User to run launchctl commands

**Returns** True if successful or if the service is already running

**Return type** *bool*

**CLI Example:**
```
salt '*' service.start org.cups.cupsd
```

### salt.modules.mac_service.status

**Parameters**
- **name** *(str)* – Used to find the service from launchctl. Can be any part of the service name or a regex expression.
- **sig** *(str)* – Find the service with status.pid instead. Note that `name` must still be provided.
- **runas** *(str)* – User to run launchctl commands

**Returns** The PID for the service if it is running, or 'loaded' if the service should not always have a PID, or otherwise an empty string

**Return type** *str*

**CLI Example:**
```
salt '*' service.status cups
```

### salt.modules.mac_service.stop

**Parameters**
- **name** *(str)* – Service label, file name, or full path
- **runas** *(str)* – User to run launchctl commands

**Returns** True if successful or if the service is already stopped

**Return type** *bool*

**CLI Example:**
```
salt '*' service.stop org.cups.cupsd
```

### 21.9.228 salt.modules.mac_shadow module

Manage macOS local directory passwords and policies

New in version 2016.3.0.
Note that it is usually better to apply password policies through the creation of a configuration profile.

```python
salt.modules.mac_shadow.del_password(name)
```
Deletes the account password

- **Parameters**
  - name (str) - The user name of the account
- **Returns**
  - True if successful, otherwise False
- **Return type**
  - bool
- **Raises**
  - CommandExecutionError on user not found or any other unknown error

CLI Example:
```
salt '*' shadow.del_password username
```

```python
salt.modules.mac_shadow.get_account_created(name)
```
Get the date/time the account was created

- **Parameters**
  - name (str) - The username of the account
- **Returns**
  - The date/time the account was created (yyyy-mm-dd hh:mm:ss)
- **Return type**
  - str
- **Raises**
  - CommandExecutionError on user not found or any other unknown error

CLI Example:
```
salt '*' shadow.get_account_created admin
```

```python
salt.modules.mac_shadow.get_change(name)
```
Gets the date on which the password expires

- **Parameters**
  - name (str) - The name of the user account
- **Returns**
  - The date the password will expire
- **Return type**
  - str
- ** Raises**
  - CommandExecutionError on user not found or any other unknown error

CLI Example:
```
salt '*' shadow.get_change username
```

```python
salt.modules.mac_shadow.get_expire(name)
```
Gets the date on which the account expires

- **Parameters**
  - name (str) - The name of the user account
- **Returns**
  - The date the account expires
- **Return type**
  - str
- ** Raises**
  - CommandExecutionError on user not found or any other unknown error

CLI Example:
```
salt '*' shadow.get_expire username
```

```python
salt.modules.mac_shadow.get_last_change(name)
```
Get the date/time the account was changed

- **Parameters**
  - name (str) - The username of the account
- **Returns**
  - The date/time the account was modified (yyyy-mm-dd hh:mm:ss)
- **Return type**
  - str
- ** Raises**
  - CommandExecutionError on user not found or any other unknown error

CLI Example:
```
salt '*' shadow.get_last_change admin
```

```python
salt.modules.mac_shadow.get_login_failed_count(name)
```
Get the number of failed login attempts

- **Parameters**
  - name (str) - The username of the account
- **Returns**
  - The number of failed login attempts
Return type: int

Raises: CommandExecutionError on user not found or any other unknown error

CLI Example:
```bash
salt '*' shadow.get_login_failed_count admin
```

**salt.modules.mac_shadow.get_login_failed_last(name)**

Get the date/time of the last failed login attempt

Parameters:
- name (str) – The username of the account

Returns:
- The date/time of the last failed login attempt on this account (yyyy-mm-dd hh:mm:ss)

Return type: str

Raises: CommandExecutionError on user not found or any other unknown error

CLI Example:
```bash
salt '*' shadow.get_login_failed_last admin
```

**salt.modules.mac_shadow.get_maxdays(name)**

Get the maximum age of the password

Parameters:
- name (str) – The username of the account

Returns:
- The maximum age of the password in days

Return type: int

Raises: CommandExecutionError on user not found or any other unknown error

CLI Example:
```bash
salt '*' shadow.get_maxdays admin 90
```

**salt.modules.mac_shadow.info(name)**

Return information for the specified user

Parameters:
- name (str) – The username

Returns:
- A dictionary containing the user’s shadow information

Return type: dict

CLI Example:
```bash
salt '*' shadow.info admin
```

**salt.modules.mac_shadow.set_change(name, date)**

Sets the date on which the password expires. The user will be required to change their password. Format is mm/dd/yyyy

Parameters:
- name (str) – The name of the user account
- date (date) – The date the password will expire. Must be in mm/dd/yyyy format.

Returns:
- True if successful, otherwise False

Return type: bool

Raise:
- CommandExecutionError on user not found or any other unknown error

CLI Example:
```bash
salt '*' shadow.set_change username 09/21/2016
```

**salt.modules.mac_shadow.set_expire(name, date)**

Sets the date on which the account expires. The user will not be able to login after this date. Date format is mm/dd/yyyy

Parameters:
- name (str) – The name of the user account
... • **date** (*datetime*) – The date the account will expire. Format must be mm/dd/yyyy.
  Returns True if successful, False if not
  Return type bool
  Raises CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.set_expire username 07/23/2015
```

salt.modules.mac_shadow.set_inactdays (*name, days*)
Set the number if inactive days before the account is locked. Not available in macOS

Parameters

- **name** (*str*) – The user name
- **days** (*int*) – The number of days

Returns Will always return False until macOS supports this feature.
Return type bool

CLI Example:

```
salt '*' shadow.set_inactdays admin 90
```

salt.modules.mac_shadow.set_maxdays (*name, days*)
Set the maximum age of the password in days

Parameters

- **name** (*str*) – The username of the account
- **days** (*int*) – The maximum age of the account in days

Returns True if successful, False if not
Return type bool

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.set_maxdays admin 90
```

salt.modules.mac_shadow.set_mindays (*name, days*)
Set the minimum password age in days. Not available in macOS.

Parameters

- **name** (*str*) – The user name
- **days** (*int*) – The number of days

Returns Will always return False until macOS supports this feature.
Return type bool

CLI Example:

```
salt '*' shadow.set_mindays admin 90
```

salt.modules.mac_shadow.set_password (*name, password*)
Set the password for a named user (insecure, the password will be in the process list while the command is running)

Parameters

- **name** (*str*) – The name of the local user, which is assumed to be in the local directory service
- **password** (*str*) – The plaintext password to set

Returns True if successful, otherwise False
Return type bool
Raises CommandExecutionError on user not found or any other unknown error

CLI Example:
```
salt '*' mac_shadow.set_password macuser macpassword
```

```python
salt.modules.mac_shadow.set_warndays(name, days)
```
Set the number of days before the password expires that the user will start to see a warning. Not available in macOS

Parameters
- `name` *(str)* - The user name
- `days` *(int)* - The number of days

Returns Will always return False until macOS supports this feature.

Return type `bool`

CLI Example:
```
salt '*' shadow.set_warndays admin 90
```

**21.9.229 salt.modules.mac_softwareupdate module**

Support for the softwareupdate command on MacOS.

```python
salt.modules.mac_softwareupdate.download(name)
```
Download a named update so that it can be installed later with the `update` or `update_all` functions

Parameters `name` *(str)* - The update to download.

Returns True if successful, otherwise False

Return type `bool`

CLI Example:
```
salt '*' softwareupdate.download <update name>
```

```python
salt.modules.mac_softwareupdate.download_all(recommended=False, restart=True)
```
Download all available updates so that they can be installed later with the `update` or `update_all` functions. It returns a list of updates that are now downloaded.

Parameters
- `recommended` *(bool)* - If set to True, only install the recommended updates. If set to False (default) all updates are installed.
- `restart` *(bool)* - Set this to False if you do not want to install updates that require a restart. Default is True

Returns A list containing all downloaded updates on the system.

Return type `list`

CLI Example:
```
salt '*' softwareupdate.download_all
```

```python
salt.modules.mac_softwareupdate.get_catalog()
```
New in version 2016.3.0.

Get the current catalog being used for update lookups. Will return a url if a custom catalog has been specified. Otherwise the word 'Default' will be returned

Returns The catalog being used for update lookups

Return type `str`

CLI Example:
salt '*' softwareupdates.get_catalog

salt.modules.mac_softwareupdate.ignore(name)
Ignore a specific program update. When an update is ignored the `-` and version number at the end will be omitted, so "SecUpd2014-001-1.0" becomes "SecUpd2014-001". It will be removed automatically if present. An update is successfully ignored when it no longer shows up after list_updates.

Parameters
name – The name of the update to add to the ignore list.

Ptype str

Returns True if successful, False if not

Return type bool

CLI Example:
salt '*' softwareupdate.ignore <update-name>

salt.modules.mac_softwareupdate.list_available(recommended=False, restart=False)
List all available updates.

Parameters
• recommended (bool) – Show only recommended updates.
• restart (bool) – Show only updates that require a restart.

Returns Returns a dictionary containing the updates

Return type dict

CLI Example:
salt '*' softwareupdate.list_available

salt.modules.mac_softwareupdate.list_downloads()
Return a list of all updates that have been downloaded locally.

Returns A list of updates that have been downloaded

Return type list

CLI Example:
salt '*' softwareupdate.list_downloads

salt.modules.mac_softwareupdate.list_ignored()
List all updates that have been ignored. Ignored updates are shown without the `-` and version number at the end, this is how the softwareupdate command works.

Returns The list of ignored updates

Return type list

CLI Example:
salt '*' softwareupdate.list_ignored

salt.modules.mac_softwareupdate.reset_catalog()
New in version 2016.3.0.
Reset the Software Update Catalog to the default.

Returns True if successful, False if not

Return type bool

CLI Example:
salt '*' softwareupdates.reset_catalog

salt.modules.mac_softwareupdate.reset_ignored()
Make sure the ignored updates are not ignored anymore, returns a list of the updates that are no longer ignored.
Returns True if the list was reset, Otherwise False
Return type bool

CLI Example:
salt '*' softwareupdate.reset_ignored

salt.modules.mac_softwareupdate.schedule_enable(enable)
Enable/disable automatic update scheduling.
   Parameters enable - True/On/Yes/1 to turn on automatic updates. False/No/Off/0 to turn off
                      automatic updates. If this value is empty, the current status will be returned.
   Type bool
   Returns True if scheduling is enabled, False if disabled
   Return type bool

CLI Example:
salt '*' softwareupdate.schedule_enable on|off

salt.modules.mac_softwareupdate.schedule_enabled()
Check the status of automatic update scheduling.
   Returns True if scheduling is enabled, False if disabled
   Return type bool

CLI Example:
salt '*' softwareupdate.schedule_enabled

salt.modules.mac_softwareupdate.set_catalog(url)
New in version 2016.3.0.
Set the Software Update Catalog to the URL specified
   Parameters url (str) - The url to the update catalog
   Returns True if successful, False if not
   Return type bool

CLI Example:
salt '*' softwareupdates.set_catalog http://swupd.local:8888/index.sucatalog

salt.modules.mac_softwareupdate.update(name)
Install a named update.
   Parameters name (str) - The name of the of the update to install.
   Returns True if successfully updated, otherwise False
   Return type bool

CLI Example:
salt '*' softwareupdate.update <update-name>

salt.modules.mac_softwareupdate.update_all(recommended=False, restart=True)
Install all available updates. Returns a dictionary containing the name of the update and the status of its
installation.
   Parameters
     - recommended (bool) - If set to True, only install the recommended updates. If set
to False (default) all updates are installed.
     - restart (bool) - Set this to False if you do not want to install updates that require
a restart. Default is True
   Returns A dictionary containing the updates that were installed and the status of its installation.
If no updates were installed an empty dictionary is returned.
Return type  dict

CLI Example:
salt '*' softwareupdate.update_all

salt.modules.mac_softwareupdate.update_available(name)
Check whether or not an update is available with a given name.

Parameters
   name (str) – The name of the update to look for

Returns
   True if available, False if not

Return type  bool

CLI Example:
salt '*' softwareupdate.update_available <update-name>
salt '*' softwareupdate.update_available "<update with whitespace>"

21.9.230  salt.modules.mac_sysctl module

Module for viewing and modifying sysctl parameters

salt.modules.mac_sysctl.assign(name, value)
Assign a single sysctl parameter for this minion

Parameters
   name (str) – The name of the sysctl value to edit.
   value (str) – The sysctl value to apply.

CLI Example:
salt '*' sysctl.assign net.inet.icmp.icmplim 50

salt.modules.mac_sysctl.get(name)
Return a single sysctl parameter for this minion

Parameters
   name (str) – The name of the sysctl value to display.

CLI Example:
salt '*' sysctl.get hw.physmem

salt.modules.mac_sysctl.persist(name, value, config='/etc/sysctl.conf', apply_change=False)
Assign and persist a simple sysctl parameter for this minion.

Parameters
   name (str) – The name of the sysctl value to edit.
   value (str) – The sysctl value to apply.
   config (str) – The location of the sysctl configuration file.
   apply_change (bool) – Default is False; Default behavior only creates or edits the sysctl.conf file. If apply is set to True, the changes are applied to the system.

CLI Example:
salt '*' sysctl.persist net.inet.icmp.icmplim 50
salt '*' sysctl.persist coretemp_load NO config=/etc/sysctl.conf

salt.modules.mac_sysctl.show(config_file=False)
Return a list of sysctl parameters for this minion

CLI Example:
salt '*' sysctl.show
21.9.231 salt.modules.mac_system module

System module for sleeping, restarting, and shutting down the system on Mac OS X

New in version 2016.3.0.

**Warning:** Using this module will enable `atrun` on the system if it is disabled.

salt.modules.mac_system.get_boot_arch()
Get the kernel architecture setting from `com.apple.Boot.plist`

**Returns** A string value representing the boot architecture setting

**Return type** str

CLI Example:
```
salt '*' system.get_boot_arch
```

salt.modules.mac_system.get_computer_name()
Gets the computer name

**Returns** The computer name

**Return type** str

CLI Example:
```
salt '*' system.get_computer_name
```

salt.modules.mac_system.get_disable_keyboard_on_lock()
Get whether or not the keyboard should be disabled when the X Serve enclosure lock is engaged.

**Returns** True if disable keyboard on lock is on, False if off

**Return type** bool

CLI Example:
```
.. code-block:: bash
    salt '*' system.get_disable_keyboard_on_lock
```

salt.modules.mac_system.get_remote_events()
Displays whether remote apple events are on or off.

**Returns** True if remote apple events are on, False if off

**Return type** bool

CLI Example:
```
salt '*' system.get_remote_events
```

salt.modules.mac_system.get_remote_login()
Displays whether remote login (SSH) is on or off.

**Returns** True if remote login is on, False if off

**Return type** bool

CLI Example:
```
salt '*' system.get_remote_login
```

salt.modules.mac_system.get_restart_delay()
Get the number of seconds after which the computer will start up after a power failure.

**Returns** A string value representing the number of seconds the system will delay restart after power loss

**Return type** str

CLI Example:
salt '*' system.get_restart_delay

salt.modules.mac_system.get_startup_disk()
Displays the current startup disk
Returns The current startup disk
Return type str
CLI Example:
salt '*' system.get_startup_disk

salt.modules.mac_system.get_subnet_name()
Gets the local subnet name
Returns The local subnet name
Return type str
CLI Example:
salt '*' system.get_subnet_name

salt.modules.mac_system.halt(at_time=None)
Halt a running system
Parameters at_time (str) – Any valid at expression. For example, some valid at expressions could be:
    • noon
    • midnight
    • fri
    • 9:00 AM
    • 2:30 PM tomorrow
    • now + 10 minutes

Note: If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: "14:00"

CLI Example:
salt '*' system.halt
salt '*' system.halt 'now + 10 minutes'

salt.modules.mac_system.list_startup_disks()
List all valid startup disks on the system.
Returns A list of valid startup disks
Return type list
CLI Example:
salt '*' system.list_startup_disks

salt.modules.mac_system.restart(at_time=None)
Restart the system
Parameters at_time (str) – Any valid at expression. For example, some valid at expressions could be:
    • noon
- midnight
- fri
- 9:00 AM
- 2:30 PM tomorrow
- now + 10 minutes

**Note:** If you pass a time only, with no ’AM/PM’ designation, you have to double quote the parameter on the command line. For example: ”"14:00”"

CLI Example:
```
salt '*' system.restart
salt '*' system.restart '12:00 PM fri'
```

salt.modules.mac_system.set_boot_arch(`arch='default'`)  
Set the kernel to boot in 32 or 64 bit mode on next boot.

**Note:** When this function fails with the error changes to kernel architecture failed to save!, then the boot arch is not updated. This is either an Apple bug, not available on the test system, or a result of system files being locked down in macOS (SIP Protection).

**Parameters**  
`arch (str) – A string representing the desired architecture. If no value is passed, default is assumed. Valid values include:**
- i386
- x86_64
- default

**Returns**  
True if successful, False if not

**Return type**  
bool

CLI Example:
```
salt '*' system.set_boot_arch i386
```

salt.modules.mac_system.set_computer_name(`name`)  
Set the computer name

**Parameters**  
`name (str) – The new computer name

**Returns**  
True if successful, False if not

**Return type**  
bool

CLI Example:
```
salt '*' system.set_computer_name "Mike's Mac"
```

salt.modules.mac_system.set_disable_keyboard_on_lock(`enable`)  
Get whether or not the keyboard should be disabled when the X Serve enclosure lock is engaged.

**Parameters**  
`enable (bool) – True to enable, False to disable. ”On” and ”Off” are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns**  
True if successful, False if not

**Return type**  
bool

CLI Example:
salt 'sys' system.set_disable_keyboard_on_lock False

```
salt.modules.mac_system.set_remote_events(enable)
Set whether the server responds to events sent by other computers (such as AppleScripts).
   Parameters enable (bool) – True to enable, False to disable. "On" and "Off" are also acceptable
   values. Additionally you can pass 1 and 0 to represent True and False respectively
   Returns True if successful, False if not
   Return type bool
```
CLI Example:
salt 'sys' system.set_remote_events On

```
salt.modules.mac_system.set_remote_login(enable)
Set the remote login (SSH) to either on or off.
   Parameters enable (bool) – True to enable, False to disable. "On" and "Off" are also acceptable
   values. Additionally you can pass 1 and 0 to represent True and False respectively
   Returns True if successful, False if not
   Return type bool
```
CLI Example:
salt 'sys' system.set_remote_login True

```
salt.modules.mac_system.set_restart_delay(seconds)
Set the number of seconds after which the computer will start up after a power failure.

   Warning: This command fails with the following error:
   Error, IOServiceOpen returned 0x10000003
   The setting is not updated. This is an apple bug. It seems like it may only work on certain versions of Mac
   Server X. This article explains the issue in more detail, though it is quite old.
   Parameters seconds (int) – The number of seconds. Must be a multiple of 30
   Returns True if successful, False if not
   Return type bool
```
CLI Example:
salt 'sys' system.set_restart_delay 180

```
salt.modules.mac_system.set_startup_disk(path)
Set the current startup disk to the indicated path. Use system.list_startup_disks to find valid startup
   disks on the system.
   Parameters path (str) – The valid startup disk path
   Returns True if successful, False if not
   Return type bool
```
CLI Example:
salt 'sys' system.set_startup_disk /System/Library/CoreServices

```
salt.modules.mac_system.set_subnet_name(name)
Set the local subnet name
   Parameters name (str) – The new local subnet name
```
**Returns**  True if successful, False if not

**Return type**  bool

CLI Example:

```text
The following will be set as 'Mikes-Mac'
salt '*' system.set_subnet_name "Mike's Mac"
```

```python
salt.modules.mac_system.shutdown(at_time=None)
```

Shutdown the system

**Parameters**  `at_time (str)` – Any valid `at` expression. For example, some valid at expressions could be:

- noon
- midnight
- fri
- 9:00 AM
- 2:30 PM tomorrow
- now + 10 minutes

**Note:** If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: "14:00"

CLI Example:

```bash
salt '*' system.shutdown
salt '*' system.shutdown 'now + 1 hour'
```

```python
salt.modules.mac_system.sleep(at_time=None)
```

Sleep the system. If a user is active on the system it will likely fail to sleep.

**Parameters**  `at_time (str)` – Any valid `at` expression. For example, some valid at expressions could be:

- noon
- midnight
- fri
- 9:00 AM
- 2:30 PM tomorrow
- now + 10 minutes

**Note:** If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: "14:00"

CLI Example:

```bash
salt '*' system.sleep
salt '*' system.sleep '10:00 PM'
```
21.9.232 salt.modules.mac_timezone module

Module for editing date/time settings on macOS

New in version 2016.3.0.

salt.modules.mac_timezone.get_date()

Displays the current date

Returns the system date

Return type str

CLI Example:

salt '*' timezone.get_date

salt.modules.mac_timezone.get_hwclock()

Get current hardware clock setting (UTC or localtime)

CLI Example:

salt '*' timezone.get_hwclock

salt.modules.mac_timezone.get_offset()

Displays the current time zone offset

Returns The current time zone offset

Return type str

CLI Example:

salt '*' timezone.get_offset

salt.modules.mac_timezone.get_time()

Get the current system time.

Returns The current time in 24 hour format

Return type str

CLI Example:

salt '*' timezone.get_time

salt.modules.mac_timezone.get_time_server()

Display the currently set network time server.

Returns the network time server

Return type str

CLI Example:

salt '*' timezone.get_time_server

salt.modules.mac_timezone.get_using_network_time()

Display whether network time is on or off

Returns True if network time is on, False if off

Return type bool

CLI Example:

salt '*' timezone.get_using_network_time

salt.modules.mac_timezone.get_zone()

Displays the current time zone

Returns The current time zone

Return type str
CLI Example:

```
salt '*' timezone.get_zone
```

```python
salt.modules.mac_timezone.get_zonecode()
```
Displays the current time zone abbreviated code

- **Returns**: The current time zone code
- **Return type**: str

CLI Example:

```
salt '*' timezone.get_zonecode
```

```python
salt.modules.mac_timezone.list_zones()
```
Displays a list of available time zones. Use this list when setting a time zone using `timezone.set_zone`

- **Returns**: a list of time zones
- **Return type**: list

CLI Example:

```
salt '*' timezone.list_zones
```

```python
salt.modules.mac_timezone.set_date(date)
```
Set the current month, day, and year

- **Parameters**
  - `date` (**str**): The date to set. Valid date formats are:
    - `%m:%d:%y`
    - `%m:%d:%Y`
    - `%m/%d/%y`
    - `%m/%d/%Y`

- **Returns**: True if successful, False if not
- **Return type**: bool

- **Raises**: SaltInvocationError on Invalid Date format
- **Raises**: CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_date 1/13/2016
```

```python
salt.modules.mac_timezone.set_hwclock(clock)
```
Sets the hardware clock to be either UTC or localtime

CLI Example:

```
salt '*' timezone.set_hwclock UTC
```

```python
salt.modules.mac_timezone.set_time(time)
```
Sets the current time. Must be in 24 hour format.

- **Parameters**
  - `time` (**str**): The time to set in 24 hour format. The value must be double quoted. 
    - *ie: "17:46"

- **Returns**: True if successful, False if not
- **Return type**: bool

- **Raises**: SaltInvocationError on Invalid Time format
- **Raises**: CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_time "17:34"
```

21.9. execution modules
Salt Documentation, Release 3000.2

salt.modules.mac_timezone.set_time_server(time_server='time.apple.com')

Designates a network time server. Enter the IP address or DNS name for the network time server.

Parameters time_server – IP or DNS name of the network time server. If nothing is passed
the time server will be set to the macOS default of 'time.apple.com'

Type str
Returns True if successful, False if not
Return type bool
Raises CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_time_server time.acme.com
```

salt.modules.mac_timezone.set_using_network_time(enable)

Set whether network time is on or off.

Parameters enable – True to enable, False to disable. Can also use 'on' or 'off'

Type str bool
Returns True if successful, False if not
Return type bool
Raises CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_using_network_time True
```

salt.modules.mac_timezone.set_zone(time_zone)

Set the local time zone. Use timezone.list_zones to list valid time_zone arguments

Parameters time_zone (str) – The time zone to apply

Returns True if successful, False if not
Return type bool
Raises SaltInvocationError on Invalid Timezone
Raises CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_zone America/Denver
```

salt.modules.mac_timezone.zone_compare(time_zone)

Compares the given timezone name with the system timezone name.

Returns True if they are the same, False if not
Return type bool

CLI Example:

```
salt '*' timezone.zone_compare America/Boise
```

21.9.233 salt.modules.mac_user

Manage users on Mac OS 10.7+

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to 'user.info' is not available), see here.

salt.modules.mac_user.add(name, uid=None, gid=None, groups=None, home=None, shell=None, full-
name=None, createhome=True, **kwargs)

Add a user to the minion

CLI Example:
salt '*' user.add name <uid> <gid> <groups> <home> <shell>

salt.modules.mac_user.chfullname(name, fullname)
    Change the user’s Full Name
    CLI Example:
    ```
    salt '*' user.chfullname foo 'Foo Bar'
    ```

salt.modules.mac_user.chgid(name, gid)
    Change the default group of the user
    CLI Example:
    ```
    salt '*' user.chgid foo 4376
    ```

salt.modules.mac_user.chgroups(name, groups, append=False)
    Change the groups to which the user belongs. Note that the user’s primary group does not have to be one of
    the groups passed, membership in the user’s primary group is automatically assumed.
    groups Groups to which the user should belong, can be passed either as a python list or a comma-separated
    string
    append Instead of removing user from groups not included in the groups parameter, just add user to any
    groups for which they are not members
    CLI Example:
    ```
    salt '*' user.chgroups foo wheel,root
    ```

salt.modules.mac_user.chhome(name, home, **kwargs)
    Change the home directory of the user
    CLI Example:
    ```
    salt '*' user.chhome foo /Users/foo
    ```

salt.modules.mac_user.chshell(name, shell)
    Change the default shell of the user
    CLI Example:
    ```
    salt '*' user.chshell foo /bin/zsh
    ```

salt.modules.mac_user.chuid(name, uid)
    Change the uid for a named user
    CLI Example:
    ```
    salt '*' user.chuid foo 4376
    ```

salt.modules.mac_user.delete(name, remove=False, force=False)
    Remove a user from the minion
    CLI Example:
    ```
    salt '*' user.delete name remove=True force=True
    ```

salt.modules.mac_user.disable_auto_login()
    New in version 2016.3.0.
    Disables auto login on the machine
Returns True if successful, otherwise False
Return type bool

CLI Example:

```bash
salt '*' user.disable_auto_login
```

salt.modules.mac_user.enable_auto_login(name, password)
New in version 2016.3.0.
Configures the machine to auto login with the specified user

Parameters
- **name** (str) – The user account use for auto login
- **password** (str) – The password to user for auto login

New in version 2017.7.3.

Returns True if successful, otherwise False
Return type bool

CLI Example:

```bash
salt '*' user.enable_auto_login stevej
```

salt.modules.mac_user.get_auto_login()
New in version 2016.3.0.

Gets the current setting for Auto Login

Returns If enabled, returns the user name, otherwise returns False
Return type str, bool

CLI Example:

```bash
salt '*' user.get_auto_login
```

salt.modules.mac_user.getent(refresh=False)
Return the list of all info for all users

CLI Example:

```bash
salt '*' user.getent
```

salt.modules.mac_user.info(name)
Return user information

CLI Example:

```bash
salt '*' user.info root
```

salt.modules.mac_user.list_groups(name)
Return a list of groups the named user belongs to.

name
The name of the user for which to list groups. Starting in Salt 2016.11.0, all groups for the user, including groups beginning with an underscore will be listed.

Changed in version 2016.11.0.

CLI Example:

```bash
salt '*' user.list_groups foo
```
salt.modules.mac_user.list_users()
    Return a list of all users
    CLI Example:
    ```
    salt '*' user.list_users
    ```

salt.modules.mac_user.primary_group(name)
    Return the primary group of the named user
    New in version 2016.3.0.
    CLI Example:
    ```
    salt '*' user.primary_group saltadmin
    ```

salt.modules.mac_user.rename(name, new_name)
    Change the username for a named user
    CLI Example:
    ```
    salt '*' user.rename name new_name
    ```

21.9.234  salt.modules.mac_xattr module

This module allows you to manage extended attributes on files or directories

```
salt '*' xattr.list /path/to/file
```

salt.modules.mac_xattr.clear(path)
    Causes the all attributes on the file/directory to be removed
    Parameters path (str) - The file(s) to get attributes from
    Returns True if successful, otherwise False
    Raises CommandExecutionError on file not found or any other unknown error
    CLI Example:
    ```
    salt '*' xattr.delete /path/to/file "com.test.attr"
    ```

salt.modules.mac_xattr.delete(path, attribute)
    Removes the given attribute from the file
    Parameters
    - path (str) - The file(s) to get attributes from
    - attribute (str) - The attribute name to be deleted from the file/directory
    Returns True if successful, otherwise False
    Return type bool
    Raises CommandExecutionError on file not found, attribute not found, and any other unknown error
    CLI Example:
    ```
    salt '*' xattr.delete /path/to/file "com.test.attr"
    ```

salt.modules.mac_xattr.list_(path, **kwargs)
    List all of the extended attributes on the given file/directory
    Parameters
    - path (str) - The file(s) to get attributes from
salt documentation, release 3000.2

- **hex** *(bool)* – Return the values with forced hexadecimal values

Returns A dictionary containing extended attributes and values for the given file

Return type **dict**

Raises CommandExecutionError on file not found or any other unknown error

CLI Example:

```
salt '*' xattr.list /path/to/file
salt '*' xattr.list /path/to/file hex=True
```

salt.modules.mac_xattr.read *(path, attribute, **kwargs)*

Read the given attributes on the given file/directory

Parameters

- **path** *(str)* – The file to get attributes from
- **attribute** *(str)* – The attribute to read
- **hex** *(bool)* – Return the values with forced hexadecimal values

Returns A string containing the value of the named attribute

Return type **str**

Raises CommandExecutionError on file not found, attribute not found, and any other unknown error

CLI Example:

```
salt '*' xattr.read /path/to/file com.test.attr
salt '*' xattr.read /path/to/file com.test.attr hex=True
```

salt.modules.mac_xattr.write *(path, attribute, value, **kwargs)*

Causes the given attribute name to be assigned the given value

Parameters

- **path** *(str)* – The file(s) to get attributes from
- **attribute** *(str)* – The attribute name to be written to the file/directory
- **value** *(str)* – The value to assign to the given attribute
- **hex** *(bool)* – Set the values with forced hexadecimal values

Returns True if successful, otherwise False

Return type **bool**

Raises CommandExecutionError on file not found or any other unknown error

CLI Example:

```
salt '*' xattr.write /path/to/file "com.test.attr" "value"
```

21.9.235 salt.modules.makeconf

Support for modifying make.conf under Gentoo

salt.modules.makeconf.append_cflags *(value)*

Add to or create a new CFLAGS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
               'new': '<new-value>'}}
```

CLI Example:
salt '*' makeconf.append_cflags '-pipe'

salt.modules.makeconf.append_cxxflags(value)
Add to or create a new CXXFLAGS in the make.conf
Return a dict containing the new value for variable:

```
{ '<variable>': { 'old': '<old-value>', 'new': '<new-value>' } }
```

CLI Example:
salt '*' makeconf.append_cxxflags '-pipe'

salt.modules.makeconf.append_emerge_default_opts(value)
Add to or create a new EMERGE_DEFAULT_OPTS in the make.conf
Return a dict containing the new value for variable:

```
{ '<variable>': { 'old': '<old-value>', 'new': '<new-value>' } }
```

CLI Example:
salt '*' makeconf.append_emerge_default_opts '--jobs'

salt.modules.makeconf.append_features(value)
Add to or create a new FEATURES in the make.conf
Return a dict containing the new value for variable:

```
{ '<variable>': { 'old': '<old-value>', 'new': '<new-value>' } }
```

CLI Example:
salt '*' makeconf.append_features 'webrsync-gpg'

salt.modules.makeconf.append_gentoo_mirrors(value)
Add to or create a new GENTOO_MIRRORS in the make.conf
Return a dict containing the new value for variable:

```
{ '<variable>': { 'old': '<old-value>', 'new': '<new-value>' } }
```

CLI Example:
salt '*' makeconf.append_gentoo_mirrors 'http://distfiles.gentoo.org'

salt.modules.makeconf.append_makeopts(value)
Add to or create a new MAKEOPTS in the make.conf
Return a dict containing the new value for variable:

```
{ '<variable>': { 'old': '<old-value>', 'new': '<new-value>' } }
```

CLI Example:
salt '§' makeconf.append_makeopts '-j3'

salt.modules.makeconf.append_var(var, value)
Add to or create a new variable in the make.conf

Return a dict containing the new value for variable:

```python
{'<variable>': {'old': '<old-value>',
               'new': '<new-value>'}}
```

CLI Example:

salt '§' makeconf.append_var 'LINGUAS' 'en'

salt.modules.makeconf.cflags_contains(value)
Verify if CFLAGS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

salt '§' makeconf.cflags_contains '-pipe'

salt.modules.makeconf.chost_contains(value)
Verify if CHOST variable contains a value in make.conf

Return True if value is set for var

CLI Example:

salt '§' makeconf.chost_contains 'x86_64-pc-linux-gnu'

salt.modules.makeconf.cxxflags_contains(value)
Verify if CXXFLAGS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

salt '§' makeconf.cxxflags_contains '-pipe'

salt.modules.makeconf.emerge_default_opts_contains(value)
Verify if EMERGE_DEFAULT_OPTS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

salt '§' makeconf.emerge_default_opts_contains '--jobs'

salt.modules.makeconf.features_contains(value)
Verify if FEATURES variable contains a value in make.conf

Return True if value is set for var

CLI Example:

salt '§' makeconf.features_contains 'webrsync-gpg'
salt.modules.makeconf.gentoo_mirrors_contains(value)
   Verify if GENTOO_MIRRORS variable contains a value in make.conf
   Return True if value is set for var
   CLI Example:
   salt '*' makeconf.gentoo_mirrors_contains 'http://distfiles.gentoo.org'

salt.modules.makeconf.get_cflags()
   Get the value of CFLAGS variable in the make.conf
   Return the value of the variable or None if the variable is not in the make.conf
   CLI Example:
   salt '*' makeconf.get_cflags

salt.modules.makeconf.get_chost()
   Get the value of CHOST variable in the make.conf
   Return the value of the variable or None if the variable is not in the make.conf
   CLI Example:
   salt '*' makeconf.get_chost

salt.modules.makeconf.get_cxxflags()
   Get the value of CXXFLAGS variable in the make.conf
   Return the value of the variable or None if the variable is not in the make.conf
   CLI Example:
   salt '*' makeconf.get_cxxflags

salt.modules.makeconf.get_emerge_default_opts()
   Get the value of EMERGE_DEFAULT_OPTS variable in the make.conf
   Return the value of the variable or None if the variable is not in the make.conf
   CLI Example:
   salt '*' makeconf.get_emerge_default_opts

salt.modules.makeconf.get_features()
   Get the value of FEATURES variable in the make.conf
   Return the value of the variable or None if the variable is not in the make.conf
   CLI Example:
   salt '*' makeconf.get_features

salt.modules.makeconf.get_gentoo_mirrors()
   Get the value of GENTOO_MIRRORS variable in the make.conf
   Return the value of the variable or None if the variable is not in the make.conf
   CLI Example:
   salt '*' makeconf.get_gentoo_mirrors
salt.modules.makeconf.get_makeopts()
Get the value of MAKEOPTS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:
```bash
salt '*' makeconf.get_makeopts
```

salt.modules.makeconf.get_sync()
Get the value of SYNC variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:
```bash
salt '*' makeconf.get_sync
```

salt.modules.makeconf.get_var(var)
Get the value of a variable in make.conf

Return the value of the variable or None if the variable is not in make.conf

CLI Example:
```bash
salt '*' makeconf.get_var 'LINGUAS'
```

salt.modules.makeconf.makeopts_contains(value)
Verify if MAKEOPTS variable contains a value in make.conf

Return True if value is set for var

CLI Example:
```bash
salt '*' makeconf.makeopts_contains '-j3'
```

salt.modules.makeconf.remove_var(var)
Remove a variable from the make.conf

Return a dict containing the new value for the variable:

```json
{"<variable>":{"old": "<old-value>",
              "new": "<new-value>"}}
```

CLI Example:
```bash
salt '*' makeconf.remove_var 'LINGUAS'
```

salt.modules.makeconf.set_cflags(value)
Set the CFLAGS variable

Return a dict containing the new value for variable:

```json
{"<variable>":{"old": "<old-value>",
              "new": "<new-value>"}}
```

CLI Example:
```bash
salt '*' makeconf.set_cflags '-march=native -O2 -pipe'
```
salt.modules.makeconf.set_chost(value)
Set the CHOST variable
Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
               'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_chost 'x86_64-pc-linux-gnu'
```

salt.modules.makeconf.set_cxxflags(value)
Set the CXXFLAGS variable
Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
               'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_cxxflags '-march=native -O2 -pipe'
```

salt.modules.makeconf.set_emerge_default_opts(value)
Set the EMERGE_DEFAULT_OPTS variable
Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
               'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_emerge_default_opts '--jobs'
```

salt.modules.makeconf.set_gentoo_mirrors(value)
Set the GENTOO_MIRRORS variable
Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
               'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_gentoo_mirrors 'http://distfiles.gentoo.org'
```

salt.modules.makeconf.set_makeopts(value)
Set the MAKEOPTS variable
Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
               'new': '<new-value>'}}
```

CLI Example:
salt '*' makeconf.set_makeopts '-j3'

salt.modules.makeconf.set_sync(value)
Set the SYNC variable
Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
              'new': '<new-value>'}}
```

CLI Example:
salt '*' makeconf.set_sync 'rsync://rsync.namerica.gentoo.org/gentoo-portage'

salt.modules.makeconf.set_var(var, value)
Set a variable in the make.conf
Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
              'new': '<new-value>'}}
```

CLI Example:
salt '*' makeconf.set_var 'LINGUAS' 'en'

salt.modules.makeconf.sync_contains(value)
Verify if SYNC variable contains a value in make.conf
Return True if value is set for var
CLI Example:
salt '*' makeconf.sync_contains 'rsync://rsync.namerica.gentoo.org/gentoo-portage'

salt.modules.makeconf.trim_cflags(value)
Remove a value from CFLAGS variable in the make.conf
Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
              'new': '<new-value>'}}
```

CLI Example:
salt '*' makeconf.trim_cflags '-pipe'

salt.modules.makeconf.trim_cxxflags(value)
Remove a value from CXXFLAGS variable in the make.conf
Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
              'new': '<new-value>'}}
```

CLI Example:
salt '*' makeconf.trim_cxxflags '-pipe'
Salt Documentation, Release 3000.2

salt.modules.makeconf.trim_emerge_default_opts(value)
Remove a value from EMERGE_DEFAULT_OPTS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
               'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_emerge_default_opts '--jobs'
```

salt.modules.makeconf.trim_features(value)
Remove a value from FEATURES variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
               'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_features 'webrsync-gpg'
```

salt.modules.makeconf.trim_gentoo_mirrors(value)
Remove a value from GENTOO_MIRRORS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
               'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_gentoo_mirrors 'http://distfiles.gentoo.org'
```

salt.modules.makeconf.trim_makeopts(value)
Remove a value from MAKEOPTS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
               'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_makeopts '-j3'
```

salt.modules.makeconf.trim_var(var, value)
Remove a value from a variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
               'new': '<new-value>'}}
```

CLI Example:
21.9.236 salt.modules.mandrill

Mandrill

Send out emails using the Mandrill API.

In the minion configuration file, the following block is required:

```
mandrill:
  key: <API_KEY>
```

New in version 2018.3.0.

```
salt.modules.mandrill.send(message, asynchronous=False, ip_pool=None, send_at=None, api_url=None, api_version=None, api_key=None, **kwargs)
```

Send out the email using the details from the `message` argument.

- `message`: The information on the message to send. This argument must be sent as dictionary with at fields as specified in the Mandrill API documentation.

- `asynchronous`: `False` Enable a background sending mode that is optimized for bulk sending. In asynchronous mode, messages/send will immediately return a status of "queued" for every recipient. To handle rejections when sending in asynchronous mode, set up a webhook for the 'reject' event. Defaults to false for messages with no more than 10 recipients; messages with more than 10 recipients are always sent asynchronously, regardless of the value of asynchronous.

- `ip_pool`: The name of the dedicated ip pool that should be used to send the message. If you do not have any dedicated IPs, this parameter has no effect. If you specify a pool that does not exist, your default pool will be used instead.

- `send_at`: When this message should be sent as a UTC timestamp in `YYYY-MM-DD HH:MM:SS` format. If you specify a time in the past, the message will be sent immediately. An additional fee applies for scheduled email, and this feature is only available to accounts with a positive balance.

**Note:** For further details please consult the API documentation.

CLI Example:

```
$ salt '*' mandrill.send message="{'subject': 'Hi', 'from_email': 'test@example.com', 'to': [{'email': 'recv@example.com', 'type': 'to'}]}"
```

**message** structure example (as YAML for readability):

```
message:
  text: |
    This is the body of the email.
    This is the second line.
```

(continues on next page)
subject: Email subject
from_name: Test At Example Dot Com
from_email: test@example.com

to:
  - email: recv@example.com
type: to
  name: Recv At Example Dot Com
- email: cc@example.com
type: cc
  name: CC At Example Dot Com
important: true
track_clicks: true
track_opens: true
attachments:
  - type: text/x-yaml
    name: yaml_file.yml
    content: aV9hbV9zdXBlcl9jdXJpb3VzOiB0cnVl

Output example:

minion:
  ---------
  comment:
  out:
  |   ---------
  |   _id:
  |   c4353540a3c123eca112bbdd704ab6

  |   reject_reason:
  |     None
  |   status:
  |     sent
result:
  True

21.9.237 salt.modules.marathon module

Module providing a simple management interface to a marathon cluster.

Currently this only works when run through a proxy minion.

New in version 2015.8.2.

salt.modules.marathon.app(id)
Return the current server configuration for the specified app.

CLI Example:

salt marathon-minion-id marathon.app my-app

salt.modules.marathon.apps()
Return a list of the currently installed app ids.

CLI Example:
salt marathon-minion-id marathon.apps

salt.modules.marathon.has_app(id)
  Return whether the given app id is currently configured.
  CLI Example:
  `salt marathon-minion-id marathon.has_app my-app`

salt.modules.marathon.info()
  Return configuration and status information about the marathon instance.
  CLI Example:
  `salt marathon-minion-id marathon.info`

salt.modules.marathon.restart_app(id, restart=False, force=True)
  Restart the current server configuration for the specified app.
  Parameters
  • restart - Restart the app
  • force - Override the current deployment
  CLI Example:
  `salt marathon-minion-id marathon.restart_app my-app true true`
  By default, this will only check if the app exists in marathon. It does not check if there are any tasks associated with it or if the app is suspended.
  The restart option needs to be set to True to actually issue a rolling restart to marathon.
  The force option tells marathon to ignore the current app deployment if there is one.

salt.modules.marathon.rm_app(id)
  Remove the specified app from the server.
  CLI Example:
  `salt marathon-minion-id marathon.rm_app my-app`

salt.modules.marathon.update_app(id, config)
  Update the specified app with the given configuration.
  CLI Example:
  `salt marathon-minion-id marathon.update_app my-app '<config yaml>'`

21.9.238 salt.modules.match

The match module allows for match routines to be run and determine target specs
salt.modules.match.compound(tgt, minion_id=None)
  Return True if the minion ID matches the given compound target
  minion_id Specify the minion ID to match against the target expression
  New in version 2014.7.0.
Salt Documentation, Release 3000.2

CLI Example:

```
salt '*' match.compound '*@cheese,foo and *'
```

salt.modules.match.data(tgt)

Return True if the minion matches the given data target

CLI Example:

```
salt '*' match.data 'spam:eggs'
```

salt.modules.match.filter_by(lookup, tgt_type='compound', minion_id=None, default='default')

Return the first match in a dictionary of target patterns

New in version 2014.7.0.

CLI Example:

```
salt '*' match.filter_by '{foo*: Foo!, bar*: Bar!}' minion_id=bar03
```

Pillar Example:

```
# Filter the data for the current minion into a variable:
{% set roles = salt['match.filter_by']({
    'web*': ['app', 'caching'],
    'db*': ['db'],
}, default='web*') %}

# Make the filtered data available to Pillar:
roles: {{ roles | yaml() }}
```

salt.modules.match.glob(tgt, minion_id=None)

Return True if the minion ID matches the given glob target

minion_id Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.glob '*'
```

salt.modules.match.grain(tgt, delimiter=')

Return True if the minion matches the given grain target. The delimiter argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.grain 'os:Ubuntu'
salt '*' match.grain 'ipv6|2001:db8::ff00:42:8329' delimiter='|'
```

delimiter Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

delim Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

salt.modules.match.grain_pcre(tgt, delimiter=')

Return True if the minion matches the given grain_pcre target. The delimiter argument can be used to specify a different delimiter.
salt.modules.match.ipcidr(tgt)
Return True if the minion matches the given ipcidr target

CLI Example:
```
salt '*' match.ipcidr '192.168.44.0/24'
```

delimiter Pillar Example:
```
'172.16.0.0/12':
- match: ipcidr
- nodeclass: internal
```

salt.modules.match.list_(tgt, minion_id=None)
Return True if the minion ID matches the given list target

minion_id Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:
```
salt '*' match.list 'server1,server2'
```

salt.modules.match.pcre(tgt, minion_id=None)
Return True if the minion ID matches the given pcre target

minion_id Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:
```
salt '*' match.pcre '.*'
```

delimiter Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

delim Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.
salt.modules.match.pillar_pcre(tgt, delimiter=':')  
Return True if the minion matches the given pillar_pcre target. The delimiter argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.pillar_pcre 'cheese:(swiss|american)'
salt '*' match.pillar_pcre 'clone_url|https://github\.com/.*\.git' delimiter='|'
```

**delimiter** Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

**delim** Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

salt.modules.match.search_by(lookup, tgt_type='compound', minion_id=None)  
Search a dictionary of target strings for matching targets

This is the inverse of match.filter_by and allows matching values instead of matching keys. A minion can be matched by multiple entries.

New in version 2017.7.0.

CLI Example:

```
salt '*' match.search_by '{web: [node1, node2], db: [node2, node3]}'
```

Pillar Example:

```
{% set roles = salt.match.search_by({'
    'web': ['G@os_family:Debian not nodeX'],
    'db': ['L@node2,node3 and G@datacenter:west'],
    'caching': ['node3', 'node4'],
}) %}
```

# Make the filtered data available to Pillar:
roles: {{ roles | yaml() }}

**21.9.239 salt.modules.mattermost module**

Module for sending messages to Mattermost

New in version 2017.7.0.

**configuration** This module can be used by either passing an api_url and hook directly or by specifying both in a configuration profile in the salt master/minion config. For example:

```
mattermost:
    hook: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
    api_url: https://example.com
```

salt.modules.mattermost.post_message(message, channel=None, username=None, api_url=None, hook=None)  
Send a message to a Mattermost channel.

**Parameters**
- **channel** – The channel name, either will work.
- **username** – The username of the poster.
- **message** – The message to send to the Mattermost channel.
- **api_url** – The Mattermost api url, if not specified in the configuration.
- **hook** – The Mattermost hook, if not specified in the configuration.

**Returns**
Boolean if message was sent successfully.

CLI Example:
```
salt '*' mattermost.post_message message='Build is done'
```

### 21.9.240 salt.modules.mdadm_raid

Salt module to manage RAID arrays with mdadm

**salt.modules.mdadm_raid.add**(name, device)
Add new device to RAID array.

CLI Example:
```
salt '*' raid.add /dev/md0 /dev/sda1
```

**salt.modules.mdadm_raid.assemble**(name, devices, test_mode=False, **kwargs)
Assemble a RAID device.

CLI Examples:
```
salt '*' raid.assemble /dev/md0 ['/dev/xvdd', '/dev/xvde']
```

**Note:** Adding `test_mode=True` as an argument will print out the mdadm command that would have been run.

- **name** The name of the array to assemble.
- **devices** The list of devices comprising the array to assemble.
- **kwargs** Optional arguments to be passed to mdadm.

**returns**
- `test_mode=True`: Prints out the full command.
- `test_mode=False (Default)`: Executes command on the host(s) and prints out the mdadm output.

For more info, read the mdadm manpage.

**salt.modules.mdadm_raid.create**(name, level, devices, metadata='default', test_mode=False, **kwargs)
Create a RAID device.

Changed in version 2014.7.0.

**Warning:** Use with CAUTION, as this function can be very destructive if not used properly!

CLI Examples:
```
salt '*' raid.create /dev/md0 level=1 chunk=256 devices="['/dev/xvdd', '/dev/xvde']" test_mode=True
```
Note: Adding test_mode=True as an argument will print out the mdadm command that would have been run.

**name**  The name of the array to create.
**level**  The RAID level to use when creating the raid.
**devices**  A list of devices used to build the array.
**metadata**  Version of metadata to use when creating the array.
**kwargs**  Optional arguments to be passed to mdadm.

**returns**
- **test_mode=True**: Prints out the full command.
- **test_mode=False (Default)**: Executes command on remote the host(s) and Prints out the mdadm output.

Note: It takes time to create a RAID array. You can check the progress in "resync_status:" field of the results from the following command:

```bash
salt '*' raid.detail /dev/md0
```

For more info, read the mdadm(8) manpage

**salt.modules.mdadm_raid.destroy(device)**

Destroy a RAID device.

WARNING This will zero the superblock of all members of the RAID array.

CLI Example:

```bash
salt '*' raid.destroy /dev/md0
```

**salt.modules.mdadm_raid.detail(device='*/dev/md0')**

Show detail for a specified RAID device

CLI Example:

```bash
salt '*' raid.detail '/dev/md0'
```

**salt.modules.mdadm_raid.examine(device, quiet=False)**

Show detail for a specified RAID component device

device  Device to examine, that is part of the RAID
quiet  If the device is not part of the RAID, do not show any error

CLI Example:

```bash
salt '*' raid.examine '/dev/sda1'
```

**salt.modules.mdadm_raid.list_()**

List the RAID devices.

CLI Example:

```bash
salt '*' raid.list
```

**salt.modules.mdadm_raid.save_config()**

Save RAID configuration to config file.

Same as: mdadm --detail --scan >> /etc/mdadm/mdadm.conf

21.9. execution modules 2075
Fixes this issue with Ubuntu REF: http://askubuntu.com/questions/209702/why-is-my-raid-dev-md1-showing-up-as-dev-md126-is-mdadm-conf-being-ignored

CLI Example:

```bash
salt '*' raid.save_config
```

**salt.modules.mdadm_raid.stop()**

Shut down all arrays that can be shut down (i.e. are not currently in use).

CLI Example:

```bash
salt '*' raid.stop
```

---

## 21.9.241 salt.modules.mdata

Module for managing metadata in SmartOS Zones

New in version 2016.3.0.

**maintainer** Jorge Schrauwen <sjorge@blackdot.be>

**maturity** new

**platform** smartos

### salt.modules.mdata.delete_(*keyname*)

Delete metadata

**prop** [string] name of property

CLI Example:

```bash
salt '*' mdata.get salt:role
salt '*' mdata.get user-script salt:role
```

### salt.modules.mdata.get_(*keyname*)

Get metadata

**keyname** [string] name of key

**Note:** If no keynames are specified, we get all (public) properties

CLI Example:

```bash
salt '*' mdata.get salt:role
salt '*' mdata.get user-script salt:role
```

### salt.modules.mdata.list()

List available metadata

CLI Example:

```bash
salt '*' mdata.list
```

### salt.modules.mdata.put_(*keyname, val*)

Put metadata

**prop** [string] name of property

**val** [string] value to set

CLI Example:
21.9.242 salt.modules.memcached

Module for Management of Memcached Keys

New in version 2014.1.0.

salt.modules.memcached.add(key, value, host='127.0.0.1', port=11211, time=0, min_compress_len=0)
Add a key to the memcached server, but only if it does not exist. Returns False if the key already exists.

CLI Example:
```
salt '*' memcached.add <key> <value>
```

salt.modules.memcached.decrement(key, delta=1, host='127.0.0.1', port=11211)
Decrement the value of a key

CLI Example:
```
salt '*' memcached.decrement <key>
salt '*' memcached.decrement <key> 2
```

salt.modules.memcached.delete(key, host='127.0.0.1', port=11211, time=0)
Delete a key from memcache server

CLI Example:
```
salt '*' memcached.delete <key>
```

salt.modules.memcached.get(key, host='127.0.0.1', port=11211)
Retrieve value for a key

CLI Example:
```
salt '*' memcached.get <key>
```

salt.modules.memcached.increment(key, delta=1, host='127.0.0.1', port=11211)
Increment the value of a key

CLI Example:
```
salt '*' memcached.increment <key>
salt '*' memcached.increment <key> 2
```

salt.modules.memcached.replace(key, value, host='127.0.0.1', port=11211, time=0, min_compress_len=0)
Replace a key on the memcached server. This only succeeds if the key already exists. This is the opposite of memcached.add

CLI Example:
```
salt '*' memcached.replace <key> <value>
```

salt.modules.memcached.set_(key, value, host='127.0.0.1', port=11211, time=0, min_compress_len=0)
Set a key on the memcached server, overwriting the value if it exists.

CLI Example:
```
salt '*' memcached.set <key> <value>
```

```
salt.modules.memcached.status(host='127.0.0.1', port=11211)
```

Get memcached status

CLI Example:
```
salt '*' memcached.status
```

### 21.9.243 salt.modules.mine

The function cache system allows for data to be stored on the master so it can be easily read by other minions

```
salt.modules.mine.delete(fun)
```
Remove specific function contents of minion.

**Parameters**
- **fun** *(str)* - The name of the function.
- **Return type** *bool*
- **Returns** True on success.

CLI Example:
```
salt '*' mine.delete 'network.interfaces'
```

```
salt.modules.mine.flush()
```
Remove all mine contents of minion.

**Return type** *bool*

**Returns** True on success

CLI Example:
```
salt '*' mine.flush
```

```
salt.modules.mine.get(tgt, fun, tgt_type='glob', exclude_minion=False)
```
Get data from the mine.

**Parameters**
- **tgt** *(str)* - Target whose mine data to get.
- **fun** *(str or list)* - Function to get the mine data of. You can specify multiple functions to retrieve using either a list or a comma-separated string of functions.
- **tgt_type** *(str)* - Default glob. Target type to use with **tgt**. See **Targeting Minions** for more information. Note that all pillar matches, whether using the compound matching system or the pillar matching system, will be exact matches, with globbing disabled.
- **exclude_minion** *(bool)* - Excludes the current minion from the result set.

CLI Example:
```
salt '*' mine.get '*' network.interfaces
salt '*' mine.get 'os:Fedora' network.interfaces grain
salt '*' mine.get 'G@os:Fedora and S@192.168.5.0/24' network.ipaddrs compound
```

See also:

Retrieving Mine data from Pillar and Orchestrate

This execution module is intended to be executed on minions. Master-side operations such as Pillar or Orchestrate that require Mine data should use the Mine Runner module instead; it can be invoked from a Pillar SLS file using the saltutil.runner module. For example:
{# set minion_ips = salt.saltutil.runner('mine.get',
tgt='*',
fun='network.ip_addrs',
tgt_type='glob') #}

```
salt.modules.mine.get_docker( interfaces=None, cidrs=None, with_container_id=False)
```

Changed in version 2017.7.8,2018.3.3: When `docker.update_mine` is set to `False` for a given minion, no mine data will be populated for that minion, and thus none will be returned for it.

Changed in version 2019.2.0: `docker.update_mine` now defaults to `False`

Get all mine data for `docker.ps` and run an aggregation routine. The `interfaces` parameter allows for specifying the network interfaces from which to select IP addresses. The `cidrs` parameter allows for specifying a list of subnets which the IP address must match.

with_container_id Boolean, to expose container_id in the list of results

New in version 2015.8.2.

CLI Example:

```
salt '*' mine.get_docker
salt '*' mine.get_docker interfaces='eth0'
salt '*' mine.get_docker interfaces=["eth0", "eth1"]
salt '*' mine.get_docker cidrs='107.170.147.0/24'
salt '*' mine.get_docker cidrs=["107.170.147.0/24", "172.17.42.0/24"]
salt '*' mine.get_docker interfaces=["eth0", "eth1"] cidrs=["107.170.147.0/24", 
→ "172.17.42.0/24"]
```

```
salt.modules.mine.send(name, *args, **kwargs)
```

Send a specific function and its result to the salt mine. This gets stored in either the local cache, or the salt master’s cache.

Parameters

- **name (str)** – Name of the function to add to the mine.

The following parameters are extracted from kwargs if present:

Parameters

- **mine_function (str)** – The name of the execution_module.function to run and whose value will be stored in the salt mine. Defaults to name.

- **allow_tgt (str)** – Targeting specification for ACL. Specifies which minions are allowed to access this function. Please note both your master and minion need to be on, at least, version 3000 for this to work properly.

- **allow_tgt_type (str)** – Type of the targeting specification. This value will be ignored if `allow_tgt` is not specified. Please note both your master and minion need to be on, at least, version 3000 for this to work properly.

Remaining args and kwargs will be passed on to the function to run.

Return type bool

Returns Whether executing the function and storing the information was succesful.

Changed in version 3000: Added `allow_tgt`- and `allow_tgt_type`-parameters to specify which minions are allowed to access this function. See Targeting Minions for more information about targeting.

CLI Example:

```
salt '*' mine.send network.ip_addrs eth0
salt '*' mine.send eth0_ip_addrs mine_function=network.ip_addrs eth0
salt '*' mine.send eth0_ip_addrs mine_function=network.ip_addrs eth0 allow_tgt='G@grain:value' allow_tgt_type=compound
```

```
salt.modules.mine.update( clear=False, mine_functions=None)
```

Call the configured functions and send the data back up to the master. The functions to be called are merged
from the master config, pillar and minion config under the option `mine_functions`:

```yaml
mine_functions:
    network.ip_addrs:
        - eth0
    disk.usage: []
```

This function accepts the following arguments:

**Parameters**

- `clear (bool)` – Default: False Specifies whether updating will clear the existing values (True), or whether it will update them (False).
- `mine_functions (dict)` – Update (or clear, see `clear`) the mine data on these functions only. This will need to have the structure as defined on https://docs.saltstack.com/en/latest/topics/mine/index.html#mine-functions

This feature can be used when updating the mine for functions that require a refresh at different intervals than the rest of the functions specified under `mine_functions` in the minion/master config or pillar. A potential use would be together with the `scheduler`, for example:

```yaml
schedule:
    lldp_mine_update:
        function: mine.update
        kwargs:
            mine_functions:
                net.lldp: []
            hours: 12
```

In the example above, the mine for `net.lldp` would be refreshed every 12 hours, while `network.ip_addrs` would continue to be updated as specified in `mine_interval`.

The function cache will be populated with information from executing these functions.

CLI Example:

```
salt '*' mine.update
```

**salt.modules.mine.valid()**

List valid entries in mine configuration.

CLI Example:

```
salt '*' mine.valid
```

## 21.9.244 salt.modules.minion module

Module to provide information about minions

**salt.modules.minion.kill** *(timeout=15)*

Kill the salt minion.

- `timeout` int seconds to wait for the minion to die.

If you have a monitor that restarts `salt-minion` when it dies then this is a great way to restart after a minion upgrade.

CLI example:
The result of the salt command shows the process ID of the minions and the results of a kill signal to the minion in as the retcode value: 0 is success, anything else is a failure.

salt.modules.minion.list()
Return a list of accepted, denied, unaccepted and rejected keys. This is the same output as salt-key -L

CLI Example:
salt 'master' minion.list

salt.modules.minion.restart()
Kill and restart the salt minion.

The configuration key minion_restart_command is an argv list for the command to restart the minion. If minion_restart_command is not specified or empty then the argv of the current process will be used.  
If the configuration value minion_restart_command is not set and the -d (daemonize) argument is missing from argv then the minion will be killed but will not be restarted and will require the parent process to perform the restart. This behavior is intended for managed salt minion processes.

CLI example:

```
$ salt minion[12] minion.restart
minion1:  
----------
    comment:  
        - Restart using process argv:  
          - /home/omniture/install/bin/salt-minion  
          - -d  
          - -c  
          - /home/omniture/install/etc/salt  
    killed:  
        10070  
    restart:  
----------

minion2:  
----------
    comment:  
        - Using configuration minion_restart_command:  
          - /home/omniture/install/bin/salt-minion  
```
(continues on next page)
The result of the command shows the process ID of minion1 that is shutdown (killed) and the results of the restart. If there is a failure in the restart it will be reflected in a non-zero retcode and possibly output in the stderr and/or stdout values along with addition information in the comment field as is demonstrated with minion2.

21.9.245 salt.modules.mod_random

Provides access to randomness generators.

New in version 2014.7.0.

```
salt.modules.mod_random.get_str(length=20)
```

New in version 2014.7.0.

Returns a random string of the specified length.

- **length** [20] Any valid number of bytes.

CLI Example:

```
salt '*' random.get_str 128
```

```
salt.modules.mod_random.hash(value, algorithm='sha512')
```

New in version 2014.7.0.

Encodes a value with the specified encoder.

- **value** The value to be hashed.
- **algorithm** [sha512] The algorithm to use. May be any valid algorithm supported by hashlib.

CLI Example:

```
salt '*' random.hash 'I am a string' md5
```

```
salt.modules.mod_random.rand_int(start=1, end=10, seed=None)
```

Returns a random integer number between the start and end number.

- **start** [1] Any valid integer number
- **end** [10] Any valid integer number
- **seed** : Optional hashable object

Changed in version 2019.2.0: Added seed argument. Will return the same result when run with the same seed.

CLI Example:
salt ' '*' random.rand_int 1 10

salt.modules.mod_random.seed(range=10, hash=None)
Returns a random number within a range. Optional hash argument can be any hashable object. If hash is omitted or None, the id of the minion is used.
hash: None Any hashable object.
range: 10 Any valid integer number
CLI Example:
salt ' '*' random.seed 10 hash=None

salt.modules.mod_random.shadow_hash(crypt_salt=None, password=None, algorithm='sha512')
Generates a salted hash suitable for /etc/shadow.
crypt_salt [None] Salt to be used in the generation of the hash. If one is not provided, a random salt will be generated.
password [None] Value to be salted and hashed. If one is not provided, a random password will be generated.
algorithm [sha512] Hash algorithm to use.
CLI Example:
salt ' '*' random.shadow_hash 'My5alT' 'MyP@sswd' md5

salt.modules.mod_random.str_encode(value, encoder='base64')
New in version 2014.7.0.
value The value to be encoded.
encoder [base64] The encoder to use on the subsequent string.
CLI Example:
salt ' '*' random.str_encode 'I am a new string' base64

21.9.246 salt.modules.modjk

Below is an example of the configuration needed for this module. This configuration data can be placed either in grains or pillar.

If using grains, this can be accomplished statically or via a grain module.

If using pillar, the yaml configuration can be placed directly into a pillar SLS file, making this both the easier and more dynamic method of configuring this module.

modjk:
  default:
    url: http://localhost/jkstatus
    user: modjk
    pass: secret
    realm: authentication realm for digest passwords
    timeout: 5
  otherVhost:
    url: http://otherVhost/jkstatus
    user: modjk
    pass: secret2
    realm: authentication realm2 for digest passwords
    timeout: 600
salt.modules.modjk.bulk_activate(workers, lbw, profile='default')

Activate all the given workers in the specific load balancer

CLI Examples:

```
salt '*' modjk.bulk_activate node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_activate node1,node2,node3 loadbalancer1 other-profile
salt '*' modjk.bulk_activate ['node1','node2','node3'] loadbalancer1
salt '*' modjk.bulk_activate ['node1','node2','node3'] loadbalancer1 other-profile
```

generate-

salt.modules.modjk.bulk_disable(workers, lbw, profile='default')

Disable all the given workers in the specific load balancer

CLI Examples:

```
salt '*' modjk.bulk_disable node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_disable node1,node2,node3 loadbalancer1 other-profile
salt '*' modjk.bulk_disable ['node1','node2','node3'] loadbalancer1
salt '*' modjk.bulk_disable ['node1','node2','node3'] loadbalancer1 other-profile
```

generate-

salt.modules.modjk.bulk_recover(workers, lbw, profile='default')

Recover all the given workers in the specific load balancer

CLI Examples:

```
salt '*' modjk.bulk_recover node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_recover node1,node2,node3 loadbalancer1 other-profile
salt '*' modjk.bulk_recover ['node1','node2','node3'] loadbalancer1
salt '*' modjk.bulk_recover ['node1','node2','node3'] loadbalancer1 other-profile
```

generate-

salt.modules.modjk.bulk_stop(workers, lbw, profile='default')

Stop all the given workers in the specific load balancer

CLI Examples:

```
salt '*' modjk.bulk_stop node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_stop node1,node2,node3 loadbalancer1 other-profile
salt '*' modjk.bulk_stop ['node1','node2','node3'] loadbalancer1
salt '*' modjk.bulk_stop ['node1','node2','node3'] loadbalancer1 other-profile
```

generate-

salt.modules.modjk.dump_config(profile='default')

Dump the original configuration that was loaded from disk

CLI Examples:

```
salt '*' modjk.dump_config
salt '*' modjk.dump_config other-profile
```

generate-

salt.modules.modjk.get_running(profile='default')

Get the current running config (not from disk)

CLI Examples:

```
salt '*' modjk.get_running
salt '*' modjk.get_running other-profile
```

generate-
Salt modules.modjk.\texttt{lb\_edit}(lbn, settings, profile='default')

Edit the loadbalancer settings

Note: http://tomcat.apache.org/connectors-doc/reference/status.html Data Parameters for the standard Update Action

CLI Examples:

\begin{verbatim}
salt '*' modjk.lb_edit loadbalancer1 "{'vlr': 1, 'vlt': 60}"
salt '*' modjk.lb_edit loadbalancer1 "{'vlr': 1, 'vlt': 60}" other-profile
\end{verbatim}

salt.modules.modjk.\texttt{list\_configured\_members}(lbn, profile='default')

Return a list of member workers from the configuration files

CLI Examples:

\begin{verbatim}
salt '*' modjk.list_configured_members loadbalancer1
salt '*' modjk.list_configured_members loadbalancer1 other-profile
\end{verbatim}

salt.modules.modjk.\texttt{recover\_all}(lbn, profile='default')

Set the all the workers in lbn to recover and activate them if they are not

CLI Examples:

\begin{verbatim}
salt '*' modjk.recover_all loadbalancer1
salt '*' modjk.recover_all loadbalancer1 other-profile
\end{verbatim}

salt.modules.modjk.\texttt{reset\_stats}(lbn, profile='default')

Reset all runtime statistics for the load balancer

CLI Examples:

\begin{verbatim}
salt '*' modjk.reset_stats loadbalancer1
salt '*' modjk.reset_stats loadbalancer1 other-profile
\end{verbatim}

salt.modules.modjk.\texttt{version}(profile='default')

Return the modjk version

CLI Examples:

\begin{verbatim}
salt '*' modjk.version
salt '*' modjk.version other-profile
\end{verbatim}

salt.modules.modjk.\texttt{worker\_activate}(worker, lbn, profile='default')

Set the worker to activate state in the lbn load balancer

CLI Examples:

\begin{verbatim}
salt '*' modjk.worker_activate node1 loadbalancer1
salt '*' modjk.worker_activate node1 loadbalancer1 other-profile
\end{verbatim}

salt.modules.modjk.\texttt{worker\_disable}(worker, lbn, profile='default')

Set the worker to disable state in the lbn load balancer

CLI Examples:

\begin{verbatim}
salt '*' modjk.worker_disable node1 loadbalancer1
salt '*' modjk.worker_disable node1 loadbalancer1 other-profile
\end{verbatim}
salt.modules.modjk.worker_edit (worker, lbn, settings, profile='default')
Edit the worker settings

Note: http://tomcat.apache.org/connectors-doc/reference/status.html Data Parameters for the standard Update Action

CLI Examples:
```
salt '*' modjk.worker_edit node1 loadbalancer1 "{'vwf': 500, 'vwd': 60}"  
salt '*' modjk.worker_edit node1 loadbalancer1 "{'vwf': 500, 'vwd': 60}" other-profile
```

salt.modules.modjk.worker_recover (worker, lbn, profile='default')
Set the worker to recover this module will fail if it is in OK state

CLI Examples:
```
salt '*' modjk.worker_recover node1 loadbalancer1  
salt '*' modjk.worker_recover node1 loadbalancer1 other-profile
```

salt.modules.modjk.worker_status (worker, profile='default')
Return the state of the worker

CLI Examples:
```
salt '*' modjk.worker_status node1  
salt '*' modjk.worker_status node1 other-profile
```

salt.modules.modjk.worker_stop (worker, lbn, profile='default')
Set the worker to stopped state in the lbn load balancer

CLI Examples:
```
salt '*' modjk.worker_activate node1 loadbalancer1  
salt '*' modjk.worker_activate node1 loadbalancer1 other-profile
```

salt.modules.modjk.workers (profile='default')
Return a list of member workers and their status

CLI Examples:
```
salt '*' modjk.workers  
salt '*' modjk.workers other-profile
```

21.9.247 salt.modules.mongodb

Module to provide MongoDB functionality to Salt

configuration This module uses PyMongo, and accepts configuration details as parameters as well as configuration settings:

```
mongodb.host: 'localhost'
mongodb.port: 27017
mongodb.user: ''
mongodb.password: ''
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.
salt.modules.mongodb.db_exists(name, user=None, password=None, host=None, port=None, authdb=None)

Checks if a database exists in MongoDB

CLI Example:
```
salt '*' mongodb.db_exists <name> <user> <password> <host> <port>
```

salt.modules.mongodb.db_list(user=None, password=None, host=None, port=None, authdb=None)

List all MongoDB databases

CLI Example:
```
salt '*' mongodb.db_list <user> <password> <host> <port>
```

salt.modules.mongodb.db_remove(name, user=None, password=None, host=None, port=None, authdb=None)

Remove a MongoDB database

CLI Example:
```
salt '*' mongodb.db_remove <name> <user> <password> <host> <port>
```

salt.modules.mongodb.find(collection, query=None, user=None, password=None, host=None, port=None, database='admin', authdb=None)

Find an object or list of objects in a collection

CLI Example:
```
salt '*' mongodb.find mycollection '[["foo": "FOO", "bar": "BAR"]]' <user> <password> <host> <port> <database>
```

salt.modules.mongodb.insert(objects, collection, user=None, password=None, host=None, port=None, database='admin', authdb=None)

Insert an object or list of objects into a collection

CLI Example:
```
salt '*' mongodb.insert '[["foo": "FOO", "bar": "BAR"], "foo": "BAZ", "bar": "BAM"}]' mycollection <user> <password> <host> <port> <database>
```

salt.modules.mongodb.remove(collection, query=None, user=None, password=None, host=None, port=None, database='admin', w=1, authdb=None)

Remove an object or list of objects into a collection

CLI Example:
```
salt '*' mongodb.remove mycollection '[["foo": "FOO", "bar": "BAR"], "foo": "BAZ", "bar": "BAM"]' <user> <password> <host> <port> <database>
```

salt.modules.mongodb.update_one(objects, collection, user=None, password=None, host=None, port=None, database='admin', authdb=None)

Update an object into a collection

New in version 2016.11.0.

CLI Example:
```
salt '*' mongodb.update_one '"_id": "my_minion"'}{"bar": "BAR"}' mycollection <user> <password> <host> <port> <database>
```
salt.modules.mongodb.user_create(name, passwd, user=None, password=None, host=None, port=None, database='admin', authdb=None, roles=None)

Create a MongoDB user
CLI Example:
```
salt '*' mongodb.user_create <user_name> <user_password> <roles> <user> <password> → <host> <port> <database>
```

salt.modules.mongodb.user_exists(name, user=None, password=None, host=None, port=None, database='admin', authdb=None)

Checks if a user exists in MongoDB
CLI Example:
```
salt '*' mongodb.user_exists <name> <user> <password> <host> <port> <database>
```

salt.modules.mongodb.user_find(name, user=None, password=None, host=None, port=None, database='admin', authdb=None)

Get single user from MongoDB
CLI Example:
```
salt '*' mongodb.user_find <name> <user> <password> <host> <port> <database> →<authdb>
```

salt.modules.mongodb.user_grant_roles(name, roles, database, user=None, password=None, host=None, port=None, authdb=None)

Grant one or many roles to a MongoDB user
CLI Examples:
```
salt '*' mongodb.user_grant_roles johndoe "["readWrite"]" dbname admin adminpwd
→ localhost 27017
```
```
salt '*' mongodb.user_grant_roles janedoe 
"{"role": "readWrite", "db": "dbname" } → , 
{"role": "read", "db": "otherdb"}"
dbname admin adminpwd localhost 27017
```

salt.modules.mongodb.user_list(user=None, password=None, host=None, port=None, database='admin', authdb=None)

List users of a MongoDB database
CLI Example:
```
salt '*' mongodb.user_list <user> <password> <host> <port> <database>
```

salt.modules.mongodb.user_remove(name, user=None, password=None, host=None, port=None, database='admin', authdb=None)

Remove a MongoDB user
CLI Example:
```
salt '*' mongodb.user_remove <name> <user> <password> <host> <port> <database>
```

salt.modules.mongodb.user_revoke_roles(name, roles, database, user=None, password=None, host=None, port=None, authdb=None)

Revoke one or many roles to a MongoDB user
CLI Examples:
salt.modules.mongodb.user_roles_exists(name, roles, database, user=None, password=None, host=None, port=None, authdb=None)

Checks if a user of a MongoDB database has specified roles

CLI Examples:

```
salt '*' mongodb.user_roles_exists johndoe '""readWrite""" dbname admin adminpwd
← localhost 27017
```

```
salt '*' mongodb.user_roles_exists johndoe '""readWrite", "db": "dbname""', {"role": "read", "db": "otherdb"}]
dbname admin adminpwd localhost 27017
```

salt.modules.mongodb.version(user=None, password=None, host=None, port=None, database='admin', authdb=None)

Get MongoDB instance version

CLI Example:

```
salt '*' mongodb.version <user> <password> <host> <port> <database>
```

21.9.248 salt.modules.monit

Monit service module. This module will create a monit type service watcher.

salt.modules.monit.configtest()

New in version 2016.3.0.

Test monit configuration syntax

CLI Example:

```
salt '*' monit.configtest
```

salt.modules.monit.id_(reset=False)

New in version 2016.3.0.

Return monit unique id.

reset [False] Reset current id and generate a new id when it’s True.

CLI Example:

```
salt '*' monit.id [reset=True]
```

salt.modules.monit.monitor(name)

monitor service via monit

CLI Example:

```
salt '*' monit.monitor <service name>
```

salt.modules.monit.reload_()

New in version 2016.3.0.
Reload monit configuration

CLI Example:

```
salt '*' monit.reload
```

salt.modules.monit.restart(name)

Restart service via monit

CLI Example:

```
salt '*' monit.restart <service name>
```

salt.modules.monit.start(name)

CLI Example:

```
salt '*' monit.start <service name>
```

salt.modules.monit.status(svc_name="")

Display a process status from monit

CLI Example:

```
salt '*' monit.status
salt '*' monit.status <service name>
```

salt.modules.monit.stop(name)

Stops service via monit

CLI Example:

```
salt '*' monit.stop <service name>
```

salt.modules.monit.summary(svc_name="")

Display a summary from monit

CLI Example:

```
salt '*' monit.summary
salt '*' monit.summary <service name>
```

salt.modules.monit.unmonitor(name)

Unmonitor service via monit

CLI Example:

```
salt '*' monit.unmonitor <service name>
```

salt.modules.monit.validate()

New in version 2016.3.0.

Check all services

CLI Example:

```
salt '*' monit.validate
```

salt.modules.monit.version()

New in version 2016.3.0.

Return version from monit -V
CLI Example:
```
salt '*' monit.version
```

## 21.9.249 salt.modules.moosefs

Module for gathering and managing information about MooseFS

```
salt.modules.moosefs.dirinfo(path, opts=None)
```

Return information on a directory located on the Moose

CLI Example:
```
salt '*' moosefs.dirinfo /path/to/dir/ [-n][h|H]]
```

```
salt.modules.moosefs.fileinfo(path)
```

Return information on a file located on the Moose

CLI Example:
```
salt '*' moosefs.fileinfo /path/to/dir/
```

```
salt.modules.moosefs.getgoal(path, opts=None)
```

Return goal(s) for a file or directory

CLI Example:
```
salt '*' moosefs.getgoal /path/to/file [-n][h|H]]
salt '*' moosefs.getgoal /path/to/dir/ [-n][h|H][r]]
```

```
salt.modules.moosefs.mounts()
```

Return a list of current MooseFS mounts

CLI Example:
```
salt '*' moosefs.mounts
```

## 21.9.250 salt.modules.mount

Salt module to manage Unix mounts and the fstab file

```
salt.modules.mount.active(extended=False)
```

List the active mounts.

CLI Example:
```
salt '*' mount.active
```

```
salt.modules.mount.automaster(config='/etc/auto_salt')
```

List the contents of the auto master

CLI Example:
```
salt '*' mount.automaster
```
salt.modules.mount.delete_mount_cache(real_name)
   New in version 2018.3.0.
   Provide information if the path is mounted
   CLI Example:
   ```
   salt '*' mount.delete_mount_cache /mnt/share
   ```

salt.modules.mount.filesystems(config='/etc/filesystems')
   New in version 2018.3.3.
   List the contents of the filesystems
   CLI Example:
   ```
   salt '*' mount.filesystems
   ```

salt.modules.mount.fstab(config='/etc/fstab')
   Changed in version 2016.3.2.
   List the contents of the fstab
   CLI Example:
   ```
   salt '*' mount.fstab
   ```

salt.modules.mount.is_fuse_exec(cmd)
   Returns true if the command passed is a fuse mountable application.
   CLI Example:
   ```
   salt '*' mount.is_fuse_exec sshfs
   ```

salt.modules.mount.is_mounted(name)
   New in version 2014.7.0.
   Provide information if the path is mounted
   CLI Example:
   ```
   salt '*' mount.is_mounted /mnt/share
   ```

salt.modules.mount.mount(name, device, mkmnt=False, fstype='', opts='defaults', user=None, util='mount')
   Mount a device
   CLI Example:
   ```
   salt '*' mount.mount /mnt/foo /dev/sd1 True
   ```

salt.modules.mount.read_mount_cache(name)
   New in version 2018.3.0.
   Provide information if the path is mounted
   CLI Example:
   ```
   salt '*' mount.read_mount_cache /mnt/share
   ```

salt.modules.mount.remount(name, device, mkmnt=False, fstype='', opts='defaults', user=None)
   Attempt to remount a device, if the device is not already mounted, mount is called
salt.modules.mount.rm_automaster(name, device, config='/etc/auto_salt')
Remove the mount point from the auto_master

CLI Example:
salt '*' mount.rm_automaster /mnt/foo /dev/sdz1 True

salt.modules.mount.rm_filesystems(name, device, config='/etc/filesystems')
New in version 2018.3.3.
Remove the mount point from the filesystems

CLI Example:
salt '*' mount.rm_filesystems /mnt/foo /dev/sdg

salt.modules.mount.rm_fstab(name, device, config='/etc/fstab')
Changed in version 2016.3.2.
Remove the mount point from the fstab

CLI Example:
salt '*' mount.rm_fstab /mnt/foo /dev/sdg

salt.modules.mount.rm_vfstab(name, device, config='/etc/vfstab')
New in version 2016.3.2.
Remove the mount point from the vfstab

CLI Example:
salt '*' mount.rm_vfstab /mnt/foo /device/c0t0d0p0

salt.modules.mount.set_automaster(name, device, fstype, opts='', config='/etc/auto_salt', test=False, not_change=False, **kwargs)
Verify that this mount is represented in the auto_salt, change the mount to match the data passed, or add the mount if it is not present.

CLI Example:
salt '*' mount.set_automaster /mnt/foo /dev/sdz1 ext4

salt.modules.mount.set_filesystems(name, device, vfstype, opts='-', mount='true', config='/etc/filesystems', test=False, match_on='auto', not_change=False, **kwargs)
New in version 2018.3.3.
Verify that this mount is represented in the filesystems, change the mount to match the data passed, or add the mount if it is not present on AIX

If the entry is found via match_on and not_change is True, the current line will be preserved.

Provide information if the path is mounted

Parameters

- name – The name of the mount point where the device is mounted.
- **device** – The device that is being mounted.
- **vfstype** – The file system that is used (AIX has two fstypes, fstype and vfstype - similar to Linux fSTYPE)
- **opts** – Additional options used when mounting the device.
- **mount** – Mount if not mounted, default True.
- **config** – Configuration file, default /etc/filesystems.
- **match** – File systems type to match on, default auto

CLI Example:
```
salt '*' mount.set_filesystems /mnt/foo /dev/sdz1 jfs2
```

salt.modules.mount.set_fstab(`name`, `device`, `fstype`, `opts='defaults'`, `dump=0`, `pass_num=0`, `config='/etc/fstab'`, `test=False`, `match_on='auto'`, `not_change=False`, **kwargs)

Verify that this mount is represented in the fstab, change the mount to match the data passed, or add the mount if it is not present.

If the entry is found via `match_on` and `not_change` is True, the current line will be preserved.

CLI Example:
```
salt '*' mount.set_fstab /mnt/foo /dev/sdz1 ext4
```

salt.modules.mount.set_vfstab(`name`, `device`, `fstype`, `opts='-'`, `device_fsck='-'`, `pass_fsck='-'`, `mount_at_boot='yes'`, `config='/etc/vfstab'`, `test=False`, `match_on='auto'`, `not_change=False`, **kwargs)

.. versionadded:: 2016.3.2 Verify that this mount is represented in the fstab, change the mount to match the data passed, or add the mount if it is not present.

If the entry is found via `match_on` and `not_change` is True, the current line will be preserved.

CLI Example:
```
salt '*' mount.set_vfstab /mnt/foo /device/c0t0d0p0 ufs
```

salt.modules.mount.swapoff(`name`)
Deactivate a named swap mount

Changed in version 2016.3.2.

CLI Example:
```
salt '*' mount.swapoff /root/swapfile
```

salt.modules.mount.swapon(`name`, `priority=None`)
Activate a swap disk

Changed in version 2016.3.2.

CLI Example:
```
salt '*' mount.swapon /root/swapfile
```

salt.modules.mount.swaps()
Return a dict containing information on active swap

Changed in version 2016.3.2.
CLI Example:

```
salt '*' mount.swaps
```

salt.modules.mount.umount(name, device=None, user=None, util='mount')

Attempt to unmount a device by specifying the directory it is mounted on

CLI Example:

```
salt '*' mount.umount /mnt/foo
```

New in version 2015.5.0.

```
salt '*' mount.umount /mnt/foo /dev/xvdc1
```

salt.modules.mount.vfstab(config='/etc/vfstab')

New in version 2016.3.2.

List the contents of the vfstab

CLI Example:

```
salt '*' mount.vfstab
```

salt.modules.mount.write_mount_cache(real_name, device, mkmnt, fstype, mount_opts)

New in version 2018.3.0.

Provide information if the path is mounted

Parameters

- **real_name** – The real name of the mount point where the device is mounted.
- **device** – The device that is being mounted.
- **mkmnt** – Whether or not the mount point should be created.
- **fstype** – The file system that is used.
- **mount_opts** – Additional options used when mounting the device.

Returns

Boolean if message was sent successfully.

CLI Example:

```
salt '*' mount.write_mount_cache /mnt/share /dev/sda1 False ext4 defaults,nosuid
```

21.9.251 salt.modules.mssql

Module to provide MS SQL Server compatibility to salt.

depends

- FreeTDS
- pymssql Python module

configuration  In order to connect to MS SQL Server, certain configuration is required in minion config/pillars on the relevant minions. Some sample pillars might look like:

```
mssql.server: 'localhost'
mssql.port:  1433
mssql.user:  'sysdba'
```
mssql.password: 'Some preferable complex password'
mssql.database: ''

The default for the port is '1433' and for the database is '' (empty string); in most cases they can be left at the default setting. Options that are directly passed into functions will overwrite options from configs or pillars.

salt.modules.mssql.db_create(database, containment='NONE', new_database_options=None, **kwargs)

Creates a new database. Does not update options of existing databases. new_database_options can only be a list of strings

CLI Example:

```
salt minion mssql.db_create DB_NAME
```

salt.modules.mssql.db_exists(database_name, **kwargs)

Find if a specific database exists on the MS SQL server.

CLI Example:

```
salt minion mssql.db_exists database_name='DBNAME'
```

salt.modules.mssql.db_list(**kwargs)

Return the database list created on a MS SQL server.

CLI Example:

```
salt minion mssql.db_list
```

salt.modules.mssql.db_remove(database_name, **kwargs)

Drops a specific database from the MS SQL server. It will not drop any of 'master', 'model', 'msdb' or 'tempdb'.

CLI Example:

```
salt minion mssql.db_remove database_name='DBNAME'
```

salt.modules.mssql.login_create(login, new_login_password=None, new_login_domain='', new_login_roles=None, new_login_options=None, **kwargs)

Creates a new login. Does not update password of existing logins. For Windows authentication, provide new_login_domain. For SQL Server authentication, provide new_login_password. Since hashed passwords are varbinary values, if the new_login_password is 'int/long', it will be considered to be HASHED. new_login_roles a list of SERVER roles
new_login_options a list of strings

CLI Example:

```
salt minion mssql.login_create LOGIN_NAME database=DBNAME [new_login_→password=PASSWORD]
```

salt.modules.mssql.login_exists(login, domain='', **kwargs)

Find if a login exists in the MS SQL server. domain, if provided, will be prepended to login

CLI Example:

```
salt minion mssql.login_exists 'LOGIN'
```

salt.modules.mssql.login_remove(login, **kwargs)

Removes an login.
salt.minion.mssql.role_remove(LOGINNAME)

```
salt.minion.mssql.role_create(role, owner=None, grants=None, **kwargs)
```

Creates a new database role. If no owner is specified, the role will be owned by the user that executes CREATE ROLE, which is the user argument or mssql.user option. grants is list of strings.

CLI Example:

```
salt minion mssql.role_create role=product01 owner=sysdb grants='["SELECT", "INSERT", "UPDATE", "DELETE", "EXECUTE"]'
```

```
salt.minion.mssql.role_exists(role, **kwargs)
```

Checks if a role exists.

CLI Example:

```
salt minion mssql.role_exists db_owner
```

```
salt.minion.mssql.role_list(**kwargs)
```

Lists database roles.

CLI Example:

```
salt minion mssql.role_list
```

```
salt.minion.mssql.role_remove(role, **kwargs)
```

Remove a database role.

CLI Example:

```
salt minion mssql.role_create role=test_role01
```

```
salt.minion.mssql.tsql_query(query, **kwargs)
```

Run a SQL query and return query result as list of tuples, or a list of dictionaries if as_dict was passed, or an empty list if no data is available.

CLI Example:

```
salt minion mssql.tsql_query 'SELECT @@version as version' as_dict=True
```

```
salt.minion.mssql.user_create(username, login=None, domain=None, database=None, roles=None, options=None, **kwargs)
```

Creates a new user. If login is not specified, the user will be created without a login. domain, if provided, will be prepended to username. options can only be a list of strings

CLI Example:

```
salt minion mssql.user_create USERNAME database=DBNAME
```

```
salt.minion.mssql.user_exists(username, domain=None, database=None, **kwargs)
```

Find if an user exists in a specific database on the MS SQL server. domain, if provided, will be prepended to username

CLI Example:

```
salt minion mssql.user_exists 'USERNAME' [database='DBNAME']
```
**salt.modules.mssql**

`salt.modules.mssql.user_list(**kwargs)`  
Get the user list for a specific database on the MS SQL server.  

CLI Example:  
```
salt minion mssql.user_list [database='DBNAME']
```

`salt.modules.mssql.user_remove(username, **kwargs)`  
Removes an user.  

CLI Example:  
```
salt minion mssql.user_remove USERNAME database=DBNAME
```

`salt.modules.mssql.version(**kwargs)`  
Return the version of a MS SQL server.  

CLI Example:  
```
salt minion mssql.version
```

---

### 21.9.252 `salt.modules.msteams` module

Module for sending messages to MS Teams  
New in version 2017.7.0.

**configuration** This module can be used by either passing a hook_url directly or by specifying it in a configuration profile in the salt master/minion config. For example:

```yaml
msteams:
    hook_url: https://outlook.office.com/webhook/837
```

`salt.modules.msteams.post_card(message, hook_url=None, title=None, theme_color=None)`  
Send a message to an MS Teams channel.  
- **param message**: The message to send to the MS Teams channel.  
- **param hook_url**: The Teams webhook URL, if not specified in the configuration.  
- **param title**: Optional title for the posted card  
- **param theme_color**: Optional hex color highlight for the posted card  

:returns: Boolean if message was sent successfully.

CLI Example:  
```
salt '*' msteams.post_card message="Build is done"
```

---

### 21.9.253 `salt.modules.munin`

Run munin plugins/checks from salt and format the output as data.

`salt.modules.munin.list_plugins()`  
List all the munin plugins  

CLI Example:  
```
salt '*' munin.list_plugins
```

`salt.modules.munin.run(plugins)`  
Run one or more named munin plugins  

CLI Example:
salt ' '* munin.run uptime
salt ' '* munin.run uptime,cpu,load,memory

salt.modules.munin.run_all()
Run all the munin plugins

CLI Example:
salt ' '* munin.run_all

21.9.254 salt.modules.mysql

Module to provide MySQL compatibility to salt.

depends
- MySQLdb Python module

**Note:** On CentOS 5 (and possibly RHEL 5) both MySQL-python and python26-mysqldb need to be installed.

**configuration** In order to connect to MySQL, certain configuration is required in /etc/salt/minion on the relevant minions. Some sample configs might look like:

```
mysql.host: 'localhost'
mysql.port: 3306
mysql.user: 'root'
mysql.pass: '
mysql.db: 'mysql'
mysql.unix_socket: '/tmp/mysql.sock'
mysql.charset: 'utf8'
```

You can also use a defaults file:

```
mysql.default_file: '/etc/mysql/debian.cnf'
```

Changed in version 2014.1.0: 'charset' connection argument added. This is a MySQL charset, not a python one.

Changed in version 0.16.2: Connection arguments from the minion config file can be overridden on the CLI by using the arguments defined here. Additionally, it is now possible to setup a user with no password.

salt.modules.mysql.alter_db(name, character_set=None, collate=None, **connection_args)
Modify database using ALTER DATABASE %(dbname)s CHARACTER SET %(charset)s COLLATE %(collation)s; query.

CLI Example:
salt '*i' mysql.alter_db testdb charset='latin1'

salt.modules.mysql.db_check(name, table=None, **connection_args)
Repairs the full database or just a given table

CLI Example:
salt '*i' mysql.db_check dbname
salt '*i' mysql.db_check dbname dbtable
salt.modules.mysql.db_create(name, character_set=None, collate=None, **connection_args)

Adds a databases to the MySQL server.

- **name**: The name of the database to manage
- **character_set**: The character set, if left empty the MySQL default will be used
- **collate**: The collation, if left empty the MySQL default will be used

CLI Example:

```
salt '*' mysql.db_create 'dbname'
salt '*' mysql.db_create 'dbname' 'utf8' 'utf8_general_ci'
```

salt.modules.mysql.db_exists(name, **connection_args)

Checks if a database exists on the MySQL server.

CLI Example:

```
salt '*' mysql.db_exists 'dbname'
```

salt.modules.mysql.db_get(name, **connection_args)

Return a list of databases of a MySQL server using the output from the `SELECT DEFAULT_CHARACTER_SET_NAME, DEFAULT_COLLATION_NAME FROM INFORMATION_SCHEMA.SCHEMATA WHERE SCHEMA_NAME='dbname';` query.

CLI Example:

```
salt '*' mysql.db_get test
```

salt.modules.mysql.db_list(**connection_args)

Return a list of databases of a MySQL server using the output from the `SHOW DATABASES` query.

CLI Example:

```
salt '*' mysql.db_list
```

salt.modules.mysql.db_optimize(name, table=None, **connection_args)

Optimizes the full database or just a given table

CLI Example:

```
salt '*' mysql.db_optimize dbname
```

salt.modules.mysql.db_remove(name, **connection_args)

Removes a databases from the MySQL server.

CLI Example:

```
salt '*' mysql.db_remove 'dbname'
```

salt.modules.mysql.db_repair(name, table=None, **connection_args)

Repairs the full database or just a given table

CLI Example:

```
salt '*' mysql.db_repair dbname
```

salt.modules.mysql.db_tables(name, **connection_args)

Shows the tables in the given MySQL database (if exists)

CLI Example:
Salt Documentation, Release 3000.2

```bash
salt '*' mysql.db_tables 'database'
```

```
salt.modules.mysql.file_query(database, file_name, **connection_args)
Run an arbitrary SQL query from the specified file and return the the number of affected rows.
New in version 2017.7.0.

database
database to run script inside

file_name
File name of the script. This can be on the minion, or a file that is reachable by the fileserver

CLI Example:

```bash
salt '*' mysql.file_query mydb file_name=/tmp/sqlfile.sql
salt '*' mysql.file_query mydb file_name=salt://sqlfile.sql
```

Return data:

```
{'query time': {'human': '39.0ms', 'raw': '0.03899'}, 'rows affected': 1L}
```

```
salt.modules.mysql.free_slave(**connection_args)
Frees a slave from its master. This is a WIP, do not use.

CLI Example:

```bash
salt '*' mysql.free_slave
```

```
salt.modules.mysql.get_master_status(**connection_args)
Retrieves the master status from the minion.

Returns:

```
{'host.domain.com': {'Binlog_Do_DB': '', 'Binlog_Ignore_DB': '', 'File': 'mysql-bin.000021', 'Position': 107}}
```

CLI Example:

```bash
salt '*' mysql.get_master_status
```

```
salt.modules.mysql.get_slave_status(**connection_args)
Retrieves the slave status from the minion.

Returns:

```
{'host.domain.com': {'Connect Retry': 60, 'Exec_Master_Log_Pos': 107, 'Last_Errno': 0, 'Last_Error': '', 'Last_IO_Errno': 0, 'Last_IO_Error': '', 'Last_SQL_Errno': 0, 'Last_SQL_Error': '', 'Master_Host': 'comet.scion-eng.com', 'Master_Log_File': 'mysql-bin.000021', 'Master_Port': 3306, 'Master_SSL_Allowed': 'No',
```

(continues on next page)
Master_SSL_CA_File: '',
'Master_SSL_CA_Path': '',
'Master_SSL_Cipher': '',
'Master_SSL_Cert': '',
'Master_SSL_Cipher': '',
'Master_SSL_Verify_Server_Cert': 'No',

'Slave_IO_State': 'Waiting for master to send event',
'Slave_SQL_Running': 'Yes',
'Until_Condition': 'None',
'Until_Log_File': '',
'Until_Log_Pos': 0}

CLI Example:
salt '*' mysql.get_slave_status

salt.modules.mysql.grant_add(grant, database, user, host='localhost', grant_option=False, escape=True, ssl_option=False, **connection_args)

Adds a grant to the MySQL server.
For database, make sure you specify database.table or database.*

CLI Example:
salt '*' mysql.grant_add 'SELECT,INSERT,UPDATE,...' 'database.*' ->'frank' 'localhost'

salt.modules.mysql.grant_exists(grant, database, user, host='localhost', grant_option=False, escape=True, **connection_args)

Checks to see if a grant exists in the database

CLI Example:
salt '*' mysql.grant_exists 'SELECT,INSERT,UPDATE,...' 'database.*' ->'frank' 'localhost'

salt.modules.mysql.grant_revoke(grant, database, user, host='localhost', grant_option=False, escape=True, **connection_args)

Removes a grant from the MySQL server.

CLI Example:
Salt Documentation, Release 3000.2

```bash
salt '*' mysql.grant_revoke 'SELECT,INSERT,UPDATE' 'database.*' 'frank' -> 'localhost'
```

salt.modules.mysql.plugin_add(name, soname=None, **connection_args)
Add a plugin.

CLI Example:

```bash
salt '*' mysql.plugin_add auth_socket
```

salt.modules.mysql.plugin_remove(name, **connection_args)
Remove a plugin.

CLI Example:

```bash
salt '*' mysql.plugin_remove auth_socket
```

salt.modules.mysql.plugin_status(name, **connection_args)
Return the status of a plugin.

CLI Example:

```bash
salt '*' mysql.plugin_status auth_socket
```

salt.modules.mysql.plugins_list(**connection_args)
Return a list of plugins and their status from the SHOW PLUGINS query.

CLI Example:

```bash
salt '*' mysql.plugins_list
```

salt.modules.mysql.processlist(**connection_args)
Retrieves the processlist from the MySQL server via "SHOW FULL PROCESSLIST".

Returns: a list of dicts, with each dict representing a process:

```json
[
    {
        'Command': 'Query',
        'Host': 'localhost',
        'Id': 39,
        'Info': 'SHOW FULL PROCESSLIST',
        'Rows_examined': 0,
        'Rows_read': 1,
        'Rows_sent': 0,
        'State': None,
        'Time': 0,
        'User': 'root',
        'db': 'mysql'
    }
]
```

CLI Example:

```bash
salt '*' mysql.processlist
```

salt.modules.mysql.query(database, query, **connection_args)
Run an arbitrary SQL query and return the results or the number of affected rows.

CLI Example:

```bash
salt '*' mysql.query mydb "UPDATE mytable set myfield=1 limit 1"
```

21.9. execution modules
Return data:
```
{'query time': {'human': '39.0ms', 'raw': '0.03899'}, 'rows affected': 1L}
```

CLI Example:
```
salt '*' mysql.query mydb "SELECT id,name,cash from users limit 3"
```

Return data:
```
{'columns': ('id', 'name', 'cash'),
 'query time': {'human': '1.0ms', 'raw': '0.001'},
 'results': ((1L, 'User 1', Decimal('110.000000')),
  (2L, 'User 2', Decimal('215.636756')),
  (3L, 'User 3', Decimal('0.040000'))),
 'rows returned': 3L}
```

CLI Example:
```
salt '*' mysql.query mydb 'INSERT into users values (null,"user 4", 5)'
```

Return data:
```
{'query time': {'human': '25.6ms', 'raw': '0.02563'}, 'rows affected': 1L}
```

CLI Example:
```
salt '*' mysql.query mydb 'DELETE from users where id = 4 limit 1'
```

Return data:
```
{'query time': {'human': '39.0ms', 'raw': '0.03899'}, 'rows affected': 1L}
```

Jinja Example: Run a query on mydb and use row 0, column 0's data.
```
{{ salt['mysql.query']('mydb', 'SELECT info from mytable limit 1')[results | iteritems][0][0] }}
```

salt.modules.mysql.quote_identifier(identifier, for_grants=False)
Return an identifier name (column, table, database, etc) escaped for MySQL
This means surrounded by ‘’ character and escaping this character inside. It also means doubling the '%' character for MySQLdb internal usage.

Parameters
- `identifier` – the table, column or database identifier
- `for_grants` – is False by default, when using database names on grant queries you should set it to True to also escape _ and % characters as requested by MySQL. Note that these characters should only be escaped when requesting grants on the database level (my_%db.*) but not for table level grants (my_%db:foo)

CLI Example:
```
salt '*' mysql.quote_identifier 'foo`bar'
```

salt.modules.mysql.showglobal(**connection_args)
Retrieves the show global variables from the minion.

Returns: show global variables full dict
CLI Example:

```
salt '*' mysql.showglobal
```

```
salt.modules.mysql.showvariables("connection_args")
Retrieves the show variables from the minion.
Returns: show variables full dict
```

CLI Example:

```
salt '*' mysql.showvariables
```

```
salt.modules.mysql.slave_lag("connection_args")
Return the number of seconds that a slave SQL server is lagging behind the master, if the host is not a slave it will return -1. If the server is configured to be a slave for replication but slave IO is not running then -2 will be returned. If there was an error connecting to the database or checking the slave status, -3 will be returned.
```

CLI Example:

```
salt '*' mysql.slave_lag
```

```
salt.modules.mysql.status("connection_args")
Return the status of a MySQL server using the output from the SHOW STATUS query.
```

CLI Example:

```
salt '*' mysql.status
```

```
salt.modules.mysql.tokenize_grant(grant)
External wrapper function :param grant: :return: dict
```

CLI Example:

```
salt '*' mysql.tokenize_grant  "GRANT SELECT, INSERT ON testdb.* TO ...
```

```
salt.modules.mysql.user_chpass(user, host='localhost', password=None, password_hash=None, allow_passwordless=False, unix_socket=None, password_column=None, **connection_args)
Change password for a MySQL user
host Host for which this user/password combo applies
password The password to set for the new user. Will take precedence over the password_hash option if both are specified.
password_hash The password in hashed form. Be sure to quote the password because YAML doesn’t like the *
. A password hash can be obtained from the mysql command-line client like so:
```

```
mysql> SELECT PASSWORD('mypass');
+--------------------------------------+
| PASSWORD('mypass')                   |
+--------------------------------------+
| +6C8989366EAF75BB670AD8EA7A7FC1176A95CEF4 |
+--------------------------------------+
1 row in set (0.00 sec)
```

allow_passwordless If True, then password and password_hash can be omitted (or set to None) to permit a passwordless login.
New in version 0.16.2: The allow_passwordless option was added.

CLI Examples:
salt 'mysql.user_chpass' frank localhost newpassword
salt 'mysql.user_chpass' frank localhost password_hash='hash'
salt 'mysql.user_chpass' frank localhost allow_passwordless=True

salt.modules.mysql.user_create(user, host='localhost', password=None, password_hash=None, allow_passwordless=False, unix_socket=False, password_column=None, auth_plugin='mysql_native_password', **connection_args)

Creates a MySQL user

host Host for which this user/password combo applies

password The password to use for the new user. Will take precedence over the password_hash option if both are specified.

password_hash The password in hashed form. Be sure to quote the password because YAML doesn’t like the *
A password hash can be obtained from the mysql command-line client like so:

```
mysql> SELECT PASSWORD('mypass');
+-----------------------------+
| PASSWORD('mypass')           |
| +6C989366EAF75BB678AD8EA7A7FC1176A95CEF4 |
+-------------------------------+
1 row in set (0.00 sec)
```

allow_passwordless If True, then password and password_hash can be omitted (or set to None) to permit a passwordless login.

unix_socket If True and allow_passwordless is True then will be used unix_socket auth plugin.

password_column The password column to use in the user table.

auth_plugin The authentication plugin to use, default is to use the mysql_native_password plugin.

New in version 0.16.2: The allow_passwordless option was added.

CLI Examples:

salt 'mysql.user_create' 'username' 'hostname' 'password'
salt 'mysql.user_create' 'username' 'hostname' password_hash='hash'
salt 'mysql.user_create' 'username' 'hostname' allow_passwordless=True

salt.modules.mysql.user_exists(user, host='localhost', password=None, password_hash=None, passwordless=False, unix_socket=False, password_column=None, **connection_args)

Checks if a user exists on the MySQL server. A login can be checked to see if passwordless login is permitted by omitting password and password_hash, and using passwordless=True.

New in version 0.16.2: The passwordless option was added.

CLI Example:

salt 'mysql.user_exists' 'username' 'hostname' 'password'
salt 'mysql.user_exists' 'username' 'hostname' password_hash='hash'
salt 'mysql.user_exists' 'username' passwordless=True
salt 'mysql.user_exists' 'username' password_column='authentication_string'

salt.modules.mysql.user_grants(user, host='localhost', **connection_args)

Shows the grants for the given MySQL user (if it exists)

CLI Example:

salt 'mysql.user_grants' 'frank' 'localhost'
salt.modules.mysql.user_info(user, host='localhost', **connection_args)
Get full info on a MySQL user

CLI Example:
salt '*' mysql.user_info root localhost

salt.modules.mysql.user_list(**connection_args)
Return a list of users on a MySQL server

CLI Example:
salt '*' mysql.user_list

salt.modules.mysql.user_remove(user, host='localhost', **connection_args)
Delete MySQL user

CLI Example:
salt '*' mysql.user_remove frank localhost

salt.modules.mysql.verify_login(user, password=None, **connection_args)
Attempt to login using the provided credentials. If successful, return true. Otherwise, return False.

CLI Example:
salt '*' mysql.verify_login root password

salt.modules.mysql.version(**connection_args)
Return the version of a MySQL server using the output from the SELECT VERSION() query.

CLI Example:
salt '*' mysql.version

21.9.255 salt.modules.nacl

This module helps include encrypted passwords in pillars, grains and salt state files.

depends libnacl, https://github.com/saltstack/libnacl

This is often useful if you wish to store your pillars in source control or share your pillar data with others that you trust. I don’t advise making your pillars public regardless if they are encrypted or not.

When generating keys and encrypting passwords use –local when using salt-call for extra security. Also consider using just the salt runner nacl when encrypting pillar passwords.

configuration The following configuration defaults can be define (pillar or config files) Avoid storing private keys in pillars! Ensure master does not have pillar_opts=True:

```
# /etc/salt/master.d/nacl.conf
nacl.config:
  # NOTE: 'key' and 'key_file' have been renamed to 'sk', 'sk_file'
  # also 'box_type' default changed from secretbox to sealedbox.
  box_type: sealedbox  (default)
  sk_file: /etc/salt/pki/master/nacl (default)
  pk_file: /etc/salt/pki/master/nacl.pub (default)
  sk: None
  pk: None
```
Usage can override the config defaults:

```
salt-call nacl.enc sk_file=/etc/salt/pki/master/nacl pk_file=/etc/salt/pki/master/nacl.pub
```

The nacl lib uses 32byte keys, these keys are base64 encoded to make your life more simple. To generate your `sk_file` and `pk_file` use:

```
salt-call --local nacl.keygen sk_file=/etc/salt/pki/master/nacl
# or if you want to work without files.
salt-call --local nacl.keygen
local:
    -------
    pk: /kfGX7PbWeu099702PBBKWLPg/9p06IQRswkdWHCDk0=
    sk: SVWut5SqNpuNzb1b9y6b2eXg2PlIo43GbPz48Sow
```

Now with your keypair, you can encrypt data:

You have two option, `sealedbox` or `secretbox`.

SecretBox is data encrypted using private key `pk`. Sealedbox is encrypted using public key `pk`.

Recommend using Sealedbox because the one way encryption permits developers to encrypt data for source control but not decrypt. Sealedbox only has one key that is for both encryption and decryption.

```
salt-call --local nacl.enc asecretpass
pk=/kfGX7PbWeu099702PBBKWLPg/9p06IQRswkdWHCDk0=
tqXzeIhnTAM9Xf0mdLcpEdkIMbfBGpj2oTKmlgrm3S1DTVHh9h8mU1GkllGq/+cYsk6m5WhGdk58=
```

To decrypt the data:

```
salt-call --local nacl.dec data=tqXzeIhnTAM9Xf0mdLcpEdkIMbfBGpj2oTKmlgrm3S1DTVHh9h8mU1GkllGq/+cYsk6m5WhGdk58=
sk=SVWut5SqNpuNzb1b9y6b2eXg2PlIo43GbPz48Sow
```

When the keys are defined in the master config you can use them from the nacl runner without extra parameters:

```
# cat /etc/salt/master.d/nacl.conf
nacl.config:
    sk_file: /etc/salt/pki/master/nacl
    pk: 'cTIqXwnU1dulg4KxsbEC7/NoeKEzd4nLeYcCFpd9k='
```

```
salt-run nacl.enc 'asecretpass'
salt-run nacl.dec 'tqXzeIhnTAM9Xf0mdLcpEdkIMbfBGpj2oTKmlgrm3S1DTVHh9h8mU1GkllGq/+cYsk6m5WhGdk58='
```

# a salt developers minion could have pillar data that includes a nacl public key

```
nacl.config:
    pk: '/kfGX7PbWeu099702PBBKWLPg/9p06IQRswkdWHCDk0='
```

The developer can then use a less-secure system to encrypt data.

```
salt-call --local nacl.enc apassword
```

Pillar files can include protected data that the salt master decrypts:
pillarexample:
  user: root
  password1: {{salt.nacl.dec('DRB7Q6/X5gGSRCTpZyxS6hWj0llUA+uaVyvou3vJ4=')|json}}
  cert_key: {{salt.nacl.dec_file('/srv/salt/certs/example.com/key.nacl')|json}}
  cert_key2: {{salt.nacl.dec_file('salt://certs/example.com/key.nacl')|json}}

Larger files like certificates can be encrypted with:

    salt-call nacl.enc_file /tmp/cert.crt out=/tmp/cert.nacl
    # or more advanced
    cert=$(cat /tmp/cert.crt)
    salt-call --out=newline_values_only nacl.enc_pub data="$cert" /tmp/cert.nacl

In pillars rendered with jinja be sure to include |json so line breaks are encoded:

    cert: "{{salt.nacl.dec('S2uogToXkgENz9...085KYt')|json}}"

In states rendered with jinja it is also good pratice to include |json:

    {{sls}} private key:
      file.managed:
        - name: /etc/ssl/private/cert.key
        - mode: 700
        - contents: "{{pillar['pillarexample'][\'cert_key\']|json}}"

Optional small program to encrypt data without needing salt modules.

    #!/bin/python3
    import sys, base64, libnacl.sealed
    pk = base64.b64decode('YOURPUBKEY')
    b = libnacl.sealed.SealedBox(pk)
    data = sys.stdin.buffer.read()
    print(base64.b64encode(b.encrypt(data)).decode())

    echo 'apassword' | nacl_enc.py

    salt.modules.nacl.dec(data, **kwargs)
    Alias to [box_type]_decrypt
    box_type: secretbox, sealedbox(default)

    salt.modules.nacl.dec_file(name, out=None, **kwargs)
    This is a helper function to decrypt a file and return its contents.
    You can provide an optional output file using out
    name can be a local file or when not using salt-run can be a url like salt://, https:// etc.
    CLI Examples:

        salt-run nacl.dec_file name=/tmp/id_rsa.nacl
        salt-call nacl.dec_file name=salt://crt/mycert.nacl out=/tmp/id_rsa
        salt-run nacl.dec_file name=/tmp/id_rsa.nacl box_type=secretbox
        sk_
        →file=/etc/salt/pki/master/nacl.pub

    salt.modules.nacl.enc(data, **kwargs)
    Alias to [box_type]_encrypt
    box_type: secretbox, sealedbox(default)
salt.modules.nacl.enc_file(name, out=None, **kwargs)
This is a helper function to encrypt a file and return its contents.

You can provide an optional output file using out

name can be a local file or when not using salt-run can be a url like salt://, https:// etc.

CLI Examples:

```bash
salt-run nacl.enc_file name=/tmp/id_rsa
salt-call nacl.enc_file name=salt://crt/mycert out=/tmp/cert
salt-run nacl.enc_file name=/tmp/id_rsa box_type=secretbox
   → etc/salt/pki/master/nacl.pub

salt-run nacl.enc_file name=/tmp/id_rsa
   box_type=secretbox
   sk_file=/etc/salt/pki/master/nacl.pub
```

salt.modules.nacl.keygen(sk_file=None, pk_file=None, **kwargs)
Use libnacl to generate a keypair.

If no sk_file is defined return a keypair.

If only the sk_file is defined pk_file will use the same name with a postfix .pub.

When the sk_file is already existing, but pk_file is not. The pk_file will be generated using the sk_file.

CLI Examples:

```bash
salt-call nacl.keygen
salt-call nacl.keygen sk_file=/etc/salt/pki/master/nacl
salt-call nacl.keygen sk_file=/etc/salt/pki/master/nacl pk_file=/etc/salt/pki/
   → master/nacl.pub
salt-call --local nacl.keygen
```

salt.modules.nacl.sealedbox_decrypt(data, **kwargs)
Decrypt data using a secret key that was encrypted using a public key with nacl.sealedbox_encrypt.

CLI Examples:

```bash
salt-call nacl.sealedbox_decrypt pEXHQM6cuaF7A=
salt-call --local nacl.sealedbox_decrypt data='pEXHQM6cuaF7A=' sk_file=/etc/salt/
   → pk/master/nacl
salt-call --local nacl.sealedbox_decrypt data='pEXHQM6cuaF7A=' sk='YmFkcGFzcwo='
```

salt.modules.nacl.sealedbox_encrypt(data, **kwargs)
Encrypt data using a public key generated from nacl.keygen. The encrypted data can be decrypted using nacl.sealedbox_decrypt only with the secret key.

CLI Examples:

```bash
salt-run nacl.sealedbox_encrypt datatoenc
salt-call --local nacl.sealedbox_encrypt datatoenc pk_file=/etc/salt/pki/master/
   → nacl.pub
salt-call --local nacl.sealedbox_encrypt datatoenc pk=
   → 'vrwQF7cNiNAVQVAiS3bvcbJUnF8cN6fU9YTZD9mBFzQ='
```

salt.modules.nacl.secretbox_decrypt(data, **kwargs)
Decrypt data that was encrypted using nacl.secretbox_encrypt using the secret key that was generated from nacl.keygen.

CLI Examples:
salt-call nacl.secretbox_decrypt pEXHQM6cuaF7A=
salt-call --local nacl.secretbox_decrypt data='pEXHQM6cuaF7A=' sk_file=/etc/salt/pki/master/nacl
salt-call --local nacl.secretbox_decrypt data='pEXHQM6cuaF7A=' sk='YmFkcGFzcwo='

salt.modules.nacl.secretbox_encrypt(data, **kwargs)
Encrypt data using a secret key generated from nacl.keygen. The same secret key can be used to decrypt the data using nacl.secretbox_decrypt.

CLI Examples:
salt-run nacl.secretbox_encrypt datatoenc
salt-call --local nacl.secretbox_encrypt datatoenc sk_file=/etc/salt/pki/master/nacl
salt-call --local nacl.secretbox_encrypt datatoenc sk='YmFkcGFzcwo='

21.9.256 salt.modules.nagios

Run nagios plugins/checks from salt and get the return as data.
salt.modules.nagios.list_plugins()
List all the nagios plugins

CLI Example:
salt '*' nagios.list_plugins

salt.modules.nagios.recode(plugin, args=", key_name=None)
Run one nagios plugin and return retcode of the execution

salt.modules.nagios.recode_pillar(pillar_name)
Run one or more nagios plugins from pillar data and get the result of cmd.recode The pillar have to be in this format:

```
-------
webserver:
  Ping_google:
    - check_icmp: 8.8.8.8
    - check_icmp: google.com
  Load:
    - check_load: -w 0.8 -c 1
  APT:
    - check_apt
-------
```

webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You must to group different checks(one o more) and always it will return the highest value of all the checks

CLI Example:
salt '*' nagios.recode webserver

salt.modules.nagios.run(plugin, args=")
Run nagios plugin and return all the data execution with cmd.run

CLI Example:
salt '_salt' nagios.run check_apt
salt 'salt' nagios.run check_1cmp '8.8.8.8'

salt.modules.nagios.run_all(plugin, args='')
Run nagios plugin and return all the data execution with cmd.run_all

salt.modules.nagios.run_all_pillar(pillar_name)
Run one or more nagios plugins from pillar data and get the result of cmd.run_all The pillar have to be in this format:

```
------
webserver:
    Ping_google:
        - check_icmp: 8.8.8.8
        - check_icmp: google.com
    Load:
        - check_load: -w 0.8 -c 1
    APT:
        - check_apt
------
```

webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You have to group different checks in a group

CLI Example:

```
salt 'salt' nagios.run webserver
```

salt.modules.nagios.run_pillar(pillar_name)
Run one or more nagios plugins from pillar data and get the result of cmd.run The pillar have to be in this format:

```
------
webserver:
    Ping_google:
        - check_icmp: 8.8.8.8
        - check_icmp: google.com
    Load:
        - check_load: -w 0.8 -c 1
    APT:
        - check_apt
------
```

webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You have to group different checks in a group

CLI Example:

```
salt 'salt' nagios.run webserver
```

21.9.257 salt.modules.nagios_rpc
Check Host & Service status from Nagios via JSON RPC.
New in version 2015.8.0.

**salt.modules.nagios_rpc.host_status** *(hostname=None, **kwargs)*

Check status of a particular host. By default statuses are returned in a numeric format.

Parameters:
- `hostname` The hostname to check the status of the service in Nagios.
- `numeric` Turn to false in order to return status in text format ('OK' instead of 0, 'Warning' instead of 1 etc)

Returns: status: 'OK', 'Warning', 'Critical' or 'Unknown'

CLI Example:
```
salt '*' nagios_rpc.host_status hostname=webserver.domain.com
salt '*' nagios_rpc.host_status hostname=webserver.domain.com numeric=False
```

**salt.modules.nagios_rpc.service_status** *(hostname=None, service=None, **kwargs)*

Check status of a particular service on a host on it in Nagios. By default statuses are returned in a numeric format.

Parameters:
- `hostname` The hostname to check the status of the service in Nagios.
- `service` The service to check the status of in Nagios.
- `numeric` Turn to false in order to return status in text format ('OK' instead of 0, 'Warning' instead of 1 etc)

Returns: status: 'OK', 'Warning', 'Critical' or 'Unknown'

CLI Example:
```
salt '*' nagios_rpc.service_status hostname=webserver.domain.com service='HTTP'
salt '*' nagios_rpc.service_status hostname=webserver.domain.com service='HTTP' numeric=False
```

**21.9.258 salt.modules.namecheap_domains_dns**

Namecheap DNS Management

New in version 2017.7.0.

Prerequisites

This module uses the *requests* Python module to communicate to the namecheap API.

Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```
salt.modules.namecheap_domains_dns.get_hosts(sld, tld)
Retrieves DNS host record settings for the requested domain.

returns a dictionary of information about the requested domain
sld SLD of the domain name
tld TLD of the domain name
CLI Example:
salt 'my-minion' namecheap_domains_dns.get_hosts sld tld

salt.modules.namecheap_domains_dns.get_list(sld, tld)
Gets a list of DNS servers associated with the requested domain.

returns a dictionary of information about requested domain
sld SLD of the domain name
tld TLD of the domain name
CLI Example:
salt 'my-minion' namecheap_domains_dns.get_list sld tld

salt.modules.namecheap_domains_dns.set_custom(sld, tld, nameservers)
Sets domain to use custom DNS servers.

returns True if the custom nameservers were set successfully
sld SLD of the domain name
tld TLD of the domain name
nameservers array of strings List of nameservers to be associated with this domain
CLI Example:
salt 'my-minion' namecheap_domains_dns.set_custom sld tld nameserver

salt.modules.namecheap_domains_dns.set_default(sld, tld)
Sets domain to use namecheap default DNS servers. Required for free services like Host record management, URL forwarding, email forwarding, dynamic DNS and other value added services.
sld SLD of the domain name
tld TLD of the domain name
Returns True if the domain was successfully pointed at the default DNS servers.
CLI Example:
salt 'my-minion' namecheap_domains_dns.set_default sld tld

salt.modules.namecheap_domains_dns.set_hosts(sld, tld, hosts)
Sets DNS host records settings for the requested domain.

returns True if the host records were set successfully
sld SLD of the domain name
tld TLD of the domain name
hosts Must be passed as a list of Python dictionaries, with each dictionary containing the following keys:
• hostname
• recordtype - One of A, AAAA, CNAME, MX, MXE, TXT, URL, URL301, or FRAME
• address - URL or IP address
• ttl - An integer between 60 and 60000 (default: 1800)
Additionally, the mxpref key can be present, but must be accompanied by an emailtype key.
CLI Example:
salt 'my-minion' namecheap_domains_dns.set_hosts sld tld hosts
21.9.259  salt.modules.namecheap_domains module

Namecheap Domain Management

New in version 2017.7.0.

Prerequisites

This module uses the requests Python module to communicate to the namecheap API.

Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```yaml
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

salt.modules.namecheap_domains.check(*domains_to_check)

Checks the availability of domains

- **domains_to_check** array of strings List of domains to check

Returns a dictionary mapping the each domain name to a boolean denoting whether or not it is available.

CLI Example:

```
salt 'my-minion' namecheap_domains.check domain-to-check
```  

salt.modules.namecheap_domains.create(domain_name, years, **kwargs)

Try to register the specified domain name

- **domain_name** The domain name to be registered
- **years** Number of years to register

Returns the following information:

- Whether or not the domain was renewed successfully
- Whether or not WhoisGuard is enabled
- Whether or not registration is instant
- The amount charged for registration
- The domain ID
- The order ID
- The transaction ID

CLI Example:

```
salt 'my-minion' namecheap_domains.create my-domain-name 2
```  

salt.modules.namecheap_domains.get_info(domain_name)

Returns information about the requested domain

- **domain_name** string Domain name to get information about

CLI Example:
salt 'my-minion' namecheap_domains.get_info my-domain-name

```
salt.modules.namecheap_domains.get_list(list_type=None, search_term=None, page=None, page_size=None, sort_by=None)
```

Returns a list of domains for the particular user as a list of objects offset by page length of page_size

- **list_type** [ALL] One of ALL, EXPIRING, EXPIRED
- **search_term** Keyword to look for on the domain list
- **page** [1] Number of result page to return
- **page_size** [20] Number of domains to be listed per page (minimum: 10, maximum: 100)
- **sort_by** One of NAME, NAME_DESC, EXPIREDATE, EXPIREDATE_DESC, CREATEDATE, or CREATEDATE_DESC

CLI Example:

```
salt 'my-minion' namecheap_domains.get_list
```

```
salt.modules.namecheap_domains.get_tld_list()
```

Returns a list of TLDs as objects

CLI Example:

```
salt 'my-minion' namecheap_domains.get_tld_list
```

```
salt.modules.namecheap_domains.reactivate(domain_name)
```

Try to reactivate the expired domain name

Returns the following information:
- Whether or not the domain was reactivated successfully
- The amount charged for reactivation
- The order ID
- The transaction ID

CLI Example:

```
salt 'my-minion' namecheap_domains.reactivate my-domain-name
```

```
salt.modules.namecheap_domains.renew(domain_name, years, promotion_code=None)
```

Try to renew the specified expiring domain name for a specified number of years

- **domain_name** The domain name to be renewed
- **years** Number of years to renew

Returns the following information:
- Whether or not the domain was renewed successfully
- The domain ID
- The order ID
- The transaction ID
- The amount charged for renewal

CLI Example:

```
salt 'my-minion' namecheap_domains.renew my-domain-name 5
```

### 21.9.260 salt.modules.namecheap_domains_ns

Namecheap Nameserver Management

New in version 2017.7.0.
Prerequisites

This module uses the requests Python module to communicate to the namecheap API.

Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

<table>
<thead>
<tr>
<th>Namecheap.name</th>
<th>companyname</th>
</tr>
</thead>
<tbody>
<tr>
<td>Namecheap.key</td>
<td>a1b2c3d4e5f67a8b0c0d1e2f3</td>
</tr>
<tr>
<td>Namecheap.client_ip</td>
<td>162.155.30.172</td>
</tr>
</tbody>
</table>

#Real url
| Namecheap.url | https://api.namecheap.com/xml.response |

#Sandbox url
| Namecheap.url | https://api.sandbox.namecheap.xml.response |

salt.modules.namecheap_domains_ns.create(sld, tld, nameserver, ip)

Creates a new nameserver. Returns True if the nameserver was created successfully.

sld SLD of the domain name
tld TLD of the domain name
nameserver Nameserver to create
ip Nameserver IP address

CLI Example:

```
salt '*' namecheap_domains_ns.create sld tld nameserver ip
```

salt.modules.namecheap_domains_ns.delete(sld, tld, nameserver)

Deletes a nameserver. Returns True if the nameserver was deleted successfully

sld SLD of the domain name
tld TLD of the domain name
nameserver Nameserver to delete

CLI Example:

```
salt '*' namecheap_domains_ns.delete sld tld nameserver
```

salt.modules.namecheap_domains_ns.get_info(sld, tld, nameserver)

Retrieves information about a registered nameserver. Returns the following information:

- IP Address set for the nameserver
- Domain name which was queried
- A list of nameservers and their statuses

sld SLD of the domain name
tld TLD of the domain name
nameserver Nameserver to retrieve

CLI Example:

```
salt '*' namecheap_domains_ns.get_info sld tld nameserver
```

salt.modules.namecheap_domains_ns.update(sld, tld, nameserver, old_ip, new_ip)

Deletes a nameserver. Returns True if the nameserver was updated successfully.

sld SLD of the domain name
tld TLD of the domain name
nameserver Nameserver to create
old_ip Current ip address
new_ip New ip address
21.9.261 salt.modules.namecheap_ssl module

Namecheap SSL Certificate Management

New in version 2017.7.0.

Prerequisites

This module uses the requests Python module to communicate to the namecheap API.

Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

salt.modules.namecheap_ssl.activate(
csr_file, certificate_id, web_server_type, approver_email=None, http_dc_validation=False, **kwargs)

Activates a newly-purchased SSL certificate. Returns a dictionary of result values.

- csr_file: Path to Certificate Signing Request file
- certificate_id: Unique ID of the SSL certificate you wish to activate
- web_server_type: The type of certificate format to return. Possible values include:
  - apache2
  - apacheapachessl
  - apacheopenssl
  - apacheraven
  - apachessl
  - apachessleay
  - c2net
  - cobaltseries
  - cpanel
  - domino
  - dominogo4625
  - dominogo4626
  - ensim
  - hsphere
  - ibmhttp
  - iis
  - iis4
  - iis5
  -iplanet
  - ipswitch
- netscape
- other
- plesk
- tomcat
- weblogic
- website
- webstar
- zeusv3

**approver_email**  The email ID which is on the approver email list.

Note: `http_dc_validation` must be set to `False` if this option is used.

**http_dc_validation**  [False] Whether or not to activate using HTTP-based validation.

Note: For other parameters which may be required, see here.

CLI Example:

```
salt 'my-minion' namecheap_ssl.activate my-csr-file my-cert-id apachessl
```

```python
salt.modules.namecheap_ssl.create(years, certificate_type, promotion_code=None, 
                                     sans_to_add=None)
```

Creates a new SSL certificate. Returns the following information:
- Whether or not the SSL order was successful
- The certificate ID
- The order ID
- The transaction ID
- The amount charged for the order
- The date on which the certificate was created
- The date on which the certificate will expire
- The type of SSL certificate
- The number of years for which the certificate was purchased
- The current status of the SSL certificate

**years**  [1] Number of years to register

**certificate_type**  Type of SSL Certificate. Possible values include:
- EV Multi Domain SSL
- EV SSL
- EV SSL SGC
- EssentialSSL
- EssentialSSL Wildcard
- InstantSSL
- InstantSSL Pro
- Multi Domain SSL
- PositiveSSL
- PositiveSSL Multi Domain
- PositiveSSL Wildcard
- PremiumSSL
- PremiumSSL Wildcard
- QuickSSL Premium
- RapidSSL
- RapidSSL Wildcard
- SGC Supercert
- SSL Web Server
• SSL Webserver EV
• SSL123
• Secure Site
• Secure Site Pro
• Secure Site Pro with EV
• Secure Site with EV
• True BusinessID
• True BusinessID Multi Domain
• True BusinessID Wildcard
• True BusinessID with EV
• True BusinessID with EV Multi Domain
• Unified Communications

**promotional_code** An optional promo code to use when creating the certificate

**sans_to_add** [0] This parameter defines the number of add-on domains to be purchased in addition to the default number of domains included with a multi-domain certificate. Each certificate that supports SANs has the default number of domains included. You may check the default number of domains included and the maximum number of domains that can be added to it in the table below.

<table>
<thead>
<tr>
<th>Provider</th>
<th>Product name</th>
<th>Default number of domains (domain from CSR is counted here)</th>
<th>Maximum number of total domains</th>
<th>Maximum number of domains that can be passed in sans_to_add parameter</th>
</tr>
</thead>
<tbody>

<td>25</td>
<td>24</td>
</tr>
</tbody>
</table>

CLI Example:

```
salt 'my-minion' namecheap_ssl.create 2 RapidSSL
```
salt.modules.namecheap_ssl.get_info(certificate_id, returncertificate=False, returntype=None)
Retrieves information about the requested SSL certificate. Returns a dictionary of information about the SSL certificate with two keys:
- ssl - Contains the metadata information
- certificate - Contains the details for the certificate such as the CSR, Approver, and certificate data

certificate_id Unique ID of the SSL certificate
returncertificate [False] Set to True to ask for the certificate in response
returntype Optional type for the returned certificate. Can be either "Individual" (for X.509 format) or "PKCS7"

Note: Required if returncertificate is True

CLI Example:
```
salt 'my-minion' namecheap_ssl.get_info my-cert-id
```

salt.modules.namecheap_ssl.get_list(**kwargs)
Returns a list of SSL certificates for a particular user

ListType [All] Possible values:
- All
- Processing
- EmailSent
- TechnicalProblem
- InProgress
- Completed
- Deactivated
- Active
- Cancelled
- NewPurchase
- NewRenewal

SearchTerm Keyword to look for on the SSL list
Page [1] Page number to return
PageSize [20] Total number of SSL certificates to display per page (minimum: 10, maximum: 100)

SorryBy One of PURCHASEDATE, PURCHASEDATE_DESC, SSLTYPE, SSLTYPE_DESC, EXPIREDATETIME, EXPIREDATETIME_DESC, Host_Name, or Host_Name_DESC

CLI Example:
```
salt 'my-minion' namecheap_ssl.get_list Processing
```

salt.modules.namecheap_ssl.parse_csr(csr_file, certificate_type, http_dc_validation=False)
Parses the CSR. Returns a dictionary of result values.

csr_file Path to Certificate Signing Request file

certificate_type Type of SSL Certificate. Possible values include:
- EV Multi Domain SSL
- EV SSL
- EV SSL SGC
- EssentialSSL
- EssentialSSL Wildcard
- InstantSSL
- InstantSSL Pro
- Multi Domain SSL
- PositiveSSL
- PositiveSSL Multi Domain
- PositiveSSL Wildcard
- **PremiumSSL**
- **PremiumSSL Wildcard**
- **QuickSSL Premium**
- **RapidSSL**
- **RapidSSL Wildcard**
- **SGC Supercert**
- **SSL Web Server**
- **SSL Webserver EV**
- **SSL123**
- **Secure Site**
- **Secure Site Pro**
- **Secure Site Pro with EV**
- **Secure Site with EV**
- **True BusinessID**
- **True BusinessID Multi Domain**
- **True BusinessID Wildcard**
- **True BusinessID with EV**
- **True BusinessID with EV Multi Domain**
- **Unified Communications**

**http_dc_validation** [False] Set to True if a Comodo certificate and validation should be done with files instead of emails and to return the info to do so

CLI Example:

```
salt 'my-minion' namecheap_ssl.parse_csr my-csr-file PremiumSSL
```

```python
salt.modules.namecheap_ssl.reissue(csr_file, certificate_id, web_server_type, approver_email=None, http_dc_validation=False, **kwargs)
```

Reissues a purchased SSL certificate. Returns a dictionary of result values.

csr_file Path to Certificate Signing Request file
certificate_id Unique ID of the SSL certificate you wish to activate
web_server_type The type of certificate format to return. Possible values include:

- apache2
- apachepachessl
- apachepopenssl
- apacheraven
- apachessl
- apachessleay
- c2net
- cobaltseries
- cpanel
- domino
- dominogo4625
- dominogo4626
- ensim
- hsphere
- ibmhttp
- iis
- iis4
- iis5
-iplanet
- ipswitch
- netscape
- other
- plesk
• tomcat
• weblogic
• website
• webstar
• zeusv3

approver_email  The email ID which is on the approver email list.

Note: http_dc_validation must be set to False if this option is used.

http_dc_validation  [False] Whether or not to activate using HTTP-based validation.

Note: For other parameters which may be required, see here.

CLI Example:

```bash
salt 'my-minion' namecheap_ssl.reissue my-csr-file my-cert-id apachessl
```

salt.modules.namecheap_ssl.renew(years, certificate_id, certificate_type, promotion_code=None)

Renews an SSL certificate if it is ACTIVE and Expires <= 30 days. Returns the following information:
• The certificate ID
• The order ID
• The transaction ID
• The amount charged for the order

years  [1] Number of years to register
certificate_id  Unique ID of the SSL certificate you wish to renew
certificate_type  Type of SSL Certificate. Possible values include:
• EV Multi Domain SSL
• EV SSL
• EV SSL SGC
• EssentialSSL
• EssentialSSL Wildcard
• InstantSSL
• InstantSSL Pro
• Multi Domain SSL
• PositiveSSL
• PositiveSSL Multi Domain
• PositiveSSL Wildcard
• PremiumSSL
• PremiumSSL Wildcard
• QuickSSL Premium
• RapidSSL
• RapidSSL Wildcard
• SGC Supercert
• SSL Web Server
• SSL Webserver EV
• SSL123
• Secure Site
• Secure Site Pro
• Secure Site Pro with EV
• Secure Site with EV
• True BusinessID
• True BusinessID Multi Domain
• True BusinessID Wildcard
• True BusinessID with EV
• True BusinessID with EV Multi Domain
• Unified Communications

**promotional_code**  An optional promo code to use when renewing the certificate

CLI Example:

```
salt 'my-minion' namecheap_ssl.renew 1 my-cert-id RapidSSL
```

## 21.9.262 salt.modules.namecheap_users module

Namecheap User Management

New in version 2017.7.0.

**Prerequisites**

This module uses the **requests** Python module to communicate to the namecheap API.

**Configuration**

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
# Real url
namecheap.url: https://api.namecheap.com/xml.response
# Sandbox url
# namecheap.url: https://api.sandbox.namecheap.xml.response
```

salt.modules.namecheap_users.check_balances(minimum=100)

Checks if the provided minimum value is present in the user’s account.

- Returns a boolean. Returns False if the user’s account balance is less than the provided minimum or True if greater than the minimum.
- minimum [100] The value to check

CLI Example:

```
salt 'my-minion' namecheap_users.check_balances
salt 'my-minion' namecheap_users.check_balances minimum=150
```

salt.modules.namecheap_users.get_balances()

Gets information about fund in the user’s account. This method returns the following information: Available Balance, Account Balance, Earned Amount, Withdrawable Amount and Funds Required for AutoRenew.

**Note:** If a domain setup with automatic renewal is expiring within the next 90 days, the FundsRequired-ForAutoRenew attribute shows the amount needed in your Namecheap account to complete auto renewal.

CLI Example:

```
salt 'my-minion' namecheap_users.get_balances
```
21.9.263 salt.modules.napalm_mod module

NAPALM helpers

Helpers for the NAPALM modules.

New in version 2017.7.0.

**salt.modules.napalm_mod.alive(**kwargs)**

Returns the alive status of the connection layer. The output is a dictionary under the usual dictionary output of the NAPALM modules.

CLI Example:

```
salt '*' napalm.alive
```

Output Example:

```
result: True
out: 
is_alive: False
comment: '
```

**salt.modules.napalm_mod.call**(method, *args, **kwargs)**

Execute arbitrary methods from the NAPALM library. To see the expected output, please consult the NAPALM documentation.

Note: This feature is not recommended to be used in production. It should be used for testing only!

CLI Example:

```
salt '*' napalm.call get_lldp_neighbors
salt '*' napalm.call get_firewall_policies
salt '*' napalm.call get_bgp_config group='my-group'
```

**salt.modules.napalm_mod.compliance_report**(filepath=None, string=None, render='jinja|yaml', **kwargs)**

Return the compliance report.

*filepath* The absolute path to the validation file.

Changed in version 2019.2.0.

Beginning with release codename 2019.2.0, this function has been enhanced, to be able to leverage the multi-engine template rendering of Salt, besides the possibility to retrieve the file source from remote systems, the URL schemes supported being:

- salt://
- ftp://
- s3://
- swift://

Or on the local file system (on the Minion).

Note: The rendering result does not necessarily need to be YAML, instead it can be any format interpreted by Salt’s rendering pipeline (including pure Python).
string  New in version 2019.2.0.
    
The compliance report send as inline string, to be used as the file to send through the renderer system.
    
    Note, not all renderer modules can work with strings; the 'py' renderer requires a file, for example.

renderer: jinja|yaml  New in version 2019.2.0.
    
The renderer pipe to send the file through; this is overridden by a "she-bang" at the top of the file.

kwargs  Changed in version 2019.2.0.
    
    Keyword args to pass to Salt’s compile_template() function.

CLI Example:

    salt '*' napalm.compliance_report ~/validate.yml
    salt '*' napalm.compliance_report salt://path/to/validator.sls

Validation File Example (pure YAML):

    - get_facts:
        os_version: 4.17
    - get_interfaces_ip:
        Management1:
            ipv4:
                10.0.2.14:
                    prefix_length: 24
                    _mode: strict

Validation File Example (as Jinja + YAML):

    - get_facts:
        os_version: {{ grains.version }}
    - get_interfaces_ip:
        Loopback0:
            ipv4:
                {{ grains.lo0.ipv4 }}:
                    prefix_length: 24
                    _mode: strict
    - get_bgp_neighbors: {{ pillar.bgp.neighbors }}

Output Example:

```
device1:  
        ----------
        comment:
        out:  
            ----------
            complies:
                False
            gets_facts:
                ----------
                complies:
                    False
                extra:
                missing:
                present:
                    ----------
                    os_version:
                        ----------
                        actual_value:
```

result:

New in version 2019.2.0.

Return the diff, as text, between the two different configuration sources. The sources can be either specified using the source1 and source2 arguments when retrieving from the managed network device.

source1: candidate The source from where to retrieve the configuration to be compared with. Available options: candidate, running, startup. Default: candidate.
candidate_path Absolute or remote path from where to load the candidate configuration text. This argument allows any URI supported by cp.get_url, e.g., salt://, https://, s3://, ftp://, etc.

source2: running The source from where to retrieve the configuration to compare with. Available options: candidate, running, startup. Default: running.
running_path Absolute or remote path from where to load the running configuration text. This argument allows any URI supported by cp.get_url, e.g., salt://, https://, s3://, ftp://, etc.

saltenv: base Salt fileserver environment from which to retrieve the file. Ignored if candidate_path or running_path is not a salt:// URL.

CLI Example:

```
salt '*' napalm.config_diff_text
candidate_path=https://bit.ly/2mAdq7z
# Would compare the running config with the configuration available at
# https://bit.ly/2mAdq7z
```

New in version 2019.2.0.

Return the diff, as Python dictionary, between two different sources. The sources can be either specified using the source1 and source2 arguments when retrieving from the managed network device.

source1: candidate The source from where to retrieve the configuration to be compared with. Available options: candidate, running, startup. Default: candidate.
candidate_path Absolute or remote path from where to load the candidate configuration text. This argument allows any URI supported by cp.get_url, e.g., salt://, https://, s3://, ftp://, etc.

source2: running The source from where to retrieve the configuration to compare with. Available options: candidate, running, startup. Default: running.
running_path Absolute or remote path from where to load the running configuration text. This argument allows any URI supported by cp.get_url, e.g., salt://, https://, s3://, ftp://, etc.

saltenv: base Salt fileserver environment from which to retrieve the file. Ignored if candidate_path or running_path is not a salt:// URL.
running_path is not a salt:// URL.

CLI Example:

```
salt '*' napalm.config_diff_text
salt '*' napalm.config_diff_text candidate_path=https://bit.ly/2mAdq7z
# Would compare the running config with the configuration available at
# https://bit.ly/2mAdq7z
```

CLI Example:

```
salt '*' napalm.config_diff_tree
salt '*' napalm.config_diff_tree running startup
```

salt.modules.napalm_mod.config_filter_lines(\`parent_regex`, \`child_regex`, \`source`='running')

New in version 2019.2.0.

Return a list of detailed matches, for the configuration blocks (parent-child relationship) whose parent respects the regular expressions configured via the \`parent_regex` argument, and the child matches the \`child_regex` regular expression. The result is a list of dictionaries with the following keys:

- `match`: a boolean value that tells whether \`child_regex` matched any children lines.
- `parent`: the parent line (as text).
- `child`: the child line (as text). If no child line matched, this field will be `None`.

**Note:** This function is only available only when the underlying library `ciscoconfparse` is installed. See `ciscoconfparse module` for more details.

parent_regex The regular expression to match the parent configuration lines against.

child_regex The regular expression to match the child configuration lines against.

CLI Example:

```
salt '*' napalm.config_filter_lines '^interface' 'ip address'
salt '*' napalm.config_filter_lines '^interface' 'shutdown' source=candidate
```

salt.modules.napalm_mod.config_find_lines(\`regex`, \`source`='running')

New in version 2019.2.0.

Return the configuration lines that match the regular expressions from the \`regex` argument. The configuration is read from the network device interrogated.

regex The regular expression to match the configuration lines against.

CLI Example:

```
salt '*' napalm.config_find_lines '^interface Ethernet1\d'
```

salt.modules.napalm_mod.config_lines_w_child(\`parent_regex`, \`child_regex`, \`source`='running')

New in version 2019.2.0.

Return the configuration lines that match the regular expressions from the \`parent_regex` argument, having child lines matching \`child_regex`. The configuration is read from the network device interrogated.

**Note:** This function is only available only when the underlying library `ciscoconfparse` is installed. See
**ciscoconfparse module** for more details.

**parent_regex** The regular expression to match the parent configuration lines against.

**child_regex** The regular expression to match the child configuration lines against.

**source:** **running** The configuration type to retrieve from the network device. Default: running. Available options: running, start-up, candidate.

CLI Example:

```python
salt '*' napalm.config_lines_w_child '^interface' 'ip address'
salt '*' napalm.config_lines_w_child '^interface' 'shutdown' source=candidate
```

**salt.modules.napalm_mod.config_lines_wo_child**

```python
def config_lines_wo_child(parent_regex, child_regex, source='running',)
```

New in version 2019.2.0.

Return the configuration lines that match the regular expressions from the `parent_regex` argument, having the child lines *not* matching `child_regex`. The configuration is read from the network device interrogated.

**Note:** This function is only available only when the underlying library ciscoconfparse is installed. See **ciscoconfparse module** for more details.

**parent_regex** The regular expression to match the parent configuration lines against.

**child_regex** The regular expression to match the child configuration lines against.

**source:** **running** The configuration type to retrieve from the network device. Default: running. Available options: running, start-up, candidate.

CLI Example:

```python
salt '*' napalm.config_lines_wo_child '^interface' 'ip address'
salt '*' napalm.config_lines_wo_child '^interface' 'shutdown' source=candidate
```

**salt.modules.napalm_mod.config_merge_diff**

```python
def config_merge_diff(source='running', merge_config=None, merge_path=None, saltenv='base',)
```

New in version 2019.2.0.

Return the merge diff, as text, after merging the merge config into the configuration source requested (without loading the config on the device).

**source:** **running** The configuration type to retrieve from the network device. Default: running. Available options: running, start-up, candidate.

**merge_config** The config to be merged into the initial config, sent as text. This argument is ignored when `merge_path` is set.

**merge_path** Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**saltenv:** **base** Salt fileserv environment from which to retrieve the file. Ignored if `merge_path` is not a `salt://` URL.

CLI Example:

```python
salt '*' napalm.config_merge_diff merge_path=salt://path/to/merge.cfg
```

**salt.modules.napalm_mod.config_merge_text**

```python
def config_merge_text(source='running', merge_config=None, merge_path=None, saltenv='base',)
```

New in version 2019.2.0.

Return the merge result of the configuration from `source` with the merge configuration, as plain text (without loading the config on the device).

**merge_config** The config to be merged into the initial config, sent as text. This argument is ignored when merge_path is set.

**merge_path** Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**saltenv:** base Salt fileserver environment from which to retrieve the file. Ignored if merge_path is not a salt:// URL.

CLI Example:

```bash
salt '*' napalm.config_merge_tree merge_path=salt://path/to/merge.cfg
```

**salt.modules.napalm_mod.config_merge_tree**

```python
salt.modules.napalm_mod.config_merge_tree(source='running', merge_config=None, merge_path=None, saltenv='base')
```

New in version 2019.2.0.

Return the merge tree of the initial_config with the merge_config, as a Python dictionary.

**merge_config** The config to be merged into the initial config, sent as text. This argument is ignored when merge_path is set.

**merge_path** Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**saltenv:** base Salt fileserver environment from which to retrieve the file. Ignored if merge_path is not a salt:// URL.

CLI Example:

```bash
salt '*' napalm.config_merge_tree merge_path=salt://path/to/merge.cfg
```

**salt.modules.napalm_mod.config_tree**

```python
salt.modules.napalm_mod.config_tree(source='running', with_tags=False)
```

New in version 2019.2.0.

Transform Cisco IOS style configuration to structured Python dictionary. Depending on the value of the with_tags argument, this function may provide different views, valuable in different situations.

**with_tags:** False Whether this function should return a detailed view, with tags.

CLI Example:

```bash
salt '*' napalm.config_tree
```

**salt.modules.napalm_mod.junos_call**

```python
salt.modules.napalm_mod.junos_call(fun, *args, **kwargs)
```

New in version 2019.2.0.

Execute an arbitrary function from the junos execution module. To check what args and kwargs you must send to the function, please consult the appropriate documentation.

**fun** The name of the function. E.g., `set_hostname`.

**args** List of arguments to send to the junos function invoked.

**kwargs** Dictionary of key-value arguments to send to the junos function invoked.

CLI Example:

```bash
salt '*' napalm.junos_fun cli 'show system commit'
```

**salt.modules.napalm_mod.junos_cli**

```python
salt.modules.napalm_mod.junos_cli(command, format=None, dev_timeout=None, dest=None, **kwargs)
```

New in version 2019.2.0.

Execute a CLI command and return the output in the specified format.
command The command to execute on the Junos CLI.

format: text Format in which to get the CLI output (either text or xml).

dev_timeout: 30 The NETCONF RPC timeout (in seconds).

dest Destination file where the RPC output is stored. Note that the file will be stored on the Proxy Minion.

To push the files to the Master, use cp.push.

CLI Example:

```
salt '*' napalm.junos_cli 'show lldp neighbors'
```

salt.modules.napalm_mod.junos_commit(**kwargs)

New in version 2019.2.0.

Commit the changes loaded in the candidate configuration.

dev_timeout: 30 The NETCONF RPC timeout (in seconds).

comment Provide a comment for the commit.

confirm Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled
back in the specified amount of time unless the commit is confirmed.

sync: False When True, on dual control plane systems, requests that the candidate configuration on one
control plane be copied to the other control plane, checked for correct syntax, and committed on both
Routing Engines.

force_sync: False When True, on dual control plane systems, force the candidate configuration on one
control plane to be copied to the other control plane.

full When True, requires all the daemons to check and evaluate the new configuration.

detail When True, return commit detail.

CLI Examples:

```
salt '*' napalm.junos_commit comment='Committing via Salt' detail=True
salt '*' napalm.junos_commit dev_timeout=60 confirm=10
salt '*' napalm.junos_commit sync=True dev_timeout=90
```

salt.modules.napalm_mod.junos_copy_file(src, dst, **kwargs)

New in version 2019.2.0.

Copies the file on the remote Junos device.

src The source file path. This argument accepts the usual Salt URIs (e.g., salt://, http://, https://, s3://, ftp://, etc.).

dst The destination path on the device where to copy the file.

CLI Example:

```
salt '*' napalm.junos_copy_file https://example.com/junos.cfg /var/tmp/myjunos.cfg
```

salt.modules.napalm_mod.junos_facts(**kwargs)

New in version 2019.2.0.

The complete list of Junos facts collected by junos-eznc.

CLI Example:

```
salt '*' napalm.junos_facts
```

salt.modules.napalm_mod.junos_install_os(path=None, **kwargs)

New in version 2019.2.0.

Installs the given image on the device.

path The image file source. This argument supports the following URIs:

- Absolute path on the Minion.
- salt:// to fetch from the Salt fileserver.
Salt Documentation, Release 3000.2

- ftp://
- swift://
- s3://

device_timeout: 30 The NETCONF RPC timeout (in seconds)
reboot: False Whether to reboot the device after the installation is complete.
no_copy: False If True the software package will not be copied to the remote device.

CLI Example:

```
salt '*' napalm.junos_install_os salt://images/junos_16_1.tgz reboot=True
```

`salt.modules.napalm_mod.junos_rpc` *(cmd=None, dest=None, format=None, **kwargs)*

New in version 2019.2.0.

Execute an RPC request on the remote Junos device.

- `cmd` The RPC request to the executed. To determine the RPC request, you can check from the command line of the device, by executing the usual command followed by `| display xml rpc`, e.g., `show lldp neighbors | display xml rpc`.
- `dest` Destination file where the RPC output is stored. Note that the file will be stored on the Proxy Minion. To push the files to the Master, use `cp.push` Execution function.
- `format`: xml The format in which the RPC reply is received from the device.
- `device_timeout`: 30 The NETCONF RPC timeout.
- `filter`: Used with the `get-config` RPC request to filter out the config tree.
- `terse`: False Whether to return terse output.

**Note:** Some RPC requests may not support this argument.

- `interface_name` Name of the interface to query.

CLI Example:

```
salt '*' napalm.junos_rpc get-lldp-neighbors-information
salt '*' napalm.junos_rpc get-config <configuration><system><ntp/></system></configuration>
```

`salt.modules.napalm_mod.netmiko_args` (**kwargs)*

New in version 2019.2.0.

Return the key-value arguments used for the authentication arguments for the netmiko module.

When running in a non-native NAPALM driver (e.g., panos, f5, mos - either from https://github.com/napalm-automation-community or defined in user’s own environment, one can specify the Netmiko device type (the `device_type` argument) via the `netmiko_device_type_map` configuration option / Pillar key, e.g.,

```
netmiko_device_type_map:
  f5: f5_ltm
  dellos10: dell_os10
```

The configuration above defines the mapping between the NAPALM os Grain and the Netmiko device_type, e.g., when the NAPALM Grain is f5, it would use the f5_ltm SSH Netmiko driver to execute commands over SSH on the remote network device.

CLI Example:

```
salt '*' napalm.netmiko_args
```

`salt.modules.napalm_mod.netmiko_call` *(method, *args, **kwargs)*

New in version 2019.2.0.
Execute an arbitrary Netmiko method, passing the authentication details from the existing NAPALM connection.

method  The name of the Netmiko method to execute.
args  List of arguments to send to the Netmiko method specified in method.
kwargs  Key-value arguments to send to the execution function specified in method.

CLI Example:

```
salt '*' napalm.netmiko_call send_command 'show version'
```

salt.modules.napalm_mod.netmiko_commands(*commands, **kwargs)
New in version 2019.2.0.

Invoke one or more commands to be executed on the remote device, via Netmiko. Returns a list of strings, with the output from each command.

commands  A list of commands to be executed.
expect_string  Regular expression pattern to use for determining end of output. If left blank will default to being based on router prompt.
delay_factor: 1  Multiplying factor used to adjust delays (default: 1).
max_loops: 500  Controls wait time in conjunction with delay_factor. Will default to be based upon self.timeout.
auto_find_prompt: True  Whether it should try to auto-detect the prompt (default: True).
strip_prompt: True  Remove the trailing router prompt from the output (default: True).
strip_command: True  Remove the echo of the command from the output (default: True).
normalize: True  Ensure the proper enter is sent at end of command (default: True).
use_textfsm: False  Process command output through TextFSM template (default: False).

CLI Example:

```
salt '*' napalm.netmiko_commands 'show version' 'show interfaces'
```

salt.modules.napalm_mod.netmiko_config(*config_commands, **kwargs)
New in version 2019.2.0.

Load a list of configuration commands on the remote device, via Netmiko.

**Warning:** Please remember that netmiko does not have any rollback safeguards and any configuration change will be directly loaded into the running config if the platform doesn't have the concept of candidate config.

On Junos, or other platforms that have this capability, the changes will not be loaded into the running config, and the user must set the commit argument to True to transfer the changes from the candidate into the running config before exiting.

config_commands  A list of configuration commands to be loaded on the remote device.
config_file  Read the configuration commands from a file. The file can equally be a template that can be rendered using the engine of choice (see template_engine).

This can be specified using the absolute path to the file, or using one of the following URL schemes:

- salt://, to fetch the file from the Salt files server.
- http:// or https://
- ftp://
- s3://
- swift://

exit_config_mode: True  Determines whether or not to exit config mode after complete.
delay_factor: 1  Factor to adjust delays.
max_loops: 150  Controls wait time in conjunction with delay_factor (default: 150).
strip_prompt: False  Determines whether or not to strip the prompt (default: False).
strip_command: **False** Determines whether or not to strip the command (default: False).
config_mode_command The command to enter into config mode.
commit: **False** Commit the configuration changes before exiting the config mode. This option is by default disabled, as many platforms don’t have this capability natively.

CLI Example:

```
salt '*' napalm.netmiko_config 'set system ntp peer 1.2.3.4' commit=True
```

salt.modules.napalm_mod.netmiko_conn(**kwargs)
New in version 2019.2.0.

Return the connection object with the network device, over Netmiko, passing the authentication details from the existing NAPALM connection.

**Warning:** This function is not suitable for CLI usage, more rather to be used in various Salt modules.

**Usage Example:**

```
conn = __salt__['napalm.netmiko_conn']()
res = conn.send_command('show interfaces')
conn.disconnect()
```

salt.modules.napalm_mod.netmiko_fun(fun, *args, **kwargs)
New in version 2019.2.0.

Call an arbitrary function from the Netmiko module, passing the authentication details from the existing NAPALM connection.

fun: The name of the function from the Netmiko to invoke.
args: List of arguments to send to the execution function specified in fun.
kwargs: Key-value arguments to send to the execution function specified in fun.

**CLI Example:**

```
salt '*' napalm.netmiko_fun send_command 'show version'
```

salt.modules.napalm_mod.netmiko_multi_call(*methods, **kwargs)
New in version 2019.2.0.

Execute a list of arbitrary Netmiko methods, passing the authentication details from the existing NAPALM connection.

methods: List of dictionaries with the following keys:
  - name: the name of the Netmiko function to invoke.
  - args: list of arguments to send to the name method.
  - kwargs: key-value arguments to send to the name method.

**CLI Example:**

```
salt '*' napalm.netmiko_multi_call "{"name": 'send_command', 'args': ['show\nversion']}
" "{"name": 'send_command', 'args': ['show interfaces']}"
```

salt.modules.napalm_mod.nxos_api_config(commands=None, config_file=None, template_engine='jinja', context=None, defaults=None, saltenv='base', **kwargs)
New in version 2019.2.0.

Configures the Nexus switch with the specified commands, via the NX-API.
commands The list of configuration commands to load on the Nexus switch.

Note: This argument is ignored when config_file is specified.

config_file The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- salt://
- https://
- ftp://
- s3://
- swift://

template_engine: jinja The template engine to use when rendering the source file. Default: jinja. To simply fetch the file without attempting to render, set this argument to None.

context: None Variables to add to the template context.
defaults: None Default values of the context dict.
saltenv: base Salt filesystem environment from which to retrieve the file. Ignored if config_file is not a salt:// URL.

CLI Example:

```bash
salt '*' napalm.nxos_api_config 'spanning-tree mode mstp'
salt '*' napalm.nxos_api_config config_file=https://bit.ly/2LGLcDy context="{
    'servers': ['1.2.3.4'])"
```

salt.modules.napalm_mod.nxos_api_rpc (commands, method='cli', **kwargs)

New in version 2019.2.0.

Execute an arbitrary RPC request via the Nexus API.

commands The RPC commands to be executed.

method: cli The type of the response, i.e., raw text (cli_ascii) or structured document (cli). Defaults to cli (structured data).

CLI Example:

```bash
salt '*' napalm.nxos_api_rpc 'show version'
```

salt.modules.napalm_mod.nxos_api_show (commands, raw_text=True, **kwargs)

New in version 2019.2.0.

Execute one or more show (non-configuration) commands.

commands The commands to be executed.

raw_text: True Whether to return raw text or structured data.

CLI Example:

```bash
salt '*' napalm.nxos_api_show 'show version'
salt '*' napalm.nxos_api_show 'show bgp sessions' 'show processes' raw_text=False
```

salt.modules.napalm_mod.pyeapi_call (method, *args, **kwargs)

New in version 2019.2.0.

Invoke an arbitrary method from the pyeapi library. This function forwards the existing connection details to the pyeapi.run_commands execution function.

method The name of the pyeapi method to invoke.

kwargs Key-value arguments to send to the pyeapi method.

CLI Example:
salt 'star' napalm.pyeapi_call run_commands 'show version' encoding=text
salt 'star' napalm.pyeapi_call get_config as_string=True

salt.modules.napalm_mod.pyeapi_config(cmds=None, config_file=None, template_engine='jinja', context=None, defaults=None, saltenv='base', **kwargs)

New in version 2019.2.0.

Configures the Arista switch with the specified commands, via the pyeapi library. This function forwards the existing connection details to the pyeapi.run_commands execution function.

- **commands** The list of configuration commands to load on the Arista switch.

  Note: This argument is ignored when config_file is specified.

- **config_file** The source file with the configuration commands to be sent to the device.

  The file can also be a template that can be rendered using the template engine of choice. This can be specified using the absolute path to the file, or using one of the following URL schemes:
  - salt://
  - https://
  - ftp://
  - s3://
  - swift://

- **template_engine**: jinja The template engine to use when rendering the source file. Default: jinja. To simply fetch the file without attempting to render, set this argument to None.

- **context**: None Variables to add to the template context.

- **defaults**: None Default values of the context dict.

- **saltenv**: base Salt fileservers environment from which to retrieve the file. Ignored if config_file is not a salt:// URL.

  CLI Example:

  ```
  salt 'star' napalm.pyeapi_config 'ntp server 1.2.3.4'
  ```

salt.modules.napalm_mod.pyeapi_conn(**kwargs)

New in version 2019.2.0.

Return the connection object with the Arista switch, over pyeapi, passing the authentication details from the existing NAPALM connection.

  Warning: This function is not suitable for CLI usage, more rather to be used in various Salt modules, to reusing the established connection, as in opposite to opening a new connection for each task.

  Usage example:

  ```python
  conn = __salt__['napalm.pyeapi_conn']()
  res1 = conn.run_commands('show version')
  res2 = conn.get_config(as_string=True)
  ```

salt.modules.napalm_mod.pyeapi_nxos_api_args(**prev_kwargs)

New in version 2019.2.0.

Return the key-value arguments used for the authentication arguments for the pyeapi execution module.

  CLI Example:
salt 'xn' napalm.pyeapi_nxos_api_args

salt.modules.napalm_mod.pyeapi_run_commands('commands', **kwargs)
Execute a list of commands on the Arista switch, via the pyeapi library. This function forwards the existing connection details to the pyeapi.run_commands execution function.

commands  A list of commands to execute.

encoding: json  The requested encoding of the command output. Valid values for encoding are json (default) or text.

CLI Example:

salt 'xn' napalm.pyeapi_run_commands 'show version' encoding=text
salt 'xn' napalm.pyeapi_run_commands 'show ip bgp neighbors'

salt.modules.napalm_mod.reconnect(force=False, **kwargs)
Reconnect the NAPALM proxy when the connection is dropped by the network device. The connection can be forced to be restarted using the force argument.

Note:  This function can be used only when running proxy minions.

CLI Example:

salt 'xn' napalm.reconnect
salt 'xn' napalm.reconnect force=True

salt.modules.napalm_mod.rpc(command, **kwargs)
New in version 2019.2.0.

This is a wrapper to execute RPC requests on various network operating systems supported by NAPALM, invoking the following functions for the NAPALM native drivers:

- napalm.junos_rpc for junos
- napalm.pyeapi_run_commands for eos
- napalm.nxos_api_rpc for nxos
- napalm.netmiko_commands for ios, iosxr, and nxos_ssh

command  The RPC command to execute. This depends on the nature of the operating system.

kwargs  Key-value arguments to be sent to the underlying Execution function.

The function capabilities are extensible in the user environment via the napalm_rpc_map configuration option / Pillar, e.g.,

napalm_rpc_map:
  f5: napalm.netmiko_commands
  panos: panos.call

The mapping above reads: when the NAPALM os Grain is f5, then call napalm.netmiko_commands for RPC requests.

By default, if the user does not specify any map, non-native NAPALM drivers will invoke the napalm.netmiko_commands Execution function.

CLI Example:

salt 'xn' napalm.rpc 'show version'
salt 'xn' napalm.rpc get-interfaces
salt.modules.napalm_mod.scp_get(remote_path, local_path=", recursive=False, preserve_times=False, **kwargs)

New in version 2019.2.0.

Transfer files and directories from remote network device to the localhost of the Minion.

**Note:** This function is only available only when the underlying library scp is installed. See scp module for more details.

- remote_path: Path to retrieve from remote host. Since this is evaluated by scp on the remote host, shell wildcards and environment variables may be used.
- recursive: False Transfer files and directories recursively.
- preserve_times: False Preserve mtime and atime of transferred files and directories.
- passphrase: Used for decrypting private keys.
- pkey: An optional private key to use for authentication.
- key_filename: The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.
- timeout: An optional timeout (in seconds) for the TCP connect.
- socket_timeout: 10 The channel socket timeout in seconds.
- buff_size: 16384 The size of the SCP send buffer.
- allow_agent: True Set to False to disable connecting to the SSH agent.
- look_for_keys: True Set to False to disable searching for discoverable private key files in ~/.ssh/banner_timeout An optional timeout (in seconds) to wait for the SSH banner to be presented.
- auth_timeout: An optional authentication timeout (in seconds) to wait for an authentication response.
- auto_add_policy: False Automatically add the host to the known_hosts.

CLI Example:

```
salt '*' napalm.scp_get /var/tmp/file /tmp/file auto_add_policy=True
```

salt.modules.napalm_mod.scp_put(files, remote_path=None, recursive=False, preserve_times=False, saltenv='base', **kwargs)

New in version 2019.2.0.

Transfer files and directories to remote network device.

**Note:** This function is only available only when the underlying library scp is installed. See scp module for more details.

- files: A single path or a list of paths to be transferred.
- remote_path: The path on the remote device where to store the files.
- recursive: True Transfer files and directories recursively.
- preserve_times: False Preserve mtime and atime of transferred files and directories.
- saltenv: base The name of the Salt environment. Ignored when files is not a salt:// URL.
- hostname: The hostname of the remote device.
- port: 22 The port of the remote device.
- username: The username required for SSH authentication on the device.
- password: Used for password authentication. It is also used for private key decryption if passphrase is not given.
- passphrase: Used for decrypting private keys.
- pkey: An optional private key to use for authentication.
- key_filename: The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.
- timeout: An optional timeout (in seconds) for the TCP connect.
socket_timeout: 10 The channel socket timeout in seconds.
buf_size: 16384 The size of the SCP send buffer.
allow_agent: True Set to False to disable connecting to the SSH agent.
look_for_keys: True Set to False to disable searching for discoverable private key files in ~/.ssh/
banner_timeout An optional timeout (in seconds) to wait for the SSH banner to be presented.
auth_timeout An optional timeout (in seconds) to wait for an authentication response.
auto_add_policy: False Automatically add the host to the known_hosts.

CLI Example:
```
salt '*' napalm.scp_put /path/to/file /var/tmp/file auto_add_policy=True
```

21.9.264 salt.modules.napalm_netacl

NAPALM ACL

Generate and load ACL (firewall) configuration on network devices.

New in version 2017.7.0.

- **Codeauthor**: Mircea Ulinic <ping@mirceaolinic.net>
- **Maturity**: new
- **Depends**: capirca, napalm
- **Platform**: unix

**Dependencies**

The firewall configuration is generated by Capirca.

To install Capirca, execute: `pip install capirca`.

To be able to load configuration on network devices, it requires NAPALM library to be installed: `pip install napalm` Please check Installation for complete details.

- **salt.modules.napalm_netacl.get_filter_pillar**(filter_name, pillar_key='acl', pillarenv=None, saltenv=None)
  
  Helper that can be used inside a state SLS, in order to get the filter configuration given its name.
  
  - **filter_name**: The name of the filter.
  - **pillar_key**: The root key of the whole policy config.
  - **pillarenv**: Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
  - **saltenv**: Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

- **salt.modules.napalm_netacl.get_term_pillar**(filter_name, term_name, pillar_key='acl', pillarenv=None, saltenv=None)
  
  Helper that can be used inside a state SLS, in order to get the term configuration given its name, under a certain filter uniquely identified by its name.
  
  - **filter_name**: The name of the filter.
  - **term_name**: The name of the term.
  - **pillar_key**: acl The root key of the whole policy config. Default: acl.
  - **pillarenv**: Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
  - **saltenv**: Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.
salt.modules.napalm_netacl.load_filter_config(filter_name, filter_options=None, terms=None, prepend=True, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=True, only_lower_merge=False, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d', test=False, commit=True, debug=False, **kwargs)

Generate and load the configuration of a policy filter.

**Note:** The order of the terms is very important. The configuration loaded on the device respects the order defined in the terms and/or inside the pillar.

When merging the terms with the pillar data, consider the prepend argument to make sure the order is correct!

**filter_name** The name of the policy filter.

**filter_options** Additional filter options. These options are platform-specific. See the complete list of options.

**terms** List of terms for this policy filter. If not specified or empty, will try to load the configuration from the pillar, unless merge_pillar is set as False.

**prepend:** True When merge_pillar is set as True, the final list of terms generated by merging the terms from terms with those defined in the pillar (if any): new terms are prepended at the beginning, while existing ones will preserve the position. To add the new terms at the end of the list, set this argument to False.

**pillar_key:** acl The key in the pillar containing the default attributes values. Default: acl.

**pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv** Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

**merge_pillar:** True Merge the CLI variables with the pillar. Default: True.

The merge logic depends on the prepend argument and the CLI has higher priority than the pillar.

**only_lower_merge:** False Specify if it should merge only the terms fields. Otherwise it will try to merge also filters fields. Default: False. This option requires merge_pillar, otherwise it is ignored.

**revision_id** Add a comment in the filter config having the description for the changes applied.

**revision_no** The revision count.

**revision_date:** True Boolean flag: display the date when the filter configuration was generated. Default: True.

**revision_date_format:** %Y/%m/%d The date format to be used when generating the perforce data. Default: %Y/%m/%d (year/month/day).

**test:** False Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.

**commit:** True Commit? Default: True.

**debug:** False Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw configuration loaded on the device.

The output is a dictionary having the same form as net.load_config.

**CLI Example:**

```bash
salt 'edge01.bjm01' netacl.load_filter_config my-filter pillar_key=netacl\n->debug=True
```

**Output Example:**
edge01.bjm01:

----------

already_configured:
False

candidate:

diff:

[edit firewall]
+ family inet {
+ /*
+ ** $Date: 2017/03/22 $**
+ */
+ filter my-filter {

+     then accept;
+ }
+ }
}

loaded_config:

firewall {

    family inet {
        replace:
        /*
        ** $Date: 2017/03/22 $**
        */
        filter my-filter {
          interface-specific;
          term my-term {
            from {
              source-port [ 1234 1235 ];
            }
            then {
              reject;
            }
          }
          term my-other-term {
            from {
              protocol tcp;
              source-port 5678-5680;
            }
            then accept;
          }
        }
    }
}

(continues on next page)
The filter configuration has been loaded from the pillar, having the following structure:

```
netacl:
  - my-filter:
    terms:
      - my-term:
        source_port:
         - 1234
         - 1235
        action: reject
      - my-other-term:
        source_port:
         - 5678
         - 5680
        protocol: tcp
        action: accept
```

The filter configuration has been loaded from the pillar, having the following structure:

salt.modules.napalm_netacl.load_policy_config(filters=None, prepend=True, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=True, only_lower_merge=False, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d', test=False, commit=True, debug=False, **kwargs)

Generate and load the configuration of the whole policy.

**Note:** The order of the filters and their terms is very important. The configuration loaded on the device respects the order defined in the filters and/or inside the pillar.

When merging the filters with the pillar data, consider the prepend argument to make sure the order is correct!

- **filters** List of filters for this policy. If not specified or empty, will try to load the configuration from the pillar, unless merge_pillar is set as False.
- **prepend**: True When merge_pillar is set as True, the final list of filters generated by merging the filters from filters with those defined in the pillar (if any): new filters are prepended at the beginning, while existing ones will preserve the position. To add the new filters at the end of the list, set this argument to False.
- **pillar_key**: acl The key in the pillar containing the default attributes values. Default: acl.
- **pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
- **saltenv** Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.
- **merge_pillar**: True Merge the CLI variables with the pillar. Default: True.

The merge logic depends on the prepend argument and the CLI has higher priority than the pillar.

- **only_lower_merge**: False Specify if it should merge only the filters and terms fields. Otherwise it will try to merge everything at the policy level. Default: False. This option requires merge_pillar, otherwise it is ignored.
**revision_id**  Add a comment in the policy config having the description for the changes applied.

**revision_no**  The revision count.

**revision_date:**  **True**  Boolean flag: display the date when the policy configuration was generated. Default: True.

**revision_date_format:**  **%Y/%m/%d**  The date format to be used when generating the perforce data. Default: %Y/%m/%d (<year>/<month>/<day> '').

**test:**  **False**  Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.

**commit:**  **True**  Commit? Default: True.

**debug:**  **False**  Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw configuration loaded on the device.

The output is a dictionary having the same form as `net.load_config`.

CLI Example:

```
salt 'edge01.flw01' netacl.load_policy_config debug=True
```

Output Example:

```
edge01.flw01:
   """
   already_configured:
   False

(continues on next page)
The policy configuration has been loaded from the pillar, having the following structure:

```yaml
acl:
  - my-filter:
    terms:
      - my-term:
        source_port:
          - 1234
          - 1235
        protocol:
          - tcp
          - udp
        source_address: 1.2.3.4
        action: reject
      - my-other-term:
        source_port:
          - [5678, 5680]
        protocol: tcp
        action: accept
    - block-icmp:
      terms:
        - first-term:
          protocol:
            - icmp
          action: reject
```

salt.modules.napalm_netacl.load_term_config(filter_name, term_name, filter_options=None, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=True, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d', test=False, commit=True, debug=False, source_service=None, destination_service=None, **term_fields)

Generate and load the configuration of a policy term.

**filter_name** The name of the policy filter.

**term_name** The name of the term.

**filter_options** Additional filter options. These options are platform-specific. See the complete list of options.

**pillar_key:** acl The key in the pillar containing the default attributes values. Default: acl. If the pillar contains the following structure:

```yaml
firewall:
  - my-filter:
    terms:
      - my-term:
        source_port: 1234
        source_address:
          - 1.2.3.4/32
          - 5.6.7.8/32
```
The pillar_key field would be specified as `firewall`.

**pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

**merge_pillar**: `True` Merge the CLI variables with the pillar. Default: `True`.

The properties specified through the CLI have higher priority than the pillar.

**revision_id** Add a comment in the term config having the description for the changes applied.

**revision_no** The revision count.

**revision_date**: `True` Boolean flag: display the date when the term configuration was generated. Default: `True`.

**revision_date_format**: `%Y/%m/%d` The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (<year>/<month>/<day>).

**test**: `False` Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit**: `True` Commit? Default: `True`.

**debug**: `False` Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

**source_service** A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a source_port and protocol.

As this module is available on Unix platforms only, it reads the IANA port assignment from `/etc/services`.

If the user requires additional shortcuts to be referenced, they can add entries under `/etc/services`, which can be managed using the `file state`.

**destination_service** A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a destination_port and protocol. Allows the same options as `source_service`.

**term_fields** Term attributes. To see what fields are supported, please consult the list of supported keywords.

Some platforms have a few other optional keywords.

**Note:** The following fields are accepted (some being platform-specific):

- action
- address
- address_exclude
- comment
- counter
- expiration
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix
- forwarding_class
- forwarding_class_except
- logging
- log_name
- loss_priority
- option
- policer
- port
- precedence
- principals
- protocol
- protocol_except
- qos
• pan_application
• routing_instance
• source_address
• source_address_exclude
• source_port
• source_prefix
• verbatim
• packet_length
• fragment_offset
• hop_limit
• icmp_type
• ether_type
• traffic_class_count
• traffic_type
• translated
• dscp_set
• dscp_match
• dscp_except
• next_ip
• flexible_match_range
• source_prefix_except
• destination_prefix_except
• vpn
• source_tag
• destination_tag
• source_interface
• destination_interface
• flattened
• flattened_addr
• flattened_saddr
• flattened_daddr
• priority

Note: The following fields can be also a single value and a list of values:
• action
• address
• address_exclude
• comment
• destination_address
• destination_address_exclude
• destination_port
• destination_prefix
• forwarding_class
• forwarding_class_except
• logging
• option
• port
• precedence
• principals
• protocol
• protocol_except
• pan_application
• source_address
• source_address_exclude
• source_port
• source_prefix
• verbatim
• icmp_type
• ether_type
• traffic_type
• dscp_match
• dscp_except
• flexible_match_range
• source_prefix_except
• destination_prefix_except
• source_tag
• destination_tag
• source_service
• destination_service

Example: destination_address can be either defined as:

```
destination_address: 172.17.17.1/24
```

or as a list of destination IP addresses:

```
destination_address:
   - 172.17.17.1/24
   - 172.17.19.1/24
```

or a list of services to be matched:

```
source_service:
   - ntp
   - snmp
   - ldap
   - bgpd
```

Note: The port fields source_port and destination_port can be used as above to select either a single value, either a list of values, but also they can select port ranges. Example:

```
source_port:
   - 1000
   - 2000
   - 3000
   - 4000
```

With the configuration above, the user is able to select the 1000-2000 and 3000-4000 source port ranges.

The output is a dictionary having the same form as `net.load_config`.

CLI Example:

```
salt 'edge01.bjm01' netacl.load_term_config filter-name term-name source_address=1.2.3.4 destination_address=5.6.7.8 action=accept test=True debug=True
```

Output Example:
edge01.bjm01:

----------

already_configured:
False
comment:
  Configuration discarded.
diff:
  [edit firewall]
  + family inet {
  +   /*
  +   ** $Date: 2017/03/22 $**

  +     term term-name {
  +       from {
  +         source-address {
  +           1.2.3.4/32;
  +         }
  +       }
  +     }
  +     then accept;
  +   }
  + }
  }

loaded_config:
  firewall {
    family inet {
      replace:
      /*
      ** $Date: 2017/03/22 $**
      */
      filter filter-name {
        interface-specific;
        term term-name {
          from {
            source-address {
              1.2.3.4/32;
            }
          }
        }
      }
      then accept;
    }
  }

result:
  True

21.9.265 salt.modules.napalm_bgp module
NAPALM BGP

Manages BGP configuration on network devices and provides statistics.

**codeauthor** Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>

**maturity** new

**depends** napalm

**platform** unix

**Dependencies**

- *napalm proxy minion*

New in version 2016.11.0.

salt.modules.napalm_bgp.config(group=None, neighbor=None, **kwargs)

Provides the BGP configuration on the device.

**Parameters**

- **group** – Name of the group selected to display the configuration.
- **neighbor** – IP Address of the neighbor to display the configuration. If the group parameter is not specified, the neighbor setting will be ignored.

**Returns** A dictionary containing the BGP configuration from the network device. The keys of the main dictionary are the group names.

Each group has the following properties:

- type (string)
- description (string)
- apply_groups (string list)
- multihop_ttl (int)
- multipath (True/False)
- local_address (string)
- local_as (int)
- remote_as (int)
- import_policy (string)
- export_policy (string)
- remove_private_as (True/False)
- prefix_limit (dictionary)
- neighbors (dictionary)

Each neighbor in the dictionary of neighbors provides:

- description (string)
- import_policy (string)
- export_policy (string)
- local_address (string)
- local_as (int)
- remote_as (int)
- authentication_key (string)
- prefix_limit (dictionary)
- route_reflector_client (True/False)
- nhs (True/False)

**CLI Example:**

21.9. execution modules
salt '*' bgp.config # entire BGP config
salt '*' bgp.config PEERS-GROUP-NAME # provides detail only about BGP group PEERS-GROUP-NAME
salt '*' bgp.config PEERS-GROUP-NAME 172.17.17.1 # provides details only about BGP neighbor 172.17.17.1, # configured in the group PEERS-GROUP-NAME

Output Example:

```json
{
    'PEERS-GROUP-NAME':{
        'type': 'external',
        'description': 'Here we should have a nice description',
        'apply_groups': ['BGP-PREFIX-LIMIT'],
        'import_policy': 'PUBLIC-PEER-IN',
        'export_policy': 'PUBLIC-PEER-OUT',
        'remove_private': True,
        'multipath': True,
        'multihop_ttl': 30,
        'neighbors': {
            '192.168.0.1': {
                'description': 'Facebook [CDN]',
                'prefix_limit': {
                    'inet': {

}
```

```
salt.modules.napalm_bgp.neighbors(neighbor=None, **kwargs)
```

Provides details regarding the BGP sessions configured on the network device.

**Parameters**

- **neighbor** – IP Address of a specific neighbor.
Returns

A dictionary with the statistics of the all/selected BGP neighbors. Outer dictionary keys represent the VRF name. Keys of inner dictionary represent the AS numbers, while the values are lists of dictionaries, having the following keys:

- up (True/False)
- local_as (int)
- remote_as (int)
- local_address (string)
- routing_table (string)
- local_address_configured (True/False)
- local_port (int)
- remote_address (string)
- remote_port (int)
- multihop (True/False)
- multipath (True/False)
- remove_private_as (True/False)
- import_policy (string)
- export_policy (string)
- input_messages (int)
- output_messages (int)
- input_updates (int)
- output_updates (int)
- messages_queued_out (int)
- connection_state (string)
- previous_connection_state (string)
- last_event (string)
- suppress_4byte_as (True/False)
- local_as_prepend (True/False)
- holdtime (int)
- configured_holdtime (int)
- keepalive (int)
- configured_keepalive (int)
- active_prefix_count (int)
- received_prefix_count (int)
- accepted_prefix_count (int)
- suppressed_prefix_count (int)
- advertised_prefix_count (int)
• flap_count (int)

CLI Example:

```bash
salt '*' bgp.neighbors # all neighbors
salt '*' bgp.neighbors 172.17.17.1 # only session with BGP neighbor(s) 172.17.17.1
```

Output Example:

```
{
    'default': {
        8121: [
            {
                'up': True,
                'local_as': 13335,
                'remote_as': 8121,
                'local_address': '172.101.76.1',
                'local_address_configured': True,
                'local_port': 179,
                'remote_address': '192.247.78.0',
                'router_id': '192.168.0.1',
                'remote_port': 58380,
                'multihop': False,
                'import_policy': '4-NTT-TRANSIT-IN',
                'export_policy': '4-NTT-TRANSIT-OUT',
                'input_messages': 123,
                'output_messages': 13,
                'input_updates': 123,
                'output_updates': 5,
                'messages_queued_out': 23,
                'connection_state': 'Established',
                'previous_connection_state': 'EstabSync',
                'last_event': 'RecvKeepAlive',
                'suppress_4byte_as': False,
                'local_as_prepend': False,
                'holdtime': 90,
                'configured_holdtime': 90,
                'keepalive': 30,
                'configured_keepalive': 30,
                'active_prefix_count': 132808,
                'received_prefix_count': 566739,
                'accepted_prefix_count': 566479,
                'suppressed_prefix_count': 0,
                'advertise_prefix_count': 0,
                'flap_count': 27
            }
        ]
    }
}
```

21.9.266 salt.modules.napalm_formula module

NAPALM Formula helpers

New in version 2019.2.0.

This is an Execution Module providing helpers for various NAPALM formulas, e.g., napalm-interfaces-formula,
napalm-bgp-formula, napalm-ntp-formula etc., meant to provide various helper functions to make the templates more readable.

```python
salt.modules.napalm_formula.container_path(model, key=None, container=None, delim=':')
```

Return the list of all the possible paths in a container, down to the config container. This function can be used to verify that the `model` is a Python object correctly structured and respecting the OpenConfig hierarchy.

- **model**: The OpenConfig-structured object to inspect.
- **delim**: The key delimiter. In particular cases, it is indicated to use // as : might be already used in various cases, e.g., IPv6 addresses, interface name (e.g., Juniper QFX series), etc.

CLI Example:

```
salt '*' napalm_formula.container_path "{"interfaces": {"interface": {"Ethernet1 →": {"config": {"name": 'Ethernet1'}}}}}")"
```

The example above would return a list with the following element: interfaces:interface:Ethernet1:config which is the only possible path in that hierarchy.

Other output examples:

```
- interfaces:interface:Ethernet1:config
- interfaces:interface:Ethernet1:subinterfaces:subinterface:0:config
- interfaces:interface:Ethernet2:config
```

```python
salt.modules.napalm_formula.defaults(model, defaults, delim='//', flipped_merge=False)
```

Apply the defaults to a Python dictionary having the structure as described in the OpenConfig standards.

- **model**: The OpenConfig model to apply the defaults to.
- **defaults**: The dictionary of defaults. This argument must equally be structured with respect to the OpenConfig standards.
- **delim**: The key delimiter to use. Generally, // should cover all the possible cases, and you don’t need to override this value.
- **flipped_merge**: Whether should merge the model into the defaults, or the defaults into the model.

    Default: False (merge the model into the defaults, i.e., any defaults would be overridden by the values from the model).

CLI Example:

```
salt '*' napalm_formula.defaults "{"interfaces": {"interface": {"Ethernet1": { →: {"config": {"name": 'Ethernet1'}}}}}}", "{"interfaces": {"interface": {'*': { →: {"config": {"enabled": True}}}}}}"
```

As one can notice in the example above, the * corresponds to the interface name, therefore, the defaults will be applied on all the interfaces.

```python
salt.modules.napalm_formula.dictupdate(dest, upd, recursive_update=True, merge_lists=False)
```

Recursive version of the default dict.update

- **dest**: The destination dictionary.
- **upd**: The update dictionary.
- **recursive_update**: Whether should the recursive update be applied.
- **merge_lists**: Whether should the list types be merged.

If recursive_update=False, will use the classic dict.update, or fall back on a manual merge (helpful for non-dict types like FunctionWrapper).

If merge_lists=True, will aggregate list object types instead of replace. The list in upd is added to the list in dest, so the resulting list is dest[key] + upd[key]. This behaviour is only activated when recursive_update=True. By default merge_lists=False.

```python
salt.modules.napalm_formula.render_field(dictionary, field, prepend=None, append=None, quotes=False, **opts)
```

21.9. execution modules
Render a field found under the field level of the hierarchy in the dictionary object. This is useful to render a field in a Jinja template without worrying that the hierarchy might not exist. For example if we do the following in Jinja: {{ interfaces.interface.Ethernet5.config.description }} for the following object: {'interfaces': {'interface': {'Ethernet1': {'config': {'enabled': True}}}}}} it would error, as the Ethernet5 key does not exist. With this helper, we can skip this and avoid existence checks. This must be however used with care.

dictionary The dictionary to traverse.
field The key name or part to traverse in the dictionary.
prepend: None The text to prepend in front of the text. Usually, we need to have the name of the field too when generating the configuration.
append: None Text to append at the end.
quotes: False Whether should wrap the text around quotes.

CLI Example:

```bash
salt '*' napalm_formula.render_field "{'enabled': True}" enabled
# This would return the value of the 'enabled' leaf key
salt '*' napalm_formula.render_field "{'enabled': True}" description
# This would not error
```

Jinja usage example:

```jinja%
set config = {'enabled': True, 'description': 'Interface description'} %
{{ salt.napalm_formula.render_field(config, 'description', quotes=True) }}
%
```

The example above would be rendered on Arista / Cisco as:

```
description "Interface description"
```

While on Junos (the semicolon is important to be added, otherwise the configuration won’t be accepted by Junos):

```
description "Interface description;"
```

salt.modules.napalm_formula.render_fields(dictionary, 'fields', **opts)
This function works similarly to render_field but for a list of fields from the same dictionary, rendering, indenting and distributing them on separate lines.

dictionary The dictionary to traverse.
fields A list of field names or paths in the dictionary.
indent: 0 The indentation to use, prepended to the rendered field.
separator: \n The separator to use between fields.

CLI Example:

```bash
salt '*' napalm_formula.render_fields "{'mtu': 68, 'description': 'Interface description'}" mtu description
```

Jinja usage example:

```jinja%
set config={'mtu': 68, 'description': 'Interface description'} %
{{ salt.napalm_formula.render_fields(config, 'mtu', 'description', quotes=True) }}
%
```

The Jinja example above would generate the following configuration:

```
mtu "68"
description "Interface description"
```

salt.modules.napalm_formula.setval(key, val, dict=None, delim=':')
Set a value under the dictionary hierarchy identified under the key. The target 'foo/bar/baz' returns the dictionary hierarchy {'foo': {'bar': {'baz': {}}}}.
