#### 21.19.1 salt.states.acme module

ACME / Let’s Encrypt certificate management state

See also the module documentation

```python
def loadgitlab:
    cmd.run:
        - name: gitlab-ctl hup

dev.example.com:
    acme.cert:
        - aliases: gitlab.example.com
        - email: acmemaster@example.com
        - webroot: /opt/gitlab/embedded/service/gitlab-rails/public
        - renew: 14
        - fire_event: acme/dev.example.com
        - onchanges_in:
            - cmd: loadgitlab

salt.states.acme.cert(name, aliases=None, email=None, webroot=None, test_cert=False, renew=None, 
    keysize=None, server=None, owner='root', group='root', mode='0640', 
    certname=None, preferred_challenges=None, tls_sni_01_port=None, 
    tls_sni_01_address=None, http_01_port=None, http_01_address=None, 
    dns_plugin=None, dns_plugin_credentials=None)
```

Obtain/renew a certificate from an ACME CA, probably Let’s Encrypt.

**Parameters**

- `name` – Common Name of the certificate (DNS name of certificate)
- `aliases` – subjectAltNames (Additional DNS names on certificate)
- `email` – e-mail address for interaction with ACME provider
- **webroot** – True or a full path to webroot. Otherwise use standalone mode
- **test_cert** – Request a certificate from the Happy Hacker Fake CA (mutually exclusive with 'server')
- **renew** – True/'force' to force a renewal, or a window of renewal before expiry in days
- **keysize** – RSA key bits
- **server** – API endpoint to talk to
- **owner** – owner of the private key file
- **group** – group of the private key file
- **mode** – mode of the private key file
- **certname** – Name of the certificate to save
- **preferred_challenges** – A sorted, comma delimited list of the preferred challenge to use during authorization with the most preferred challenge listed first.
- **tls_sni_01_port** – Port used during tls-sni-01 challenge. This only affects the port Certbot listens on. A conforming ACME server will still attempt to connect on port 443.
- **tls_sni_01_address** – The address the server listens to during tls-sni-01 challenge.
- **http_01_port** – Port used in the http-01 challenge. This only affects the port Certbot listens on. A conforming ACME server will still attempt to connect on port 80.
- **https_01_address** – The address the server listens to during http-01 challenge.
- **dns_plugin** – Name of a DNS plugin to use (currently only 'cloudflare')
- **dns_plugin_credentials** – Path to the credentials file if required by the specified DNS plugin

21.19.2 salt.states.alias

Configuration of email aliases

The mail aliases file can be managed to contain definitions for specific email aliases:

```
username:
    alias.present:
        - target: user@example.com

thomas:
    alias.present:
        - target: thomas@example.com
```

The default alias file is set to /etc/aliases, as defined in Salt’s config execution module. To change the alias file from the default location, set the following in your minion config:

```
aliases.file: /my/alias/file
```

salt.states.alias.absent(name)

Ensure that the named alias is absent

- **name** The alias to remove

salt.states.alias.present(name, target)

Ensures that the named alias is present with the given target or list of targets. If the alias exists but the target differs from the previous entry, the target(s) will be overwritten. If the alias does not exist, the alias will be created.

- **name** The local user/address to assign an alias to
- **target** The forwarding address
21.19.3 salt.states.alternatives

Configuration of the alternatives system

Control the alternatives system

```python
{% set my_hadoop_conf = '/opt/hadoop/conf' %}

{{ my_hadoop_conf }}:
  file.directory
  hadoop-0.20-conf:
    alternatives.install:
      - name: hadoop-0.20-conf
      - link: /etc/hadoop-0.20/conf
      - path: {{ my_hadoop_conf }}
      - priority: 30
      - require:
        - file: {{ my_hadoop_conf }}
    hadoop-0.20-conf:
      alternatives.remove:
        - name: hadoop-0.20-conf
        - path: {{ my_hadoop_conf }}

salt.states.alternatives.auto(name)
New in version 0.17.0.
Instruct alternatives to use the highest priority path for <name>
name is the master name for this link group (e.g. pager)

salt.states.alternatives.install(name, link, path, priority)
Install new alternative for defined <name>
name is the master name for this link group (e.g. pager)
link is the symlink pointing to /etc/alternatives/<name>. (e.g. /usr/bin/pager)
path is the location of the new alternative target. NB: This file / directory must already exist. (e.g. /usr/bin/less)
priority is an integer; options with higher numbers have higher priority in automatic mode.

salt.states.alternatives.remove(name, path)
Removes installed alternative for defined <name> and <path> or fallback to default alternative, if some defined before.
name is the master name for this link group (e.g. pager)
path is the location of one of the alternative target files. (e.g. /usr/bin/less)

salt.states.alternatives.set_(name, path)
New in version 0.17.0.
Sets alternative for <name> to <path>, if <path> is defined as an alternative for <name>.
name is the master name for this link group (e.g. pager)
path is the location of one of the alternative target files. (e.g. /usr/bin/less)

foo:
  alternatives.set:
    - path: /usr/bin/foo-2.0
```

21.19.4 salt.states.ansiblegate
Execution of Ansible modules from within states

With `ansible.call` these states allow individual Ansible module calls to be made via states. To call an Ansible module function use a `module.run` state:

```python
some_set_of_tasks:
  ansible:
    - system.ping
    - packaging.os.zypper
    - name: emacs
    - state: installed
```

class salt.states.ansiblegate.AnsibleState

An Ansible state caller.

```python
def get_args(argset):
    # Get args and kwargs from the argset.
    return argset

salt.states.ansiblegate.playbooks(name, rundir=None, git_repo=None, git_kwargs=None, ansible_kwargs=None)

Run Ansible Playbooks

Parameters

- `name` – path to playbook. This can be relative to rundir or the git repo
- `rundir` – location to run ansible-playbook from.
- `git_repo` – git repository to clone for ansible playbooks. This is cloned using the `git.latest` state, and is cloned to the `rundir` if specified, otherwise it is clone to the `cache_dir`
- `git_kwargs` – extra kwargs to pass to `git.latest` state module besides the `name` and `target`
- `ansible_kwargs` – extra kwargs to pass to `ansible.playbooks` execution module besides the `name` and `target`

Returns

Ansible playbook output.

```python
run nginx install:
  ansible.playbooks:
    - name: install.yml
    - git_repo: git://github.com/gituser/playbook.git
    - git_kwargs:
        rev: master
```

21.19.5 `salt.states.apache`

Apache state

New in version 2014.7.0.

Allows for inputting a yaml dictionary into a file for apache configuration files.

The variable `this` is special and signifies what should be included with the above word between angle brackets (<>).

```yaml
/etc/httpd/conf.d/website.com.conf:
  apache.configfile:
    - config:
        VirtualHost:
```

(continues on next page)
this: '*:80'
ServerName:  
  - website.com
ServerAlias:  
  - www.website.com  
  - dev.website.com
ErrorLog: logs/website.com-error_log
CustomLog: logs/website.com-access_log combined
DocumentRoot: /var/www/vhosts/website.com
Directory:  
  this: /var/www/vhosts/website.com
  Order: Deny,Allow
  Deny from: all
  Allow from:  
    - 127.0.0.1  
    - 192.168.100.0/24
Options:
  - Indexes
  - FollowSymlinks
  AllowOverride: All

Changed in version 2018.3.

Allows having the same section container multiple times (e.g. `<Directory /path/to/dir>`).

YAML structure stays the same only replace dictionary with a list.

When a section container does not have mandatory attribute, such as `<Else>`, it still needs keyword `this` with empty string (or "" if nicer output is required - without space).

/etc/httpd/conf.d/website.com.conf:

```
apache.configfile:
  - config:
    - VirtualHost:
      - this: '*:80'
      - ServerName:  
        - website.com
      - DocumentRoot: /var/www/vhosts/website.com
      - Directory:
        - this: /var/www/vhosts/website.com
        Order: Deny,Allow
        Deny from: all
        Allow from:  
          - 127.0.0.1  
          - 192.168.100.0/24
        Options:
          - Indexes
          - FollowSymlinks
          AllowOverride: All
        - Directory:
          - this: /var/www/vhosts/website.com/private
          - Order: Deny,Allow
          - Deny from: all
          - Allow from:  
            - 127.0.0.1  
            - 192.168.100.0/24
          - If:  
```
```
    this: some condition
    do: something
- Else:
    this:
    do: something else
- Else:
    this: ""
    do: another thing
```

salt.states.apache.configfile(name, config)

### 21.19.6 salt.states.apache_conf module

Manage Apache Confs

New in version 2016.3.0.

Enable and disable apache confs.

```yaml
Enable security conf:
    apache_conf.enabled:
    - name: security

Disable security conf:
    apache_conf.disabled:
    - name: security
```

salt.states.apache_conf.disabled(name)

Ensure an Apache conf is disabled.

- **name** Name of the Apache conf

salt.states.apache_conf.enabled(name)

Ensure an Apache conf is enabled.

- **name** Name of the Apache conf

### 21.19.7 salt.states.apache_module

Manage Apache Modules

New in version 2014.7.0.

Enable and disable apache modules.

```yaml
Enable cgi module:
    apache_module.enabled:
    - name: cgi

Disable cgi module:
    apache_module.disabled:
    - name: cgi
```

salt.states.apache_module.disabled(name)

Ensure an Apache module is disabled.

- **name** Name of the Apache module

New in version 2016.3.0.
salt.states.apache_module.enabled(name)
Ensure an Apache module is enabled.

   name  Name of the Apache module

New in version 2016.3.0.

21.19.8 salt.states.apache_site module
Manage Apache Sites
New in version 2016.3.0.
Enable and disable apache sites.

Enable default site:
   apache_site.enabled:
   - name: default

Disable default site:
   apache_site.disabled:
   - name: default

salt.states.apache_site.disabled(name)
Ensure an Apache site is disabled.

   name  Name of the Apache site

salt.states.apache_site.enabled(name)
Ensure an Apache site is enabled.

   name  Name of the Apache site

21.19.9 salt.states.aptpkg
Package management operations specific to APT- and DEB-based systems

salt.states.aptpkg.held(name)
Set package in 'hold' state, meaning it will not be upgraded.

   name  The name of the package, e.g., 'tmux'

21.19.10 salt.states.archive
Extract an archive
New in version 2014.1.0.

salt.states.archive.extracted(name, source, source_hash=None, source_hash_name=None, source_hash_update=False, skip_files_list_verify=False, skip_verify=False, password=None, options=None, list_options=None, force=False, overwrite=False, clean=False, clean_parent=False, user=None, group=None, if_missing=None, trim_output=False, use_cmd_unzip=None, extract_perms=True, enforce_toplevel=True, enforce_ownership_on=None, archive_format=None, **kwargs)

New in version 2014.1.0.
Changed in version 2016.11.0: This state has been rewritten. Some arguments are new to this release and will not be available in the 2016.3 release cycle (and earlier). Additionally, the ZIP Archive Handling section below applies specifically to the 2016.11.0 release (and newer).

Ensure that an archive is extracted to a specific directory.

**Important: Changes for 2016.11.0**

In earlier releases, this state would rely on the `if_missing` argument to determine whether or not the archive needed to be extracted. When this argument was not passed, then the state would just assume `if_missing` is the same as the `name` argument (i.e. the parent directory into which the archive would be extracted).

This caused a number of annoyances. One such annoyance was the need to know beforehand a path that would result from the extraction of the archive, and setting `if_missing` to that directory, like so:

```
extract_myapp:
  archive.extracted:
    - name: /var/www
    - source: salt://apps/src/myapp-16.2.4.tar.gz
    - user: www
    - group: www
    - if_missing: /var/www/myapp-16.2.4
```

If `var/www` already existed, this would effectively make `if_missing` a required argument, just to get Salt to extract the archive.

Some users worked around this by adding the top-level directory of the archive to the end of the `name` argument, and then used `--strip` or `--strip-components` to remove that top-level dir when extracting:

```
extract_myapp:
  archive.extracted:
    - name: /var/www/myapp-16.2.4
    - source: salt://apps/src/myapp-16.2.4.tar.gz
    - user: www
    - group: www
```

With the rewrite for 2016.11.0, these workarounds are no longer necessary. `if_missing` is still a supported argument, but it is no longer required. The equivalent SLS in 2016.11.0 would be:

```
extract_myapp:
  archive.extracted:
    - name: /var/www
    - source: salt://apps/src/myapp-16.2.4.tar.gz
    - user: www
    - group: www
```

Salt now uses a function called `archive.list` to get a list of files/directories in the archive. Using this information, the state can now check the minion to see if any paths are missing, and know whether or not the archive needs to be extracted. This makes the `if_missing` argument unnecessary in most use cases.

**Important: ZIP Archive Handling**

*Note: this information applies to 2016.11.0 and later.*

Salt has two different functions for extracting ZIP archives:

1. `archive.unzip`, which uses Python’s `zipfile` module to extract ZIP files.
2. `archive.cmd_unzip`, which uses the `unzip` CLI command to extract ZIP files.

Salt will prefer the use of `archive.cmd_unzip` when CLI options are specified (via the `options` argument), and will otherwise prefer the `archive.unzip` function. Use of `archive.cmd_unzip` can be forced however by setting the `use_cmd_unzip` argument to `True`. By contrast, setting this argument to `False` will force usage of `archive.unzip`. For example:

```
/var/www:
  archive.extracted:
    - source: salt://foo/bar/myapp.zip
    - use_cmd_unzip: True
```

When `use_cmd_unzip` is omitted, Salt will choose which extraction function to use based on the source archive and the arguments passed to the state. When in doubt, simply do not set this argument; it is provided as a means of overriding the logic Salt uses to decide which function to use.

There are differences in the features available in both extraction functions. These are detailed below.

- **Command-line options** (only supported by `archive.cmd_unzip`) - When the `options` argument is used, `archive.cmd_unzip` is the only function that can be used to extract the archive. Therefore, if `use_cmd_unzip` is specified and set to `False`, and `options` is also set, the state will not proceed.

- **Permissions** - Due to an upstream bug in Python, permissions are not preserved when the `zipfile` module is used to extract an archive. As of the 2016.11.0 release, `archive.unzip` (as well as this state) has an `extract_perms` argument which, when set to `True` (the default), will attempt to match the permissions of the extracted files/directories to those defined within the archive. To disable this functionality and have the state not attempt to preserve the permissions from the ZIP archive, set `extract_perms` to `False`:

```
/var/www:
  archive.extracted:
    - source: salt://foo/bar/myapp.zip
    - extract_perms: False
```

**name** Directory into which the archive should be extracted

**source** Archive to be extracted

**Note:** This argument uses the same syntax as its counterpart in the `file.managed` state.

**source_hash** Hash of source file, or file with list of hash-to-file mappings

**Note:** This argument uses the same syntax as its counterpart in the `file.managed` state.

Changed in version 2016.11.0: If this argument specifies the hash itself, instead of a URI to a file containing hashes, the hash type can now be omitted and Salt will determine the hash type based on the length of the hash. For example, both of the below states are now valid, while before only the second one would be:

```
foo_app:
  archive.extracted:
    - name: /var/www
    - source: https://mydomain.tld/foo.tar.gz
    - source_hash: 3360db35e682f1c5f9c58aa307de16d41361618c

bar_app:
  archive.extracted:
```

(continues on next page)
source_hash_name When source_hash refers to a hash file, Salt will try to find the correct hash by matching the filename part of the source URI. When managing a file with a source of salt://files/foo.tar.gz, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fccc4a4d8  foo.tar.gz
```

This line would also match:

```
acbd18db4cc2f85cedef654fccc4a4d8  ./dir1/foo.tar.gz
```

However, sometimes a hash file will include multiple similar paths:

```
37b51d194a7513e45b56f6524f2d51f2  ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8  ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88  ./dir3/foo.txt
```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```
/var/www:
  archive.extracted:
    - source: https://mydomain.tld/dir2/foo.tar.gz
    - source_hash: https://mydomain.tld/hashes
    - source_hash_name: ./dir2/foo.tar.gz
```

Note: This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using foo.txt would not match.

New in version 2016.11.0.

source_hash_update [False] Set this to True if archive should be extracted if source_hash has changed and there is a difference between the archive and the local files. This would extract regardless of the if_missing parameter.

Note that this is only checked if the source value has not changed. If it has (e.g. to increment a version number in the path) then the archive will not be extracted even if the hash has changed.

Note: Setting this to True along with keep_source set to False will result the source re-download to do a archive file list check. If it’s not desirable please consider the skip_files_list_verify argument.

New in version 2016.3.0.

skip_files_list_verify [False] Set this to True if archive should be extracted if source_hash has changed but only checksums of the archive will be checked to determine if the extraction is required.

Note: The current limitation of this logic is that you have to set minions hash_type config option to the same one that you’re going to pass via source_hash argument.
New in version 3000.

**skip_verify** `[False]` If `True`, hash verification of remote file sources (http://, https://, ftp://) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.3.4.

**keep_source** `[True]` For source archives not local to the minion (i.e. from the Salt fileserver or a remote source such as http(s) or ftp), Salt will need to download the archive to the minion cache before they can be extracted. To remove the downloaded archive after extraction, set this argument to `False`.

New in version 2017.7.3.

**keep** `[True]` Same as `keep_source`, kept for backward-compatibility.

---

**Note:** If both `keep_source` and `keep` are used, `keep` will be ignored.

**password** For ZIP archives only. Password used for extraction.

New in version 2016.3.0.

Changed in version 2016.11.0: The newly-added `archive.is_encrypted` function will be used to determine if the archive is password-protected. If it is, then the `password` argument will be required for the state to proceed.

**options** For tar and zip archives only. This option can be used to specify a string of additional arguments to pass to the tar/zip command.

If this argument is not used, then the minion will attempt to use Python’s native `tarfile/zipfile` support to extract it. For zip archives, this argument is mostly used to overwrite existing files with o.

Using this argument means that the `tar` or `unzip` command will be used, which is less platform-independent, so keep this in mind when using this option; the CLI options must be valid options for the `tar/zip` implementation on the minion’s OS.

New in version 2016.11.0.

Changed in version 2015.8.11,2016.3.2: XZ-compressed tar archives no longer require `J` to manually be set in the `options`, they are now detected automatically and decompressed using the `xz` CLI command and extracted using `tar xvf`. This is a more platform-independent solution, as not all tar implementations support the `J` argument for extracting archives.

---

**Note:** For tar archives, main operators like `-x`, `--extract`, `--get`, `-c` and `-f/--file` should not be used here.

**list_options** For tar archives only. This state uses `archive.list` to discover the contents of the source archive so that it knows which file paths should exist on the minion if the archive has already been extracted. For the vast majority of tar archives, `archive.list` "just works". Archives compressed using gzip, bzip2, and xz/lzma (with the help of the `xz` CLI command) are supported automatically. However, for archives compressed using other compression types, CLI options must be passed to `archive.list`.

This argument will be passed through to `archive.list` as its `options` argument, to allow it to successfully list the archive’s contents. For the vast majority of archives, this argument should not need to be used, it should only be needed in cases where the state fails with an error stating that the archive’s contents could not be listed.

New in version 2016.11.0.

**force** `[False]` If a path that should be occupied by a file in the extracted result is instead a directory (or vice-versa), the state will fail. Set this argument to `True` to force these paths to be removed in order to allow the archive to be extracted.
**Warning:** Use this option very carefully.

New in version 2016.11.0.

**overwrite** [False] Set this to True to force the archive to be extracted. This is useful for cases where the filenames/directories have not changed, but the content of the files have.

New in version 2016.11.1.

**clean** [False] Set this to True to remove any top-level files and recursively remove any top-level directory paths before extracting.

**Note:** Files will only be cleaned first if extracting the archive is deemed necessary, either by paths missing on the minion, or if overwrite is set to True.

New in version 2016.11.1.

**clean_parent** [False] If True, and the archive is extracted, delete the parent directory (i.e. the directory into which the archive is extracted), and then re-create that directory before extracting. Note that clean and clean_parent are mutually exclusive.

New in version 3000.

**user** The user to own each extracted file. Not available on Windows.

New in version 2015.8.0.

Changed in version 2016.3.0: When used in combination with if_missing, ownership will only be enforced if if_missing is a directory.

Changed in version 2016.11.0: Ownership will be enforced only on the file/directory paths found by running `archive.list` on the source archive. An alternative root directory on which to enforce ownership can be specified using the `enforce_ownership_on` argument.

**group** The group to own each extracted file. Not available on Windows.

New in version 2015.8.0.

Changed in version 2016.3.0: When used in combination with if_missing, ownership will only be enforced if if_missing is a directory.

Changed in version 2016.11.0: Ownership will be enforced only on the file/directory paths found by running `archive.list` on the source archive. An alternative root directory on which to enforce ownership can be specified using the `enforce_ownership_on` argument.

**if_missing** If specified, this path will be checked, and if it exists then the archive will not be extracted. This path can be either a directory or a file, so this option can also be used to check for a semaphore file and conditionally skip extraction.

Changed in version 2016.3.0: When used in combination with either user or group, ownership will only be enforced when if_missing is a directory.

Changed in version 2016.11.0: Ownership enforcement is no longer tied to this argument, it is simply checked for existence and extraction will be skipped if if is present.

**trim_output** [False] Useful for archives with many files in them. This can either be set to True (in which case only the first 100 files extracted will be in the state results), or it can be set to an integer for more exact control over the max number of files to include in the state results.

New in version 2016.3.0.

**use_cmd_unzip** [False] Set to True for zip files to force usage of the `archive.cmd_unzip` function to extract.

New in version 2016.11.0.
extract_perms [True] For ZIP archives only. When using `archive.unzip` to extract ZIP archives, Salt works around an upstream bug in Python to set the permissions on extracted files/directories to match those encoded into the ZIP archive. Set this argument to `False` to skip this workaround.

New in version 2016.11.0.

enforce_toplevel [True] This option will enforce a single directory at the top level of the source archive, to prevent extracting a `‘tar-bomb’`. Set this argument to `False` to allow archives with files (or multiple directories) at the top level to be extracted.

New in version 2016.11.0.

enforce_ownership_on When user or group is specified, Salt will default to enforcing permissions on the file/directory paths detected by running `archive.list` on the source archive. Use this argument to specify an alternate directory on which ownership should be enforced.

Note: This path must be within the path specified by the name argument.

New in version 2016.11.0.

archive_format One of `tar`, `zip`, or `rar`.

Changed in version 2016.11.0: If omitted, the archive format will be guessed based on the value of the source argument. If the minion is running a release older than 2016.11.0, this option is required.

Examples
1. tar with lmza (i.e. xz) compression:

   ```
   graylog2-server:
   
   archive.extracted:
   
   - name: /opt/
   
   - source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-server-0.9.6p1.tar.lzma
   
   - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
   ```

2. tar archive with flag for verbose output, and enforcement of user/group ownership:

   ```
   graylog2-server:
   
   archive.extracted:
   
   - name: /opt/
   
   - source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-server-0.9.6p1.tar.gz
   
   - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
   
   - options: v
   
   - user: foo
   
   - group: foo
   ```

3. tar archive, with `source_hash_update` set to `True` to prevent state from attempting extraction unless the `source_hash` differs from the previous time the archive was extracted:

   ```
   graylog2-server:
   
   archive.extracted:
   
   - name: /opt/
   
   - source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-server-0.9.6p1.tar.lzma
   
   - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
   
   - source_hash_update: True
   ```
## 21.19.11 salt.states.artifactory

This state downloads artifacts from artifactory.

```python
salt.states.artifactory.downloaded(name, artifact, target_dir='tmp', target_file=None, use_literal_group_id=False)
```

Ensures that the artifact from artifactory exists at given location. If it doesn’t exist, then it will be downloaded. If it already exists then the checksum of existing file is checked against checksum in artifactory. If it is different then the step will fail.

**artifact** Details of the artifact to be downloaded from artifactory. Various options are:

- **artifactory_url**: URL of the artifactory instance
- **repository**: Repository in artifactory
- **artifact_id**: Artifact ID
- **group_id**: Group ID
- **packaging**: Packaging
- **classifier**: Classifier .. versionadded:: 2015.8.0
- **version**: Version One of the following: - Version to download - latest - Download the latest release of this artifact - latest_snapshot - Download the latest snapshot for this artifact
- **username**: Artifactory username .. versionadded:: 2015.8.0
- **password**: Artifactory password .. versionadded:: 2015.8.0

**target_dir** Directory where the artifact should be downloaded. By default it is downloaded to /tmp directory.

**target_file** Target file to download artifact to. By default file name is resolved by artifactory.

An example to download an artifact to a specific file:

```yaml
jboss_module_downloaded:
  artifactory.downloaded:
    - artifact:
        artifactory_url: http://artifactory.intranet.example.com/artifactory
        repository: 'libs-release-local'
        artifact_id: 'module'
        group_id: 'com.company.module'
        packaging: 'jar'
        classifier: 'sources'
        version: '1.0'
        target_file: /opt/jboss7/modules/com/company/lib/module.jar
```

Download artifact to the folder (automatically resolves file name):

```yaml
jboss_module_downloaded:
  artifactory.downloaded:
    - artifact:
        artifactory_url: http://artifactory.intranet.example.com/artifactory
        repository: 'libs-release-local'
        artifact_id: 'module'
        group_id: 'com.company.module'
        packaging: 'jar'
        classifier: 'sources'
        version: '1.0'
        target_dir: /opt/jboss7/modules/com/company/lib
```

## 21.19.12 salt.states.at

Configuration disposable regularly scheduled tasks for at.

The at state can be add disposable regularly scheduled tasks for your system.
salt.states.at.absent(name, jobid=None, **kwargs)
Changed in version 2017.7.0.
Remove a job from queue

jobid: string|int Specific jobid to remove
tag  [string] Job's tag
runas  [string] Runs user-specified jobs
kwargs  Addition kwargs can be provided to filter jobs. See output of at.jobcheck for more.

example1:
at.absent:

Warning: this will remove all jobs!

example2:
at.absent:
- year: 13

example3:
at.absent:
- tag: rose

example4:
at.absent:
- tag: rose
  - day: 13
  - hour: 16

example5:
at.absent:
- jobid: 4

salt.states.at.mod_watch(name, **kwargs)
The at watcher, called to invoke the watch command.

Note: This state exists to support special handling of the watch requisite. It should not be called directly.
Parameters for this function should be set by the state being triggered.

name  The name of the atjob

salt.states.at.present(name, timespec, tag=None, user=None, job=None, unique_tag=False)
Changed in version 2017.7.0.
Add a job to queue.
job  [string] Command to run.
timespec  [string] The 'timespec' follows the format documented in the at(1) manpage.
tag  [string] Make a tag for the job.
user  [string] The user to run the at job .. versionadded:: 2014.1.4
unique_tag  [boolean] If set to True job will not be added if a job with the tag exists. .. versionadded:: 2017.7.0

rose:
at.present:
salt.states.at.watch(name, timespec, tag=None, user=None, job=None, unique_tag=False)

New in version 2017.7.0.

Add an at job if trigger by watch

job [string] Command to run.
timespec [string] The 'timespec' follows the format documented in the at(1) manpage.
tag [string] Make a tag for the job.
user [string] The user to run the at job .. versionadded:: 2014.1.4
unique_tag [boolean] If set to True job will not be added if a job with the tag exists. .. versionadded:: 2017.7.0

minion_restart:
at.watch:
  - job: 'salt-call --local service.restart salt-minion'
  - timespec: 'now +1 min'
  - tag: minion_restart
  - unique_tag: trye
  - watch:
    - file: /etc/salt/minion

21.19.13 salt.states.augeas

Configuration management using Augeas

New in version 0.17.0.

This state requires the augeas Python module.

Augeas can be used to manage configuration files.

Warning: Minimal installations of Debian and Ubuntu have been seen to have packaging bugs with python-augeas, causing the augeas module to fail to import. If the minion has the augeas module installed, and the state fails with a comment saying that the state is unavailable, first restart the salt-minion service. If the problem persists past that, the following command can be run from the master to determine what is causing the import to fail:
salt minion-id cmd.run 'python -c "from augeas import Augeas"'

For affected Debian/Ubuntu hosts, installing libpython2.7 has been known to resolve the issue.

salt.states.augeas.change(name, context=None, changes=None, lens=None, load_path=None, **kwargs)

New in version 2014.7.0.

This state replaces setvalue().

Issue changes to Augeas, optionally for a specific context, with a specific lens.

name State name
context A file path, prefixed by /files. Should resolve to an actual file (not an arbitrary augeas path). This is used to avoid duplicating the file name for each item in the changes list (for example, set bind 0.
0.0.0 in the example below operates on the file specified by context). If context is not specified, a file path prefixed by /files should be included with the set command.

The file path is examined to determine if the specified changes are already present.

```yaml
redis-conf:
    augeas.change:
      - context: /files/etc/redis/redis.conf
        changes:
          - set bind 0.0.0.0
          - set maxmemory 1G
```

changes List of changes that are issued to Augeas. Available commands are set, setm, m/v/move, ins/insert, and rm/remove.

lens The lens to use, needs to be suffixed with .lns, e.g.: Nginx.lns. See the list of stock lenses shipped with Augeas.

New in version 2016.3.0.

load_path A list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LENS_LIB.

Usage examples:

Set the bind parameter in /etc/redis/redis.conf:

```yaml
redis-conf:
    augeas.change:
      - context: /files/etc/redis/redis.conf
        changes:
          - set /files/etc/redis/redis.conf/bind 0.0.0.0
```

Note: Use the context parameter to specify the file you want to manipulate. This way you don’t have to include this in the changes every time:

```yaml
redis-conf:
    augeas.change:
      - context: /files/etc/redis/redis.conf
        changes:
          - set bind 0.0.0.0
          - set databases 4
          - set maxmemory 1G
```

Augeas is aware of a lot of common configuration files and their syntax. It knows the difference between for example ini and yaml files, but also files with very specific syntax, like the hosts file. This is done with lenses, which provide mappings between the Augeas tree and the file.

There are many preconfigured lenses that come with Augeas by default, and they specify the common locations for configuration files. So most of the time Augeas will know how to manipulate a file. In the event that you need to manipulate a file that Augeas doesn’t know about, you can specify the lens to use like this:

```yaml
redis-conf:
    augeas.change:
      - lens: redis.lns
        context: /files/etc/redis/redis.conf
        changes:
          - set bind 0.0.0.0
```

Note: Even though Augeas knows that /etc/redis/redis.conf is a Redis configuration file and knows how to parse it, it is recommended to specify the lens anyway. This is because by default, Augeas loads all
known lenses and their associated file paths. All these files are parsed when Augeas is loaded, which can take some time. When specifying a lens, Augeas is loaded with only that lens, which speeds things up quite a bit.

A more complex example, this adds an entry to the services file for Zabbix, and removes an obsolete service:

```
zabbix-service:
    augeas.change:
        - lens: services.lns
        - context: /files/etc/services
        - changes:
            - ins service-name after service-name[last()]
            - set service-name[last()] "zabbix-agent"
            - set "service-name[. = 'zabbix-agent']/port" 10050
            - set "service-name[. = 'zabbix-agent']/protocol" tcp
            - set "service-name[. = 'zabbix-agent']/#comment" "Zabbix Agent service"
            - rm "service-name[. = 'im-obsolete']"
        - unless: grep "zabbix-agent" /etc/services
```

**Warning:** Don’t forget the `unless` here, otherwise it will fail on next runs because the service is already defined. Additionally you have to quote lines containing `service-name[. = 'zabbix-agent']` otherwise `augeas_cfg` execute will fail because it will receive more parameters than expected.

**Note:** Order is important when defining a service with Augeas, in this case it’s `port`, `protocol` and `#comment`. For more info about the lens check services lens documentation.

http://augeas.net/docs/references/lenses/files/services-aug.html#Services.record

#### 21.19.14 salt.states.aws_sqs

Manage SQS Queues

Create and destroy SQS queues. Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses the `awscli` tool provided by Amazon. This can be downloaded from pip. Also check the documentation for `awscli` for configuration information.

```
myqueue:
    aws_sqs.exists:
        - region: eu-west-1
```

```python
salt.states.aws_sqs.absent(name, region, user=None, opts=False)
    Remove the named SQS queue if it exists.
    name Name of the SQS queue.
    region Region to remove the queue from
    user Name of the user performing the SQS operations
    opts Include additional arguments and options to the aws command line

salt.states.aws_sqs.exists(name, region, user=None, opts=False)
    Ensure the SQS queue exists.
    name Name of the SQS queue.
    region Region to create the queue
    user Name of the user performing the SQS operations
```
opts  Include additional arguments and options to the aws command line

21.19.15 salt.states.azurearm_compute

Azure (ARM) Compute State Module
New in version 2019.2.0.

maintainer  <devops@decisionlab.io>
maturity  new
depends
  • azure >= 2.0.0
  • azure-common >= 1.1.8
  • azure-mgmt >= 1.0.0
  • azure-mgmt-compute >= 1.0.0
  • azure-mgmt-network >= 1.7.1
  • azure-mgmt-resource >= 1.1.0
  • azure-mgmt-storage >= 1.0.0
  • azure-mgmt-web >= 0.32.0
  • azure-storage >= 0.34.3
  • msrestazure >= 0.4.21

platform  linux

configuration  This module requires Azure Resource Manager credentials to be passed as a dictionary of keyword arguments to the connection_auth parameter in order to work properly. Since the authentication parameters are sensitive, it’s recommended to pass them to the states via pillar.

Required provider parameters:
if using username and password:
  • subscription_id
  • username
  • password
if using a service principal:
  • subscription_id
  • tenant
  • client_id
  • secret

Optional provider parameters:
cloud_environment: Used to point the cloud driver to different API endpoints, such as Azure GovCloud. Possible values:
  • AZURE_PUBLIC_CLOUD (default)
  • AZURE_CHINA_CLOUD
- AZURE_US_GOV_CLOUD
- AZURE_GERMAN_CLOUD

Example Pillar for Azure Resource Manager authentication:

```python
azurearm:
  user_pass_auth:
    subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
    username: fletch
    password: 123pass
  mysubscription:
    subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
    tenant: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
    client_id: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
    secret: Xxxxxxxxxxxxxxxxxxxxxxxx
    cloud_environment: AZURE_PUBLIC_CLOUD
```

Example states using Azure Resource Manager authentication:

```python
{% set profile = salt['pillar.get']('azurearm:mysubscription') %}
Ensure availability set exists:
  azurearm_compute.availability_set_present:
    - name: my_avail_set
    - resource_group: my_rg
    - virtual_machines:
      - my_vm1
      - my_vm2
    - tags:
      how_awesome: very
      contact_name: Elmer Fudd Gantry
    - connection_auth: {{ profile }}

Ensure availability set is absent:
  azurearm_compute.availability_set_absent:
    - name: other_avail_set
    - resource_group: my_rg
    - connection_auth: {{ profile }}
```

```python
salt.states.azurearm_compute.availability_set_absent(name, resource_group, connection_auth=None)
```

New in version 2019.2.0.

Ensure an availability set does not exist in a resource group.

Parameters

- **name** – Name of the availability set.
- **resource_group** – Name of the resource group containing the availability set.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

```python
salt.states.azurearm_compute.availability_set_present(name, resource_group,
  tags=None, platform_update_domain_count=None,
  platform_fault_domain_count=None, virtual_machines=None,
  sku=None, connection_auth=None, **kwargs)
```

New in version 2019.2.0.
Ensure an availability set exists.

Parameters

- **name** – Name of the availability set.
- **resource_group** – The resource group assigned to the availability set.
- **tags** – A dictionary of strings can be passed as tag metadata to the availability set object.
- **platform_update_domain_count** – An optional parameter which indicates groups of virtual machines and underlying physical hardware that can be rebooted at the same time.
- **platform_fault_domain_count** – An optional parameter which defines the group of virtual machines that share a common power source and network switch.
- **virtual_machines** – A list of names of existing virtual machines to be included in the availability set.
- **sku** – The availability set SKU, which specifies whether the availability set is managed or not. Possible values are 'Aligned' or 'Classic'. An 'Aligned' availability set is managed, 'Classic' is not.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```yaml
Ensure availability set exists:
    azurearm_compute.availability_set_present:
      - name: aset1
      - resource_group: group1
      - platform_update_domain_count: 5
      - platform_fault_domain_count: 3
      - sku: aligned
      - tags:
          contact_name: Elmer Fudd Gantry
      - connection_auth: {{ profile }}
      - require:
        - azurearm_resource: Ensure resource group exists
```

21.19.16 salt.states.azurearm_network

Azure (ARM) Network State Module

New in version 2019.2.0.

**maintainer** <devops@decisionlab.io>

**maturity** new

**depends**

- azure >= 2.0.0
- azure-common >= 1.1.8
- azure-mgmt >= 1.0.0
- azure-mgmt-compute >= 1.0.0
- azure-mgmt-network >= 1.7.1
- azure-mgmt-resource >= 1.1.0
- azure-mgmt-storage >= 1.0.0
- azure-mgmt-web >= 0.32.0
platform linux

configuration This module requires Azure Resource Manager credentials to be passed as a dictionary of keyword arguments to the connection_auth parameter in order to work properly. Since the authentication parameters are sensitive, it’s recommended to pass them to the states via pillar.

Required provider parameters:

if using username and password:
  * subscription_id
  * username
  * password

if using a service principal:
  * subscription_id
  * tenant
  * client_id
  * secret

Optional provider parameters:

cloud_environment: Used to point the cloud driver to different API endpoints, such as Azure GovCloud. Possible values:

  * AZURE_PUBLIC_CLOUD (default)
  * AZURE_CHINA_CLOUD
  * AZURE_US_GOV_CLOUD
  * AZURE_GERMAN_CLOUD

Example Pillar for Azure Resource Manager authentication:

```yaml
azurearm:
  user_pass_auth:
    subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
    username: fletch
    password: 123pass
  mysubscription:
    subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
    tenant: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
    client_id: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
    secret: XXXXXXXXXXXXXXXXXXXXXXXXXXX
    cloud_environment: AZURE_PUBLIC_CLOUD
```

Example states using Azure Resource Manager authentication:

```yaml
{% set profile = salt['pillar.get']('azurearm:mysubscription') %}
Ensure virtual network exists:
  azurearm_network.virtual_network_present:
    - name: my_vnet
    - resource_group: my_rg
    - address_prefixes:
```

  contact_name: Elmer Fudd Gantry
- connection_auth: {{ profile }}

Ensure virtual network is absent:
azurearm_network.virtual_network_absent:
  - name: other_vnet
  - resource_group: my_rg
  - connection_auth: {{ profile }}

salt.states.azurearm_network.load_balancer_absent(name, resource_group, connection_auth=None)

New in version 2019.2.0.
Ensure a load balancer does not exist in the resource group.

Parameters

- **name** – Name of the load balancer.
- **resource_group** – The resource group assigned to the load balancer.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_network.load_balancer_present(name, resource_group, sku=None, frontend_ip_configurations=None, backend_address_pools=None, load_balancing_rules=None, probes=None, inbound_nat_rules=None, inbound_nat_pools=None, outbound_nat_rules=None, tags=None, connection_auth=None, **kwargs)

New in version 2019.2.0.
Ensure a load balancer exists.

Parameters

- **name** – Name of the load balancer.
- **resource_group** – The resource group assigned to the load balancer.
- **sku** – The load balancer SKU, which can be 'Basic' or 'Standard'.
- **tags** – A dictionary of strings can be passed as tag metadata to the load balancer object.
- **frontend_ip_configurations** – An optional list of dictionaries representing valid FrontendIPConfiguration objects. A frontend IP configuration can be either private (using private IP address and subnet parameters) or public (using a reference to a public IP address object). Valid parameters are:
  - **name** – The name of the resource that is unique within a resource group.
  - **private_ip_address** – The private IP address of the IP configuration. Required if 'private_ip_allocation_method' is 'Static'.
  - **private_ip_allocation_method** – The Private IP allocation method. Possible values are: 'Static' and 'Dynamic'.
  - **subnet** – Name of an existing subnet inside of which the frontend IP will reside.
  - **public_ip_address** – Name of an existing public IP address which will be
assigned to the frontend IP object.

- **backend_address_pools** – An optional list of dictionaries representing valid BackendAddressPool objects. Only the 'name' parameter is valid for a BackendAddressPool dictionary. All other parameters are read-only references from other objects linking to the backend address pool. Inbound traffic is randomly load balanced across IPs in the backend IPs.

- **probes** – An optional list of dictionaries representing valid Probe objects. Valid parameters are:
  - **name**: The name of the resource that is unique within a resource group.
  - **protocol**: The protocol of the endpoint. Possible values are 'Http' or 'Tcp'. If 'Tcp' is specified, a received ACK is required for the probe to be successful. If 'Http' is specified, a 200 OK response from the specified URI is required for the probe to be successful.
  - **port**: The port for communicating the probe. Possible values range from 1 to 65535, inclusive.
  - **interval_in_seconds**: The interval, in seconds, for how frequently to probe the endpoint for health status. Typically, the interval is slightly less than half the allocated timeout period (in seconds) which allows two full probes before taking the instance out of rotation. The default value is 15, the minimum value is 5.
  - **number_of_probes**: The number of probes where if no response, will result in stopping further traffic from being delivered to the endpoint. This values allows endpoints to be taken out of rotation faster or slower than the typical times used in Azure.
  - **request_path**: The URI used for requesting health status from the VM. Path is required if a protocol is set to 'Http'. Otherwise, it is not allowed. There is no default value.

- **load_balancing_rules** – An optional list of dictionaries representing valid LoadBalancingRule objects. Valid parameters are:
  - **name**: The name of the resource that is unique within a resource group.
  - **load_distribution**: The load distribution policy for this rule. Possible values are 'Default', 'SourceIP', and 'SourceIPProtocol'.
  - **frontend_port**: The port for the external endpoint. Port numbers for each rule must be unique within the Load Balancer. Acceptable values are between 0 and 65534. Note that value 0 enables 'Any Port'.
  - **backend_port**: The port used for internal connections on the endpoint. Acceptable values are between 0 and 65535. Note that value 0 enables 'Any Port'.
  - **idle_timeout_in_minutes**: The timeout for the TCP idle connection. The value can be set between 4 and 30 minutes. The default value is 4 minutes. This element is only used when the protocol is set to TCP.
  - **enable Floating_ip**: Configures a virtual machine's endpoint for the floating IP capability required to configure a SQL AlwaysOn Availability Group. This setting is required when using the SQL AlwaysOn Availability Groups in SQL server. This setting can't be changed after you create the endpoint.
  - **disable_outbound_snat**: Configures SNAT for the VMs in the backend pool to use the public IP address specified in the frontend of the load balancing rule.
  - **frontend_ip_configuration**: Name of the frontend IP configuration object used by the load balancing rule object.
  - **backend_address_pool**: Name of the backend address pool object used by the load balancing rule object. Inbound traffic is randomly load balanced across IPs in the backend IPs.
  - **probe**: Name of the probe object used by the load balancing rule object.

- **inbound_nat_rules** – An optional list of dictionaries representing valid In-
boundNatRule objects. Defining inbound NAT rules on your load balancer is mutually exclusive with defining an inbound NAT pool. Inbound NAT pools are referenced from virtual machine scale sets. NICs that are associated with individual virtual machines cannot reference an Inbound NAT pool. They have to reference individual inbound NAT rules. Valid parameters are:

- **name**: The name of the resource that is unique within a resource group.
- **frontend_ip_configuration**: Name of the frontend IP configuration object used by the inbound NAT rule object.
- **protocol**: Possible values include 'Udp', 'Tcp', or 'All'.
- **frontend_port**: The port for the external endpoint. Port numbers for each rule must be unique within the Load Balancer. Acceptable values range from 1 to 65534.
- **backend_port**: The port used for the internal endpoint. Acceptable values range from 1 to 65535.
- **idle_timeout_in_minutes**: The timeout for the TCP idle connection. The value can be set between 4 and 30 minutes. The default value is 4 minutes. This element is only used when the protocol is set to TCP.
- **enableloating_ip**: Configures a virtual machine's endpoint for the floating IP capability required to configure a SQL AlwaysOn Availability Group. This setting is required when using the SQL AlwaysOn Availability Groups in SQL server. This setting can't be changed after you create the endpoint.
- **inbound_nat_pools** – An optional list of dictionaries representing valid InboundNatPool objects. They define an external port range for inbound NAT to a single backend port on NICs associated with a load balancer. Inbound NAT rules are created automatically for each NIC associated with the Load Balancer using an external port from this range. Defining an Inbound NAT pool on your Load Balancer is mutually exclusive with defining inbound NAT rules. Inbound NAT pools are referenced from virtual machine scale sets. NICs that are associated with individual virtual machines cannot reference an inbound NAT pool. They have to reference individual inbound NAT rules. Valid parameters are:
  - **name**: The name of the resource that is unique within a resource group.
  - **frontend_ip_configuration**: Name of the frontend IP configuration object used by the inbound NAT pool object.
  - **protocol**: Possible values include 'Udp', 'Tcp', or 'All'.
  - **frontend_port_range_start**: The first port number in the range of external ports that will be used to provide Inbound NAT to NICs associated with a load balancer. Acceptable values range between 1 and 65534.
  - **frontend_port_range_end**: The last port number in the range of external ports that will be used to provide Inbound NAT to NICs associated with a load balancer. Acceptable values range between 1 and 65535.
  - **backend_port**: The port used for internal connections to the endpoint. Acceptable values are between 1 and 65535.
- **outbound_nat_rules** – An optional list of dictionaries representing valid OutboundNatRule objects. Valid parameters are:
  - **name**: The name of the resource that is unique within a resource group.
  - **frontend_ip_configuration**: Name of the frontend IP configuration object used by the outbound NAT rule object.
  - **backend_address_pool**: Name of the backend address pool object used by the outbound NAT rule object. Outbound traffic is randomly load balanced across IPs in the backend IPs.
  - **allocated_outbound_ports**: The number of outbound ports to be used for NAT.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.
Example usage:

```python
Ensure load balancer exists:
azurearm_network.load_balancer_present:
  - name: lb1
  - resource_group: group1
  - location: eastus
  - frontend_ip_configurations:
    - name: lb1_feip1
      public_ip_address: pub_ip1
  - backend_address_pools:
    - name: lb1_bepool1
  - probes:
    - name: lb1_webprobe1
      protocol: tcp
      port: 80
      interval_in_seconds: 5
      number_of_probes: 2
  - load_balancing_rules:
    - name: lb1_webprobe1
      protocol: tcp
      frontend_port: 80
      backend_port: 80
      idle_timeout_in_minutes: 4
      frontend_ip_configuration: lb1_feip1
      backend_address_pool: lb1_bepool1
      probe: lb1_webprobe1
  - tags:
    - contact_name: Elmer Fudd Gantry
  - connection_auth: {{ profile }}
  - require:
    - azurearm_resource: Ensure resource group exists
    - azurearm_network: Ensure public IP exists
```

salt.states.azurearm_network.network_interface_absent(name, resource_group, connection_auth=None)

New in version 2019.2.0.

Ensure a network interface does not exist in the resource group.

Parameters

- **name** – Name of the network interface.
- **resource_group** – The resource group assigned to the network interface.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_network.network_interface_present(name, ip_configurations, subnet, virtual_network, resource_group, tags=None, virtual_machine=None, network_security_group=None, dns_settings=None, mac_address=None, primary=None, enable_accelerated_networking=None, enable_ip_forwarding=None, connection_auth=None, **kwargs)
New in version 2019.2.0.

Ensure a network interface exists.

Parameters

- **name** – Name of the network interface.
- **ip_configurations** – A list of dictionaries representing valid NetworkInterfaceIPConfiguration objects. The 'name' key is required at minimum. At least one IP Configuration must be present.
- **subnet** – Name of the existing subnet assigned to the network interface.
- **virtual_network** – Name of the existing virtual network containing the subnet.
- **resource_group** – The resource group assigned to the virtual network.
- **tags** – A dictionary of strings can be passed as tag metadata to the network interface object.
- **network_security_group** – The name of the existing network security group to assign to the network interface.
- **virtual_machine** – The name of the existing virtual machine to assign to the network interface.
- **dns_settings** – An optional dictionary representing a valid NetworkInterfaceDnsSettings object. Valid parameters are:
  - **dns_servers**: List of DNS server IP addresses. Use 'AzureProvidedDNS' to switch to Azure provided DNS resolution. 'AzureProvidedDNS' value cannot be combined with other IPs, it must be the only value in dns_servers collection.
  - **internal_dns_name_label**: Relative DNS name for this NIC used for internal communications between VMs in the same virtual network.
  - **internal_fqdn**: Fully qualified DNS name supporting internal communications between VMs in the same virtual network.
  - **internal_domain_name_suffix**: Even if internal_dns_name_label is not specified, a DNS entry is created for the primary NIC of the VM. This DNS name can be constructed by concatenating the VM name with the value of internal_domain_name_suffix.
- **mac_address** – Optional string containing the MAC address of the network interface.
- **primary** – Optional boolean allowing the interface to be set as the primary network interface on a virtual machine with multiple interfaces attached.
- **enable_accelerated_networking** – Optional boolean indicating whether accelerated networking should be enabled for the interface.
- **enable_ip_forwarding** – Optional boolean indicating whether IP forwarding should be enabled for the interface.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```python
Ensure network interface exists:
azurearm_network.network_interface_present:
  - name: iface1
  - subnet: vnet1_sn1
  - virtual_network: vnet1
  - resource_group: group1
  - ip_configurations:
    - name: iface1_ipc1
      public_ip_address: pub_ip2
  - dns_settings:
    internal_dns_name_label: decisionlab-int-test-label
    - primary: True
    - enable_accelerated_networking: True
```

(continues on next page)
- `enable_ip_forwarding`: False
- `network_security_group`: nsg1
- `connection_auth`: {{ profile }}
- `require`:
  - `azurearm_network`: Ensure subnet exists
  - `azurearm_network`: Ensure network security group exists
  - `azurearm_network`: Ensure another public IP exists

salt.states.azurearm_network.network_security_group_absent(name, resource_group, connection_auth=None)

New in version 2019.2.0.

Ensure a network security group does not exist in the resource group.

Parameters

- `name` – Name of the network security group.
- `resource_group` – The resource group assigned to the network security group.
- `connection_auth` – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_network.network_security_group_present(name, resource_group, tags=None, security_rules=None, connection_auth=None, **kwargs)

New in version 2019.2.0.

Ensure a network security group exists.

Parameters

- `name` – Name of the network security group.
- `resource_group` – The resource group assigned to the network security group.
- `tags` – A dictionary of strings can be passed as tag metadata to the network security group object.
- `security_rules` – An optional list of dictionaries representing valid SecurityRule objects. See the documentation for the security_rule_present state or security_rule_create_or_update execution module for more information on required and optional parameters for security rules. The rules are only managed if this parameter is present. When this parameter is absent, implemented rules will not be removed, and will merely become unmanaged.
- `connection_auth` – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure network security group exists:
  azurearm_network.network_security_group_present:
    - name: nsg1
    - resource_group: group1
    - security_rules:
      - name: nsg1_rule1
        priority: 100
        protocol: tcp
        access: allow
        direction: outbound
```

(continues on next page)

salt.states.azurearm_network.public_ip_address_absent(name, resource_group, connection_auth=None)

New in version 2019.2.0.

Ensure a public IP address does not exist in the resource group.
Parameters
- name – Name of the public IP address.
- resource_group – The resource group assigned to the public IP address.
- connection_auth – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_network.public_ip_address_present(name, resource_group, tags=None, sku=None, public_ip_allocation_method=None, public_ip_address_version=None, dns_settings=None, idle_timeout_in_minutes=None, connection_auth=None, **kwargs)

New in version 2019.2.0.

Ensure a public IP address exists.
Parameters
- name – Name of the public IP address.
- resource_group – The resource group assigned to the public IP address.
- dns_settings – An optional dictionary representing a valid PublicIPAddressDnsSettings object. Parameters include 'domain_name_label' and 'reverse_fqdn', which accept strings. The 'domain_name_label' parameter is concatenated with the regionalized DNS zone make up the fully qualified domain name associated with the public IP address. If a domain name label is specified, an A DNS record is created for the public IP in the Microsoft Azure DNS system. The 'reverse_fqdn' parameter is a user-visible, fully qualified domain name that resolves to this public IP address. If the reverse FQDN is specified, then a PTR DNS record is created pointing from the IP address in the in-addr.arpa domain to the reverse FQDN.
- **sku** – The public IP address SKU, which can be 'Basic' or 'Standard'.
- **public_ip_allocation_method** – The public IP allocation method. Possible values are: 'Static' and 'Dynamic'.
- **public_ip_address_version** – The public IP address version. Possible values are: 'IPv4' and 'IPv6'.
- **idle_timeout_in_minutes** – An integer representing the idle timeout of the public IP address.
- **tags** – A dictionary of strings can be passed as tag metadata to the public IP address object.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```python
tags = {
    'contact_name': 'Elmer Fudd Gantry',
    'connection_auth': {{ 'profile' }},
}
```

salt.states.azurearm_network.public_ip_address_present:
```python
name: pub_ip1
resource_group: group1
dns_settings:
    domain_name_label: decisionlab-ext-test-label
sku: basic
public_ip_allocation_method: static
public_ip_address_version: ipv4
idle_timeout_in_minutes: 4
tags:
    contact_name: Elmer Fudd Gantry
    connection_auth: {{ profile }}
```

New in version 2019.2.0.

Ensure a route table does not exist in the resource group.

Parameters

- **name** – Name of the route table.
- **route_table** – The name of the existing route table containing the route.
- **resource_group** – The resource group assigned to the route table.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_network.route_absent:
```python
name, route_table, resource_group, connection_auth=None)
```

New in version 2019.2.0.

Ensure a route exists within a route table.

Parameters

- **name** – Name of the route.
- **address_prefix** – The destination CIDR to which the route applies.
- **next_hop_type** – The type of Azure hop the packet should be sent to. Possible values are: 'VirtualNetworkGateway', 'VnetLocal', 'Internet', 'VirtualAppliance', and 'None'.
- **next_hop_ip_address** – The IP address packets should be forwarded to. Next hop values are only allowed in routes where the next hop type is 'VirtualAppliance'.
- **route_table** – The name of the existing route table which will contain the route.
• `resource_group` – The resource group assigned to the route table.
• `connection_auth` – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

Ensure route exists:
```python
azurearm_network.route_present:
- name: rt1_route2
- route_table: rt1
- resource_group: group1
- address_prefix: '192.168.0.0/16'
- next_hop_type: vnetlocal
- connection_auth: {{ profile }}
- require:
  - azurearm_network: Ensure route table exists
```

salt.states.azurearm_network.route_table_absent(name, resource_group, connection_auth=None)

New in version 2019.2.0.

Ensure a route table does not exist in the resource group.

Parameters

• `name` – Name of the route table.
• `resource_group` – The resource group assigned to the route table.
• `connection_auth` – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_network.route_table_present(name, resource_group, tags=None, routes=None, disable_bgp_route_propagation=None, connection_auth=None, **kwargs)

New in version 2019.2.0.

Ensure a route table exists.

Parameters

• `name` – Name of the route table.
• `resource_group` – The resource group assigned to the route table.
• `routes` – An optional list of dictionaries representing valid Route objects contained within a route table. See the documentation for the route_present state or route_create_or_update execution module for more information on required and optional parameters for routes. The routes are only managed if this parameter is present. When this parameter is absent, implemented routes will not be removed, and will merely become unmanaged.
• `disable_bgp_route_propagation` – An optional boolean parameter setting whether to disable the routes learned by BGP on the route table.
• `tags` – A dictionary of strings can be passed as tag metadata to the route table object.
• `connection_auth` – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

Ensure route table exists:
```python
azurearm_network.route_table_present:
- name: rt1
- resource_group: group1
- routes:

salt.states.azurearm_network.security_rule_absent(name, security_group, resource_group, connection_auth=None)

New in version 2019.2.0.

Ensure a security rule does not exist in the network security group.

Parameters
- **name** – Name of the security rule.
- **security_group** – The network security group containing the security rule.
- **resource_group** – The resource group assigned to the network security group.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_network.security_rule_present(name, access, direction, priority, protocol, security_group, resource_group, destination_address_prefix=None, destination_port_range=None, source_address_prefix=None, source_port_range=None, description=None, destination_address_prefixes=None, destination_port_ranges=None, source_address_prefixes=None, source_port_ranges=None, connection_auth=None, **kwargs)

New in version 2019.2.0.

Ensure a security rule exists.

Parameters
- **name** – Name of the security rule.
- **access** – 'allow' or 'deny'
- **direction** – 'inbound' or 'outbound'
- **priority** – Integer between 100 and 4096 used for ordering rule application.
- **protocol** – 'tcp', 'udp', or '*'
- **security_group** – The name of the existing network security group to contain the security rule.
- **resource_group** – The resource group assigned to the network security group.
- **description** – Optional description of the security rule.
- **destination_address_prefix** – The CIDR or destination IP range. Asterix '*' can also be used to match all destination IPs. Default tags such as 'VirtualNetwork', 'AzureLoadBalancer' and 'Internet' can also be used. If this is an ingress rule, specifies where network traffic originates from.
- **destination_port_range** – The destination port or range. Integer or range between 0 and 65535. Asterix '*' can also be used to match all ports.
source_address_prefix – The CIDR or source IP range. Asterix '*' can also be used to match all source IPs. Default tags such as 'VirtualNetwork', 'AzureLoadBalancer' and 'Internet' can also be used. If this is an ingress rule, specifies where network traffic originates from.

source_port_range – The source port or range. Integer or range between 0 and 65535. Asterix '*' can also be used to match all ports.

destination_address_prefixes – A list of destination_address_prefix values. This parameter overrides destination_address_prefix and will cause any value entered there to be ignored.

destination_port_ranges – A list of destination_port_range values. This parameter overrides destination_port_range and will cause any value entered there to be ignored.

source_address_prefixes – A list of source_address_prefix values. This parameter overrides source_address_prefix and will cause any value entered there to be ignored.

source_port_ranges – A list of source_port_range values. This parameter overrides source_port_range and will cause any value entered there to be ignored.

connection_auth – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

Ensure security rule exists:

```python
salt.states.azurearm_network.security_rule_present:
  name: nsg1_rule2
  security_group: nsg1
  resource_group: group1
  priority: 101
  protocol: tcp
  access: allow
  direction: inbound
  source_address_prefix: internet
  destination_address_prefix: virtualnetwork
  source_port_range: '*'
  destination_port_ranges:
    - '80'
    - '443'
  connection_auth: {{
    profile
  }}
```

salt.states.azurearm_network.subnet_absent(name, virtual_network, resource_group, connection_auth=None)

New in version 2019.2.0.

Ensure a virtual network does not exist in the virtual network.

Parameters

- name – Name of the subnet.
- virtual_network – Name of the existing virtual network containing the subnet.
- resource_group – The resource group assigned to the virtual network.
- connection_auth – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_network.subnet_present(name, address_prefix, virtual_network, resource_group, security_group=None, route_table=None, connection_auth=None, **kwargs)

New in version 2019.2.0.
Ensure a subnet exists.

Parameters
- **name** – Name of the subnet.
- **address_prefix** – A CIDR block used by the subnet within the virtual network.
- **virtual_network** – Name of the existing virtual network to contain the subnet.
- **resource_group** – The resource group assigned to the virtual network.
- **security_group** – The name of the existing network security group to assign to the subnet.
- **route_table** – The name of the existing route table to assign to the subnet.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure subnet exists:
  azurearm_network.subnet_present:
    - name: vnet1_sn1
    - virtual_network: vnet1
    - resource_group: group1
    - address_prefix: '192.168.1.0/24'
    - security_group: nsg1
    - route_table: rt1
    - connection_auth: {{ profile }}
    - require:
      - azurearm_network: Ensure virtual network exists
      - azurearm_network: Ensure network security group exists
      - azurearm_network: Ensure route table exists
```

salt.states.azurearm_network.virtual_network_absent(name, resource_group, connection_auth=None)

New in version 2019.2.0.

Ensure a virtual network does not exist in the resource group.

Parameters
- **name** – Name of the virtual network.
- **resource_group** – The resource group assigned to the virtual network.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_network.virtual_network_present(name, address_prefixes, resource_group, dns_servers=None, tags=None, connection_auth=None, **kwargs)

New in version 2019.2.0.

Ensure a virtual network exists.

Parameters
- **name** – Name of the virtual network.
- **resource_group** – The resource group assigned to the virtual network.
- **address_prefixes** – A list of CIDR blocks which can be used by subnets within the virtual network.
- **dns_servers** – A list of DNS server addresses.
- **tags** – A dictionary of strings can be passed as tag metadata to the virtual network object.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:
Ensure virtual network exists:

```yaml
ensure virtual network exists:
  azurearm_network.virtual_network_present:
    - name: vnet1
    - resource_group: group1
    - address_prefixes:
        - '10.0.0.0/8'
        - '192.168.0.0/16'
    - dns_servers:
        - '8.8.8.8'
    - tags:
      - contact_name: Elmer Fudd Gantry
      - connection_auth: {{ profile }}
    - require:
      - azurearm_resource: Ensure resource group exists
```

21.19.17 salt.states.azurearm_resource

Azure (ARM) Resource State Module

New in version 2019.2.0.

**maintainer** <devops@decisionlab.io>

**maturity** new

**depends**

- azure >= 2.0.0
- azure-common >= 1.1.8
- azure-mgmt >= 1.0.0
- azure-mgmt-compute >= 1.0.0
- azure-mgmt-network >= 1.7.1
- azure-mgmt-resource >= 1.1.0
- azure-mgmt-storage >= 1.0.0
- azure-mgmt-web >= 0.32.0
- azure-storage >= 0.34.3
- msrestazure >= 0.4.21

**platform** linux

**configuration** This module requires Azure Resource Manager credentials to be passed as a dictionary of keyword arguments to the `connection_auth` parameter in order to work properly. Since the authentication parameters are sensitive, it’s recommended to pass them to the states via pillar.

Required provider parameters:

if using username and password:

- subscription_id
- username
- password

if using a service principal:
• subscription_id
• tenant
• client_id
• secret

Optional provider parameters:

cloud_environment: Used to point the cloud driver to different API endpoints, such as Azure GovCloud. Possible values:

• AZURE_PUBLIC_CLOUD (default)
• AZURE_CHINA_CLOUD
• AZURE_US_GOV_CLOUD
• AZURE_GERMAN_CLOUD

Example Pillar for Azure Resource Manager authentication:

```yaml
azurearm:
  user_pass_auth:
    subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
    username: fletch
    password: 123pass

msubscription:
  subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
  tenant: ABCDEFA-B1234-ABCDEF-1234-ABCDEFABABCD
  client_id: ABCDEFA-B1234-ABCDEF-1234-ABCDEFABABCD
  secret: XXXXXXXXXXXXXXXXXXX

cloud_environment: AZURE_PUBLIC_CLOUD
```

Example states using Azure Resource Manager authentication:

```python
{% set profile = salt['pillar.get']('azurearm:msubscription') %}

Ensure resource group exists:
```yaml
azurearm_resource.resource_group_present:
  - name: my_rg
  - location: westus
  - tags:
    how_awesome: very
    contact_name: Elmer Fudd Gantry
  - connection_auth: {{ profile }}
```

Ensure resource group is absent:
```yaml
azurearm_resource.resource_group_absent:
  - name: other_rg
  - connection_auth: {{ profile }}
```

```python
salt.states.azurearm_resource.policy_assignment_absent(name, scope, connection_auth=None)
```

New in version 2019.2.0.

Ensure a policy assignment does not exist in the provided scope.

Parameters

- **name** – Name of the policy assignment.
- **scope** – The scope of the policy assignment.

**connection_auth** A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.
salt.states.azurearm_resource.policy_assignment_present(name, scope, definition_name, display_name=None, description=None, assignment_type=None, parameters=None, connection_auth=None, **kwargs)

New in version 2019.2.0.

Ensure a security policy assignment exists.

Parameters

- **name** – Name of the policy assignment.
- **scope** – The scope of the policy assignment.
- **definition_name** – The name of the policy definition to assign.
- **display_name** – The display name of the policy assignment.
- **description** – The policy assignment description.
- **assignment_type** – The type of policy assignment.
- **parameters** – Required dictionary if a parameter is used in the policy rule.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure policy assignment exists:

  azurearm_resource.policy_assignment_present:
    - name: testassign
    - scope: /subscriptions/bc75htn-a0fhsi-349b-56gh-4fghti-f84852
    - definition_name: testpolicy
    - display_name: Test Assignment
    - description: Test assignment for testing assignments.
    - connection_auth: {{ profile }}
```

salt.states.azurearm_resource.policy_definition_absent(name, connection_auth=None)

New in version 2019.2.0.

Ensure a policy definition does not exist in the current subscription.

Parameters

- **name** – Name of the policy definition.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_resource.policy_definition_present(name, policy_rule=None, policy_type=None, mode=None, display_name=None, description=None, metadata=None, parameters=None, policy_rule_json=None, policy_rule_file=None, template='jinja', source_hash=None, source_hash_name=None, skip_verify=False, connection_auth=None, **kwargs)
New in version 2019.2.0.

Ensure a security policy definition exists.

Parameters

- **name** – Name of the policy definition.
- **policy_rule** – A YAML dictionary defining the policy rule. See Azure Policy Definition documentation for details on the structure. One of `policy_rule`, `policy_rule_json`, or `policy_rule_file` is required, in that order of precedence for use if multiple parameters are used.
- **policy_rule_json** – A text field defining the entirety of a policy definition in JSON. See Azure Policy Definition documentation for details on the structure. One of `policy_rule`, `policy_rule_json`, or `policy_rule_file` is required, in that order of precedence for use if multiple parameters are used. Note that the `name` field in the JSON will override the `name` parameter in the state.
- **policy_rule_file** – The source of a JSON file defining the entirety of a policy definition. See Azure Policy Definition documentation for details on the structure. One of `policy_rule`, `policy_rule_json`, or `policy_rule_file` is required, in that order of precedence for use if multiple parameters are used. Note that the `name` field in the JSON will override the `name` parameter in the state.
- **skip_verify** – Used for the `policy_rule_file` parameter. If True, hash verification of remote file sources (http://, https://, ftp://) will be skipped, and the `source_hash` argument will be ignored.
- **source_hash** – This can be a source hash string or the URI of a file that contains source hash strings.
- **source_hash_name** – When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename/URI associated with that hash.
- **policy_type** – The type of policy definition. Possible values are NotSpecified, BuiltIn, and Custom. Only used with the `policy_rule` parameter.
- **mode** – The policy definition mode. Possible values are NotSpecified, Indexed, and All. Only used with the `policy_rule` parameter.
- **display_name** – The display name of the policy definition. Only used with the `policy_rule` parameter.
- **description** – The policy definition description. Only used with the `policy_rule` parameter.
- **metadata** – The policy definition metadata defined as a dictionary. Only used with the `policy_rule` parameter.
- **parameters** – Required dictionary if a parameter is used in the policy rule. Only used with the `policy_rule` parameter.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```python
Ensure policy definition exists:
    azurearm_resource.policy_definition_present:
    - name: testpolicy
    - display_name: Test Policy
    - description: Test policy for testing policies.
    - policy_rule:
      if:
        allOf:
        - equals: Microsoft.Compute/virtualMachines/write
        - source: action
        - field: location
        in:
        - eastus
```

(continues on next page)
salt.states.azurearm_resource.resource_group_absent(name, connection_auth=None)
New in version 2019.2.0.
Ensure a resource group does not exist in the current subscription.
Parameters
• **name** – Name of the resource group.
• **connection_auth** – A dict with subscription and authentication parameters to be
  used in connecting to the Azure Resource Manager API.

salt.states.azurearm_resource.resource_group_present(name, location, managed_by=None, tags=None, connection_auth=None, **kwargs)
New in version 2019.2.0.
Ensure a resource group exists.
Parameters
• **name** – Name of the resource group.
• **location** – The Azure location in which to create the resource group. This value
cannot be updated once the resource group is created.
• **managed_by** – The ID of the resource that manages this resource group. This value
cannot be updated once the resource group is created.
• **tags** – A dictionary of strings can be passed as tag metadata to the resource group
  object.
• **connection_auth** – A dict with subscription and authentication parameters to be
  used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure resource group exists:
    azurearm_resource.resource_group_present:
      name: group1
      location: eastus
      tags:
        contact_name: Elmer Fudd Gantry
      connection_auth: {{ profile }}
```

21.19.18 salt.states.beacon

Management of the Salt beacons

New in version 2015.8.0.

```
ps:
  beacon.present:
    - save: True
    - enable: False
    - services:
      salt-master: running
      apache2: stopped
```

(continues on next page)
sh:
    beacon.present: []

load:
    beacon.present:
        averages:
            1m:
                - 0.0
                - 2.0
            5m:
                - 0.0
                - 1.5
            15m:
                - 0.1
                - 1.0

.. versionadded:: 3000

Beginning in the 3000 release, multiple copies of a beacon can be configured using the `beacon_module` parameter.

inotify_infs:
    beacon.present:
        save: True
        enable: True
        files:
            /etc/infs.conf:
                mask:
                    - create
                    - delete
                    - modify
                recurse: True
                auto_add: True
            interval: 10
            beacon_module: inotify
            disable_during_state_run: True

inotify_ntp:
    beacon.present:
        save: True
        enable: True
        files:
            /etc/ntp.conf:
                mask:
                    - create
                    - delete
                    - modify
                recurse: True
                auto_add: True
            interval: 10
            beacon_module: inotify
            disable_during_state_run: True

salt.states.beacon.absent(name, save=False, **kwargs)
    Ensure beacon is absent.
    name The name of the beacon ensured absent.
save True/False, if True the beacons.conf file be updated too. Default is False.

```python
salt.states.beacon.disabled(name, **kwargs)
```
Disable a beacon.

```python
salt.states.beacon.enabled(name, **kwargs)
```
Enable a beacon.

```python
salt.states.beacon.present(name, save=False, **kwargs)
```
Ensure beacon is configured with the included beacon data.

**21.19.19 salt.states.bigip**

A state module designed to enforce load-balancing configurations for F5 Big-IP entities.

```python
maturity develop
platform f5_bigip_11.6
```

```python
salt.states.bigip.add_pool_member(hostname, username, password, name, member)
```
A function to connect to a bigip device and add a new member to an existing pool.

```python
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to modify
member The member to add to the pool
```

```python
salt.states.bigip.create_monitor(hostname, username, password, monitor_type, name, **kwargs)
```
A function to connect to a bigip device and create a monitor.

```python
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
monitor_type The type of monitor to create
name The name of the monitor to create
```

```python
kwargs [ arg=val ] ...
```
Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

```python
salt.states.bigip.create_node(hostname, username, password, name, address)
```
Create a new node if it does not already exist.

```python
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the node to create
address The address of the node
```
Create a new node if it does not already exist.

salt.states.bigip.create_profile  (hostname, username, password, profile_type, name, **kwargs)
A function to connect to a bigip device and create a profile.
hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
profile_type  The type of profile to create
name  The name of the profile to create
kwargs  [ arg=val ] ...
Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.
Special Characters |, , and : must be escaped using \ when used within strings.

```python
class bigip(create_virtual)(hostname, username, password, name, destination, 
pool=None, address_status=None, auto_lasthop=None,

salt.states.bigip.delete_monitor( hostname, username, password, monitor_type, name )
    Modify an existing monitor. If it does exists, only the parameters specified will be enforced.
    hostname The host/address of the bigip device
    username The iControl REST username
    password The iControl REST password
    monitor_type The type of monitor to create
    name The name of the monitor to create
    kwargs [ arg=val ] ...
    Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.
salt.states.bigip.delete_node( hostname, username, password, name )
    Delete an existing node.
    hostname The host/address of the bigip device
    username The iControl REST username
    password The iControl REST password
    name The name of the node which will be deleted.
salt.states.bigip.delete_pool( hostname, username, password, name )
    Delete an existing pool.
    hostname The host/address of the bigip device
    username The iControl REST username
    password The iControl REST password
    name The name of the pool which will be deleted
salt.states.bigip.delete_pool_member( hostname, username, password, name, member )
    Delete an existing pool member.
    hostname The host/address of the bigip device
    username The iControl REST username
    password The iControl REST password
    name The name of the pool to be modified
    member The name of the member to delete from the pool
salt.states.bigip.delete_profile( hostname, username, password, profile_type, name )
    Modify an existing profile. If it does exists, only the parameters specified will be enforced.
    hostname The host/address of the bigip device
    username The iControl REST username
    password The iControl REST password
    profile_type The type of profile to create
    name The name of the profile to create
    kwargs [ arg=val ] ...
    Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.
salt.states.bigip.delete_virtual( hostname, username, password, name )
    Delete an existing virtual.
hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
name     The name of the virtual which will be deleted

salt.states.bigip.list_monitor(hostname, username, password, monitor_type, name)
A function to list an existing monitor.
hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
monitor_type  The type of monitor to list
name     The name of the monitor to list

salt.states.bigip.list_node(hostname, username, password, name)
A function to connect to a bigip device and list a specific node.
hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
name     The name of the node to list.

salt.states.bigip.list_pool(hostname, username, password, name)
A function to connect to a bigip device and list a specific pool.
hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
name     The name of the pool to list.

salt.states.bigip.list_profile(hostname, username, password, profile_type, name)
A function to list an existing profile.
hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
profile_type  The type of profile to list
name     The name of the profile to list

salt.states.bigip.list_virtual(hostname, username, password, name)
A function to list a specific virtual.
hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
name     The name of the virtual to list

salt.states.bigip.manage_monitor(hostname, username, password, monitor_type, name, **kwargs)
Create a new monitor if a monitor of this type and name does not already exists. If it does exists, only the parameters specified will be enforced.
hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
monitor_type  The type of monitor to create
name     The name of the monitor to create
kwargs  [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.
```python
salt.states.bigip.manage_node(hostname, username, password, name, address, connection_limit=None, description=None, dynamic_ratio=None, logging=None, monitor=None, rate_limit=None, ratio=None, session=None, node_state=None)
```

Manages a node of a given bigip device. If the node does not exist it will be created, otherwise, only the properties which are different than the existing will be updated.

- `hostname` The host/address of the bigip device
- `username` The iControl REST username
- `password` The iControl REST password
- `name` The name of the node to manage
- `address` The address of the node
- `connection_limit` [integer]
- `description` [string]
- `dynamic_ratio` [integer]
- `logging` [enabled | disabled]
- `monitor` [[name] | none | default]
- `rate_limit` [integer]
- `ratio` [integer]
- `session` [user-enabled | user-disabled]
- `node_state` (state) [user-down | user-up]

```python
salt.states.bigip.manage_pool(hostname, username, password, name, allow_nat=None, allow_snat=None, description=None, gateway_failsafe_device=None, ignore_persisted_weight=None, ip_tos_to_client=None, ip_tos_to_server=None, link_qos_to_client=None, link_qos_to_server=None, load_balancing_mode=None, min_active_members=None, min_up_members=None, min_up_members_action=None, min_up_members_checking=None, monitor=None, profiles=None, queue_depth_limit=None, queue_on_connection_limit=None, queue_time_limit=None, reselect_tries=None, service_down_action=None, slow_ramp_time=None)
```

Create a new pool if it does not already exist. Pool members are managed separately. Only the parameters specified are enforced.

- `hostname` The host/address of the bigip device
- `username` The iControl REST username
- `password` The iControl REST password
- `name` The name of the pool to create
- `allow_nat` [yes | no]
- `allow_snat` [yes | no]
- `description` [string]
- `gateway_failsafe_device` [string]
- `ignore_persisted_weight` [enabled | disabled]
- `ip_tos_to_client` [pass-through | [integer]]
- `ip_tos_to_server` [pass-through | [integer]]
- `link_qos_to_client` [pass-through | [integer]]
- `link_qos_to_server` [pass-through | [integer]]
- `load_balancing_mode` [dynamic-ratio-member | dynamic-ratio-node | fastest-app-response | fastest-node | least-connections-members | least-connections-node | least-sessions | observed-member | observed-node | predictive-member | predictive-node | ratio-least-connections-member | ratio-least-connections-node | ratio-member | ratio-node | ratio-session | round-robin | weighted-least-connections-member | weighted-least-connections-node]
- `min_active_members` [integer]
- `min_up_members` [integer]
- `min_up_members_action` [failover | reboot | restart-all]
min_up_members_checking [enabled | disabled]
monitor [name]
profiles [none | profile_name]
queue_depth_limit [integer]
queue_on_connection_limit [enabled | disabled]
queue_time_limit [integer]
reselect_tries [integer]
service_down_action [drop | none | reselect | reset]
slow_ramp_time [integer]

salt.states.bigip.manage_pool_members(hostname, username, password, name, members)
Manage the members of an existing pool. This function replaces all current pool members. Only the parameters specified are enforced.
	housename The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to modify
members list of pool members to manage.

salt.states.bigip.manage_profile(hostname, username, password, profile_type, name, **kwargs)
Create a new profile if a monitor of this type and name does not already exists. If it does exists, only the parameters specified will be enforced.
	housename The host/address of the bigip device
username The iControl REST username
password The iControl REST password
profile_type The type of profile to create
name The name of the profile to create
kwargs [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.

salt.states.bigip.manage_virtual(hostname, username, password, name, destination, pool=None, address_status=None, auto_lasthop=None, bwc_policy=None, cmp_enabled=None, connection_limit=None, dhcp_relay=None, description=None, fallback_persistence=None, flow_eviction_policy=None, gtm_score=None, ip_forward=None, ip_protocol=None, internal=None, twelve_forward=None, last_hop_pool=None, mask=None, mirror=None, nat64=None, persist=None, profiles=None, policies=None, rate_class=None, rate_limit=None, rate_limit_mode=None, rate_limit_dst=None, rate_limit_src=None, reject=None, source=None, source_address_translation=None, source_port=None, virtual_state=None, traffic_classes=None, translate_address=None, translate_port=None, vlans=None)
Manage a virtual server. If a virtual does not exists it will be created, otherwise only the parameters specified will be enforced.
	housename The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the virtual to create
destination [ [virtual_address_name:port] | [ipv4:port] | [ipv6:port] ]
pool [ [pool_name] | none]
address_status [yes | no]
auto_lasthop [default | enabled | disabled]
bwc_policy [none] | string
cmp_enabled [yes | no]
dhcp_relay [yes | no]
connection_limit [integer]
description [string]
state [disabled | enabled]
fallback_persistence [none | [profile name] ]
flow_eviction_policy [none | [eviction policy name] ]
gtm_score [integer]
ip_forward [yes | no]
ip_protocol [any | protocol]
internal [yes | no]
twelve_forward(12-forward) [yes | no]
last_hop-pool [ [pool_name] | none]
mask { [ipv4] | [ipv6] }
mirror { [disabled | enabled | none] }
nat64 [enabled | disabled]
persist [list]
profiles [none | default | list ]
policies [none | default | list ]

vlans [none | default | dictionary]
   vlan_ids [ list]
   enabled [ true | false ]
salt.states.bigip.modify_monitor (hostname, username, password, monitor_type, name, **kwargs)

Modify an existing monitor. If it does exists, only the parameters specified will be enforced.
hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
monitor_type  The type of monitor to create
name  The name of the monitor to create
kwargs [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.
salt.states.bigip.modify_node(hostname, username, password, name, connection_limit=None, description=None, dynamic_ratio=None, logging=None, monitor=None, rate_limit=None, ratio=None, session=None, node_state=None)

Modify an existing node. Only a node which already exists will be modified and only the parameters specified will be enforced.

hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
name  The name of the node to modify
connection_limit  [integer]
description  [string]
dynamic_ratio  [integer]
logging  [enabled | disabled]
monitor  [name | none | default]
ratio  [integer]
rate_limit  [integer]
node_state  [user-down | user-up]

salt.states.bigip.modify_pool(hostname, username, password, name, allow_nat=None, allow_snat=None, description=None, gateway_failsafe_device=None, ignore_persisted_weight=None, ip_tos_to_client=None, ip_tos_to_server=None, link_qos_to_client=None, link_qos_to_server=None, load_balancing_mode=None, min_active_members=None, min_up_members=None, min_up_members_action=None, min_up_members_checking=None, monitor=None, profiles=None, queue_depth_limit=None, queue_on_connection_limit=None, queue_time_limit=None, reselect_tries=None, service_down_action=None, slow_ramp_time=None)

Modify an existing pool. Pool members are managed separately. Only the parameters specified are enforced.

hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
name  The name of the pool to create
allow_nat  [yes | no]
allow_snat  [yes | no]
description  [string]
ignore_persisted_weight  [enabled | disabled]
ip_tos_to_client  [pass-through | [integer]]
ip_tos_to_server  [pass-through | [integer]]
link_qos_to_client  [pass-through | [integer]]
link_qos_to_server  [pass-through | [integer]]
load_balancing_mode  [dynamic-ratio-member | dynamic-ratio-node | fastest-app-response | fastest-node | least-connections-members | least-connections-node | least-sessions | observed-member | observed-node | predictive-member | predictive-node | ratio-least-connections-member | ratio-least-connections-node | ratio-member | ratio-node | ratio-session | round-robin | weighted-least-connections-member | weighted-least-connections-node]
min_active_members  [integer]
min_up_members  [integer]
min_up_members_action  [failover | reboot | restart-all]
min_up_members_checking  [enabled | disabled]
monitor  [name]
profiles [none | profile_name]
queue_depth_limit [integer]
queue_on_connection_limit [enabled | disabled]
queue_time_limit [integer]
reselect_tries [integer]
service_down_action [drop | none | reselect | reset]
slow_ramp_time [integer]
salt.states.bigip.modify_pool_member(hostname, username, password, name, member,
connection_limit=None, description=None, dynamic_ratio=None, inherit_profile=None, logging=None,
monitor=None, priority_group=None, profiles=None, rate_limit=None, ratio=None, session=None,
member_state=None)

A function to connect to a bigip device and modify a member of an existing pool.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to modify
member The member modify
connection_limit [integer]
description [string]
dynamic_ratio [integer]
inherit_profile [enabled | disabled]
logging [enabled | disabled]
monitor [name]
priority_group [integer]
profiles [none | profile_name]
rate_limit [integer]
ratio [integer]
session [user-enabled | user-disabled]
member_state (state) [ user-up | user-down ]
salt.states.bigip.modify_profile(hostname, username, password, profile_type, name,**kwargs)

Modify an existing profile. If it does exists, only the parameters specified will be enforced.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
profile_type The type of profile to create
name The name of the profile to create
kwargs [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.
salt.states.bigip.modify_virtual(hostname, username, password, name, destination, pool=None, address_status=None, auto_lasthop=None, bwc_policy=None, cmp_enabled=None, connection_limit=None, dhcp_relay=None, description=None, fallback_persistence=None, flow_eviction_policy=None, gtm_score=None, ip_forward=None, ip_protocol=None, internal=None, twelve_forward=None, last_hop_pool=None, mask=None, mirror=None, nat64=None, persist=None, profiles=None, policies=None, rate_class=None, rate_limit=None, rate_limit_mode=None, rate_limit_dst=None, rate_limit_src=None, rules=None, related_rules=None, reject=None, source=None, source_address_translation=None, source_port=None, virtual_state=None, traffic_classes=None, translate_address=None, translate_port=None, vlans=None)

Modify an virtual server. modify an existing virtual. Only parameters specified will be enforced.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the virtual to create
destination [ [virtual_address_name:port] | [ipv4:port] | [ipv6:port] ]
pool [ [pool_name] | none]
address_status [yes | no]
auto_lasthop [default | enabled | disabled ]
bwc_policy [none] | string]
cmp_enabled [yes | no]
dhcp_relay [yes | no]
connection_limit [integer]
description [string]

   enabled [ true | false ]

21.19.20 salt.states.blockdev

Management of Block Devices
A state module to manage blockdevices

```
/dev/sda:
  blockdev.tuned:
    - read-only: True
master-data:
  blockdev.tuned:
    - name: /dev/vg/master-data
    - read-only: True
    - read-ahead: 1024
```

New in version 2014.7.0.

salt.states.blockdev.formatted(name, fs_type='ext4', force=False, **kwargs)
Manage filesystems of partitions.
name The name of the block device
fs_type The filesystem it should be formatted as
force Force mke2fs to create a filesystem, even if the specified device is not a partition on a block special
device. This option is only enabled for ext and xfs filesystems
This option is dangerous, use it with caution.
New in version 2016.11.0.

salt.states.blockdev.tuned(name, **kwargs)
Manage options of block device
name The name of the block device
opts:
  - read-ahead Read-ahead buffer size
  - filesystem-read-ahead Filesystem Read-ahead buffer size
  - read-only Set Read-Only
  - read-write Set Read-Write

21.19.21 salt.states.boto3_elasticache module

Manage Elasticache with boto3

New in version 2017.7.0.
Create, destroy and update Elasticache clusters. Be aware that this interacts with Amazon’s services, and so may
incur charges.
This module uses boto3 behind the scenes - as a result it inherits any limitations it boto3’s implementation of the AWS API. It is also designed to as directly as possible leverage boto3’s parameter naming and semantics. This allows one to use http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html as an excellent source for details too involved to reiterate here.

Note: This module is designed to be transparent ("intentionally ignorant" is the phrase I used to describe it to my boss) to new AWS / boto options - since all AWS API params are passed directly through both the state and executions modules, any new args to existing functions which become available after this documentation is written should work immediately.

Brand new API calls, of course, would still require new functions to be added :)

This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information is available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```
elasticache.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticache.key: askdjghsdfjkgWupUjasdfklkdfsdlgjsdfjajkghs
```

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkgWupUjasdfklkdfsdlgjsdfjajkghs
  region: us-east-1
```

Ensure myelasticache exists:
```
boto3_elasticache.present:
  - name: myelasticache
    - engine: redis
    - cache_node_type: cache.t1.micro
    - num_cache_nodes: 1
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkgWupUjasdfklkdfsdlgjsdfjajkghs
```

# Using a profile from pillars
Ensure myelasticache exists:
```
boto3_elasticache.present:
  - name: myelasticache
    - engine: redis
    - cache_node_type: cache.t1.micro
    - num_cache_nodes: 1
    - region: us-east-1
    - profile: myprofile
```

# Passing in a profile
Ensure myelasticache exists:
```
boto3_elasticache.present:
  - name: myelasticache
    - engine: redis
    - cache_node_type: cache.t1.micro
```

(continues on next page)
- **num_cache_nodes**: 1
- **notification_topic_arn**: arn:aws:sns:us-east-1:879879:my-sns-topic
- **region**: us-east-1
- **profile**:
  - **keyid**: GKTADJGHEIQSXMKKRBJ08H
  - **key**: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

salt.states.boto3_elasticache.cache_cluster_absent(name, wait=600, region=None, key=None, keyid=None, profile=None, **args)

Ensure a given cache cluster is deleted.

**name** Name of the cache cluster.

**wait** Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

**CacheClusterId** The node group (shard) identifier. Note: In general this parameter is not needed, as ‘name’ is used if it’s not provided.

**FinalSnapshotIdentifier** The user-supplied name of a final cache cluster snapshot. This is the unique name that identifies the snapshot. ElastiCache creates the snapshot, and then deletes the cache cluster immediately afterward.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto3_elasticache.cache_cluster_present(name, wait=900, security_groups=None, region=None, key=None, keyid=None, profile=None, **args)

Ensure a given cache cluster exists.

**name** Name of the cache cluster (cache cluster id).

**wait** Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

**security_groups** One or more VPC security groups (names and/or IDs) associated with the cache cluster.

---

**Note:** This is additive with any sec groups provided via the SecurityGroupIds parameter below. Use this parameter ONLY when you are creating a cluster in a VPC.

**CacheClusterId** The node group (shard) identifier. This parameter is stored as a lowercase string.

**Constraints:**
- A name must contain from 1 to 20 alphanumeric characters or hyphens.
- The first character must be a letter.
- A name cannot end with a hyphen or contain two consecutive hyphens.

---

**Note:** In general this parameter is not needed, as ‘name’ is used if it’s not provided.

**ReplicationGroupId** The ID of the replication group to which this cache cluster should belong. If this parameter is specified, the cache cluster is added to the specified replication group as a read replica; otherwise, the cache cluster is a standalone primary that is not part of any replication group. If the specified repli-
cation group is Multi-AZ enabled and the Availability Zone is not specified, the cache cluster is created in Availability Zones that provide the best spread of read replicas across Availability Zones.

**AZMode** Specifies whether the nodes in this Memcached cluster are created in a single Availability Zone or created across multiple Availability Zones in the cluster’s region. If the AZMode and PreferredAvailabilityZones are not specified, ElastiCache assumes single-az mode.

**Note:** This parameter is ONLY supported for Memcached cache clusters.

**PreferredAvailabilityZone** The EC2 Availability Zone in which the cache cluster is created. All nodes belonging to this Memcached cache cluster are placed in the preferred Availability Zone. If you want to create your nodes across multiple Availability Zones, use PreferredAvailabilityZones.

Default: System chosen Availability Zone.

**PreferredAvailabilityZones** A list of the Availability Zones in which cache nodes are created. The order of the zones in the list is not important. The number of Availability Zones listed must equal the value of NumCacheNodes. If you want all the nodes in the same Availability Zone, use PreferredAvailabilityZone instead, or repeat the Availability Zone multiple times in the list.

Default: System chosen Availability Zones.

**Note:** This option is ONLY supported on Memcached.

If you are creating your cache cluster in an Amazon VPC (recommended) you can only locate nodes in Availability Zones that are associated with the subnets in the selected subnet group.

**NumCacheNodes** The initial (integer) number of cache nodes that the cache cluster has.

**Note:** For clusters running Redis, this value must be 1.
For clusters running Memcached, this value must be between 1 and 20.

**CacheNodeType** The compute and memory capacity of the nodes in the node group (shard). Valid node types (and pricing for them) are exhaustively described at https://aws.amazon.com/elasticache/pricing/

**Note:**
- All T2 instances must be created in a VPC
- Redis backup/restore is not supported for Redis (cluster mode disabled) T1 and T2 instances. Backup/restore is supported on Redis (cluster mode enabled) T2 instances.
- Redis Append-only files (AOF) functionality is not supported for T1 or T2 instances.

**Engine** The name of the cache engine to be used for this cache cluster. Valid values for this parameter are: memcached | redis

**EngineVersion** The version number of the cache engine to be used for this cache cluster. To view the supported cache engine versions, use the DescribeCacheEngineVersions operation.

**Note:** You can upgrade to a newer engine version but you cannot downgrade to an earlier engine version. If you want to use an earlier engine version, you must delete the existing cache cluster or replication group and create it anew with the earlier engine version.

**CacheParameterGroupName** The name of the parameter group to associate with this cache cluster. If this argument is omitted, the default parameter group for the specified engine is used. You cannot use any parameter group which has cluster-enabled='yes' when creating a cluster.
CacheSubnetGroupName  The name of the Cache Subnet Group to be used for the cache cluster. Use this parameter ONLY when you are creating a cache cluster within a VPC.

Note: If you’re going to launch your cluster in an Amazon VPC, you need to create a subnet group before you start creating a cluster.

CacheSecurityGroupNames  A list of Cache Security Group names to associate with this cache cluster. Use this parameter ONLY when you are creating a cache cluster outside of a VPC.

SecurityGroupIds  One or more VPC security groups associated with the cache cluster. Use this parameter ONLY when you are creating a cache cluster within a VPC.

Tags  A list of tags to be added to this resource. Note that due to shortcomings in the AWS API for ElastiCache, these can only be set during resource creation - later modification is not (currently) supported.

SnapshotArns  A single-element string list containing an Amazon Resource Name (ARN) that uniquely identifies a Redis RDB snapshot file stored in Amazon S3. The snapshot file is used to populate the node group (shard). The Amazon S3 object name in the ARN cannot contain any commas.

Note: This parameter is ONLY valid if the Engine parameter is redis.

SnapshotName  The name of a Redis snapshot from which to restore data into the new node group (shard). The snapshot status changes to restoring while the new node group (shard) is being created.

Note: This parameter is ONLY valid if the Engine parameter is redis.

PreferredMaintenanceWindow  Specifies the weekly time range during which maintenance on the cache cluster is permitted. It is specified as a range in the format ddd:hh24:mi-ddd:hh24:mi (24H Clock UTC). The minimum maintenance window is a 60 minute period. Valid values for ddd are: sun, mon, tue, wed, thu, fri, sat

Example: sun:23:00-mon:01:30

Port  The port number on which each of the cache nodes accepts connections.

Default: 6379

NotificationTopicArn  The Amazon Resource Name (ARN) of the Amazon Simple Notification Service (SNS) topic to which notifications are sent.

Note: The Amazon SNS topic owner must be the same as the cache cluster owner.

AutoMinorVersionUpgrade  This (boolean) parameter is currently disabled.

SnapshotRetentionLimit  The number of days for which ElastiCache retains automatic snapshots before deleting them.

Default: 0 (i.e., automatic backups are disabled for this cache cluster).

Note: This parameter is ONLY valid if the Engine parameter is redis.

SnapshotWindow  The daily time range (in UTC) during which ElastiCache begins taking a daily snapshot of your node group (shard). If you do not specify this parameter, ElastiCache automatically chooses an appropriate time range.

Example: 05:00-09:00

Note: This parameter is ONLY valid if the Engine parameter is redis.
AuthToken  The password used to access a password protected server.

Password constraints:
  • Must be only printable ASCII characters.
  • Must be at least 16 characters and no more than 128 characters in length.
  • Cannot contain any of the following characters: '/', '', or '@'.

CacheNodeIdsToRemove A list of cache node IDs to be removed. A node ID is a numeric identifier (0001, 0002, etc.). This parameter is only valid when NumCacheNodes is less than the existing number of cache nodes. The number of cache node IDs supplied in this parameter must match the difference between the existing number of cache nodes in the cluster or pending cache nodes, whichever is greater, and the value of NumCacheNodes in the request.

NewAvailabilityZones The list of Availability Zones where the new Memcached cache nodes are created. This parameter is only valid when NumCacheNodes in the request is greater than the sum of the number of active cache nodes and the number of cache nodes pending creation (which may be zero). The number of Availability Zones supplied in this list must match the cache nodes being added in this request. Note: This option is only supported on Memcached clusters.

NotificationTopicStatus The status of the SNS notification topic. Notifications are sent only if the status is active.

Valid values: active | inactive

region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto3_elasticache.cache_subnet_group_absent(name, region=profile, key=keyid, keyid=None, key=None, region=profile, **args)

Ensure a given cache subnet group is deleted.

name  Name of the cache subnet group.
CacheSubnetGroupName  A name for the cache subnet group. Note: In general this parameter is not needed, as 'name' is used if it’s not provided.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto3_elasticache.cache_subnet_group_present(name, region=profile, key=keyid, keyid=None, key=None, region=profile, **args)

Ensure cache subnet group exists.

name  A name for the cache subnet group. This value is stored as a lowercase string. Constraints: Must contain no more than 255 alphanumeric characters or hyphens.
subnets  A list of VPC subnets (IDs, Names, or a mix) for the cache subnet group.
CacheSubnetGroupName  A name for the cache subnet group. This value is stored as a lowercase string. Constraints: Must contain no more than 255 alphanumeric characters or hyphens. Note: In general this parameter is not needed, as ‘name’ is used if it’s not provided.
CacheSubnetGroupDescription  A description for the cache subnet group.
SubnetIds  A list of VPC subnet IDs for the cache subnet group. This is ADDITIVE with 'subnets' above.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
Ensure a given replication group is deleted.

**name** Name of the replication group.

**wait** Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

**ReplicationGroupId** The replication group identifier. Note: In general this parameter is not needed, as ‘name’ is used if it’s not provided.

**RetainPrimaryCluster** If set to true, all of the read replicas are deleted, but the primary node is retained.

**FinalSnapshotIdentifier** The name of a final node group (shard) snapshot. ElastiCache creates the snapshot from the primary node in the cluster, rather than one of the replicas; this is to ensure that it captures the freshest data. After the final snapshot is taken, the replication group is immediately deleted.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

Ensure a replication group exists and is in the given state.

**name** Name of replication group

**wait** Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

**security_groups** One or more VPC security groups (names and/or IDs) associated with the cache cluster.

**ReplicationGroupId** The replication group identifier. This parameter is stored as a lowercase string.

**ReplicationGroupDescription** A user-created description for the replication group.

**PrimaryClusterId** The identifier of the cache cluster that serves as the primary for this replication group.

This cache cluster must already exist and have a status of available. This parameter is not required if NumCacheClusters, NumNodeGroups, or ReplicasPerNodeGroup is specified.

**AutomaticFailoverEnabled** Specifies whether a read-only replica is automatically promoted to read/write primary if the existing primary fails. If true, Multi-AZ is enabled for this replication group. If false,
Multi-AZ is disabled for this replication group.

Default: False

**Note:** AutomaticFailoverEnabled must be enabled for Redis (cluster mode enabled) replication groups.

ElastiCache Multi-AZ replication groups is not supported on:

- Redis versions earlier than 2.8.6.
- Redis (cluster mode disabled): T1 and T2 node types.
- Redis (cluster mode enabled): T2 node types.

**NumCacheClusters** The number of clusters this replication group initially has. This parameter is not used if there is more than one node group (shard). You should use ReplicasPerNodeGroup instead. If Multi-AZ is enabled, the value of this parameter must be at least 2. The maximum permitted value for NumCacheClusters is 6 (primary plus 5 replicas).

**PreferredCacheClusterAZs** A list of EC2 Availability Zones in which the replication group’s cache clusters are created. The order of the Availability Zones in the list is the order in which clusters are allocated. The primary cluster is created in the first AZ in the list. This parameter is not used if there is more than one node group (shard). You should use NodeGroupConfiguration instead. The number of Availability Zones listed must equal the value of NumCacheClusters.

Default: System chosen Availability Zones.

**Note:** If you are creating your replication group in an Amazon VPC (recommended), you can only locate cache clusters in Availability Zones associated with the subnets in the selected subnet group.

**NumNodeGroups** An optional parameter that specifies the number of node groups (shards) for this Redis (cluster mode enabled) replication group. For Redis (cluster mode disabled) either omit this parameter or set it to 1.

Default: 1

**ReplicasPerNodeGroup** An optional parameter that specifies the number of replica nodes in each node group (shard). Valid values are: 0 to 5

**NodeGroupConfiguration** A list of node group (shard) configuration options. Each node group (shard) configuration has the following: Slots, PrimaryAvailabilityZone, ReplicaAvailabilityZones, ReplicaCount. If you’re creating a Redis (cluster mode disabled) or a Redis (cluster mode enabled) replication group, you can use this parameter to configure one node group (shard) or you can omit this parameter. For fiddly details of the expected data layout of this param, see [http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html?#ElastiCache.Client.create_replication_group](http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html?#ElastiCache.Client.create_replication_group)

**CacheNodeType** The compute and memory capacity of the nodes in the node group (shard). See [https://aws.amazon.com/elasticache/pricing/](https://aws.amazon.com/elasticache/pricing/) for current sizing, prices, and constraints.

**Engine** The name of the cache engine to be used for the cache clusters in this replication group.

**EngineVersion** The version number of the cache engine to be used for the cache clusters in this replication group. To view the supported cache engine versions, use the DescribeCacheEngineVersions operation.

**Note:** You can upgrade to a newer engine version but you cannot downgrade to an earlier engine version. If you want to use an earlier engine version, you must delete the existing cache cluster or replication group and create it anew with the earlier engine version.

**CacheParameterGroupName** The name of the parameter group to associate with this replication group. If this argument is omitted, the default cache parameter group for the specified engine is used.

**Note:** If you are running Redis version 3.2.4 or later, only one node group (shard), and want to use a default parameter group, we recommend that you specify the parameter group by name.
To create a Redis (cluster mode disabled) replication group, use CacheParameterGroupName=default.redis3.2
To create a Redis (cluster mode enabled) replication group, use CacheParameterGroupName=default.redis3.2.cluster.on

CacheSubnetGroupName  The name of the cache subnet group to be used for the replication group.

Note: If you’re going to launch your cluster in an Amazon VPC, you need to create a subnet group before you start creating a cluster. For more information, see Subnets and Subnet Groups.

CacheSecurityGroupNames  A list of cache security group names to associate with this replication group.
SecurityGroupIds  One or more Amazon VPC security groups associated with this replication group. Use this parameter only when you are creating a replication group in an VPC.
Tags  A list of tags to be added to this resource. Note that due to shortcomings in the AWS API for Elasticache, these can only be set during resource creation - later modification is not (currently) supported.
SnapshotArns  A list of ARNs that uniquely identify the Redis RDB snapshot files stored in Amazon S3. These snapshot files are used to populate the replication group. The Amazon S3 object name in the ARN cannot contain any commas. The list must match the number of node groups (shards) in the replication group, which means you cannot repartition.

Note: This parameter is only valid if the Engine parameter is redis.

SnapshotName  The name of a snapshot from which to restore data into the new replication group. The snapshot status changes to restoring while the new replication group is being created. Note: This parameter is only valid if the Engine parameter is redis.
PreferredMaintenanceWindow  Specifies the weekly time range during which maintenance on the cluster is performed. It is specified as a range in the format ddd:hh24:mi-ddd:hh24:mi (24H Clock UTC). The minimum maintenance window is a 60 minute period. Valid values for ddd are: sun, mon, tue, wed, thu, fri, sat

Example: sun:23:00-mon:01:30
Port  The port number on which each member of the replication group accepts connections.
NotificationTopicArn  The ARN of an SNS topic to which notifications are sent.

Note: The SNS topic owner must be the same as the cache cluster owner.

AutoMinorVersionUpgrade  This parameter is currently disabled.
SnapshotRetentionLimit  The number of days for which ElastiCache will retain automatic snapshots before deleting them.
Default: 0 (that is, automatic backups are disabled for this cache cluster).

Note: This parameter is only valid if the Engine parameter is redis.

SnapshotWindow  The daily time range (in UTC) during which ElastiCache begins taking a daily snapshot of your node group (shard). If you do not specify this parameter, ElastiCache automatically chooses an appropriate time range.

Example: 05:00-09:00

Note: This parameter is only valid if the Engine parameter is redis.
AuthToken  The password used to access a password protected server. Password constraints:

- Must be only printable ASCII characters.
- Must be at least 16 characters and no more than 128 characters in length.
- Cannot contain any of the following characters: '/', '"', or '@'.

SnapshoptingClusterId  The cache cluster ID that is used as the daily snapshot source for the replication group.

NotificationTopicStatus  The status of the SNS notification topic. Notifications are sent only if the status is active. Valid values: active | inactive

region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.22  salt.states.boto3_elasticsearch module

Manage Elasticsearch Service

New in version Natrium.

collection  This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
es.keyid: GKTADJGHEIQXSMMKRB8H
es.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
es.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQXSMMKRB8H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

codeauthor  Herbert Buurman <herbert.buurman@ogd.nl>

depends  boto3

salt.states.boto3_elasticsearch.absent(name, blocking=True, region=None, keyid=None, key=None, profile=None)

Ensure the Elasticsearch Domain specified does not exist.

Parameters

- name (str) – The name of the Elasticsearch domain to be made absent.
- blocking (bool) – Whether or not the state should wait for the deletion to be completed. Default: True
New in version Natrium.

Example:

```yaml
Remove Elasticsearch Domain:
boto3_elasticsearch.absent:
  - name: my_domain
  - region: eu-west-1
```

`salt.states.boto3_elasticsearch.latest(name, minor_only=True, region=None, keyid=None, profile=None)`

Ensures the Elasticsearch domain specifies runs on the latest compatible version of elasticsearch, upgrading it if it is not.

Note that this operation is blocking until the upgrade is complete.

Parameters
- `name` *(str)* – The name of the Elasticsearch domain to upgrade.
- `minor_only` *(bool)* – Only upgrade to the latest minor version.

New in version Natrium.

Example:

The following example will ensure the elasticsearch domain `my_domain` is upgraded to the latest minor version. So if it is currently 5.1 it will be upgraded to 5.6.

```yaml
Upgrade Elasticsearch Domain:
boto3_elasticsearch.latest:
  - name: my_domain
  - minor_only: True
  - region: eu-west-1
```

`salt.states.boto3_elasticsearch.present(name, elasticsearch_version=None, elasticsearch_cluster_config=None, ebs_options=None, access_policies=None, snapshot_options=None, vpc_options=None, cognito_options=None, encryption_at_rest_options=None, node_to_node_encryption_options=None, advanced_options=None, log_publishing_options=None, blocking=True, tags=None, region=None, keyid=None, key=None, profile=None)`

Ensure an Elasticsearch Domain exists.

Parameters
- `name` *(str)* – The name of the Elasticsearch domain that you are creating. Domain names are unique across the domains owned by an account within an AWS region. Domain names must start with a letter or number and can contain the following characters: a-z (lowercase), 0-9, and - (hyphen).
- `elasticsearch_version` *(str)* – String of format X.Y to specify version for the Elasticsearch domain eg. "1.5" or "2.3".
- `elasticsearch_cluster_config` *(dict)* – Dict specifying the configuration options for an Elasticsearch domain. Keys (case sensitive) in here are:
  - `InstanceType` *(str)*: The instance type for an Elasticsearch cluster.
  - `InstanceCount` *(int)*: The instance type for an Elasticsearch cluster.
  - `DedicatedMasterEnabled` *(bool)*: Indicate whether a dedicated master node is enabled.
  - `ZoneAwarenessEnabled` *(bool)*: Indicate whether zone awareness is enabled.
- ZoneAwarenessConfig (dict): Specifies the zone awareness configuration for a domain when zone awareness is enabled. Keys (case sensitive) in here are:
  * AvailabilityZoneCount (int): An integer value to indicate the number of availability zones for a domain when zone awareness is enabled. This should be equal to number of subnets if VPC endpoints is enabled.
- DedicatedMasterType (str): The instance type for a dedicated master node.
- DedicatedMasterCount (int): Total number of dedicated master nodes, active and on standby, for the cluster.

- **ebs_options** (dict) – Dict specifying the options to enable or disable and specifying the type and size of EBS storage volumes. Keys (case sensitive) in here are:
  - EBSEnabled (bool): Specifies whether EBS-based storage is enabled.
  - VolumeType (str): Specifies the volume type for EBS-based storage.
  - VolumeSize (int): Integer to specify the size of an EBS volume.
  - Iops (int): Specifies the IOPD for a Provisioned IOPS EBS volume (SSD).

- **access_policies** (str or dict) – Dict or JSON string with the IAM access policy.

- **snapshot_options** (dict) – Dict specifying the snapshot options. Keys (case sensitive) in here are:
  - AutomatedSnapshotStartHour (int): Specifies the time, in UTC format, when the service takes a daily automated snapshot of the specified Elasticsearch domain. Default value is 0 hours.

- **vpc_options** (dict) – Dict with the options to specify the subnets and security groups for the VPC endpoint. Keys (case sensitive) in here are:
  - SubnetIds (list): The list of subnets for the VPC endpoint.
  - SecurityGroupIds (list): The list of security groups for the VPC endpoint.

- **cognito_options** (dict) – Dict with options to specify the cognito user and identity pools for Kibana authentication. Keys (case sensitive) in here are:
  - Enabled (bool): Specifies the option to enable Cognito for Kibana authentication.
  - UserPoolId (str): Specifies the Cognito user pool ID for Kibana authentication.
  - IdentityPoolId (str): Specifies the Cognito identity pool ID for Kibana authentication.
  - RoleArn (str): Specifies the role ARN that provides Elasticsearch permissions for accessing Cognito resources.

- **encryption_at_rest_options** (dict) – Dict specifying the encryption at rest options. This option can only be used for the creation of a new Elasticsearch domain. Keys (case sensitive) in here are:
  - Enabled (bool): Specifies the option to enable Encryption At Rest.
  - KmsKeyId (str): Specifies the KMS Key ID for Encryption At Rest options.

- **node_to_node_encryption_options** (dict) – Dict specifying the node to node encryption options. This option can only be used for the creation of a new Elasticsearch domain. Keys (case sensitive) in here are:
  - Enabled (bool): Specify True to enable node-to-node encryption.

- **advanced_options** (dict) – Dict with option to allow references to indices in an HTTP request body. Must be False when configuring access to individual sub-resources. By default, the value is True. See http://docs.aws.amazon.com/elasticsearch-service/latest/developerguide/es-createupdatedomains.html#es-createdomain-configure-advanced-options for more information.

- **log_publishing_options** (dict) – Dict with options for various type of logs. The keys denote the type of log file and can be one of the following:
  - INDEX_SLOW_LOGS
  - SEARCH_SLOW_LOGS
  - ES_APPLICATION_LOGS
The value assigned to each key is a dict with the following case sensitive keys:

- `CloudWatchLogsLogGroupArn (str)`: The ARN of the Cloudwatch log group to which the log needs to be published.
- `Enabled (bool)`: Specifies whether given log publishing option is enabled or not.
  - `blocking (bool)` – Whether or not the state should wait for all operations (create/update/upgrade) to be completed. Default: True
  - `tags (dict)` – Dict of tags to ensure are present on the Elasticsearch domain.

New in version Natrium.

Example:

This will create an elasticsearch domain consisting of a single t2.small instance in the eu-west-1 region (Ireland) and will wait until the instance is available before returning from the state.

```
Create new domain:
boto3_elasticsearch.present:
  - name: my_domain
  - elasticsearch_version: '5.1'
  - elasticsearch_cluster_config:
    InstanceType: t2.small.elasticsearch
    InstanceCount: 1
    DedicatedMasterEnabled: False
    ZoneAwarenessEnabled: False
  - ebs_options:
    EBSEnabled: True
    VolumeType: gp2
    VolumeSize: 10
  - snapshot_options:
    AutomatedSnapshotStartHour: 3
  - vpc_options:
    SubnetIds:
    - subnet-12345678
    SecurityGroupIds:
    - sg-12345678
  - node_to_node_encryption_options:
    Enabled: False
  - region: eu-west-1
  - tags:
    foo: bar
    baz: qux
```

```
salt.states.boto3_elasticsearch.tagged(name, tags=None, replace=False, region=None, keyid=None, key=None, profile=None)
```

Ensures the Elasticsearch domain has the tags provided. Adds tags to the domain unless `replace` is set to `True`, in which case all existing tags will be replaced with the tags provided in `tags`. (This will remove all tags if `replace` is `True` and `tags` is empty).

Parameters

- `name (str)` – The Elasticsearch domain to work with.
- `tags (dict)` – The tags to add to/replace on the Elasticsearch domain.
- `replace (bool)` – Whether or not to replace (True) all existing tags on the Elasticsearch domain, or add (False) tags to the ES domain.

New in version Natrium.

```
salt.states.boto3_elasticsearch.upgraded(name, elasticsearch_version, blocking=True, region=None, keyid=None, key=None, profile=None)
```

Ensures the Elasticsearch domain specified runs on the specified version of elasticsearch. Only upgrades are possible as downgrades require a manual snapshot and an S3 bucket to store them in.

Note that this operation is blocking until the upgrade is complete.
Parameters

- **name** *(str)* – The name of the Elasticsearch domain to upgrade.
- **elasticsearch_version** *(str)* – String of format X.Y to specify version for the Elasticsearch domain eg. "1.5" or "2.3".

New in version Natrium.

Example:

```
Upgrade Elasticsearch Domain:
boto3_elasticsearch.upgraded:
  - name: my_domain
  - elasticsearch_version: '7.2'
  - region: eu-west-1
```

## 21.19.23 salt.states.boto3_route53 module

Manage Route53 records with Boto 3

New in version 2017.7.0.

Create and delete Route53 records. Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses boto3, which can be installed via package, or pip.

This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

<table>
<thead>
<tr>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>route53.keyid: GKTADJGHEIQSXMKKRBJ08H</td>
</tr>
<tr>
<td>route53.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs</td>
</tr>
</tbody>
</table>

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

<table>
<thead>
<tr>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>myprofile:</td>
</tr>
<tr>
<td>- keyid: GKTADJGHEIQSXMKKRBJ08H</td>
</tr>
<tr>
<td>- key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs</td>
</tr>
<tr>
<td>- region: us-east-1</td>
</tr>
</tbody>
</table>

An exciting new AWS Route 53 Hosted Zone:

```
boto_route53.hosted_zone_present:
  - Name: example.com.
  - PrivateZone: true
  - VPCs: |
    - VPCName: MyLittleVPC
    - VPCRegion: us-east-1
    - VPCId: vpc-12345678
  - region: us-east-1
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

<table>
<thead>
<tr>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>mycnamerecord:</td>
</tr>
<tr>
<td>- Name: test.example.com.</td>
</tr>
<tr>
<td>- ResourceRecords:</td>
</tr>
</tbody>
</table>

(continues on next page)
- DomainName: example.com.
- TTL: 60
- Type: CNAME
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdflkjgklgjsdfjajkghs

salt.states.boto3_route53.hosted_zone_absent(name, Name=None, PrivateZone=False, region=None, key=None, keyid=None, profile=None)

Ensure the Route53 Hosts Zone described is absent
name The name of the state definition.
Name The name of the domain. This should be a fully-specified domain, and should terminate with a period.
If not provided, the value of name will be used.
PrivateZone Set True if deleting a private hosted zone.

salt.states.boto3_route53.hosted_zone_present(name, Name=None, PrivateZone=False, CallerReference=None, Comment=None, VPCs=None, region=None, key=None, keyid=None, profile=None)

Ensure a hosted zone exists with the given attributes.
name The name of the state definition.
Name The name of the domain. This should be a fully-specified domain, and should terminate with a period.
This is the name you have registered with your DNS registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request. If not provided, the value of name will be used.
PrivateZone Set True if creating a private hosted zone. If true, then 'VPCs' is also required.
Comment Any comments you want to include about the hosted zone.
CallerReference A unique string that identifies the request and that allows create_hosted_zone() calls to be retried without the risk of executing the operation twice. This helps ensure idempotency across state calls, but can cause issues if a zone is deleted and then an attempt is made to recreate it with the same CallerReference. If not provided, a unique UUID will be generated at each state run, which can potentially lead to duplicate zones being created if the state is run again while the previous zone creation is still in PENDING status (which can occasionally take several minutes to clear). Maximum length of 128.
VPCs A list of dicts, each dict composed of a VPCRegion, and either a VPCId or a VPCName. Note that this param is ONLY used if PrivateZone == True
VPCId When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCName.
VPCName When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCId.
VPCRegion When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from VPCId or VPCName, if possible. This will fail if a given VPCName exists in multiple regions visible to the bound account, in which case you’ll need to provide an explicit value for VPCRegion.

salt.states.boto3_route53.rr_absent(name, HostedZoneld=None, DomainName=None, PrivateZone=False, Name=None, Type=None, SetIdentifier=None, region=None, key=None, keyid=None, profile=None)

Ensure the Route53 record is deleted.
name The name of the state definition. This will be used for Name if the latter is not provided.
HostedZoneld The ID of the zone to delete the record from. Exclusive with DomainName.
DomainName The domain name of the zone to delete the record from. Exclusive with HostedZoneld.
PrivateZone Set to True if the RR to be removed is in a private zone, False if public.
Name Name of the resource record.
Type  The record type (A, NS, MX, TXT, etc.)
SetIdentifier  Valid for Weighted, Latency, Geolocation, and Failover resource record sets only. An identifier that differentiates among multiple resource record sets that have the same combination of DNS name and type. The value of SetIdentifier must be unique for each resource record set that has the same combination of DNS name and type. Omit SetIdentifier for any other types of record sets.
region  The region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

```
salt.states.boto3_route53.rr_present(name, HostedZoneId=None, DomainName=None, PrivateZone=False, Name=None, Type=None, SetIdentifier=None, Weight=None, Region=None, GeoLocation=None, Failover=None, TTL=None, ResourceRecords=None, AliasTarget=None, HealthCheckId=None, TrafficPolicyInstanceId=None, region=None, key=None, keyid=None, profile=None)
```

Ensure the Route53 record is present.

name  The name of the state definition. This will be used for Name if the latter is not provided.
HostedZoneId  The ID of a zone to create the record in. Exclusive with DomainName.
DomainName  The domain name of a zone to create the record in. Exclusive with HostedZoneId.
PrivateZone  Set to True if the resource record should be in a private zone, False if public.
Name  Name of the Route 53 resource record being managed.
Type  The record type (A, NS, MX, TXT, etc.)
SetIdentifier  Valid for Weighted, Latency, Geolocation, and Failover resource record sets only. An identifier that differentiates among multiple resource record sets that have the same combination of DNS name and type. The value of SetIdentifier must be unique for each resource record set that has the same combination of DNS name and type. Omit SetIdentifier for any other types of record sets.
Weight  Valid for Weighted resource record sets only. Among resource record sets that have the same combination of DNS name and type, a value that determines the proportion of DNS queries that Amazon Route 53 responds to using the current resource record set. Amazon Route 53 calculates the sum of the weights for the resource record sets that have the same combination of DNS name and type. Amazon Route 53 then responds to queries based on the ratio of a resource’s weight to the total.

Note the following:
- You must specify a value for the Weight element for every weighted resource record set.
- You can only specify one ResourceRecord per weighted resource record set.
- You can’t create latency, failover, or geolocation resource record sets that have the same values for the Name and Type elements as weighted resource record sets.
- You can create a maximum of 100 weighted resource record sets that have the same values for the Name and Type elements.
- For weighted (but not weighted alias) resource record sets, if you set Weight to 0 for a resource record set, Amazon Route 53 never responds to queries with the applicable value for that resource record set. However, if you set Weight to 0 for all resource record sets that have the same combination of DNS name and type, traffic is routed to all resources with equal probability. The effect of setting Weight to 0 is different when you associate health checks with weighted resource record sets. For more information, see Options for Configuring Amazon Route 53 Active-Active and Active-Passive Failover in the Amazon Route 53 Developer Guide.
Region  Valid for Latency-based resource record sets only. The Amazon EC2 Region where the resource that is specified in this resource record set resides. The resource typically is an AWS resource, such as an EC2 instance or an ELB load balancer, and is referred to by an IP address or a DNS domain name, depending on the record type.
GeoLocation  Geo location resource record sets only. A dict that lets you control how Route 53 responds to DNS queries based on the geographic origin of the query. For example, if you want all queries from Africa to be routed to a web server with an IP address of 192.0.2.111, create a resource record set with a
Type of A and a ContinentCode of AF.

<table>
<thead>
<tr>
<th>ContinentCode</th>
</tr>
</thead>
<tbody>
<tr>
<td>The two-letter code for the continent.</td>
</tr>
<tr>
<td>Valid values: AF</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>CountryCode</th>
</tr>
</thead>
<tbody>
<tr>
<td>The two-letter code for the country.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>SubdivisionCode</th>
</tr>
</thead>
<tbody>
<tr>
<td>The code for the subdivision, for example, a state in the United States or a province in Canada.</td>
</tr>
</tbody>
</table>

Notes

- Creating geolocation and geolocation alias resource record sets in private hosted zones is not supported.
- If you create separate resource record sets for overlapping geographic regions (for example, one resource record set for a continent and one for a country on the same continent), priority goes to the smallest geographic region. This allows you to route most queries for a continent to one resource and to route queries for a country on that continent to a different resource.
- You can’t create two geolocation resource record sets that specify the same geographic location.
- The value * in the CountryCode element matches all geographic locations that aren’t specified in other geolocation resource record sets that have the same values for the Name and Type elements.
- Geolocation works by mapping IP addresses to locations. However, some IP addresses aren’t mapped to geographic locations, so even if you create geolocation resource record sets that cover all seven continents, Amazon Route 53 will receive some DNS queries from locations that it can’t identify. We recommend that you create a resource record set for which the value of CountryCode is *, which handles both queries that come from locations for which you haven’t created geolocation resource record sets and queries from IP addresses that aren’t mapped to a location. If you don’t create a * resource record set, Amazon Route 53 returns a "no answer" response for queries from those locations.
- You can’t create non-geolocation resource record sets that have the same values for the Name and Type elements as geolocation resource record sets.

TTL  The resource record cache time to live (TTL), in seconds. Note the following:

- If you’re creating an alias resource record set, omit TTL. Amazon Route 53 uses the value of TTL for the alias target.
- If you’re associating this resource record set with a health check (if you’re adding a HealthCheckId element), we recommend that you specify a TTL of 60 seconds or less so clients respond quickly to changes in health status.
- All of the resource record sets in a group of weighted, latency, geolocation, or failover resource record sets must have the same value for TTL.
- If a group of weighted resource record sets includes one or more weighted alias resource record sets for which the alias target is an ELB load balancer, we recommend that you specify a TTL of 60 seconds for all of the non-alias weighted resource record sets that have the same name and type. Values other than 60 seconds (the TTL for load balancers) will change the effect of the values that you specify for Weight.

ResourceRecords  A list, containing one or more values for the resource record. No single value can exceed 4,000 characters. For details on how to format values for different record types, see Supported DNS Resource Record Types in the Amazon Route 53 Developer Guide.

Note: You can specify more than one value for all record types except CNAME and SOA.

It is also possible to pass "magic" strings as resource record values. This functionality can easily be extended, but for the moment supports the following:
'magic:ec2_instance_tag:some_tag_name:some_string:some_instance_attr'
This tells salt to lookup an EC2 instance with a tag 'some_tag_name' which has the value 'some_string'
and substitute the 'some_instance_attr' attribute of that instance as the resource record value being
evaluated.

This should work generally for any EC2 instance tags, as long as the instance attribute being fetched is
available to getattr(instance, 'attribute') as seen in the code below. Anything else will most likely require
this function to be extended to handle it.

The canonical use-case for this (at least at our site) is to query the Name tag (which we always popu-
late with the host's FQDN) to lookup the public or private IPs bound to the instance, so we can then
automagically create Route 53 records for them.

AliasTarget The rules governing how to define an AliasTarget for the various supported use-cases are obtuse
beyond reason and attempting to paraphrase them (or even worse, cut-and-paste them in their entirety)
would be silly and counterproductive. If you need this feature, then Read The Fine Materials at the
Boto 3 Route 53 page and/or the AWS Route 53 docs and suss them for yourself - I sure won't claim to
understand them particularly well.

region The region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

21.19.24 salt.states.boto_apigateway module

Manage Apigateway Rest APIs

New in version 2016.11.0.

depends

• boto >= 2.8.0
• boto3 >= 1.2.1
• botocore >= 1.4.49

Create and destroy rest apis depending on a swagger version 2 definition file. Be aware that this interacts with
Amazon's services, and so may incur charges.

This module uses boto3, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance
Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is neces-
sary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

| vpc.keyid | GKTADJGHEIQSXMKKRBJ08H |
| vpc.key  | askdjghsdfjkghWupUjasdfdkfklgjsdfjajkghs |

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull
from pillars or minion config:

<table>
<thead>
<tr>
<th>myprofile</th>
</tr>
</thead>
<tbody>
<tr>
<td>keyid</td>
</tr>
<tr>
<td>key</td>
</tr>
<tr>
<td>region</td>
</tr>
</tbody>
</table>
Ensure Apigateway API exists:
```yaml
boto_apigateway.present:
  - name: myfunction
  - region: us-east-1
  - keyid: GKTADJGHEIQXSXMKRRBQ8H
  - key: askdjghsdfjkgWupUjasdfklkflgjdsdfjajkghs
```

```python
salt.states.boto_apigateway.absent(name, api_name, stage_name, nuke_api=False, region=None, key=None, keyid=None, profile=None)
```
Ensure the stage_name associated with the given api_name deployed by boto_apigateway’s present state is removed. If the currently associated deployment to the given stage_name has no other stages associated with it, the deployment will also be removed.
- name Name of the swagger file in YAML format
- api_name Name of the rest api on AWS ApiGateway to ensure is absent.
- stage_name Name of the stage to be removed irrespective of the swagger file content. If the current deployment associated with the stage_name has no other stages associated with it, the deployment will also be removed.
- nuke_api If True, removes the API itself only if there are no other stages associated with any other deployments once the given stage_name is removed.
- region Region to connect to.
- key Secret key to be used.
- keyid Access key to be used.
- profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```python
salt.states.boto_apigateway.present(name, api_name, swagger_file, stage_name, api_key_required, lambda_integration_role, lambda_region=None, stage_variables=None, region=None, key=None, keyid=None, profile=None, lambda_funcname_format='{stage}_{api}_{resource}_{method}', authorization_type='NONE', error_response_template=None, response_template=None)
```
Ensure the specified api_name with the corresponding swaggerfile is deployed to the given stage_name in AWS ApiGateway.

This state currently only supports ApiGateway integration with AWS Lambda, and CORS support is handled through a Mock integration.

There may be multiple deployments for the API object, each deployment is tagged with a description (i.e. unique label) in pretty printed json format consisting of the following key/values.

```json
{
  "api_name": api_name,
  "swagger_file": basename_of_swagger_file
  "swagger_file_md5sum": md5sum_of_swagger_file,
  "swagger_info_object": info_object_content_in_swagger_file
}
```
Please note that the name of the lambda function to be integrated will be derived via the provided lambda_funcname_format parameters:
- the default lambda_funcname_format is a string with the following substitutable keys: "[stage]_[api]_[resource]_[method]". The user can choose to reorder the known keys.
- the stage key corresponds to the stage_name passed in.
- the api key corresponds to the api_name passed in.
- the resource corresponds to the resource path defined in the passed swagger file.
- the method corresponds to the method for a resource path defined in the passed swagger file.
For the default lambda_funcname_format, given the following input:

```
api_name = 'Test Service'
stage_name = 'alpha'
basePath = '/api'
path = '/a/{b}/c'
method = 'POST'
```

We will end up with the following Lambda Function Name that will be looked up: 'test_service_alpha_a_b_c_post'

The canonicalization of these input parameters is done in the following order:
1. lambda_funcname_format is formatted with the input parameters as passed,
2. resulting string is stripped for leading/trailing spaces,
3. path parameter’s curly braces are removed from the resource path,
4. consecutive spaces and forward slashes in the paths are replaced with '_'
5. consecutive '_' are replaced with '_'

Please note that for error response handling, the swagger file must have an error response model with the following schema. The lambda functions should throw exceptions for any non successful responses. An optional pattern field can be specified in errorMessage field to aid the response mapping from Lambda to the proper error return status codes.

```
Error:
  type: object
  properties:
    stackTrace:
      type: array
      items:
        type: array
        items:
          type: string
          description: call stack
    errorType:
      type: string
      description: error type
    errorMessage:
      type: string
      description: |
        Error message, will be matched based on pattern.
        If no pattern is specified, the default pattern used for response mapping will be **.
```

**name** The name of the state definition

**api_name** The name of the rest api that we want to ensure exists in AWS API Gateway

**swagger_file** Name of the location of the swagger rest api definition file in YAML format.

**stage_name** Name of the stage we want to be associated with the given api_name and swagger_file definition

**api_key_required** True or False - whether the API Key is required to call API methods

**lambda_integration_role** The name or ARN of the IAM role that the AWS ApiGateway assumes when it executes your lambda function to handle incoming requests

**lambda_region** The region where we expect to find the lambda functions. This is used to determine the region where we should look for the Lambda Function for integration purposes. The region determination is based on the following priority:
1. lambda_region as passed in (is not None)
2. if lambda_region is None, use the region as if a boto_lambda function were executed without explicitly specifying lambda region.
3. if region determined in (2) is different than the region used by boto_apigateway functions, a final lookup will be attempted using the boto_apigateway region.
stage_variables A dict with variables and their values, or a pillar key (string) that contains a dict with variables and their values. key and values in the dict must be strings. {'string': 'string'}

region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

lambda_funcname_format Please review the earlier example for the usage. The only substitutable keys in the funcname format are {stage}, {api}, {resource}, {method}. Any other keys or positional substitution parameters will be flagged as an invalid input.

authorization_type This field can be either 'NONE', or 'AWS_IAM'. This will be applied to all methods in the given swagger spec file. Default is set to 'NONE'.

error_response_template String value that defines the response template mapping that should be applied in cases error occurs. Refer to AWS documentation for details: http://docs.aws.amazon.com/apigateway/latest/developerguide/api-gateway-mapping-template-reference.html

If set to None, the following default value is used:

```python
'#{set($inputRoot = $input.path($))}
{
  "errorMessage": "$inputRoot.errorMessage",
  "errorType": "$inputRoot.errorType",
  "stackTrace": ["$inputRoot.stackTrace[0]"
  #foreach($stackTrace in $inputRoot.stackTrace)
    [
    #foreach($elem in $stackTrace)
      "$elem"
    #if($foreach.hasNext),#end
    #end
    ]
    #if($foreach.hasNext),#end
  #end
  ]
  
  
}''
```

New in version 2017.7.0.

response_template String value that defines the response template mapping applied in case of success (including OPTIONS method). If set to None, empty ({}) template is assumed, which will transfer response from the lambda function as is.

New in version 2017.7.0.

salt.states.boto_apigateway.usage_plan_absent(name, plan_name, region=None, key=None, keyid=None, profile=None)

Ensures usage plan identified by name is no longer present

New in version 2017.7.0.

name name of the state
plan_name name of the plan to remove

usage plan absent:

```yaml
boto_apigateway.usage_plan_absent:
  - plan_name: my_usage_plan
  - profile: my_profile
```

New in version 2017.7.0.
**Salt Documentation, Release 3000.2**

salt.states.boto_apigateway.usage_plan_association_absent(name, plan_name, api_stages, region=None, key=None, keyid=None, profile=None)

Ensures usage plan identified by name is removed from provided api_stages If a plan is associated to stages not listed in api_stages parameter, those associations remain intact.

New in version 2017.7.0.

name name of the state

plan_name name of the plan to use

api_stages list of dictionaries, where each dictionary consists of the following keys:

  - apiId id of the api to detach usage plan from
  - stage name of the api to detach usage plan from

UsagePlanAssociationAbsent:
boto_apigateway.usage_plan_association_absent:
  - plan_name: my_plan
  - api_stages:
    - apiId: 9kb0404ec0
      stage: my_stage
    - apiId: l9v7o2aj90
      stage: my_stage
  - profile: my_profile

salt.states.boto_apigateway.usage_plan_association_present(name, plan_name, api_stages, region=None, key=None, keyid=None, profile=None)

Ensures usage plan identified by name is added to provided api_stages

New in version 2017.7.0.

name name of the state

plan_name name of the plan to use

api_stages list of dictionaries, where each dictionary consists of the following keys:

  - apiId id of the api to attach usage plan to
  - stage name of the api to attach usage plan to

UsagePlanAssociationPresent:
boto_apigateway.usage_plan_association_present:
  - plan_name: my_plan
  - api_stages:
    - apiId: 9kb0404ec0
      stage: my_stage
    - apiId: l9v7o2aj90
      stage: my_stage
  - profile: my_profile

salt.states.boto_apigateway.usage_plan_present(name, plan_name, description=None, throttle=None, quota=None, region=None, key=None, keyid=None, profile=None)

Ensure the specified usage plan with the corresponding metrics is deployed

New in version 2017.7.0.

name name of the state

plan_name [Required] name of the usage plan
throttle  [Optional] throttling parameters expressed as a dictionary. If provided, at least one of the throttling parameters must be present
rateLimit  rate per second at which capacity bucket is populated
burstLimit  maximum rate allowed
quota  [Optional] quota on the number of api calls permitted by the plan. If provided, limit and period must be present
limit  [Required] number of calls permitted per quota period
offset  [Optional] number of calls to be subtracted from the limit at the beginning of the period
period  [Required] period to which quota applies. Must be DAY, WEEK or MONTH

UsagePlanPresent:
boto_apigateway.usage_plan_present:
  - plan_name: my_usage_plan
  - throttle:
    - rateLimit: 70
    - burstLimit: 100
  - quota:
    - limit: 1000
    - offset: 0
    - period: DAY
  - profile: my_profile

21.19.25  salt.states.boto_asg

Manage Autoscale Groups

New in version 2014.7.0.

Create and destroy autoscale groups. Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit autoscale credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

```python
asg.keyid: GKTADJGHEIQSXMKKRBJ08H
asg.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```python
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

Ensure myasg exists:
boto_asg.present:
  - name: myasg
  - launch_config_name: mylc

(continues on next page)
- **availability_zones**:  
  - us-east-1a  
  - us-east-1b  
- **min_size**: 1  
- **max_size**: 1  
- **desired_capacity**: 1  
- **load_balancers**:  
  - myelb  
- **suspended_processes**:  
  - AddToLoadBalancer  
  - AlarmNotification  
- **scaling_policies**  
  - adjustment_type: ChangeInCapacity  
  - as_name: api-production-iad  
  - cooldown: 1800  
  - min_adjustment_step: None  
  - name: ScaleDown  
  - scaling_adjustment: -1  
- **region**: us-east-1  
- **keyid**: GKTADJGHEIQSXMKKRBJ08H  
- **key**: askdjghsdfjkgHwupUjasdfkldfklgjsdfjajkghs

# Using a profile from pillars.  
Ensure myasg exists:  
```python  
boto_asg.present:  
- name: myasg  
- launch_config_name: mylc  
- availability_zones:  
  - us-east-1a  
  - us-east-1b  
- min_size: 1  
- max_size: 1  
- desired_capacity: 1  
- load_balancers:  
  - myelb  
- profile: myprofile
```

# Passing in a profile.  
Ensure myasg exists:  
```python  
boto_asg.present:  
- name: myasg  
- launch_config_name: mylc  
- availability_zones:  
  - us-east-1a  
  - us-east-1b  
- min_size: 1  
- max_size: 1  
- desired_capacity: 1  
- load_balancers:  
  - myelb  
- profile:  
  - keyid: GKTADJGHEIQSXMKKRBJ08H  
  - key: askdjghsdfjkgHwupUjasdfkldfklgjsdfjajkghs  
  - region: us-east-1
```

# Deleting an autoscale group with running instances.
Ensure myasg is deleted:

```yaml
boto_asg.absent:
  - name: myasg
    # If instances exist, we must force the deletion of the asg.
    - force: True
```

It's possible to specify cloudwatch alarms that will be setup along with the ASG. Note the alarm name will be the name attribute defined, plus the ASG resource name.

Ensure myasg exists:

```yaml
boto_asg.present:
  - name: myasg
  - launch_config_name: mylc
  - availability_zones: [us-east-1a, us-east-1b]
  - min_size: 1
  - max_size: 1
  - desired_capacity: 1
  - load_balancers: [myelb]
  - profile: myprofile
  - alarms:
    - CPU:
      name: 'ASG CPU **MANAGED BY SALT**'
      attributes:
        metric: CPUUtilization
        namespace: AWS/EC2
        statistic: Average
        comparison: '>='
        threshold: 65.0
        period: 60
        evaluation_periods: 30
        unit: null
        description: 'ASG CPU'
      alarm_actions: [arn:aws:sns:us-east-1:12345:myalarm]
      insufficient_data_actions: []
      ok_actions: [arn:aws:sns:us-east-1:12345:myalarm]
```

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that 'boto_asg_alarms' will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for an ASG resource.

Setting the alarms in a pillar:

```yaml
my_asg_alarm:
  CPU:
    name: 'ASG CPU **MANAGED BY SALT**'
    attributes:
      metric: CPUUtilization
      namespace: AWS/EC2
      statistic: Average
      comparison: '>='
      threshold: 65.0
      period: 60
      evaluation_periods: 30
      unit: null
```

(continues on next page)
Overriding the alarm values on the resource:

```python
Ensure myasg exists:
  boto_asg.present:
    - name: myasg
    - launch_config_name: mylc
    - availability_zones:
      - us-east-1a
      - us-east-1b
    - min_size: 1
    - max_size: 1
    - desired_capacity: 1
    - load_balancers:
      - myelb
    - profile: myprofile
    - alarms_from_pillar: my_asg_alarm

  # override CPU:attributes:threshold
  - alarms:
    - CPU:
      - attributes:
        - threshold: 50.0
```

```python
salt.states.boto_asg.absent(name, force=False, region=None, key=None, keyid=None, profile=None, remove_lc=False)
```

Ensure the named autoscale group is deleted.

- **name** Name of the autoscale group.
- **force** Force deletion of autoscale group.
- **remove_lc** Delete the launch config as well.
- **region** The region to connect to.
- **key** Secret key to be used.
- **keyid** Access key to be used.
- **profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```python
salt.states.boto_asg.present(name, launch_config_name, availability_zones, min_size, max_size, launch_config= None, desired_capacity= None, load_balancers= None, default_cooldown= None, health_check_type= None, health_check_period= None, placement_group= None, vpc_zone_identifier= None, subnet_names= None, tags= None, termination_policies= None, termination_policies_from_pillar= 'boto_asg_termination_policies', suspended_processes= None, scaling_policies= None, scaling_policies_from_pillar= 'boto_asg_scaling_policies', scheduled_actions= None, scheduled_actions_from_pillar= 'boto_asg_scheduled_actions', alarms= None, alarms_from_pillar= 'boto_asg_alarms', region= None, key= None, keyid= None, profile= None, notification_arn= None, notification_arn_from_pillar= 'boto_asg_notification_arn', notification_types= None, notification_types_from_pillar= 'boto_asg_notification_types')
```

Ensure the autoscale group exists.

- **name** Name of the autoscale group.
**launch_config_name**  Name of the launch config to use for the group. Or, if `launch_config` is specified, this will be the launch config name’s prefix. (see below)

**launch_config**  A dictionary of launch config attributes. If specified, a launch config will be used or created, matching this set of attributes, and the autoscale group will be set to use that launch config. The launch config name will be the `launch_config_name` followed by a hyphen followed by a hash of the `launch_config` dict contents. Example:

```python
my_asg:
  boto_asg.present:
    - launch_config:
        - ebs_optimized: false
        - instance_profile_name: my_iam_profile
        - kernel_id: '
        - ramdisk_id: '
        - key_name: my_ssh_key
        - image_name: aws2015091-hvm
        - instance_type: c3.xlarge
        - instance_monitoring: false
        - security_groups:
            - my_sec_group_01
            - my_sec_group_02
```

**availability_zones**  List of availability zones for the group.

**min_size**  Minimum size of the group.

**max_size**  Maximum size of the group.

**desired_capacity**  The desired capacity of the group.

**load_balancers**  List of load balancers for the group. Once set this can not be updated (Amazon restriction).

**default_cooldown**  Number of seconds after a Scaling Activity completes before any further scaling activities can start.

**health_check_type**  The service you want the health status from, Amazon EC2 or Elastic Load Balancer (EC2 or ELB).

**health_check_period**  Length of time in seconds after a new EC2 instance comes into service that Auto Scaling starts checking its health.

**placement_group**  Physical location of your cluster placement group created in Amazon EC2. Once set this can not be updated (Amazon restriction).

**vpc_zone_identifier**  A list of the subnet identifiers of the Virtual Private Cloud.

**subnet_names**  For VPC, a list of subnet names (NOT subnet IDs) to deploy into. Exclusive with `vpc_zone_identifier`.

**tags**  A list of tags. Example:

```yaml
- key: 'key'
  value: 'value'
  propagate_at_launch: true
```

**termination_policies**  A list of termination policies. Valid values are:

- OldestInstance
- NewestInstance
- OldestLaunchConfiguration
- ClosestToNextInstanceHour
- Default

If no value is specified, the Default value is used.

**termination_policies_from_pillar**  name of pillar dict that contains termination policy settings. Termination policies defined for this specific state will override those from pillar.

scaling_policies_from_pillar: name of pillar dict that contains scaling policy settings. Scaling policies defined for this specific state will override those from pillar.

scheduled_actions: a dictionary of scheduled actions. Each key is the name of scheduled action and each value is dictionary of options. For example:

```yaml
- scheduled_actions:
  scale_up_at_10:
    desired_capacity: 4
    min_size: 3
    max_size: 5
    recurrence: "@ 9 * * 1-5"
  scale_down_at_7:
    desired_capacity: 1
    min_size: 1
    max_size: 1
    recurrence: "@ 19 * * 1-5"
```

scheduled_actions_from_pillar: name of pillar dict that contains scheduled_actions settings. Scheduled actions for this specific state will override those from pillar.

alarms: a dictionary of name->boto_cloudwatch_alarm sections to be associated with this ASG. All attributes should be specified except for dimension which will be automatically set to this ASG.

See the salt.states.boto_cloudwatch_alarm state for information about these attributes.

If any alarm actions include "self:" this will be replaced with the asg name. For example, alarm_actions reading "[scaling_policy:self:ScaleUp]" will map to the arn for this asg’s scaling policy named “ScaleUp”. In addition, any alarms that have only scaling_policy as actions will be ignored if min_size is equal to max_size for this ASG.

alarms_from_pillar: name of pillar dict that contains alarm settings. Alarms defined for this specific state will override those from pillar.

region The region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
notification_arn The AWS arn that notifications will be sent to
notification_arn_from_pillar name of the pillar dict that contains notification_arn settings. A notification_arn defined for this specific state will override the one from pillar.

notification_types A list of event names that will trigger a notification. The list of valid notification types is:
- autoscaling:EC2_INSTANCE_LAUNCH
- autoscaling:EC2_INSTANCE_LAUNCH_ERROR
- autoscaling:EC2_INSTANCE_TERMINATE
- autoscaling:EC2_INSTANCE_TERMINATE_ERROR
- autoscaling:TEST_NOTIFICATION

notification_types_from_pillar name of the pillar dict that contains notification_types settings. notification_types defined for this specific state will override those from the pillar.

21.19.26 salt.states.boto_cfn

Connection module for Amazon Cloud Formation

New in version 2015.8.0.

depends boto

configuration This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

```yaml
stack-present:
boto_cfn.present:
  - name: mystack
  - template_body: salt://base/mytemplate.json
  - disable_rollback: true
  - region: eu-west-1
  - keyid: 'AKIAJHTMIQ2ASDFLASDF'
  - key: 'fdkjsafkljsASSADFalkfjasdf'

stack-absent:
boto_cfn.absent:
  - name: mystack
```

salt.states.boto_cfn.absent(name, region=None, key=None, keyid=None, profile=None)

Ensure cloud formation stack is absent.

name (string) – The name of the stack to delete.

region (string) - Region to connect to.

key (string) - Secret key to be used.

keyid (string) - Access key to be used.

profile (dict) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_cfn.present(name, template_body=None, template_url=None, parameters=None, notification_arns=None, disable_rollback=None, timeout_in_minutes=None, capabilities=None, tags=None, on_failure=None, stack_policy_body=None, stack_policy_url=None, use_previous_template=None, stack_policy_during_update_body=None, stack_policy_during_update_url=None, region=None, key=None, keyid=None, profile=None)

Ensure cloud formation stack is present.

name (string) - Name of the stack.

template_body (string) – Structure containing the template body. Can also be loaded from a file by using salt://.

template_url (string) – Location of file containing the template body. The URL must point to a template located in an S3 bucket in the same region as the stack.

parameters (list) – A list of key/value tuples that specify input parameters for the stack. A 3-tuple (key, value, bool) may be used to specify the UsePreviousValue option.

notification_arns (list) – The Simple Notification Service (SNS) topic ARNs to publish stack related events. You can find your SNS topic ARNs using the `SNS_console` or your Command Line Interface (CLI).

disable_rollback (bool) – Indicates whether or not to rollback on failure.

timeout_in_minutes (integer) – The amount of time that can pass before the stack status becomes CREATE_FAILED; if DisableRollback is not set or is set to False, the stack will be rolled back.
capabilities (list) – The list of capabilities you want to allow in the stack. Currently, the only valid capability is 'CAPABILITY_IAM'.

tags (dict) – A set of user-defined Tags to associate with this stack, represented by key/value pairs. Tags defined for the stack are propagated to EC2 resources that are created as part of the stack. A maximum number of 10 tags can be specified.

on_failure (string) – Determines what action will be taken if stack creation fails. This must be one of: DO NOTHING, ROLLBACK, or DELETE. You can specify either OnFailure or DisableRollback, but not both.

stack_policy_body (string) – Structure containing the stack policy body. Can also be loaded from a file by using salt://.

stack_policy_url (string) – Location of a file containing the stack policy. The URL must point to a policy (max size: 16KB) located in an S3 bucket in the same region as the stack. If you pass StackPolicyBody and StackPolicyURL, only StackPolicyBody is used.

use_previous_template (boolean) – Used only when templates are not the same. Set to True to use the previous template instead of uploading a new one via TemplateBody or TemplateURL.

stack_policy_during_update_body (string) – Used only when templates are not the same. Structure containing the temporary overriding stack policy body. If you pass StackPolicyDuringUpdateBody and StackPolicyDuringUpdateURL, only StackPolicyDuringUpdateBody is used. Can also be loaded from a file by using salt://.

stack_policy_during_update_url (string) – Used only when templates are not the same. Location of a file containing the temporary overriding stack policy. The URL must point to a policy (max size: 16KB) located in an S3 bucket in the same region as the stack. If you pass StackPolicyDuringUpdateBody and StackPolicyDuringUpdateURL, only StackPolicyDuringUpdateBody is used.

region (string) - Region to connect to.

key (string) - Secret key to be used.

keyid (string) - Access key to be used.

profile (dict) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.27 salt.states.boto_cloudfront

Manage CloudFront distributions

New in version 2018.3.0.

Create, update and destroy CloudFront distributions.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them, either in a pillar file or in the minion’s config file:

```
cloudfront.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudfront.key: askdjghsdfjkghWupUjasdflkdfklgjsdfajkgas
```

It’s also possible to specify key, keyid, and region via a profile, either passed in as a dict, or a string to pull from pillars or minion config:
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkgWupUjasdfklgjsdfjajkghs
region: us-east-1

aws:
region: us-east-1:
profile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkgWupUjasdfklgjsdfjajkghs
region: us-east-1

depends boto3

salt.states.boto_cloudfront.present(name, config, tags, region=None, key=None, keyid=None, profile=None)

Ensure the CloudFront distribution is present.
name (string) Name of the CloudFront distribution
config (dict) Configuration for the distribution
tags (dict) Tags to associate with the distribution
region (string) Region to connect to
key (string) Secret key to use
keyid (string) Access key to use
profile (dict or string) A dict with region, key, and keyid, or a pillar key (string) that contains such a dict.

Example:
Manage my_distribution CloudFront distribution:
boto_cloudfront.present:
  - name: my_distribution
  - config:
    Comment: 'partial config shown, most parameters elided'
    Enabled: True
  - tags:
    testing_key: testing_value

21.19.28 salt.states.boto_cloudtrail module

Manage CloudTrail Objects

New in version 2016.3.0.

Create and destroy CloudTrail objects. Be aware that this interacts with Amazon’s services, and so may incur charges.

depends

  • boto
  • boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

```
Ensure trail exists:
boto_cloudtrail.present:
  - Name: mytrail
  - S3BucketName: mybucket
  - S3KeyPrefix: prefix
  - region: us-east-1
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

salt.states.boto_cloudtrail.absent(name, Name=None, region=None, key=None, keyid=None, profile=None)

Ensures trail with passed properties is absent.

- **name**  The name of the state definition.
- **Name**  Name of the trail.
- **region**  Region to connect to.
- **key**  Secret key to be used.
- **keyid**  Access key to be used.
- **profile**  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_cloudtrail.present(name, Name=None, S3BucketName=None, S3KeyPrefix=None, SnsTopicName=None, IncludeGlobalServiceEvents=True, IsMultiRegionTrail=None, EnableLogFileValidation=False, CloudWatchLogsLogGroupArn=None, CloudWatchLogsRoleArn=None, KmsKeyId=None, LoggingEnabled=True, Tags=None, region=None, key=None, keyid=None, profile=None)

Ensures trail exists.

- **name**  The name of the state definition
- **Name**  Name of the trail.
- **S3BucketName**  Specifies the name of the Amazon S3 bucket designated for publishing log files.
- **S3KeyPrefix**  Specifies the Amazon S3 key prefix that comes after the name of the bucket you have designated for log file delivery.
- **SnsTopicName**  Specifies the name of the Amazon SNS topic defined for notification of log file delivery. The maximum length is 256 characters.
- **IncludeGlobalServiceEvents**  Specifies whether the trail is publishing events from global services such as IAM to the log files.
- **EnableLogFileValidation**  Specifies whether log file integrity validation is enabled. The default is false.
- **CloudWatchLogsLogGroupArn**  Specifies a log group name using an Amazon Resource Name (ARN), a unique identifier that represents the log group to which CloudTrail logs will be delivered. Not required unless you specify CloudWatchLogsRoleArn.
- **CloudWatchLogsRoleArn**  Specifies the role for the CloudWatch Logs endpoint to assume to write to a user's log group.
- **KmsKeyId**  Specifies the KMS key ID to use to encrypt the logs delivered by CloudTrail. The value can be a
an alias name prefixed by "alias/", a fully specified ARN to an alias, a fully specified ARN to a key, or a globally unique identifier.

LoggingEnabled Whether logging should be enabled for the trail
Tags A dictionary of tags that should be set on the trail
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.29 salt.states.boto_cloudwatch_alarm

Manage Cloudwatch alarms

New in version 2014.7.0.

Create and destroy cloudwatch alarms. Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

| cloudwatch.keyid: GKTADJGHEIQSXMKKRBJ08H |
| cloudwatch.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs |

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

| myprofile: |
| keyid: GKTADJGHEIQSXMKKRBJ08H |
| key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs |
| region: us-east-1 |

| my test alarm: |
| boto_cloudwatch_alarm.present: |
| - name: my test alarm |
| - attributes: |
|   metric: ApproximateNumberOfMessagesVisible |
|   namespace: AWS/SQS |
|   statistic: Average |
|   comparison: ">=" |
|   threshold: 20000.0 |
|   period: 60 |
|   evaluation_periods: 1 |
|   description: test alarm via salt |
|   dimensions: |
|     QueueName: |
|       the-sqs-queue-name |
|   alarm_actions: |
|     - arn:aws:sns:us-east-1:111111111:myalerting-action |
salt.states.boto_cloudwatch_alarm.absent(name, region=None, key=None, keyid=None, profile=None)

Ensure the named cloudwatch alarm is deleted.

- **name**: Name of the alarm.
- **region**: Region to connect to.
- **key**: Secret key to be used.
- **keyid**: Access key to be used.
- **profile**: A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_cloudwatch_alarm.present(name, attributes, region=None, key=None, keyid=None, profile=None)

Ensure the cloudwatch alarm exists.

- **name**: Name of the alarm
- **attributes**: A dict of key/value cloudwatch alarm attributes.
- **region**: Region to connect to.
- **key**: Secret key to be used.
- **keyid**: Access key to be used.
- **profile**: A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.30 salt.states.boto_cloudwatch_event module

Manage CloudTrail Objects

New in version 2016.11.0.

Create and destroy CloudWatch event rules. Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses boto3, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```
cloudwatch_event.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch_event.key: askdjghsdfjkgwupUjasdflkdfklgjsdfjajkghs
```

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkgwupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

Ensure event rule exists:
```
boto_cloudwatch_event.present:
    - Name: mytrail
    - ScheduleExpression: 'rate(120 minutes)'
    - State: 'DISABLED'
    - Targets:
        - Id: "target1"
```

(continues on next page)
salt.states.boto_cloudwatch_event.absent(name, Name=None, region=None, key=None, keyid=None, profile=None)

Ensure CloudWatch event rule with passed properties is absent.

- **name** The name of the state definition.
- **Name** Name of the event rule. Defaults to the value of the 'name' param if not provided.
- **region** Region to connect to.
- **key** Secret key to be used.
- **keyid** Access key to be used.
- **profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_cloudwatch_event.present(name, Name=None, ScheduleExpression=None, EventPattern=None, Description=None, RoleArn=None, State=None, Targets=None, region=None, key=None, keyid=None, profile=None)

Ensure trail exists.

- **name** The name of the state definition.
- **Name** Name of the event rule. Defaults to the value of the 'name' param if not provided.
- **ScheduleExpression** The scheduling expression. For example, cron(0 20 * * ? *), "rate(5 minutes)"
- **EventPattern** The event pattern.
- **Description** A description of the rule.
- **State** Indicates whether the rule is ENABLED or DISABLED.
- **RoleArn** The Amazon Resource Name (ARN) of the IAM role associated with the rule.
- **Targets** A list of resources to be invoked when the rule is triggered.
- **region** Region to connect to.
- **key** Secret key to be used.
- **keyid** Access key to be used.
- **profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.31 salt.states.boto_cognitoidentity module

Manage CognitoIdentity Functions

New in version 2016.11.0.

Create and destroy CognitoIdentity identity pools. Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses boto3, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:
It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

Ensure function exists:

```python
boto_cognitoidentity.pool_absent:
  - name: my_identity_pool
  - IdentityPoolName: my_identity_pool
  - region: us-east-1
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

salt.states.boto_cognitoidentity.pool_present:
  - name: IdentityPoolName
  - region: region
  - key: key
  - keyid: keyid
  - profile: profile
```

Ensure Cognito Identity Pool exists.

```python
salt.states.boto_cognitoidentity.pool_present:
  - name: IdentityPoolName
  - AuthenticatedRole
  - AllowUnauthenticatedIdentities=False
  - UnauthenticatedRole=None
  - SupportedLoginProviders=None
  - DeveloperProviderName=None
  - OpenIdConnectProviderARNs=None
  - region=None
  - key=None
  - keyid=None
  - profile=None
```

Ensure function exists:

```python
boto_cognitoidentity.pool_present:
  - name: IdentityPoolName
  - region: region
  - key: key
  - keyid: keyid
  - profile: profile
```

Ensure Cognito Identity Pool exists.

```python
salt.states.boto_cognitoidentity.pool_present:
  - name: IdentityPoolName
  - region: region
  - key: key
  - keyid: keyid
  - profile: profile
```
**OpenIdConnectProviderARNs**  A list or pillar name that contains a list of OpenID Connect provider ARNs.
- **region**  Region to connect to.
- **key**  Secret key to be used.
- **keyid**  Access key to be used.
- **profile**  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 21.19.32  salt.states.boto_datapipeline module

Manage Data Pipelines

New in version 2016.3.0.

Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses boto3, which can be installed via package, or pip.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](https://aws.amazon.com/boto3/).

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```
datapipeline.keyid: GKTADJGHEIQSXMKKRBJ08H
datapipeline.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

Ensure daily data pipeline exists:

```
boto_datapipeline.present:
    - name: my-datapipeline
      - pipeline_objects:
          DefaultSchedule:
            name: Every 1 day
            fields:
              period: 1 Day
              type: Schedule
              startAt: FIRST_ACTIVATION_DATE_TIME
          - parameter_values:
              myDDBTableName: my-dynamo-table
```

salt.states.boto_datapipeline.absent(name, region=None, key=None, keyid=None, profile=None)

Ensure a pipeline with the service_name does not exist

- **name**  Name of the service to ensure a data pipeline does not exist for.
- **region**  Region to connect to.
- **key**  Secret key to be used.
- **keyid**  Access key to be used.
- **profile**  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
salt.states.boto_datapipeline.present(name, pipeline_objects=None, pipeline_objects_from_pillars='boto_datapipeline_pipeline_objects', parameter_objects=None, parameter_objects_from_pillars='boto_datapipeline_parameter_objects', parameter_values=None, parameter_values_from_pillars='boto_datapipeline_parameter_values', region=None, key=None, keyid=None, profile=None)

Ensure the data pipeline exists with matching definition.

name  Name of the service to ensure a data pipeline exists for.
pipeline_objects  Pipeline objects to use. Will override objects read from pillars.
pipeline_objects_from_pillars  The pillar key to use for lookup.
parameter_objects  Parameter objects to use. Will override objects read from pillars.
pipeline_objects_from_pillars  The pillar key to use for lookup.
parameter_objects_from_pillars  The pillar key to use for lookup.
parameter_values  Parameter values to use. Will override values read from pillars.
parameter_values_from_pillars  The pillar key to use for lookup.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.33 salt.states.boto_dynamodb

Manage DynamoDB Tables

New in version 2015.5.0.

Create and destroy DynamoDB tables. Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit DynamoDB credentials but can also utilize IAM roles assigned to the instance through
Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration
is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
region: us-east-1
```

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull
from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

Ensure DynamoDB table does not exist:

```
boto_dynamodb.absent:
    - table_name: new_table
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
      region: us-east-1
```

(continues on next page)
Ensure DynamoDB table exists:
```
boto_dynamodb.present:
  - table_name: new_table
  - read_capacity_units: 1
  - write_capacity_units: 2
  - hash_key: primary_id
  - hash_key_data_type: N
  - range_key: start_timestamp
  - range_key_data_type: N
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkgWupUjasdfklfdkgjsdfjajkghs
  - region: us-east-1
  - local_indexes:
    - index:
      - name: "primary_id_end_timestamp_index"
      - hash_key: primary_id
      - hash_key_data_type: N
      - range_key: end_timestamp
      - range_key_data_type: N
  - global_indexes:
    - index:
      - name: "name_end_timestamp_index"
      - hash_key: name
      - hash_key_data_type: S
      - range_key: end_timestamp
      - range_key_data_type: N
      - read_capacity_units: 3
      - write_capacity_units: 4
```

It’s possible to specify cloudwatch alarms that will be setup along with the DynamoDB table. Note the alarm name will be defined by the name attribute provided, plus the DynamoDB resource name.

Ensure DynamoDB table exists:
```
boto_dynamodb.present:
  - name: new_table
  - read_capacity_units: 1
  - write_capacity_units: 2
  - hash_key: primary_id
  - hash_key_data_type: N
  - range_key: start_timestamp
  - range_key_data_type: N
  - local_indexes:
    - index:
      - name: "primary_id_end_timestamp_index"
      - hash_key: primary_id
      - hash_key_data_type: N
      - range_key: end_timestamp
      - range_key_data_type: N
  - global_indexes:
    - index:
      - name: "name_end_timestamp_index"
      - hash_key: name
      - hash_key_data_type: S
      - range_key: end_timestamp
      - range_key_data_type: N
      - read_capacity_units: 3
      - write_capacity_units: 4
  - alarms:
    - ConsumedWriteCapacityUnits:
      name: 'DynamoDB ConsumedWriteCapacityUnits **MANAGED BY SALT**'
      attributes:
        metric: ConsumedWriteCapacityUnits
        namespace: AWS/DynamoDB
        statistic: Sum
        comparison: '>= '
        # threshold_percent is used to calculate the actual threshold
        # based on the provisioned capacity for the table.
        threshold_percent: 0.75
        period: 300
        evaluation_periods: 2
        unit: Count
```
description: 'DynamoDB ConsumedWriteCapacityUnits'
alarm_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]
insufficient_data_actions: []
ok_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWuwUjasdflkdfklgjsdfajkghs
- region: us-east-1

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that 'boto_dynamodb_alarms' will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for a resource.

Setting the alarms in a pillar:

```
boto_dynamodb_alarms:
  ConsumedWriteCapacityUnits:
    name: 'DynamoDB ConsumedWriteCapacityUnits **MANAGED BY SALT**'
    attributes:
      metric: ConsumedWriteCapacityUnits
      namespace: AWS/DynamoDB
      statistic: Sum
      comparison: '>='
      # threshold_percent is used to calculate the actual threshold
      # based on the provisioned capacity for the table.
      threshold_percent: 0.75
      period: 300
      evaluation_periods: 2
      unit: Count
      description: 'DynamoDB ConsumedWriteCapacityUnits'
      alarm_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]
      insufficient_data_actions: []
      ok_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]

Ensure DynamoDB table exists:
```
boto_dynamodb.present:
  - name: new_table
  - read_capacity_units: 1
  - write_capacity_units: 2
  - hash_key: primary_id
  - hash_key_data_type: N
  - range_key: start_timestamp
  - range_key_data_type: N
  - alarms:
    ConsumedWriteCapacityUnits:
      attributes:
        threshold_percent: 0.90
        period: 900

exception salt.states.boto_dynamodb.GsiNotUpdatableError
Raised when a global secondary index cannot be updated.

salt.states.boto_dynamodb.absent(name, region=None, key=None, keyid=None, profile=None)
Ensure the DynamoDB table does not exist.

  name  Name of the DynamoDB table.
  region  Region to connect to.
  key  Secret key to be used.
  keyid  Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_dynamodb.present(name=None, table_name=None, region=None, key=None, keyid=None, profile=None, read_capacity_units=None, write_capacity_units=None, alarms=None, alarms_from_pillar='boto_dynamodb_alarms', hash_key=None, hash_key_data_type=None, range_key=None, range_key_data_type=None, local_indexes=None, global_indexes=None, backup_configs_from_pillars='boto_dynamodb_backupconfigs')

Ensure the DynamoDB table exists. Table throughput can be updated after table creation.

Global secondary indexes (GSIs) are managed with some exceptions:

- If a GSI deletion is detected, a failure will occur (deletes should be done manually in the AWS console).
- If multiple GSIs are added in a single Salt call, a failure will occur (boto supports one creation at a time).
  Note that this only applies after table creation; multiple GSIs can be created during table creation.
- Updates to existing GSIs are limited to read/write capacity only (DynamoDB limitation).

name Name of the DynamoDB table

table_name Name of the DynamoDB table (deprecated)

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

read_capacity_units The read throughput for this table

write_capacity_units The write throughput for this table

hash_key The name of the attribute that will be used as the hash key for this table

hash_key_data_type The DynamoDB datatype of the hash key

range_key The name of the attribute that will be used as the range key for this table

range_key_data_type The DynamoDB datatype of the range key

local_indexes The local indexes you would like to create

global_indexes The global indexes you would like to create

backup_configs_from_pillars Pillars to use to configure DataPipeline backups

21.19.34 salt.states.boto_ec2

Manage EC2

New in version 2015.8.0.

This module provides an interface to the Elastic Compute Cloud (EC2) service from AWS.

The below code creates a key pair:

```bash
create-key-pair:
boto_ec2.key_present:
  - name: mykeypair
  - save_private: /root/
  - region: eu-west-1
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkgHwupUjasdflkdfklgjsdfjadghs

import-key-pair:
boto_ec2.key_present:
```

(continues on next page)
You can also use salt:// in order to define the public key.

```yaml
import-key-pair:
boto_ec2.key_present:
  - name: mykeypair
  - upload_public: salt://mybase/public_key.pub
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

The below code deletes a key pair:

```yaml
delete-key-pair:
boto_ec2.key_absent:
  - name: mykeypair
  - region: eu-west-1
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

`salt.states.boto_ec2.eni_absent(name, release_eip=False, region=None, key=None, keyid=None, profile=None)`

Ensure the EC2 ENI is absent.

New in version 2016.3.0.
- `name` Name tag associated with the ENI.
- `release_eip` True/False - release any EIP associated with the ENI
- `region` Region to connect to.
- `key` Secret key to be used.
- `keyid` Access key to be used.
- `profile` A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_ec2.eni_present(name, subnet_id=None, subnet_name=None, private_ip_address=None, description=None, groups=None, source_dest_check=True, allocate_eip=None, arecords=None, region=None, key=None, keyid=None, profile=None)`

Ensure the EC2 ENI exists.

New in version 2016.3.0.
- `name` Name tag associated with the ENI.
- `subnet_id` The VPC subnet ID the ENI will exist within.
- `subnet_name` The VPC subnet name the ENI will exist within.
- `private_ip_address` The private ip address to use for this ENI. If this is not specified AWS will automatically assign a private IP address to the ENI. Must be specified at creation time; will be ignored afterward.
- `description` Description of the key.
- `groups` A list of security groups to apply to the ENI.
- `source_dest_check` Boolean specifying whether source/destination checking is enabled on the ENI.
- `allocate_eip` allocate and associate an EIP to the ENI. Could be 'standard' to allocate Elastic IP to EC2 region or 'vpc' to get it for a particular VPC

Changed in version 2016.11.0.
- `arecords` A list of arecord dicts with attributes needed for the DNS add_record state. By default the boto_route53.add_record state will be used, which requires: name, zone, ttl, and identifier. See the
boto_route53 state for information about these attributes. Other DNS modules can be called by specifying the provider keyword. By default, the private ENI IP address will be used, set 'public: True' in the arecord dict to use the ENI’s public IP address.

New in version 2016.3.0.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_ec2.instance_absent(name, instance_name=None, instance_id=None, release_eip=False, region=None, key=None, keyid=None, profile=None, filters=None)

Ensure an EC2 instance does not exist (is stopped and removed).

Changed in version 2016.11.0.

**name** (string) - The name of the state definition.

**instance_name** (string) - The name of the instance.

**instance_id** (string) - The ID of the instance.

**release_eip** (bool) - Release any associated EIPs during termination.

**region** (string) - Region to connect to.

**key** (string) - Secret key to be used.

**keyid** (string) - Access key to be used.

**profile** (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**filters** (dict) - A dict of additional filters to use in matching the instance to delete.

YAML example fragment:

```
- filters:
  vpc-id: vpc-abcdef12
```

salt.states.boto_ec2.instance_present(name, instance_name=None, instance_id=None, image_id=None, image_name=None, tags=None, key_name=None, security_groups=None, user_data=None, instance_type=None, placement=None, kernel_id=None, ramdisk_id=None, vpc_name=None, monitoring_enabled=None, subnet_id=None, subnet_name=None, private_ip_address=None, block_device_map=None, disable_api_termination=None, instance_initiated_shutdown_behavior=None, placement_group=None, client_token=None, security_group_ids=None, security_group_names=None, additional_info=None, tenancy=None, instance_profile_arn=None, instance_profile_name=None, ebs_optimized=None, network_interfaces=None, network_interface_name=None, network_interface_id=None, attributes=None, target_state=None, public_ip=None, allocation_id=None, allocate_eip=False, region=None, key=None, keyid=None, profile=None)

Ensure an EC2 instance is running with the given attributes and state.

**name** (string) - The name of the state definition. Recommended that this match the instance_name attribute.
(generally the FQDN of the instance).

**instance_name** (string) - The name of the instance, generally its FQDN. Exclusive with 'instance_id'.

**instance_id** (string) - The ID of the instance (if known). Exclusive with 'instance_name'.

**image_id** (string) – The ID of the AMI image to run.

**image_name** (string) – The name of the AMI image to run.

**tags** (dict) - Tags to apply to the instance.

**key_name** (string) – The name of the key pair with which to launch instances.

**security_groups** (list of strings) – The names of the EC2 classic security groups with which to associate instances

**user_data** (string) – The Base64-encoded MIME user data to be made available to the instance(s) in this reservation.

**instance_type** (string) – The EC2 instance size/type. Note that only certain types are compatible with HVM based AMIs.

**placement** (string) – The Availability Zone to launch the instance into.

**kernel_id** (string) – The ID of the kernel with which to launch the instances.

**ramdisk_id** (string) – The ID of the RAM disk with which to launch the instances.

**vpc_id** (string) - The ID of a VPC to attach the instance to.

**vpc_name** (string) - The name of a VPC to attach the instance to.

**monitoring_enabled** (bool) – Enable detailed CloudWatch monitoring on the instance.

**subnet_id** (string) – The ID of the subnet within which to launch the instances for VPC.

**subnet_name** (string) – The name of the subnet within which to launch the instances for VPC.

**private_ip_address** (string) – If you’re using VPC, you can optionally use this parameter to assign the instance a specific available IP address from the subnet (e.g., 10.0.0.25).

**block_device_map** (boto.ec2.blockdevicemapping.BlockDeviceMapping) – A BlockDeviceMapping data structure describing the EBS volumes associated with the Image.

**disable_api_termination** (bool) – If True, the instances will be locked and will not be able to be terminated via the API.

**instance_initiated_shutdown_behavior** (string) – Specifies whether the instance stops or terminates on instance-initiated shutdown. Valid values are:

- 'stop'
- 'terminate'

**placement_group** (string) – If specified, this is the name of the placement group in which the instance(s) will be launched.

**client_token** (string) – Unique, case-sensitive identifier you provide to ensure idempotency of the request. Maximum 64 ASCII characters.

**security_group_ids** (list of strings) – The IDs of the VPC security groups with which to associate instances.

**security_group_names** (list of strings) – The names of the VPC security groups with which to associate instances.

**additional_info** (string) – Specifies additional information to make available to the instance(s).

**tenancy** (string) – The tenancy of the instance you want to launch. An instance with a tenancy of 'dedicated' runs on single-tenant hardware and can only be launched into a VPC. Valid values are:"default" or "dedicated". NOTE: To use dedicated tenancy you MUST specify a VPC subnet-ID as well.

**instance_profile_arn** (string) – The Amazon resource name (ARN) of the IAM Instance Profile (IIP) to associate with the instances.

**instance_profile_name** (string) – The name of the IAM Instance Profile (IIP) to associate with the instances.

**ebs_optimized** (bool) – Whether the instance is optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and a tuned configuration stack to provide optimal EBS I/O performance. This optimization isn’t available with all instance types.

**network_interfaces** (boto.ec2.networkinterface.NetworkInterfaceCollection) – A NetworkInterfaceCollection data structure containing the ENI specifications for the instance.

**network_interface_name** (string) - The name of Elastic Network Interface to attach

New in version 2016.11.0.

**network_interface_id**
(string) - The id of Elastic Network Interface to attach
New in version 2016.11.0.

**attributes** (dict) - Instance attributes and value to be applied to the instance. Available options are:
- instanceType - A valid instance type (m1.small)
- kernel - Kernel ID (None)
- ramdisk - Ramdisk ID (None)
- userData - Base64 encoded String (None)
- disableApiTermination - Boolean (true)
- instanceInitiatedShutdownBehavior - stop|terminate
- blockDeviceMapping - List of strings - ie: ['/dev/sda=false']
- sourceDestCheck - Boolean (true)
- groupSet - Set of Security Groups or IDs
- ebsOptimized - Boolean (false)
- sriovNetSupport - String - ie: 'simple'

**target_state** (string) - The desired target state of the instance. Available options are:
- running
- stopped

Note that this option is currently UNIMPLEMENTED.

**public_ip** (string) - The IP of a previously allocated EIP address, which will be attached to the instance. EC2 Classic instances ONLY - for VCP pass in an allocation_id instead.

**allocation_id** (string) - The ID of a previously allocated EIP address, which will be attached to the instance. VPC instances ONLY - for Classic pass in a public_ip instead.

**allocate_eip** (bool) - Allocate and attach an EIP on-the-fly for this instance. Note you'll want to release this address when terminating the instance, either manually or via the `release_eip` flag to `instance_absent`.

**region** (string) - Region to connect to.
**key** (string) - Secret key to be used.
**keyid** (string) - Access key to be used.

**profile** (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

```python
salt.states.boto_ec2.key_absent(name, region=None, key=None, keyid=None, profile=None)
```

Deletes a key pair

```python
salt.states.boto_ec2.key_present(name, save_private=None, upload_public=None, region=None, key=None, keyid=None, profile=None)
```

Ensure key pair is present.

```python
salt.states.boto_ec2.private_ips_absent(name, network_interface_name=None, network_interface_id=None, private_ip_addresses=None, region=None, key=None, keyid=None, profile=None)
```

Ensure an ENI does not have secondary private ip addresses associated with it

**name** (String) - State definition name

**network_interface_id** (String) - The EC2 network interface id, example eni-123456789

**private_ip_addresses** (List or String) - The secondary private ip address(es) that should be absent on the ENI.

**region** (string) - Region to connect to.

**key** (string) - Secret key to be used.

**keyid** (string) - Access key to be used.

**profile** (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
salt.states.boto_ec2.private_ips_present(name, network_interface_name=None, network_interface_id=None, private_ip_addresses=None, allow_reassignment=False, region=None, key=None, keyid=None, profile=None)

Ensure an ENI has secondary private ip addresses associated with it

name (String) - State definition name
network_interface_id (String) - The EC2 network interface id, example eni-123456789
private_ip_addresses (List or String) - The secondary private ip address(es) that should be present on the ENI.
allow_reassignment (Boolean) - If true, will reassign a secondary private ip address associated with another
ENI. If false, state will fail if the secondary private ip address is associated with another ENI.
region (string) - Region to connect to.
key (string) - Secret key to be used.
keyid (string) - Access key to be used.
profile (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region,
key and keyid.

salt.states.boto_ec2.snapshot_created(name, ami_name, instance_name, wait_until_available=True, wait_timeout_seconds=300, **kwargs)

Create a snapshot from the given instance

New in version 2016.3.0.

salt.states.boto_ec2.volume_absent(name, volume_name=None, volume_id=None, instance_name=None, instance_id=None, device=None, region=None, key=None, keyid=None, profile=None)

Ensure the EC2 volume is detached and absent.

New in version 2016.11.0.

name State definition name.
volume_name Name tag associated with the volume. For safety, if this matches more than one volume, the
state will refuse to apply.
volume_id Resource ID of the volume.
instance_name Only remove volume if it is attached to instance with this Name tag. Exclusive with 'in-
stance_id'. Requires 'device'.
instance_id Only remove volume if it is attached to this instance. Exclusive with 'instance_name'. Requires
'device'.
device Match by device rather than ID. Requires one of 'instance_name' or 'instance_id'.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and
keyid.

salt.states.boto_ec2.volume_present(name, volume_name=None, volume_id=None, instance_name=None, instance_id=None, device=None, size=None, snapshot_id=None, volume_type=None, iops=None, encrypted=False, kms_key_id=None, region=None, key=None, keyid=None, profile=None)

Ensure the EC2 volume is present and attached.

name State definition name.
volume_name The Name tag value for the volume. If no volume with that matching name tag is found, a new
volume will be created. If multiple volumes are matched, the state will fail.
volume_id Resource ID of the volume. Exclusive with 'volume_name'.
instance_name Attach volume to instance with this Name tag. Exclusive with 'instance_id'.
instance_id Attach volume to instance with this ID. Exclusive with 'instance_name'.
device  The device on the instance through which the volume is exposed (e.g. /dev/sdh)

size  The size of the new volume, in GiB. If you're creating the volume from a snapshot and don't specify
a volume size, the default is the snapshot size. Optionally specified at volume creation time; will be
ignored afterward. Requires 'volume_name'.

snapshot_id  The snapshot ID from which the new Volume will be created. Optionally specified at volume
creation time; will be ignored afterward. Requires 'volume_name'.

volume_type  The type of the volume. Optionally specified at volume creation time; will be ignored afterward.
Requires 'volume_name'. Valid volume types for AWS can be found here: 

iops  The provisioned IOPS you want to associate with this volume. Optionally specified at volume creation
time; will be ignored afterward. Requires 'volume_name'.

encrypted  Specifies whether the volume should be encrypted. Optionally specified at volume creation
time; will be ignored afterward. Requires 'volume_name'.

kms_key_id  If encrypted is True, this KMS Key ID may be specified to encrypt volume with this key. Opti-
ionally specified at volume creation time; will be ignored afterward. Requires 'volume_name'. e.g.:
ar:aws:kms:us-east-1:012345678910:key/abcd1234-a123-456a-a12b-a123b4cd56ef

region  Region to connect to.

key  Secret key to be used.

keyid  Access key to be used.

profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and
keyid.

click.salt.states.boto_ec2.volumes_tagged(name, tag_maps, authoritative=False, region=None,
key=None, keyid=None, profile=None)

Ensure EC2 volume(s) matching the given filters have the defined tags.

New in version 2016.11.0.

click.salt.states.boto_ec2.volumes_tagged

ame  State definition name.

tag_maps  List of dicts of filters and tags, where 'filters' is a dict suitable for passing to the 'filters' argument
of boto_ec2.get_all_volumes(), and 'tags' is a dict of tags to be set on volumes as matched by the given
filters. The filter syntax is extended to permit passing either a list of volume_ids or an instance_name
(with instance_name being the Name tag of the instance to which the desired volumes are mapped).
Each mapping in the list is applied separately, so multiple sets of volumes can be all tagged differently
with one call to this function.

YAML example fragment:

```
- filters:
  attachment.instance_id: i-abcdef12
  tags:
    Name: dev-int-abcdef12.aws-foo.com
- filters:
  attachment.device: /dev/sdf
  tags:
    ManagedSnapshots: true
    BillingGroup: bubba.hotep@aws-foo.com
- filters:
  instance_name: prd-foo-01.aws-foo.com
  tags:
    Name: prd-foo-01.aws-foo.com
    BillingGroup: infra-team@aws-foo.com
- filters:
  volume_ids: [ vol-12345689, vol-abcdef12 ]
  tags:
    BillingGroup: infra-team@aws-foo.com
```

authoritative  Should un-declared tags currently set on matched volumes be deleted? Boolean.

region  Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.35 salt.states.boto_elasticache

Manage Elasticache

New in version 2014.7.0.

Create, destroy and update Elasticache clusters. Be aware that this interacts with Amazon’s services, and so may incur charges.

Note: This module currently only supports creation and deletion of elasticache resources and will not modify clusters when their configuration changes in your state files.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```yaml
elasticache.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticache.key: askdjghsdfjkgWupUjasdfklkdfklsjdfjajkgks
```

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkgWupUjasdfklkdfklsjdfjajkgks
  region: us-east-1
```

Ensure myelasticache exists:

```yaml
boto_elasticache.present:
  - name: myelasticache
  - engine: redis
  - cache_node_type: cache.t1.micro
  - num_cache_nodes: 1
  - region: us-east-1
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkgWupUjasdfklkdfklsjdfjajkgks
```

# Using a profile from pillars

Ensure myelasticache exists:

```yaml
boto_elasticache.present:
  - name: myelasticache
  - engine: redis
  - cache_node_type: cache.t1.micro
  - num_cache_nodes: 1
  - region: us-east-1
  - profile: myprofile
```
# Passing in a profile

Ensure myelasticache exists:

```yaml
boto_elasticache.present:
  - name: myelasticache
  - engine: redis
  - cache_node_type: cache.t1.micro
  - num_cache_nodes: 1
  - region: us-east-1
  - profile:
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkgHupUjasdfklkdfklgjsdfjajkghs
```

```
salt.states.boto_elasticache.absent(name, wait=True, region=None, key=None, keyid=None, profile=None)
```

Ensure the named elasticache cluster is deleted.

- `name`: Name of the cache cluster.
- `wait`: Boolean. Wait for confirmation from boto that the cluster is in the deleting state.
- `region`: Region to connect to.
- `key`: Secret key to be used.
- `keyid`: Access key to be used.
- `profile`: A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_elasticache.cache_cluster_absent(*args, **kwargs)
```

```
salt.states.boto_elasticache.cache_cluster_present(*args, **kwargs)
```

```
salt.states.boto_elasticache.creategroup(name, primary_cluster_id, replication_group_description, wait=None, region=None, key=None, keyid=None, profile=None)
```

Ensure the a replication group is create.

- `name`: Name of replication group
- `wait`: Waits for the group to be available
- `primary_cluster_id`: Name of the master cache node
- `replication_group_description`: Description for the group
- `region`: Region to connect to.
- `key`: Secret key to be used.
- `keyid`: Access key to be used.
- `profile`: A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_elasticache.present(name, engine=None, cache_node_type=None, num_cache_nodes=None, preferred_availability_zone=None, port=None, cache_parameter_group_name=None, cache_security_group_names=None, replication_group_id=None, auto_minor_version_upgrade=True, security_group_ids=None, cache_subnet_group_name=None, engine_version=None, notification_topic_arn=None, preferred_maintenance_window=None, wait=None, region=None, key=None, keyid=None, profile=None)
```

Ensure the cache cluster exists.

- `name`: Name of the cache cluster (cache cluster id).
The name of the cache engine to be used for this cache cluster. Valid values are memcached or redis.

**cache_node_type**
The compute and memory capacity of the nodes in the cache cluster. cache.t1.micro, cache.m1.small, etc. See: https://boto.readthedocs.io/en/latest/ref/elasticache.html#boto.elasticache.

**num_cache_nodes**
The number of cache nodes that the cache cluster will have.

**preferred_availability_zone**
The EC2 Availability Zone in which the cache cluster will be created. All cache nodes belonging to a cache cluster are placed in the preferred availability zone.

**port**
The port number on which each of the cache nodes will accept connections.

**cache_parameter_group_name**
The name of the cache parameter group to associate with this cache cluster. If this argument is omitted, the default cache parameter group for the specified engine will be used.

**cache_security_group_names**
A list of cache security group names to associate with this cache cluster. Use this parameter only when you are creating a cluster outside of a VPC.

**replication_group_id**
The replication group to which this cache cluster should belong. If this parameter is specified, the cache cluster will be added to the specified replication group as a read replica; otherwise, the cache cluster will be a standalone primary that is not part of any replication group.

**auto_minor_version_upgrade**
Determines whether minor engine upgrades will be applied automatically to the cache cluster during the maintenance window. A value of True allows these upgrades to occur; False disables automatic upgrades.

**security_group_ids**
One or more VPC security groups associated with the cache cluster. Use this parameter only when you are creating a cluster in a VPC.

**cache_subnet_group_name**
The name of the cache subnet group to be used for the cache cluster. Use this parameter only when you are creating a cluster in a VPC.

**engine_version**
The version number of the cache engine to be used for this cluster.

**notification_topic_arn**
The Amazon Resource Name (ARN) of the Amazon Simple Notification Service (SNS) topic to which notifications will be sent. The Amazon SNS topic owner must be the same as the cache cluster owner.

**preferred_maintenance_window**
The weekly time range (in UTC) during which system maintenance can occur. Example: sun:05:00-sun:09:00

**wait**
Boolean. Wait for confirmation from boto that the cluster is in the available state.

**region**
Region to connect to.

**key**
Secret key to be used.

**keyid**
Access key to be used.

**profile**
A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_elasticache.replication_group_absent(name, tags=None, region=None, key=None, keyid=None, profile=None)

salt.states.boto_elasticache.replication_group_present(*args, **kwargs)

salt.states.boto_elasticache.subnet_group_absent(name, tags=None, region=None, key=None, keyid=None, profile=None)

salt.states.boto_elasticache.subnet_group_present(name, subnet_ids=None, subnet_names=None, description=None, tags=None, region=None, key=None, keyid=None, profile=None)

Ensure ElastiCache subnet group exists.

New in version 2015.8.0.

**name**
The name for the ElastiCache subnet group. This value is stored as a lowercase string.

**subnet_ids**
A list of VPC subnet IDs for the cache subnet group. Exclusive with subnet_names.

**subnet_names**
A list of VPC subnet names for the cache subnet group. Exclusive with subnet_ids.

**description**
Subnet group description.

**tags**
A list of tags.
region  Region to connect to.
key   Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.36 salt.states.boto_elasticsearch_domain module

Manage Elasticsearch Domains

New in version 2016.11.0.

Create and destroy Elasticsearch domains. Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses boto3, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```yaml
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdflkdfklgjhsdkjghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjhsdkjghs
  region: us-east-1
```

Ensure domain exists:

```yaml
boto_elasticsearch_domain.present:
  - DomainName: mydomain
  - profile='user-credentials'
  - ElasticsearchVersion: "2.3"
  - ElasticsearchClusterConfig:
    InstanceType": "t2.micro.elasticsearch"
    InstanceCount: 1
    DedicatedMasterEnabled: False
    ZoneAwarenessEnabled: False
  - EBSOptions:
    EBSEnabled: True
    VolumeType: "gp2"
    VolumeSize: 10
    Iops: 0
  - AccessPolicies:
    Version: "2012-10-17"
    Statement:
      - Effect: "Allow"
      - Principal:
        AWS: "*"
      - Action:
        - "es:*"
```

(continues on next page)
- **Resource:** "arn:aws:es:*:111111111111:domain/mydomain/*"
  - **Condition:**
    - **IpAddress:**
      - "aws:SourceIp":
        - "127.0.0.1"
        - "127.0.0.2"
  - **SnapshotOptions:**
    - **AutomatedSnapshotStartHour:** 0
  - **AdvancedOptions:**
    - **rest.action.multi.allow_explicit_index**: "true"
  - **Tags:**
    - **a**: "b"
    - **region**: us-east-1
    - **keyid**: GKTADJGHEIQSXMKKRBJ08H
    - **key**: askdjghsdfjkghWupUjasdfklkdgjsdfjajkghs

salt.states.boto_elasticsearch_domain.absent(name, DomainName, region=None, key=None, keyid=None, profile=None)

Ensure domain with passed properties is absent.
- **name** The name of the state definition.
- **DomainName** Name of the domain.
- **region** Region to connect to.
- **key** Secret key to be used.
- **keyid** Access key to be used.
- **profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_elasticsearch_domain.present(name, DomainName, ElasticsearchClusterConfig=None, EBSOptions=None, AccessPolicies=None, SnapshotOptions=None, AdvancedOptions=None, Tags=None, region=None, key=None, keyid=None, profile=None, ElasticsearchVersion='1.5')

Ensure domain exists.
- **name** The name of the state definition
- **DomainName** Name of the domain.
- **ElasticsearchClusterConfig** Configuration options for an Elasticsearch domain. Specifies the instance type and number of instances in the domain cluster.
  - **InstanceType** (string) – The instance type for an Elasticsearch cluster.
  - **InstanceCount** (integer) – The number of instances in the specified domain cluster.
  - **DedicatedMasterEnabled** (boolean) – A boolean value to indicate whether a dedicated master node is enabled. See About Dedicated Master Nodes for more information.
  - **ZoneAwarenessEnabled** (boolean) – A boolean value to indicate whether zone awareness is enabled. See About Zone Awareness for more information.
  - **DedicatedMasterType** (string) – The instance type for a dedicated master node.
  - **DedicatedMasterCount** (integer) – Total number of dedicated master nodes, active and on standby, for the cluster.
- **EBSOptions** Options to enable, disable and specify the type and size of EBS storage volumes.
  - **EBSEnabled** (boolean) – Specifies whether EBS-based storage is enabled.
  - **VolumeType** (string) – Specifies the volume type for EBS-based storage.
VolumeSize (integer) – Integer to specify the size of an EBS volume.

Iops (integer) – Specifies the IOPD for a Provisioned IOPS EBS volume (SSD).

**AccessPolicies** IAM access policy

**SnapshotOptions** Option to set time, in UTC format, of the daily automated snapshot. Default value is 0 hours.

AutomatedSnapshotStartHour (integer) – Specifies the time, in UTC format, when the service takes a daily automated snapshot of the specified Elasticsearch domain. Default value is 0 hours.

**AdvancedOptions** Option to allow references to indices in an HTTP request body. Must be false when configuring access to individual sub-resources. By default, the value is true.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**ElasticsearchVersion** String of format X.Y to specify version for the Elasticsearch domain eg. "1.5" or "2.3".

### 21.19.37 salt.states.boto_elb

Manage ELBs

New in version 2014.7.0.

Create and destroy ELBs. Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit elb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```yaml
elb.keyid: GKTADJGHEIQSXMKKRBJ08H
elb.key: askdjghsdfjkgWupUjasdflkdsfklgjsdfjajkghs
```

It’s also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:  
  keyid: GKTADJGHEIQSXMKKRBJ08H  
  key: askdjghsdfjkgWupUjasdflkdsfklgjsdfjajkghs  
  region: us-east-1  
```

**Ensure myelb ELB exists:**

```yaml
boto_elb.present:  
  - name: myelb  
    - region: us-east-1  
    - availability_zones:  
      - us-east-1a  
      - us-east-1c  
      - us-east-1d  
    - keyid: GKTADJGHEIQSXMKKRBJ08H  
    - key: askdjghsdfjkgWupUjasdflkdsfklgjsdfjajkghs  
    - listeners:  
      - elb_port: 443  
```

(continues on next page)
instance_port: 80
elb_protocol: HTTPS
instance_protocol: HTTP
certificate: 'arn:aws:iam::111111:server-certificate/mycert'
policies:
  - my-ssl-policy
  - cookie-policy
  - elb_port: 8210
  instance_port: 8210
  elb_protocol: TCP
backends:
  - instance_port: 80
    policies:
      - enable-proxy-protocol
health_check:
  target: 'HTTP:80/
attributes:
  cross_zone_load_balancing:
    enabled: true
  access_log:
    enabled: true
  s3_bucket_name: 'mybucket'
s3_bucket_prefix: 'my-logs'
emit_interval: 5
connecting_settings:
  idle_timeout: 60
cnames:
  - name: mycname.example.com.
    zone: example.com.
    ttl: 60
  - name: myothercname.example.com.
    zone: example.com.
security_groups:
  - my-security-group
policies:
  - policy_name: my-ssl-policy
    policy_type: SSLNegotiationPolicyType
    policy:
      Protocol-TLSv1.2: true
      Protocol-SSLv3: false
      Server-Defined-Cipher-Order: true
      ECDHE-ECDSA-AES128-GCM-SHA256: true
  - policy_name: cookie-policy
    policy_type: LBCookieStickinessPolicyType
    policy: {}  # no policy means this is a session cookie
  - policy_name: enable-proxy-protocol
    policy_type: ProxyProtocolPolicyType
    policy:
      ProxyProtocol: true

# Using a profile from pillars
Ensure myelb ELB exists:
boto_elb.present:
  - name: myelb
  - region: us-east-1
  - profile: myelbprofile
# Passing in a profile

Ensure myelb ELB exists:

```yaml
boto_elb.present:
  - name: myelb
  - region: us-east-1
  - profile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkgWupUjasdflkdfklsdfjksajkg
```

It's possible to specify attributes from pillars by specifying a pillar. You can override the values defined in the pillard by setting the attributes on the resource. The module will use the default pillar key 'boto_elb_attributes', which allows you to set default attributes for all ELB resources.

Setting the attributes pillar:

```yaml
my_elb_attributes:
  cross_zone_load_balance:
    enabled: true
  connection_draining:
    enabled: true
  timeout: 20
  access_log:
    enabled: true
  s3_bucket_name: 'mybucket'
  s3_bucket_prefix: 'my-logs'
  emit_interval: 5
```

Overriding the attribute values on the resource:

```yaml
Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - attributes_from_pillar: my_elb_attributes
      # override cross_zone_load_balancing:enabled
      - attributes:
        cross_zone_load_balance:
          enabled: false
        - profile: myelbprofile
```

It's possible to specify cloudwatch alarms that will be setup along with the ELB. Note the alarm name will be defined by the name attribute provided, plus the ELB resource name.

```yaml
Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - profile: myelbprofile
    - alarms:
      UnHealthyHostCount:
        name: 'ELB UnHealthyHostCount **MANAGED BY SALT**'
        attributes:
          metric: UnHealthyHostCount
          namespace: AWS/ELB
          statistic: Average
          comparison: '>='
```

(continues on next page)
### UnHealthyHostCount

**Threshold:** 1.0  
**Period:** 600  
**Evaluation Periods:** 6  
**Unit:** null  
**Description:** ELB UnHealthyHostCount  
**Alarm Actions:** ['arn:aws:sns:us-east-1:12345:myalarm']  
**Insufficient Data Actions:** []  
**OK Actions:** ['arn:aws:sns:us-east-1:12345:myalarm']

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that 'boto_elb_alarms' will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for a resource.

**Setting the alarms in a pillar:**

```yaml
my_elb_alarm:
  UnHealthyHostCount:
    name: 'ELB UnHealthyHostCount **MANAGED BY SALT**'
    attributes:
      metric: UnHealthyHostCount
      namespace: AWS/ELB
      statistic: Average
      comparison: '>='
      threshold: 1.0
      period: 600
      evaluation_periods: 6
      unit: null
      description: ELB UnHealthyHostCount
      insufficient_data_actions: []
      ok_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
```

**Overriding the alarm values on the resource:**

```yaml
Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - profile: myelbprofile
    - alarms_from_pillar: my_elb_alarm
      # override UnHealthyHostCount:attributes:threshold
    - alarms:
        UnHealthyHostCount:
          attributes:
            threshold: 2.0
```

Tags can also be set:

**New in version 2016.3.0.**

```yaml
Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - profile: myelbprofile
    - tags:
```

(continues on next page)
MyTag: 'My Tag Value'
OtherTag: 'My Other Value'

salt.states.boto_elb.absent(name, region=None, key=None, keyid=None, profile=None)
Ensure an ELB does not exist
name name of the ELB

salt.states.boto_elb.present(name, listeners, availability_zones=None, subnets=None, subnet_names=None, security_groups=None, scheme='internet-facing', health_check=None, attributes=None, attributes_from_pillar='boto_elb_attributes', cnames=None, alarms=None, alarms_from_pillar='boto_elb_alarms', policies=None, policies_from_pillar='boto_elb_policies', backends=None, region=None, key=None, keyid=None, profile=None, wait_for_sync=True, tags=None, instance_ids=None, instance_names=None)
Ensure the ELB exists.
name Name of the ELB.
availability_zones A list of availability zones for this ELB.
listeners A list of listener lists; example:

```
[
    ['443', 'HTTPS', 'arn:aws:iam::1111111:server-certificate/mycert'],
    ['8443', '80', 'HTTPS', 'HTTP', 'arn:aws:iam::1111111:server-certificate/mycert']
]
```

subnets A list of subnet IDs in your VPC to attach to your LoadBalancer.
subnet_names A list of subnet names in your VPC to attach to your LoadBalancer.
security_groups The security groups assigned to your LoadBalancer within your VPC. Must be passed either as a list or a comma-separated string.

For example, a list:

```
- security_groups:
  - secgroup-one
  - secgroup-two
```

Or as a comma-separated string:

```
- security_groups: secgroup-one,secgroup-two
```
scheme The type of a LoadBalancer, internet-facing or internal. Once set, can not be modified.
health_check A dict defining the health check for this ELB.
attributes A dict defining the attributes to set on this ELB. Unknown keys will be silently ignored.

See the salt.modules.boto_elb.set_attributes function for recognized attributes.
attributes_from_pillar name of pillar dict that contains attributes. Attributes defined for this specific state will override those from pillar.
cnames A list of cname dicts with attributes needed for the DNS add_record state. By default the boto_route53.add_record state will be used, which requires: name, zone, ttl, and identifier. See the boto_route53 state for information about these attributes. Other DNS modules can be called by specifying the provider keyword. the cnames dict will be passed to the state as kwargs.

See the salt.states.boto_route53 state for information about these attributes.
alarms: a dictionary of name->boto_cloudwatch_alarm sections to be associated with this ELB. All attributes should be specified except for dimension which will be automatically set to this ELB.
See the `salt.states.boto_cloudwatch_alarm` state for information about these attributes.

*alarms_from_pillar*: name of pillar dict that contains alarm settings. Alarms defined for this specific state will override those from pillar.

*region*: Region to connect to.

*key*: Secret key to be used.

*keyid*: Access key to be used.

*profile*: A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

*wait_for_sync*: Wait for an INSYNC change status from Route53.

*tags*: dict of tags

*instance_ids*: list of instance ids. The state will ensure that these, and ONLY these, instances are registered with the ELB. This is additive with instance_names.

*instance_names*: list of instance names. The state will ensure that these, and ONLY these, instances are registered with the ELB. This is additive with instance_ids.

**salt.states.boto_elb.register_instances***(name, instances, region=None, key=None, keyid=None, profile=None)***

Add EC2 instance(s) to an Elastic Load Balancer. Removing an instance from the `instances` list does not remove it from the ELB.

*name*: The name of the Elastic Load Balancer to add EC2 instances to.

*instances*: A list of EC2 instance IDs that this Elastic Load Balancer should distribute traffic to. This state will only ever append new instances to the ELB. EC2 instances already associated with this ELB will not be removed if they are not in the `instances` list.

New in version 2015.8.0.

```
add-instances:
  boto_elb.register_instances:
    - name: myloadbalancer
      instances:
        - instance-id1
        - instance-id2
```

---

**21.19.38 salt.states.boto_elbv2 module**

Manage AWS Application Load Balancer

New in version 2017.7.0.

Add and remove targets from an ALB target group.

This module uses boto3, which can be installed via package, or pip.

This module accepts explicit alb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```
elbv2.keyid: GKTADJGHEIQSXMKKRBJ08H
elbv2.key: askdjghsdfjkghWuPujaslfkkdfklgjsdfajkghs
elbv2.region: us-west-2
```

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
region: us-east-1

salt.states.boto_elbv2.create_target_group(name, protocol, port, vpc_id, region=None, key=None, keyid=None, profile=None, health_check_protocol='HTTP', health_check_port='traffic-port', health_check_path='/', health_check_interval_seconds=30, health_check_timeout_seconds=5, healthy_threshold_count=5, unhealthy_threshold_count=2, **kwargs)

New in version 2017.11.0.

Create target group if not present.

name (string) - The name of the target group.
protocol (string) - The protocol to use for routing traffic to the targets
port (int) - The port on which the targets receive traffic. This port is used unless you specify a port override when registering the traffic.
vpc_id (string) - The identifier of the virtual private cloud (VPC).
health_check_protocol (string) - The protocol the load balancer uses when performing health check on targets. The default is the HTTP protocol.
health_check_port (string) - The port the load balancer uses when performing health checks on targets. The default is 'traffic-port', which indicates the port on which each target receives traffic from the load balancer.
health_check_path (string) - The ping path that is the destination on the targets for health checks. The default is '/.
health_check_interval_seconds (integer) - The approximate amount of time, in seconds, between health checks of an individual target. The default is 30 seconds.
health_check_timeout_seconds (integer) - The amount of time, in seconds, during which no response from a target means a failed health check. The default is 5 seconds.
healthy_threshold_count (integer) - The number of consecutive health checks successes required before considering an unhealthy target healthy. The default is 5.
unhealthy_threshold_count (integer) - The number of consecutive health check failures required before considering a target unhealthy. The default is 2.
returns (bool) - True on success, False on failure.

CLI example: .. code-block:: yaml

create-target:
boto_elb2.create_targets_group:
  • name: myALB
  • protocol: https
  • port: 443
  • vpc_id: myVPC

salt.states.boto_elbv2.delete_target_group(name, region=None, key=None, keyid=None, profile=None)

Delete target group.

name (string) - The Amazon Resource Name (ARN) of the resource.
returns (bool) - True on success, False on failure.

CLI example:

check-target:
boto_elb2.delete_targets_group:

(continues on next page)

21.19. state modules
- name: myALB
- protocol: https
- port: 443
- vpc_id: myVPC

salt.states.boto_elbv2.targets_deregistered(name, targets, region=None, key=None, keyid=None, profile=None, **kwargs)

Remove targets to an Application Load Balancer target group.

name The ARN of the Application Load Balancer Target Group to remove targets from.

targets A list of target IDs or a string of a single target registered to the target group to be removed

New in version Unknown.

remove-targets:
    boto_elb.targets_deregistered:
        - name: arn:myloadbalancer
        - targets:
            - instance-id1
            - instance-id2

salt.states.boto_elbv2.targets_registered(name, targets, region=None, key=None, keyid=None, profile=None, **kwargs)

Add targets to an Application Load Balancer target group. This state will not remove targets.

name The ARN of the Application Load Balancer Target Group to add targets to.

targets A list of target IDs or a string of a single target that this target group should distribute traffic to.

add-targets:
    boto_elb.targets_registered:
        - name: arn:myloadbalancer
        - targets:
            - instance-id1
            - instance-id2

21.19.39 salt.states.boto_iam

Manage IAM objects

New in version 2015.8.0.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit IAM credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

delete-user:
    boto_iam.user_absent:
        - name: myuser
        - delete_keys: true
delete-keys:
  boto_iam.keys_absent:
    - access_keys:
      - 'AKIAJHTMIQ2ASDFLASDF'
      - 'PQIAJHTMIQ2ASRTLASFR'
    - user_name: myuser

create-user:
  boto_iam.user_present:
    - name: myuser
    - policies:
      mypolicy: |
        {
        "Version": "2012-10-17",
        "Statement": [{
        "Effect": "Allow",
        "Action": "*",
        "Resource": "*"}]
        }
    - password: NewPassword$$1
    - region: eu-west-1
    - keyid: 'AKIAJHTMIQ2ASDFLASDF'
    - key: 'fdkjsafkljsASSADFalkfjasdf'

create-group:
  boto_iam.group_present:
    - name: mygroup
    - users:
      - myuser
      - myuser1
    - policies:
      mypolicy: |
        {
        "Version": "2012-10-17",
        "Statement": [{
        "Effect": "Allow",
        "Action": "*",
        "Resource": "*"}]
        }
    - region: eu-west-1
    - keyid: 'AKIAJHTMIQ2ASDFLASDF'
    - key: 'safsdfsalsdfkjsafkljsASSADFalkfj'

change-policy:
  boto_iam.account_policy:
    - change_password: True
    - region: eu-west-1
    - keyid: 'AKIAJHTMIQ2ASDFLASDF'
    - key: 'safsdfsalsdfkjsafkljsASSADFalkfj'

create_server_certificate:
  boto_iam.server_cert_present:
    - name: mycert
    - public_key: salt://base/mycert.crt
    - private_key: salt://base/mycert.key

**salt.states.boto_iam.account_policy**  
(name=None, allow_users_to_change_password=None, hard_expiry=None, max_password_age=None, minimum_password_length=None, password_reuse_prevention=None, require_lowercase_characters=None, require_numbers=None, require_symbols=None, require_uppercase_characters=None, region=None, key=None, keyid=None, profile=None)

Change account policy.

New in version 2015.8.0.
**name** (string) The name of the account policy
**allow_users_to_change_password** (bool) Allows all IAM users in your account to use the AWS Management Console to change their own passwords.
**hard_expiry** (bool) Prevents IAM users from setting a new password after their password has expired.
**max_password_age** (int) The number of days that an IAM user password is valid.
**minimum_password_length** (int) The minimum number of characters allowed in an IAM user password.
**password_reuse_prevention** (int) Specifies the number of previous passwords that IAM users are prevented from reusing.
**require_lowercase_characters** (bool) Specifies whether IAM user passwords must contain at least one lowercase character from the ISO basic Latin alphabet (a to z).
**require_numbers** (bool) Specifies whether IAM user passwords must contain at least one numeric character (0 to 9).

**require_symbols** (bool) Specifies whether IAM user passwords must contain at least one of the following non-alphanumeric characters: ! @ $ % ^ & * ( ) _ + - = [ ] { } | '

**require_uppercase_characters** (bool) Specifies whether IAM user passwords must contain at least one uppercase character from the ISO basic Latin alphabet (A to Z).

**region** (string) Region to connect to.

**key** (string) Secret key to be used.

**keyid** (string) Access key to be used.

**profile** (dict) A dict with region, key and keyid, or a pillar key (string)

**salt.states.boto_iam.group_absent** *(name, region=None, key=None, keyid=None, profile=None)*

New in version 2015.8.0.

Ensure the IAM group is absent.

**name** (string) The name of the group.

**region** (string) Region to connect to.

**key** (string) Secret key to be used.

**keyid** (string) Access key to be used.

**profile** (dict) A dict with region, key and keyid, or a pillar key (string)

**salt.states.boto_iam.group_present** *(name, policies=None, policies_from_pillars=None, managed_policies=None, users=None, path='/', region=None, key=None, keyid=None, profile=None, delete_policies=True)*

New in version 2015.8.0.

Ensure the IAM group is present

**name** (string) The name of the new group.

**path** (string) The path for the group, defaults to '/'

**policies** (dict) A dict of IAM group policy documents.

**policies_from_pillars** (list) A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the policies argument. If keys conflict, the keys in the policies argument will override the keys defined in policies_from_pillars.

**managed_policies** (list) A list of policy names or ARNs that should be attached to this group.

**users** (list) A list of users to be added to the group.

**region** (string) Region to connect to.

**key** (string) Secret key to be used.

**keyid** (string) Access key to be used.

**profile** (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**delete_policies** (boolean) Delete or detach existing policies that are not in the given list of policies. Default value is True. If False is specified, existing policies will not be deleted or detached allowing manual modifications on the IAM group to be persistent.

**salt.states.boto_iam.keys_absent** *(access_keys, user_name, region=None, key=None, keyid=None, profile=None)*

New in version 2015.8.0.

Ensure the IAM user access_key_id is absent.

**access_key_id** (list) A list of access key ids

**user_name** (string) The username of the user

**region** (string) Region to connect to.

**key** (string) Secret key to be used.

**keyid** (string) Access key to be used.
profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_iam.keys_present(name, number, save_dir, region=None, key=None, keyid=None, profile=None, save_format='{2}
{0}
{3}
{1}
')
```

New in version 2015.8.0.

Ensure the IAM access keys are present.

name (string) The name of the new user.

number (int) Number of keys that user should have.

save_dir (string) The directory that the key/keys will be saved. Keys are saved to a file named according to the username provided.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

save_format (dict) Save format is repeated for each key. Default format is "\{2\}n\{0\}n\{3\}n\{1\}n\"", where \{0\} and \{1\} are placeholders for new key_id and key respectively, whereas \{2\} and \{3\} are "key_id-{number}" and 'key-{number}' strings kept for compatibility.

```
salt.states.boto_iam.policy_absent(name, region=None, key=None, keyid=None, profile=None)
```

New in version 2015.8.0.

Ensure the IAM managed policy with the specified name is absent.

name (string) The name of the new policy.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_iam.policy_present(name, policy_document, path=None, description=None, region=None, key=None, keyid=None, profile=None)
```

New in version 2015.8.0.

Ensure the IAM managed policy is present.

name (string) The name of the new policy.

policy_document (dict) The document of the new policy.

path (string) The path in which the policy will be created. Default is '/'.

description (string) Description

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_iam.saml_provider_absent(name, region=None, key=None, keyid=None, profile=None)
```

New in version 2016.11.0.

Ensure the SAML provider with the specified name is absent.

name (string) The name of the SAML provider.

saml_metadata_document (string) The xml document of the SAML provider.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.
profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iam.saml_provider_present(name, saml_metadata_document, region=None, key=None, keyid=None, profile=None)

New in version 2016.11.0.

Ensure the SAML provider with the specified name is present.

name (string) The name of the SAML provider.
saml_metadata_document (string) The xml document of the SAML provider.
region (string) Region to connect to.
key (string) Secret key to be used.
keyid (string) Access key to be used.
profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iam.server_cert_absent(name, region=None, key=None, keyid=None, profile=None)

Deletes a server certificate.

New in version 2015.8.0.

name (string) The name for the server certificate. Do not include the path in this value.
region (string) The name of the region to connect to.
key (string) The key to be used in order to connect
keyid (string) The keyid to be used in order to connect
profile (string) The profile that contains a dict of region, key, keyid

salt.states.boto_iam.server_cert_present(name, public_key, private_key, cert_chain=None, path=None, region=None, key=None, keyid=None, profile=None)

Create server certificate.

New in version 2015.8.0.

name (string) The name for the server certificate. Do not include the path in this value.
public_key (string) The contents of the public key certificate in PEM-encoded format.
private_key (string) The contents of the private key in PEM-encoded format.
cert_chain (string) The contents of the certificate chain. This is typically a concatenation of the PEM-encoded public key certificates of the chain.
path (string) The path for the server certificate.
region (string) The name of the region to connect to.
key (string) The key to be used in order to connect
keyid (string) The keyid to be used in order to connect
profile (string) The profile that contains a dict of region, key, keyid

salt.states.boto_iam.user_absent(name, delete_keys=True, delete_mfa_devices=True, delete_profile=True, region=None, key=None, keyid=None, profile=None)

New in version 2015.8.0.

Ensure the IAM user is absent. User cannot be deleted if it has keys.

name (string) The name of the new user.
delete_keys (bool) Delete all keys from user.
delete_mfa_devices (bool) Delete all mfa devices from user.

delete_profile (bool) Delete profile from user.

New in version 2016.3.0.

region (string) Region to connect to.
key (string)  Secret key to be used.
keyid (string)  Access key to be used.
profile (dict)  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key
and keyid.
salt.states.boto_iam.user_present(name, policies=None, policies_from_pillars=None, managed_policies=None, password=None, path=None, region=None, key=None, keyid=None, profile=None)

New in version 2015.8.0.

Ensure the IAM user is present
name (string)  The name of the new user.
policies (dict)  A dict of IAM group policy documents.
policies_from_pillars (list)  A list of pillars that contain role policy dicts. Policies in the pillars will be merged
in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier
defined keys. The policies defined here will be merged with the policies defined in the policies argument.
If keys conflict, the keys in the policies argument will override the keys defined in policies_from_pillars.
managed_policies (list)  A list of managed policy names or ARNs that should be attached to this user.
password (string)  The password for the new user. Must comply with account policy.
path (string)  The path of the user. Default is ‘/’.

New in version 2015.8.2.
region (string)  Region to connect to.
key (string)  Secret key to be used.
keyid (string)  Access key to be used.
profile (dict)  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key
and keyid.

21.19.40  salt.states.boto_iam_role

Manage IAM roles

New in version 2014.7.0.
This module uses boto, which can be installed via package, or pip.
This module accepts explicit IAM credentials but can also utilize IAM roles assigned to the instance through In-
stance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is
necessary. More information available here.
If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

iam.keyid: GKTADJGHEIQSXMKKRBJ08H
iam.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull
from pillars or minion config:

myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1

Creating a role will automatically create an instance profile and associate it with the role. This is the default behavior
of the AWS console.
myrole:
  boto_iam_role.present:
    - region: us-east-1
    - key: GKTADJGHEIQSXMKKRBJ08H
    - keyid: askdjghsdfjkgshWupUjasdfklkdgjsdfjajkghs
    - policies_from_pillars:
      - shared_iam_bootstrap_policy
    - policies:
      MySQSPolicy:
        Statement:
        - Action:
          - sqs:*
        Effect: Allow
        Resource:
        - arn:aws:sqs:*::*
        Sid: MyPolicySQS1
      MyS3Policy:
        Statement:
        - Action:
          - s3:GetObject
        Effect: Allow
        Resource:
        - arn:aws:s3:*::*:mybucket/*

# Using a credentials profile from pillars
myrole:
  boto_iam_role.present:
    - profile: myiamprofile

# Passing in a credentials profile
myrole:
  boto_iam_role.present:
    - profile:
      key: GKTADJGHEIQSXMKKRBJ08H
      keyid: askdjghsdfjkgshWupUjasdfklkdgjsdfjajkghs
      region: us-east-1

If delete_policies: False is specified, existing policies that are not in the given list of policies will not be deleted. This allows manual modifications on the IAM role to be persistent. This functionality was added in 2015.8.0.

Note: When using the profile parameter and region is set outside of the profile group, region is ignored and a default region will be used.

If region is missing from the profile data set, us-east-1 will be used as the default region.

salt.states.boto_iam_role.absent(name, region=None, key=None, keyid=None, profile=None)
Ensure the IAM role is deleted.
  name Name of the IAM role.
  region Region to connect to.
  key Secret key to be used.
  keyid Access key to be used.
  profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
salt.states.boto_iam_role.present(name, policy_document=None, policy_document_from_pillars=None, path=None, policies=None, policies_from_pillars=None, managed_policies=None, create_instance_profile=True, region=None, key=None, keyid=None, profile=None, delete_policies=True)

Ensure the IAM role exists.

name Name of the IAM role.
policy_document The policy that grants an entity permission to assume the role. (See https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create_role)
policy_document_from_pillars A pillar key that contains a role policy document. The statements defined here will be appended with the policy document statements defined in the policy_document argument.

   New in version 2017.7.0.
path The path to the role/instance profile. (See https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create_role)
policies A dict of IAM role policies.
policies_from_pillars A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the policies argument. If keys conflict, the keys in the policies argument will override the keys defined in policies_from_pillars.
managed_policies A list of (AWS or Customer) managed policies to be attached to the role.
create_instance_profile A boolean of whether or not to create an instance profile and associate it with this role.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
delete_policies Deletes existing policies that are not in the given list of policies. Default value is True. If False is specified, existing policies will not be deleted allowing manual modifications on the IAM role to be persistent.

   New in version 2015.8.0.

21.19.41 salt.states.boto_iot module

Manage IoT Objects

New in version 2016.3.0.

Create and destroy IoT objects. Be aware that this interacts with Amazon’s services, and so may incur charges.

depends

   • boto
   • boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:
It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```python
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkgWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

### Ensure policy exists:

```python
boto_iot.policy_present:
    - policyName: mypolicy
    - policyDocument:
        Version: "2012-10-17"
        Statement:
            Action:
                - iot:Publish
            Resource: *
            Effect: "Allow"
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkgWupUjasdflkdfklgjsdfjajkghs
```

### Ensure topic rule exists:

```python
boto_iot.topic_rule_present:
    - ruleName: myrule
    - sql: "SELECT * FROM 'iot/test'"
    - description: 'test rule'
    - ruleDisabled: false
    - actions:
        - lambda:
            functionArn: "arn:aws:us-east-1:1234:function/functionname"
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkgWupUjasdflkdfklgjsdfjajkghs
```

**salt.states.boto_iot.policy_absent**(name, policyName, region=None, key=None, keyid=None,
profile=None)

Ensure policy with passed properties is absent.

- **name** The name of the state definition.
- **policyName** Name of the policy.
- **region** Region to connect to.
- **key** Secret key to be used.
- **keyid** Access key to be used.
- **profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto_iot.policy_attached**(name, policyName, principal, region=None, key=None,
keyid=None, profile=None)

Ensure policy is attached to the given principal.

- **name** The name of the state definition
- **policyName** Name of the policy.
- **principal** The principal which can be a certificate ARN or a Cognito ID.
- **region** Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
salt.states.boto_iot.policy_detached(name, policyName, principal, region=None, key=None, keyid=None, profile=None)

Ensure policy is attached to the given principal.
name  The name of the state definition.
policyName  Name of the policy.
principal  The principal which can be a certificate ARN or a Cognito ID.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
salt.states.boto_iot.policy_present(name, policyName, policyDocument, region=None, key=None, keyid=None, profile=None)

Ensure policy exists.
name  The name of the state definition
policyName  Name of the policy.
policyDocument  The JSON document that describes the policy. The length of the policyDocument must be a minimum length of 1, with a maximum length of 2048, excluding whitespace.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
salt.states.boto_iot.thing_type_absent(name, thingTypeName, region=None, key=None, keyid=None, profile=None)

Ensure thing type with passed properties is absent.
New in version 2016.11.0.
name  The name of the state definition.
thingTypeName  Name of the thing type.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
salt.states.boto_iot.thing_type_present(name, thingTypeName, thingTypeDescription, searchableAttributesList, region=None, key=None, keyid=None, profile=None)

Ensure thing type exists.
New in version 2016.11.0.
name  The name of the state definition.
thingTypeName  Name of the thing type.
thingTypeDescription  Description of the thing type.
searchableAttributesList  List of string attributes that are searchable for the thing type.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key, keyid, or a pillar key (string) that contains a dict with region, key, and keyid.
salt.states.boto_iot.topic_rule_absent(name, ruleName, region=None, key=None, keyid=None, profile=None)

Ensure topic rule with passed properties is absent.

name The name of the state definition.
ruleName Name of the policy.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iot.topic_rule_present(name, ruleName, sql, actions, description="", ruleDisabled=False, region=None, key=None, keyid=None, profile=None)

Ensure topic rule exists.

name The name of the state definition
ruleName Name of the rule.
sql The SQL statement used to query the topic.
actions The actions associated with the rule.
description The description of the rule.
ruleDisable Specifies whether the rule is disabled.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.42 salt.states.boto_kinesis module

Manage Kinesis Streams

New in version 2017.7.0.

Create and destroy Kinesis streams. Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses boto3, which can be installed via package, or pip.

This module accepts explicit Kinesis credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
region: us-east-1
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```
Ensure Kinesis stream does not exist:

```bash
boto_kinesis.absent:
- name: new_stream
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkgHupUjasdkfjklgsdfjajkghs
- region: us-east-1
```

Ensure Kinesis stream exists:

```bash
boto_kinesis.present:
- name: new_stream
- retention_hours: 168
- enhanced_monitoring: ['ALL']
- num_shards: 2
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkgHupUjasdkfjklgsdfjajkghs
- region: us-east-1
```

**salt.states.boto_kinesis.absent(name, region=None, key=None, keyid=None, profile=None)**

Delete the kinesis stream, if it exists.

- **name (string)** Stream name
- **region (string)** Region to connect to.
- **key (string)** Secret key to be used.
- **keyid (string)** Access key to be used.
- **profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto_kinesis.present(name, retention_hours=None, enhanced_monitoring=None, num_shards=None, do_reshard=True, region=None, key=None, keyid=None, profile=None)**

Ensure the kinesis stream is properly configured and scaled.

- **name (string)** Stream name
- **retention_hours (int)** Retain data for this many hours. AWS allows minimum 24 hours, maximum 168 hours.
- **enhanced_monitoring (list of string)** Turn on enhanced monitoring for the specified shard-level metrics. Pass in ['ALL'] or True for all metrics, [] or False for no metrics. Turn on individual metrics by passing in a list: ['IncomingBytes', 'OutgoingBytes'] Note that if only some metrics are supplied, the remaining metrics will be turned off.
- **num_shards (int)** Reshard stream (if necessary) to this number of shards ‼‼! Resharding is expensive! Each split or merge can take up to 30 seconds, and the reshard method balances the partition space evenly. Resharding from N to N+1 can require 2N operations. Resharding is much faster with powers of 2 (e.g. 2^N to 2^N+1) ‼‼!
- **do_reshard (boolean)** If set to False, this script will NEVER reshard the stream, regardless of other input. Useful for testing.
- **region (string)** Region to connect to.
- **key (string)** Secret key to be used.
- **keyid (string)** Access key to be used.
- **profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

## 21.19.43 salt.states.boto_kms

Manage KMS keys, key policies and grants.

New in version 2015.8.0.

Be aware that this interacts with Amazon’s services, and so may incur charges.
This module uses boto, which can be installed via package, or pip.

This module accepts explicit kms credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```
elb.keyid: GKTADJGHEIQSXMKKRBJ08H
elb.key: askdjghsdfjkgHwupUjasdfklkdlgsdfjajkgfhs
```

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjhgsdfjkgHwupUjasdfklkdlgsdfjajkgfhs
  region: us-east-1
```

```
Ensure mykey key exists:  
boto_kms.key_present:    
  name: mykey  
  region: us-east-1  

# Using a profile from pillars  
Ensure mykey key exists:
  boto_kms.key_present:
    name: mykey  
    region: us-east-1  
    profile: myprofile  

# Passing in a profile  
Ensure mykey key exists:
  boto_key.key_present:
    name: mykey  
    region: us-east-1  
    profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjhgsdfjkgHwupUjasdfklkdlgsdfjajkgfhs
```

salt.states.boto_kms.key_present(name, policy, description=None, key_usage=None, grants=None, manage_grants=False, key_rotation=False, enabled=True, region=None, key=None, keyid=None, profile=None)

Ensure the KMS key exists. KMS keys can not be deleted, so this function must be used to ensure the key is enabled or disabled.

- **name**: Name of the key.
- **policy**: Key usage policy.
- **description**: Description of the key.
- **key_usage**: Specifies the intended use of the key. Can only be set on creation, defaults to ENCRYPT_DECRYPT, which is also the only supported option.
- **grants**: A list of grants to apply to the key. Not currently implemented.
- **manage_grants**: Whether or not to manage grants. False by default, which will not manage any grants.
- **key_rotation**: Whether or not key rotation is enabled for the key. False by default.
- **enabled**: Whether or not the key is enabled. True by default.
- **region**: Region to connect to.
- **key**: Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.44  salt.states.boto_lambda module

Manage Lambda Functions

New in version 2016.3.0.
Create and destroy Lambda Functions. Be aware that this interacts with Amazon’s services, and so may incur charges.

depends
  - boto
  - boto3

The dependencies listed above can be installed via package or pip.
This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```
{vpc.keyid: 'GKTADJGHEIQSXMKKRBJ08H',
vpc.key: 'askdjghsdfjkgUjadsflkdfklgjsdfjajkghs'}
```

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
{myprofile: {'keyid': 'GKTADJGHEIQSXMKKRBJ08H',
              'key': 'askdjghsdfjkgUjadsflkdfklgjsdfjajkghs',
              'region': 'us-east-1'}}
```

Ensure function exists:
```
boto_lambda.function_present:
  - FunctionName: myfunction
  - Runtime: python2.7
  - Role: iam_role_name
  - Handler: entry_function
  - ZipFile: code.zip
  - S3Bucket: bucketname
  - S3Key: keyname
  - S3ObjectVersion: version
  - Description: "My Lambda Function"
  - Timeout: 3
  - MemorySize: 128
  - region: us-east-1
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkgUjadsflkdfklgjsdfjajkghs
```

```
salt.states.boto_lambda.alias_absent(name, FunctionName, Name, region=None, key=None, keyid=None, profile=None)
```

Ensure alias with passed properties is absent.

name  The name of the state definition.
FunctionName  Name of the function.
Name  Name of the alias.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```python
salt.states.boto_lambda.alias_present(name, FunctionName, Name, FunctionVersion, Description=", region=None, key=None, keyid=None, profile=None)
```

Ensure alias exists.

- name  The name of the state definition.
- FunctionName  Name of the function for which you want to create an alias.
- Name  The name of the alias to be created.
- FunctionVersion  Function version for which you are creating the alias.
- Description  A short, user-defined function description. Lambda does not use this value. Assign a meaningful description as you see fit.
- region  Region to connect to.
- key  Secret key to be used.
- keyid  Access key to be used.
- profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_lambda.event_source_mapping_absent(name, EventSourceArn, FunctionName, region=None, key=None, keyid=None, profile=None)
```

Ensure event source mapping with passed properties is absent.

- name  The name of the state definition.
- EventSourceArn  ARN of the event source.
- FunctionName  Name of the lambda function.
- region  Region to connect to.
- key  Secret key to be used.
- keyid  Access key to be used.
- profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_lambda.event_source_mapping_present(name, EventSourceArn, FunctionName, StartingPosition, Enabled=True, BatchSize=100, region=None, key=None, keyid=None, profile=None)
```

Ensure event source mapping exists.

- name  The name of the state definition.
- EventSourceArn  The Amazon Resource Name (ARN) of the Amazon Kinesis or the Amazon DynamoDB stream that is the event source.
- FunctionName  The Lambda function to invoke when AWS Lambda detects an event on the stream.

You can specify an unqualified function name (for example, "Thumbnail") or you can specify Amazon Resource Name (ARN) of the function (for example, "arn:aws:lambda:us-west-2:account-id:funcation:ThumbNail"). AWS Lambda also allows you to specify only the account ID qualifier (for example, "account-id:ThumbNail"). Note that the length constraint applies only to the ARN. If you specify only the function name, it is limited to 64 character in length.

- StartingPosition  The position in the stream where AWS Lambda should start reading. (TRIM_HORIZON | LATEST)
- Enabled  Indicates whether AWS Lambda should begin polling the event source. By default, Enabled is true.
BatchSize  The largest number of records that AWS Lambda will retrieve from your event source at the time of invoking your function. Your function receives an event with all the retrieved records. The default is 100 records.

region  Region to connect to.

key  Secret key to be used.

keyid  Access key to be used.

profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_lambda.function_absent(name, FunctionName, region=None, key=None, keyid=None, profile=None)

Ensure function with passed properties is absent.

name  The name of the state definition.

FunctionName  Name of the function.

region  Region to connect to.

key  Secret key to be used.

keyid  Access key to be used.

profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_lambda.function_present(name, FunctionName, Runtime, Role, Handler, ZipFile=None, S3Bucket=None, S3Key=None, S3ObjectVersion=None, Description="", Timeout=3, MemorySize=128, Permissions=None, RoleRe- tries=5, region=None, key=None, keyid=None, profile=None, VpcConfig=None, Environment=None)

Ensure function exists.

name  The name of the state definition.

FunctionName  Name of the Function.

Runtime  The Runtime environment for the function. One of ‘nodejs’, ‘java8’, or ‘python2.7’

Role  The name or ARN of the IAM role that the function assumes when it executes your function to access any other AWS resources.

Handler  The function within your code that Lambda calls to begin execution. For Node.js it is the module-name.*export* value in your function. For Java, it can be package.classname::handler or package.classname.

ZipFile  A path to a .zip file containing your deployment package. If this is specified, S3Bucket and S3Key must not be specified.

S3Bucket  Amazon S3 bucket name where the .zip file containing your package is stored. If this is specified, S3Key must be specified and ZipFile must NOT be specified.

S3Key  The Amazon S3 object (the deployment package) key name you want to upload. If this is specified, S3Key must be specified and ZipFile must NOT be specified.

S3ObjectVersion  The version of S3 object to use. Optional, should only be specified if S3Bucket and S3Key are specified.

Description  A short, user-defined function description. Lambda does not use this value. Assign a meaningful description as you see fit.

Timeout  The function execution time at which Lambda should terminate this function. Because the execution time has cost implications, we recommend you set this value based on your expected execution time. The default is 3 seconds.

MemorySize  The amount of memory, in MB, your function is given. Lambda uses this memory size to infer the amount of CPU and memory allocated to your function. Your function use-case determines your CPU and memory requirements. For example, a database operation might need less memory compared to an image processing function. The default value is 128 MB. The value must be a multiple of 64 MB.

VpcConfig  If your Lambda function accesses resources in a VPC, you must provide this parameter identifying the list of security group IDs/Names and subnet IDs/Name. These must all belong to the same VPC. This is a dict of the form:
VpcConfig:
  SecurityGroupNames:
    - mysecgroup1
    - mysecgroup2
  SecurityGroupIds:
    - sg-abcdef1234
  SubnetNames:
    - mysubnet1
  SubnetIds:
    - subnet-1234abcd
    - subnet-abcd1234

If VpcConfig is provided at all, you MUST pass at least one security group and one subnet.

Permissions  A list of permission definitions to be added to the function’s policy

RoleRetries  IAM Roles may take some time to propagate to all regions once created. During that time function creation may fail; this state will automatically retry this number of times. The default is 5.

Environment  The parent object that contains your environment’s configuration settings. This is a dictionary of the form:

```
{
  'Variables': {
    'VariableName': 'VariableValue'
  }
}
```

New in version 2017.7.0.

region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.45  salt.states.boto_lc

Manage Launch Configurations

New in version 2014.7.0.

Create and destroy Launch Configurations. Be aware that this interacts with Amazon’s services, and so may incur charges.

A limitation of this module is that you can not modify launch configurations once they have been created. If a launch configuration with the specified name exists, this module will always report success, even if the specified configuration doesn’t match. This is due to a limitation in Amazon’s launch configuration API, as it only allows launch configurations to be created and deleted.

Also note that a launch configuration that’s in use by an autoscale group can not be deleted until the autoscale group is no longer using it. This may affect the way in which you want to order your states.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit autoscale credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:
It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkgwhWupUjasdflkdfklgjsdfjajkgghs
  region: us-east-1
```

Credential information is shared with autoscale groups as launch configurations and autoscale groups are completely dependent on each other.

```yaml
# Using a profile from pillars.
Ensure mylc exists:
  boto_lc.present:
    - name: mylc
      - image_id: ami-0b9c9f62
      - key_name: mykey
      - security_groups:
          - mygroup
      - instance_type: m1.small
      - instance_monitoring: true
      - block_device_mappings:
          - '/dev/sda1':
            size: 20
            volume_type: 'io1'
            iops: 220
            delete_on_termination: true
      - cloud_init:
        boohooks:
          'disable-master.sh': |
          #!/bin/bash
          echo "manual" > /etc/init/salt-master.override
        scripts:
          'run_salt.sh': |
          #!/bin/bash
          add-apt-repository -y ppa:saltstack/salt
          apt-get update
          apt-get install -y salt-minion
          salt-call state.highstate
          - region: us-east-1
          - keyid: GKTADJGHEIQSXMKKRBJ08H
          - key: askdjghsdfjkgwhWupUjasdflkdfklgjsdfjajkgghs

# Passing in a profile.
Ensure mylc exists:
  boto_lc.present:
    - name: mylc
      - image_id: ami-0b9c9f62
      - profile: myprofile

(continues on next page)
**Salt Documentation, Release 3000.2**

(continued from previous page)

```yaml
- image_id: ami-0b9c9f62
- profile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjghWupUjasdfklfklgjsdfjajkghs
  region: us-east-1
```

### salt.states.boto_lc.absent(name, region=None, key=None, keyid=None, profile=None)

Ensure the named launch configuration is deleted.

- **name**: Name of the launch configuration.
- **region**: The region to connect to.
- **key**: Secret key to be used.
- **keyid**: Access key to be used.
- **profile**: A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### salt.states.boto_lc.present(name, image_id, key_name=None, vpc_id=None, vpc_name=None, security_groups=None, user_data=None, cloud_init=None, instance_type='m1.small', kernel_id=None, ramdisk_id=None, block_deviceMappings=None, delete_on_termination=None, instance_monitoring=False, spot_price=None, instance_profile_name=None, ebs_optimized=False, associate_public_ip_address=None, region=None, key=None, keyid=None, profile=None)

Ensure the launch configuration exists.

- **name**: Name of the launch configuration.
- **image_id**: AMI to use for instances. AMI must exist or creation of the launch configuration will fail.
- **key_name**: Name of the EC2 key pair to use for instances. Key must exist or creation of the launch configuration will fail.
- **vpc_id**: The VPC id where the security groups are defined. Only necessary when using named security groups that exist outside of the default VPC. Mutually exclusive with vpc_name.
- **vpc_name**: Name of the VPC where the security groups are defined. Only necessary when using named security groups that exist outside of the default VPC. Mutually exclusive with vpc_id.
- **security_groups**: List of Names or security group id’s of the security groups with which to associate the EC2 instances or VPC instances, respectively. Security groups must exist, or creation of the launch configuration will fail.
- **user_data**: The user data available to launched EC2 instances.
- **cloud_init**: A dict of cloud_init configuration. Currently supported keys: boothooks, scripts and cloud-config. Mutually exclusive with user_data.
- **instance_type**: The instance type. ex: m1.small.
- **kernel_id**: The kernel id for the instance.
- **ramdisk_id**: The RAM disk ID for the instance.
- **block_deviceMappings**: A dict of block device mappings that contains a dict with volume_type, delete_on_termination, iops, size, encrypted, snapshot_id.
  - **volume_type**: Indicates what volume type to use. Valid values are standard, io1, gp2. Default is standard.
  - **delete_on_termination**: Whether the volume should be explicitly marked for deletion when its instance is terminated (True), or left around (False). If not provided, or None is explicitly passed, the default AWS behaviour is used, which is True for ROOT volumes of instances, and False for all others.
  - **iops**: For Provisioned IOPS (SSD) volumes only. The number of I/O operations per second (IOPS) to provision for the volume.
  - **size**: Desired volume size (in GiB).
- **encrypted**: Indicates whether the volume should be encrypted. Encrypted EBS volumes must be attached to instances that support Amazon EBS encryption. Volumes that are created from encrypted snapshots are automatically encrypted. There is no way to create an encrypted volume from an unencrypted snapshot or an unencrypted volume from an encrypted snapshot.

---

**21.19. state modules**

3311
instance_monitoring  Whether instances in group are launched with detailed monitoring.

spot_price  The spot price you are bidding. Only applies if you are building an autoscaling group with spot instances.

instance_profile_name  The name or the Amazon Resource Name (ARN) of the instance profile associated with the IAM role for the instance. Instance profile must exist or the creation of the launch configuration will fail.

ebs_optimized  Specifies whether the instance is optimized for EBS I/O (true) or not (false).

associate_public_ip_address  Used for Auto Scaling groups that launch instances into an Amazon Virtual Private Cloud. Specifies whether to assign a public IP address to each instance launched in a Amazon VPC.

region  The region to connect to.

key  Secret key to be used.

keyid  Access key to be used.

profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.46  salt.states.boto_rds

Manage RDSs

New in version 2015.8.0.

Create and destroy RDS instances. Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit rds credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```
# pillar file
rds.keyid: GKTADJGHEIQSXMKKRBJ08H
rds.key: askdjghsdfkjgkHUpUjasdflkdfklgjsdfjajkgghs
```

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
# minion config file
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfkjgkHUpUjasdflkdfklgjsdfjajkgghs
  region: us-east-1
```

Ensure myrds RDS exists:
```
# pillar file
Ensure myrds RDS exists:
  boto_rds.present:
    - name: myrds
    - allocated_storage: 5
    - storage_type: standard
    - db_instance_class: db.t2.micro
    - engine: MySQL
    - master_username: myuser
    - master_user_password: mypass
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfkjgkHUpUjasdflkdfklgjsdfjajkgghs
```

(continues on next page)
Ensure parameter group exists:
create-parameter-group:
  boto_rds.parameter_present:
    - name: myparametergroup
    - db_parameter_group_family: mysql5.6
    - description: "parameter group family"
    - parameters:
      - binlog_cache_size: 32768
      - binlog_checksum: CRC32
    - region: eu-west-1

depends boto3

salt.states.boto_rds.absent(name, skip_final_snapshot=None, final_db_snapshot_identifier=None, tags=None, wait_for_deletion=True, timeout=180, region=None, key=None, keyid=None, profile=None)

Ensure RDS instance is absent.
name Name of the RDS instance.
skip_final_snapshot Whether a final db snapshot is created before the instance is deleted. If True, no snapshot is created. If False, a snapshot is created before deleting the instance.
final_db_snapshot_identifier If a final snapshot is requested, this is the identifier used for that snapshot.
tags A dict of tags.
wait_for_deletion (bool) Wait for the RDS instance to be deleted completely before finishing the state.
timeout (in seconds) The amount of time that can pass before raising an Exception.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_rds.parameter_present(name, db_parameter_group_family, description, parameters=None, apply_method='pending-reboot', tags=None, region=None, key=None, keyid=None, profile=None)

Ensure DB parameter group exists and update parameters.
name The name for the parameter group.
db_parameter_group_family The DB parameter group family name. A DB parameter group can be associated with one and only one DB parameter group family, and can be applied only to a DB instance running a database engine and engine version compatible with that DB parameter group family.
description Parameter group description.
parameters The DB parameters that need to be changed of type dictionary.
apply_method The apply-immediate method can be used only for dynamic parameters; the pending-reboot method can be used with MySQL and Oracle DB instances for either dynamic or static parameters. For Microsoft SQL Server DB instances, the pending-reboot method can be used only for static parameters.
tags A dict of tags.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
salt.states.boto_rds.present(name, allocated_storage, db_instance_class, engine, master_username, master_user_password, db_name=None, storage_type=None, db_security_groups=None, vpc_security_group_ids=None, vpc_security_groups=None, availability_zone=None, db_subnet_group_name=None, preferred_maintenance_window=None, db_parameter_group_name=None, db_cluster_identifier=None, tde_credential_arn=None, tde_credential_password=None, storage_encrypted=None, kms_keyid=None, backup_retention_period=None, preferred_backup_window=None, port=None, multi_az=None, engine_version=None, auto_minor_version_upgrade=None, license_model=None, iops=None, option_group_name=None, character_set_name=None, publicly_accessible=None, wait_status=None, tags=None, copy_tags_to_snapshot=None, region=None, domain=None, key=None, keyid=None, monitoring_interval=None, monitoring_role_arn=None, domain_iam_role_name=None, promotion_tier=None, profile=None)

Ensure RDS instance exists.

name Name of the RDS state definition.

allocated_storage The amount of storage (in gigabytes) to be initially allocated for the database instance.

db_instance_class The compute and memory capacity of the Amazon RDS DB instance.

engine The name of the database engine to be used for this instance. Supported engine types are: MySQL, mariadb, oracle-se1, oracle-se, oracle-ee, sqlserver-ee, sqlserver-ex, sqlserver-web, postgres and aurora. For more information, please see the engine argument in the Boto3 RDS create_db_instance documentation.

master_username The name of master user for the client DB instance.

master_user_password The password for the master database user. Can be any printable ASCII character except "/", "", or "@".

db_name The meaning of this parameter differs according to the database engine you use. See the Boto3 RDS documentation to determine the appropriate value for your configuration. [https://boto3.readthedocs.io/en/latest/reference/services/rds.html#RDS.Client.create_db_instance](https://boto3.readthedocs.io/en/latest/reference/services/rds.html#RDS.Client.create_db_instance)

storage_type Specifies the storage type to be associated with the DB instance. Options are standard, gp2 and io1. If you specify io1, you must also include a value for the iops parameter.

db_security_groups A list of DB security groups to associate with this DB instance.

vpc_security_group_ids A list of EC2 VPC security group IDs to associate with this DB instance.

vpc_security_groups A list of EC2 VPC security groups (IDs or Name tags) to associate with this DB instance.

availability_zone The EC2 Availability Zone that the database instance will be created in.

db_subnet_group_name A DB subnet group to associate with this DB instance.

preferred_maintenance_window The weekly time range (in UTC) during which system maintenance can occur.

db_parameter_group_name A DB parameter group to associate with this DB instance.

db_cluster_identifier If the DB instance is a member of a DB cluster, contains the name of the DB cluster that the DB instance is a member of.

tde_credential_arn The ARN from the Key Store with which the instance is associated for TDE encryption.

tde_credential_password The password to use for TDE encryption if an encryption key is not used.

storage_encrypted Specifies whether the DB instance is encrypted.

kms_keyid If storage_encrypted is true, the KMS key identifier for the encrypted DB instance.

backup_retention_period The number of days for which automated backups are retained.

preferred_backup_window The daily time range during which automated backups are created if automated backups are enabled.

port The port number on which the database accepts connections.

multi_az Specifies if the DB instance is a Multi-AZ deployment. You cannot set the AvailabilityZone parameter if the MultiAZ parameter is set to true.
engine_version  The version number of the database engine to use.
auto_minor_version_upgrade  Indicates that minor engine upgrades will be applied automatically to the DB instance during the maintenance window.
license_model  License model information for this DB instance.
iops  The amount of Provisioned IOPS (input/output operations per second) to be initially allocated for the DB instance.
option_group_name  Indicates that the DB instance should be associated with the specified option group.
character_set_name  For supported engines, indicates that the DB instance should be associated with the specified CharacterSet.
publicly_accessible  Specifies the accessibility options for the DB instance. A value of true specifies an Internet-facing instance with a publicly resolvable DNS name, which resolves to a public IP address. A value of false specifies an internal instance with a DNS name that resolves to a private IP address.
wait_status  Wait for the RDS instance to reach a desired status before finishing the state. Available states: available, modifying, backing-up
tags  A dict of tags.
copy_tags_to_snapshot  Specifies whether tags are copied from the DB instance to snapshots of the DB instance.
region  Region to connect to.
domain  The identifier of the Active Directory Domain.
key  AWS secret key to be used.
keyid  AWS access key to be used.
monitoring_interval  The interval, in seconds, between points when Enhanced Monitoring metrics are collected for the DB instance.
monitoring_role_arn  The ARN for the IAM role that permits RDS to send Enhanced Monitoring metrics to CloudWatch Logs.
domain_iam_role_name  Specify the name of the IAM role to be used when making API calls to the Directory Service.
promotion_tier  A value that specifies the order in which an Aurora Replica is promoted to the primary instance after a failure of the existing primary instance. For more information, see Fault Tolerance for an Aurora DB Cluster.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
salt.states.boto_rds.replica_present(name, source, db_instance_class=None, availability_zone=None, port=None, auto_minor_version_upgrade=None, iops=None, option_group_name=None, publicly_accessible=None, tags=None, region=None, key=None, keyid=None, profile=None, db_parameter_group_name=None)

Ensure RDS replica exists.

```
Ensure myrds replica RDS exists:
boto_rds.create_replica:
  - name: myreplica
  - source: mydb
```
salt.states.boto_rdssubnet_group_absent(name, tags=None, region=None, key=None, keyid=None, profile=None)
salt.states.boto_rds.subnet_group_present(name, description, subnet_ids=None, subnet_names=None, tags=None, region=None, key=None, keyid=None, profile=None)

Ensure DB subnet group exists.
name  The name for the DB subnet group. This value is stored as a lowercase string.
subnet_ids  A list of the EC2 Subnet IDs for the DB subnet group. Either subnet_ids or subnet_names must be provided.
subnet_names  A list of The EC2 Subnet names for the DB subnet group. Either subnet_ids or subnet_names must be provided.
description  Subnet group description.
tags  A dict of tags.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.47  salt.states.boto_route53

Manage Route53 records

New in version 2014.7.0.

Create and delete Route53 records. Be aware that this interacts with Amazon’s services, and so may incur charges. This module uses boto, which can be installed via package, or pip.

This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

<table>
<thead>
<tr>
<th>route53.keyid</th>
<th>GKTADJGHEIQXSXMKRRBJ08H</th>
</tr>
</thead>
<tbody>
<tr>
<td>route53.key</td>
<td>askdjghsdfjkghWupUjadsfklkgjsdfjajkghs</td>
</tr>
</tbody>
</table>

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
    keyid: GKTADJGHEIQXSXMKRRBJ08H
    key: askdjghsdfjkghWupUjadsfklkgjsdfjajkghs
    region: us-east-1
```

```yaml
mycnamerecord:
  boto_route53.present:
    name: test.example.com.
    value: my-elb.us-east-1.elb.amazonaws.com.
    zone: example.com.
    ttl: 60
    record_type: CNAME
    region: us-east-1
    keyid: GKTADJGHEIQXSXMKRRBJ08H
    key: askdjghsdfjkghWupUjadsfklkgjsdfjajkghs
```

```
myarecord:
  boto_route53.present:
    name: test.example.com.
    value: 1.1.1.1
    zone: example.com.
    ttl: 60
    record_type: A
    region: us-east-1
```

# Using a profile from pillars

(continues on next page)
- **profile**: myprofile

# Passing in a profile

```bash
myarecord:
  boto_route53.present:
    - name: test.example.com.
    - value: 1.1.1.1
    - zone: example.com.
    - ttl: 60
    - record_type: A
    - region: us-east-1
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkgHUpUjasdfklfkgjsdfjajkghs
```

salt.states.boto_route53.absent(name, zone, record_type, identifier=None, region=None, key=None, keyid=None, profile=None, wait_for_sync=True, split_dns=False, private_zone=False)

Ensure the Route53 record is deleted.

- **name**: Name of the record.
- **zone**: The zone to delete the record from.
- **record_type**: The record type (A, NS, MX, TXT, etc.)
- **identifier**: An identifier to match for deletion.
- **region**: The region to connect to.
- **key**: Secret key to be used.
- **keyid**: Access key to be used.
- **profile**: A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
- **wait_for_sync**: Wait for an INSYNC change status from Route53.
- **split_dns**: Route53 supports a public and private DNS zone with the same names.
- **private_zone**: If using split_dns, specify if this is the private zone.

salt.states.boto_route53.hosted_zone_absent(name, domain_name=None, region=None, key=None, keyid=None, profile=None)

Ensure the Route53 Hostes Zone described is absent.

- **name**: The name of the state definition.
- **domain_name**: The FQDN (including final period) of the zone you wish absent. If not provided, the value of name will be used.

salt.states.boto_route53.hosted_zone_present(name, domain_name=None, private_zone=False, caller_ref=None, comment=None, vpc_id=None, vpc_name=None, vpc_region=None, region=None, key=None, keyid=None, profile=None)

Ensure a hosted zone exists with the given attributes. Note that most things cannot be modified once a zone is created - it must be deleted and re-spun to update these attributes:

- **private_zone**: (AWS API limitation).
- **comment**: (the appropriate call exists in the AWS API and in boto3, but has not, as of this writing, been added to boto2).
- **vpc_id**: (same story - we really need to rewrite this module with boto3)
- **vpc_name**: (really just a pointer to vpc_id anyway).
- **vpc_region**: (again, supported in boto3 but not boto2).

If you need the ability to update these attributes, please use the newer boto3_route53 module instead.

- **name**: The name of the state definition.
- **domain_name**: The name of the domain. This must be fully-qualified, terminating with a period. This is the
name you have registered with your domain registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request. Defaults to the value of name if not provided.

**private_zone** Set True if creating a private hosted zone.

**caller_ref** A unique string that identifies the request and that allows create_hosted_zone() calls to be retried without the risk of executing the operation twice. This helps ensure idempotency across state calls, but can cause issues if a zone is deleted and then an attempt is made to recreate it with the same caller_ref. If not provided, a unique UUID will be generated at each state run, which avoids the risk of the above (transient) error. This option is generally not needed. Maximum length of 128.

**comment** Any comments you want to include about the hosted zone.

**vpc_id** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpe_name. Ignored when creating a non-private zone.

**vpc_name** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpe_id. Ignored when creating a non-private zone.

**vpc_region** When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from vpc_id or vpc_name, where possible. If this fails, you’ll need to provide an explicit value for this option. Ignored when creating a non-private zone.

```python
salt.states.boto_route53.present(
    name, value, zone, record_type, ttl=None, identifier=None,
    region=None, key=None, keyid=None, profile=None,
    wait_for_sync=True, split_dns=False, private_zone=False)
```

Ensure the Route53 record is present.

**name** Name of the record.

**value** Value of the record. As a special case, you can pass in: private:<Name tag> to have the function autodetermine the private IP public:<Name tag> to have the function autodetermine the public IP

**zone** The zone to create the record in.

**record_type** The record type (A, NS, MX, TXT, etc.)

**ttl** The time to live for the record.

**identifier** The unique identifier to use for this record.

**region** The region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**wait_for_sync** Wait for an INSYNC change status from Route53 before returning success.

**split_dns** Route53 supports parallel public and private DNS zones with the same name.

**private_zone** If using split_dns, specify if this is the private zone.

```python
salt.states.boto_route53.rr_absent(*args, **kwargs)
salt.states.boto_route53.rr_present(*args, **kwargs)
```

## 21.19.48 salt.states.boto_s3_bucket module

Manage S3 Buckets

New in version 2016.3.0.

Create and destroy S3 buckets. Be aware that this interacts with Amazon’s services, and so may incur charges.

**depends**

- `boto`
- `boto3`
The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```yaml
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkgWupUjasdfklkjdflgjdsfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkgWupUjasdfklkjdflgjdsfjajkghs
  region: us-east-1
```

Ensure bucket exists:

```yaml
boto_s3_bucket.present:
  - Bucket: mybucket
  - LocationConstraint: EU
  - ACL:
    - GrantRead: "uri=http://acs.amazonaws.com/groups/global/AllUsers"
  - CORSRules:
    - AllowedHeaders: []
    - AllowedMethods: ["GET"]
    - AllowedOrigins: ["*"]
    - ExposeHeaders: []
    - MaxAgeSeconds: 123
  - LifecycleConfiguration:
    - Expiration:
      - Days: 123
      - ID: "idstring"
      - Prefix: "prefixstring"
      - Status: "enabled",
      - ID: "lc1"
    - Transitions:
      - Days: 123
      - StorageClass: "GLACIER"
    - NoncurrentVersionExpiration:
      - NoncurrentDays: 123
      - StorageClass: "GLACIER"
  - Logging:
    - TargetBucket: log_bucket
    - TargetPrefix: prefix
    - TargetGrants:
      - Grantee:
        - DisplayName: "string"
        - EmailAddress: "string"
        - ID: "string"
        - Type: "AmazonCustomerByEmail"
        - URI: "string"
        - Permission: "READ"
    - NotificationConfiguration:
```

(continues on next page)

      ReplaceKeyWith: "string"
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkgWupUjasdfklkdfklgjsdfjajkghs
salt.states.boto_s3_bucket.absent(name, Bucket, Force=False, region=None, key=None, keyid=None, profile=None)

Ensure bucket with passed properties is absent.

name  The name of the state definition.
Bucket Name of the bucket.
Force Empty the bucket first if necessary - Boolean.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_s3_bucket.present(name, Bucket, LocationConstraint=None, ACL=None, CORSRules=None, LifecycleConfiguration=None, Logging=None, NotificationConfiguration=None, Policy=None, Replication=None, RequestPayment=None, Tagging=None, Versioning=None, Website=None, region=None, key=None, keyid=None, profile=None)

Ensure bucket exists.

name  The name of the state definition
Bucket Name of the bucket.
LocationConstraint  'EU'|'eu-west-1'|'us-west-1'|'us-west-2'|'ap-southeast-1'|'ap-southeast-2'|'ap-northeast-1'|'sa-east-1'|'cn-north-1'|'eu-central-1'
ACL  The permissions on a bucket using access control lists (ACL).
CORSRules  The cors configuration for a bucket.
LifecycleConfiguration  Lifecycle configuration for your bucket
Logging  The logging parameters for a bucket and to specify permissions for who can view and modify the logging parameters.
NotificationConfiguration  notifications of specified events for a bucket
Policy  Policy on the bucket
Replication  Replication rules. You can add as many as 1,000 rules. Total replication configuration size can be up to 2 MB
RequestPayment  The request payment configuration for a bucket. By default, the bucket owner pays for downloads from the bucket. This configuration parameter enables the bucket owner (only) to specify that the person requesting the download will be charged for the download
Tagging  A dictionary of tags that should be set on the bucket
Versioning  The versioning state of the bucket
Website  The website configuration of the bucket
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.49  salt.states.boto_secgroup

Manage Security Groups

New in version 2014.7.0.

Create and destroy Security Groups. Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit EC2 credentials but can also utilize IAM roles assigned to the instance through In-
stance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```yaml
secgroup.keyid: GKTADJGHEIQXSMMRKBRJ08H
secgroup.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
  keyid: GKTADJGHEIQXSMMRKBRJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

Ensure mysecgroup exists:

```yaml
boto_secgroup.present:
  - name: mysecgroup
  - description: My security group
  - vpc_name: myvpc
  - rules:
    - ip_protocol: tcp
      from_port: 80
      to_port: 80
      cidr_ip:
      - 10.0.0.0/8
      - 192.168.0.0/16
    - ip_protocol: tcp
      from_port: 8080
      to_port: 8090
      cidr_ip:
      - 10.0.0.0/8
      - 192.168.0.0/16
    - ip_protocol: icmp
      from_port: -1
      to_port: -1
      source_group_name: mysecgroup
    - ip_protocol: tcp
      from_port: 8080
      to_port: 8080
      source_group_name: MyOtherSecGroup
      source_group_name_vpc: MyPeeredVPC
    - rules_egress:
      - ip_protocol: all
        from_port: -1
        to_port: -1
        cidr_ip:
      - 10.0.0.0/8
      - 192.168.0.0/16
    - tags:
      SomeTag: 'My Tag Value'
      SomeOtherTag: 'Other Tag Value'
      - region: us-east-1
      - keyid: GKTADJGHEIQXSMMRKBRJ08H
      - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

# Using a profile from pillars
Ensure mysecgroup exists:

```python
boto_secgroup.present:
  - name: mysecgroup
  - description: My security group
  - profile: myprofile
```

# Passing in a profile
Ensure mysecgroup exists:

```python
boto_secgroup.present:
  - name: mysecgroup
  - description: My security group
  - profile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkgHwupUjasdfldkfjklgsdfkajgkh
    region: us-east-1
```

Note: When using the profile parameter and region is set outside of the profile group, region is ignored and a default region will be used.

If region is missing from the profile data set, us-east-1 will be used as the default region.

```python
salt.states.boto_secgroup.absent(name, vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)
```

Ensure a security group with the specified name does not exist.

- name Name of the security group.
- vpc_id The ID of the VPC to remove the security group from, if any. Exclusive with vpc_name.
- vpc_name The name of the VPC to remove the security group from, if any. Exclusive with vpc_name.
- region Region to connect to.
- key Secret key to be used.
- keyid Access key to be used.
- profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

```python
salt.states.boto_secgroup.present(name, description, vpc_id=None, vpc_name=None, rules=None, rules_egress=None, delete_ingress_rules=True, delete_egress_rules=True, region=None, key=None, keyid=None, profile=None, tags=None)
```

Ensure the security group exists with the specified rules.

- name Name of the security group.
- description A description of this security group.
- vpc_id The ID of the VPC to create the security group in, if any. Exclusive with vpc_name.
- vpc_name The name of the VPC to create the security group in, if any. Exclusive with vpc_id.
- rules A list of ingress rule dicts. If not specified, rules=None, the ingress rules will be unmanaged. If set to an empty list, [], then all ingress rules will be removed.
- rules_egress A list of egress rule dicts. If not specified, rules_egress=None, the egress rules will be unmanaged. If set to an empty list, [], then all egress rules will be removed.
- delete_ingress_rules Some tools (EMR comes to mind) insist on adding rules on-the-fly, which salt will happily remove on the next run. Set this param to False to avoid deleting rules which were added outside
of salt.

**delete_egress_rules** Some tools (EMR comes to mind) insist on adding rules on-the-fly, which salt will happily remove on the next run. Set this param to False to avoid deleting rules which were added outside of salt.

- **region** Region to connect to.
- **key** Secret key to be used.
- **keyid** Access key to be used.
- **profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key, and keyid.
- **tags** List of key:value pairs of tags to set on the security group

New in version 2016.3.0.

### 21.19.50 salt.states.boto_sns

Manage SNS Topics

Create and destroy SNS topics. Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```yaml
sns.keyid: GKTADJGHEIQSXMKKRBJ08H
sns.key: askdjghsdfjkghWupUjasdflkdfklgjsdfajkghs
```

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfajkghs
  region: us-east-1
```

```yaml
mytopic:
  boto_sns.present:
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfajkghs
```

# Using a profile from pillars
```
mytopic:
  boto_sns.present:
    - region: us-east-1
    - profile: mysnsprofile
```

# Passing in a profile
```
mytopic:
  boto_sns.present:
    - region: us-east-1
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkghWupUjasdflkdfklgjsdfajkghs
```
salt.states.boto_sns.absent(name, region=None, key=None, keyid=None, profile=None, unsubscribe=False)

Ensure the named sns topic is deleted.

name Name of the SNS topic.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
unsubscribe If True, unsubscribe all subscriptions to the SNS topic before deleting the SNS topic.

New in version 2016.11.0.

salt.states.boto_sns.present(name, subscriptions=None, region=None, key=None, keyid=None, profile=None)

Ensure the SNS topic exists.

name Name of the SNS topic.
subscriptions List of SNS subscriptions.

Each subscription is a dictionary with a protocol and endpoint key:

```
[
    {'protocol': 'https', 'endpoint': 'https://www.example.com/sns-endpoint'},
    {'protocol': 'sqs', 'endpoint': 'arn:aws:sqs:us-west-2:123456789012:MyQueue'}
]
```

region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.51 salt.states.boto_sqs

Manage SQS Queues

New in version 2014.7.0.

Create and destroy SQS queues. Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit SQS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```
sqs.keyid: GKTADJGHEIQSXMKKRBJ08H
sqs.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```
myqueue:
  boto_sqs.present:
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjjkghWupUjasdfklkdfklgjsdfjajkghs
    - attributes:
        ReceiveMessageWaitTimeSeconds: 20

# Using a profile from pillars
myqueue:
  boto_sqs.present:
    - region: us-east-1
    - profile: mysqsprofile

# Passing in a profile
myqueue:
  boto_sqs.present:
    - region: us-east-1
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjjkghWupUjasdfklkdfklgjsdfjajkghs

salt.states.boto_sqs.absent(name, region=None, key=None, keyid=None, profile=None)

Ensure the named sqs queue is deleted.

- **name**: Name of the SQS queue.
- **region**: Region to connect to.
- **key**: Secret key to be used.
- **keyid**: Access key to be used.
- **profile**: A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_sqs.present(name, attributes=None, region=None, key=None, keyid=None, profile=None)

Ensure the SQS queue exists.

- **name**: Name of the SQS queue.
- **attributes**: A dict of key/value SQS attributes.
- **region**: Region to connect to.
- **key**: Secret key to be used.
- **keyid**: Access key to be used.
- **profile**: A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.52 salt.states.boto_vpc

Manage VPCs

New in version 2015.8.0.

- **depends**
  - boto >= 2.8.0
  - boto3 >= 1.2.6

Create and destroy VPCs. Be aware that this interacts with Amazon's services, and so may incur charges.
This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```yaml
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It’s also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

```yaml
aws:
  region:
    us-east-1:
      profile:
        keyid: GKTADJGHEIQSXMKKRBJ08H
        key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
        region: us-east-1
```

Ensure VPC exists:
```yaml
boto_vpc.present:
  - name: myvpc
    - cidr_block: 10.10.11.0/24
    - dns_hostnames: True
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

Ensure subnet exists:
```yaml
boto_vpc.subnet_present:
  - name: mysubnet
    - vpc_id: vpc-123456
    - cidr_block: 10.0.0.0/16
    - region: us-east-1
    - profile: myprofile
```

```yaml
{% set profile = salt['pillar.get']('aws:region:us-east-1:profile') %}
```

Ensure internet gateway exists:
```yaml
boto_vpc.internet_gateway_present:
  - name: myigw
    - vpc_name: myvpc
    - profile: {{ profile }}
```

Ensure route table exists:
```yaml
boto_vpc.route_table_present:
  - name: my_route_table
    - vpc_id: vpc-123456
    - routes:
      - destination_cidr_block: 0.0.0.0/0
        instance_id: i-123456
        subnet_names:
```

(continues on next page)
New in version 2016.11.0.

Request, accept and delete VPC peering connections. VPC peering connections can be named allowing the name to be used throughout the state file. Following example shows how to request and accept a VPC peering connection.

```python
accept the vpc peering connection:
boto_vpc.accept_vpc_peering_connection:
  - conn_name: salt_vpc_peering
  - region: us-west-2
  - require:
    - boto_vpc: request a vpc peering connection

request a vpc peering connection:
boto_vpc.request_vpc_peering_connection:
  - requester_vpc_id: vpc-4a3d522e
  - peer_vpc_id: vpc-ae81e9ca
  - region: us-west-2
  - conn_name: salt_vpc_peering
```

VPC peering connections need not be named. In this case the VPC peering connection ID should be used in the state file.

```python
accept the vpc peering connection:
boto_vpc.accept_vpc_peering_connection:
  - conn_id: pcx-1873c371
  - region: us-west-2
```

VPC peering connections can be deleted, as shown below.

```python
delete a named vpc peering connection:
boto_vpc.delete_vpc_peering_connection:
  - conn_name: salt_vpc_peering

delete a vpc peering connection by id:
boto_vpc.delete_vpc_peering_connection:
  - conn_id: pcx-1873c371
```

salt.states.boto_vpc.absent(name=None, tags=None, region=None, key=None, keyid=None, profile=None)

Ensure VPC with passed properties is absent.

- name Name of the VPC.
- tags A list of tags. All tags must match.
- region Region to connect to.
- key Secret key to be used.
- keyid Access key to be used.
- profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
salt.states.boto_vpc.accept_vpc_peering_connection(name=None, conn_id=None, conn_name=None, region=None, key=None, keyid=None, profile=None)

Accept a VPC pending requested peering connection between two VPCs.

name Name of this state
conn_id The connection ID to accept. Exclusive with conn_name. String type.
conn_name The name of the VPC peering connection to accept. Exclusive with conn_id. String type.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```python
boto_vpc.accept_vpc_peering_connection:
- conn_name: salt_peering_connection

# usage with vpc peering connection id and region
boto_vpc.accept_vpc_peering_connection:
- conn_id: pbx-1873d472
- region: us-west-2
```

salt.states.boto_vpc.delete_vpc_peering_connection(name, conn_id=None, conn_name=None, region=None, key=None, keyid=None, profile=None)

name Name of the state
conn_id ID of the peering connection to delete. Exclusive with conn_name.
conn_name The name of the peering connection to delete. Exclusive with conn_id.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```python
delete a vpc peering connection:
boto_vpc.delete_vpc_peering_connection:
- region: us-west-2
- conn_id: pcx-4613b12e
```

Connection name can be specified (instead of ID). Specifying both conn_name and conn_id will result in an error.

```python
delete a vpc peering connection:
boto_vpc.delete_vpc_peering_connection:
- conn_name: salt_vpc_peering
```

salt.states.boto_vpc.dhcp_options_absent(name=None, dhcp_options_id=None, region=None, key=None, keyid=None, profile=None)

Ensure a set of DHCP options with the given settings exist.

name (string) Name of the DHCP options set.
**dhcp_options_id** (string) Id of the DHCP options set.
**region** (string) Region to connect to.
**key** (string) Secret key to be used.
**keyid** (string) Access key to be used.
**profile** (various) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

```python
salt.states.boto_vpc.dhcp_options_present(name, dhcp_options_id=None, vpc_name=None, vpc_id=None, domain_name=None, domain_name_servers=None, ntp_servers=None, netbios_name_servers=None, netbios_node_type=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Ensure a set of DHCP options with the given settings exist. Note that the current implementation only SETS values during option set creation. It is unable to update option sets in place, and thus merely verifies the set exists via the given name and/or dhcp_options_id param.

**name** (string) Name of the DHCP options.
**vpc_name** (string) Name of a VPC to which the options should be associated. Either vpc_name or vpc_id must be provided.
**vpc_id** (string) Id of a VPC to which the options should be associated. Either vpc_name or vpc_id must be provided.
**domain_name** (string) Domain name to be associated with this option set.
**domain_name_servers** (list of strings) The IP address(es) of up to four domain name servers.
**ntp_servers** (list of strings) The IP address(es) of up to four desired NTP servers.
**netbios_name_servers** (list of strings) The IP address(es) of up to four NetBIOS name servers.
**netbios_node_type** (string) The NetBIOS node type (1, 2, 4, or 8). For more information about the allowed values, see RFC 2132. The recommended is 2 at this time (broadcast and multicast are currently not supported).
**tags** (dict of key:value pairs) A set of tags to be added.
**region** (string) Region to connect to.
**key** (string) Secret key to be used.
**keyid** (string) Access key to be used.
**profile** (various) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

```python
salt.states.boto_vpc.internet_gateway_absent(name, detach=False, region=None, key=None, keyid=None, profile=None)
```

Ensure the named internet gateway is absent.

**name** Name of the internet gateway.
**detach** First detach the internet gateway from a VPC, if attached.
**region** Region to connect to.
**key** Secret key to be used.
**keyid** Access key to be used.
**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```python
salt.states.boto_vpc.internet_gateway_present(name, vpc_name=None, vpc_id=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Ensure an internet gateway exists.

**name** Name of the internet gateway.
**vpc_name** Name of the VPC to which the internet gateway should be attached.
**vpc_id** Id of the VPC to which the internet_gateway should be attached. Only one of vpc_name or vpc_id may be provided.
tags  A list of tags.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_vpc.nat_gateway_absent(name=None, subnet_name=None, subnet_id=None, region=None, key=None, keyid=None, profile=None, wait_for_delete_retries=0)
```

Ensure the nat gateway in the named subnet is absent.

This function requires boto3.

New in version 2016.11.0.

name  Name of the state.
subnet_name  Name of the subnet within which the nat gateway should exist
subnet_id  Id of the subnet within which the nat gateway should exist. Either subnet_name or subnet_id must be provided.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
wait_for_delete_retries  NAT gateway may take some time to be go into deleted or failed state. During the deletion process, subsequent release of elastic IPs may fail; this state will automatically retry this number of times to ensure the NAT gateway is in deleted or failed state before proceeding. Default is set to 0 for backward compatibility.

```
salt.states.boto_vpc.nat_gateway_present(name, subnet_name=None, subnet_id=None, region=None, key=None, keyid=None, profile=None, allocation_id=None)
```

Ensure a nat gateway exists within the specified subnet

This function requires boto3.

New in version 2016.11.0.

Example:

```
boto_vpc.nat_gateway_present:
   - subnet_name: my-subnet
```

name  Name of the state
subnet_name  Name of the subnet within which the nat gateway should exist
subnet_id  Id of the subnet within which the nat gateway should exist. Either subnet_name or subnet_id must be provided.
allocation_id  If specified, the elastic IP address referenced by the ID is associated with the gateway. Otherwise, a new allocation_id is created and used.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_vpc.present(name, cidr_block, instance_tenancy=None, dns_support=None, dns_hostnames=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Ensure VPC exists.
name  Name of the VPC.
cidr_block  The range of IPs in CIDR format, for example: 10.0.0.0/24. Block size must be between /16 and /28 netmask.
instance_tenancy  Instances launched in this VPC will be single-tenant or dedicated hardware.
dns_support  Indicates whether the DNS resolution is supported for the VPC.
dns_hostnames  Indicates whether the instances launched in the VPC get DNS hostnames.
tags  A list of tags.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_vpc.request_vpc_peering_connection(name, requester_vpc_id=None, requester_vpc_name=None, peer_vpc_id=None, peer_vpc_name=None, conn_name=None, peer_owner_id=None, region=None, key=None, keyid=None, profile=None)

name  Name of the state
requester_vpc_id  ID of the requesting VPC. Exclusive with requester_vpc_name. String type.
requester_vpc_name  Name tag of the requesting VPC. Exclusive with requester_vpc_id. String type.
peer_vpc_id  ID of the VPC to create VPC peering connection with. This can be a VPC in another account. Exclusive with peer_vpc_name. String type.
peer_vpc_name  Name tag of the VPC to create VPC peering connection with. This can only be a VPC the same account. Exclusive with peer_vpc_id. String type.
conn_name  The (optional) name to use for this VPC peering connection. String type.
peer_owner_id  ID of the owner of the peer VPC. String type. If this isn’t supplied AWS uses your account ID. Required if peering to a different account.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

request a vpc peering connection:
  boto_vpc.request_vpc_peering_connection:
    - requester_vpc_id: vpc-4b3522e
    - peer_vpc_id: vpc-ae83f9ca
    - conn_name: salt_peering_connection

salt.states.boto_vpc.route_table_absent(name, region=None, key=None, keyid=None, profile=None)

Ensure the named route table is absent.
name  Name of the route table.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
salt.states.boto_vpc.route_table_present(name, vpc_name=None, vpc_id=None, routes=None, subnet_ids=None, subnet_names=None, tags=None, region=None, key=None, keyid=None, profile=None)

Ensure route table with routes exists and is associated to a VPC.

This function requires boto3 to be installed if nat gateways are specified.

Example:

```yaml
boto_vpc.route_table_present:
  - name: my_route_table
  - vpc_id: vpc-123456
  - routes:
    - destination_cidr_block: 0.0.0.0/0
      internet_gateway_name: InternetGateway
    - destination_cidr_block: 10.10.11.0/24
      instance_id: i-123456
    - destination_cidr_block: 10.10.12.0/24
      interface_id: enI-123456
    - destination_cidr_block: 10.10.13.0/24
      instance_name: mygatewayserver
  - subnet_names:
    - subnet1
    - subnet2
```

- **name** Name of the route table.
- **vpc_name** Name of the VPC with which the route table should be associated.
- **vpc_id** Id of the VPC with which the route table should be associated. Either vpc_name or vpc_id must be provided.
- **routes** A list of routes. Each route has a cidr and a target.
- **subnet_ids** A list of subnet ids to associate
- **subnet_names** A list of subnet names to associate
- **tags** A list of tags.
- **region** Region to connect to.
- **key** Secret key to be used.
- **keyid** Access key to be used.
- **profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_vpc.subnet_absent(name=None, subnet_id=None, region=None, key=None, keyid=None, profile=None)

Ensure subnet with passed properties is absent.

- **name** Name of the subnet.
- **region** Region to connect to.
- **key** Secret key to be used.
- **keyid** Access key to be used.
- **profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_vpc.subnet_present(name, cidr_block, vpc_name=None, vpc_id=None, availability_zone=None, tags=None, region=None, key=None, keyid=None, profile=None, route_table_id=None, route_table_name=None, auto_assign_public_ipv4=False)

Ensure a subnet exists.

- **name** Name of the subnet.
cidr_block The range if IPs for the subnet, in CIDR format. For example: 10.0.0.0/24. Block size must be between /16 and /28 netmask.

vpc_name Name of the VPC in which the subnet should be placed. Either vpc_name or vpc_id must be provided.

vpc_id Id of the VPC in which the subnet should be placed. Either vpc_name or vpc_id must be provided.

availability_zone AZ in which the subnet should be placed.

tags A list of tags.

route_table_id A route table ID to explicitly associate the subnet with. If both route_table_id and route_table_name are specified, route_table_id will take precedence.

New in version 2016.11.0.

route_table_name A route table name to explicitly associate the subnet with. If both route_table_id and route_table_name are specified, route_table_id will take precedence.

New in version 2016.11.0.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
ensure peering twixt local vpc and the other guys:
  - boto_vpc.vpc_peering_connection_present:
    - requester_vpc_name: my_local_vpc
```

(continues on next page)
21.19.53 salt.states.bower

Installation of Bower Packages

These states manage the installed packages using Bower. Note that npm, git and bower must be installed for these states to be available, so bower states should include requisites to pkg.installed states for the packages which provide npm and git (simply npm and git in most cases), and npm.installed state for the package which provides bower.

Example:

```yaml
# Example configuration

- peer_vpc_name: some_other_guys_vpc
- conn_name: peering_from_here_to_there
- peer_owner_id: 012345654321

# State configuration

salt.states.bower.

```

Install Bower packages using Bower.

- **name**: The package to install
- **dir**: The target directory in which to install the package
- **pkgs**: A list of packages to install with a single Bower invocation; specifying this argument will ignore the `name` argument
- **user**: The user to run Bower with
- **env**: A list of environment variables to be set prior to execution. The format is the same as the `cmd.run` state function.

Example:

```yaml
# Install Bower packages

- name: underscore
  dir: /path/to/project
  require:
    - pkg: npm
    - pkg: git

- name: jquery#2.0
  dir: /path/to/project
```

### state.bower.bootstrap(name, user=None)

Bootstraps a frontend distribution.

- **name**: The package to install
- **user**: The user to run Bower with

### state.bower.installed(name, dir, pkgs=None, user=None, env=None)

Verify that the given package is installed and is at the correct version (if specified).

- **name**: The package to install
- **dir**: The target directory in which to install the package
- **pkgs**: A list of packages to install with a single Bower invocation; specifying this argument will ignore the `name` argument
- **user**: The user to run Bower with
- **env**: A list of environment variables to be set prior to execution. The format is the same as the `cmd.run` state function.
salt.states.bower.pruned(name, user=None, env=None)
    New in version 2017.7.0.
    Cleans up local bower_components directory.
    Will execute 'bower prune' on the specified directory (param: name)
    user  The user to run Bower with

salt.states.bower.removed(name, dir, user=None)
    Verify that the given package is not installed.
    dir  The target directory in which to install the package
    user  The user to run Bower with

21.19.54  salt.states.cabal

Installation of Cabal Packages

New in version 2015.8.0.

These states manage the installed packages for Haskell using cabal. Note that cabal-install must be installed for these states to be available, so cabal states should include a requisite to a pkg.installed state for the package which provides cabal (cabal-install in case of Debian based distributions). Example:

```yaml
.. code-block:: yaml

    cabal-install: pkg.installed

ShellCheck:
    cabal.installed:
        • require: - pkg: cabal-install

salt.states.cabal.installed(name, pkgs=None, user=None, install_global=False, env=None)
    Verify that the given package is installed and is at the correct version (if specified).

ShellCheck-0.3.5:
    cabal:
        - installed:

name  The package to install
user  The user to run cabal install with
install_global  Install package globally instead of locally
env  A list of environment variables to be set prior to execution. The format is the same as the cmd.run.
    state function.

salt.states.cabal.removed(name, user=None, env=None)
    Verify that given package is not installed.

21.19.55  salt.states.ceph module

Manage ceph with salt.
New in version 2016.11.0.

salt.states.ceph.quorum(name, **kwargs)
    Quorum state
This state checks the mon daemons are in quorum. It does not alter the cluster but can be used in formula as a dependency for many cluster operations.

Example usage in sls file:

```
quorum:
  sesceph.quorum:
    - require:
      - sesceph: mon_running
```

### 21.19.56 salt.states.chef

**Execute Chef client runs**

Run chef-client or chef-solo

```
my-chef-run:
  chef.client:
    - override-runlist: 'demo1,demo2'
    - server: 'https://chef.domain.com'

default-chef-run:
  chef.client: []

my-solo-run:
  chef.solo:
    - environment: dev
```

#### salt.states.chef.client(name, **kwargs)

- **name**: Unique identifier for the state. Does not affect the Chef run.
- **server**: The chef server URL
- **client_key**: Set the client key file location
- **config**: The configuration file to use
- **config-file-jail**: Directory under which config files are allowed to be loaded (no client.rb or knife.rb outside this path will be loaded).
- **environment**: Set the Chef Environment on the node
- **group**: Group to set privilege to
- **json-attributes**: Load attributes from a JSON file or URL
- **localmode**: Point chef-client at local repository if True
- **log_level**: Set the log level (debug, info, warn, error, fatal)
- **logfile**: Set the log file location
- **node-name**: The node name for this client
- **override-runlist**: Replace current run list with specified items for a single run
- **pid**: Set the PID file location, defaults to /tmp/chef-client.pid
- **run-lock-timeout**: Set maximum duration to wait for another client run to finish, default is indefinitely.
- **runlist**: Permanently replace current run list with specified items
- **user**: User to set privilege to
- **validation_key**: Set the validation key file location, used for registering new clients

#### salt.states.chef.solo(name, **kwargs)

- **name**: Unique identifier for the state. Does not affect the Chef run.
- **config**: The configuration file to use
- **environment**: Set the Chef Environment on the node
- **group**: Group to set privilege to
- **json-attributes**: Load attributes from a JSON file or URL
log_level  Set the log level (debug, info, warn, error, fatal)
logfile  Set the log file location
node-name  The node name for this client
override-runlist  Replace current run list with specified items for a single run
recipe-url  Pull down a remote gzipped tarball of recipes and untar it to the cookbook cache
run-lock-timeout  Set maximum duration to wait for another client run to finish, default is indefinitely.
user  User to set privilege to

21.19.57  salt.states.chocolatey module

Manage Chocolatey package installs .. versionadded:: 2016.3.0

Note:  Chocolatey pulls data from the Chocolatey internet database to determine current versions, find available versions, etc. This is normally a slow operation and may be optimized by specifying a local, smaller chocolatey repo.

salt.states.chocolatey.installed(name, version=None, source=None, force=False, pre_versions=False, install_args=None, override_args=False, force_x86=False, package_args=None, allow_multiple=False)

Installs a package if not already installed

Parameters

- **name** (str) – The name of the package to be installed. Required.
- **version** (str) – Install a specific version of the package. Defaults to latest version. If the version is different to the one installed then the specified version will be installed. Default is None.
- **source** (str) – Chocolatey repository (directory, share or remote URL, feed). Defaults to the official Chocolatey feed. Default is None.
- **force** (bool) – Reinstall the current version of an existing package. Do not use with allow_multiple. Default is False.
- **pre_versions** (bool) – Include pre-release packages. Default is False.
- **install_args** (str) – Install arguments you want to pass to the installation process, i.e product key or feature list. Default is None.
- **override_args** (bool) – Set to True if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments. Default is False.
- **force_x86** (bool) – Force x86 (32bit) installation on 64 bit systems. Default is False.
- **package_args** (str) – Arguments you want to pass to the package. Default is None.
- **allow_multiple** (bool) – Allow multipe versions of the package to be installed. Do not use with force. Does not work with all packages. Default is False.

New in version 2017.7.0.

Installsomepackage:
  chocolatey.installed:
  - name: packagename
  - version: '12.04'
  - source: 'mychocolatey/source'
  - force: True

salt.states.chocolatey.uninstalled(name, version=None, uninstall_args=None, override_args=False)

Uninstalls a package
name  The name of the package to be uninstalled
version Uninstalls a specific version of the package. Defaults to latest version installed.
uninstall_args  A list of uninstall arguments you want to pass to the uninstallation process i.e product key or feature list
override_args  Set to true if you want to override the original uninstall arguments (for the native uninstaller) in the package and use your own. When this is set to False uninstall_args will be appended to the end of the default arguments

Removemypackage:
chocolatey.uninstalled:
  - name: mypackage
  - version: '21.5'

salt.states.chocolatey.upgraded(name, version=None, source=None, force=False, pre_versions=False, install_args=None, override_args=False, force_x86=False, package_args=None)

Upgrades a package. Will install the package if not installed.

New in version 2018.3.0.
Parameters

- **name** (*str*) – The name of the package to be installed. Required.
- **version** (*str*) – Install a specific version of the package. Defaults to latest version. If the version is greater than the one installed then the specified version will be installed. Default is None.
- **source** (*str*) – Chocolatey repository (directory, share or remote URL, feed). Defaults to the official Chocolatey feed. Default is None.
- **force** (*bool*) – True will reinstall an existing package with the same version. Default is False.
- **pre_versions** (*bool*) – True will include pre-release packages. Default is False.
- **install_args** (*str*) – Install arguments you want to pass to the installation process, i.e product key or feature list. Default is None.
- **override_args** (*bool*) – True will override the original install arguments (for the native installer) in the package and use those specified in install_args. False will append install_args to the end of the default arguments. Default is False.
- **force_x86** (*bool*) – True forces 32bit installation on 64 bit systems. Default is False.
- **package_args** (*str*) – Arguments you want to pass to the package. Default is None.

upgrade_some_package:
chocolatey.upgraded:
  - name: packagename
  - version: '12.04'
  - source: 'mychocolatey/source'

21.19.58 salt.states.chronos_job module

Configure Chronos jobs via a salt proxy.

my_job:
  chronos_job.config:
    - config:

(continues on next page)
New in version 2015.8.2.

salt.states.chronos_job.absent(name)
Ensure that the chronos job with the given name is not present.
Parameters name – The app name
Returns A standard Salt changes dictionary

salt.states.chronos_job.config(name, config)
Ensure that the chronos job with the given name is present and is configured to match the given config values.
Parameters
  • name – The job name
  • config – The configuration to apply (dict)
Returns A standard Salt changes dictionary

21.19.59 salt.states.cimc

A state module to manage Cisco UCS chassis devices.

   codeauthor Spencer Ervin <spencer_ervin@hotmail.com>
   maturity new
   depends none
   platform unix

About

This state module was designed to handle connections to a Cisco Unified Computing System (UCS) chassis. This module relies on the CIMC proxy module to interface with the device.

See also:

CIMC Proxy Module

salt.states.cimc.hostname(name, hostname=None)
Ensures that the hostname is set to the specified value.
New in version 2019.2.0.
name: The name of the module function to execute.
hostname(str): The hostname of the server.
SLS Example:

set_name:
cimc.hostname:
  - hostname: foobar

salt.states.cimc.logging_levels(name, remote=None, local=None)
Ensures that the logging levels are set on the device. The logging levels must match the following options: emergency, alert, critical, error, warning, notice, informational, debug.
New in version 2019.2.0.
name: The name of the module function to execute.
remote(str): The logging level for SYSLOG logs.
local(str): The logging level for the local device.

SLS Example:

```
logging_levels:
cimc.logging_levels:
  - remote: informational
  - local: notice
```

salt.states.cimc.ntp(name, servers)
Ensures that the NTP servers are configured. Servers are provided as an individual string or list format. Only four NTP servers will be reviewed. Any entries past four will be ignored.
name: The name of the module function to execute.
servers(str, list): The IP address or FQDN of the NTP servers.

SLS Example:

```
ntp_configuration_list:
cimc.ntp:
  - servers:
    - foo.bar.com
    - 10.10.10.10

ntp_configuration_str:
cimc.ntp:
  - servers: foo.bar.com
```

salt.states.cimc.power_configuration(name, policy=None, delayType=None, delayValue=None)
Ensures that the power configuration is configured on the system. This is only available on some C-Series servers.
New in version 2019.2.0.
name: The name of the module function to execute.
policy(str): The action to be taken when chassis power is restored after an unexpected power loss. This can be one of the following:
  reset: The server is allowed to boot up normally when power is restored. The server can restart immediately or, optionally, after a fixed or random delay.
  stay-off: The server remains off until it is manually restarted.
  last-state: The server restarts and the system attempts to restore any processes that were running before power was lost.
delayType(str): If the selected policy is reset, the restart can be delayed with this option. This can be one of the following:
  fixed: The server restarts after a fixed delay.
  random: The server restarts after a random delay.
delayValue(int): If a fixed delay is selected, once chassis power is restored and the Cisco IMC has finished rebooting, the system waits for the specified number of seconds before restarting the server. Enter an integer between 0 and 240.
SLS Example:
```python
def reset_power:
    cimc.power_configuration:
        - policy: reset
        - delayType: fixed
        - delayValue: 0

def power_off:
    cimc.power_configuration:
        - policy: stay-off
```

**salt.states.cimc.syslog** *(name, primary=None, secondary=None)*

Ensures that the syslog servers are set to the specified values. A value of None will be ignored.

- `name`: The name of the module function to execute.
- `primary` (str): The IP address or FQDN of the primary syslog server.
- `secondary` (str): The IP address or FQDN of the secondary syslog server.

**SLS Example:**

```plaintext
def syslog_configuration:
    cimc.syslog:
        - primary: 10.10.10.10
        - secondary: foo.bar.com
```

**salt.states.cimc.user** *(name, id=None, user=None, priv=None, password=None, status='active')*

Ensures that a user is configured on the device. Due to being unable to verify the user password. This is a forced operation.

- `name`: The name of the module function to execute.
- `id` (int): The user ID slot on the device.
- `user` (str): The username of the user.
- `priv` (str): The privilege level of the user.
- `password` (str): The password of the user.
- `status` (str): The status of the user. Can be either active or inactive.

**SLS Example:**

```plaintext
def user_configuration:
    cimc.user:
        - id: 11
        - user: foo
        - priv: admin
        - password: mypassword
        - status: active
```

**21.19.60 salt.states.cisconso**

State module for Cisco NSO Proxy minions

For documentation on setting up the cisconso proxy minion look in the documentation for *salt.proxy.cisconso*. 
salt.states.cisconso.value_present(name, datastore, path, config)

Ensure a specific value exists at a given path

Parameters

- **name** (str) – The name for this rule
- **datastore** (DatastoreType (str enum)) – The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (list, str OR tuple) – The device path to set the value at, a list of element names in order, / separated
- **config** (dict) – The new value at the given path

Examples:

```python
enable pap auth:
    cisconso.config_present:
        - name: enable_pap_auth
        - datastore: running
        - path: devices/device/ex0/config/sys/interfaces/serial/ppp0/authentication
        - config:
            authentication:
                method: pap
            "list-name": foobar
```

21.19.61 salt.states.cloud

Using states instead of maps to deploy clouds

New in version 2014.1.0.

Use this minion to spin up a cloud instance:

```yaml
my-ec2-instance:
    cloud.profile:
        my-ec2-config
```

salt.states.cloud.absent(name, onlyif=None, unless=None)

Ensure that no instances with the specified names exist.

CAUTION: This is a destructive state, which will search all configured cloud providers for the named instance, and destroy it.

- **name** The name of the instance to destroy
- **onlyif** Do run the state only if is unless succeed
- **unless** Do not run the state at least unless succeed

salt.states.cloud.present(name, cloud_provider, onlyif=None, unless=None, opts=None, **kwargs)

Spin up a single instance on a cloud provider, using salt-cloud. This state does not take a profile argument; rather, it takes the arguments that would normally be configured as part of the state.

Note that while this function does take any configuration argument that would normally be used to create an instance, it will not verify the state of any of those arguments on an existing instance. Stateful properties of an instance should be configured using their own individual state (i.e., cloud.tagged, cloud.untagged, etc).

- **name** The name of the instance to create
- **cloud_provider** The name of the cloud provider to use
- **onlyif** Do run the state only if is unless succeed
- **unless** Do not run the state at least unless succeed
- **opts** Any extra opts that need to be used
salt.states.cloud.profile(name, profile, onlyif=None, unless=None, opts=None, **kwargs)

Create a single instance on a cloud provider, using a salt-cloud profile.

- **name** The name of the instance to create
- **profile** The name of the cloud profile to use
- **onlyif** Do run the state only if is unless succeed
- **unless** Do not run the state at least unless succeed
- **kwargs** Any profile override or addition
- **opts** Any extra opts that need to be used

salt.states.cloud.volume_absent(name, provider=None, **kwargs)

Check that a block volume exists.

salt.states.cloud.volume_attached(name, server_name, provider=None, **kwargs)

Check if a block volume is attached.

salt.states.cloud.volume_detached(name, server_name=None, provider=None, **kwargs)

Check if a block volume is attached.

Returns True if server or Volume do not exist.

salt.states.cloud.volume_present(name, provider=None, **kwargs)

Check that a block volume exists.

### 21.19.62 salt.states.cmd

**Execution of arbitrary commands**

The cmd state module manages the enforcement of executed commands, this state can tell a command to run under certain circumstances.

A simple example to execute a command:

```bash
# Store the current date in a file
'date > /tmp/salt-run':
  cmd.run
```

Only run if another execution failed, in this case truncate syslog if there is no disk space:

```bash
'rm -f /var/log/messages/:
  cmd.run:
    - unless: echo 'foo' > /tmp/.test && rm -f /tmp/.test
```

Only run if the file specified by creates does not exist, in this case touch /tmp/foo if it does not exist:

```bash
touch /tmp/foo:
  cmd.run:
    - creates: /tmp/foo
```

creates also accepts a list of files, in which case this state will run if any of the files do not exist:

```bash
"echo 'foo' | tee /tmp/bar > /tmp/baz":
  cmd.run:
```

(continues on next page)
- creates:
  - /tmp/bar
  - /tmp/baz

Note: The creates option was added to version 2014.7.0

Sometimes when running a command that starts up a daemon, the init script doesn’t return properly which causes Salt to wait indefinitely for a response. In situations like this try the following:

```python
run_installer:
  cmd.run:
    - name: /tmp/installer.bin > /dev/null 2>&1
```

Salt determines whether the cmd state is successfully enforced based on the exit code returned by the command. If the command returns a zero exit code, then salt determines that the state was successfully enforced. If the script returns a non-zero exit code, then salt determines that it failed to successfully enforce the state. If a command returns a non-zero exit code but you wish to treat this as a success, then you must place the command in a script and explicitly set the exit code of the script to zero.

Please note that the success or failure of the state is not affected by whether a state change occurred nor the stateful argument.

When executing a command or script, the state (i.e., changed or not) of the command is unknown to Salt’s state system. Therefore, by default, the cmd state assumes that any command execution results in a changed state.

This means that if a cmd state is watched by another state then the state that’s watching will always be executed due to the changed state in the cmd state.

### Using the "Stateful" Argument

Many state functions in this module now also accept a stateful argument. If stateful is specified to be true then it is assumed that the command or script will determine its own state and communicate it back by following a simple protocol described below:

1. **If there’s nothing in the stdout of the command, then assume no changes.** Otherwise, the stdout must be either in JSON or its last non-empty line must be a string of key=value pairs delimited by spaces (no spaces on either side of =).
2. **If it’s JSON then it must be a JSON object (e.g., []).** If it’s key=value pairs then quoting may be used to include spaces. (Python’s shlex module is used to parse the key=value string)

Two special keys or attributes are recognized in the output:

```python
changed: bool (i.e., 'yes', 'no', 'true', 'false', case-insensitive)
comment: str (i.e., any string)
```

So, only if changed is True then assume the command execution has changed the state, and any other key values or attributes in the output will be set as part of the changes.

3. **If there’s a comment then it will be used as the comment of the state.**

Here’s an example of how one might write a shell script for use with a stateful command:
#!/bin/bash
#
echo "Working hard..."
#
# writing the state line
echo
echo # an empty line here so the next line will be the last.
echo "changed=yes comment='something has changed' whatever=123"

And an example SLS file using this module:

Run myscript:
  cmd.run:
    - name: /path/to/myscript
    - cwd: /
    - stateful: True

Run only if myscript changed something:
  cmd.run:
    - name: echo hello
    - cwd: /
    - onchanges:
      - cmd: Run myscript

Note that if the second cmd.run state also specifies stateful: True it can then be watched by some other states as well.

4. The stateful argument can optionally include a test_name parameter.

This is used to specify a command to run in test mode. This command should return stateful data for changes that would be made by the command in the name parameter.

New in version 2015.2.0.

Run myscript:
  cmd.run:
    - name: /path/to/myscript
    - cwd: /
    - stateful:
      - test_name: /path/to/myscript test

Run masterscript:
  cmd.script:
    - name: masterscript
    - source: salt://path/to/masterscript
    - cwd: /
    - stateful:
      - test_name: masterscript test

Should I use cmd.run or cmd.wait?

Note: Use cmd.run together with onchanges instead of cmd.wait.

These two states are often confused. The important thing to remember about them is that cmd.run states are run each time the SLS file that contains them is applied. If it is more desirable to have a command that only runs after
some other state changes, then `cmd.wait` does just that. `cmd.wait` is designed to watch other states, and is executed when the state it is watching changes. Example:

```bash
/usr/local/bin/postinstall.sh:
  cmd.wait:
    - watch:
      - pkg: mycustompkg
  file.managed:
    - source: salt://utils/scripts/postinstall.sh
mycustompkg:
  pkg.installed:
    - require:
      - file: /usr/local/bin/postinstall.sh
```

cmd.wait itself do not do anything; all functionality is inside its `mod_watch` function, which is called by `watch` on changes.

The preferred format is using the `onchanges Requisite`, which works on `cmd.run` as well as on any other state. The example would then look as follows:

```bash
/usr/local/bin/postinstall.sh:
  cmd.run:
    - onchanges:
      - pkg: mycustompkg
  file.managed:
    - source: salt://utils/scripts/postinstall.sh
mycustompkg:
  pkg.installed:
    - require:
      - file: /usr/local/bin/postinstall.sh
```

How do I create an environment from a pillar map?

The map that comes from a pillar can be directly consumed by the `env` option! To use it, one may pass it like this. Example:

```bash
printenv:
  cmd.run:
    - env: {{ salt['pillar.get']('example:mykey'), {} }}
```

salt.states.cmd.call(name, func, args=(), kws=..., onlyif=..., unless=..., creates=..., output_loglevel=,..., **kwargs)

Invoke a pre-defined Python function with arguments specified in the state declaration. This function is mainly used by the `salt.renderers.pydsl` renderer.

The interpretation of `onlyif` and `unless` arguments are identical to those of `cmd.run`, and all other arguments allowed by `cmd.run` are allowed here, except that their effects apply only to the commands specified in `onlyif` and `unless` rather than to the function to be invoked.

In addition, the `stateful` argument has no effects here.

The return value of the invoked function will be interpreted as follows.

If it’s a dictionary then it will be passed through to the state system, which expects it to have the usual structure returned by any salt state function.
Otherwise, the return value (denoted as `result` in the code below) is expected to be a JSON serializable object, and this dictionary is returned:

```python
{
    'name': name,
    'changes': {'retval': result},
    'result': True if result is None else bool(result),
    'comment': result if isinstance(result, six.string_types) else ''
}
```

`salt.states.cmd.mod_run_check(cmd_kwargs, onlyif, unless, creates)`

Execute the onlyif and unless logic. Return a result dict if:

- onlyif failed (onlyif != 0)
- unless succeeded (unless == 0) else return True

`salt.states.cmd.mod_watch(name, **kwargs)`

Execute a cmd function based on a watch call

**Note:** This state exists to support special handling of the `watch` requisite. It should not be called directly.

Parameters for this function should be set by the state being triggered.

`salt.states.cmd.run(name, onlyif=None, unless=None, creates=None, cwd=None, root=None, runas=None, shell=None, env=None, prepend_path=None, stateful=False, umask=None, output_loglevel='debug', hide_output=False, timeout=None, ignore_timeout=False, use_vt=False, success_retcodes=None, **kwargs)`

Run a command if certain circumstances are met. Use `cmd.run` if you want to use the `watch` requisite.

- **name** The command to execute, remember that the command will execute with the path and permissions of the salt-minion.
- **onlyif** A command to run as a check, run the named command only if the command passed to the `onlyif` option returns a zero exit status
- **unless** A command to run as a check, only run the named command if the command passed to the `unless` option returns a non-zero exit status
- **cwd** The current working directory to execute the command in, defaults to `/root`
- **root** Path to the root of the jail to use. If this parameter is set, the command will run inside a chroot
- **runas** The user name to run the command as
- **shell** The shell to use for execution, defaults to the shell grain
- **env** A list of environment variables to be set prior to execution. Example:

```yaml
script-foo:
  cmd.run:
    - env:
      - BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that `yes`, `no`, `on`, `off`, `true`, and `false` are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal `'$PATH'`:

```yaml
script-bar:
  cmd.run:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing `$PATH` by using a bit of Jinja:
mycommand:
  cmd.run:
    name: ls -l /
    env:
      PATH: {{ [current_path, '/my/special/bin']|join(':') }}

prepend_path  $PATH segment to prepend (trailing ':' not necessary) to $PATH. This is an easier alternative to the Jinja workaround.

New in version 2018.3.0.

stateful  The command being executed is expected to return data about executing a state. For more information, see the Using the "Stateful" Argument section.

umask  The umask (in octal) to use when running the command.

output_loglevel  [debug] Control the loglevel at which the output from the command is logged to the minion log.

Note: The command being run will still be logged at the debug loglevel regardless, unless quiet is used for this value.

hide_output  [False] Suppress stdout and stderr in the state's results.

Note: This is separate from output_loglevel, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

timeout  If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill

ignore_timeout  Ignore the timeout of commands, which is useful for running nohup processes.

New in version 2015.8.0.

creates  Only run if the file specified by creates do not exist. If you specify a list of files then this state will only run if any of the files do not exist.

New in version 2015.8.0.

use_vt  [False] Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

bg  [False] If True, run command in background and do not await or deliver its results.

New in version 2016.3.6.

success_retcodes: This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

Note: cmd.run supports the usage of reload_modules. This functionality allows you to force Salt to reload all modules. You should only use reload_modules if your cmd.run does some sort of installation (such as pip), if you do not reload the modules future items in your state which rely on the software being installed will fail.

getpip:
  cmd.run:
    - name: /usr/bin/python /usr/local/sbin/get-pip.py
    - unless: which pip
    - require:
pkg: python
file: /usr/local/sbin/get-pip.py
reload_modules: True

```
salt.states.cmd.script(name, source=None, template=None, onlyif=None, unless=None, creates=None, cwd=None, runas=None, shell=None, env=None, stateful=False, umask=None, timeout=None, use_vt=False, output_loglevel='debug', hide_output=False, defaults=None, context=None, success_retcodes=None, **kwargs)
```

Download a script and execute it with specified arguments.

**source** The location of the script to download. If the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs

**template** If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported

**name** Either "cmd arg1 arg2 arg3..." (cmd is not used) or a source "salt://...".

**onlyif** Run the named command only if the command passed to the onlyif option returns true

**unless** Run the named command only if the command passed to the unless option returns false

**cwd** The current working directory to execute the command in, defaults to /root

**runas** The name of the user to run the command as

**shell** The shell to use for execution. The default is set in grains['shell']

**env** A list of environment variables to be set prior to execution. Example:

```
salt://scripts/foo.sh:
    cmd.script:
        - env:
            - BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that yes, no, on, off, true, and false are all loaded as boolean True and False values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found here.

Variables as values are not evaluated. So $PATH in the following example is a literal '$PATH':

```
salt://scripts/bar.sh:
    cmd.script:
        - env: "PATH=/some/path:$PATH"
```

One can still use the existing $PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}
mycommand:
    cmd.run:
        - name: ls -l /
        - env:
          - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

**saltenv** [base] The Salt environment to use

**umask** The umask (in octal) to use when running the command.

**stateful** The command being executed is expected to return data about executing a state. For more information, see the Using the "Stateful" Argument section.

**timeout** If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill
**args**  String of command line args to pass to the script. Only used if no args are specified as part of the *name* argument. To pass a string containing spaces in YAML, you will need to doubly-quote it: "arg1 'arg two' arg3"

**creates**  Only run if the file specified by *creates* do not exist. If you specify a list of files then this state will only run if *any* of the files do not exist.

New in version 2014.7.0.

**use_vt**  Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

**context**  New in version 2016.3.0.

overrides default context variables passed to the template.

**defaults**  New in version 2016.3.0.

Default context passed to the template.

**output_loglevel**  [debug]  Control the loglevel at which the output from the command is logged to the minion log.

---

**Note:**  The command being run will still be logged at the *debug* loglevel regardless, unless quiet is used for this value.

**hide_output**  [False]  Suppress stdout and stderr in the state's results.

---

**Note:**  This is separate from *output_loglevel*, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

**success_retcodes:**  This parameter will be allow a list of
non-zero return codes that should be considered a success. If the return code returned from
the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

```python
salt.states.cmd.wait(name, onlyif=None, unless=None, creates=None, cwd=None, root=None, runas=None, shell=None, env=(), stateful=False, umask=None, output_loglevel='debug', hide_output=False, use_vt=False, success_retcodes=None, **kwargs)
```

Run the given command only if the watch statement calls it.

---

**Note:**  Use *cmd.run* together with *onchanges* instead of *cmd.wait*.

**name**  The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

**onlyif**  A command to run as a check, run the named command only if the command passed to the *onlyif* option returns true

**unless**  A command to run as a check, only run the named command if the command passed to the *unless* option returns false

**cwd**  The current working directory to execute the command in, defaults to /root

**root**  Path to the root of the jail to use. If this parameter is set, the command will run inside a chroot

**runas**  The user name to run the command as

**shell**  The shell to use for execution, defaults to /bin/sh

**env**  A list of environment variables to be set prior to execution. Example:
Variables as values are not evaluated. So $PATH in the following example is a literal 'PATH':

```yaml
script-bar:
  cmd.wait:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing $PATH by using a bit of Jinja:

```yaml
{%- set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}
mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

`umask` The umask (in octal) to use when running the command.

`stateful` The command being executed is expected to return data about executing a state. For more information, see the Using the "Stateful" Argument section.

`creates` Only run if the file specified by creates do not exist. If you specify a list of files then this state will only run if any of the files do not exist.

New in version 2014.7.0.

`output_loglevel` [debug] Control the loglevel at which the output from the command is logged to the minion log.

**Note:** The command being run will still be logged at the debug loglevel regardless, unless quiet is used for this value.

`hide_output` [False] Suppress stdout and stderr in the state’s results.

**Note:** This is separate from output_loglevel, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

`use_vt` Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

`success_retcodes` This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

```python
salt.states.cmd.wait_call(name, func, args=(), kws=None, onlyif=None, unless=None, creates=None, stateful=False, use_vt=False, output_loglevel='debug', hide_output=False, **kwargs)
```
salt.states.cmd.wait_script(name, source=None, template=None, onlyif=None, unless=None, cwd=None, runas=None, shell=None, env=None, stateful=False, umask=None, use_vt=False, output_loglevel='debug', **kwargs)

Download a script from a remote source and execute it only if a watch statement calls it.

source The source script being downloaded to the minion, this source script is hosted on the salt master server.
If the file is located on the master in the directory named spam, and is called eggs, the source string is
salt://spam/eggs

template If this setting is applied then the named templating engine will be used to render the downloaded
file, currently jinja, mako, and wempy are supported

name The command to execute, remember that the command will execute with the path and permissions of
the salt-minion.

onlyif A command to run as a check, run the named command only if the command passed to the onlyif
option returns true

unless A command to run as a check, only run the named command if the command passed to the unless
option returns false

cwd The current working directory to execute the command in, defaults to /root

runas The user name to run the command as

shell The shell to use for execution, defaults to the shell grain

env A list of environment variables to be set prior to execution. Example:

```
salt://scripts/foo.sh:
    cmd.wait_script:
      - env:
        - BATCH: 'yes'
```

Warning: The above illustrates a common PyYAML pitfall, that yes, no, on, off, true, and false are
all loaded as boolean True and False values, and must be enclosed in quotes to be used as strings.
More info on this (and other) PyYAML idiosyncrasies can be found here.

Variables as values are not evaluated. So $PATH in the following example is a literal '$PATH':

```
salt://scripts/bar.sh:
    cmd.wait_script:
      - env: "PATH=/some/path:$PATH"
```

One can still use the existing $PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env: PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

umask The umask (in octal) to use when running the command.

stateful The command being executed is expected to return data about executing a state. For more informa-
tion, see the Using the "Stateful" Argument section.

use_vt Use VT util (saltstack) to stream the command output more interactively to the console and the logs.
This is experimental.

output_loglevel [debug] Control the loglevel at which the output from the command is logged to the minion
log.
Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

hide_output [False] Suppress stdout and stderr in the state’s results.

Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

success_retcodes: This parameter will allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero. New in version 2019.2.0.

### 21.19.63 salt.states.composer

Installation of Composer Packages

These states manage the installed packages for composer for PHP. Note that either composer is installed and accessible via a bin directory or you can pass the location of composer in the state.

```bash
get-composer:
cmd.run:
  - name: 'CURL=`which curl`; $CURL -sS https://getcomposer.org/installer | php'
  - unless: test -f /usr/local/bin/composer
  - cwd: /root/

install-composer:
cmd.wait:
  - name: mv /root/composer.phar /usr/local/bin/composer
  - cwd: /root/
  - watch:
    - cmd: get-composer

/path/to/project:
composer.installed:
  - no_dev: true
  - require:
    - cmd: install-composer

# Without composer installed in your PATH
# Note: composer.phar must be executable for state to work properly
/path/to/project:
composer.installed:
  - composer: /path/to/composer.phar
  - php: /usr/local/bin/php
  - no_dev: true

salt.states.composer.installed(name, composer=None, php=None, user=None, prefer_source=None, prefer_dist=None, no_scripts=None, no_plugins=None, optimize=None, no_dev=None, quiet=False, composer_home='/root', always_check=True, env=None)

Verify that the correct versions of composer dependencies are present.
name Directory location of the `composer.json` file.
composer Location of the `composer.phar` file. If not set composer will just execute `composer` as if it is installed globally. (i.e. `/path/to/composer.phar`)
php Location of the php executable to use with composer. (i.e. `/usr/bin/php`)
user Which system user to run composer as.

New in version 2014.1.4.
prefer_source `--prefer-source` option of composer.
prefer_dist `--prefer-dist` option of composer.
no_scripts `--no-scripts` option of composer.
no_plugins `--no-plugins` option of composer.
optimize `--optimize-autoloader` option of composer. Recommended for production.
no_dev `--no-dev` option for composer. Recommended for production.
quiet `--quiet` option for composer. Whether or not to return output from composer.
composer_home `$COMPOSER_HOME` environment variable
always_check If True, always run composer install in the directory. This is the default behavior. If False, only run composer install if there is no vendor directory present.
env A list of environment variables to be set prior to execution.

```python
code

salt.states.composer.update(name='name', composer=None, php=None, user=None, prefer_source=None, prefer_dist=None, no_scripts=None, no_plugins=None, optimize=None, no_dev=None, quiet=False, composer_home='/root', env=None)
```

Composer update the directory to ensure we have the latest versions of all project dependencies.

name Directory location of the `composer.json` file.
composer Location of the `composer.phar` file. If not set composer will just execute composer as if it is installed globally. (i.e. `/path/to/composer.phar`)
php Location of the php executable to use with composer. (i.e. `/usr/bin/php`)
user Which system user to run composer as.

New in version 2014.1.4.
prefer_source `--prefer-source` option of composer.
prefer_dist `--prefer-dist` option of composer.
no_scripts `--no-scripts` option of composer.
no_plugins `--no-plugins` option of composer.
optimize `--optimize-autoloader` option of composer. Recommended for production.
no_dev `--no-dev` option for composer. Recommended for production.
quiet `--quiet` option for composer. Whether or not to return output from composer.
composer_home `$COMPOSER_HOME` environment variable
env A list of environment variables to be set prior to execution.

21.19.64 salt.states.cron

Management of cron, the Unix command scheduler

Cron declarations require a number of parameters. The following are the parameters used by Salt to define the various timing values for a cron job:

- minute
- hour
- daymonth
- month
- dayweek (0 to 6 are Sunday through Saturday, 7 can also be used for Sunday)
**Warning:** Any timing arguments not specified take a value of \*\*. This means that setting `hour` to 5, while not defining the `minute` param, will result in Salt adding a job that will execute every minute between 5 and 6 A.M.!

Additionally, the default user for these states is `root`. Therefore, if the cron job is for another user, it is necessary to specify that user with the `user` parameter.

A long time ago (before 2014.2), when making changes to an existing cron job, the name declaration is the parameter used to uniquely identify the job, so if an existing cron that looks like this:

```
date > /tmp/crontest:
cron.present:
    - user: root
    - minute: 5
```

Is changed to this:

```
date > /tmp/crontest:
cron.present:
    - user: root
    - minute: 7
    - hour: 2
```

Then the existing cron will be updated, but if the cron command is changed, then a new cron job will be added to the user’s crontab.

The current behavior is still relying on that mechanism, but you can also specify an identifier to identify your crontabs:

```
date > /tmp/crontest:
cron.present:
    - identifier: SUPERCRON
    - user: root
    - minute: 7
    - hour: 2
```

New in version 2014.1.2.

And, some months later, you modify it:

```
superscript > /tmp/crontest:
cron.present:
    - identifier: SUPERCRON
    - user: root
    - minute: 3
    - hour: 4
```

New in version 2014.1.2.

The old `date > /tmp/crontest` will be replaced by `superscript > /tmp/crontest`.

Additionally, Salt also supports running a cron every \( x \) minutes very similarly to the Unix convention of using \( */5 \) to have a job run every five minutes. In Salt, this looks like:

```
date > /tmp/crontest:
cron.present:
    - user: root
    - minute: '*/5'
```
The job will now run every 5 minutes.

Additionally, the temporal parameters (minute, hour, etc.) can be randomized by using `random` instead of using a specific value. For example, by using the `random` keyword in the `minute` parameter of a cron state, the same cron job can be pushed to hundreds or thousands of hosts, and they would each use a randomly-generated minute. This can be helpful when the cron job accesses a network resource, and it is not desirable for all hosts to run the job concurrently.

```
/path/to/cron/script:
  cron.present:
    - user: root
    - minute: random
    - hour: 2
```

New in version 0.16.0.

Since Salt assumes a value of `*` for unspecified temporal parameters, adding a parameter to the state and setting it to `random` will change that value from `*` to a randomized numeric value. However, if that field in the cron entry on the minion already contains a numeric value, then using the `random` keyword will not modify it.

Added the opportunity to set a job with a special keyword like `@reboot` or `@hourly`. Quotes must be used, otherwise PyYAML will strip the `@` sign.

```
/path/to/cron/script:
  cron.present:
    - user: root
    - special: '@hourly'
```

The script will be executed every reboot if cron daemon support this option.

```
/path/to/cron/otherscript:
  cron.absent:
    - user: root
    - special: '@daily'
```

This counter part definition will ensure than a job with a special keyword is not set.

```python
salt.states.cron.absent(name, user='root', identifier=False, special=None, **kwargs)
```

Verifies that the specified cron job is absent for the specified user; only the name is matched when removing a cron job.

- **name**: The command that should be absent in the user crontab.
- **user**: The name of the user whose crontab needs to be modified, defaults to the root user
- **identifier**: Custom-defined identifier for tracking the cron line for future crontab edits. This defaults to the state name
- **special**: The special keyword used in the job (eg. @reboot, @hourly...). Quotes must be used, otherwise PyYAML will strip the `@` sign.

```python
salt.states.cron.env_absent(name, user='root')
```

Verifies that the specified environment variable is absent from the crontab for the specified user

- **name**: The name of the environment variable to remove from the user crontab
- **user**: The name of the user whose crontab needs to be modified, defaults to the root user

```python
salt.states.cron.env_present(name, value=None, user='root')
```

Verifies that the specified environment variable is present in the crontab for the specified user.

- **name**: The name of the environment variable to set in the user crontab
- **user**: The name of the user whose crontab needs to be modified, defaults to the root user
- **value**: The value to set for the given environment variable
salt.states.cron.file(name, source_hash=None, source_hash_name=None, user='root', template=None, context=None, replace=True, defaults=None, backup=None, **kwargs)

Provides file.managed-like functionality (templating, etc.) for a pre-made crontab file, to be assigned to a given user.

name The source file to be used as the crontab. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs

If the file is hosted on a HTTP or FTP server then the source_hash argument is also required

source_hash This can be either a file which contains a source hash string for the source, or a source hash string. The source hash string is the hash algorithm followed by the hash of the file: md5=e138491e9d5b97023cea823fe17bac22

source_hash_name When source_hash refers to a hash file, Salt will try to find the correct hash by matching the filename/URI associated with that hash. By default, Salt will look for the filename being managed. When managing a file at path /tmp/foo.txt, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fcccc4a4d8   foo.txt
```

However, sometimes a hash file will include multiple similar paths:

```
37b51d194a7513e45b56f6524f2d51f2   ./dir1/foo.txt
acbd18db4cc2f85cedef654fcccc4a4d8   ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88    ./dir3/foo.txt
```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```
foo_crontab:
   cron.file:
      - name: https://mydomain.tld/dir2/foo.txt
      - source_hash: https://mydomain.tld/hasches
      - source_hash_name: ./dir2/foo.txt
```

Note: This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using foo.txt would not match.

New in version 2016.3.5.

user The user to whom the crontab should be assigned. This defaults to root.

template If this setting is applied then the named templating engine will be used to render the downloaded file. Currently, jinja and mako are supported.

context Overrides default context variables passed to the template.

replace If the crontab should be replaced, if False then this command will be ignored if a crontab exists for the specified user. Default is True.

defaults Default context passed to the template.

backup Overrides the default backup mode for the user’s crontab.

salt.states.cron.present(name, user='root', minute='*', hour='*', daymonth='*', month='*', dayweek='*', comment=None, commented=False, identifier=False, special=None)

Verifies that the specified cron job is present for the specified user. It is recommended to use identifier. Otherwise the cron job is installed twice if you change the name. For more advanced information about what exactly can be set in the cron timing parameters, check your cron system’s documentation. Most Unix-like systems’ cron documentation can be found via the crontab man page: man 5 crontab.

name The command that should be executed by the cron job.
user  The name of the user whose crontab needs to be modified, defaults to the root user
minute  The information to be set into the minute section, this can be any string supported by your cron system’s the minute field. Default is *
hour   The information to be set in the hour section. Default is *
daymonth  The information to be set in the day of month section. Default is *
month   The information to be set in the month section. Default is *
dayweek  The information to be set in the day of week section. Default is *
comment User comment to be added on line previous the cron job
commented  The cron job is set commented (prefixed with #DISABLED#). Defaults to False.

New in version 2016.3.0.

identifier Custom-defined identifier for tracking the cron line for future crontab edits. This defaults to the state name
special A special keyword to specify periodicity (eg. @reboot, @hourly...). Quotes must be used, otherwise PyYAML will strip the ’@’ sign.

New in version 2016.3.0.

---

21.19.65 salt.states.csf module

CSF Ip tables management

depends

- csf utility

class configuration See [http://download.configserver.com/csf/install.txt](http://download.configserver.com/csf/install.txt) for setup instructions.

<table>
<thead>
<tr>
<th>Simply allow/deny rules:</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>csf.rule_present:</strong></td>
</tr>
<tr>
<td><strong>ip:</strong> 1.2.3.4</td>
</tr>
<tr>
<td><strong>method:</strong> allow</td>
</tr>
</tbody>
</table>

salt.states.csf.nics_skip(name, nics, ipv6)

Alias for csf.nics_skipped

salt.states.csf.nics_skipped(name, nics, ipv6=False)

name  Meaningless arg, but required for state.
nics  A list of nics to skip.
nipv6  Boolean. Set to true if you want to skip the ipv6 interface. Default false (ipv4).

salt.states.csf.option_present(name, value, reload=False)

Ensure the state of a particular option/setting in csf.

name  The option name in csf.conf
value  The value it should be set to.
reload Boolean. If set to true, csf will be reloaded after.

salt.states.csf.pports_open(name, ports, proto='tcp', direction='in')

Ensure ports are open for a protocol, in a direction. e.g. - proto='tcp', direction='in' would set the values for TCP_IN in the csf.conf file.

ports  A list of ports that should be open.
proto  The protocol. May be one of 'tcp', 'udp', 'tcp6', or 'udp6'.
direction Choose 'in', 'out', or both to indicate the port should be opened for inbound traffic, outbound traffic, or both.

salt.states.csf.rule_absent(name, method, port=None, proto='tcp', direction='in', port_origin='d',
ip_origin='s', ttl=None, reload=False)

Ensure iptable is not present.
name The ip address or CIDR for the rule.
method The type of rule. Either ‘allow’ or ‘deny’.
port Optional port to be open or closed for the iptables rule.
proto The protocol. Either ‘tcp’, ‘udp’. Only applicable if port is specified.
direction The direction of traffic to apply the rule to. Either ‘in’, or ‘out’. Only applicable if port is specified.
port_origin Specifies either the source or destination port is relevant for this rule. Only applicable if port is specified. Either ‘s’, or ‘d’.
ip_origin Specifies whether the ip in this rule refers to the source or destination ip. Either ‘s’, or ‘d’. Only applicable if port is specified.
ttl How long the rule should exist. If supplied, csf.tempallow() or csf.tempdeny() are used.
reload Reload the csf service after applying this rule. Default false.
salt.states.csf.rule_present(name, method, port=None, proto='tcp', direction='in', port_origin='d', ip_origin='s', ttl=None, comment=' ', reload=False)

Ensure iptable rule exists.
name The ip address or CIDR for the rule.
method The type of rule. Either ‘allow’ or ‘deny’.
port Optional port to be open or closed for the iptables rule.
proto The protocol. Either ‘tcp’, or ‘udp’. Only applicable if port is specified.
direction The direction of traffic to apply the rule to. Either ‘in’, or ‘out’. Only applicable if port is specified.
port_origin Specifies either the source or destination port is relevant for this rule. Only applicable if port is specified. Either ‘s’, or ‘d’.
ip_origin Specifies whether the ip in this rule refers to the source or destination ip. Either ‘s’, or ‘d’. Only applicable if port is specified.
ttl How long the rule should exist. If supplied, csf.tempallow() or csf.tempdeny() are used.
comment An optional comment to appear after the rule as a #comment.
reload Reload the csf service after applying this rule. Default false.
salt.states.csf.testing_off(name, reload=False)

Ensure testing mode is enabled in csf.
reload Reload CSF after changing the testing status. Default false.
salt.states.csf.testing_on(name, reload=False)

Ensure testing mode is enabled in csf.
reload Reload CSF after changing the testing status. Default false.

21.19.66 salt.states.cyg

Installation of Cygwin packages.
A state module to manage cygwin packages. Packages can be installed or removed.

dos2unix:
cyg.installed

class salt.states.cyg.DictDiffer(current_dict, past_dict)
Calculate the difference between two dictionaries.
(1) items added
(2) items removed
(3) keys same in both but changed values
(4) keys same in both and unchanged values

added()
Return a set of additions to past_dict.

changed()
Return a set of the keys with changed values.
removed()
Return a set of things removed from past_dict.

same()
True if the two dicts are the same.

unchanged()
Return a set of the keys with unchanged values.

salt.states.cyg.installed(name, cyg_arch='x86_64', mirrors=None)
Make sure that a package is installed.
name The name of the package to install
cyg_arch [x86_64] The cygwin architecture to install the package into. Current options are x86 and x86_64
mirrors [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:

```rsync
cyg.installed:
- mirrors:
  - http://mirror/without/public/key: ""
```

salt.states.cyg.removed(name, cyg_arch='x86_64', mirrors=None)
Make sure that a package is not installed.
name The name of the package to uninstall
cyg_arch [x86_64] The cygwin architecture to remove the package from. Current options are x86 and x86_64
mirrors [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:

```rsync
cyg.removed:
- mirrors:
  - http://mirror/without/public/key: ""
```

salt.states.cyg.updated(name=None, cyg_arch='x86_64', mirrors=None)
Make sure all packages are up to date.
name [None] No affect, salt fails poorly without the arg available
cyg_arch [x86_64] The cygwin architecture to update. Current options are x86 and x86_64
mirrors [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:

```rsync
cyg.updated:
- mirrors:
  - http://mirror/without/public/key: ""
```

21.19.67 salt.states.ddns

Dynamic DNS updates

Ensure a DNS record is present or absent utilizing RFC 2136 type dynamic updates.

depends
  - dnspython

21.19. state modules
Note: The dnspython module is required when managing DDNS using a TSIG key. If you are not using a TSIG key, DDNS is allowed by ACLs based on IP address and the dnspython module is not required.

Example:

```python
webserver:
    ddns.present:
        - zone: example.com
        - ttl: 60
        - data: 111.222.333.444
        - nameserver: 123.234.345.456
        - keyfile: /srv/salt/dnspy_tsig_key.txt
```

```python
salt.states.ddns.absent(name, zone, data=None, rdtype=None, **kwargs)
Ensures that the named DNS record is absent.

name The host portion of the DNS record, e.g., 'webserver'. Name and zone are concatenated when the entry is created unless name includes a trailing dot, so make sure that information is not duplicated in these two arguments.

zone The zone to check

data Data for the DNS record. E.g., the IP address for an A record. If omitted, all records matching name (and rdtype, if provided) will be purged.

rdtype DNS resource type. If omitted, all types will be purged.

**kwargs Additional arguments the ddns.update function may need (e.g. nameserver, keyfile, keyname).

Note that the nsupdate key file can’t be reused by this function, the keyfile and other arguments must follow the dnspython spec.
```

```python
salt.states.ddns.present(name, zone, ttl, data, rdtype='A', **kwargs)
Ensures that the named DNS record is present with the given ttl.

name The host portion of the DNS record, e.g., 'webserver'. Name and zone are concatenated when the entry is created unless name includes a trailing dot, so make sure that information is not duplicated in these two arguments.

zone The zone to check/update

ttl TTL for the record

data Data for the DNS record. E.g., the IP address for an A record.

rdtype DNS resource type. Default 'A'.

**kwargs Additional arguments the ddns.update function may need (e.g. nameserver, keyfile, keyname).

Note that the nsupdate key file can’t be reused by this function, the keyfile and other arguments must follow the dnspython spec.
```

21.19.68 salt.states.debconfmod

Management of debconf selections

depends
    • debconf-utils package

The debconfmod state module manages the enforcement of debconf selections, this state can set those selections prior to package installation.

Available Functions

The debconfmod state has two functions, the set and set_file functions
**set** Set debconf selections from the state itself

**set_file** Set debconf selections from a file

```yaml
nullmailer-debconf:
  debconf.set:
    - name: nullmailer
    - data:
      'shared/mailname': {'type': 'string', 'value': 'server.domain.tld'}
      nullmailer/relayhost: {'type': 'string', 'value': 'mail.domain.tld'}

ferm-debconf:
  debconf.set:
    - name: ferm
    - data:
      'ferm/enable': {'type': 'boolean', 'value': True}
```

**Note:** Due to how PyYAML imports nested dicts (see [here](#)), the values in the `data` dict must be indented four spaces instead of two.

If you’re setting debconf values that requires `dpkg-reconfigure`, you can use the `onchanges` requisite to reconfigure your package:

```yaml
set-default-shell:
  debconf.set:
    - name: dash
    - data:
      'dash/sh': {'type': 'boolean', 'value': false}

reconfigure-dash:
  cmd.run:
    - name: dpkg-reconfigure -f noninteractive dash
    - onchanges:
      - debconf: set-default-shell

Every time the `set-default-shell` state changes, the `reconfigure-dash` state will also run.

**Note:** For boolean types, the value should be `true` or `false`, not 'true' or 'false'.

**salt.states.debconfmod**.set(name, data,**kwargs)
Set debconf selections

```yaml
<state_id>:
  debconf.set:
    - name: <name>
    - data:
      <question>: {'type': <type>, 'value': <value>}
      <question>: {'type': <type>, 'value': <value>}

<state_id>:
  debconf.set:
    - name: <name>
    - data:
      <question>: {'type': <type>, 'value': <value>}
      <question>: {'type': <type>, 'value': <value>}
```

name: The package name to set answers for.
data: A set of questions/answers for debconf. Note that everything under this must be indented twice.
question: The question the is being pre-answered
value: The answer to the question

salt.states.debconfmod.set_file(name, source, template=None, context=None, defaults=None, **kwargs)
Set debconf selections from a file or a template

```yaml
<state_id>:
  debconf.set_file:
    - source: salt://pathto/pkg.selections
<state_id>:
  debconf.set_file:
    - source: salt://pathto/pkg.selections?saltenv=myenvironment
<state_id>:
  debconf.set_file:
    - source: salt://pathto/pkg.selections.jinja2
    - template: jinja
    - context: some_value: "false"
```

source: The location of the file containing the package selections
template: If this setting is applied then the named templating engine will be used to render the package selections file, currently jinja, mako, and wempy are supported
context: Overrides default context variables passed to the template.
defaults: Default context passed to the template.

21.19.69 salt.states.dellchassis

Manage chassis via Salt Proxies.
New in version 2015.8.2.
Below is an example state that sets basic parameters:

```yaml
my-dell-chassis:
  dellchassis.chassis:
    - chassis_name: my-dell-chassis
    - datacenter: dc-1-us
    - location: my-location
    - mode: 2
    - idrac_launch: 1
    - slot_names:
      - server-1: my-slot-name
      - server-2: my-other-slot-name
    - blade_power_states:
      - server-1: on
      - server-2: off
      - server-3: powercycle
```

However, it is possible to place the entire set of chassis configuration data in pillar. Here’s an example pillar structure:

```yaml
proxy:
  host: 10.27.20.18
```

(continues on next page)
admin_username: root
fallback_admin_username: root
passwords:
  - super-secret
  - old-secret
proxytype: fx2

chassis:
  name: fx2-1
  username: root
  password: saltstack1
  datacenter: london
  location: rack-1-shelf-3
  management_mode: 2
  idrac_launch: 0
  slot_names:
    - 'server-1': blade1
    - 'server-2': blade2

servers:
  server-1:
    idrac_password: saltstack1
    ipmi_over_lan: True
    ip: 172.17.17.132
    netmask: 255.255.0.0
    gateway: 172.17.17.1
  server-2:
    idrac_password: saltstack1
    ipmi_over_lan: True
    ip: 172.17.17.2
    netmask: 255.255.0.0
    gateway: 172.17.17.1
  server-3:
    idrac_password: saltstack1
    ipmi_over_lan: True
    ip: 172.17.17.20
    netmask: 255.255.0.0
    gateway: 172.17.17.1
  server-4:
    idrac_password: saltstack1
    ipmi_over_lan: True
    ip: 172.17.17.2
    netmask: 255.255.0.0
    gateway: 172.17.17.1

switches:
  switch-1:
    ip: 192.168.1.2
    netmask: 255.255.255.0
    gateway: 192.168.1.1
    snmp: nonpublic
    password: saltstack1
  switch-2:
    ip: 192.168.1.3
    netmask: 255.255.255.0
    gateway: 192.168.1.1
And to go with it, here’s an example state that pulls the data from the pillar stated above:

```
{% set details = pillar.get('proxy:chassis', {}) %}

standup-step1:
  dellchassis.chassis:
    - name: {{ details['name'] }}
    - location: {{ details['location'] }}
    - mode: {{ details['management_mode'] }}
    - idrac_launch: {{ details['idrac_launch'] }}
    - slot_names:
      {% for entry in details['slot_names'] %}
        - {{ entry.keys()[0] }}: {{ entry[entry.keys()[0]] }}
      {% endfor %}

blade_powercycle:
  dellchassis.chassis:
    - blade_power_states:
      - server-1: powercycle
      - server-2: powercycle
      - server-3: powercycle
      - server-4: powercycle

# Set idrac_passwords for blades. racadm needs them to be called 'server-x'
{% for k, v in details['servers'].iteritems() %}
  {{ k }}:
    - idrac_password: {{ v['idrac_password'] }}
{% endfor %}

# Set management ip addresses, passwords, and snmp strings for switches
{% for k, v in details['switches'].iteritems() %}
  {{ k }}-switch-setup:
    dellchassis.switch:
      - name: {{ k }}
      - ip: {{ v['ip'] }}
      - netmask: {{ v['netmask'] }}
      - gateway: {{ v['gateway'] }}
      - password: {{ v['password'] }}
      - snmp: {{ v['snmp'] }}
{% endfor %}
```

Note: This state module relies on the dracr.py execution module, which runs racadm commands on the chassis, blades, etc. The racadm command runs very slowly and, depending on your state, the proxy minion return might timeout before the racadm commands have completed. If you are repeatedly seeing minions timeout after state calls, please use the `-t` CLI argument to increase the timeout variable.

For example:
```
salt '*' state.sls my-dell-chasis-state-name -t 60
```

Note: The Dell CMC units perform adequately but many iDRACs are excruciatingly slow. Some functions can take
salt.states.dellchassis.blade_idrac(name, idrac_password=None, idrac_ipmi=None, idrac_ip=None, idrac_netmask=None, idrac_gateway=None, idrac_dnsname=None, idrac_dhcp=None)

Set parameters for iDRAC in a blade.

Parameters

- **idrac_password** – Password to use to connect to the iDRACs directly (idrac_ipmi and idrac_dnsname must be set directly on the iDRAC. They can't be set through the CMC. If this password is present, use it instead of the CMC password)
- **idrac_ipmi** – Enable/Disable IPMI over LAN
- **idrac_ip** – Set IP address for iDRAC
- **idrac_netmask** – Set netmask for iDRAC
- **idrac_gateway** – Set gateway for iDRAC
- **idrac_dhcp** – Turn on DHCP for iDRAC (True turns on, False does nothing because setting a static IP will disable DHCP).

Returns

A standard Salt changes dictionary

NOTE: If any of the IP address settings is configured, all of ip, netmask, and gateway must be present

salt.states.dellchassis.chassis(name, chassis_name=None, password=None, datacenter=None, location=None, mode=None, idrac_launch=None, slot_names=None, blade_power_states=None)

Manage a Dell Chassis.

- **chassis_name** The name of the chassis.
- **datacenter** The datacenter in which the chassis is located
- **location** The location of the chassis.
- **password** Password for the chassis. Note: If this password is set for the chassis, the current implementation of this state will set this password both on the chassis and the iDrac passwords on any configured blades. If the password for the blades should be distinct, they should be set separately with the blade_idrac function.
- **mode** The management mode of the chassis. Viable options are:
  - 0: None
  - 1: Monitor
  - 2: Manage and Monitor
- **idrac_launch** The iDRAC launch method of the chassis. Viable options are:
  - 0: Disabled (launch iDRAC using IP address)
  - 1: Enabled (launch iDRAC using DNS name)
- **slot_names** The names of the slots, provided as a list identified by their slot numbers.
- **blade_power_states** The power states of a blade server, provided as a list and identified by their server numbers. Viable options are:
  - on: Ensure the blade server is powered on.
  - off: Ensure the blade server is powered off.
  - powercycle: Power cycle the blade server.

Example:

```yaml
my-dell-chassis:
dellchassis.chassis:
  - chassis_name: my-dell-chassis
  - location: my-location
  - datacenter: london
  - mode: 2
  - idrac_launch: 1
  - slot_names:
```

(continues on next page)
- 1: my-slot-name
- 2: my-other-slot-name
- blade_power_states:
  - server-1: on
  - server-2: off
  - server-3: powercycle

salt.states.dellchassis.firmware_update(hosts=None, directory="")

State to update the firmware on host using the racadm command

firmwarefile filename (string) starting with salt://

host string representing the hostname supplied to the racadm command
directory Directory name where firmwarefile will be downloaded

dell-chassis-firmware-update:
dellchassis.firmware_update:
  hosts:
    cmc:
      salt://firmware_cmc.exe
    server-1:
      salt://firmware.exe
directory: /opt/firmwares

salt.states.dellchassis.switch(name, ip=, netmask=, gateway=, dhcp=, password=, snmp=)

Manage switches in a Dell Chassis.

name The switch designation (e.g. switch-1, switch-2)
ip The Static IP Address of the switch
netmask The netmask for the static IP
gateway The gateway for the static IP
dhcp True: Enable DHCP False: Do not change DHCP setup (disabling DHCP is automatic when a static IP is set)
password The access (root) password for the switch
snmp The SNMP community string for the switch

Example:

my-dell-chassis:
dellchassis.switch:
  - switch: switch-1
  - ip: 192.168.1.1
  - netmask: 255.255.255.0
  - gateway: 192.168.1.254
  - dhcp: True
  - password: secret
  - snmp: public

21.19.70 salt.states.disk

Disk monitoring state

Monitor the state of disk resources.

The disk.status function can be used to report that the used space of a filesystem is within the specified limits.
It can be used with an onfail requisite, for example, to take additional action in response to or in preparation for other states.

To use kilobytes (KB) for minimum and maximum rather than percents, specify the absolute flag:

```python
salt.states.disk.status(name, maximum=None, minimum=None, absolute=False, free=False)
```

Return the current disk usage stats for the named mount point

- **name** Disk mount or directory for which to check used space
- **maximum** The maximum disk utilization
- **minimum** The minimum disk utilization
- **absolute** By default, the utilization is measured in percentage. Set the absolute flag to use kilobytes.

New in version 2016.11.0.

- **free** By default, minimum & maximum refer to the amount of used space. Set to True to evaluate the free space instead.

### 21.19.71 salt.states.docker_container

Management of Docker containers

New in version 2017.7.0.

- **depends** docker Python module

**Note:** Older releases of the Python bindings for Docker were called docker-py in PyPI. All releases of docker, and releases of docker-py >= 1.6.0 are supported. These python bindings can easily be installed using pip.install:

```bash
salt myminion pip.install docker
```

To upgrade from docker-py to docker, you must first uninstall docker-py, and then install docker:
salt myminion pip.uninstall docker-py
salt myminion pip.install docker

These states were moved from the `docker` state module (formerly called `dockerng`) in the 2017.7.0 release. When running the `docker_container.running` state for the first time after upgrading to 2017.7.0, your container(s) may be replaced. The changes may show diffs for certain parameters which say that the old value was an empty string, and the new value is None. This is due to the fact that in prior releases Salt was passing empty strings for these values when creating the container if they were undefined in the SLS file, where now Salt simply does not pass any arguments not explicitly defined in the SLS file. Subsequent runs of the state should not replace the container if the configuration remains unchanged.

Note: To pull from a Docker registry, authentication must be configured. See here for more information on how to configure access to docker registries in Pillar data.

```python
salt.states.docker_container.absent(name, force=False)
```

Ensure that a container is absent

- **name** Name of the container
- **force** [False] Set to True to remove the container even if it is running

Usage Examples:

```python
mycontainer:
    docker_container.absent

multiple_containers:
    docker_container.absent:
        - names:
            - foo
            - bar
            - baz
```

```python
salt.states.docker_container.mod_run_check(onlyif, unless, creates)
```

Execute the onlyif/unless/creates logic. Returns a result dict if any of the checks fail, otherwise returns True

```python
salt.states.docker_container.mod_watch(name, sfun=None, **kwargs)
```

The docker_container watcher, called to invoke the watch command.

Note: This state exists to support special handling of the watch requisite. It should not be called directly. Parameters for this function should be set by the state being triggered.

```python
salt.states.docker_container.run(name, image=None, onlyif=None, unless=None, creates=None, bg=False, failhard=True, replace=False, force=False, skip_translate=None, ignore_collisions=False, validate_ip_addrs=True, client_timeout=60, **kwargs)
```

New in version 2018.3.0.

Note: If no tag is specified in the image name, and nothing matching the specified image is pulled on the minion, the docker pull that retrieves the image will pull all tags for the image. A tag of latest is not implicit for the pull. For this reason, it is recommended to specify the image in repo:tag notation.

Like the `cmd.run` state, only for Docker. Does the equivalent of a docker run and returns information about the container that was created, as well as its output.
This state accepts the same arguments as `docker_container.running`, with the exception of `watch_action`, `start`, and `shutdown_timeout` (though the `force` argument has a different meaning in this state).

In addition, this state accepts the arguments from `docker.logs`, with the exception of `follow`, to control how logs are returned.

Additionally, the following arguments are supported:

- **onlyif** A command or list of commands to run as a check. The container will only run if any of the specified commands returns a zero exit status.
- **unless** A command or list of commands to run as a check. The container will only run if any of the specified commands returns a non-zero exit status.
- **creates** A path or list of paths. Only run if one or more of the specified paths do not exist on the minion.
- **bg** [False] If True, run container in background and do not await or deliver its results.

**Note**: This may not be useful in cases where other states depend on the results of this state. Also, the logs will be inaccessible once the container exits if `auto_remove` is set to True, so keep this in mind.

- **failhard** [True] If True, the state will return a `False` result if the exit code of the container is non-zero. When this argument is set to `False`, the state will return a `True` result regardless of the container’s exit code.

**Note**: This has no effect if `bg` is set to True.

- **replace** [False] If True, and if the named container already exists, this will remove the existing container. The default behavior is to return a `False` result when the container already exists.
- **force** [False] If True, and the named container already exists, and `replace` is also set to True, then the container will be forcibly removed. Otherwise, the state will not proceed and will return a `False` result.

**CLI Examples**:

```
salt myminion docker.run_container myuser/myimage command=/usr/local/bin/myscript.sh
```

**USAGE EXAMPLE**

```python
{% set pkg_version = salt.pillar.get('pkg_version', '1.0-1') %}
built_package:
  docker_container.run:
    - image: myuser/builder:latest
    - binds: /home/myuser/builds:/build_dir
    - command: /scripts/build.sh {{ pkg_version }}
    - creates: /home/myuser/builds/myapp-{{ pkg_version }}.noarch.rpm
    - replace: True
    - networks:
      - mynet
    - require:
      - docker_network: mynet
```

**salt.states.docker_container.running**

- **name** Name of the container
- **image** Image to use for the container
- **force** [False] If True, and the named container already exists, and `replace` is also set to True, then the container will be forcibly removed. Otherwise, the state will not proceed and will return a `False` result.
- **networks** None
- **networks** None

Ensure that a container with a specific configuration is present and running

- **name** Name of the container
- **image** Image to use for the container

**CLI Examples**:

```
salt myminion docker.run_container myuser/myimage command=/usr/local/bin/myscript.sh
```
Note: This state will pull the image if it is not present. However, if the image needs to be built from a Dockerfile or loaded from a saved image, or if you would like to use requisites to trigger a replacement of the container when the image is updated, then the `docker_image.present` state should be used to manage the image.

Changed in version 2018.3.0: If no tag is specified in the image name, and nothing matching the specified image is pulled on the minion, the `docker pull` that retrieves the image will pull all tags for the image. A tag of `latest` is no longer implicit for the pull. For this reason, it is recommended to specify the image in `repo:tag` notation.

`skip_translate` This function translates Salt CLI or SLS input into the format which `docker-py` expects. However, in the event that Salt’s translation logic fails (due to potential changes in the Docker Remote API, or to bugs in the translation code), this argument can be used to exert granular control over which arguments are translated and which are not.

Pass this argument as a comma-separated list (or Python list) of arguments, and translation for each passed argument name will be skipped. Alternatively, pass `True` and all translation will be skipped.

Skipping translation allows for arguments to be formatted directly in the format which `docker-py` expects. This allows for API changes and other issues to be more easily worked around. An example of using this option to skip translation would be:

For example, imagine that there is an issue with processing the `port_bindings` argument, and the following configuration no longer works as expected:

```
mycontainer:
  docker_container.running:
    - image: 7.3.1611
    - port_bindings:
      - 10.2.9.10:8080:80
```

By using `skip_translate`, you can forego the input translation and configure the port binding in the format `docker-py` needs:

```
mycontainer:
  docker_container.running:
    - image: 7.3.1611
    - skip_translate: port_bindings
    - port_bindings: {8080: [('10.2.9.10', 80)], '4193/udp': 9314}
```

See the following links for more information:
- `docker-py` Low-level API
- Docker Engine API

`ignore_collisions` [False] Since many of `docker-py`'s arguments differ in name from their CLI counterparts (with which most Docker users are more familiar), Salt detects usage of these and aliases them to the `docker-py` version of that argument so that both CLI and API versions of a given argument are supported. However, if both the alias and the `docker-py` version of the same argument (e.g. `env` and `environment`) are used, an error will be raised. Set this argument to `True` to suppress these errors and keep the `docker-py` version of the argument.

`validate_ip_addrs` [True] For parameters which accept IP addresses as input, IP address validation will be performed. To disable, set this to `False`.

`force` [False] Set this parameter to `True` to force Salt to re-create the container irrespective of whether or not it is configured as desired.

`watch_action` [force] Control what type of action is taken when this state `watches` another state that has changes. The default action is `force`, which runs the state with `force` set to `True`, triggering a rebuild of the container.
If any other value is passed, it will be assumed to be a kill signal. If the container matches the specified configuration, and is running, then the action will be to send that signal to the container. Kill signals can be either strings or numbers, and are defined in the Standard Signals section of the signal(7) manpage. Run man 7 signal on a Linux host to browse this manpage. For example:

```yaml
mycontainer:
  docker_container.running:
    - image: busybox
    - watch_action: SIGHUP
    - watch:
      - file: some_file
```

**Note:** If the container differs from the specified configuration, or is not running, then instead of sending a signal to the container, the container will be re-created/started and no signal will be sent.

**start** [True] Set to False to suppress starting of the container if it exists, matches the desired configuration, but is not running. This is useful for data-only containers, or for non-daemonized container processes, such as the Django migrate and collectstatic commands. In instances such as this, the container only needs to be started the first time.

**shutdown_timeout** If the container needs to be replaced, the container will be stopped using docker.stop. If a shutdown_timeout is not set, and the container was created using stop_timeout, that timeout will be used. If neither of these values were set, then a timeout of 10 seconds will be used. Changed in version 2017.7.0: This option was renamed from stop_timeout to shutdown_timeout to accommodate the stop_timeout container configuration setting.

**client_timeout** [60] Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

**Note:** This is only used if Salt needs to pull the requested image.

### NETWORK MANAGEMENT

New in version 2018.3.0.

Changed in version 2019.2.0: If the networks option is used, any networks (including the default bridge network) which are not specified will be disconnected.

The networks argument can be used to ensure that a container is attached to one or more networks. Optionally, arguments can be passed to the networks. In the example below, net1 is being configured with arguments, while net2 and bridge are being configured without arguments:

```yaml
foo:
  docker_container.running:
    - image: myuser/myimage:foo
    - networks:
      - net1:
        - aliases:
          - bar
          - baz
        - ipv4_address: 10.0.20.50
      - net2
      - bridge
    - require:
      - docker_network: net1
      - docker_network: net2
```
The supported arguments are the ones from the docker-py's `connect_container_to_network` function (other than `container` and `net_id`).

**Important:** Unlike with the arguments described in the CONTAINER CONFIGURATION PARAMETERS section below, these network configuration parameters are not translated at all. Consult the `connect_container_to_network` documentation for the correct type/format of data to pass.

To start a container with no network connectivity (only possible in 2019.2.0 and later) pass this option as an empty list. For example:

```yaml
foo:
  docker_container.running:
    - image: myuser/myimage:foo
    - networks: []
```

**CONTAINER CONFIGURATION PARAMETERS**

**auto_remove (or `rm`)** [False] Enable auto-removal of the container on daemon side when the container’s process exits (analogous to running a docker container with `--rm` on the CLI).

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - auto_remove: True
```

**binds** Files/directories to bind mount. Each bind mount should be passed in one of the following formats:

- `<host_path>:` `<container_path>` - `host_path` is mounted within the container as `container_path` with read-write access.
- `<host_path>:` `<container_path>` `<selinux_context>` - `host_path` is mounted within the container as `container_path` with read-write access. Additionally, the specified selinux context will be set within the container.
- `<host_path>:` `<container_path>` `<read_only>` - `host_path` is mounted within the container as `container_path`, with the read-only or read-write setting explicitly defined.
- `<host_path>:` `<container_path>` `<read_only>` `<selinux_context>` - `host_path` is mounted within the container as `container_path`, with the read-only or read-write setting explicitly defined. Additionally, the specified selinux context will be set within the container.

 `<read_only>` can be either `rw` for read-write access, or `ro` for read-only access. When omitted, it is assumed to be read-write.

 `<selinux_context>` can be `z` if the volume is shared between multiple containers, or `Z` if the volume should be private.

**Note:** When both `<read_only>` and `<selinux_context>` are specified, there must be a comma before `<selinux_context>`.

Binds can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - binds: /srv/www:/var/www:ro,/etc/foo.conf:/usr/local/etc/foo.conf:rw

foo:
  docker_container.running:
    - binds: /srv/www:/var/www:ro,/etc/foo.conf:/usr/local/etc/foo.conf:rw
```

(continues on next page)
However, in cases where both ro/rw and an selinux context are combined, the only option is to use a YAML list, like so:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - binds:
      - /srv/www:/var/www:ro,Z
      - /home/myuser/conf/foo.conf:/etc/foo.conf:Z
```

Since the second bind in the previous example is mounted read-write, the `rw` and comma can be dropped. For example:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - binds:
      - /srv/www:/var/www:ro,Z
      - /home/myuser/conf/foo.conf:/etc/foo.conf:Z
```

**blkio_weight**  Block IO weight (relative weight), accepts a weight value between 10 and 1000.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - blkio_weight: 100
```

**blkio_weight_device**  Block IO weight (relative device weight), specified as a list of expressions in the format `PATH:RATE`

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - blkio_weight_device: /dev/sda:100
```

**cap_add**  List of capabilities to add within the container. Can be expressed as a comma-separated list or a Python list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cap_add: SYS_ADMIN,MKNOD

foo:
  docker_container.running:
    - image: bar/baz:latest
    - cap_add:
      - SYS_ADMIN
      - MKNOD
```

**Note:** This option requires Docker 1.2.0 or newer.
**cap_drop** List of capabilities to drop within the container. Can be expressed as a comma-separated list or a Python list. The below two examples are equivalent:

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cap_drop: SYS_ADMIN,MKNOD
```

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cap_drop:
      - SYS_ADMIN
      - MKNOD
```

---

**Note:** This option requires Docker 1.2.0 or newer.

**command (or cmd)** Command to run in the container

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - command: bash
```

**cpuset_cpus (or cpuset)** CPUs on which which to allow execution, specified as a string containing a range (e.g. \(0-3\)) or a comma-separated list of CPUs (e.g. \(0,1\)).

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpuset_cpus: "0,1"
```

**cpuset_mems** Memory nodes on which which to allow execution, specified as a string containing a range (e.g. \(0-3\)) or a comma-separated list of MEMs (e.g. \(0,1\)). Only effective on NUMA systems.

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpuset_mems: "0,1"
```

**cpu_group** The length of a CPU period in microseconds

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpu_group: 100000
```

**cpu_period** Microseconds of CPU time that the container can get in a CPU period

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpu_period: 50000
```

**cpu_shares** CPU shares (relative weight), specified as an integer between 2 and 1024.

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
```

(continues on next page)
- image: bar/baz:latest
- cpu_shares: 512

detach  [False] If True, run the container’s command in the background (daemon mode)

```yaml
foo:
  docker_container.running:
  - image: bar/baz:latest
  - detach: True
```

**devices** List of host devices to expose within the container. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```yaml
foo:
  docker_container.running:
  - image: bar/baz:latest
  - devices: /dev/net/tun,/dev/xvda1:/dev/xvda1,/dev/xvdb1:/dev/xvdb1:r
```

```yaml
foo:
  docker_container.running:
  - image: bar/baz:latest
  - devices:
    - /dev/net/tun
    - /dev/xvda1:/dev/xvda1
    - /dev/xvdb1:/dev/xvdb1:r
```

devices_read_bps  Limit read rate (bytes per second) from a device, specified as a list of expressions in the format PATH:RATE, where RATE is either an integer number of bytes, or a string ending in kb, mb, or gb. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```yaml
foo:
  docker_container.running:
  - image: bar/baz:latest
  - devices_read_bps: /dev/sda:1mb,/dev/sdb:5mb
```

```yaml
foo:
  docker_container.running:
  - image: bar/baz:latest
  - devices_read_bps:
    - /dev/sda:1mb
    - /dev/sdb:5mb
```

devices_read_iops  Limit read rate (I/O per second) from a device, specified as a list of expressions in the format PATH:RATE, where RATE is a number of I/O operations. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```yaml
foo:
  docker_container.running:
  - image: bar/baz:latest
  - devices_read_iops: /dev/sda:1000,/dev/sdb:500
```

```yaml
foo:
  docker_container.running:
  - image: bar/baz:latest
  - devices_read_iops:
    - /dev/sda:1000
    - /dev/sdb:500
```
device_write_bps  Limit write rate (bytes per second) from a device, specified as a list of expressions in the format PATH:RATE, where RATE is either an integer number of bytes, or a string ending in kb, mb, or gb. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_write_bps: /dev/sda:1mb,/dev/sdb:5mb
```

device_read_iops  Limit write rate (I/O per second) from a device, specified as a list of expressions in the format PATH:RATE, where RATE is a number of I/O operations. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_iops: /dev/sda:1000,/dev/sdb:500
```

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_iops: /dev/sda:1000
    - /dev/sdb:500
```

dns  List of DNS nameservers. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns: 8.8.8.8,8.8.4.4
```

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns:
        - 8.8.8.8
        - 8.8.4.4
```

Note: To skip IP address validation, use `validate_ip_addrs=False`

dns_opt  Additional options to be added to the container’s `resolv.conf` file. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns_opt: ndots:9
```
```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns_opt:
      - ndots:9
```

dns_search List of DNS search domains. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns_search: foo1.domain.tld,foo2.domain.tld

foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns_search:
      - foo1.domain.tld
      - foo2.domain.tld
```

domainname The domain name to use for the container

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - domainname: domain.tld
```

entrypoint Entrypoint for the container

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - entrypoint: "mycmd --arg1 --arg2"
```

This argument can also be specified as a list:

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - entrypoint:
      - mycmd
      - --arg1
      - --arg2
```

environment Either a list of variable/value mappings, or a list of strings in the format VARNAME=value. The below three examples are equivalent:

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - environment:
      - VAR1: value
      - VAR2: value

foo:
  docker_container.running:
    - image: bar/baz:latest
    - environment: "VAR1=value,VAR2=value"
```
foo:
    docker_container.running:
        - image: bar/baz:latest
        - environment:
            - VAR1=value
            - VAR2=value

extra_hosts: Additional hosts to add to the container’s /etc/hosts file. Can be expressed as a comma-separated list or a Python list. The below two examples are equivalent:

foo:
    docker_container.running:
        - image: bar/baz:latest
        - extra_hosts: web1:10.9.8.7,web2:10.9.8.8

foo:
    docker_container.running:
        - image: bar/baz:latest
        - extra_hosts:
            - web1:10.9.8.7
            - web2:10.9.8.8

Note: To skip IP address validation, use validate_ip_addrs=False

Note: This option requires Docker 1.3.0 or newer.

group_add: List of additional group names and/or IDs that the container process will run as. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

foo:
    docker_container.running:
        - image: bar/baz:latest
        - group_add: web,network

foo:
    docker_container.running:
        - image: bar/baz:latest
        - group_add:
            - web
            - network

hostname: Hostname of the container. If not provided, the value passed as the container’s ‘name’ will be used for the hostname.

foo:
    docker_container.running:
        - image: bar/baz:latest
        - hostname: web1

Warning: hostname cannot be set if network_mode is set to host. The below example will result in an error:
foo:
    docker_container.running:
    - image: bar/baz:latest
    - hostname: web1
    - network_mode: host

**interactive** (or **stdin_open**)  [False] Leave stdin open, even if not attached

foo:
    docker_container.running:
    - image: bar/baz:latest
    - interactive: True

**ipc_mode** (or **ipc**) Set the IPC mode for the container. The default behavior is to create a private IPC namespace for the container, but this option can be used to change that behavior:
- **container:<container_name_or_id>** reuses another container shared memory, semaphores and message queues
- **host**: use the host’s shared memory, semaphores and message queues

foo:
    docker_container.running:
    - image: bar/baz:latest
    - ipc_mode: container:foo

foo:
    docker_container.running:
    - image: bar/baz:latest
    - ipc_mode: host

**Warning**: Using **host** gives the container full access to local shared memory and is therefore considered insecure.

**isolation** Specifies the type of isolation technology used by containers

foo:
    docker_container.running:
    - image: bar/baz:latest
    - isolation: hyperv

**Note**: The default value on Windows server is **process**, while the default value on Windows client is **hyperv**. On Linux, only **default** is supported.

**labels** Add metadata to the container. Labels can be set both with and without values, and labels with values can be passed either as **key=value** or **key**: **value** pairs. For example, while the below would be very confusing to read, it is technically valid, and demonstrates the different ways in which labels can be passed:

```yaml
mynet:
    docker_network.present:
    - labels:
      - foo
      - bar=baz
      - **hello**: world
```
The labels can also simply be passed as a YAML dictionary, though this can be error-prone due to some idiosyncrasies with how PyYAML loads nested data structures:

```yaml
foo:
  docker_network.present:
    labels:
      foo: bar
      bar: baz
      hello: world
```

Changed in version 2018.3.0: Methods for specifying labels can now be mixed. Earlier releases required either labels with or without values.

**links**  
Link this container to another. Links can be specified as a list of mappings or a comma-separated or Python list of expressions in the format `<container_name_or_id>:<link_alias>`. The below three examples are equivalent:

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - links:
      - web1: link1
      - web2: link2
```

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - links: web1:link1,web2:link2
```

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - links:
      - web1:link1
      - web2:link2
```

**log_driver** and **log_opt**  
Set container’s logging driver and options to configure that driver. Requires Docker 1.6 or newer.

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - log_driver: syslog
    - log_opt:
      - syslog-address: tcp://192.168.0.42
      - syslog-facility: daemon
```

The **log_opt** can also be expressed as a comma-separated or YAML list of key=value pairs. The below two examples are equivalent to the above one:

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - log_driver: syslog
    - log_opt: "syslog-address=tcp://192.168.0.42,syslog-facility=daemon"
```

(continues on next page)
- **image**: bar/baz:latest
- **log_driver**: syslog
- **log_opt**:
  - syslog-address=tcp://192.168.0.42
  - syslog-facility=daemon

---

**Note**: The logging driver feature was improved in Docker 1.13 introducing option name changes. Please see Docker’s [Configure logging drivers](#) documentation for more information.

---

**lxc_conf** Additional LXC configuration parameters to set before starting the container. Either a list of variable/value mappings, or a list of strings in the format `VARNAME=value`. The below three examples are equivalent:

```yaml
foo:
  docker_container.running:
  - **image**: bar/baz:latest
  - **lxc_conf**:
    - lxc.utsname: docker
    - lxc.arch: x86_64

foo:
  docker_container.running:
  - **image**: bar/baz:latest
  - **lxc_conf**: lxc.utsname=docker,lxc.arch=x86_64

foo:
  docker_container.running:
  - **image**: bar/baz:latest
  - **lxc_conf**:
    - lxc.utsname=docker
    - lxc.arch=x86_64
```

---

**Note**: These LXC configuration parameters will only have the desired effect if the container is using the LXC execution driver, which has been deprecated for some time.

---

**mac_address** MAC address to use for the container. If not specified, a random MAC address will be used.

```yaml
foo:
  docker_container.running:
  - **image**: bar/baz:latest
  - **mac_address**: 01:23:45:67:89:0a
```

---

**mem_limit** (or **memory**) [0] Memory limit. Can be specified in bytes or using single-letter units (i.e. 512M, 2G, etc.). A value of 0 (the default) means no memory limit.

```yaml
foo:
  docker_container.running:
  - **image**: bar/baz:latest
  - **mem_limit**: 512M
```

---

**mem_swappiness** Tune a container’s memory swappiness behavior. Accepts an integer between 0 and 100.
memswap_limit (or memory_swap) [-1] Total memory limit (memory plus swap). Set to -1 to disable swap. A value of 0 means no swap limit.

```yaml
foo:
docker_container.running:
  - image: bar/baz:latest
  - memswap_limit: 1G
```

network_disabled [False] If True, networking will be disabled within the container

```yaml
foo:
docker_container.running:
  - image: bar/baz:latest
  - network_disabled: True
```

network_mode [bridge] One of the following:
- bridge - Creates a new network stack for the container on the docker bridge
- none - No networking (equivalent of the Docker CLI argument --net=none). Not to be confused with Python’s None.
- container:<name_or_id> - Reuses another container’s network stack
- host - Use the host’s network stack inside the container

**Warning:** Using host mode gives the container full access to the host’s system’s services (such as D-bus), and is therefore considered insecure.

```yaml
foo:
docker_container.running:
  - image: bar/baz:latest
  - network_mode: "none"

foo:
docker_container.running:
  - image: bar/baz:latest
  - network_mode: container:web1
```

oom_kill_disable Whether to disable OOM killer

```yaml
foo:
docker_container.running:
  - image: bar/baz:latest
  - oom_kill_disable: False
```

oom_score_adj An integer value containing the score given to the container in order to tune OOM killer preferences

```yaml
foo:
docker_container.running:
  - image: bar/baz:latest
  - oom_score_adj: 500
```

pid_mode Set to host to use the host container’s PID namespace within the container. Requires Docker 1.5.0 or newer.
foo:
  docker_container.running:
    - image: bar/baz:latest
    - pid_mode: host

Note: This option requires Docker 1.5.0 or newer.

pids_limit Set the container’s PID limit. Set to -1 for unlimited.

foo:
  docker_container.running:
    - image: bar/baz:latest
    - pids_limit: 2000

port_bindings (or publish) Bind exposed ports. Port bindings should be passed in the same way as the
  --publish argument to the docker run CLI command:
  • ip:hostPort:containerPort - Bind a specific IP and port on the host to a specific port
    within the container.
  • ip::containerPort - Bind a specific IP and an ephemeral port to a specific port within the
    container.
  • hostPort:containerPort - Bind a specific port on all of the host’s interfaces to a specific
    port within the container.
  • containerPort - Bind an ephemeral port on all of the host’s interfaces to a specific port within
    the container.

Multiple bindings can be separated by commas, or expressed as a YAML list, and port ranges can be
defined using dashes. The below two examples are equivalent:

foo:
  docker_container.running:
    - image: bar/baz:latest
    - port_bindings: "4505-4506:14505-14506,2123:2123/udp,8080"

foo:
  docker_container.running:
    - image: bar/baz:latest
    - port_bindings:
        4505-4506:14505-14506
        2123:2123/udp
        8080

Note: When specifying a protocol, it must be passed in the containerPort value, as seen in the
examples above.

ports A list of ports to expose on the container. Can either be a comma-separated list or a YAML list. If the
protocol is omitted, the port will be assumed to be a TCP port. The below two examples are equivalent:

foo:
  docker_container.running:
    - image: bar/baz:latest
    - ports: 1111,2222/udp

foo:
  docker_container.running:
(continues on next page)
privileged [False] If True, runs the exec process with extended privileges

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - privileged: True
```

publish_all_ports (or publish_all) [False] Publish all ports to the host

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ports: 8080
    - publish_all_ports: True
```

read_only [False] If True, mount the container's root filesystem as read only

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - read_only: True
```

restart_policy (or restart) Set a restart policy for the container. Must be passed as a string in the format policy[:retry_count] where policy is one of always, unless-stopped, or on-failure, and retry_count is an optional limit to the number of retries. The retry count is ignored when using the always or unless-stopped restart policy.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - restart_policy: on-failure:5
```

```
bar:
  docker_container.running:
    - image: bar/baz:latest
    - restart_policy: always
```

security_opt (or security_opts): Security configuration for MLS systems such as SELinux and AppArmor. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - security_opt: apparmor:unconfined
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - security_opt:
      - apparmor:unconfined
```

Important: Some security options can contain commas. In these cases, this argument must be passed
as a Python list, as splitting by comma will result in an invalid configuration.

Note: See the documentation for security_opt at https://docs.docker.com/engine/reference/run/#security-configuration

**shm_size**  Size of /dev/shm

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - shm_size: 128M
```

**stop_signal**  Specify the signal docker will send to the container when stopping. Useful when running systemd as PID 1 inside the container.

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - stop_signal: SIGRTMIN+3
```

Note: This option requires Docker 1.9.0 or newer and docker-py 1.7.0 or newer.

**stop_timeout**  Timeout to stop the container, in seconds

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - stop_timeout: 5
```

Note: In releases prior to 2017.7.0, this option was not set in the container configuration, but rather this timeout was enforced only when shutting down an existing container to replace it. To remove the ambiguity, and to allow for the container to have a stop timeout set for it, the old stop_timeout argument has been renamed to shutdown_timeout, while stop_timeout now refers to the container's configured stop timeout.

**storage_opt**  Storage driver options for the container. Can be either a list of strings in the format option=value, or a list of mappings between option and value. The below three examples are equivalent:

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - storage_opt: dm.basesize: 40G

foo:
  docker_container.running:
    - image: bar/baz:latest
    - storage_opt: dm.basesize=40G
```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - storage_opt:
        - dm.basesize=40G

**sysctls** (or **sysctl**) Set sysctl options for the container. Can be either a list of strings in the format `option=value`, or a list of mappings between option and value. The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - sysctls:
        - fs.nr_open: 1048576
        - kernel.pid_max: 32768

foo:
  docker_container.running:
    - image: bar/baz:latest
    - sysctls: fs.nr_open=1048576,kernel.pid_max=32768

foo:
  docker_container.running:
    - image: bar/baz:latest
    - sysctls:
        - fs.nr_open=1048576
        - kernel.pid_max=32768
```

tmpfs A map of container directories which should be replaced by tmpfs mounts and their corresponding mount options.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - tmpfs:
        - /run: rw,noexec,nosuid,size=65536k
```

tty [False] Attach TTYs

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - tty: True
```

ulimits List of ulimits. These limits should be passed in the format `<ulimit_name>:<soft_limit>:<hard_limit>`, with the hard limit being optional. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ulimits: nofile=1024:1024,nproc=60

foo:
  docker_container.running:
    - image: bar/baz:latest
    - ulimits:
```

(continues on next page)
- nofile=1024:1024
- nproc=60

**user** User under which to run exec process

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - user: foo
```

**usersns_mode**  (or **user_ns_mode**) Sets the user namespace mode, when the user namespace remapping option is enabled

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - usersns_mode: host
```

**volumes**  (or **volume**) List of directories to expose as volumes. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volumes: /mnt/vol1,/mnt/vol2
```

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volumes:
      - /mnt/vol1
      - /mnt/vol2
```

**volumes_from** Container names or IDs from which the container will get volumes. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volumes_from: foo
```

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volumes_from:
      - foo
```

**volume_driver** sets the container’s volume driver

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volume_driver: foobar
```

**working_dir**  (or **workdir**) Working directory inside the container

```yaml
foo:
  docker_container.running:
```

(continues on next page)
- **image**: bar/baz:latest
- **working_dir**: /var/log/nginx

salt.states.docker_container.stopped(name=None, containers=None, shutdown_timeout=None, unpause=False, error_on_absent=True, **kwargs)

Ensure that a container (or containers) is stopped

- **name** Name or ID of the container
- **containers** Run this state on more than one container at a time. The following two examples accomplish the same thing:

```python
stopped_containers:
  docker_container.stopped:
    - names:
      - foo
      - bar
      - baz
```

```python
stopped_containers:
  docker_container.stopped:
    - containers:
      - foo
      - bar
      - baz
```

However, the second example will be a bit quicker since Salt will stop all specified containers in a single run, rather than executing the state separately on each image (as it would in the first example).

- **shutdown_timeout** Timeout for graceful shutdown of the container. If this timeout is exceeded, the container will be killed. If this value is not passed, then the container’s configured stop_timeout will be observed. If stop_timeout was also unset on the container, then a timeout of 10 seconds will be used.

- **unpause** [False] Set to True to unpause any paused containers before stopping. If unset, then an error will be raised for any container that was paused.

- **error_on_absent** [True] By default, this state will return an error if any of the specified containers are absent. Set this to False to suppress that error.

### 21.19.72 salt.states.docker_image

Management of Docker images

New in version 2017.7.0.

- **depends** docker Python module

**Note:** Older releases of the Python bindings for Docker were called docker-py in PyPI. All releases of docker, and releases of docker-py >= 1.6.0 are supported. These python bindings can easily be installed using pip.install:

```
salt myminion pip.install docker
```

To upgrade from docker-py to docker, you must first uninstall docker-py, and then install docker:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```
These states were moved from the `docker` state module (formerly called `dockerng`) in the 2017.7.0 release.

**Note:** To pull from a Docker registry, authentication must be configured. See [here](#) for more information on how to configure access to docker registries in [Pillar](#) data.

`salt.states.docker_image.absent(name=None, images=None, force=False)`

Ensure that an image is absent from the Minion. Image names can be specified either using `repo:tag` notation, or just the repo name (in which case a tag of `latest` is assumed).

**images** Run this state on more than one image at a time. The following two examples accomplish the same thing:

```python
remove_images:
  docker_image.absent:
    - names:
      - busybox
      - centos:6
      - nginx

remove_images:
  docker_image.absent:
    - images:
      - busybox
      - centos:6
      - nginx
```

However, the second example will be a bit quicker since Salt will do all the deletions in a single run, rather than executing the state separately on each image (as it would in the first example).

**force** [False] Salt will fail to remove any images currently in use by a container. Set this option to true to remove the image even if it is already present.

**Note:** This option can also be overridden by Pillar data. If the Minion has a pillar variable named `docker.running.force` which is set to `True`, it will turn on this option. This pillar variable can even be set at runtime. For example:

```bash
salt myminion state.sls docker_stuff pillar="{docker.force: True}"
```

If this pillar variable is present and set to `False`, then it will turn off this option.

For more granular control, setting a pillar variable named `docker.force.image_name` will affect only the named image.

`salt.states.docker_image.mod_watch(name, sfun=None, **kwargs)`

The docker_image watcher, called to invoke the watch command.

**Note:** This state exists to support special handling of the `watch` requisite. It should not be called directly. Parameters for this function should be set by the state being triggered.

`salt.states.docker_image.present(name, tag=None, build=None, load=None, force=False, insecure_registry=False, client_timeout=60, dockerfile=None, sls=None, base='opensuse/python', saltenv='base', pillarenv=None, pillar=None, **kwargs)`
Changed in version 2018.3.0: The `tag` argument has been added. It is now required unless pulling from a registry.

Ensure that an image is present. The image can either be pulled from a Docker registry, built from a Dockerfile, loaded from a saved image, or built by running SLS files against a base image.

If none of the `build`, `load`, or `sls` arguments are used, then Salt will pull from the configured registries. If the specified image already exists, it will not be pulled unless `force` is set to `True`. Here is an example of a state that will pull an image from the Docker Hub:

```
myuser/myimage:
  docker_image.present:
    - tag: mytag
```

`tag` Tag name for the image. Required when using `build`, `load`, or `sls` to create the image, but optional if pulling from a repository.

New in version 2018.3.0.

`build` Path to directory on the Minion containing a Dockerfile

```
myuser/myimage:
  docker_image.present:
    - build: /home/myuser/docker/myimage
    - tag: mytag
```

The image will be built using `docker.build` and the specified image name and tag will be applied to it.

New in version 2016.11.0.

Changed in version 2018.3.0: The `tag` must be manually specified using the `tag` argument.

`load` Loads a tar archive created with `docker.load` (or the `docker load` Docker CLI command), and assigns it the specified repo and tag.

```
myuser/myimage:
  docker_image.present:
    - load: salt://path/to/image.tar
    - tag: mytag
```

Changed in version 2018.3.0: The `tag` must be manually specified using the `tag` argument.

`force` [False] Set this parameter to `True` to force Salt to pull/build/load the image even if it is already present.

`client_timeout` Timeout in seconds for the Docker client. This is not a timeout for the state, but for receiving a response from the API.

`dockerfile` Allows for an alternative Dockerfile to be specified. Path to alternative Dockerfile is relative to the build path for the Docker container.

New in version 2016.11.0.

`sls` Allow for building of image with `docker.sls_build` by specifying the SLS files with which to build. This can be a list or comma-separated string.

```
myuser/myimage:
  docker_image.present:
    - tag: latest
```

(continues on next page)
- **sls**:  
  - webapp1  
  - webapp2  
- **base**: centos  
- **saltenv**: base

Changed in version 2018.3.0: The tag must be manually specified using the tag argument.

**base** Base image with which to start `docker.sls_build`

New in version 2017.7.0.

**saltenv** Specify the environment from which to retrieve the SLS indicated by the mods parameter.

New in version 2017.7.0.

Changed in version 2018.3.0: Now uses the effective saltenv if not explicitly passed. In earlier versions, base was assumed as a default.

**pillarenv** Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.

New in version 2018.3.0.

**pillar** Custom Pillar values, passed as a dictionary of key-value pairs

New in version 2018.3.0.

---

**Note**: Values passed this way will override Pillar values set via pillar_roots or an external Pillar source.

New in version 2018.3.0.

---

### 21.19.73 `salt.states.docker_network`

Management of Docker networks

New in version 2017.7.0.

**depends** docker Python module

**Note**: Older releases of the Python bindings for Docker were called docker-py in PyPI. All releases of docker, and releases of docker-py >= 1.6.0 are supported. These python bindings can easily be installed using `pip.install`:

```
salt myminion pip.install docker
```

To upgrade from docker-py to docker, you must first uninstall docker-py, and then install docker:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

These states were moved from the docker state module (formerly called dockerng) in the 2017.7.0 release.

**salt.states.docker_network.absent**(name)

Ensure that a network is absent.

**name** Name of the network

Usage Example:
salt.states.docker_network.present(name, skip_translation=None, ignore_collisions=False, validate_ip_addrs=True, containers=None, reconnect=True, **kwargs)

Changed in version 2018.3.0: Support added for network configuration options other than `driver` and `driver_opts`, as well as IPAM configuration.

Ensure that a network is present.

**Note:** This state supports all arguments for network and IPAM pool configuration which are available for the release of docker-py installed on the minion. For that reason, the arguments described below in the NETWORK CONFIGURATION and IP ADDRESS MANAGEMENT (IPAM) sections may not accurately reflect what is available on the minion. The `docker.get_client_args` function can be used to check the available arguments for the installed version of docker-py (they are found in the `network_config` and `ipam_config` sections of the return data), but Salt will not prevent a user from attempting to use an argument which is unsupported in the release of Docker which is installed. In those cases, network creation be attempted but will fail.

**name**  Network name

**skip_translation**  This function translates Salt SLS input into the format which docker-py expects. However, in the event that Salt’s translation logic fails (due to potential changes in the Docker Remote API, or to bugs in the translation code), this argument can be used to exert granular control over which arguments are translated and which are not.

Pass this argument as a comma-separated list (or Python list) of arguments, and translation for each passed argument name will be skipped. Alternatively, pass `True` and all translation will be skipped.

 Skipping translation allows for arguments to be formatted directly in the format which docker-py expects. This allows for API changes and other issues to be more easily worked around. See the following links for more information:

- docker-py Low-level API
- Docker Engine API

New in version 2018.3.0.

**ignore_collisions**  [False]  Since many of docker-py’s arguments differ in name from their CLI counterparts (with which most Docker users are more familiar), Salt detects usage of these and aliases them to the docker-py version of that argument. However, if both the alias and the docker-py version of the same argument (e.g. `options` and `driver_opts`) are used, an error will be raised. Set this argument to `True` to suppress these errors and keep the docker-py version of the argument.

New in version 2018.3.0.

**validate_ip_addrs**  [True]  For parameters which accept IP addresses/subnets as input, validation will be performed. To disable, set this to `False`.

New in version 2018.3.0.

**containers**  A list of containers which should be connected to this network.

**Note:** As of the 2018.3.0 release, this is not the recommended way of managing a container’s membership in a network, for a couple reasons:

1. It does not support setting static IPs, aliases, or links in the container’s IP configuration.
2. If a `docker_container.running` state replaces a container, it will not be reconnected to the network until the `docker_network.present` state is run again. Since containers often have require requisites to ensure that the network is present, this means that
the `docker_network.present` state ends up being run before the `docker_container.running`, leaving the container unattached at the end of the Salt run. For these reasons, it is recommended to use `docker_container.running`'s network management support.

**reconnect** [True] If `containers` is not used, and the network is replaced, then Salt will keep track of the containers which were connected to the network and reconnect them to the network after it is replaced. Salt will first attempt to reconnect using the same IP the container had before the network was replaced. If that fails (for instance, if the network was replaced because the subnet was modified), then the container will be reconnected without an explicit IP address, and its IP will be assigned by Docker.

Set this option to False to keep Salt from trying to reconnect containers. This can be useful in some cases when managing static IPs in `docker_container.running`. For instance, if a network’s subnet is modified, it is likely that the static IP will need to be updated in the `docker_container.running` state as well. When the network is replaced, the initial reconnect attempt would fail, and the container would be reconnected with an automatically-assigned IP address. Then, when the `docker_container.running` state executes, it would disconnect the network again and reconnect using the new static IP. Disabling the reconnect behavior in these cases would prevent the unnecessary extra reconnection.

New in version 2018.3.0.

**NETWORK CONFIGURATION ARGUMENTS**

**driver** Network driver

```yaml
mynet:
  docker_network.present:
    - driver: macvlan
```

**driver_opts (or driver_opt, or options)** Options for the network driver. Either a dictionary of option names and values or a Python list of strings in the format `varname=value`. The below three examples are equivalent:

```yaml
mynet:
  docker_network.present:
    - driver: macvlan
```

```yaml
mynet:
  docker_network.present:
    - driver_opts: macvlan_mode=bridge,parent=eth0
```

```yaml
mynet:
  docker_network.present:
    - driver_opt:
        - macvlan_mode: bridge
        - parent: eth0
```

```yaml
mynet:
  docker_network.present:
    - driver_opts:
        - macvlan_mode: bridge
        - parent: eth0
```

The options can also simply be passed as a dictionary, though this can be error-prone due to some idiosyncrasies with how PyYAML loads nested data structures:

```yaml
mynet:
  docker_network.present:
    - driver: macvlan
```

(continues on next page)
- **driver_opts**: 
  - macvlan_mode: bridge
  - parent: eth0

**check_duplicate** [True] If True, checks for networks with duplicate names. Since networks are primarily keyed based on a random ID and not on the name, and network name is strictly a user-friendly alias to the network which is uniquely identified using ID, there is no guaranteed way to check for duplicates. This option provides a best effort, checking for any networks which have the same name, but it is not guaranteed to catch all name collisions.

```yaml
mynet:
  docker_network.present:
    - check_duplicate: False
```

**internal** [False] If True, restricts external access to the network

```yaml
mynet:
  docker_network.present:
    - internal: True
```

**labels** Add metadata to the network. Labels can be set both with and without values, and labels with values can be passed either as key=value or key: value pairs. For example, while the below would be very confusing to read, it is technically valid, and demonstrates the different ways in which labels can be passed:

```yaml
mynet:
  docker_network.present:
    - labels:
      - foo
      - bar=ba
      - hello: world
```

The labels can also simply be passed as a YAML dictionary, though this can be error-prone due to some idiosyncrasies with how PyYAML loads nested data structures:

```yaml
foo:
  docker_network.present:
    - labels:
      foo: '
      bar: baz
      hello: world
```

Changed in version 2018.3.0: Methods for specifying labels can now be mixed. Earlier releases required either labels with or without values.

**enable_ipv6** (or **ipv6**) [False] Enable IPv6 on the network

```yaml
mynet:
  docker_network.present:
    - enable_ipv6: True
```

**Note:** While it should go without saying, this argument must be set to True to configure an IPv6 subnet. Also, if this option is turned on without an IPv6 subnet explicitly configured, you will get an error unless you have set up a fixed IPv6 subnet. Consult the Docker IPv6 docs for information on how to do this.

**attachable** [False] If True, and the network is in the global scope, non-service containers on worker nodes will be able to connect to the network.
**Note**: This option cannot be reliably managed on CentOS 7. This is because while support for this option was added in API version 1.24, its value was not added to the inspect results until API version 1.26. The version of Docker which is available for CentOS 7 runs API version 1.24, meaning that while Salt can pass this argument to the API, it has no way of knowing the value of this config option in an existing Docker network.

**Scope** Specify the network’s scope (local, global or swarm)

**Ingress** [False] If True, create an ingress network which provides the routing-mesh in swarm mode

**IP ADDRESS MANAGEMENT (IPAM)**

This state supports networks with either IPv4, or both IPv4 and IPv6. If configuring IPv4, then you can pass the IPAM pool arguments below as individual arguments. However, if configuring IPv4 and IPv6, the arguments must be passed as a list of dictionaries, in the ipam_pools argument (click here for some examples). These docs also have more information on these arguments.

**IPAM ARGUMENTS**

- **ipam_driver** IPAM driver to use, if different from the default one

- **ipam_opts** Options for the IPAM driver. Either a dictionary of option names and values or a Python list of strings in the format `varname=value`. The below three examples are equivalent:

```
mynet:
    docker_network.present:
        - ipam_driver: foo
        - ipam_opts: foo=bar,baz=qux

mynet:
    docker_network.present:
        - ipam_driver: foo
        - ipam_opts: 
            - foo: bar
            - baz: qux
```

```
The options can also simply be passed as a dictionary, though this can be error-prone due to some idiosyncrasies with how PyYAML loads nested data structures:

```yaml
mynet:
  docker_network.present:
    - ipam_driver: macvlan
    - ipam_opts:
      foo: bar
      baz: qux
```

**IPAM POOL ARGUMENTS**

- **subnet** Subnet in CIDR format that represents a network segment
- **iprange (or ip_range)** Allocate container IP from a sub-range within the subnet
- **gateway** IPv4 or IPv6 gateway for the master subnet
- **aux_addresses (or aux_address)** A dictionary of mapping container names to IP addresses which should be allocated for them should they connect to the network. Either a dictionary of option names and values or a Python list of strings in the format `host=ipaddr`.

**IPAM CONFIGURATION EXAMPLES**

Below is an example of an IPv4-only network (keep in mind that subnet is the only required argument).

```yaml
mynet:
  docker_network.present:
    - subnet: 10.0.20.0/24
    - iprange: 10.0.20.128/25
    - gateway: 10.0.20.254
    - aux_addresses:
      foo.bar.tld: 10.0.20.50
      hello.world.tld: 10.0.20.51
```

**Note:** The aux_addresses can be passed differently, in the same way that driver_opts and ipam_opts can.

This same network could also be configured this way:

```yaml
mynet:
  docker_network.present:
    - ipam_pools:
      - subnet: 10.0.20.0/24
        iprange: 10.0.20.128/25
        gateway: 10.0.20.254
        aux_addresses:
          foo.bar.tld: 10.0.20.50
          hello.world.tld: 10.0.20.51
```

Here is an example of a mixed IPv4/IPv6 subnet.

```yaml
mynet:
  docker_network.present:
    - ipam_pools:
      - subnet: 10.0.20.0/24
        gateway: 10.0.20.1
      - subnet: fe3f:2180:26:1::/123
        gateway: fe3f:2180:26:1::1
```
21.19.74  salt.states.docker_volume

Management of Docker volumes
New in version 2017.7.0.

depends  docker Python module

Note: Older releases of the Python bindings for Docker were called docker-py in PyPI. All releases of docker, and releases of docker-py >= 1.6.0 are supported. These python bindings can easily be installed using pip.install:

salt myminion pip.install docker

To upgrade from docker-py to docker, you must first uninstall docker-py, and then install docker:

salt myminion pip.uninstall docker-py
salt myminion pip.install docker

These states were moved from the docker state module (formerly called dockerng) in the 2017.7.0 release.

salt.states.docker_volume.absent(name, driver=None)

Ensure that a volume is absent.

New in version 2015.8.4.

Changed in version 2017.7.0: This state was renamed from docker_volume_absent to docker_volume.absent

name  Name of the volume

Usage Examples:

volume_foo:
  docker_volume.absent

salt.states.docker_volume.present(name, driver=None, driver_opts=None, force=False)

Ensure that a volume is present.

New in version 2015.8.4.

Changed in version 2015.8.6: This state no longer deletes and re-creates a volume if the existing volume’s driver does not match the driver parameter (unless the force parameter is set to True).

Changed in version 2017.7.0: This state was renamed from docker_volume.present to docker_volume.present

name  Name of the volume
driver  Type of driver for that volume. If None and the volume does not yet exist, the volume will be created using Docker’s default driver. If None and the volume does exist, this function does nothing, even if the existing volume’s driver is not the Docker default driver. (To ensure that an existing volume’s driver matches the Docker default, you must explicitly name Docker’s default driver here.)
driver_opts  Options for the volume driver
force  [False] If the volume already exists but the existing volume’s driver does not match the driver specified by the driver parameter, this parameter controls whether the function errors out (if False) or deletes and re-creates the volume (if True).

Usage Examples:

volume_foo:
  docker_volume.present
volume_bar:
  docker_volume.present
  - name: bar
  - driver: local
  - driver_opts:
    - foo: bar

volume_bar:
  docker_volume.present
  - name: bar
  - driver: local
  - driver_opts:
    - foo: bar
    - option: value

21.19.75 salt.states.drac

Management of Dell DRAC

The DRAC module is used to create and manage DRAC cards on Dell servers

Ensure the user damian is present

damian:
  drac.present:
  - name: damian
  - password: secret
  - permission: login,test_alerts,clear_logs

Ensure the user damian does not exist

damian:
  drac.absent:
  - name: damian

Ensure DRAC network is in a consistent state

my_network:
  drac.network:
  - ip: 10.225.108.29
  - netmask: 255.255.255.224
  - gateway: 10.225.108.1

salt.states.drac.absent(name)
  Ensure a user does not exist on the Dell DRAC
  name: The users username

classic.states.drac.network(ip, netmask, gateway)
  Ensure the DRAC network settings are consistent

classic.states.drac.present(name, password, permission)
  Ensure the user exists on the Dell DRAC
  name: The users username
  password: The password used to authenticate
  permission: The permissions that should be assigned to a user
21.19.76 salt.states.elasticsearch

State module to manage Elasticsearch.

New in version 2017.7.0.

salt.states.elasticsearch.alias_absent(name, index)
Ensure that the index alias is absent.
name Name of the index alias to remove
index Name of the index for the alias

salt.states.elasticsearch.alias_present(name, index, definition=None)
Ensure that the named index alias is present.
name Name of the alias
index Name of the index

Example:

mytestalias:
  elasticsearch.alias_present:
    - index: testindex
    - definition:
      filter:
        term:
          user: kimchy

salt.states.elasticsearch.index_absent(name)
Ensure that the named index is absent.
name Name of the index to remove

salt.states.elasticsearch.index_present(name, definition=None)
Ensure that the named index is present.
name Name of the index to add
definition Optional dict for creation parameters as per https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-create-index.html

Example:

# Default settings
mytestindex:
  elasticsearch_index.present

# Extra settings
mytestindex2:
  elasticsearch_index.present:
    - definition:
      settings:
        index:
          number_of_shards: 10

salt.states.elasticsearch.index_template_absent(name)
Ensure that the named index template is absent.
name Name of the index to remove

salt.states.elasticsearch.index_template_present(name, definition, check_definition=False)
Ensure that the named index template is present.
name Name of the index to add
**definition** Required dict for creation parameters as per https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-templates.html

**check_definition** If the template already exists and the definition is up to date

Example:

```yaml
mytestindex2_template:
  elasticsearch.index_template_present:
    - definition:
        template: logstash-\*
        order: 1
        settings:
          number_of_shards: 1
```

**salt.states.elasticsearch.pipeline_absent**(name)

Ensure that the named pipeline is absent

- **name** Name of the pipeline to remove

**salt.states.elasticsearch.pipeline_present**(name, definition)

Ensure that the named pipeline is present.

- **name** Name of the index to add
- **definition** Required dict for creation parameters as per https://www.elastic.co/guide/en/elasticsearch/reference/master/pipeline.html

Example:

```yaml
test_pipeline:
  elasticsearch.pipeline_present:
    - definition:
        description: example pipeline
        processors:
          - set:
              field: collector_timestamp_millis
              value: '[[ '{{ ' }}_ingest.timestamp{{ ' }}]' ]
```

**salt.states.elasticsearch.search_template_absent**(name)

Ensure that the search template is absent

- **name** Name of the search template to remove

**salt.states.elasticsearch.search_template_present**(name, definition)

Ensure that the named search template is present.

- **name** Name of the search template to add
- **definition** Required dict for creation parameters as per http://www.elastic.co/guide/en/elasticsearch/reference/current/search-template.html

Example:

```yaml
test_pipeline:
  elasticsearch.search_template_present:
    - definition:
        inline:
          size: 10
```

## 21.19.77 salt.states.elasticsearch_index

State module to manage Elasticsearch indices

New in version 2015.8.0.

Deprecated since version 2017.7.0: Use elasticsearch state instead
salt.states.elasticsearch_index.absent(name)
    Ensure that the named index is absent.
    name Name of the index to remove

salt.states.elasticsearch_index.present(name, definition=None)
    New in version 2015.8.0.
    Changed in version 2017.3.0: Marked definition as optional.
    Ensure that the named index is present.
    name Name of the index to add
    definition Optional dict for creation parameters as per
    Example:

    # Default settings
    mytestindex:
        elasticsearch_index.present

    # Extra settings
    mytestindex2:
        elasticsearch_index.present:
            - definition:
                settings:
                    index:
                        number_of_shards: 10

21.19.78  salt.states.elasticsearch_index_template

State module to manage Elasticsearch index templates
New in version 2015.8.0.
Deprecated since version 2017.7.0: Use elasticsearch state instead

salt.states.elasticsearch_index_template.absent(name)
    Ensure that the named index template is absent.
    name Name of the index to remove

salt.states.elasticsearch_index_template.present(name, definition)
    New in version 2015.8.0.
    Changed in version 2017.3.0: Marked definition as required.
    Ensure that the named index template is present.
    name Name of the index to add
    definition Required dict for creation parameters as per
    Example:

    mytestindex2_template:
        elasticsearch_index_template.present:
            - definition:
                template: logstash-*
                order: 1
                settings:
                    number_of_shards: 1

21.19.  state modules
21.19.79 salt.states.environ

Support for getting and setting the environment variables of the current salt process.

```
salt.states.environ.setenv(name, value, false_unsets=False, clear_all=False, update_minion=False, permanent=False)
```

Set the salt process environment variables.

- **name** The environment key to set. Must be a string.
- **value** Either a string or dict. When string, it will be the value set for the environment key of `name` above. When a dict, each key/value pair represents an environment variable to set.
- **false_unsets** If a key’s value is False and false_unsets is True, then the key will be removed from the salt processes environment dict entirely. If a key’s value is False and false_unsets is not True, then the key’s value will be set to an empty string. Default: False
- **clear_all** USE WITH CAUTION! This option can unset environment variables needed for salt to function properly. If clear_all is True, then any environment variables not defined in the environ dict will be deleted. Default: False
- **update_minion** If True, apply these environ changes to the main salt-minion process. If False, the environ changes will only affect the current salt subprocess. Default: False
- **permanent** On Windows minions this will set the environment variable in the registry so that it is always added as a environment variable when applications open. If you want to set the variable to HKLM instead of HKCU just pass in “HKLM” for this parameter. On all other minion types this will be ignored. Note: This will only take affect on applications opened after this has been set.

Example:

```
a_string_env:
environ.setenv:
  - name: foo
  - value: bar
  - update_minion: True

a_dict_env:
environ.setenv:
  - name: does_not_matter
  - value:
    foo: bar
    baz: quux
```

21.19.80 salt.states.eselect

Management of Gentoo configuration using eselect

A state module to manage Gentoo configuration via eselect

```
salt.states.eselect.set_(name, target, module_parameter=None, action_parameter=None)
```

Verify that the given module is set to the given target

- **name** The name of the module
- **target** The target to be set for this module
- **module_parameter** additional params passed to the defined module
- **action_parameter** additional params passed to the defined action

Example:

```
profile:
eselect.set:
  - target: hardened/linux/amd64
```
Manage etcd Keys

New in version 2015.8.0.

depends
  - python-etcd

This state module supports setting and removing keys from etcd.

Configuration

To work with an etcd server you must configure an etcd profile. The etcd config can be set in either the Salt Minion configuration file or in pillar:

```yaml
my_etd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

It is technically possible to configure etcd without using a profile, but this is not considered to be a best practice, especially when multiple etcd servers or clusters are available.

```yaml
etcd.host: 127.0.0.1
etcd.port: 4001
```

Note: The etcd configuration can also be set in the Salt Master config file, but in order to use any etcd configurations defined in the Salt Master config, the `pillar_opts` must be set to `True`.

Be aware that setting `pillar_opts` to `True` has security implications as this makes all master configuration settings available in all minion’s pillars.

Etcd profile configuration can be overridden using following arguments: `host`, `port`, `username`, `password`, `ca`, `client_key` and `client_cert`.

```yaml
my-value:
  etcd.set:
    - name: /path/to/key
    - value: value
    - host: 127.0.0.1
    - port: 2379
    - username: user
    - password: pass
```

Available Functions

- set

  This will set a value to a key in etcd. Changes will be returned if the key has been created or the value of the key has been updated. This means you can watch these states for changes.
/foo/bar/baz:
  etcd.set:
    - value: foo
    - profile: my_etcd_config

- **wait_set**
  Performs the same functionality as `set` but only if a watch requisite is `True`.

/some/file.txt:
  file.managed:
    - source: salt://file.txt

/foo/bar/baz:
  etcd.wait_set:
    - value: foo
    - profile: my_etcd_config
    - watch:
      - file: /some/file.txt

- **rm**
  This will delete a key from etcd. If the key exists then changes will be returned and thus you can watch for changes on the state, if the key does not exist then no changes will occur.

/foo/bar/baz:
  etcd.rm:
    - profile: my_etcd_config

- **wait_rm**
  Performs the same functionality as `rm` but only if a watch requisite is `True`.

/some/file.txt:
  file.managed:
    - source: salt://file.txt

/foo/bar/baz:
  etcd.wait_rm:
    - profile: my_etcd_config
    - watch:
      - file: /some/file.txt

salt.states.etcd_mod.directory(name, profile=None, **kwargs)
Create a directory in etcd.

  name  The etcd directory name, for example: /foo/bar/baz.
  profile  Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

    my_etcd_config:
      etcd.host: 127.0.0.1
      etcd.port: 4001

salt.states.etcd_mod.mod_watch(name, **kwargs)
The etcd watcher, called to invoke the watch command. When called, execute a etcd function based on a watch call requisite.

  **Note:** This state exists to support special handling of the watch requisite. It should not be called directly.
Parameters for this function should be set by the state being triggered.

```python
salt.states.etcd_mod.rm(name, recurse=False, profile=None, **kwargs)
```

Deletes a key from etcd

- **name**: The etcd key name to remove, for example `/foo/bar/baz`
- **recurse**: Optional, defaults to `False`. If `True` performs a recursive delete.
- **profile**: Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

```python
my_etd_config:
    etcd.host: 127.0.0.1
    etcd.port: 4001
```

```python
salt.states.etcd_mod.set_(name, value, profile=None, **kwargs)
```

Set a key in etcd

- **name**: The etcd key name, for example: `/foo/bar/baz`
- **value**: The value the key should contain.
- **profile**: Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

```python
my_etd_config:
    etcd.host: 127.0.0.1
    etcd.port: 4001
```

```python
salt.states.etcd_mod.wait_rm(name, recurse=False, profile=None, **kwargs)
```

Deletes a key from etcd only if the watch statement calls it. This function is also aliased as `wait_rm`.

- **name**: The etcd key name to remove, for example `/foo/bar/baz`
- **recurse**: Optional, defaults to `False`. If `True` performs a recursive delete, see: https://python-etcd.readthedocs.io/en/latest/#delete-a-key.
- **profile**: Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

```python
my_etd_config:
    etcd.host: 127.0.0.1
    etcd.port: 4001
```

```python
salt.states.etcd_mod.wait_set(name, value, profile=None, **kwargs)
```

Set a key in etcd only if the watch statement calls it. This function is also aliased as `wait_set`.

- **name**: The etcd key name, for example: `/foo/bar/baz`
- **value**: The value the key should contain.
- **profile**: The etcd profile to use that has been configured on the Salt Master, this is optional and defaults to `None`.

```python
my_etd_config:
    etcd.host: 127.0.0.1
    etcd.port: 4001
```

21.19.82 salt.states.ethtool module

Configuration of network device

New in version 2016.11.0.

**codeauthor** Krzysztof Pawlowski <msciciel@msciciel.eu>
maturity new
depends python-ethtool
platform linux

eth0:
  ethtool.coalesce:
    - name: eth0
    - rx_usecs: 24
    - tx_usecs: 48

eth0:
  ethtool.ring:
    - name: eth0
    - rx: 1024
    - tx: 1024

eth0:
  ethtool.offload:
    - name: eth0
    - tcp_segmentation_offload: on

salt.states.ethtool.coalesce(name, **kwargs)
Manage coalescing settings of network device
name Interface name to apply coalescing settings

eth0:
  ethtool.coalesce:
    - name: eth0

salt.states.ethtool.offload(name, **kwargs)
Manage protocol offload and other features of network device
name Interface name to apply coalescing settings
ethtool.offload:
  - name: eth0
  - tcp_segmentation_offload: on

```
salt.states.ethtool.

### salt.states.esxi

Manage VMware ESXi Hosts.
New in version 2015.8.4.

**Dependencies**

- pyVmomi Python Module
- ESXCLI

**pyVmomi**

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See Issue #29537 for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original ESXi State Module was developed against.
ESXCLI

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for vSphere 5.5 and vSphere 6.0.

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host’s syslog configuration.

Note: Be aware that some functionality in this state module may depend on the type of license attached to the ESXi host.

For example, certain services are only available to manipulate service state or policies with a VMware vSphere Enterprise or Enterprise Plus license, while others are available with a Standard license. The ntpd service is restricted to an Enterprise Plus license, while ssh is available via the Standard license.

Please see the vSphere Comparison page for more information.

About

This state module was written to be used in conjunction with Salt’s ESXi Proxy Minion. For a tutorial on how to use Salt’s ESXi Proxy Minion, please refer to the ESXi Proxy Minion Tutorial for configuration examples, dependency installation instructions, how to run remote execution functions against ESXi hosts via a Salt Proxy Minion, and a larger state example.

```
salt.states.esxi.coredump_configured(name, enabled, dump_ip, host_vnic='vmk0', dump_port=6500)
```

Ensures a host’s core dump configuration.

- **name** Name of the state.
- **enabled** Sets whether or not ESXi core dump collection should be enabled. This is a boolean value set to True or False to enable or disable core dumps.

Note that ESXi requires that the core dump must be enabled before any other parameters may be set. This also affects the changes results in the state return dictionary. If enabled is False, we can’t obtain any previous settings to compare other state variables, resulting in many old references returning None.

Once enabled is True the changes dictionary comparisons will be more accurate. This is due to the way the system coredemp network configuration command returns data.

- **dump_ip** The IP address of host that will accept the dump.
- **host_vnic** Host VNic port through which to communicate. Defaults to vmk0.
- **dump_port** TCP port to use for the dump. Defaults to 6500.

Example:

```
configure-host-coredump:
  esxi.coredump_configured:
    - enabled: True
    - dump_ip: 'my-coredump-ip.example.com'
```
salt.states.esxi.diskgroups_configured(name, diskgroups, erase_disks=False)

Configures the disk groups to use for vsan.

This function will do the following:
1. Check whether or not all disks in the diskgroup spec exist, and raises and errors if they do not.
2. Create diskgroups with the correct disk configurations if diskgroup (identified by the cache disk canonical name) doesn’t exist
3. Adds extra capacity disks to the existing diskgroup

Example:

```yaml
{
  'cache_scsi_addr': 'vmhba1:C0:T0:L0',
  'capacity_scsi_addrs': [
    'vmhba2:C0:T0:L0',
    'vmhba3:C0:T0:L0',
    'vmhba4:C0:T0:L0',
  ]
}
```

**name**  Mandatory state name

**diskgroups**  Disk group representation containing scsi disk addresses. Scsi addresses are expected for disks in the diskgroup:

**erase_disks**  Specifies whether to erase all partitions on all disks member of the disk group before the disk group is created. Default value is False.

salt.states.esxi.host_cache_configured(name, enabled, datastore, swap_size='100%', dedicated_backing_disk=False, erase_backing_disk=False)

Configures the host cache used for swapping.

It will do the following:
1. Checks if backing disk exists
2. Creates the VMFS datastore if doesn’t exist (datastore partition will be created and use the entire disk)
3. Raises an error if `dedicated_backing_disk` is True and partitions already exist on the backing disk
4. Configures host_cache to use a portion of the datastore for caching (either a specific size or a percentage of the datastore)

**Examples**

**Percentage swap size (can’t be 100%)**

```yaml
{
  'enabled': true,
  'datastore': {
    'backing_disk_scsi_addr': 'vmhba0:C0:T0:L0',
    'vmfs_version': 5,
    'name': 'hostcache'
  }
  'dedicated_backing_disk': false
  'swap_size': '98%',
}
```

**Fixed sized swap size**

```yaml
{
  'enabled': true,
  'datastore': {
    'backing_disk_scsi_addr': 'vmhba0:C0:T0:L0',
  }
}
```
name  Mandatory state name.
enabled  Specifies whether the host cache is enabled.
datastore  Specifies the host cache datastore.
swap_size  Specifies the size of the host cache swap. Can be a percentage or a value in GiB. Default value is 100%.
dedicated_backing_disk  Specifies whether the backing disk is dedicated to the host cache which means it must have no other partitions. Default is False
erase_backing_disk  Specifies whether to erase all partitions on the backing disk before the datastore is created. Default value is False.

```

\n
'swap_size': '10GiB',
}
```

salt.states.esxi.ntp_configured(name, service_running, ntp_servers=None, service_policy=None, service_restart=False, update_datetime=False)

Ensures a host’s NTP server configuration such as setting NTP servers, ensuring the NTP daemon is running or stopped, or restarting the NTP daemon for the ESXi host.

name  Name of the state.

service_running  Ensures the running state of the ntp daemon for the host. Boolean value where True indicates that ntpd should be running and False indicates that it should be stopped.

ntp_servers  A list of servers that should be added to the ESXi host’s NTP configuration.

service_policy  The policy to set for the NTP service.

---

**Note:** When setting the service policy to off or on, you must quote the setting. If you don’t, the yaml parser will set the string to a boolean, which will cause trouble checking for stateful changes and will error when trying to set the policy on the ESXi host.

service_restart  If set to True, the ntp daemon will be restarted, regardless of its previous running state. Default is False.

update_datetime  If set to True, the date/time on the given host will be updated to UTC. Default setting is False. This option should be used with caution since network delays and execution delays can result in time skews.

Example:

```

configure-host-ntp:
  esxi.ntp_configured:
    - service_running: True
    - ntp_servers:
      - 192.174.1.100
      - 192.174.1.200
    - service_policy: 'on'
    - service_restart: True
```
name  Name of the state.
password  The new password to change on the host.

Example:

```yaml
configure-host-password:
esxi.password_present:
  - password: 'new-bad-password'
```

**salt.states.esxi.ssh_configured**

```python
salt.states.esxi.ssh_configured(name, service_running, ssh_key=None, ssh_key_file=None, service_policy=None, service_restart=False, certificate_verify=False)
```

Manage the SSH configuration for a host including whether or not SSH is running or the presence of a given
SSH key. Note: Only one ssh key can be uploaded for root. Uploading a second key will replace any existing
key.

**name**  Name of the state.

**service_running**  Ensures whether or not the SSH service should be running on a host. Represented as a
boolean value where True indicates that SSH should be running and False indicates that SSH should
stopped.

In order to update SSH keys, the SSH service must be running.

**ssh_key**  Public SSH key to added to the authorized_keys file on the ESXi host. You can use ssh_key or
ssh_key_file, but not both.

**ssh_key_file**  File containing the public SSH key to be added to the authorized_keys file on the ESXi host. You
can use ssh_key_file or ssh_key, but not both.

**service_policy**  The policy to set for the NTP service.

Note: When setting the service policy to off or on, you must quote the setting. If you don’t, the yaml
parser will set the string to a boolean, which will cause trouble checking for stateful changes and will
error when trying to set the policy on the ESXi host.

**service_restart**  If set to True, the SSH service will be restarted, regardless of its previous running state.
Default is False.

**certificate_verify**  If set to True, the SSL connection must present a valid certificate. Default is False.

Example:

```yaml
configure-host-ssh:
esxi.ssh_configured:
  - service_running: True
  - ssh_key_file: /etc/salt/ssh_keys/my_key.pub
  - service_policy: 'on'
  - service_restart: True
  - certificate_verify: True
```

**salt.states.esxi.syslog_configured**

```python
salt.states.esxi.syslog_configured(name, syslog_configs, firewall=True, reset_service=True, reset_syslog_config=False, reset_configs=None)
```

Ensures the specified syslog configuration parameters. By default, this state will reset the syslog service after
any new or changed parameters are set successfully.

**name**  Name of the state.

**syslog_configs**  Name of parameter to set (corresponds to the command line switch for esxcli without the
double dashes (-))

Valid syslog_config values are logdir, loghost, logdir-unique, default-rotate, default-size, and default-timeout.

Each syslog_config option also needs a configuration value to set. For example, loghost requires
URLs or IP addresses to use for logging. Multiple log servers can be specified by listing them, comma-
separated, but without spaces before or after commas
enable the firewall rule set for syslog. Defaults to True.
reset_service  After a successful parameter set, reset the service. Defaults to True.
reset_syslog_config Resets the syslog service to it's default settings. Defaults to False. If set to True, default settings defined by the list of syslog configs in reset_configs will be reset before running any other syslog settings.
reset_configs A comma-delimited list of parameters to reset. Only runs if reset_syslog_config is set to True. If reset_syslog_config is set to True, but no syslog configs are listed in reset_configs, then reset_configs will be set to all by default.

See syslog_configs parameter above for a list of valid options.

Example:

```yaml
configure-host-syslog:
  esxi.syslog_configured:
    - syslog_configs:
default-timeout: 120
    - firewall: True
    - reset_service: True
    - reset_syslog_config: True
    - reset_configs: loghost,default-timeout
```

salt.states.esxi.vmotion_configured(name, enabled, device='vmk0')

Configures a host's VMotion properties such as enabling VMotion and setting the device VirtualNic that VMotion will use.

name  Name of the state.
enabled Ensures whether or not VMotion should be enabled on a host as a boolean value where True indicates that VMotion should be enabled and False indicates that VMotion should be disabled.
device The device that uniquely identifies the VirtualNic that will be used for VMotion for the host. Defaults to vmk0.

Example:

```yaml
configure-vmotion:
  esxi.vmotion_configured:
    - enabled: True
    - device: sample-device
```

salt.states.esxi.vsan_configured(name, enabled, add_disks_to_vsan=False)

Configures a host’s VSAN properties such as enabling or disabling VSAN, or adding VSAN-eligible disks to the VSAN system for the host.

name  Name of the state.
enabled Ensures whether or not VSAN should be enabled on a host as a boolean value where True indicates that VSAN should be enabled and False indicates that VSAN should be disabled.
add_disks_to_vsan If set to True, any VSAN-eligible disks for the given host will be added to the host's VSAN system. Default is False.

Example:

```yaml
configure-host-vsan:
  esxi.vsan_configured:
    - enabled: True
    - add_disks_to_vsan: True
```
21.19.84 salt.states.event

Send events through Salt’s event system during state runs

```
salt.states.event.send(name, data=None, preload=None, with_env=False, with_grains=False, with_pillar=False, show_changed=True, **kwargs)
```

Send an event to the Salt Master

New in version 2014.7.0.

Accepts the same arguments as the `event.send` execution module of the same name, with the additional argument:

**Parameters** `show_changed` – If True, state will show as changed with the data argument as the change value. If False, shows as unchanged.

**Example:**

```
# ...snip bunch of states above

mycompany/mystaterun/status/update:
  event.send:
    - data:
      status: "Half-way through the state run!"

# ...snip bunch of states below
```

```
salt.states.event.wait(name, sfun=None)
```

Fire an event on the Salt master event bus if called from a watch statement

New in version 2014.7.0.

**Example:**

```
# Stand up a new web server.
apache:
  pkg:
    - installed
    - name: httpd
  service:
    - running
    - enable: True
    - name: httpd

# Notify the load balancer to update the pool once Apache is running.
refresh_pool:
  event:
    - wait
    - name: mycompany/loadbalancer/pool/update
    - data:
      new_web_server_ip: {{ grains[ipv4] | first }}
    - watch:
      - pkg: apache
```

21.19.85 salt.states.file

Operations on regular files, special files, directories, and symlinks

Salt States can aggressively manipulate files on a system. There are a number of ways in which files can be managed.

21.19. state modules
Regular files can be enforced with the `file.managed` state. This state downloads files from the salt master and places them on the target system. Managed files can be rendered as a jinja, mako, or wempy template, adding a dynamic component to file management. An example of `file.managed` which makes use of the jinja templating system would look like this:

```
/etc/http/conf/http.conf:
file.managed:
  - source: salt://apache/http.conf
  - user: root
  - group: root
  - mode: 644
  - attrs: ai
  - template: jinja
  - defaults:
    - custom_var: "default value"
    - other_var: 123
{% if grains['os'] == 'Ubuntu' %}
  - context:
    - custom_var: "override"
{% endif %}
```

It is also possible to use the `py renderer` as a templating option. The template would be a Python script which would need to contain a function called `run()`, which returns a string. All arguments to the state will be made available to the Python script as globals. The returned string will be the contents of the managed file. For example:

```python
def run():
    lines = ['foo', 'bar', 'baz']
    lines.extend([source, name, user, context])  # Arguments as globals
    return '

'.join(lines)
```

**Note:** The `defaults` and `context` arguments require extra indentation (four spaces instead of the normal two) in order to create a nested dictionary. [More information.](#)

If using a template, any user-defined template variables in the file defined in `source` must be passed in using the `defaults` and/or `context` arguments. The general best practice is to place default values in `defaults`, with conditional overrides going into `context`, as seen above.

The template will receive a variable `custom_var`, which would be accessed in the template using `{{ custom_var }}`. If the operating system is Ubuntu, the value of the variable `custom_var` would be `override`, otherwise it is the default `default value`.

The `source` parameter can be specified as a list. If this is done, then the first file to be matched will be the one that is used. This allows you to have a default file on which to fall back if the desired file does not exist on the salt fileserver. Here’s an example:

```
/etc/foo.conf:
file.managed:
  - source: salt://foo.conf.{{ grains['fqdn'] }}
  - salt://foo.conf.fallback
  - user: foo
  - group: users
  - mode: 644
  - attrs: i
  - backup: minion
```
Note: Salt supports backing up managed files via the backup option. For more details on this functionality please review the `backup_mode documentation`.

The `source` parameter can also specify a file in another Salt environment. In this example `foo.conf` in the `dev` environment will be used instead.

```
/etc/foo.conf:
  file.managed:
    - source: 'salt://foo.conf?saltenv=dev'
    - user: foo
    - group: users
    - mode: '0644'
    - attrs: i
```

Warning: When using a mode that includes a leading zero you must wrap the value in single quotes. If the value is not wrapped in quotes it will be read by YAML as an integer and evaluated as an octal.

The `names` parameter, which is part of the state compiler, can be used to expand the contents of a single state declaration into multiple, single state declarations. Each item in the `names` list receives its own individual state name and is converted into its own low-data structure. This is a convenient way to manage several files with similar attributes.

```
salt_master_conf:
  file.managed:
    - user: root
    - group: root
    - mode: '0644'
    - names:
      - /etc/salt/master.d/master.conf:
        - source: salt://saltmaster/master.conf
      - /etc/salt/minion.d/minion-99.conf:
        - source: salt://saltmaster/minion.conf
```

Note: There is more documentation about this feature in the `Names declaration` section of the `Highstate docs`.

Special files can be managed via the `mknod` function. This function will create and enforce the permissions on a special file. The function supports the creation of character devices, block devices, and FIFO pipes. The function will create the directory structure up to the special file if it is needed on the minion. The function will not overwrite or operate on (change major/minor numbers) existing special files with the exception of user, group, and permissions. In most cases the creation of some special files require root permissions on the minion. This would require that the minion to be run as the root user. Here is an example of a character device:

```
/var/named/chroot/dev/random:
  file.mknod:
    - ntype: c
    - major: 1
    - minor: 8
    - user: named
    - group: named
    - mode: 660
```
Here is an example of a block device:

```
/var/named/chroot/dev/loop0:
  file.mknod:
    - ntype: b
    - major: 7
    - minor: 0
    - user: named
    - group: named
    - mode: 660
```

Here is an example of a fifo pipe:

```
/var/named/chroot/var/log/logfifo:
  file.mknod:
    - ntype: p
    - user: named
    - group: named
    - mode: 660
```

Directories can be managed via the `directory` function. This function can create and enforce the permissions on a directory. A directory statement will look like this:

```
/srv/stuff/substuf:
  file.directory:
    - user: fred
    - group: users
    - mode: 755
    - makedirs: True
```

If you need to enforce user and/or group ownership or permissions recursively on the directory’s contents, you can do so by adding a `recurse` directive:

```
/srv/stuff/substuf:
  file.directory:
    - user: fred
    - group: users
    - mode: 755
    - makedirs: True
    - recurse:
      - user
      - group
      - mode
```

As a default, `mode` will resolve to `dir_mode` and `file_mode`, to specify both directory and file permissions, use this form:

```
/srv/stuff/substuf:
  file.directory:
    - user: fred
    - group: users
    - file_mode: 744
    - dir_mode: 755
    - makedirs: True
    - recurse:
      - user
      - group
      - mode
```
Symlinks can be easily created; the symlink function is very simple and only takes a few arguments:

```
/etc/grub.conf:
  file.symlink:
    - target: /boot/grub/grub.conf
```

Recursive directory management can also be set via the `recurse` function. Recursive directory management allows for a directory on the salt master to be recursively copied down to the minion. This is a great tool for deploying large code and configuration systems. A state using `recurse` would look something like this:

```
/opt/code/flask:
  file.recurse:
    - source: salt://code/flask
    - include_empty: True
```

A more complex `recurse` example:

```
{% set site_user = 'testuser' %}
{% set site_name = 'test_site' %}
{% set project_name = 'test_proj' %}
{% set sites_dir = 'test_dir' %}

django-project:
  file.recurse:
    - name: {{ sites_dir }}/{{ site_name }}/{{ project_name }}
    - user: {{ site_user }}
    - dir_mode: 2775
    - file_mode: '0644'
    - template: jinja
    - source: salt://project/templates_dir
    - include_empty: True
```

Retention scheduling can be applied to manage contents of backup directories. For example:

```
/var/backups/example_directory:
  file.retention_schedule:
    - strftime_format: example_name_%Y%m%dT%H%M%S.tar.bz2
    - retain:
      most_recent: 5
      first_of_hour: 4
      first_of_day: 14
      first_of_week: 6
      first_of_month: 6
      first_of_year: all
```

```
salt.states.file.absent(name, **kwargs)
Make sure that the named file or directory is absent. If it exists, it will be deleted. This will work to reverse any of the functions in the file state module. If a directory is supplied, it will be recursively deleted.

name The path which should be deleted
```

```
salt.states.file.accumulated(name, filename, text, **kwargs)
Prepare accumulator which can be used in template in file.managed state. Accumulator dictionary becomes available in template. It can also be used in file.blockreplace.

name Accumulator name
filename Filename which would receive this accumulator (see file.managed state documentation about name)
text String or list for adding in accumulator
require_in / watch_in One of them required for sure we fill up accumulator before we manage the file. Probably the same as filename
```
Example:

Given the following:

```
animals_doing_things:
file.accumulated:
  - filename: /tmp/animal_file.txt
  - text: 'jumps over the lazy dog.'
  - require_in:
    - file: animal_file

animal_file:
file.managed:
  - name: /tmp/animal_file.txt
  - source: salt://animal_file.txt
  - template: jinja
```

One might write a template for `animal_file.txt` like the following:

```
The quick brown fox{% for animal in accumulator['animals_doing_things'] %}{%for animal %}{% endfor %}
```

Collectively, the above states and template file will produce:

```
The quick brown fox jumps over the lazy dog.
```

Multiple accumulators can be "chained" together.

**Note:** The 'accumulator' data structure is a Python dictionary. Do not expect any loop over the keys in a deterministic order!

salt.states.file.append(name, text=None, makedirs=False, source=None, source_hash=None, template='jinja', sources=None, source_hashes=None, defaults=None, context=None, ignore_whitespace=True)

Ensure that some text appears at the end of a file.

The text will not be appended if it already exists in the file. A single string of text or a list of strings may be appended.

- **name**  The location of the file to append to.
- **text**  The text to be appended, which can be a single string or a list of strings.
- **makedirs**  If the file is located in a path without a parent directory, then the state will fail. If makedirs is set to True, then the parent directories will be created to facilitate the creation of the named file. Defaults to False.
- **source**  A single source file to append. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials (see s3.get state documentation). File retrieval from Openstack Swift object storage is supported via swift://container/object_path URLs (see swift.get documentation).

For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs.

If the file is hosted on an HTTP or FTP server, the source_hash argument is also required.

- **source_hash**  This can be one of the following:
  1. a source hash string
  2. the URI of a file that contains source hash strings
The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

<table>
<thead>
<tr>
<th>Type</th>
<th>Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>sha512</td>
<td>128</td>
</tr>
<tr>
<td>sha384</td>
<td>96</td>
</tr>
<tr>
<td>sha256</td>
<td>64</td>
</tr>
<tr>
<td>sha224</td>
<td>56</td>
</tr>
<tr>
<td>sha1</td>
<td>40</td>
</tr>
<tr>
<td>md5</td>
<td>32</td>
</tr>
</tbody>
</table>

See the `source_hash` parameter description for `file.managed` function for more details and examples.

**template** The named templating engine will be used to render the appended-to file. Defaults to `jinja`. The following templates are supported:
- `cheetah`
- `genshi`
- `jinja`
- `mako`
- `py`
- `wempy`

**sources** A list of source files to append. If the files are hosted on an HTTP or FTP server, the `source_hashes` argument is also required.

**source_hashes** A list of source_hashes corresponding to the sources list specified in the sources argument.

**defaults** Default context passed to the template.

**context** Overrides default context variables passed to the template.

**ignore_whitespace** New in version 2015.8.4.

Spaces and Tabs in text are ignored by default, when searching for the appending content, one space or multiple tabs are the same for salt. Set this option to `False` if you want to change this behavior.

Multi-line example:

```yaml
/etc/motd:
  file.append:
    text: |
    Thou hadst better eat salt with the Philosophers of Greece, than sugar with the Courtiers of Italy.
    - Benjamin Franklin
```

Multiple lines of text:

```yaml
/etc/motd:
  file.append:
    text:
      - Trust no one unless you have eaten much salt with him.
      - "Salt is born of the purest of parents: the sun and the sea."
```

Gather text from multiple template files:

```yaml
/etc/motd:
  file:
    append
    template: jinja
    sources:
      salt://motd/devops-messages.tmpl
```

(continues on next page)
- salt://motd/hr-messages.tmpl
- salt://motd/general-messages.tmpl

New in version 0.9.5.

salt.states.file.blockreplace(name, marker_start='#– start managed zone –', marker_end='#– end managed zone –', source=None, source_hash=None, template='jinja', sources=None, source_hashes=None, defaults=None, context=None, content='', append_if_not_found=False, prepend_if_not_found=False, backup='.bak', show_changes=True, append_newline=None)

Maintain an edit in a file in a zone delimited by two line markers

New in version 2014.1.0.

Changed in version 2017.7.5, 2018.3.1: append_newline argument added. Additionally, to improve idempotence, if the string represented by marker_end is found in the middle of the line, the content preceding the marker will be removed when the block is replaced. This allows one to remove append_newline: False from the SLS and have the block properly replaced if the end of the content block is immediately followed by the marker_end (i.e. no newline before the marker).

A block of content delimited by comments can help you manage several lines entries without worrying about old entries removal. This can help you maintaining an un-managed file containing manual edits.

Note: This function will store two copies of the file in-memory (the original version and the edited version) in order to detect changes and only edit the targeted file if necessary.

Additionally, you can use file.accumulated and target this state. All accumulated data dictionaries' content will be added in the content block.

name  Filesystem path to the file to be edited

marker_start  The line content identifying a line as the start of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output

marker_end  The line content identifying the end of the content block. As of versions 2017.7.5 and 2018.3.1, everything up to the text matching the marker will be replaced, so it's important to ensure that your marker includes the beginning of the text you wish to replace.

content  The content to be used between the two lines identified by marker_start and marker_end

source  The source file to download to the minion, this source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials. (see s3.get state documentation) File retrieval from Openstack Swift object storage is supported via swift://container/object_path URLs, see swift.get documentation. For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs. If source is left blank or None (use ~ in YAML), the file will be created as an empty file and the content will not be managed. This is also the case when a file already exists and the source is undefined; the contents of the file will not be changed or managed.

If the file is hosted on a HTTP or FTP server then the source_hash argument is also required.

A list of sources can also be passed in to provide a default source and a set of fallbacks. The first source in the list that is found to exist will be used and subsequent entries in the list will be ignored.

file_override_example:
file.blockreplace:

(continues on next page)
### source_hash

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

<table>
<thead>
<tr>
<th>Type</th>
<th>Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>sha512</td>
<td>128</td>
</tr>
<tr>
<td>sha384</td>
<td>96</td>
</tr>
<tr>
<td>sha256</td>
<td>64</td>
</tr>
<tr>
<td>sha224</td>
<td>56</td>
</tr>
<tr>
<td>sha1</td>
<td>40</td>
</tr>
<tr>
<td>md5</td>
<td>32</td>
</tr>
</tbody>
</table>

See the `source_hash` parameter description for `file.managed` function for more details and examples.

### template [jinja]

Templating engine to be used to render the downloaded file. The following engines are supported:

- `cheetah`
- `genshi`
- `jinja`
- `mako`
- `py`
- `wempy`

### context

Overrides default context variables passed to the template

### defaults

Default context passed to the template

### append_if_not_found [False]

If markers are not found and this option is set to `True`, the content block will be appended to the file.

### prepend_if_not_found [False]

If markers are not found and this option is set to `True`, the content block will be prepended to the file.

### backup

The file extension to use for a backup of the file if any edit is made. Set this to `False` to skip making a backup.

### dry_run [False]

If `True`, do not make any edits to the file and simply return the changes that *would* be made.

### show_changes [True]

Controls how changes are presented. If `True`, the `Changes` section of the state return will contain a unified diff of the changes made. If `False`, then it will contain a boolean (`True` if any changes were made, otherwise `False`).

### append_newline

Controls whether or not a newline is appended to the content block. If the value of this argument is `True` then a newline will be added to the content block. If it is `False`, then a newline will not be added to the content block. If it is unspecified, then a newline will only be added to the content block if it does not already end in a newline.

New in version 2017.7.5,2018.3.1.

Example of usage with an accumulator and with a variable:

```python
{% set myvar = 42 %}
hosts-config-block-{{ myvar }}:
  file.blockreplace:
```
will generate and maintain a block of content in /etc/hosts:

```
# START managed zone 42 -DO-NOT-EDIT-
First line of content
text 2
text 3
text 4
# END managed zone 42 --
```

salt.states.file.cached(name, source_hash=",  
source_hash_name=None, skip_verify=False, 
saltenv=\'base\')

New in version 2017.7.3.

Ensures that a file is saved to the minion’s cache. This state is primarily invoked by other states to ensure that we do not re-download a source file if we do not need to.

**name**  The URL of the file to be cached. To cache a file from an environment other than base, either use the saltenv argument or include the saltenv in the URL (e.g. salt://path/to/file.conf?saltenv=\'dev\').

**Note:** A list of URLs is not supported, this must be a single URL. If a local file is passed here, then the state will obviously not try to download anything, but it will compare a hash if one is specified.

**source_hash**  See the documentation for this same argument in the *file.managed* state.

**Note:** For remote files not originating from the salt:// fileserver, such as http(s) or ftp servers, this state will not re-download the file if the locally-cached copy matches this hash. This is done to prevent unnecessary downloading on repeated runs of this state. To update the cached copy of a file, it is necessary to update this hash.
source_hash_name  See the documentation for this same argument in the file.managed state.

skip_verify  See the documentation for this same argument in the file.managed state.

Note: Setting this to True will result in a copy of the file being downloaded from a remote (http(s), ftp, etc.) source each time the state is run.

saltenv  Used to specify the environment from which to download a file from the Salt fileserver (i.e. those with salt:// URL).
This state will in most cases not be useful in SLS files, but it is useful when writing a state or remote-execution module that needs to make sure that a file at a given URL has been downloaded to the cachedir. One example of this is in the archive.extracted state:

```python
result = __states__['file.cached']({
    source_match,  # The entire regex pattern
    source_hash,  # The hash of the source file
    source_hash_name,  # The name of the source file
    skip_verify,  # Whether to verify the source hash
    saltenv  # The environment to use
})
```

This will return a dictionary containing the state’s return data, including a result key which will state whether or not the state was successful. Note that this will not catch exceptions, so it is best used within a try/except.

Once this state has been run from within another state or remote-execution module, the actual location of the cached file can be obtained using `cp.is_cached`:

```python
cached = __salt__['cp.is_cached']({
    source_match,  # The full path to the source file
    saltenv  # The environment to use
})
```

This function will return the cached path of the file, or an empty string if the file is not present in the minion cache.

salt.states.file.comment(name, regex, char='#', backup='.bak')
Comment out specified lines in a file.

- **name**  The full path to the file to be edited
- **regex**  A regular expression used to find the lines that are to be commented; this pattern will be wrapped in parenthesis and will move any preceding/trailing ^ or $ characters outside the parenthesis (e.g., the pattern ^foo$ will be rewritten as ^foo$) Note that you _need_ the leading ^, otherwise each time you run highstate, another comment char will be inserted.
- **char**  [ #] The character to be inserted at the beginning of a line in order to comment it out
- **backup**  [.bak] The file will be backed up before edit with this file extension

**Warning:** This backup will be overwritten each time `sed / comment / uncomment` is called. Meaning the backup will only be useful after the first invocation.

Set to False/None to not keep a backup.

Usage:

```
/etc/fstab:
file.comment:
  - regex: ^bind 127.0.0.1
```

New in version 0.9.5.

salt.states.file.copy_(name, source, force=False, makedirs=False, preserve=False, user=None, group=None, mode=None, subdir=False, **kwargs)
If the file defined by the `source` option exists on the minion, copy it to the named path. The file will not be
overwritten if it already exists, unless the \texttt{force} option is set to \texttt{True}.

\textbf{Note:} This state only copies files from one location on a minion to another location on the same minion. For copying files from the master, use a \texttt{file.managed} state.

**name** The location of the file to copy to
**source** The location of the file to copy to the location specified with name
**force** If the target location is present then the file will not be moved, specify "force: True" to overwrite the target file
**makdirs** If the target subdirectories don’t exist create them
**preserve** New in version 2015.5.0.

Set \texttt{preserve: True} to preserve user/group ownership and mode after copying. Default is \texttt{False}. If \texttt{preserve} is set to \texttt{True}, then user/group/mode attributes will be ignored.

**user** New in version 2015.5.0.

The user to own the copied file, this defaults to the user salt is running as on the minion. If \texttt{preserve} is set to \texttt{True}, then this will be ignored

**group** New in version 2015.5.0.

The group to own the copied file, this defaults to the group salt is running as on the minion. If \texttt{preserve} is set to \texttt{True} or on Windows this will be ignored

**mode** New in version 2015.5.0.

The permissions to set on the copied file, aka 644, '0775', '4664'. If \texttt{preserve} is set to \texttt{True}, then this will be ignored. Not supported on Windows.

The default mode for new files and directories corresponds unmask of salt process. For existing files and directories it’s not enforced.

**subdir** New in version 2015.5.0.

If the name is a directory then place the file inside the named directory

\textbf{Note:} The copy function accepts paths that are local to the Salt minion. This function does not support salt://, http://, or the other additional file paths that are supported by \texttt{states.file.managed} and \texttt{states.file.recurse}.

\begin{verbatim}
3426 Chapter 21. Salt Module Reference
\end{verbatim}
- encoding_type: base64
- contents_pillar: mypillar:thefile

# or

```python
write_base64_encoded_string_to_a_file:
  file.decode:
    - name: /tmp/new_file
    - encoding_type: base64
    - encoded_data: Z2V0IHNhbHRlZAo=
```

Be careful with multi-line strings that the YAML indentation is correct. E.g.,

```
write_base64_encoded_string_to_a_file:
  file.decode:
    - name: /tmp/new_file
    - encoding_type: base64
    - encoded_data: {{ salt.pillar.get('path:to:data') | indent(8) }}
```

salt.states.file.directory

Ensure that a named directory is present and has the right perms

- name The location to create or manage a directory, as an absolute path
- user The user to own the directory; this defaults to the user salt is running as on the minion
- group The group ownership set for the directory; this defaults to the group salt is running as on the minion.
  On Windows, this is ignored
- recurse Enforce user/group ownership and mode of directory recursively. Accepts a list of strings representing what you would like to recurse. If mode is defined, will recurse on both file_mode and dir_mode if they are defined. If ignore_files or ignore_dirs is included, files or directories will be left unchanged respectively. Example:

```
/var/log/httpd:
  file.directory:
    - user: root
    - group: root
    - dir_mode: 755
    - file_mode: 644
    - recurse:
      - user
      - group
      - mode
```

Leave files or directories unchanged:

```
/var/log/httpd:
  file.directory:
    - user: root
    - group: root
    - dir_mode: 755
```

(continues on next page)
- **file_mode**: 644
- **recurse**: - user - group - mode - ignore_dirs

New in version 2015.5.0.

**max_depth** Limit the recursion depth. The default is no limit=None. 'max_depth' and 'clean' are mutually exclusive.

New in version 2016.11.0.

**dir_mode / mode** The permissions mode to set any directories created. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

**file_mode** The permissions mode to set any files created if 'mode' is run in 'recurse'. This defaults to dir_mode. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

**makedirs** If the directory is located in a path without a parent directory, then the state will fail. If makedirs is set to True, then the parent directories will be created to facilitate the creation of the named file.

**clean** Make sure that only files that are set up by salt and required by this function are kept. If this option is set then everything in this directory will be deleted unless it is required. 'clean' and 'max_depth' are mutually exclusive.

**require** Require other resources such as packages or files

**exclude_pat** When 'clean' is set to True, exclude this pattern from removal list and preserve in the destination.

**follow_symlinks** [False] If the desired path is a symlink (or recurse is defined and a symlink is encountered while recursing), follow it and check the permissions of the directory/file to which the symlink points.

New in version 2014.1.4.

**force** If the name of the directory exists and is not a directory and force is set to False, the state will fail. If force is set to True, the file in the way of the directory will be deleted to make room for the directory, unless backupname is set, then it will be renamed.

New in version 2014.7.0.

**backupname** If the name of the directory exists and is not a directory, it will be renamed to the backupname. If the backupname already exists and force is False, the state will fail. Otherwise, the backupname will be removed first.

New in version 2014.7.0.

**allow_symlink** [True] If allow_symlink is True and the specified path is a symlink, it will be allowed to remain if it points to a directory. If allow_symlink is False then the state will fail, unless force is also set to True, in which case it will be removed or renamed, depending on the value of the backupname argument.

New in version 2014.7.0.

**children_only** [False] If children_only is True the base of a path is excluded when performing a recursive operation. In case of /path/to/base, base will be ignored while all of /path/to/base/* are still operated on.

**win_owner** [None] The owner of the directory. If this is not passed, user will be used. If user is not passed, the account under which Salt is running will be used.

New in version 2017.7.0.

**win_perms** [None] A dictionary containing permissions to grant and their propagation. For example:

{{'Administrators': {'perms': 'full_control', 'applies_to': 'this_folder_only'}}}

Can be a single basic perm or a list of advanced perms. perms must be specified. applies_to is optional and defaults to this_folder_subfolder_files.
New in version 2017.7.0.

**win_deny_perms** [None] A dictionary containing permissions to deny and their propagation. For example: 
```python
{'Administrators': {'perms': 'full_control', 'applies_to': 'this_folder_only'}}
```
Can be a single basic perm or a list of advanced perms.

New in version 2017.7.0.

**win_inheritance** [True] True to inherit permissions from the parent directory, False not to inherit permission.

New in version 2017.7.0.

**win_perms_reset** [False] If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False.

New in version 2018.3.0.

Here's an example using the above `win_*` parameters:

```python
create_config_dir:
  file.directory:
  - name: 'C:\config\'
  - win_owner: Administrators
  - win_perms:
    # Basic Permissions
    dev_ops:
      perms: full_control
    # List of advanced permissions
    appuser:
      perms:
        - read_attributes
        - read_ea
        - create_folders
        - read_permissions
      applies_to: this_folder_only
    joe_snuffy:
      perms: read
      applies_to: this_folder_files
  - win_deny_perms:
    fred_snuffy:
      perms: full_control
  - win_inheritance: False
```

**salt.states.file.exists**(name, **kwargs)
Verify that the named file or directory is present or exists. Ensures pre-requisites outside of Salt’s purview (e.g., keytabs, private keys, etc.) have been previously satisfied before deployment.

This function does not create the file if it doesn’t exist, it will return an error.

**name** Absolute path which must exist

**salt.states.file.hardlink**(name, target, force=False, makedirs=False, user=None, group=None, dir_mode=None, **kwargs)
Create a hard link If the file already exists and is a hard link pointing to any location other than the specified target, the hard link will be replaced. If the hard link is a regular file or directory then the state will return False. If the regular file is desired to be replaced with a hard link pass force: True

**name** The location of the hard link to create

**target** The location that the hard link points to

**force** If the name of the hard link exists and force is set to False, the state will fail. If force is set to True, the file or directory in the way of the hard link file will be deleted to make room for the hard link, unless backupname is set, when it will be renamed

**makedirs** If the location of the hard link does not already have a parent directory then the state will fail, setting makedirs to True will allow Salt to create the parent directory
user  The user to own any directories made if makedirs is set to true. This defaults to the user salt is running as on the minion.

group  The group ownership set on any directories made if makedirs is set to true. This defaults to the group salt is running as on the minion. On Windows, this is ignored.

dir_mode  If directories are to be created, passing this option specifies the permissions for those directories.

salt.states.file.line( name, content=None, match=None, mode=None, location=None, before=None, after=None, show_changes=True, backup=False, quiet=False, indent=True, create=False, user=None, group=None, file_mode=None)

Line-based editing of a file.

New in version 2015.8.0.

Parameters

- name  – Filesystem path to the file to be edited.
- content  – Content of the line. Allowed to be empty if mode=delete.
- match  – Match the target line for an action by a fragment of a string or regular expression.

If neither before nor after are provided, and match is also None, match becomes the content value.

- mode  – Defines how to edit a line. One of the following options is required:
  - ensure  If line does not exist, it will be added.
  - replace  If line already exists, it will be replaced.
  - delete  Delete the line, once found.
  - insert  Insert a line.

Note:  If mode=insert is used, at least one of the following options must also be defined: location, before, or after. If location is used, it takes precedence over the other two options.

- location  – Defines where to place content in the line. Note this option is only used when mode=insert is specified. If a location is passed in, it takes precedence over both the before and after kwargs. Valid locations are:
  - start  Place the content at the beginning of the file.
  - end  Place the content at the end of the file.
- before  – Regular expression or an exact case-sensitive fragment of the string. This option is only used when either the ensure or insert mode is defined.
- after  – Regular expression or an exact case-sensitive fragment of the string. This option is only used when either the ensure or insert mode is defined.
- show_changes  – Output a unified diff of the old file and the new file. If False return a boolean if any changes were made. Default is True

Note:  Using this option will store two copies of the file in-memory (the original version and the edited version) in order to generate the diff.

- backup  – Create a backup of the original file with the extension: ”Year-Month-Day-Hour-Minutes-Seconds”.
- quiet  – Do not raise any exceptions. E.g. ignore the fact that the file that is tried to be edited does not exist and nothing really happened.
- indent  – Keep indentation with the previous line. This option is not considered when the delete mode is specified.
- create  – Create an empty file if doesn’t exists.

New in version 2016.11.0.

- user  – The user to own the file, this defaults to the user salt is running as on the minion.
New in version 2016.11.0.

- **group** – The group ownership set for the file, this defaults to the group salt is running as on the minion On Windows, this is ignored.

New in version 2016.11.0.

- **file_mode** – The permissions to set on this file, aka 644, 0775, 4664. Not supported on Windows.

New in version 2016.11.0.

If an equal sign (=) appears in an argument to a Salt command, it is interpreted as a keyword argument in the format of `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```python
update_config:
  file.line:
  - name: /etc/myconfig.conf
  - mode: ensure
  - content: my key = my value
  - before: somekey,*
```

```python
salt.states.file.managed(name, source=None, source_hash='", source_hash_name=None, keep_source=True, user=None, group=None, mode=None, attrs=None, template=None, makedirs=False, dir_mode=None, context=None, replace=True, defaults=None, backup='", show_changes=True, create=True, contents=None, tmp_dir='", tmp_ext='", contents_pillar=None, contents_newline=True, contents_delimiter=';', encoding=None, encoding_errors='strict', allow_empty=True, follow_symlinks=True, check_cmd=None, skip_verify=False, win_owner=None, win_perms=None, win_deny_perms=None, win_inheritance=True, win_perms_reset=False, **kwargs)
```

Manage a given file, this function allows for a file to be downloaded from the salt master and potentially run through a templating system.

**name**  The location of the file to manage, as an absolute path.

**source** The source file to download to the minion, this source file can be hosted on either the salt master server (`salt://`), the salt minion local file system (`/`), or on an HTTP or FTP server (`http(s)://`, `ftp://`).

Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials. (see`s3.get state documentation`) File retrieval from Openstack Swift object storage is supported via`swift://container/object_path` URLs, see`swift.get documentation`. For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is `salt://spam/eggs`. If source is left blank or None (use `-` in YAML), the file will be created as an empty file and the content will not be managed. This is also the case when a file already exists and the source is undefined; the contents of the file will not be changed or managed. If source is left blank or None, please also set replaced to False to make your intention explicit.

If the file is hosted on a HTTP or FTP server then the source_hash argument is also required.

A list of sources can also be passed in to provide a default source and a set of fallbacks. The first source in the list that is found to exist will be used and subsequent entries in the list will be ignored. Source list functionality only supports local files and remote files hosted on the salt master server or retrievable via HTTP, HTTPS, or FTP.

```python
file_override_example:
  file.managed:
  - source:
```
source_hash

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

<table>
<thead>
<tr>
<th>Type</th>
<th>Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>sha512</td>
<td>128</td>
</tr>
<tr>
<td>sha384</td>
<td>96</td>
</tr>
<tr>
<td>sha256</td>
<td>64</td>
</tr>
<tr>
<td>sha224</td>
<td>56</td>
</tr>
<tr>
<td>sha1</td>
<td>40</td>
</tr>
<tr>
<td>md5</td>
<td>32</td>
</tr>
</tbody>
</table>

Using a Source Hash File  The file can contain several checksums for several files. Each line must contain both the file name and the hash. If no file name is matched, the first hash encountered will be used, otherwise the most secure hash with the correct source file name will be used.

When using a source hash file the source_hash argument needs to be a url, the standard download urls are supported, ftp, http, salt etc:

Example:

```
tomdroid-src-0.7.3.tar.gz:
  file.managed:
    - name: /tmp/tomdroid-src-0.7.3.tar.gz
    - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/
    - source_hash: https://launchpad.net/tomdroid/beta/0.7.3/+download/tomdroid-src-0.7.3.tar.gz
```

The following lines are all supported formats:

```
/etc/rc.conf ef6e82e4006dee563d98ada2a2a80a27
sha254c8525aee419eb649f0233be91c151178b30f0df8e9bdcc8de71b1d5c8b06a /
/etc/resolv.conf
/etc/resolv.conf
```

Debian file type *.dsc files are also supported.

Inserting the Source Hash in the SLS Data

The source_hash can be specified as a simple checksum, like so:

```
tomdroid-src-0.7.3.tar.gz:
  file.managed:
    - name: /tmp/tomdroid-src-0.7.3.tar.gz
    - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/tomdroid-src-0.7.3.tar.gz
    - source_hash: 79eef25f9b0b2c642c62b7f37d4f53f
```

Note: Releases prior to 2016.11.0 must also include the hash type, like in the below example:
**Known issues:** If the remote server URL has the hash file as an apparent sub-directory of the source file, the module will discover that it has already cached a directory where a file should be cached. For example:

```yaml
File_managed:
- Name: /tmp/tomdroid-src-0.7.3.tar.gz
- Source: https://launchpad.net/tomdroid/beta/0.7.3/+download/tomdroid-src-0.7.3.tar.gz
- Source_hash: md5=79eef25f9b0b2c642c62b7f737d4f53f
```

**source_hash_name** When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename/URI associated with that hash. By default, Salt will look for the filename being managed. When managing a file at path `/tmp/foo.txt`, then the following line in a hash file would match:

```plaintext
acbd18db4cc2f85cedef654fccc4a4d8 foo.txt
```

However, sometimes a hash file will include multiple similar paths:

```plaintext
37b51d194a7513e45b56f6524f2d51f2 ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8 ./dir2/foo.txt
73feff4a7b6bb68e44cf984c85f6e88 ./dir3/foo.txt
```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```yaml
File_managed:
- Source: https://mydomain.tld/dir2/foo.txt
- Source_hash: https://mydomain.tld/_hashes
- Source_hash_name: ./dir2/foo.txt
```

**Note:** This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using `foo.txt` would not match.

New in version 2016.3.5.

**keep_source** [True] Set to False to discard the cached copy of the source file once the state completes. This can be useful for larger files to keep them from taking up space in minion cache. However, keep in mind that discarding the source file will result in the state needing to re-download the source file if the state is run again.

New in version 2017.7.3.

**user** The user to own the file, this defaults to the user salt is running as on the minion.

**group** The group ownership set for the file, this defaults to the group salt is running as on the minion. On Windows, this is ignored.
mode The permissions to set on this file, e.g. 644, 0775, or 4664.

The default mode for new files and directories corresponds to the umask of the salt process. The mode of existing files and directories will only be changed if mode is specified.

**Note:** This option is not supported on Windows.

Changed in version 2016.11.0: This option can be set to keep, and Salt will keep the mode from the Salt fileserver. This is only supported when the source URL begins with salt://, or for files local to the minion. Because the source option cannot be used with any of the contents options, setting the mode to keep is also incompatible with the contents options.

**Note:** keep does not work with salt-ssh.

As a consequence of how the files are transferred to the minion, and the inability to connect back to the master with salt-ssh, salt is unable to stat the file as it exists on the fileserver and thus cannot mirror the mode on the salt-ssh minion.

attrs The attributes to have on this file, e.g. a, i. The attributes can be any or a combination of the following characters: aAcCdDeijPsStTu.

**Note:** This option is not supported on Windows.

New in version 2018.3.0.

**template** If this setting is applied, the named templating engine will be used to render the downloaded file.

The following templates are supported:
- cheetah
- genshi
- jinja
- mako
- py
- wempy

**makedirs** [False] If set to True, then the parent directories will be created to facilitate the creation of the named file. If False, and the parent directory of the destination file doesn’t exist, the state will fail.

**dir_mode** If directories are to be created, passing this option specifies the permissions for those directories.

If this is not set, directories will be assigned permissions by adding the execute bit to the mode of the files.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it’s not enforced.

**replace** [True] If set to False and the file already exists, the file will not be modified even if changes would otherwise be made. Permissions and ownership will still be enforced, however.

**context** Overrides default context variables passed to the template.

**defaults** Default context passed to the template.

**backup** Overrides the default backup mode for this specific file. See backup_mode documentation for more details.

**show_changes** Output a unified diff of the old file and the new file. If False return a boolean if any changes were made.

**create** [True] If set to False, then the file will only be managed if the file already exists on the system.

**contents** Specify the contents of the file. Cannot be used in combination with source. Ignores hashes and does not use a templating engine.

This value can be either a single string, a multiline YAML string or a list of strings. If a list of strings,
then the strings will be joined together with newlines in the resulting file. For example, the below two example states would result in identical file contents:

```
/path/to/file1:
  file.managed:
    - contents:
      - This is line 1
      - This is line 2

/path/to/file2:
  file.managed:
    - contents: |
      This is line 1
      This is line 2
```

`contents_pillar` New in version 0.17.0.

Changed in version 2016.11.0: contents_pillar can also be a list, and the pillars will be concatenated together to form one file.

Operates like `contents`, but draws from a value stored in pillar, using the pillar path syntax used in `pillar.get`. This is useful when the pillar value contains newlines, as referencing a pillar variable using a jinja/mako template can result in YAML formatting issues due to the newlines causing indentation mismatches.

For example, the following could be used to deploy an SSH private key:

```
/home/deployer/.ssh/id_rsa:
  file.managed:
    - user: deployer
    - group: deployer
    - mode: 600
    - attrs: a
    - contents_pillar: userdata:deployer:id_rsa
```

This would populate `/home/deployer/.ssh/id_rsa` with the contents of `pillar['userdata']['deployer']['id_rsa']`. An example of this pillar setup would be like so:

```
userdata:
  deployer:
    id_rsa: |
      -----BEGIN RSA PRIVATE KEY-----
      MIIEowIBAAKCAQEoQiwO3JhBquPAalQF9qP1llZNXVjYMIsrMe2HcWUBgh+vYU7sCwx/dH6+VvNwmCqmnP+8gTPKG1vvgAobJAnMT623dMXjVKnwEagZPRJkXyB/HaAre9euNiY3LizBTWREeMFT+rWvIKBpvwlgGrfgz70mOpqVU+UyFbAGL+GpxzZAMaFpZw4sB1lRuissXZj/sHpQbSp9MSiE04Z3rjCP1cxI
      -----END RSA PRIVATE KEY-----
```

Note: The private key above is shortened to keep the example brief, but shows how to do multiline string in YAML. The key is followed by a pipe character, and the multiline string is indented two more spaces.

To avoid the hassle of creating an indented multiline YAML string, the `file_tree external pillar` can be used instead. However, this will not work for binary files in Salt releases before 2015.8.4.

`contents_grains` New in version 2014.7.0.
Operates like `contents`, but draws from a value stored in `grains.get`. This functionality works similarly to `contents_pillar`, but with grains.

For example, the following could be used to deploy a "message of the day" file:

```
write_motd:
  file.managed:
    - name: /etc/motd
      contents_grains: motd
```

This would populate `/etc/motd` file with the contents of the `motd` grain. The `motd` grain is not a default grain, and would need to be set prior to running the state:

```
salt '*' grains.set motd 'Welcome! This system is managed by Salt.'
```

Changed in version 2015.8.4: This option is now ignored if the contents being deployed contain binary data.

If True, files managed using `contents`, `contents_pillar`, or `contents_grains` will have a newline added to the end of the file if one is not present. Setting this option to False will ensure the final line, or entry, does not contain a new line. If the last line, or entry in the file does contain a new line already, this option will not remove it.

`contents_delimiter` New in version 2015.8.4.

Can be used to specify an alternate delimiter for `contents_pillar` or `contents_grains`. This delimiter will be passed through to `pillar.get` or `grains.get` when retrieving the contents.

`encoding` If specified, then the specified encoding will be used. Otherwise, the file will be encoded using the system locale (usually UTF-8). See https://docs.python.org/3/library/codecs.html#standard-encodings for the list of available encodings.

New in version 2017.7.0.

`encoding_errors` ["strict"] Error encoding scheme. Default is `"strict"`. See https://docs.python.org/2/library/codecs.html#codec-base-classes for the list of available schemes.

New in version 2017.7.0.

If set to False, then the state will fail if the contents specified by `contents_pillar` or `contents_grains` are empty.

If the desired path is a symlink follow it and make changes to the file to which the symlink points.

`check_cmd` New in version 2014.7.0.

The specified command will be run with an appended argument of a temporary file containing the new managed contents. If the command exits with a zero status the new managed contents will be written to the managed destination. If the command exits with a nonzero exit code, the state will fail and no changes will be made to the file.

For example, the following could be used to verify sudoers before making changes:

```
/etc/sudoers:
  file.managed:
    - user: root
    - group: root
    - mode: 0440
    - attrs: i
    - source: salt://sudoers/files/sudoers.jinja
```

(continues on next page)
NOTE: This check_cmd functions differently than the requisite check_cmd.

tmp_dir Directory for temp file created by check_cmd. Useful for checkers dependent on config file location (e.g. daemons restricted to their own config directories by an apparmor profile).

```
/etc/dhcp/dhcpd.conf:
  file.managed:
    - user: root
    - group: root
    - mode: 0755
    - tmp_dir: '/etc/dhcp'
    - contents: '# Managed by Salt'
    - check_cmd: dhcpd -t -cf
```

tmp_ext Suffix for temp file created by check_cmd. Useful for checkers dependent on config file extension (e.g. the init-checkconf upstart config checker).

```
/etc/init/test.conf:
  file.managed:
    - user: root
    - group: root
    - mode: 0440
    - tmp_ext: '.conf'
    - contents:
      - 'description "Salt Minion"'
      - 'start on started mountall'
      - 'stop on shutdown'
      - 'respawn'
      - 'exec salt-minion'
    - check_cmd: init-checkconf -f
```

skip_verify [False] If True, hash verification of remote file sources (http://, https://, ftp://) will be skipped, and the source_hash argument will be ignored.

New in version 2016.3.0.

win_owner [None] The owner of the directory. If this is not passed, user will be used. If user is not passed, the account under which Salt is running will be used.

New in version 2017.7.0.

win_perms [None] A dictionary containing permissions to grant and their propagation. For example:
{'Administrators': {'perms': 'full_control'}} Can be a single basic perm or a list of advanced perms. perms must be specified. applies_to does not apply to file objects.

New in version 2017.7.0.

win_deny_perms [None] A dictionary containing permissions to deny and their propagation. For example:
{'Administrators': {'perms': 'full_control'}} Can be a single basic perm or a list of advanced perms. perms must be specified. applies_to does not apply to file objects.

New in version 2017.7.0.

win_inheritance [True] True to inherit permissions from the parent directory, False not to inherit permission.

New in version 2017.7.0.

win_perms_reset [False] If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False.

New in version 2018.3.0.

Here’s an example using the above win_* parameters:
create_config_file:
file.managed:
  - name: C:\config\settings.cfg
  - source: salt://settings.cfg
  - win_owner: Administrators
  - win_perms:
    # Basic Permissions
dev_ops:
    perms: full_control
    # List of advanced permissions
appuser:
  perms:
    - read_attributes
    - read_ea
    - create_folders
    - read_permissions
joe_snuffy:
  perms: read
  - win_deny_perms:
fred_snuffy:
  perms: full_control
  - win_inheritance: False

salt.states.file.missing(name, **kwargs)
Verify that the named file or directory is missing, this returns True only if the named file is missing but does not remove the file if it is present.
name Absolute path which must NOT exist

salt.states.file.mknod(name, ntype, major=0, minor=0, user=None, group=None, mode='0600')
Create a special file similar to the 'nix mknod command. The supported device types are p (fifo pipe), c (character device), and b (block device). Provide the major and minor numbers when specifying a character device or block device. A fifo pipe does not require this information. The command will create the necessary dirs if needed. If a file of the same name not of the same type/major/minor exists, it will not be overwritten or unlinked (deleted). This is logically in place as a safety measure because you can really shoot yourself in the foot here and it is the behavior of 'nix mknod. It is also important to note that not just anyone can create special devices. Usually this is only done as root. If the state is executed as none other than root on a minion, you may receive a permission error.
name name of the file
ntype node type 'p' (fifo pipe), 'c' (character device), or 'b' (block device)
major major number of the device does not apply to a fifo pipe
minor minor number of the device does not apply to a fifo pipe
user owning user of the device/pipe
group owning group of the device/pipe
mode permissions on the device/pipe
Usage:

/dev/chr:
file.mknod:
  - ntype: c
  - major: 180
  - minor: 31
  - user: root
  - group: root
  - mode: 660

/dev/blk:
**file.mknod**:  
- ntype: b  
- major: 8  
- minor: 999  
- user: root  
- group: root  
- mode: 660  

**/dev/fifo**:  
**file.mknod**:  
- ntype: p  
- user: root  
- group: root  
- mode: 660  

New in version 0.17.0.

**salt.states.file.mod_run_check_cmd(cmd, filename, **check_cmd_opts)**

Execute the check_cmd logic.

Return a result dict if check_cmd succeeds (check_cmd == 0) otherwise return True

**salt.states.file.not_cached(name, saltenv='base')**

New in version 2017.7.3.

Ensures that a file is saved to the minion’s cache. This state is primarily invoked by other states to ensure that we do not re-download a source file if we do not need to.

**name** The URL of the file to be cached. To cache a file from an environment other than base, either use the saltenv argument or include the saltenv in the URL (e.g. `salt://path/to/file.conf?saltenv=dev`).

**Note**: A list of URLs is not supported, this must be a single URL. If a local file is passed here, the state will take no action.

**saltenv** Used to specify the environment from which to download a file from the Salt fileserver (i.e. those with `salt://` URL).

**salt.states.file.patch(name, source=None, source_hash=None, source_hash_name=None, skip_verify=False, template=None, context=None, defaults=None, options='', reject_file=None, strip=None, saltenv=None, **kwargs)**

Ensure that a patch has been applied to the specified file or directory

Changed in version 2019.2.0: The hash and dry_run_first options are now ignored, as the logic which determines whether or not the patch has already been applied no longer requires them. Additionally, this state now supports patch files that modify more than one file. To use these sort of patches, specify a directory (and, if necessary, the strip option) instead of a file.

**Note**: A suitable patch executable must be available on the minion. Also, keep in mind that the pre-check this state does to determine whether or not changes need to be made will create a temp file and send all patch output to that file. This means that, in the event that the patch would not have applied cleanly, the comment included in the state results will reference a temp file that will no longer exist once the state finishes running.

**name** The file or directory to which the patch should be applied

**source** The patch file to apply
Changed in version 2019.2.0: The source can now be from any file source supported by Salt (salt://, http://, https://, ftp://, etc.). Templating is also now supported.

**source_hash** Works the same way as in `file.managed`.

New in version 2019.2.0.

**source_hash_name** Works the same way as in `file.managed`

New in version 2019.2.0.

**skip_verify** Works the same way as in `file.managed`

New in version 2019.2.0.

**template** Works the same way as in `file.managed`

New in version 2019.2.0.

**context** Works the same way as in `file.managed`

New in version 2019.2.0.

**defaults** Works the same way as in `file.managed`

New in version 2019.2.0.

**options** Extra options to pass to patch. This should not be necessary in most cases.

---

**Note:** For best results, short opts should be separate from one another. The `-N` and `-r`, and `-o` options are used internally by this state and cannot be used here. Additionally, instead of using `-pN` or `--strip=N`, use the `strip` option documented below.

**reject_file** If specified, any rejected hunks will be written to this file. If not specified, then they will be written to a temp file which will be deleted when the state finishes running.

**Important:** The parent directory must exist. Also, this will overwrite the file if it is already present.

New in version 2019.2.0.

**strip** Number of directories to strip from paths in the patch file. For example, using the below SLS would instruct Salt to use `-p1` when applying the patch:

```
/etc/myfile.conf:
  file.patch:
    - source: salt://myfile.patch
    - strip: 1
```

New in version 2019.2.0: In previous versions, `-p1` would need to be passed as part of the `options` value.

**saltenv** Specify the environment from which to retrieve the patch file indicated by the `source` parameter. If not provided, this defaults to the environment from which the state is being executed.

**Note:** Ignored when the patch file is from a non-salt:// source.

---

**Usage:**

```
# Equivalent to `patch --forward /opt/myfile.txt myfile.patch`
/opt/myfile.txt:
  file.patch:
    - source: salt://myfile.patch
```

---

3440 Chapter 21. Salt Module Reference
salt.states.file.prepend(name, text=None, makedirs=False, source=None, source_hash=None, template='jinja', sources=None, source_hashes=None, defaults=None, context=None, header=None)

Ensure that some text appears at the beginning of a file

The text will not be prepended again if it already exists in the file. You may specify a single line of text or a list of lines to append.

**name**  The location of the file to append to.

**text**  The text to be appended, which can be a single string or a list of strings.

**makedirs**  If the file is located in a path without a parent directory, then the state will fail. If makedirs is set to True, then the parent directories will be created to facilitate the creation of the named file. Defaults to False.

**source**  A single source file to append. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials (see s3.get state documentation). File retrieval from Openstack Swift object storage is supported via swift://container/object_path URLs (see swift.get documentation).

For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs.

If the file is hosted on an HTTP or FTP server, the source_hash argument is also required.

**source_hash**  This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

<table>
<thead>
<tr>
<th>Type</th>
<th>Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>sha512</td>
<td>128</td>
</tr>
<tr>
<td>sha384</td>
<td>96</td>
</tr>
<tr>
<td>sha256</td>
<td>64</td>
</tr>
<tr>
<td>sha224</td>
<td>56</td>
</tr>
<tr>
<td>sha1</td>
<td>40</td>
</tr>
<tr>
<td>md5</td>
<td>32</td>
</tr>
</tbody>
</table>

See the `source_hash` parameter description for `file.managed` function for more details and examples.

**template**  The named templating engine will be used to render the appended-to file. Defaults to jinja. The following templates are supported:

- cheetah
- genshi
- jinja
- mako
- py
- wempy

**sources**  A list of source files to append. If the files are hosted on an HTTP or FTP server, the source_hashes argument is also required.

**source_hashes**  A list of source_hashes corresponding to the sources list specified in the sources argument.

**defaults**  Default context passed to the template.

**context**  Overrides default context variables passed to the template.

**ignore_whitespace**  New in version 2015.8.4.

Spaces and Tabs in text are ignored by default, when searching for the appending content, one space or multiple tabs are the same for salt. Set this option to False if you want to change this behavior.
Multi-line example:

```bash
/etc/motd:
  file.prepend:
    - text:
      | Thou hadst better eat salt with the Philosophers of Greece,
      | than sugar with the Courtiers of Italy.
      | - Benjamin Franklin
```

Multiple lines of text:

```bash
/etc/motd:
  file.prepend:
    - text:
      - Trust no one unless you have eaten much salt with him.
      - "Salt is born of the purest of parents: the sun and the sea."
```

Optionally, require the text to appear exactly as specified (order and position). Combine with multi-line or multiple lines of input.

```bash
/etc/motd:
  file.prepend:
    - header: True
    - text:
      - This will be the very first line in the file.
      - The 2nd line, regardless of duplicates elsewhere in the file.
      - These will be written anew if they do not appear verbatim.
```

Gather text from multiple template files:

```bash
/etc/motd:
  file:
    - prepend
    - template: jinja
    - sources:
      - salt://motd/devops-messages.tmpl
      - salt://motd/hr-messages.tmpl
      - salt://motd/general-messages.tmpl
```

New in version 2014.7.0.

```bash
class `file.recurse`
  (name, source, keep_source=True, clean=False, require=None, user=None,
   group=None, dir_mode=None, file_mode=None, sym_mode=None,
   template=None, context=None, replace=True, defaults=None,
   include_empty=False, backup=None, include_pat=None, exclude_pat=None,
   maxdepth=None, keep_symlinks=False, force_symlinks=False,
   win_owner=None, win_perms=None, win_deny_perms=None,
   win_inheritance=True, **kwargs)
```

Recurse through a subdirectory on the master and copy said subdirectory over to the specified path.

- **name** The directory to set the recursion in
- **source** The source directory, this directory is located on the salt master file server and is specified with the `salt://` protocol. If the directory is located on the master in the directory named spam, and is called eggs, the source string is `salt://spam/eggs`
- **keep_source** [True] Set to False to discard the cached copy of the source file once the state completes. This can be useful for larger files to keep them from taking up space in minion cache. However, keep in mind that discarding the source file will result in the state needing to re-download the source file if the state is run again.
New in version 2017.7.3.

**clean** Make sure that only files that are set up by salt and required by this function are kept. If this option is set then everything in this directory will be deleted unless it is required.

**require** Require other resources such as packages or files

**user** The user to own the directory. This defaults to the user salt is running as on the minion

**group** The group ownership set for the directory. This defaults to the group salt is running as on the minion. On Windows, this is ignored

**dir_mode** The permissions mode to set on any directories created.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it’s not enforced.

**Note:** This option is not supported on Windows.

**file_mode** The permissions mode to set on any files created.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it’s not enforced.

**Note:** This option is not supported on Windows.

Changed in version 2016.11.0: This option can be set to keep, and Salt will keep the mode from the Salt fileserver. This is only supported when the source URL begins with salt://, or for files local to the minion. Because the source option cannot be used with any of the contents options, setting the mode to keep is also incompatible with the contents options.

**sym_mode** The permissions mode to set on any symlink created.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it’s not enforced.

**Note:** This option is not supported on Windows.

**template** If this setting is applied, the named templating engine will be used to render the downloaded file.

The following templates are supported:

- cheetah
- genshi
- jinja
- mako
- py
- wempy

**Note:** The template option is required when recursively applying templates.

**replace** [True] If set to False and the file already exists, the file will not be modified even if changes would otherwise be made. Permissions and ownership will still be enforced, however.

**context** Overrides default context variables passed to the template.

**defaults** Default context passed to the template.

**include_empty** Set this to True if empty directories should also be created (default is False)

**backup** Overrides the default backup mode for all replaced files. See backup_mode documentation for more details.

**include_pat** When copying, include only this pattern from the source. Default is glob match; if prefixed with 'E@', then regexp match. Example:
- include_pat: hello* :: glob matches 'hello01', 'hello02'
  ... but not 'otherhello'
- include_pat: E@hello :: regexp matches 'otherhello',
  'hello01' ...

**exclude_pat** Exclude this pattern from the source when copying. If both include_pat and exclude_pat are supplied, then it will apply conditions cumulatively. i.e. first select based on include_pat, and then within that result apply exclude_pat.

Also, when 'clean=True', exclude this pattern from the removal list and preserve in the destination. Example:

- exclude_pat: APPDATA* :: glob matches APPDATA.01, APPDATA.02,.. for exclusion
- exclude_pat: E@(APPDATA)|(TEMPDATA) :: regexp matches APPDATA or TEMPDATA for exclusion

**maxdepth** When copying, only copy paths which are of depth maxdepth from the source path. Example:

- maxdepth: 0 :: Only include files located in the source directory
- maxdepth: 1 :: Only include files located in the source or immediate subdirectories

**keep_symlinks** Keep symlinks when copying from the source. This option will cause the copy operation to terminate at the symlink. If desire behavior similar to rsync, then set this to True.

**force_symlinks** Force symlink creation. This option will force the symlink creation. If a file or directory is obstructing symlink creation it will be recursively removed so that symlink creation can proceed. This option is usually not needed except in special circumstances.

**win_owner** [None] The owner of the symlink and directories if makedirs is True. If this is not passed, user will be used. If user is not passed, the account under which Salt is running will be used.

New in version 2017.7.7.

**win_perms** [None] A dictionary containing permissions to grant

New in version 2017.7.7.

**win_deny_perms** [None] A dictionary containing permissions to deny

New in version 2017.7.7.

**win_inheritance** [None] True to inherit permissions from parent, otherwise False

New in version 2017.7.7.

**salt.states.file.rename**(name, source, force=False, makedirs=False)

If the source file exists on the system, rename it to the named file. The named file will not be overwritten if it already exists unless the force option is set to True.

**name** The location of the file to rename to

**source** The location of the file to move to the location specified with name

**force** If the target location is present then the file will not be moved, specify "force: True" to overwrite the target file

**makedirs** If the target subdirectories don’t exist create them

**salt.states.file.replace**(name, pattern, repl, count=0, flags=8, bufsiz=1, append_if_not_found=False, prepend_if_not_found=False, not_found_content=None, backup='.bak', show_changes=True, ignore_if_missing=False, backslash_literal=False)

Maintain an edit in a file.

New in version 0.17.0.

**name** Filesystem path to the file to be edited. If a symlink is specified, it will be resolved to its target.
pattern  A regular expression, to be matched using Python’s `re.search()`.

**Note:** If you need to match a literal string that contains regex special characters, you may want to use salt’s custom Jinja filter, `regex_escape`.

```python
{{ 'http://example.com?foo=bar%20baz' | regex_escape }}
```

repl  The replacement text

count  Maximum number of pattern occurrences to be replaced. Defaults to 0. If `count` is a positive integer `n`, no more than `n` occurrences will be replaced, otherwise all occurrences will be replaced.

flags  A list of flags defined in the `re` module documentation from the Python standard library. Each list item should be a string that will correlate to the human-friendly flag name. E.g., `['IGNORECASE', 'MULTILINE']`. Optionally, `flags` may be an int, with a value corresponding to the XOR (`|`) of all the desired flags. Defaults to 8 (which equates to `['MULTILINE']`).

**Note:** `file.replace` reads the entire file as a string to support multiline regex patterns. Therefore, when using anchors such as `^` or `$` in the pattern, those anchors may be relative to the line OR relative to the file. The default for `file.replace` is to treat anchors as relative to the line, which is implemented by setting the default value of `flags` to `['MULTILINE']`. When overriding the default value for `flags`, if `MULTILINE` is not present then anchors will be relative to the file. If the desired behavior is for anchors to be relative to the line, then simply add `MULTILINE` to the list of flags.

bufsize  How much of the file to buffer into memory at once. The default value 1 processes one line at a time. The special value `file` may be specified which will read the entire file into memory before processing.

append_if_not_found  [False] If set to `True`, and pattern is not found, then the content will be appended to the file.

New in version 2014.7.0.

prepend_if_not_found  [False] If set to `True` and pattern is not found, then the content will be prepended to the file.

New in version 2014.7.0.

not_found_content  Content to use for append/prepend if not found. If `None` (default), uses `repl`. Useful when `repl` uses references to group in pattern.

New in version 2014.7.0.

backup  The file extension to use for a backup of the file before editing. Set to `False` to skip making a backup.

show_changes  [True] Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made. Returns a boolean or a string.

ignore_if_missing  [False] New in version 2016.3.4.

Controls what to do if the file is missing. If set to `False`, the state will display an error raised by the execution module. If set to `True`, the state will simply report no changes.

Interpret backslashes as literal backslashes for the `repl` and not escape characters. This will help when using append/prepend so that the backslashes are not interpreted for the `repl` on the second run of the state.

For complex regex patterns, it can be useful to avoid the need for complex quoting and escape sequences by making use of YAML’s multiline string syntax.

```yml
complex_search_and_replace:
  file.replace:
    # <...snip...>
```
- **pattern**: |
  CentOS \((2.6.32[^\n]+\n\s+root[^\n]+\n)+\n
**Note:** When using YAML multiline string syntax in `pattern:`, make sure to also use that syntax in the `repl:` part, or you might lose line feeds.

When regex capture groups are used in `pattern:`, their captured value is available for reuse in the `repl:` part as a backreference (ex. `\1`).

```yaml
add_login_group_to_winbind_ssh_access_list:
  file.replace:
    - name: '/etc/security/pam_winbind.conf'
    - pattern: '^require_membership_of = (.*)$'
    - repl: '\1\2,append-new-group-to-line'
```

**Note:** The `file.replace` state uses Python’s `re` module. For more advanced options, see [https://docs.python.org/2/library/re.html](https://docs.python.org/2/library/re.html)

salt.states.file.retention_schedule(*name*, *retain*, *strptime_format=None*, *timezone=None*)

Apply retention scheduling to backup storage directory.

New in version 2016.11.0.

**Parameters**

- **name** – The filesystem path to the directory containing backups to be managed.
- **retain** – Delete the backups, except for the ones we want to keep. The N below should be an integer but may also be the special value of `all`, which keeps all files matching the criteria. All of the retain options default to `None`, which means to not keep files based on this criteria.
  - `most_recent N` Keep the most recent N files.
  - `first_of_hour N` For the last N hours from now, keep the first file after the hour.
  - `first_of_day N` For the last N days from now, keep the first file after midnight. See also `timezone`.
  - `first_of_week N` For the last N weeks from now, keep the first file after Sunday midnight.
  - `first_of_month N` For the last N months from now, keep the first file after the start of the month.
  - `first_of_year N` For the last N years from now, keep the first file after the start of the year.
- **strptime_format** – A Python `strptime` format string used to first match the filenames of backups and then parse the filename to determine the datetime of the file. Defaults to `None`, which considers all files in the directory to be backups eligible for deletion and uses `os.path.getmtime()` to determine the datetime.
- **timezone** – The timezone to use when determining midnight. This is only used when datetime is pulled from `os.path.getmtime()`. Defaults to `None` which uses the timezone from the locale.

**Usage example:**

```bash
/var/backups/example_directory:
(continues on next page)```
```python
file.retention_schedule:
  - retain:
    most_recent: 5
    first_of_hour: 4
    first_of_day: 7
    first_of_week: 6  # NotImplemented yet.
    first_of_month: 6
    first_of_year: all
  - strftime_format: example_name_%Y%m%dT%H%M%S.tar.bz2
  - timezone: None

salt.states.file.serialize(name, dataset=None, dataset_pillar=None, user=None, group=None, mode=None, backup=None, makedirs=False, show_changes=True, create=True, merge_if_exists=False, encoding=None, encoding_errors='strict', serializer_opts=None, deserializer_opts=None, **kwargs)
```

Serializes dataset and store it into managed file. Useful for sharing simple configuration files.

- **name**: The location of the file to create
- **dataset**: The dataset that will be serialized
- **dataset_pillar**: Operates like `dataset`, but draws from a value stored in pillar, using the pillar path syntax used in `pillar.get`. This is useful when the pillar value contains newlines, as referencing a pillar variable using a jinja/mako template can result in YAML formatting issues due to the newlines causing indentation mismatches.

  New in version 2015.8.0.

- **formatter**: Write the data as this format. See the list of [serializer modules](https://salt.readthedocs.io/en/latest/) for supported output formats.
- **encoding**: If specified, then the specified encoding will be used. Otherwise, the file will be encoded using the system locale (usually UTF-8). See [https://docs.python.org/3/library/codecs.html#standard-encodings](https://docs.python.org/3/library/codecs.html#standard-encodings) for the list of available encodings.

  New in version 2017.7.0.

- **encoding_errors**: `['strict']` Error encoding scheme. Default is `strict`. See [https://docs.python.org/2/library/codecs.html#codec-base-classes](https://docs.python.org/2/library/codecs.html#codec-base-classes) for the list of available schemes.

  New in version 2017.7.0.

- **user**: The user to own the directory, this defaults to the user salt is running as on the minion
- **group**: The group ownership set for the directory, this defaults to the group salt is running as on the minion
- **mode**: The permissions to set on this file, e.g. 644, 0775, or 4664.

  The default mode for new files and directories corresponds unmask of salt process. For existing files and directories it’s not enforced.

  New in version 2014.1.3.

- **backup**: Overrides the default backup mode for this specific file.
- **makedirs**: Create parent directories for destination file.

  New in version 2014.1.3.

- **show_changes**: Output a unified diff of the old file and the new file. If False return a boolean if any changes were made.
- **create**: Default is True, if create is set to False then the file will only be managed if the file already exists on the system.
- **merge_if_exists**: Default is False, if merge_if_exists is True then the existing file will be parsed and the dataset passed in will be merged with the existing content.
New in version 2014.7.0.

**serializer_opts** Pass through options to serializer. For example:

```yaml
/etc/dummy/package.yaml
file.serialize:
- formatter: yaml
- serializer_opts:
  - explicit_start: True
  - default_flow_style: True
  - indent: 4
```

The valid opts are the additional opts (i.e. not the data being serialized) for the function used to serialize the data. Documentation for the these functions can be found in the list below:

- For **yaml**: `yaml.dump()`
- For **json**: `json.dumps()`
- For **python**: `pprint.pformat()`

**deserializer_opts** Like **serializer_opts** above, but only used when merging with an existing file (i.e. when **merge_if_exists** is set to `True`).

The options specified here will be passed to the deserializer to load the existing data, before merging with the specified data and re-serializing.

```yaml
/etc/dummy/package.yaml
file.serialize:
- formatter: yaml
- serializer_opts:
  - explicit_start: True
  - default_flow_style: True
  - indent: 4
- deserializer_opts:
  - encoding: latin-1
  - merge_if_exists: True
```

The valid opts are the additional opts (i.e. not the data being deserialized) for the function used to deserialize the data. Documentation for the these functions can be found in the list below:

- For **yaml**: `yaml.load()`
- For **json**: `json.loads()`

However, note that not all arguments are supported. For example, when deserializing JSON, arguments like `parse_float` and `parse_int` which accept a callable object cannot be handled in an SLS file.

New in version 2019.2.0.

For example, this state:

```json
/etc/dummy/package.json:
file.serialize:
- dataset:
  
name: naive
description: A package using naive versioning
author: A confused individual <iam@confused.com>
dependencies:
  express: '>= 1.2.0'
  optimist: '>= 0.1.0'
engine: node 0.4.1
- formatter: json
```

will manage the file `/etc/dummy/package.json:`
salt.states.file.shortcut(name, target, arguments=None, working_dir=None, description=None, icon_location=None, force=False, backupname=None, makedirs=False, user=None, **kwargs)

Create a Windows shortcut

If the file already exists and is a shortcut pointing to any location other than the specified target, the shortcut will be replaced. If it is a regular file or directory then the state will return False. If the regular file or directory is desired to be replaced with a shortcut pass force: True, if it is to be renamed, pass a backupname.

name The location of the shortcut to create. Must end with either ".lnk" or ".url"

target The location that the shortcut points to

arguments Any arguments to pass in the shortcut

working_dir Working directory in which to execute target

description Description to set on shortcut

icon_location Location of shortcut’s icon

force If the name of the shortcut exists and is not a file and force is set to False, the state will fail. If force is set to True, the link or directory in the way of the shortcut file will be deleted to make room for the shortcut, unless backupname is set, when it will be renamed

backupname If the name of the shortcut exists and is not a file, it will be renamed to the backupname. If the backupname already exists and force is False, the state will fail. Otherwise, the backupname will be removed first.

makedirs If the location of the shortcut does not already have a parent directory then the state will fail, setting makedirs to True will allow Salt to create the parent directory. Setting this to True will also create the parent for backupname if necessary.

user The user to own the file, this defaults to the user salt is running as on the minion

The default mode for new files and directories corresponds unmask of salt process. For existing files and directories it’s not enforced.

salt.states.file.symlink(name, target, force=False, backupname=None, makedirs=False, user=None, group=None, mode=None, win_owner=None, win_perms=None, win_deny_perms=None, win_inheritance=None, **kwargs)

Create a symbolic link (symlink, soft link)

If the file already exists and is a symlink pointing to any location other than the specified target, the symlink will be replaced. If an entry with the same name exists then the state will return False. If the existing entry is desired to be replaced with a symlink pass force: True, if it is to be renamed, pass a backupname.

name The location of the symlink to create

target The location that the symlink points to

force If the name of the symlink exists and is not a symlink and force is set to False, the state will fail. If force is set to True, the existing entry in the way of the symlink file will be deleted to make room for the symlink, unless backupname is set, when it will be renamed

Changed in version 3000: Force will now remove all types of existing file system entries, not just files, directories and symlinks.

backupname If the name of the symlink exists and is not a symlink, it will be renamed to the backupname. If the backupname already exists and force is False, the state will fail. Otherwise, the backupname will be
removed first. An absolute path OR a basename file/directory name must be provided. The latter will be placed relative to the symlink destination’s parent directory.

**makedirs** If the location of the symlink does not already have a parent directory then the state will fail, setting makedirs to True will allow Salt to create the parent directory

**user** The user to own the file, this defaults to the user salt is running as on the minion

**group** The group ownership set for the file, this defaults to the group salt is running as on the minion. On Windows, this is ignored

**mode** The permissions to set on this file, aka 644, 0775, 4664. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it’s not enforced.

**win_owner** [None] The owner of the symlink and directories if makedirs is True. If this is not passed, user will be used. If user is not passed, the account under which Salt is running will be used.

New in version 2017.7.7.

**win_perms** [None] A dictionary containing permissions to grant

New in version 2017.7.7.

**win_deny_perms** [None] A dictionary containing permissions to deny

New in version 2017.7.7.

**win_inheritance** [None] True to inherit permissions from parent, otherwise False

New in version 2017.7.7.

```python
salt.states.file.tidied(name, age=0, matches=None, rmdirs=False, size=0, **kwargs)
```

Remove unwanted files based on specific criteria. Multiple criteria are OR’d together, so a file that is too large but is not old enough will still get tidied.

If neither age nor size is given all files which match a pattern in matches will be removed.

**name** The directory tree that should be tidied

**age** Maximum age in days after which files are considered for removal

**matches** List of regular expressions to restrict what gets removed. Default: ['*']

**rmdirs** Whether or not it’s allowed to remove directories

**size** Maximum allowed file size. Files greater or equal to this size are removed. Doesn’t apply to directories or symbolic links

```yaml
cleanup:
  file.tidied:
    - name: /tmp/salt_test
      rmdirs: True
      matches:
        - foo
        - b.*r
```

```python
salt.states.file.touch(name, atime=None, mtime=None, makedirs=False)
```

Replicate the 'nix "touch" command to create a new empty file or update the atime and mtime of an existing file.

Note that if you just want to create a file and don’t care about atime or mtime, you should use file.managed instead, as it is more feature-complete. (Just leave out the source/template/contents arguments, and it will just create the file and/or check its permissions, without messing with contents)

**name** name of the file

**atime** atime of the file

**mtime** mtime of the file

**makedirs** whether we should create the parent directory/directories in order to touch the file

Usage:
salt.states.file.uncomment("name", regex, char='#', backup='.bak")

Uncomment specified commented lines in a file
name The full path to the file to be edited
regex A regular expression used to find the lines that are to be uncommented. This regex should not include the comment character. A leading ^ character will be stripped for convenience (for easily switching between comment() and uncomment()). The regex will be searched for from the beginning of the line, ignoring leading spaces (we prepend "^[t]"
char [ #] The character to remove in order to uncomment a line
backup [.bak] The file will be backed up before edit with this file extension;

**Warning:** This backup will be overwritten each time `sed / comment / uncomment` is called. Meaning the backup will only be useful after the first invocation.

Set to False/None to not keep a backup.

Usage:

```
/etc/adduser.conf:
  file.uncomment:
    - regex: EXTRA_GROUPS
```

New in version 0.9.5.

### 21.19.86 salt.states.firewall module

State to check firewall configurations

New in version 2016.3.0.

salt.states.firewall.check(name, port=None, **kwargs)

Checks if there is an open connection from the minion to the defined host on a specific port.

name host name or ip address to test connection to
port The port to test the connection on
kwargs Additional parameters, parameters allowed are: proto (tcp or udp) family (ipv4 or ipv6) timeout

```
testgoogle:
  firewall.check:
    - name: 'google.com'
    - port: 80
    - proto: 'tcp'
```

### 21.19.87 salt.states.firewalld

Management of firewalld

New in version 2015.8.0.
The following example applies changes to the public zone, blocks echo-reply and echo-request packets, does not set the zone to be the default, enables masquerading, and allows ports 22/tcp and 25/tcp. It will be applied permanently and directly before restart/reload.

```
public:
    firewalld.present:
        - name: public
        - block_icmp:
            - echo-reply
            - echo-request
        - default: False
        - masquerade: True
        - ports:
            - 22/tcp
            - 25/tcp
```

The following example applies changes to the public zone, enables masquerading and configures port forwarding TCP traffic from port 22 to 2222, and forwards TCP traffic from port 80 to 443 at 192.168.0.1.

```
my_zone:
    firewalld.present:
        - name: public
        - masquerade: True
        - port_fwd:
            - 22:2222:tcp
            - 80:443:tcp:192.168.0.1
```

The following example binds the public zone to interface eth0 and to all packets coming from the 192.168.1.0/24 subnet. It also removes the zone from all other interfaces or sources.

```
public:
    firewalld.present:
        - name: public
        - interfaces:
            - eth0
        - sources:
            - 192.168.1.0/24
```

Here, we define a new service that encompasses TCP ports 4505 4506:

```
saltmaster:
    firewalld.service:
        - name: saltmaster
        - ports:
            - 4505/tcp
            - 4506/tcp
```

To make this new service available in a zone, the following can be used, which would allow access to the salt master from the 10.0.0.0/8 subnet:

```
saltzone:
    firewalld.present:
        - name: saltzone
        - services:
            - saltmaster
        - sources:
            - 10.0.0.0/8
```
class salt.states.firewalld.ForwardingMapping(srcport, destport, protocol, destaddr)
    Represents a port forwarding statement mapping a local port to a remote port for a specific protocol (TCP or UDP)

todict()
    Returns a pretty dictionary meant for command line output.

salt.states.firewalld.present(name, block_icmp=None, prune_block_icmp=False, default=None, masquerade=False, ports=None, prune_ports=False, port_fwd=None, prune_port_fwd=False, services=None, prune_services=False, interfaces=None, prune_interfaces=False, sources=None, prune_sources=False, rich_rules=None, prune_rich_rules=False)

Ensure a zone has specific attributes.
name The zone to modify.
default [None] Set this zone as the default zone if True.
masquerade [False] Enable or disable masquerade for a zone.
block_icmp [None] List of ICMP types to block in the zone.
prune_block_icmp [False] If True, remove all but the specified block_icmp from the zone.
ports [None] List of ports to add to the zone.
prune_ports [False] If True, remove all but the specified ports from the zone.
port_fwd [None] List of port forwards to add to the zone.
prune_port_fwd [False] If True, remove all but the specified port_fwd from the zone.
services [None] List of services to add to the zone.
prune_services [False] If True, remove all but the specified services from the zone. .. note:: Currently defaults to True for compatibility, but will be changed to False in a future release.
interfaces [None] List of interfaces to add to the zone.
prune_interfaces [False] If True, remove all but the specified interfaces from the zone.
sources [None] List of sources to add to the zone.
prune_sources [False] If True, remove all but the specified sources from the zone.
rich_rules [None] List of rich rules to add to the zone.
prune_rich_rules [False] If True, remove all but the specified rich rules from the zone.

salt.states.firewalld.service(name, ports=None, protocols=None)

Ensure the service exists and encompasses the specified ports and protocols.

New in version 2016.11.0.

21.19.88 salt.states.gem

Installation of Ruby modules packaged as gems

A state module to manage rubygems. Gems can be set up to be installed or removed. This module will use RVM or rbenv if they are installed. In that case, you can specify what ruby version and gemset to target.

addressable:
gem.installed:
  - user: rvm
  - ruby: jruby@jgemset

salt.states.gem.installed(name, ruby=None, gem_bin=None, user=None, version=None, rdoc=False, ri=False, pre_releases=False, proxy=None, source=None)

Make sure that a gem is installed.
name The name of the gem to install
ruby: None Only for RVM or rbenv installations: the ruby version and gemset to target.
**gem_bin**: None  Custom gem command to run instead of the default. Use this to install gems to a non-default ruby install. If you are using rvm or rbenv use the ruby argument instead.

**user**: None  The user under which to run the gem command

New in version 0.17.0.

**version**: [None]  Specify the version to install for the gem. Doesn’t play nice with multiple gems at once

**rdoc**: [False]  Generate RDoc documentation for the gem(s).

**ri**: [False]  Generate RI documentation for the gem(s).

**pre_releases**: [False]  Install pre-release version of gem(s) if available.

**proxy**: [None]  Use the specified HTTP proxy server for all outgoing traffic. Format: `http://hostname[:port]`

**source**: [None]  Use the specified HTTP gem source server to download gem. Format: `http://hostname[:port]`

salt.states.gem: **removed**(name, ruby= None, user= None, gem_bin= None)

Make sure that a gem is not installed.

**name**: The name of the gem to uninstall

**gem_bin**: [None]  Full path to gem binary to use.

**ruby**: [None]  If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if gem_bin is specified.

**user**: None  The user under which to run the gem command

New in version 0.17.0.

salt.states.gem: **sources_add**(name, ruby= None, user= None)

Make sure that a gem source is added.

**name**: The URL of the gem source to be added

**ruby**: None  For RVM or rbenv installations: the ruby version and gemset to target.

**user**: None  The user under which to run the gem command

New in version 0.17.0.

salt.states.gem: **sources_remove**(name, ruby= None, user= None)

Make sure that a gem source is removed.

**name**: The URL of the gem source to be removed

**ruby**: None  For RVM or rbenv installations: the ruby version and gemset to target.

**user**: None  The user under which to run the gem command

New in version 0.17.0.

**21.19.89** salt.states.git

States to manage git repositories and git configuration

**Important**: Before using git over ssh, make sure your remote host fingerprint exists in your `~/.ssh/known_hosts` file.

Changed in version 2015.8.8: This state module now requires git 1.6.5 (released 10 October 2009) or newer.

salt.states.git: **cloned**(name, target= None, branch= None, user= None, password= None, identity= None, 

https_user= None, https_pass= None, output_encoding= None)

New in version 2018.3.3, 2019.2.0.

Ensure that a repository has been cloned to the specified target directory. If not, clone that repository. No fetches will be performed once cloned.

**name**: Address of the remote repository

**target**: Name of the target directory where repository should be cloned

**branch**: Remote branch to check out. If unspecified, the default branch (i.e. the one to the remote HEAD points) will be checked out.
Note: The local branch name will match the remote branch name. If the branch name is changed, then that branch will be checked out locally, but keep in mind that remote repository will not be fetched. If your use case requires that you keep the clone up to date with the remote repository, then consider using `git.latest`.

**user** User under which to run git commands. By default, commands are run by the user under which the minion is running.

**password** Windows only. Required when specifying **user**. This parameter will be ignored on non-Windows platforms.

**identity** Path to a private key to use for ssh URLs. Works the same way as in `git.latest`, see that state’s documentation for more information.

**https_user** HTTP Basic Auth username for HTTPS (only) clones

**https_pass** HTTP Basic Auth password for HTTPS (only) clones

**output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

salt.states.git.config_set(name, value=None, multivar=None, repo=None, user=None, password=None, output_encoding=None, **kwargs)

New in version 2014.7.0.

Changed in version 2015.8.0: Renamed from `git.config` to `git.config_set`. For earlier versions, use `git.config`.

Ensure that a config value is set to the desired value(s)

**name** Name of the git config value to set

**value** Set a single value for the config item

**multivar** Set multiple values for the config item

Note: The order matters here, if the same parameters are set but in a different order, they will be removed and replaced in the order specified.

New in version 2015.8.0.

**repo** Location of the git repository for which the config value should be set. Required unless **global** is set to **True**.

**user** User under which to run git commands. By default, the commands are run by the user under which the minion is running.

**password** Windows only. Required when specifying **user**. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**global** [False] If **True**, this will set a global git config option

**output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.
Local Config Example:

```yaml
# Single value
mylocalrepo:
  git.config_set:
    - name: user.email
    - value: foo@bar.net
    - repo: /path/to/repo

# Multiple values
mylocalrepo:
  git.config_set:
    - name: mysection.myattribute
    - multivar:
      - foo
      - bar
      - baz
    - repo: /path/to/repo
```

Global Config Example (User “foo”):

```yaml
mylocalrepo:
  git.config_set:
    - name: user.name
    - value: Foo Bar
    - user: foo
    - global: True
```

salt.states.git.config_unset(
    name, value_regex=None, repo=None, user=None, password=None,
    output_encoding=None, **kwargs)

New in version 2015.8.0.

Ensure that the named config key is not present

- **name**  The name of the configuration key to unset. This value can be a regex, but the regex must match the entire key name. For example, `foo\.` would not match all keys in the `foo` section, it would be necessary to use `foo\..+` to do so.
- **value_regex**  Regex indicating the values to unset for the matching key(s)

**Note:** This option behaves differently depending on whether or not `all` is set to `True`. If it is, then all values matching the regex will be deleted (this is the only way to delete multiple values from a multivar). If `all` is set to `False`, then this state will fail if the regex matches more than one value in a multivar.

- **all**  `[False]` If `True`, unset all matches
- **repo**  Location of the git repository for which the config value should be set. Required unless `global` is set to `True`.
- **user**  User under which to run git commands. By default, commands are run by the user under which the minion is running.
- **password**  Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

- **global**  `[False]` If `True`, this will set a global git config option
- **output_encoding**  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an
encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

Examples:

```python
# Value matching 'baz'
mylocalrepo:
    git.config_unset:
        - name: foo.bar
        - value_regex: 'baz'
        - repo: /path/to/repo

# Ensure entire multivar is unset
mylocalrepo:
    git.config_unset:
        - name: foo.bar
        - all: True

# Ensure all variables in 'foo' section are unset, including multivars
mylocalrepo:
    git.config_unset:
        - name: 'foo\..+'
        - all: True

# Ensure that global config value is unset
mylocalrepo:
    git.config_unset:
        - name: foo.bar
        - global: True
```

```
salt.states.git.detached(name, rev, target=None, remote='origin', user=None, password=None, force_clone=False, force_checkout=False, fetch_remote=True, hard_Reset=False, submodules=False, identity=None, https_user=None, https_pass=None, onlyif=None, unless=None, output_encoding=None, **kwargs)
```

New in version 2016.3.0.

Make sure a repository is cloned to the given target directory and is a detached HEAD checkout of the commit ID resolved from `rev`.

- **name**  Address of the remote repository.
- **rev** The branch, tag, or commit ID to checkout after clone. If a branch or tag is specified it will be resolved to a commit ID and checked out.
- **target** Name of the target directory where repository is about to be cloned.
- **remote** [origin] Git remote to use. If this state needs to clone the repo, it will clone it using this value as the initial remote name. If the repository already exists, and a remote by this name is not present, one will be added.
- **user** User under which to run git commands. By default, commands are run by the user under which the minion is running.
- **password** Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

- **force_clone** [False] If the target directory exists and is not a git repository, then this state will fail. Set this argument to True to remove the contents of the target directory and clone the repo into it.
- **force_checkout** [False] When checking out the revision ID, the state will fail if there are unwritten changes. Set this argument to True to discard unwritten changes when checking out.
fetch_remote [True] If False a fetch will not be performed and only local refs will be reachable.

hard_reset [False] If True a hard reset will be performed before the checkout and any uncommitted modifications to the working directory will be discarded. Untracked files will remain in place.

Note: Changes resulting from a hard reset will not trigger requisites.

submodules [False] Update submodules
identity A path on the minion (or a SaltStack fileserver URL, e.g. salt://path/to/identity_file) to a private key to use for SSH authentication.
https_user HTTP Basic Auth username for HTTPS (only) clones
https_pass HTTP Basic Auth password for HTTPS (only) clones
onlyif A command to run as a check, run the named command only if the command passed to the onlyif option returns true
unless A command to run as a check, only run the named command if the command passed to the unless option returns false
output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

salt.states.git.latest(name, rev='HEAD', target=None, branch=None, user=None, password=None, update_head=True, force_checkout=False, force_clone=False, force_fetch=False, force_reset=False, submodules=False, bare=False, mirror=False, remote='origin', fetch_tags=True, sync_tags=True, depth=None, identity=None, https_user=None, https_pass=None, onlyif=None, unless=None, refspec_branch='*', refspec_tag='*', output_encoding=None, **kwargs)

Make sure the repository is cloned to the given directory and is up-to-date.

name Address of the remote repository, as passed to git clone

Note: From the Git documentation, there are two URL formats supported for SSH authentication. The below two examples are equivalent:

```
# ssh:// URL
ssh://user@server/project.git

# SCP-like syntax
user@server:project.git
```

A common mistake is to use an ssh:// URL, but with a colon after the domain instead of a slash. This is invalid syntax in Git, and will therefore not work in Salt. When in doubt, confirm that a git clone works for the URL before using it in Salt.

It has been reported by some users that SCP-like syntax is incompatible with git repos hosted on Atlassian Stash/BitBucket Server. In these cases, it may be necessary to use ssh:// URLs for SSH authentication.

rev [HEAD] The remote branch, tag, or revision ID to checkout after clone / before update. If specified, then Salt will also ensure that the tracking branch is set to <remote>/<rev>, unless rev refers to a tag or SHA1, in which case Salt will ensure that the tracking branch is unset.

If rev is not specified, it will be assumed to be HEAD, and Salt will not manage the tracking branch at
all.

Changed in version 2015.8.0: If not specified, `rev` now defaults to the remote repository’s HEAD.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>target</code></td>
<td>Name of the target directory where repository is about to be cloned</td>
</tr>
<tr>
<td><code>branch</code></td>
<td>Name of the local branch into which to checkout the specified rev. If not specified, then Salt will not care what branch is being used locally and will just use whatever branch is currently there.</td>
</tr>
</tbody>
</table>

New in version 2015.8.0.

**Note:** If this argument is not specified, this means that Salt will not change the local branch if the repository is reset to another branch/tag/SHA1. For example, assume that the following state was run initially:

```
foo_app:
  git.latest:
    - name: https://mydomain.tld/apps/foo.git
    - target: /var/www/foo
    - user: www
```

This would have cloned the HEAD of that repo (since a `rev` wasn’t specified), and because `branch` is not specified, the branch in the local clone at `/var/www/foo` would be whatever the default branch is on the remote repository (usually `master`, but not always). Now, assume that it becomes necessary to switch this checkout to the `dev` branch. This would require `rev` to be set, and probably would also require `force_reset` to be enabled:

```
foo_app:
  git.latest:
    - name: https://mydomain.tld/apps/foo.git
    - target: /var/www/foo
    - user: www
    - rev: dev
    - force_reset: True
```

The result of this state would be to perform a hard-reset to `origin/dev`. Since `branch` was not specified though, while `/var/www/foo` would reflect the contents of the remote repo’s `dev` branch, the local branch would still remain whatever it was when it was cloned. To make the local branch match the remote one, set `branch` as well, like so:

```
foo_app:
  git.latest:
    - name: https://mydomain.tld/apps/foo.git
    - target: /var/www/foo
    - user: www
    - rev: dev
    - branch: dev
    - force_reset: True
```

This may seem redundant, but Salt tries to support a wide variety of use cases, and doing it this way allows for the use case where the local branch doesn’t need to be strictly managed.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>user</code></td>
<td>Local system user under which to run git commands. By default, commands are run by the user under which the minion is running.</td>
</tr>
</tbody>
</table>

**Note:** This is not to be confused with the username for http(s)/SSH authentication.

New in version 0.17.0.
**password**  Windows only. Required when specifying **user**. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**update_head**  [True] If set to **False**, then the remote repository will be fetched (if necessary) to ensure that the commit to which **rev** points exists in the local checkout, but no changes will be made to the local HEAD.

New in version 2015.8.3.

**force_checkout**  [False] When checking out the local branch, the state will fail if there are unwritten changes. Set this argument to **True** to discard unwritten changes when checking out.

**force_clone**  [False] If the target directory exists and is not a git repository, then this state will fail. Set this argument to **True** to remove the contents of the target directory and clone the repo into it.

**force_fetch**  [False] If a fetch needs to be performed, non-fast-forward fetches will cause this state to fail. Set this argument to **True** to force the fetch even if it is a non-fast-forward update.

New in version 2015.8.0.

**force_reset**  [False] If the update is not a fast-forward, this state will fail. Set this argument to **True** to force a hard-reset to the remote revision in these cases.

Changed in version 2019.2.0: This option can now be set to **remote-changes**, which will instruct Salt not to discard local changes if the repo is up-to-date with the remote repository.

**submodules**  [False] Update submodules on clone or branch change

**bare**  [False] Set to **True** if the repository is to be a bare clone of the remote repository.

**mirror**  Set to **True** if the repository is to be a mirror of the remote repository. This implies that **bare** set to **True**, and thus is incompatible with **rev**.

**remote**  [origin] Git remote to use. If this state needs to clone the repo, it will clone it using this value as the initial remote name. If the repository already exists, and a remote by this name is not present, one will be added.

**fetch_tags**  [True] If **True**, then when a fetch is performed all tags will be fetched, even those which are not reachable by any branch on the remote.

**sync_tags**  [True] If **True**, then Salt will delete tags which exist in the local clone but are not found on the remote repository.

New in version 2018.3.4.

**depth**  Defines depth in history when git a clone is needed in order to ensure latest. E.g. **depth**: 1 is useful when deploying from a repository with a long history. Use **rev** to specify branch or tag. This is not compatible with revision IDs.

Changed in version 2019.2.0: This option now supports tags as well as branches, on Git 1.8.0 and newer.

**identity**  Path to a private key to use for ssh URLs. This can be either a single string, or a list of strings. For example:

```bash
# Single key
git@github.com:user/repo.git:
  git.latest:
    - user: deployer
    - identity: /home/deployer/.ssh/id_rsa

# Two keys
git@github.com:user/repo.git:
  git.latest:
    - user: deployer
    - identity:
      - /home/deployer/.ssh/id_rsa
      - /home/deployer/.ssh/id_rsa_alternate
```

If multiple keys are specified, they will be tried one-by-one in order for each git command which needs...
to authenticate.

**Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphrase-less. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Changed in version 2016.3.0: Key can now be specified as a SaltStack fileserver URL (e.g. `salt://path/to/identity_file`).

**https_user** HTTP Basic Auth username for HTTPS (only) clones

New in version 2015.5.0.

**https_pass** HTTP Basic Auth password for HTTPS (only) clones

New in version 2015.5.0.

**onlyif** A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true

**unless** A command to run as a check, only run the named command if the command passed to the `unless` option returns false

**refspec_branch** [*] A glob expression defining which branches to retrieve when fetching. See `git-fetch(1)` for more information on how refspeces work.

New in version 2017.7.0.

**refspec_tag** [*] A glob expression defining which tags to retrieve when fetching. See `git-fetch(1)` for more information on how refspeces work.

New in version 2017.7.0.

**output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

New in version 2018.3.1.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

Note: Clashing ID declarations can be avoided when including different branches from the same git repository in the same SLS file by using the `name` argument. The example below checks out the `gh-pages` and `gh-pages-prod` branches from the same repository into separate directories. The example also sets up the `ssh_known_hosts` ssh key required to perform the git checkout.

Also, it has been reported that the SCP-like syntax for

```bash
gitlab.example.com:
  ssh_known_hosts:
    - present
    - user: root
    - enc: ecdsa

git-website-staging:
  git.latest:
    - name: git@gitlab.example.com:user/website.git
    - rev: gh-pages
```
- target: /usr/share/nginx/staging
- identity: /root/.ssh/website_id_rsa
- require:
  - pkg: git
  - ssh_known_hosts: gitlab.example.com

**git-website-staging:**

**git.latest:**

- name: git@gitlab.example.com:user/website.git
- rev: gh-pages
- target: /usr/share/nginx/staging
- identity: salt://website/id_rsa
- require:
  - pkg: git
  - ssh_known_hosts: gitlab.example.com

**git-website-prod:**

**git.latest:**

- name: git@gitlab.example.com:user/website.git
- rev: gh-pages-prod
- target: /usr/share/nginx/prod
- identity: /root/.ssh/website_id_rsa
- require:
  - pkg: git
  - ssh_known_hosts: gitlab.example.com

salt.states.git.mod_run_check(cmd_kwargs, onlyif, unless)

Execute the onlyif and unless logic. Return a result dict if:

- onlyif failed (onlyif != 0)
- unless succeeded (unless == 0)

Otherwise, returns True

salt.states.git.present(name, force=False, bare=True, template=None, separate_git_dir=None, shared=None, user=None, password=None, output_encoding=None)

Ensure that a repository exists in the given directory

**Warning:** If the minion has Git 2.5 or later installed, name points to a worktree, and force is set to True, then the worktree will be deleted. This has been corrected in Salt 2015.8.0.

**name** Path to the directory

Changed in version 2015.8.0: This path must now be absolute

**force** [False] If True, and if name points to an existing directory which does not contain a git repository, then the contents of that directory will be recursively removed and a new repository will be initialized in its place.

**bare** [True] If True, and a repository must be initialized, then the repository will be a bare repository.

**Note:** This differs from the default behavior of `git.init`, make sure to set this value to `False` if a bare repo is not desired.

**template** If a new repository is initialized, this argument will specify an alternate template directory.

New in version 2015.8.0.

**separate_git_dir** If a new repository is initialized, this argument will specify an alternate $GIT_DIR
New in version 2015.8.0.

**shared** Set sharing permissions on git repo. See `git-init(1)` for more details.

New in version 2015.5.0.

**user** User under which to run git commands. By default, commands are run by the user under which the minion is running.

New in version 0.17.0.

**password**
Windows only. Required when specifying **user**. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

### 21.19.90 salt.states.github module

**Github User State Module**

New in version 2016.3.0..

This state is used to ensure presence of users in the Organization.

```python
ensure user test is present in github:
    github.present:
        - name: 'Example TestUser1'
        - email: example@domain.com
        - username: 'gitexample'
```

salt.states.github.absent(name, profile='github', **kwargs)
Ensure a github user is absent

```python
ensure user test is absent in github:
    github.absent:
        - name: 'Example TestUser1'
        - email: example@domain.com
        - username: 'gitexample'
```

The following parameters are required:

- **name** Github handle of the user in organization

salt.states.github.present(name, profile='github', **kwargs)
Ensure a user is present

```python
ensure user test is present in github:
    github.present:
        - name: 'gitexample'
```

The following parameters are required:

- **name** This is the github handle of the user in the organization
salt.states.github.repo_absent(name, profile='github', **kwargs)
Ensure a repo is absent.

Example:

```
ensure repo test is absent in github:
  github.repo_absent:
    - name: 'test'
```

The following parameters are required:
name This is the name of the repository in the organization.
New in version 2016.11.0.

salt.states.github.repo_present(name, description=None, homepage=None, private=None, has_issues=None, has_wiki=None, has_downloads=None, auto_init=False, gitignore_template=None, license_template=None, teams=None, profile='github', **kwargs)
Ensure a repository is present

name This is the name of the repository.
description The description of the repository.
homepage The URL with more information about the repository.
private The visibility of the repository. Note that private repositories require a paid GitHub account.
has_issues Whether to enable issues for this repository.
has_wiki Whether to enable the wiki for this repository.
has_downloads Whether to enable downloads for this repository.
auto_init Whether to create an initial commit with an empty README.
gitignore_template The desired language or platform for a .gitignore, e.g "Haskell".
license_template The desired LICENSE template to apply, e.g "mit" or "mozilla".
teams The teams for which this repo should belong to, specified as a dict of team name to permission ('pull', 'push' or 'admin').

New in version 2017.7.0.

Example:

```
Ensure repo my-repo is present in github:
  github.repo_present:
    - name: 'my-repo'
    - description: 'My very important repository'
```

New in version 2016.11.0.

salt.states.github.team_absent(name, profile='github', **kwargs)
Ensure a team is absent.

Example:

```
ensure team test is present in github:
  github.team_absent:
    - name: 'test'
```

The following parameters are required:
name This is the name of the team in the organization.
New in version 2016.11.0.

salt.states.github.team_present(name, description=None, repo_names=None, privacy='secret', permission='pull', members=None, enforce_mfa=False, no_mfa_grace_seconds=0, profile='github', **kwargs)
Ensure a team is present

name This is the name of the team in the organization.
description  The description of the team.
repo_names  The names of repositories to add the team to.
privacy  The level of privacy for the team, can be 'secret' or 'closed'. Defaults to secret.
permission  The default permission for new repositories added to the team, can be 'pull', 'push' or 'admin'. Defaults to pull.
members  The members belonging to the team, specified as a dict of member name to optional configuration. Options include 'enforce_mfa_from' and 'mfa_exempt'.
enforce_mfa  Whether to enforce MFA requirements on members of the team. If True then all members without mfa_exempt: True configured will be removed from the team. Note that no_mfa_grace_seconds may be set to allow members a grace period.
no_mfa_grace_seconds  The number of seconds of grace time that a member will have to enable MFA before being removed from the team. The grace period will begin from enforce_mfa_from on the member configuration, which defaults to 1970/01/01.

Example:

Ensure team test is present in github:

```yaml
github.team_present:
  - name: 'test'
    members:
      user1: {}
      user2: {}
```

Ensure team test_mfa is present in github:

```yaml
github.team_present:
  - name: 'test_mfa'
    members:
      user1:
        enforce_mfa_from: 2016/06/15
        enforce_mfa: True
```

New in version 2016.11.0.

21.19.91 salt.states.glance

Managing Images in OpenStack Glance

salt.states.glance.image_present(name, visibility='public', protected=None, checksum=None, location=None, disk_format='raw', wait_for=None, timeout=30)

Checks if given image is present with properties set as specified.

An image should got through the stages 'queued', 'saving' before becoming 'active'. The attribute 'checksum' can only be checked once the image is active. If you don’t specify 'wait_for' but 'checksum' the function will wait for the image to become active before comparing checksums. If you don’t specify checksum either the function will return when the image reached 'saving'. The default timeout for both is 30 seconds.

Supported properties:
  • visibility ('public' or 'private')
  • protected (bool)
  • checksum (string, md5sum)
  • location (URL, to copy from)
  • disk_format ('raw' (default), 'vhd', 'vhdx', 'vmdk', 'vdi', 'iso', 'qcow2', 'aki', 'ari' or 'ami')

21.19.92 salt.states.glance_image
Management of OpenStack Glance Images

New in version 2018.3.0.

```yaml
depends: shade
configuration: see `salt.modules.glanceng` for setup instructions
```

Example States

```yaml
create image:
  glance_image.present:
    - name: cirros
    - filename: cirros.raw
    - image_format: raw

delete image:
  glance_image.absent:
    - name: cirros
```

```yaml
salt.states.glance_image.absent(name, auth=None)
  Ensure image does not exist
  name Name of the image

salt.states.glance_image.present(name, auth=None, **kwargs)
  Ensure image exists and is up-to-date
  name Name of the image
  enabled Boolean to control if image is enabled
  description An arbitrary description of the image
```

21.19.93 `salt.states.glusterfs`

Manage GlusterFS pool.

```yaml
salt.states.glusterfs.add_volume_bricks(name, bricks)
  Add brick(s) to an existing volume
  name Volume name
  bricks List of bricks to add to the volume
```

```yaml
myvolume:
  glusterfs.add_volume_bricks:
    - bricks:
      - host1:/srv/gluster/drive1
      - host2:/srv/gluster/drive2

Replicated Volume:
  glusterfs.add_volume_bricks:
    - name: volume2
    - bricks:
      - host1:/srv/gluster/drive2
      - host2:/srv/gluster/drive3
```

```yaml
salt.states.glusterfs.max_op_version(name)
  New in version 2019.2.0.
  Add brick(s) to an existing volume
  name Volume name
```
salt.states.glusterfs.op_version(name, version)

New in version 2019.2.0.
Add brick(s) to an existing volume
name Volume name
version Version to which the cluster.op-version should be set

salt.states.glusterfs.peered(name)
Check if node is peered.
name The remote host with which to peer.

peer-cluster:
  glusterfs.peered:
    - name: two
peer-clusters:
  glusterfs.peered:
    - names:
      - one
      - two
      - three
      - four

salt.states.glusterfs.started(name)
Check if volume has been started
name name of the volume

mycluster:
  glusterfs.started: []

salt.states.glusterfs.volume_present(name, bricks, stripe=False, replica=False, device_vg=False, transport='tcp', start=False, force=False, arbiter=False)

Ensure that the volume exists
name name of the volume
bricks list of brick paths
replica replica count for volume
arbiter use every third brick as arbiter (metadata only)

New in version 2019.2.0.
start ensure that the volume is also started

myvolume:
  glusterfs.volume_present:
    - bricks:
      - host1:/srv/gluster/drive1
      - host2:/srv/gluster/drive2
Replicated Volume:
  glusterfs.volume_present:
    - name: volume2
    - bricks:
      - host1:/srv/gluster/drive2
      - host2:/srv/gluster/drive3
    - replica: 2
    - start: True

Replicated Volume with arbiter brick:
  glusterfs.volume_present:
    - name: volume3
    - bricks:
      - host1:/srv/gluster/drive2
      - host2:/srv/gluster/drive3
      - host3:/srv/gluster/drive4
    - replica: 3
    - arbiter: True
    - start: True

21.19.94 salt.states.gnomedesktop

Configuration of the GNOME desktop

Control the GNOME settings

localdesktop_wm_prefs:
  gnomedesktop.wm_preferences:
    - user: username
    - audible_bell: false
    - action_double_click_titlebar: 'toggle-maximize'
    - visual_bell: true
    - num_workspaces: 6

localdesktop_lockdown:
  gnomedesktop.desktop_lockdown:
    - user: username
    - disable_user_switching: true

localdesktop_interface:
  gnomedesktop.desktop_interface:
    - user: username
    - clock_show_date: true
    - clock_format: 12h
salt.states.gnomedesktop.deSKTOP_INTERFACE(name, user=None, automatic_mnemonics=None, buttons_have_icons=None, can_change_accels=None, clock_format=None, clock_show_date=None, clock_show_seconds=None, cursor_blink=None, cursor_blink_time=None, cursor_blink_timeout=None, cursor_size=None, cursor_theme=None, document_font_name=None, enable_animations=None, font_name=None, gtk_color_palette=None, gtk_color_scheme=None, gtk_im_module=None, gtk_im_preedit_style=None, gtk_im_status_style=None, gtk_key_theme=None, gtk_theme=None, gtk_timeout_initial=None, gtk_timeout_repeat=None, icon_theme=None, menubar_accel=None, menubar_detachable=None, menus_have_icons=None, menus_have_tearoff=None, monospace_font_name=None, show_input_method_menu=None, show_unicode_menu=None, text_scaling_factor=None, toolbar_detachable=None, toolbar_icons_size=None, toolbar_style=None, toolkit_accessibility=None, **kwargs)

desktop_interface: sets values in the org.gnome.desktop.interface schema

salt.states.gnomedesktop.DESKTOP_LOCKDOWN(name, user=None, disable_application_handlers=None, disable_command_line=None, disable_lock_screen=None, disable_log_out=None, disable_print_setup=None, disable_printing=None, disable_save_to_disk=None, disable_user_switching=None, user_administration_disabled=None, **kwargs)

desktop_lockdown: sets values in the org.gnome.desktop.lockdown schema
salt.states.gnomedesktop.wm_preferences(name, user=None, action_double_click_titlebar=None, action_middle_click_titlebar=None, action_right_click_titlebar=None, application_based=None, audible_bell=None, auto_raise=None, auto_raise_delay=None, button_layout=None, disable_workarounds=None, focus_mode=None, focus_new_windows=None, mouse_button_modifier=None, num_workspaces=None, raise_on_click=None, resize_with_right_button=None, theme=None, titlebar_font=None, titlebar_uses_system_font=None, visual_bell=None, visual_bell_type=None, workspace_names=None, **kwargs)

wm_preferences: sets values in the org.gnome.desktop.wm.preferences schema

21.19.95 salt.states.gpg module

Management of the GPG keychains

New in version 2016.3.0.

salt.states.gpg.absent(name, keys=None, user=None, gnupghome=None, **kwargs)
Ensure GPG public key is absent in keychain
name The unique name or keyid for the GPG public key.
keys The keyid or keyIds to add to the GPG keychain.
user Remove GPG keys from the specified user’s keychain

salt.states.gpg.present(name, keys=None, user=None, keyserver=None, gnupghome=None, trust=None, **kwargs)
Ensure GPG public key is present in keychain
name The unique name or keyid for the GPG public key.
keys The keyid or keyIds to add to the GPG keychain.
user Add GPG keys to the specified user’s keychain
keyserver The keyserver to retrieve the keys from.

trust Trust level for the key in the keychain, ignored by default. Valid trust levels: expired, unknown, not_trusted, marginally, fully, ultimately

21.19.96 salt.states.grafana

Manage Grafana Dashboards

This module uses elasticsearch, which can be installed via package, or pip.

You can specify elasticsearch hosts directly to the module, or you can use an elasticsearch profile via pillars:

```yaml
mygrafanaprofile:
  hosts:
    - es1.example.com:9200
    - es2.example.com:9200
  index: grafana-dash
```
# Basic usage (uses default pillar profile key 'grafana')

Ensure myservice dashboard is managed:

```yaml
grafana.dashboard_present:
  - name: myservice
  - dashboard_from_pillar: default
  - rows_from_pillar:
    - systemhealth
    - requests
```

# Passing hosts in

Ensure myservice dashboard is managed:

```yaml
grafana.dashboard_present:
  - name: myservice
  - dashboard_from_pillar: default
  - rows:
    - collapse: false
      editable: true
      height: 150px
      title: System Health
      panels:
        - aliasColors: {}
          id: 200000
          annotate:
            enable: false
          bars: false
          datasource: null
          editable: true
          error: false

The behavior of this module is to create dashboards if they do not exist, to add rows if they do not exist in existing dashboards, and to update rows if they exist in dashboards. The module will not manage rows that are not defined, allowing users to manage their own custom rows.

salt.states.grafana.dashboard_absent(name, hosts=None, profile='grafana')
Ensure the named grafana dashboard is deleted.

name A name of the grafana dashboard.
profile A pillar key or dict that contains a list of hosts and an elasticsearch index to use.

salt.states.grafana.dashboard_present(name, dashboard=None, dashboard_from_pillar=None, rows=None, rows_from_pillar=None, profile='grafana')
Ensure the grafana dashboard exists and is managed.

name A name of the grafana dashboard.
dashboard A dict that defines a dashboard that should be managed.
dashboard_from_pillar A pillar key that contains a grafana dashboard dict. Mutually exclusive with dashboard.
rows A list of grafana rows.
rows_from_pillar A list of pillar keys that contain lists of grafana dashboard rows. Rows defined in the pillars will be appended to the rows defined in the state.
profile A pillar key or dict that contains a list of hosts and an elasticsearch index to use.
21.19.97 salt.states.grafana4_dashboard module

Manage Grafana v4.0 Dashboards

New in version 2017.7.0.

**configuration** This state requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the 'grafana' key by default, if defined.

Example configuration using basic authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_user: admin
  grafana_password: admin
  grafana_timeout: 3
```

Example configuration using token based authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_token: token
  grafana_timeout: 3
```

The behavior of this module is to create dashboards if they do not exist, to add rows if they do not exist in existing dashboards, and to update rows if they exist in dashboards. The module will not manage rows that are not defined, allowing users to manage their own custom rows.

Ensure minimum dashboard is managed:

```
salt.states.grafana4_dashboard.present:
  - name: insightful-dashboard
  - base_dashboards_from_pillar:
    - default_dashboard
  - base_rows_from_pillar:
    - default_row
  - base_panels_from_pillar:
    - default_panel
  - dashboard:
    rows:
      - title: Usage
      panels:
        - targets:
          - target: alias(constantLine(50), 'max')
        title: Imaginary
        type: graph
```

salt.states.grafana4_dashboard.absent(name, orgname=None, profile='grafana')

Ensure the named grafana dashboard is absent.

name Name of the grafana dashboard.

orgname Name of the organization in which the dashboard should be present.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

salt.states.grafana4_dashboard.present(name, base_dashboards_from_pillar=None, base_panels_from_pillar=None, base_rows_from_pillar=None, dashboard=None, orgname=None, profile='grafana')

Ensure the grafana dashboard exists and is managed.

name Name of the grafana dashboard.

base_dashboards_from_pillar A pillar key that contains a list of dashboards to inherit from
base_panels_from_pillar  A pillar key that contains a list of panels to inherit from
base_rows_from_pillar A pillar key that contains a list of rows to inherit from
dashboard  A dict that defines a dashboard that should be managed.
orgname  Name of the organization in which the dashboard should be present.
profile  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

21.19.98  salt.states.grafana4_datasource module

Manage Grafana v4.0 data sources

New in version 2017.7.0.

configuration  This state requires a configuration profile to be configured in the minion config, minion
pillar, or master config. The module will use the 'grafana' key by default, if defined.

Example configuration using basic authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_user: admin
  grafana_password: admin
  grafana_timeout: 3
```

Example configuration using token based authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_token: token
  grafana_timeout: 3
```

The behavior of this module is to create data sources if the do not exists, and to update data sources if the already exists.

```
Ensure influxdb data source is present:
grafana4_datasource.present:
  - name: influxdb
  - type: influxdb
  - url: http://localhost:8086
  - access: proxy
  - basic_auth: true
  - basic_auth_user: myuser
  - basic_auth_password: mypass
  - is_default: true
```

salt.states.grafana4_datasource.absent(name, orgname=None, profile='grafana')

Ensure that a data source is present.

name  Name of the data source to remove.
orgname  Name of the organization from which the data source should be absent.
profile  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

salt.states.grafana4_datasource.present(name, type, url, access=None, user=None, password=None, database=None, basic_auth=None, basic_auth_user=None, basic_auth_password=None, tls_auth=None, json_data=None, is_default=None, with_credentials=None, type_logo_url=None, orgname=None, profile='grafana')

Ensure that a data source is present.
name Name of the data source.
type Type of the datasource (‘graphite’, ‘influxdb’ etc.).
access Use proxy or direct. Default: proxy
url The URL to the data source API.
user Optional - user to authenticate with the data source.
password Optional - password to authenticate with the data source.
database Optional - database to use with the data source.
basic_auth Optional - set to True to use HTTP basic auth to authenticate with the data source.
basic_auth_user Optional - HTTP basic auth username.
basic_auth_password Optional - HTTP basic auth password.
json_data Optional - additional json data to post (eg. "timeInterval").
is_default Optional - set data source as default.
with_credentials Optional - Whether credentials such as cookies or auth headers should be sent with cross-site requests.
type_logo_url Optional - Logo to use for this datasource.
orgname Name of the organization in which the data source should be present.
profile Configuration profile used to connect to the Grafana instance. Default is ‘grafana’.

21.19.99 salt.states.grafana4_org module

Manage Grafana v4.0 orgs

New in version 2017.7.0.

configuration This state requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the ‘grafana’ key by default, if defined.

Example configuration using basic authentication:

```
grafana:
grafana_url: http://grafana.localhost
grafana_user: admin
grafana_password: admin
grafana_timeout: 3
```

Example configuration using token based authentication:

```
grafana:
grafana_url: http://grafana.localhost
grafana_token: token
grafana_timeout: 3
```

Ensure foobar org is present:

```
salt.states.grafana4_org.present:
  - name: foobar
    - theme: ""
    - home_dashboard_id: 0
    - timezone: "utc"
    - address1: ""
    - address2: ""
    - city: ""
    - zip_code: ""
    - state: ""
    - country: ""
```

salt.states.grafana4_org.absent(name, profile='grafana')

Ensure that a org is present.
name Name of the org to remove.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

```
salt.states.grafana4_org.present(name, users=None, theme=None, home_dashboard_id=None, timezone=None, address1=None, address2=None, city=None, zip_code=None, address_state=None, country=None, profile='grafana')
```

Ensure that an organization is present.

name Name of the org.

users Optional - Dict of user/role associated with the org. Example:

```
users:
    foo: Viewer
    bar: Editor
```

theme Optional - Selected theme for the org.

home_dashboard_id Optional - Home dashboard for the org.

timezone Optional - Timezone for the org (one of: "browser", "utc", or ").

default Optional - address1 of the org.

default Optional - address2 of the org.

city Optional - city of the org.

zip_code Optional - zip_code of the org.

address_state Optional - state of the org.

country Optional - country of the org.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

21.19.100 salt.states.grafana4_user module

Manage Grafana v4.0 users

New in version 2017.7.0.

configuration This state requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the 'grafana' key by default, if defined.

Example configuration using basic authentication:

```
grafana:
    grafana_url: http://grafana.localhost
    grafana_user: admin
    grafana_password: admin
    grafana_timeout: 3
```

Example configuration using token based authentication:

```
grafana:
    grafana_url: http://grafana.localhost
    grafana_token: token
    grafana_timeout: 3
```

Ensure foobar user is present:

```
grafana4_user.present:
    - name: foobar
    - password: mypass
    - email: "foobar@localhost"
    - fullname: Foo Bar
    - is_admin: true
```
salt.states.grafana4_user.absent(name, profile='grafana')
  Ensure that a user is present.
  name Name of the user to remove.
  profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

salt.states.grafana4_user.present(name, password, email, is_admin=False, fullname=None, theme=None, profile='grafana')
  Ensure that a user is present.
  name Name of the user.
  password Password of the user.
  email Email of the user.
  is_admin Optional - Set user as admin user. Default: False
  fullname Optional - Full name of the user.
  theme Optional - Selected theme of the user.
  profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

21.19.101 salt.states.grafana_dashboard module

Manage Grafana v2.0 Dashboards

New in version 2016.3.0.

### Grafana

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>grafana_timeout</td>
<td>3</td>
</tr>
<tr>
<td>grafana_token</td>
<td>qwertyuiop</td>
</tr>
<tr>
<td>grafana_url</td>
<td>'<a href="https://url.com">https://url.com</a>'</td>
</tr>
</tbody>
</table>

Ensure minimum dashboard is managed:

```
salt.grafana_dashboard.present:
  - name: insightful-dashboard
  - base_dashboards_from_pillar:
    - default_dashboard
  - base_rows_from_pillar:
    - default_row
  - base_panels_from_pillar:
    - default_panel
  - dashboard:
    rows:
    - title: Usage
    panels:
      - targets:
        - target: alias(constantLine(50), 'max')
        title: Imaginary
        type: graph
```

The behavior of this module is to create dashboards if they do not exist, to add rows if they do not exist in existing dashboards, and to update rows if they exist in dashboards. The module will not manage rows that are not defined, allowing users to manage their own custom rows.

salt.states.grafana_dashboard.absent(name, profile='grafana')
  Ensure the named grafana dashboard is absent.
  name Name of the grafana dashboard.
  profile A pillar key or dict that contains grafana information
salt.states.grafana_dashboard.present(name, base_dashboards_from_pillar=None, base_panels_from_pillar=None, base_rows_from_pillar=None, dashboard=None, profile='grafana')

Ensure the grafana dashboard exists and is managed.

name Name of the grafana dashboard.
base_dashboards_from_pillar A pillar key that contains a list of dashboards to inherit from
base_panels_from_pillar A pillar key that contains a list of panels to inherit from
base_rows_from_pillar A pillar key that contains a list of rows to inherit from
dashboard A dict that defines a dashboard that should be managed.
profile A pillar key or dict that contains grafana information

21.19.102 salt.states.grafana_datasource module

Manage Grafana v2.0 data sources

New in version 2016.3.0.

{grafana:
    grafana_timeout: 3
    grafana_token: qwertyuiop
    grafana_url: 'https://url.com'
}

Ensure influxdb data source is present:

salt.states.grafana_datasource.present:
- name: influxdb
- type: influxdb
- url: http://localhost:8086
- access: proxy
- basic_auth: true
- basic_auth_user: myuser
- basic_auth_password: mypass
- is_default: true

salt.states.grafana_datasource.absent(name, profile='grafana')

Ensure that a data source is present.

name Name of the data source to remove.

salt.states.grafana_datasource.present(name, type, url, access='proxy', user='', password='', database='', basic_auth=False, basic_auth_user='', basic_auth_password='', is_default=False, json_data=None, profile='grafana')

Ensure that a data source is present.

name Name of the data source.
type Which type of data source it is ('graphite', 'influxdb' etc.).
url The URL to the data source API.
user Optional - user to authenticate with the data source
password Optional - password to authenticate with the data source
basic_auth Optional - set to True to use HTTP basic auth to authenticate with the data source.
basic_auth_user Optional - HTTP basic auth username.
basic_auth_password Optional - HTTP basic auth password.
is_default Default: False

21.19.103 salt.states.grains

21.19. state modules 3479
Manage grains on the minion

This state allows for grains to be set.

Grains set or altered with this module are stored in the 'grains' file on the minions, By default, this file is located at: /etc/salt/grains

Note: This does NOT override any grains set in the minion config file.

salt.states.grains.absent(name, destructive=False, delimiter=':', force=False)
New in version 2014.7.0.

Delete a grain from the grains config file
name The grain name
destructive If destructive is True, delete the entire grain. If destructive is False, set the grain’s value to None.
Defaults to False.
force If force is True, the existing grain will be overwritten regardless of its existing or provided value type.
Defaults to False
New in version v2015.8.2.
delimiter A delimiter different from the default can be provided.
New in version v2015.8.2.
Changed in version v2015.8.2.
This state now support nested grains and complex values. It is also more conservative: if a grain has a value that is a list or a dict, it will not be removed unless the force parameter is True.

```yaml
grain_name:
grains.absent
```

salt.states.grains.append(name, value, convert=False, delimiter=': ')
New in version 2014.7.0.

Append a value to a list in the grains config file. The grain that is being appended to (name) must exist before the new value can be added.
name The grain name
value The value to append
convert If convert is True, convert non-list contents into a list. If convert is False and the grain contains non-list contents, an error is given. Defaults to False.
delimiter A delimiter different from the default can be provided.
New in version v2015.8.2.

```yaml
grain_name:
grains.append:
  - value: to_be_appended
```

salt.states.grains.exists(name, delimiter=': ')
Ensure that a grain is set
name The grain name
delimiter A delimiter different from the default can be provided.
Check whether a grain exists. Does not attempt to check or set the value.

salt.states.grains.list_absent(name, value, delimiter=': ')
Delete a value from a grain formed as a list.
New in version 2014.1.0.
name  The grain name.
value  The value to delete from the grain list.
delimiter  A delimiter different from the default : can be provided.

New in version v2015.8.2.
The grain should be list type

```
roles:
  grains.list_absent:
    - value: db
```

For multiple grains, the syntax looks like:

```
roles:
  grains.list_absent:
    - value:
      - web
      - dev
```

```
salt.states.grains.list_present(name, value, delimiter=':')
```
New in version 2014.1.0.
Ensure the value is present in the list-type grain. Note: If the grain that is provided in name is not present on the system, this new grain will be created with the corresponding provided value.
name  The grain name.
value  The value is present in the list type grain.
delimiter  A delimiter different from the default : can be provided.

New in version v2015.8.2.
The grain should be list type

```
roles:
  grains.list_present:
    - value: web
```

For multiple grains, the syntax looks like:

```
roles:
  grains.list_present:
    - value:
      - web
      - dev
```

```
salt.states.grains.make_hashable(list_grain, result=None)
```
Ensure that a list grain is hashable.
list_grain  The list grain that should be hashable
result  This function is recursive, so it must be possible to use a sublist as parameter to the function. Should not be used by a caller outside of the function.

Make it possible to compare two list grains to each other if the list contains complex objects.

```
salt.states.grains.present(name, value, delimiter=(':', force=False)
```
Ensure that a grain is set

Changed in version v2015.8.2.
name  The grain name
value  The value to set on the grain
force  If force is True, the existing grain will be overwritten regardless of its existing or provided value type.
Defaults to False
New in version v2015.8.2.

delimiter  A delimiter different from the default can be provided.

New in version v2015.8.2.

It is now capable to set a grain to a complex value (ie. lists and dicts) and supports nested grains as well.

If the grain does not yet exist, a new grain is set to the given value. For a nested grain, the necessary keys are created if they don’t exist. If a given key is an existing value, it will be converted, but an existing value different from the given key will fail the state.

If the grain with the given name exists, its value is updated to the new value unless its existing or provided value is complex (list or dict). Use `force: True` to overwrite.

```yaml
cheese:
  grains.present:
    - value: edam

nested_grain_with_complex_value:
  grains.present:
    - name: icinga:Apache SSL
      value:
      - command: check_https
      - params: -H localhost -p 443 -S

with,a,custom,delimiter:
  grains.present:
    - value: yay
    - delimiter: ',
```

### 21.19.104 salt.states.group

Management of user groups

The group module is used to create and manage group settings, groups can be either present or absent. User/Group names can be passed to the `adduser`, `deluser`, and `members` parameters. `adduser` and `deluser` can be used together but not with `members`.

In Windows, if no domain is specified in the user or group name (i.e. `DOMAIN\username`) the module will assume a local user or group.

```yaml
cheese:
  group.present:
    - gid: 7648
    - system: True
    - addusers:
      - user1
      - users2
    - delusers:
      - foo

cheese:
  group.present:
    - gid: 7648
    - system: True
    - members:
      - foo
      - bar
```

(continues on next page)
salt.states.group.absent(name)

Ensure that the named group is absent

Parameters name (str) – The name of the group to remove

Example:

```python
# Removes the local group `db_admin`

db_admin:
  - group.absent
```
	salt.states.group.present(name, gid=None, system=False, addusers=None, delusers=None, members=None)

Ensure that a group is present

Parameters

- name (str) – The name of the group to manage
- gid (str) – The group id to assign to the named group; if left empty, then the next available group id will be assigned. Ignored on Windows
- system (bool) – Whether or not the named group is a system group. This is essentially the `-r` option of `groupadd`. Ignored on Windows
- addusers (list) – List of additional users to be added as a group members. Cannot conflict with names in delusers. Cannot be used in conjunction with members.
- delusers (list) – Ensure these user are removed from the group membership. Cannot conflict with names in addusers. Cannot be used in conjunction with members.
- members (list) – Replace existing group members with a list of new members. Cannot be used in conjunction with addusers or delusers.

Example:

```python
# Adds DOMAIN\db_admins and Administrators to the local db_admin group
# Removes Users

db_admin:
  - group.present:
    - addusers:
      - DOMAIN\db_admins
      - Administrators
    - delusers:
      - Users

# Ensures only DOMAIN\domain_admins and the local Administrator are members of the local Administrators group. All other users are removed

Administrators:
  - group.present:
    - members:
      - DOMAIN\domain_admins
      - Administrator
```

21.19.105 salt.states.heat module

Management of Heat

New in version 2017.7.0.
depends
  • heat Python module

configuration See `salt.modules.heat` for setup instructions.

The heat module is used to create, show, list and delete Heat staks. Stack can be set as either absent or deploy.

```yaml
heat.deployed:
  - name:
    - template: #Required
    - environment:
      - params: {}
      - poll: 5
      - rollback: False
      - timeout: 60

heat.absent:
  - name:
    - poll: 5

mysql:
  heat.deployed:
    • template: salt://templates/mysql.heat.yaml
    • params: image: Debian 7
    • rollback: True

New in version 2017.7.5,2018.3.1: The spelling mistake in parameter `enviroment` was corrected to `environment`. The `enviroment` spelling mistake has been removed in Salt 3000.

```
salt.states.heat.absent(name, poll=5, timeout=60, profile=None)
Ensure that the named stack is absent
name The name of the stack to remove
poll Poll(in sec.) and report events until stack complete
timeout Stack creation timeout in minutes
profile Profile to use

salt.states.heat.deployed(name, template=None, environment=None, params=None, poll=5, rollback=False, timeout=60, update=False, profile=None, **connection_args)
Deploy stack with the specified properties
name The name of the stack
template File of template
environment File of environment
params Parameter dict used to create the stack
poll Poll (in sec.) and report events until stack complete
rollback Enable rollback on create failure
timeout Stack creation timeout in minutes
profile Profile to use

New in version 2017.7.5,2018.3.1: The spelling mistake in parameter `enviroment` was corrected to `environment`. The `enviroment` spelling mistake has been removed in Salt 3000.

21.19.106 salt.states.hg
Interaction with Mercurial repositories

Before using hg over ssh, make sure the remote host fingerprint already exists in ~/.ssh/known_hosts, and the remote host has this host’s public key.

```
https://bitbucket.org/example_user/example_repo:
  hg.latest:
    - rev: tip
    - target: /tmp/example_repo
```

salt.states.hg.latest(name, rev=None, target=None, clean=False, user=None, identity=None, force=False, opts=False, update_head=True)

Make sure the repository is cloned to the given directory and is up to date.

- **name**: Address of the remote repository as passed to “hg clone”
- **rev**: The remote branch, tag, or revision hash to clone/pull
- **target**: Target destination directory path on minion to clone into
- **clean**: Force a clean update with -C (Default: False)
- **user**: Name of the user performing repository management operations

New in version 0.17.0.

- **identity**: Private SSH key on the minion server for authentication (ssh://)

  New in version 2015.5.0.

- **force**: Force hg to clone into pre-existing directories (deletes contents)
- **opts**: Include additional arguments and options to the hg command line
- **update_head**: Should we update the head if new changes are found? Defaults to True

  New in version 2017.7.0.

21.19.107 salt.states.host

Management of addresses and names in hosts file

The /etc/hosts file can be managed to contain definitions for specific hosts:

```
salt-master:
  host.present:
    - ip: 192.168.0.42
```

Or using the names directive, you can put several names for the same IP. (Do not try one name with space-separated values).

```
server1:
  host.present:
    - ip: 192.168.0.42
    - names:
      - server1
      - florida
```

Note: Changing the names in host.present does not cause an update to remove the old entry.

```
server1:
  host.present:
    - ip:
```

(continues on next page)
You can replace all existing names for a particular IP address:

```
127.0.0.1:
    host.only:
        - hostnames:
            - foo.example.com
            - foo
```

Or delete all existing names for an address:

```
203.0.113.25:
    host.only:
        - hostnames: []
```

```python
salt.states.host.absent(name, ip)
Ensure that the named host is absent

name  The host to remove
ip    The ip addr(s) of the host to remove
```

```python
salt.states.host.only(name, hostnames)
Ensure that only the given hostnames are associated with the given IP address.

New in version 2016.3.0.

name  The IP address to associate with the given hostnames.
hostnames  Either a single hostname or a list of hostnames to associate with the given IP address in the given order. Any other hostname associated with the IP address is removed. If no hostnames are specified, all hostnames associated with the given IP address are removed.
```

```python
salt.states.host.present(name, ip, clean=False)
Ensures that the named host is present with the given ip

name  The host to assign an ip to
ip    The ip addr(s) to apply to the host. Can be a single IP or a list of IP addresses.
clean  Remove any entries which don’t match those configured in the ip option. Default is False.

New in version 2018.3.4.
```

### 21.19.108 salt.states.http

HTTP monitoring states

Perform an HTTP query and statefully return the result

New in version 2015.5.0.

```python
salt.states.http.query(name, match=None, match_type='string', status=None, status_type='string',
    wait_for=None, **kwargs)
Perform an HTTP query and statefully return the result

Passes through all the parameters described in the `utils.http.query` function:
name  The name of the query.
```
**match** Specifies a pattern to look for in the return text. By default, this will perform a string comparison of looking for the value of match in the return text.

**match_type** Specifies the type of pattern matching to use on match. Default is `string`, but can also be set to `pcre` to use regular expression matching if a more complex pattern matching is required.

**status** The status code for a URL for which to be checked. Can be used instead of or in addition to the `match` setting. This can be passed as an individual status code or a list of status codes.

**status_type** Specifies the type of pattern matching to use for status. Default is `string`, but can also be set to `pcre` to use regular expression matching if a more complex pattern matching is required. Additionally, if a list of strings representing statuses is given, the type `list` can be used.

New in version 3000.

**Note:** Despite the name of `match_type` for this argument, this setting actually uses Python's `re.search()` function rather than Python's `re.match()` function.

If both `match` and `status` options are set, both settings will be checked. However, note that if only one option is `True` and the other is `False`, then `False` will be returned. If this case is reached, the comments in the return data will contain troubleshooting information.

For more information about the `http.query` state, refer to the *HTTP Tutorial*.

```yaml
query_example:
  http.query:
    - name: 'http://example.com/
    - status: 200

query_example2:
  http.query:
    - name: 'http://example.com/
    - status:
      - 200
      - 201
    - status_type: list
```

**salt.states.http.wait_for_successful_query**(name, wait_for=300, **kwargs)

Like query but, repeat and wait until match/match_type or status is fulfilled. State returns result from last query state in case of success or if no successful query was made within wait_for timeout.

**name** The name of the query.

**wait_for** Total time to wait for requests that succeed.

**request_interval** Optional interval to delay requests by N seconds to reduce the number of requests sent.

**Note:** All other arguments are passed to the http.query state.
• Icinga2 Python module

configuration See salt.modules.icinga2 for setup instructions.

The icinga2 module is used to execute commands. Its output may be stored in a file or in a grain.

```
cmd_id:
  icinga2.generate_ticket:
    - name: domain.tld
    - output: "/tmp/query_id.txt"
```

salt.states.icinga2.generate_cert(name)
Generate an icinga2 certificate and key on the client.
name The domain name for which this certificate and key will be generated

salt.states.icinga2.generate_ticket(name, output=None, grain=None, key=None, overwrite=True)
Generate an icinga2 ticket on the master.
name The domain name for which this ticket will be generated
output grain: output in a grain other: the file to store results None: output to the result comment (default)
grain: grain to store the output (need output=grain)
key: the specified grain will be treated as a dictionary, the result of this state will be stored under the specified key.
overwrite: The file or grain will be overwritten if it already exists (default)

salt.states.icinga2.node_setup(name, master, ticket)
Setup the icinga2 node.
name The domain name for which this certificate will be saved
master Icinga2 master node for which this certificate will be saved
ticket Authentication ticket generated on icinga2 master

salt.states.icinga2.request_cert(name, master, ticket, port='5665')
Request CA certificate from master icinga2 node.
name The domain name for which this certificate will be saved
master Icinga2 master node for which this certificate will be saved
ticket Authentication ticket generated on icinga2 master
port Icinga2 port, defaults to 5665

salt.states.icinga2.save_cert(name, master)
Save the certificate on master icinga2 node.
name The domain name for which this certificate will be saved
master Icinga2 master node for which this certificate will be saved

21.19.110 salt.states.ifttt

Trigger an event in IFTTT

This state is useful for trigging events in IFTTT.

New in version 2015.8.0.

```
ifttt:
  ifttt.trigger_event:
    - event: TestEvent
    - value1: 'This state was executed successfully.'
    - value2: 'Another value we can send.'
    - value3: 'A third value we can send.'
```
The api key can be specified in the master or minion configuration like below:

```yaml
ifttt: secret_key: bzMRb-KKIAaNOwKEEw7927E6-B3z7muhdhYblJn4V6
```

salt.states.ifttt.trigger_event(name, event, value1=None, value2=None, value3=None)

Trigger an event in IFTTT

```yaml
ifttt-event:
  ifttt.trigger_event:
    - event: TestEvent
    - value1: 'A value that we want to send.'
    - value2: 'A second value that we want to send.'
    - value3: 'A third value that we want to send.'
```

The following parameters are required:
- `name` The unique name for this event.
- `event` The name of the event to trigger in IFTTT.

The following parameters are optional:
- `value1` One of the values that we can send to IFTTT.
- `value2` One of the values that we can send to IFTTT.
- `value3` One of the values that we can send to IFTTT.

## 21.19.111 salt.states.incron

### Management of incron, the inotify cron

The incron state module allows for user incrontabs to be cleanly managed.

Incrcon declarations require a number of parameters. The parameters needed to be declared: `path`, `mask`, and `cmd`. The `user` whose incrontab is to be edited also needs to be defined.

When making changes to an existing incron job, the `path` declaration is the unique factor, so if an existing cron that looks like this:

```yaml
Watch for modifications in /home/user:
  incron.present:
    - user: root
    - path: /home/user
    - mask: IN_MODIFY
    - cmd: 'echo "$$ $@"'
```

Is changed to this:

```yaml
Watch for modifications and access in /home/user:
  incron.present:
    - user: root
    - path: /home/user
    - mask: IN_MODIFY
    - cmd: 'echo "$$ $@"'
```

Then the existing cron will be updated, but if the cron command is changed, then a new cron job will be added to the user’s crontab.

New in version 0.17.0.
salt.states.incron.absent(name, path, mask, cmd, user='root')
    Verifies that the specified incron job is absent for the specified user; only the name is matched when removing
    a incron job.
    name  Unique comment describing the entry
    path  The path that should be watched
    user  The name of the user who’s crontab needs to be modified, defaults to the root user
    mask  The mask of events that should be monitored for
    cmd   The cmd that should be executed

salt.states.incron.present(name, path, mask, cmd, user='root')
    Verifies that the specified incron job is present for the specified user. For more advanced information about
    what exactly can be set in the cron timing parameters, check your incron system’s documentation. Most
    Unix-like systems’ incron documentation can be found via the incrontab man page: man 5 incrontab.
    name  Unique comment describing the entry
    path  The path that should be watched
    user  The name of the user who’s crontab needs to be modified, defaults to the root user
    mask  The mask of events that should be monitored for
    cmd   The cmd that should be executed

21.19.112 salt.states.influxdb08_database module

Management of Influxdb 0.8 databases

(compatible with InfluxDB version 0.5-0.8)

New in version 2014.7.0.

salt.states.influxdb08_database.absent(name, user=None, password=None, host=None, port=None)
    Ensure that the named database is absent
    name   The name of the database to remove
    user   The user to connect as (must be able to remove the database)
    password  The password of the user
    host   The host to connect to
    port   The port to connect to

salt.states.influxdb08_database.present(name, user=None, password=None, host=None, port=None)
    Ensure that the named database is present
    name   The name of the database to create
    user   The user to connect as (must be able to remove the database)
    password  The password of the user
    host   The host to connect to
    port   The port to connect to

21.19.113 salt.states.influxdb08_user module

Management of InfluxDB 0.8 users

(compatible with InfluxDB version 0.5-0.8)

New in version 2014.7.0.
salt.states.influxdb08_user.absent(name, database=None, user=None, password=None, host=None, port=None)
Ensure that the named cluster admin or database user is absent.
name The name of the user to remove
database The database to remove the user from
user The user to connect as (must be able to remove the user)
password The password of the user
host The host to connect to
port The port to connect to

salt.states.influxdb08_user.present(name, passwd, database=None, user=None, password=None, host=None, port=None)
Ensure that the cluster admin or database user is present.
name The name of the user to manage
password The password of the user
database The database to create the user in
user The user to connect as (must be able to create the user)
password The password of the user
host The host to connect to
port The port to connect to

21.19.114 salt.states.influxdb_continuous_query module
Management of Influxdb continuous queries

New in version 2017.7.0.
(compatible with InfluxDB version 0.9+)

salt.states.influxdb_continuous_query.absent(name, database, **client_args)
Ensure that given continuous query is absent.
name Name of the continuous query to remove.
database Name of the database that the continuous query was defined on.

salt.states.influxdb_continuous_query.present(name, database, query, resample_time=None, coverage_period=None, **client_args)
Ensure that given continuous query is present.
name Name of the continuous query to create.
database Database to create continuous query on.
query The query content
resample_time [None] Duration between continuous query resampling.
coverage_period [None] Duration specifying time period per sample.

21.19.115 salt.states.influxdb_database
Management of Influxdb databases

(compatible with InfluxDB version 0.9+)

salt.states.influxdb_database.absent(name, **client_args)
Ensure that given database is absent.
name Name of the database to remove.
salt.states.influxdb_database.present(name, **client_args)
   Ensure that given database is present.
   name  Name of the database to create.

21.19.116 salt.states.influxdb_retention_policy module

Management of Influxdb retention policies

New in version 2017.7.0.
(compatible with InfluxDB version 0.9+)

salt.states.influxdb_retention_policy.absent(name, database, **client_args)
   Ensure that given retention policy is absent.
   name  Name of the retention policy to remove.
   database  Name of the database that the retention policy was defined on.

salt.states.influxdb_retention_policy.convert_duration(duration)
   Convert the a duration string into XXhYYmZZs format
   duration  Duration to convert
   Returns: duration_string  String representation of duration in XXhYYmZZs format

salt.states.influxdb_retention_policy.present(name, database, duration='7d', replication=1, default=False, **client_args)
   Ensure that given retention policy is present.
   name  Name of the retention policy to create.
   database  Database to create retention policy on.

21.19.117 salt.states.influxdb_user

Management of InfluxDB users

(compatible with InfluxDB version 0.9+)

salt.states.influxdb_user.absent(name, **client_args)
   Ensure that given user is absent.
   name  The name of the user to manage

salt.states.influxdb_user.present(name, passwd, admin=False, grants=None, **client_args)
   Ensure that given user is present.
   name  Name of the user to manage
   passwd  Password of the user
   admin  [False] Whether the user should have cluster administration privileges or not.
   grants  Optional - Dict of database:privilege items associated with the user. Example:
   grants: foo_db: read bar_db: all

Example:

example user present in influxdb:

influxdb_user.present:
   - name: example
   - passwd: somepassword
   - admin: False
   - grants:
     foo_db: read
     bar_db: all
21.19.118 salt.states.infoblox_a

Infoblox A record management.

functions accept api_opts:

- api_verifyssl: verify SSL [default to True or pillar value]
- api_url: server to connect to [default to pillar value]
- api_username: [default to pillar value]
- api_password: [default to pillar value]

salt.states.infoblox_a.absent(name=None, ipv4addr=None, **api_opts)
Ensure infoblox A record is removed.

State example:

```yaml
infoblox_a.absent:
  - name: example-ha-0.domain.com

infoblox_a.absent:
  - name:
    - ipv4addr: 127.0.23.23
```

salt.states.infoblox_a.present(name=None, ipv4addr=None, data=None, ensure_data=True, **api_opts)
Ensure infoblox A record.

When you wish to update a hostname ensure name is set to the hostname of the current record. You can give a new name in the data.name.

State example:

```yaml
infoblox_a.present:
  - name: example-ha-0.domain.com
  - data:
    name: example-ha-0.domain.com
    ipv4addr: 123.0.31.2
    view: Internal
```

21.19.119 salt.states.infoblox_cname

Infoblox CNAME management.

functions accept api_opts:

- api_verifyssl: verify SSL [default to True or pillar value]
- api_url: server to connect to [default to pillar value]
- api_username: [default to pillar value]
- api_password: [default to pillar value]

salt.states.infoblox_cname.absent(name=None, canonical=None, **api_opts)
Ensure the CNAME with the given name or canonical name is removed

salt.states.infoblox_cname.present(name=None, data=None, ensure_data=True, **api_opts)
Ensure the CNAME with the given data is present.

name CNAME of record
data raw CNAME api data see: https://INFOBLOX/wapidoc

State example:

```yaml
infoblox_cname.present:
  - name: example-ha-0.domain.com
  - data:
    name: example-ha-0.domain.com
```

(continues on next page)
infoblox_cname.present:
  - name: example-ha-0.domain.com
  - data: name: example-ha-0.domain.com canonical: example.domain.com zone: example.com view: Internal comment: Example comment

api_url: https://INFOBLOX/wapi/v1.2.1
api_username: username
api_password: passwd

21.19.120 salt.states.infoblox_host_record

Infoblox host record management.

functions accept api_opts:

  api_verifyssl: verify SSL [default to True or pillar value]
  api_url: server to connect to [default to pillar value]
  api_username: [default to pillar value]
  api_password: [default to pillar value]

salt.states.infoblox_host_record.absent(name=None, ipv4addr=None, mac=None, **api_opts)

Ensure the host with the given Name ipv4addr or mac is removed.

State example:

infoblox_host_record.absent:
  - name: hostname.of.record.to.remove

infoblox_host_record.absent:
  - name:
    - ipv4addr: 192.168.0.1

infoblox_host_record.absent:
  - name:
    - mac: 12:02:12:31:23:43

salt.states.infoblox_host_record.present(name=None, data=None, ensure_data=True, **api_opts)

This will ensure that a host with the provided name exists. This will try to ensure that the state of the host matches the given data If the host is not found then one will be created.

When trying to update a hostname ensure name is set to the hostname of the current record. You can give a new name in the data.name.

Avoid race conditions, use func:nextavailableip:

• func:nextavailableip:network/ZG54dfgsrDFEFfsfsLzA:10.0.0.0/8/default
• func:nextavailableip:10.0.0.0/8
• func:nextavailableip:10.0.0.0/8,externalconfigure_for_dns
• func:nextavailableip:10.0.0.3-10.0.0.10

State Example:
# this would update `original_hostname.example.ca` to changed `data`.

```yaml
infoblox_host_record.present:
  - name: original_hostname.example.ca
  - data: {
        'namhostname.example.ca': 'hostname.example.ca',
        'aliases': [{'hostname.math.example.ca'},
        'extattrs': [{'Business Contact': {'value': 'EXAMPLE@example.ca'}}],
        'ipv4addr': [{'configure_for_dhcp': True,
                      'ipv4addr': 'func:nextavailableip:129.97.139.0/24',
                      'mac': '00:50:56:84:6e:ae'},
        'ipv6addr': []],
    }
```

## 21.19.121 salt.states.infoblox_range

Infoblox host record management.

functions accept api_opts:

- api_verifyssl: verify SSL [default to True or pillar value]
- api_url: server to connect to [default to pillar value]
- api_username: [default to pillar value]
- api_password: [default to pillar value]

```python
salt.states.infoblox_range.absent(name=None, start_addr=None, end_addr=None, data=None, **api_opts)
```

Ensure the range is removed

Supplying the end of the range is optional.

State example:

```yaml
infoblox_range.absent:
  - name: 'vlan10'

infoblox_range.absent:
  - name:
    - start_addr: 127.0.1.20
```

```python
salt.states.infoblox_range.present(name=None, start_addr=None, end_addr=None, data=None, **api_opts)
```

Ensure range record is present.

```yaml
infoblox_range.present: start_addr: '129.97.150.160', end_addr: '129.97.150.170',
```

Verbose state example:

```yaml
infoblox_range.present:
  data: {
    'always_update_dns': False,
    'authority': False,
    'comment': 'range of IP addresses used for salt.. was used for ghost images deployment',
    'ddns_generate_hostname': True,
    'deny_all_clients': False,
    'deny_bootp': False,
    'disable': False,
    'email_list': [],
    'enable_ddns': False,
    'enable_dhcp_thresholds': False,
    'enable_email_warnings': False,
    'enable_ifmap_publishing': False,
    'enable_snmp_warnings': False,
  }
```
'end_addr': '129.97.150.169',
'exclude': [],
'extend': {},
'fingerprint_filter_rules': [],
'high_water_mark': 95,
'high_water_mark_reset': 85,
'ignore_dhcp_option_list_request': False,
'lease_scavenge_time': -1,
'logic_filter_rules': [],
'low_water_mark': 0,
'low_water_mark_reset': 10,
'mac_filter_rules': [],
'member': {'_struct': 'dhcpmember',
  'ipv4addr': '129.97.128.9',
  'name': 'cn-dhcp-mc.example.ca'},
'ms_options': [],
'nac_filter_rules': [],
'name': 'ghost-range',
'network': '129.97.150.0/24',
'network_view': 'default',
'option_filter_rules': [],
'options': [{
    'name': 'dhcp-lease-time',
    'num': 51,
    'use_option': False,
    'value': '43200',
    'vendor_class': 'DHCP'}],
'recycle_leases': True,
'relay_agent_filter_rules': [],
'server_association_type': 'MEMBER',
'start_addr': '129.97.150.160',
'update_dns_on_lease_renewal': False,
'use_authority': False,
'use_bootfile': False,
'use_bootserver': False,
'use_ddns_domainname': False,
'use_ddns_generate_hostname': True,
'use_deny_bootp': False,
'use_email_list': False,
'use_enable_ddns': False,
'use_enable_dhcp_thresholds': False,
'use_enable_ifmap_publishing': False,
'use_ignore_dhcp_option_list_request': False,
'use_known_clients': False,
'use_lease_scavenge_time': False,
'use_nextserver': False,
'use_options': False,
'use_recycle_leases': False,
'use_unknown_clients': False,
'use_update_dns_on_lease_renewal': False}
Manage ini files

salt.states.ini_manage.options_absent(name, sections=None, separator=' = ')

```
/home/saltminion/api-paste.ini:
ini.options_absent:
  - separator: ' = '
  - sections:
    test:
      - testkey
      - secondoption
    test1:
      - testkey1
```

options present in file and not specified in sections dict will be untouched
changes dict will contain the list of changes made

salt.states.ini_manage.options_present(name, sections=None, separator=' = ', strict=False)

```
/home/saltminion/api-paste.ini:
in.options_present:
  - separator: ' = '
  - strict: True
  - sections:
    test:
      testkey: 'testval'
      secondoption: 'secondvalue'
    test1:
      testkey1: 'testval121'
```

options present in file and not specified in sections dict will be untouched, unless strict: True flag is used
changes dict will contain the list of changes made

salt.states.ini_manage.sections_absent(name, sections=None, separator=' = ')

```
/home/saltminion/api-paste.ini:
in.sections_absent:
  - separator: ' = '
  - sections:
    - test
    - test1
```

options present in file and not specified in sections will be deleted changes dict will contain the sections that changed

salt.states.ini_manage.sections_present(name, sections=None, separator=' = ')

```
/home/saltminion/api-paste.ini:
in.sections_present:
  - separator: ' = '
  - sections:
    - test
    - test1
```

options present in file and not specified in sections will be added changes dict will contain the sections that changed
This will only create empty sections. To also create options, use options_present state.

### 21.19.123 salt.states.ipmi

**Manage IPMI devices over LAN**

The following configuration defaults can be defined in the minion, master config or pillar:

```yaml
ipmi.config:
  api_host: 127.0.0.1
  api_user: admin
  api_pass: apassword
  api_port: 623
  api_kg: None
```

Every call can override the config defaults:

```yaml
# Ensure myipmi system is set to network boot
ipmi.boot_device:
  - name: network
  - api_host: myipmi.hostname.com
  - api_user: root
  - api_pass: apassword
  - api_kg: None

# Ensure myipmi system is powered on
ipmi.power:
  - name: boot
  - api_host: myipmi.hostname.com
  - api_user: root
  - api_pass: apassword
```

salt.states.ipmi.<boot_device>(name='default', **kwargs)

Request power state change

**name** = default

- network – Request network boot
- hd – Boot from hard drive
- safe – Boot from hard drive, requesting ’safe mode’
- optical – boot from CD/DVD/BD drive
- setup – Boot into setup utility
- default – remove any IPMI directed boot device request

**kwargs**

- api_host=localhost
- api_user=admin
- api_pass=
**salt.states.ipmi.power** (name='power_on', wait=300, **kwargs)

Request power state change

name

Ensure power state one of:

- power_on – system turn on
- power_off – system turn off (without waiting for OS)
- shutdown – request OS proper shutdown
- reset – reset (without waiting for OS)
- boot – If system is off, then ‘on’, else ‘reset’

wait wait X seconds for the job to complete before forcing. (defaults to 300 seconds)

kwargs

- api_host=localhost
- api_user=admin
- api_password=
- api_port=623
- api_kg=None

**salt.states.ipmi.user_absent** (name, channel=14, **kwargs)

Remove user Delete all user (uid) records having the matching name.

name string name of user to delete

channel channel to remove user access from defaults to 14 for auto.

kwargs

- api_host=localhost
- api_user=admin
- api_password=
- api_port=623
- api_kg=None

**salt.states.ipmi.user_present** (name, uid, password, channel=14, callback=False, link_auth=True, ipmi_msg=True, privilege_level='administrator', **kwargs)

Ensure IPMI user and user privileges.

name name of user (limit 16 bytes)

uid user id number (1 to 7)

password user password (limit 16 bytes)

channel ipmi channel defaults to 14 for auto

callback User Restricted to Callback

False = User Privilege Limit is determined by the User Privilege Limit parameter privilege_level, for both callback and non-callback connections.

True = User Privilege Limit is determined by the privilege_level parameter for callback connections, but is restricted to Callback level for non-callback connections. Thus, a user can only initiate a Callback when they ‘call in’ to the BMC, but once the callback connection has been made, the user could potentially establish a session as an Operator.

link_auth User Link authentication True/False user name and password information will be used for link authentication, e.g. PPP CHAP) for the given channel. Link authentication itself is a global setting for the channel and is enabled/disabled via the serial/modem configuration parameters.

ipmi_msg User IPMI Messaging True/False user name and password information will be used for IPMI Messaging. In this case, ‘IPMI Messaging’ refers to the ability to execute generic IPMI commands that are not associated with a particular payload type. For example, if IPMI Messaging is disabled for a user, but that user is enabled for activating the SOL payload type, then IPMI commands associated with SOL and session management, such as Get SOL Configuration Parameters and Close Session are available, but generic IPMI commands such as Get SEL Time are unavailable.)

privilege_level

- callback
• user
• operator
• administrator
• proprietary
• no_access

kwargs
• api_host=localhost
• api_user=admin
• api_pass=
• api_port=623
• api_kg=None

21.19.124 salt.states.ipset

Management of ipsets

This is an ipset-specific module designed to manage IPSets for use in IPTables Firewalls.

```python
setname:
ipset.set_present:
  - set_type: bitmap:ip
  - range: 192.168.0.0/16
  - comment: True

setname:
ipset.set_absent:
  - set_type: bitmap:ip
  - range: 192.168.0.0/16
  - comment: True

setname_entries:
ipset.present:
  - set_name: setname
  - entry: 192.168.0.3
  - comment: Hello
  - require:
    - ipset: baz

setname_entries:
ipset.present:
  - set_name: setname
  - entry: 192.168.0.3
  - entry: 192.168.1.3
  - comment: Hello
  - require:
    - ipset: baz

setname_entries:
ipset.absent:
  - set_name: setname
  - entry: 192.168.0.3
  - entry: 192.168.1.3
  - comment: Hello
```

(continues on next page)
- **require:**
  - **ipset**: baz

**setname:**

- **setname:**

salt.states.ipset.absent(name, entry=None, entries=None, family='ipv4', **kwargs)

New in version 2014.7.0.

Remove a entry or entries from a chain

- **name**: A user-defined name to call this entry by in another part of a state or formula. This should not be an actual entry.
- **family**: Network family, ipv4 or ipv6.

salt.states.ipset.flush(name, family='ipv4', **kwargs)

New in version 2014.7.0.

Flush current ipset set

- **family**: Networking family, either ipv4 or ipv6

salt.states.ipset.present(name, entry=None, family='ipv4', **kwargs)

New in version 2014.7.0.

Append a entry to a set

- **name**: A user-defined name to call this entry by in another part of a state or formula. This should not be an actual entry.
- **entry**: A single entry to add to a set or a list of entries to add to a set
- **family**: Network family, ipv4 or ipv6.

salt.states.ipset.set_absent(name, family='ipv4', **kwargs)

New in version 2014.7.0.

Verify the set is absent.

- **family**: Networking family, either ipv4 or ipv6

salt.states.ipset.set_present(name, set_type, family='ipv4', **kwargs)

New in version 2014.7.0.

Verify the set exists.

- **name**: A user-defined set name.
- **set_type**: The type for the set.
- **family**: Networking family, either ipv4 or ipv6

---

21.19.125 salt.states.iptables

Management of iptables

This is an iptables-specific module designed to manage Linux firewalls. It is expected that this state module, and other system-specific firewall states, may at some point be deprecated in favor of a more generic firewall state.

- **httpd**:
  
  iptables.append:
    - **table**: filter
    - **chain**: INPUT
    - **jump**: ACCEPT
    - **match**: state
- connstate: NEW
- dport: 80
- protocol: tcp
- sport: 1025:65535
- save: True

httpd:
    iptables.append:
        - table: filter
        - chain: INPUT
        - jump: ACCEPT
        - match:
            - state
            - comment
            - comment: "Allow HTTP"
        - connstate: NEW
        - dport: 80
        - protocol: tcp
        - sport: 1025:65535
        - save: True

.. Invert Rule

httpd:
    iptables.append:
        - table: filter
        - chain: INPUT
        - jump: ACCEPT
        - match:
            - state
            - comment
            - comment: "Allow HTTP"
        - connstate: NEW
        - source: '! 127.0.0.1'
        - dport: 80
        - protocol: tcp
        - sport: 1025:65535
        - save: True

httpd:
    iptables.append:
- `table`: filter
- `chain`: INPUT
- `jump`: ACCEPT
- `match`:
  - `state`
  - `comment`
- `comment`: "Allow HTTP"
- `connstate`: NEW
- `source`: 'not 127.0.0.1'
- `dport`: 80
- `protocol`: tcp
- `sport`: 1025:65535
- `save`: True

### httpd:

**iptables.append:**
- `table`: filter
- `family`: ipv6
- `chain`: INPUT
- `jump`: ACCEPT
- `match`: state
- `connstate`: NEW
- `dport`: 80
- `protocol`: tcp
- `sport`: 1025:65535
- `save`: True

**iptables.append:**
- `table`: filter
- `family`: ipv4
- `chain`: INPUT
- `jump`: ACCEPT
- `match`: state
- `connstate`: NEW
- `dports`:
  - 80
  - 443
- `protocol`: tcp
- `sport`: 1025:65535
- `save`: True

**iptables.insert:**
- `position`: 1
- `table`: filter
- `chain`: INPUT
- `jump`: ACCEPT
- `match`: state
- `connstate`: NEW
- `dport`: 80
- `protocol`: tcp
- `sport`: 1025:65535
- `save`: True

### httpd:

(continues on next page)
iptables.insert:
  - position: 1
  - table: filter
  - family: ipv6
  - chain: INPUT
  - jump: ACCEPT
  - match: state
  - connstate: NEW
  - dport: 80
  - protocol: tcp
  - sport: 1025:65535
  - save: True

httpd:
  iptables.delete:
  - table: filter
  - chain: INPUT
  - jump: ACCEPT
  - match: state
  - connstate: NEW
  - dport: 80
  - protocol: tcp
  - sport: 1025:65535
  - save: True

httpd:
  iptables.delete:
  - table: filter
  - chain: INPUT
  - jump: ACCEPT
  - match: state
  - connstate: NEW
  - dport: 80
  - protocol: tcp
  - sport: 1025:65535
  - save: True

httpd:
  iptables.delete:
  - table: filter
  - family: ipv6
  - chain: INPUT
  - jump: ACCEPT
  - match: state
  - connstate: NEW
  - dport: 80
  - protocol: tcp
  - sport: 1025:65535
  - save: True

default to accept:
  iptables.set_policy:
  - chain: INPUT
  - policy: ACCEPT
Note: Whereas iptables will accept \(-p, --proto[c-o[l]]\) as synonyms of \(--protocol\), if \(--proto\) appears in an iptables command after the appearance of \(-m\ \text{policy}\), it is interpreted as the \(--proto\) option of the policy extension (see the iptables-extensions(8) man page).

Example rules for IPSec policy:

```bash
accept_esp_in:
ipables.append:
- table: filter
- chain: INPUT
- jump: ACCEPT
- source: 10.20.0.0/24
- destination: 10.10.0.0/24
- in-interface: eth0
- match: policy
- dir: in
- pol: ipsec
- reqid: 1
- proto: esp

accept_esp_forward_in:
ipables.append:
- use:
  - iptables: accept_esp_in
  - chain: FORWARD

accept_esp_out:
ipables.append:
- table: filter
- chain: OUTPUT
- jump: ACCEPT
- source: 10.10.0.0/24
- destination: 10.20.0.0/24
- out-interface: eth0
- match: policy
- dir: out
- pol: ipsec
- reqid: 1
- proto: esp

accept_esp_forward_out:
ipables.append:
- use:
  - iptables: accept_esp_out
  - chain: FORWARD
```

Note: Various functions of the \iptables\ module use the \(--check\) option. If the version of \iptables\ on the target system does not include this option, an alternate version of this check will be performed using the output of \iptables-save\. This may have unintended consequences on legacy releases of \iptables\.

**salt.states.iptables.append**

New in version 0.17.0.

Add a rule to the end of the specified chain.

- **name** A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.
- **table** The table that owns the chain which should be modified
family  Network family, ipv4 or ipv6.
   All other arguments are passed in with the same name as the long option that would normally be used for
   iptables, with one exception: --state is specified as connstate instead of state (not to be confused with
   ctstate).

   Jump options that doesn’t take arguments should be passed in with an empty string.

salt.states.iptables.chain_absent(name, table='filter', family='ipv4')
   New in version 2014.1.0.
   Verify the chain is absent.
   table  The table to remove the chain from
   family  Networking family, either ipv4 or ipv6

salt.states.iptables.chain_present(name, table='filter', family='ipv4')
   New in version 2014.1.0.
   Verify the chain is exist.
   name  A user-defined chain name.
   table  The table to own the chain.
   family  Networking family, either ipv4 or ipv6

salt.states.iptables.delete(name, table='filter', family='ipv4', **kwargs)
   New in version 2014.1.0.
   Delete a rule to a chain
   name  A user-defined name to call this rule by in another part of a state or formula. This should not be an
   actual rule.
   table  The table that owns the chain that should be modified
   family  Networking family, either ipv4 or ipv6
   All other arguments are passed in with the same name as the long option that would normally be used for
   iptables, with one exception: --state is specified as connstate instead of state (not to be confused with
   ctstate).

   Jump options that doesn’t take arguments should be passed in with an empty string.

salt.states.iptables.flush(name, table='filter', family='ipv4', **kwargs)
   New in version 2014.1.0.

   Flush current iptables state
   table  The table that owns the chain that should be modified
   family  Networking family, either ipv4 or ipv6

salt.states.iptables.insert(name, table='filter', family='ipv4', **kwargs)
   New in version 2014.1.0.
   Insert a rule into a chain
   name  A user-defined name to call this rule by in another part of a state or formula. This should not be an
   actual rule.
   table  The table that owns the chain that should be modified
   family  Networking family, either ipv4 or ipv6
   position  The numerical representation of where the rule should be inserted into the chain. Note that -1 is
   not a supported position value.

   All other arguments are passed in with the same name as the long option that would normally be used for
   iptables, with one exception: --state is specified as connstate instead of state (not to be confused with
   ctstate).

   Jump options that doesn’t take arguments should be passed in with an empty string.
The `salt.states.iptables.mod_aggregate` function looks up all rules in the available low chunks and merges them into a single rules ref in the present low data.

The `salt.states.iptables.set_policy` function sets the default policy for iptables firewall tables.

**salt.states.iptables.mod_aggregate**

*low, chunks, running*

The mod_aggregate function which looks up all rules in the available low chunks and merges them into a single rules ref in the present low data.

**salt.states.iptables.set_policy**

*name, table='filter', family='ipv4', **kwargs*

Sets the default policy for iptables firewall tables.

**Table**
The table that owns the chain that should be modified.

**Family**
Networking family, either ipv4 or ipv6.

**Policy**
The requested table policy.

### 21.19.126 salt.states.jboss7

Manage JBoss 7 Application Server via CLI interface.

New in version 2015.5.0.

This state uses the jboss-cli.sh script from a JBoss or Wildfly installation and parses its output to determine the execution result.

In order to run each state, a jboss_config dictionary with the following properties must be passed:

```yaml
jboss:
  cli_path: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
  controller: 10.11.12.13:9999
  cli_user: 'jbossadm'
  cli_password: 'jbossadm'
```

If the controller doesn’t require a password, then the cli_user and cli_password parameters are optional.

Since same dictionary with configuration will be used in all the states, it may be more convenient to move JBoss configuration and other properties to the pillar.

Example of application deployment from local filesystem:

```yaml
application_deployed:
  jboss7.deployed:
    - salt_source:
      target_file: '/tmp/webapp.war'
    - jboss_config: {{ pillar['jboss'] }}
```

For the sake of brevity, examples for each state assume that jboss_config is contained in the pillar.

**salt.states.jboss7.bindings_exist**

*name, jboss_config, bindings, profile=None*

Ensures that given JNDI binding are present on the server. If a binding doesn’t exist on the server it will be created. If it already exists its value will be changed.

**jboss_config**

Dict with connection properties (see state description)

**bindings**

Dict with bindings to set.

**profile**

The profile name (domain mode only)

Example:

```yaml
jndi_entries_created:
  jboss7.bindings_exist:
    - bindings:
      'java:global/sampleapp/environment': 'DEV'
      'java:global/sampleapp/configurationFile': '/var/opt/sampleapp/config.'
    - jboss_config: {{ pillar['jboss'] }}
```
salt.states.jboss7.datasource_exists(name, jboss_config, datasource_properties, recreate=False, profile=None)

Ensures that a datasource with given properties exist on the jboss instance. If datasource doesn’t exist, it is created, otherwise only the properties that are different will be updated.

- **name** Datasource property name
- **jboss_config** Dict with connection properties (see state description)
- **datasource_properties** Dict with datasource properties
- **recreate** [False] If set to True and datasource exists it will be removed and created again. However, if there are deployments that depend on the datasource, it will not me possible to remove it.
- **profile** [None] The profile name for this datasource (domain mode only)

Example:
```
sampleDS:
    jboss7.datasource_exists:
        - recreate: False
        - datasource_properties:
            driver-name: mysql
            connection-url: 'jdbc:mysql://localhost:3306/sampleDatabase'
            jndi-name: 'java:jboss/datasources/sampleDS'
            user-name: sampleuser
            password: secret
            min-pool-size: 3
            use-java-context: True
        - jboss_config: {{ pillar['jboss'] }}
        - profile: full-ha
```

salt.states.jboss7.deployed(name, jboss_config, salt_source=None)

Ensures that the given application is deployed on server.

- **jboss_config** Dict with connection properties (see state description)
- **salt_source** How to find the artifact to be deployed.
- **target_file** Where to look in the minion’s file system for the artifact to be deployed (e.g. ‘/tmp/application-web-0.39.war’). When source is specified, also specifies where to save the retrieved file.
- **source** (optional) File on salt master (e.g. salt://application-web-0.39.war). If absent, no files will be retrieved and the artifact in target_file will be used for the deployment.
- **undeploy** (optional) Regular expression to match against existing deployments. When present, if there is a deployment that matches the regular expression, it will be undeployed before the new artifact is deployed.
- **undeploy_force** (optional) If True, the artifact will be undeployed although it has not changed.

Examples:

Deployment of a file from minion’s local file system:
```
application_deployed:
    jboss7.deployed:
        - salt_source: '/tmp/webapp.war'
        - jboss_config: {{ pillar['jboss'] }}
```

It is assumed that /tmp/webapp.war was made available by some other means. No applications will be undeployed; if an existing deployment that shares that name exists, then it will be replaced with the updated version.

Deployment of a file from the Salt master’s file system:
Here, application-web-0.39.war file is downloaded from Salt file system to /tmp/application-web-0.39.war file on minion. Existing deployments are checked if any of them matches 'application-web-.*' regular expression, and if so then it is undeployed before deploying the application. This is useful to automate deployment of new application versions.

If the source parameter of salt_source is specified, it can use any protocol that the file states use. This includes not only downloading from the master but also HTTP, HTTPS, FTP, Amazon S3, and OpenStack Swift.

salt.states.jboss7.reloaded(name, jboss_config, timeout=60, interval=5)
Reloads configuration of jboss server.

 configuration_reloaded:
    jboss7.reloaded:
    - jboss_config: {{ pillar['jboss'] }}

21.19.127 salt.states.jenkins module

Management of Jenkins

New in version 2016.3.0.

salt.states.jenkins.absent(name, **kwargs)
Ensure the job is absent from the Jenkins configured jobs
name The name of the Jenkins job to remove

salt.states.jenkins.present(name, config=None, **kwargs)
Ensure the job is present in the Jenkins configured jobs
name The unique name for the Jenkins job
config The Salt URL for the file to use for configuring the job

21.19.128 salt.states.junos module

State modules to interact with Junos devices.
maturity new
dependencies junos-eznc, jxmlease

Note: Those who wish to use junos-eznc (PyEZ) version >= 2.1.0, must use the latest salt code from github until the next release.

Refer to junos for information on connecting to junos proxy.

salt.states.junos.cli(name, **kwargs)

Executes the CLI commands and returns the text output.

```python
show version:
  junos:
    - cli
    - format: xml
```

Parameters

- **Required**
  - command: The command that need to be executed on Junos CLI. (default = None)
- **Optional**
  - kwargs: Keyworded arguments which can be provided like-
    - format: Format in which to get the CLI output. (text or xml, default = 'text')
    - timeout: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
    - dest: The destination file where the CLI output can be stored. (default = None)

salt.states.junos.commit(name, **kwargs)

Commits the changes loaded into the candidate configuration.

```python
commit the changes:
  junos:
    - commit
    - confirm: 10
```

Parameters **Optional**

- kwargs: Keyworded arguments which can be provided like-
  - timeout: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
  - comment: Provide a comment to the commit. (default = None)
  - confirm: Provide time in minutes for commit confirmation. If this option is specified, the commit will be rollbacked in the given time unless the commit is confirmed.
  - sync: On dual control plane systems, requests that the candidate configuration on one control plane be copied to the other control plane, checked for correct syntax, and committed on both Routing Engines. (default = False)
  - force_sync: On dual control plane systems, force the candidate configuration on one control plane to be copied to the other control plane.
  - full: When set to True requires all the daemons to check and evaluate the new configuration.
  - detail: When true return commit detail.

salt.states.junos.commit_check(name)

Perform a commit check on the configuration.
### perform commit check:

```
junos.commit_check
```

**salt.states.junos.diff(name, d_id)**

Gets the difference between the candidate and the current configuration.

```
get the diff:
  junos:
    - diff
    - id: 10
```

**Parameters Optional**

- `id`: The rollback id value [0-49]. (default = 0)

**salt.states.junos.file_copy(name, dest=None, **kwargs)**

Copies the file from the local device to the junos device.

```
/home/m2/info.txt:
  junos:
    - file_copy
    - dest: info_copy.txt
```

**Parameters Required**

- `src`: The source path where the file is kept.
- `dest`: The destination path where the file will be copied.

**salt.states.junos.install_config(name, **kwargs)**

Loads and commits the configuration provided.

```
Install the mentioned config:
  junos:
    - install_config
    - path: salt//configs/interface.set
    - timeout: 100
    - diffs_file: '/var/log/diff'
```

```
Install the mentioned config:
  junos:
    - install_config
    - template_path: salt//configs/interface.set
    - timeout: 100
    - template_vars:
      interface_name: lo0
      description: Creating interface via SaltStack.
```

**name** Path where the configuration/template file is present. If the file has a `*.conf` extension, the content is treated as text format. If the file has a `*.xml` extension, the content is treated as XML format. If the file has a `*.set` extension, the content is treated as Junos OS `set` commands.

**template_vars** The dictionary of data for the jinja variables present in the jinja template.

**timeout** [30] Set NETCONF RPC timeout. Can be used for commands which take a while to execute.

**overwrite** [False] Set to True if you want this file is to completely replace the configuration file.

**replace** [False] Specify whether the configuration file uses "replace:" statements. Only those statements under the 'replace' tag will be changed.

**comment** Provide a comment to the commit. (default = None)

**confirm** Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the given time unless the commit is confirmed.
**diffs_file** Path to the file where the diff (difference in old configuration and the committed configuration) will be stored.

**Note:** The file will be stored on the proxy minion. To push the files to the master use `cp.push`.

salt.states.junos.**install_os**(name, **kwargs)
Installs the given image on the device. After the installation is complete the device is rebooted, if reboot=True is given as a keyworded argument.

```
salt://images/junos_image.tgz:
  junos:
    - install_os
    - timeout: 100
    - reboot: True
```

**Parameters**
- **Required**
  - path: Path where the image file is present on the proxy minion.
- **Optional**
  - **kwargs:** keyworded arguments to be given such as timeout, reboot etc
    - timeout: Set NETCONF RPC timeout. Can be used to RPCs which take a while to execute. (default = 30 seconds)
    - reboot: Whether to reboot after installation (default = False)
    - no_copy: When True the software package will not be SCP'd to the device. (default = False)

salt.states.junos.**load**(name, **kwargs)
Loads the configuration provided onto the junos device.

```
Install the mentioned config:
  junos:
    - load
    - path: salt://configs/interface.set
```

```
Install the mentioned config:
  junos:
    - load
    - template_path: salt://configs/interface.set
    - template_vars:
      interface_name: lo0
      description: Creating interface via SaltStack.
```

**name** Path where the configuration/template file is present. If the file has a `*.conf` extension, the content is treated as text format. If the file has a `*.xml` extension, the content is treated as XML format. If the file has a `*.set` extension, the content is treated as Junos OS `set` commands.

**overwrite** [False] Set to True if you want this file is to completely replace the configuration file.

**replace** [False] Specify whether the configuration file uses "replace:" statements. Only those statements under the 'replace' tag will be changed.

**format:** Determines the format of the contents.

**update** [False] Compare a complete loaded configuration against the candidate configuration. For each hierarchy level or configuration object that is different in the two configurations, the version in the loaded configuration replaces the version in the candidate configuration. When the configuration is later committed, only system processes that are affected by the changed configuration elements parse the new configuration. This action is supported from PyEZ 2.1 (default = False)
**template_vars** Variables to be passed into the template processing engine in addition to those present in
  __pillar__, __opts__, __grains__, etc. You may reference these variables in your template like so: {{
  template_vars["var_name"] }}

salt.states.junos.lock(name)
Attempts an exclusive lock on the candidate configuration. This is a non-blocking call.

**Note:** Any user who wishes to use lock, must necessarily unlock the configuration too. Ensure unlock is
called in the same orchestration run in which the lock is called.

---

```yaml
lock the config:
  junos.lock
```

salt.states.junos.resultdecorator(function)

salt.states.junos.rollback(name, id, **kwargs)
Rollbacks the committed changes.

```yaml
rollback the changes:
  junos:
    - rollback
    - id: 5
```

**Parameters**

**Optional** –
  * id: The rollback id value [0-49]. (default = 0)
  * kwargs: **Keyworded arguments which can be provided like**–
    - timeout: Set NETCONF RPC timeout. Can be used for commands which
take a while to execute. (default = 30 seconds)
    - comment: Provide a comment to the commit. (default = None)
    - confirm: Provide time in minutes for commit confirmation. If this option
is specified, the commit will be rollbacked in the given time unless the
commit is confirmed.
    - diffs_file: Path to the file where any diffs will be written. (default = None)

salt.states.junos.rpc(name, dest=None, format='xml', args=None, **kwargs)
Executes the given rpc. The returned data can be stored in a file by specifying the destination path with dest
as an argument.

```yaml
get-interface-information:
  junos:
    - rpc
    - dest: /home/user/rpc.log
    - interface_name: lo0
```

**Parameters**

  * **Required** –
    - cmd: The rpc to be executed. (default = None)
  * **Optional** –
    - dest: Destination file where the rpc output is stored. (default = None) Note that
the file will be stored on the proxy minion. To push the files to the master use
the salt's following execution module: cp.push
    - format: The format in which the rpc reply must be stored in file specified in the
dest (used only when dest is specified) (default = xml)
    - kwargs: **keyworded arguments taken by rpc call like**–
      - timeout: Set NETCONF RPC timeout. Can be used for commands
which take a while to execute. (default= 30 seconds)
filter: Only to be used with 'get-config' rpc to get specific configuration.

terse: Amount of information you want.

interface_name: Name of the interface whose information you want.

salt.states.junos.set_hostname(name, **kwargs)
Changes the hostname of the device.

```python
device_name:
  junos:
    - set_hostname
    - comment: "Host-name set via saltstack."
```

Parameters

- **Required**
  - hostname: The name to be set. (default = None)

- **Optional**
  - kwargs:
    - timeout: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
    - comment: Provide a comment to the commit. (default = None)
    - confirm: Provide time in minutes for commit confirmation. If this option is specified, the commit will be rollbacked in the given time unless the commit is confirmed.

salt.states.junos.shutdown(name, **kwargs)
Shuts down the device.

```python
shut the device:
  junos:
    - shutdown
    - in_min: 10
```

Parameters

- **Optional**
  - kwargs:
    - reboot: Whether to reboot instead of shutdown. (default=False)
    - at: Specify time for reboot. (To be used only if reboot=yes)
    - in_min: Specify delay in minutes for shutdown

salt.states.junos.unlock(name)
Unlocks the candidate configuration.

```python
unlock the config:
  junos.unlock
```

salt.states.junos.zeroize(name)
Resets the device to default factory settings.

```python
reset my device:
  junos.zeroize
```

name: can be anything

21.19.129 salt.states.kapacitor module

Kapacitor state module.
configuration This module accepts connection configuration details either as parameters or as configuration settings in /etc/salt/minion on the relevant minions:

```
kapacitor.unsafe_ssl: 'false'
kapacitor.protocol: 'http'
kapacitor.host: 'localhost'
kapacitor.port: 9092
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

New in version 2016.11.0.

```
salt.states.kapacitor.task_absent(name)
    Ensure that a task is absent from Kapacitor.
    name Name of the task.
```

```
salt.states.kapacitor.task_present(name, tick_script, task_type='stream', database=None, retention_policy='default', enable=True, dbrps=None)
    Ensure that a task is present and up-to-date in Kapacitor.
    name Name of the task.
    tick_script Path to the TICK script for the task. Can be a salt:// source.
    task_type Task type. Defaults to 'stream'
    dbrps A list of databases and retention policies in "dbname"."rpname" format to fetch data from. For backward compatibility, the value of 'database' and 'retention_policy' will be merged as part of dbrps.
    database Which database to fetch data from. Defaults to None, which will use the default database in InfluxDB.
    retention_policy Which retention policy to fetch data from. Defaults to 'default'.
    enable Whether to enable the task or not. Defaults to True.
```

21.19.130 salt.states.kernelpkg

Manage kernel packages and active kernel version

Example state to install the latest kernel from package repositories:

```
install-latest-kernel:
    kernel.latest_installed: []
```

Example state to boot the system if a new kernel has been installed:

```
boot-latest-kernel:
    kernel.latest_active:
    - at_time: 1
```

Example state chaining the install and reboot operations:

```
install-latest-kernel:
    kernel.latest_installed: []

boot-latest-kernel:
    kernel.latest_active:
    - at_time: 1
    - onchanges:
      - kernel: install-latest-kernel
```
Chaining can also be achieved using wait/listen requisites:

```
install-latest-kernel:
    kernel.latest_installed: []

boot-latest-kernel:
    kernel.latest_wait:
        - at_time: 1
        - listen:
            - kernel: install-latest-kernel
```

```
salt.states.kernelpkg.latest_active(name, at_time=None, **kwargs)
    Initiate a reboot if the running kernel is not the latest one installed.
```

Note: This state does not install any patches. It only compares the running kernel version number to other kernel versions also installed in the system. If the running version is not the latest one installed, this state will reboot the system.

See `kernelpkg.upgrade` and `latest_installed()` for ways to install new kernel packages.

This module does not attempt to understand or manage boot loader configurations it is possible to have a new kernel installed, but a boot loader configuration that will never activate it. For this reason, it would not be advisable to schedule this state to run automatically.

Because this state function may cause the system to reboot, it may be preferable to move it to the very end of the state run. See `latest_wait()` for a waitable state that can be called with the `listen` requisite.

```
name Arbitrary name for the state. Does not affect behavior.
at_time The wait time in minutes before the system will be rebooted.
```

```
salt.states.kernelpkg.latest_installed(name, **kwargs)
    Ensure that the latest version of the kernel available in the repositories is installed.
```

Note: This state only installs the kernel, but does not activate it. The new kernel should become active at the next reboot. See `kernelpkg.needs_reboot` and `latest_active()` to initialize a reboot when needed.

```
name Arbitrary name for the state. Does not affect behavior.
```

```
salt.states.kernelpkg.latest_wait(name, at_time=None, **kwargs)
    Initiate a reboot if the running kernel is not the latest one installed. This is the waitable version of `latest_active()` and will not take any action unless triggered by a watch or listen requisite.
```

Note: Because this state function may cause the system to reboot, it may be preferable to move it to the very end of the state run using `listen` or `listen_in` requisites.

```
system-up-to-date:
    pkg.uptodate:
        - refresh: true

boot-latest-kernel:
    kernelpkg.latest_wait:
        - at_time: 1
        - listen:
            - pkg: system-up-to-date
```
name  Arbitrary name for the state. Does not affect behavior.
at_time  The wait time in minutes before the system will be rebooted.
salt.states.kernelpkg.mod_watch(name, sfun, **kwargs)
   Execute a kernelpkg state based on a watch or listen call

21.19.131  salt.states.keyboard

Management of keyboard layouts

The keyboard layout can be managed for the system:

    us:
        keyboard.system

Or it can be managed for XOrg:

    us:
        keyboard.xorg

salt.states.keyboard.system(name)
   Set the keyboard layout for the system
   name  The keyboard layout to use
salt.states.keyboard.xorg(name)
   Set the keyboard layout for XOrg
   layout  The keyboard layout to use

21.19.132  salt.states.keystone

Management of Keystone users

    depends
        - keystoneclient Python module

    configuration  See salt.modules.keystone for setup instructions.

<table>

  - **name**: nova
  - **service_type**: compute
  - **description**: OpenStack Compute Service
```

salt.states.keystone.endpoint_absent(*name*, *region=RegionOne*, **connection_args*)

Ensure that the endpoint for a service doesn’t exist in Keystone catalog  
**name** The name of the service whose endpoints should not exist  
**region** (optional) The region of the endpoint. Defaults to `RegionOne`.  
**interface** The interface type, which describes the visibility of the endpoint. (for V3 API)

salt.states.keystone.endpoint_present(*name*, **publicurl=public**, **internalurl=internal**, **adminurl=admin**, **url=url**, **connection_args=**)

Ensure the specified endpoints exists for service  
**name** The Service name  
**publicurl** The public url of service endpoint (for V2 API)  
**internalurl** The internal url of service endpoint (for V2 API)  
**adminurl** The admin url of the service endpoint (for V2 API)  
**region** The region of the endpoint
url The endpoint URL (for V3 API)
interface The interface type, which describes the visibility of the endpoint. (for V3 API)
salt.states.keystone.project_absent(name, profile=None, **connection_args)

Ensure that the keystone project is absent. Alias for tenant_absent from V2 API to fulfill V3 API naming
convention.

New in version 2016.11.0.
name The name of the project that should not exist

```
delete_nova:
    keystone.project_absent:
      - name: nova
```
salt.states.keystone.project_present(name, description=None, enabled=True, profile=None, **connection_args)

Ensures that the keystone project exists Alias for tenant_present from V2 API to fulfill V3 API naming con-
vention.

New in version 2016.11.0.
name The name of the project to manage
description The description to use for this project
enabled Availability state for this project

```
nova:
    keystone.project_present:
      - enabled: True
      - description: 'Nova Compute Service'
```
salt.states.keystone.role_absent(name, profile=None, **connection_args)

Ensure that the keystone role is absent.
name The name of the role that should not exist

salt.states.keystone.role_present(name, profile=None, **connection_args)

' Ensures that the keystone role exists
name The name of the role that should be present

salt.states.keystone.service_absent(name, profile=None, **connection_args)

Ensure that the service doesn’t exist in Keystone catalog
name The name of the service that should not exist

salt.states.keystone.service_present(name, service_type, description=None, profile=None, **connection_args)

Ensure service present in Keystone catalog
name The name of the service
service_type The type of Openstack Service
description (optional) Description of the service

salt.states.keystone.tenant_absent(name, profile=None, **connection_args)

Ensure that the keystone tenant is absent.
name The name of the tenant that should not exist

salt.states.keystone.tenant_present(name, description=None, enabled=True, profile=None, **connection_args)

Ensures that the keystone tenant exists
name The name of the tenant to manage
description The description to use for this tenant
enabled Availability state for this tenant
salt.states.keystone.user_absent(name, profile=None, **connection_args)
    Ensure that the keystone user is absent.
    name  The name of the user that should not exist

salt.states.keystone.user_present(name, password, email, tenant=None, enabled=True,
    roles=None, profile=None, password_reset=True, project=None, **connection_args)
    Ensure that the keystone user is present with the specified properties.
    name  The name of the user to manage
    password  The password to use for this user.

    **password_reset**  Whether or not to reset password after initial set. Defaults to True.
    **email**  The email address for this user
    **tenant**  The tenant (name) for this user
    **project**  The project (name) for this user (overrides tenant in api v3)
    **enabled**  Availability state for this user
    **roles**  The roles the user should have under given tenants. Passed as a dictionary mapping tenant names to a list of roles in this tenant, i.e.:

        roles:
            admin:  # tenant
                - admin  # role
            service:
                - admin
                - Member

21.19.133 salt.states.keystone_domain

Management of OpenStack Keystone Domains

New in version 2018.3.0.

    depends  shade
    configuration  see salt.modules.keystoneng for setup instructions

Example States

create domain:
    keystone_domain.present:
        - name: domain1

create domain with optional params:
    keystone_domain.present:
        - name: domain1
        - enabled: False
        - description: 'my domain'

delete domain:
    keystone_domain.absent:
        - name: domain1
salt.states.keystone_domain.absent(name, auth=None)
    Ensure domain does not exist
    name  Name of the domain

salt.states.keystone_domain.present(name, auth=None, **kwargs)
    Ensure domain exists and is up-to-date
    name  Name of the domain
    enabled  Boolean to control if domain is enabled
    description  An arbitrary description of the domain

21.19.134  salt.states.keystone_endpoint

Management of OpenStack Keystone Endpoints

New in version 2018.3.0.

    depends  shade

    configuration  see salt.modules.keystoneng for setup instructions

Example States

```yaml
create endpoint:
    keystone_endpoint.present:
        - name: public
        - url: https://example.org:9292
        - region: RegionOne
        - service_name: glance

destroy endpoint:
    keystone_endpoint.absent:
        - name: public
        - url: https://example.org:9292
        - region: RegionOne
        - service_name: glance

create multiple endpoints:
    keystone_endpoint.absent:
        - names:
            - public
            - admin
            - internal
        - url: https://example.org:9292
        - region: RegionOne
        - service_name: glance
```

salt.states.keystone_endpoint.absent(name, service_name, auth=None, **kwargs)
    Ensure an endpoint does not exists
    name  Interface name
    url  URL of the endpoint
    service_name  Service name or ID
    region  The region name to assign the endpoint

salt.states.keystone_endpoint.present(name, service_name, auth=None, **kwargs)
    Ensure an endpoint exists and is up-to-date
    name  Interface name
    url  URL of the endpoint
service_name  Service name or ID
region  The region name to assign the endpoint
enabled  Boolean to control if endpoint is enabled

21.19.135  salt.states.keystone_group

Management of OpenStack Keystone Groups

New in version 2018.3.0.

depends  shade

configuration  see  salt.modules.keystoneng for setup instructions

Example States

```yaml
create group:
  keystone_group.present:
    - name: group1

delete group:
  keystone_group.absent:
    - name: group1

create group with optional params:
  keystone_group.present:
    - name: group1
    - domain: domain1
    - description: 'my group'
```

salt.states.keystone_group.absent(name, auth=None, **kwargs)
Ensure group does not exist

- name  Name of the group
- domain  The name or id of the domain

salt.states.keystone_group.present(name, auth=None, **kwargs)
Ensure an group exists and is up-to-date

- name  Name of the group
- domain  The name or id of the domain
- description  An arbitrary description of the group

21.19.136  salt.states.keystone_project

Management of OpenStack Keystone Projects

New in version 2018.3.0.

depends  shade

configuration  see  salt.modules.keystoneng for setup instructions

Example States

```yaml
create project:
  keystone_project.present:
    - name: project1
```
delete project:
    keystone_project.absent:
      - name: project1

create project with optional params:
    keystone_project.present:
      - name: project1
      - domain: domain1
      - enabled: False
      - description: 'my project'

salt.states.keystone_project.absent(name, auth=None, **kwargs)
    Ensure a project does not exist
    name Name of the project
    domain The name or id of the domain

salt.states.keystone_project.present(name, auth=None, **kwargs)
    Ensure a project exists and is up-to-date
    name Name of the project
    domain The name or id of the domain
    description An arbitrary description of the project

21.19.137 salt.states.keystone_role

Management of OpenStack Keystone Roles

New in version 2018.3.0.

depends shade

configuration see salt.modules.keystoneng for setup instructions

Example States

create role:
    keystone_role.present:
      - name: role1

delete role:
    keystone_role.absent:
      - name: role1

create role with optional params:
    keystone_role.present:
      - name: role1
      - description: 'my group'

salt.states.keystone_role.absent(name, auth=None, **kwargs)
    Ensure role does not exist
    name Name of the role

salt.states.keystone_role.present(name, auth=None, **kwargs)
    Ensure an role exists
    name Name of the role
    description An arbitrary description of the role
21.19.138 salt.states.keystone_role_grant

Management of OpenStack Keystone Role Grants

New in version 2018.3.0.

depends shade

configuration see salt.modules.keystoneng for setup instructions

Example States

```yaml
create group:
  keystone_group.present:
    - name: group1

delete group:
  keystone_group.absent:
    - name: group1

cREATE Group with optional params:
keystone_group.present:
  - name: group1
  - domain: domain1
  - description: 'my group'
```

salt.states.keystone_role_grant.absent(name, auth=None, **kwargs)
salt.states.keystone_role_grant.present(name, auth=None, **kwargs)

21.19.139 salt.states.keystone_service

Management of OpenStack Keystone Services

New in version 2018.3.0.

depends shade

configuration see salt.modules.keystoneng for setup instructions

Example States

```yaml
create service:
  keystone_service.present:
    - name: glance
    - type: image

delete service:
  keystone_service.absent:
    - name: glance

cREATE Service with optional params:
keystone_service.present:
  - name: glance
  - type: image
  - enabled: False
  - description: 'OpenStack Image'
```
salt.states.keystone_service.absent(name, auth=None)
   Ensure service does not exist
   name Name of the service

salt.states.keystone_service.present(name, auth=None, **kwargs)
   Ensure an service exists and is up-to-date
   name Name of the group
   type Service type
   enabled Boolean to control if service is enabled
   description An arbitrary description of the service

21.19.140 salt.states.keystone_user

Management of OpenStack Keystone Users

New in version 2018.3.0.

   depends shade
   configuration see salt.modules.keystoneng for setup instructions

Example States

create user:
   keystone_user.present:
     - name: user1

delete user:
   keystone_user.absent:
     - name: user1

create user with optional params:
   keystone_user.present:
     - name: user1
     - domain: domain1
     - enabled: False
     - password: password123
     - email: "user1@example.org"
     - description: 'my user'

salt.states.keystone_user.absent(name, auth=None, **kwargs)
   Ensure user does not exists
   name Name of the user
   domain The name or id of the domain

salt.states.keystone_user.present(name, auth=None, **kwargs)
   Ensure domain exists and is up-to-date
   name Name of the domain
   domain The name or id of the domain
   enabled Boolean to control if domain is enabled
   description An arbitrary description of the domain
   password The user password
   email The users email address
21.19.141 salt.states.keystore

State management of a Java keystore

salt.states.keystore.managed(name, passphrase, entries, force_remove=False)

- **name** The path to the keystore file
- **passphrase** The password to the keystore
- **entries** A list containing an alias, certificate, and optional private_key. The certificate and private_key can be a file or a string
  - **entries**: 
    - **alias**: hostname2
      - **certificate**: /path/to/cert.crt
      - **private_key**: /path/to/key.key
    - **alias**: stringhost
      - **certificate**: |-----BEGIN CERTIFICATE-----
        MIICEjCCAXsCAg36MA0GCSqGSIb3DQEBBQUAMIGbMQswCQYDVQQGEwJKUDEOMAwG...
        2VguKv4SWjRfoRkIlHX0qVwMhSlNy2ioFLy7JcPZb+v3ftDGywUqcBiVDoera0
        -----END CERTIFICATE-----
  - **force_remove** If True will cause the state to remove any entries found in the keystore which are not defined in the state. The default is False.

Example

```python
define_keystore:
    keystore.managed:
        - name: /path/to/keystore
        - passphrase: changeit
        - force_remove: True
        - entries:
            - alias: hostname1
              certificate: /path/to/cert.crt
            - alias: remotehost
              certificate: /path/to/cert2.crt
              private_key: /path/to/key2.key
            - alias: pillarhost
              certificate: {salt.pillar.get('path:to:cert')}
```

21.19.142 salt.states.kmod

Loading and unloading of kernel modules

The Kernel modules on a system can be managed cleanly with the kmod state module:

```python
add_kvm:
    kmod.present:
        - name: kvm_amd
remove_beep:
    kmod.absent:
        - name: pcspkr
```

Multiple modules can be specified for both kmod.present and kmod.absent.
add_sound:
  kmod.present:
    - mods:
      - snd_hda_codec_hdmi
      - snd_hda_codec
      - snd_hwdn
      - snd_hda_core
      - snd_pcm
      - snd_timer
      - snd

salt.states.kmod.absent(name, persist=False, comment=True, mods=None)
Verify that the named kernel module is not loaded
name The name of the kernel module to verify is not loaded
persist Remove module from /etc/modules
comment Comment out module in /etc/modules rather than remove it
mods A list of modules to verify are unloaded. If this argument is used, the name argument, although still
required, is not used, and becomes a placeholder

New in version 2016.3.0.

salt.states.kmod.present(name, persist=False, mods=None)
Ensure that the specified kernel module is loaded
name The name of the kernel module to verify is loaded
persist Also add module to /etc/modules
mods A list of modules to verify are loaded. If this argument is used, the name argument, although still
required, is not used, and becomes a placeholder

New in version 2016.3.0.

21.19.143 salt.states.kubernetes
Manage kubernetes resources as salt states
NOTE: This module requires the proper pillar values set. See salt.modules.kubernetesmod for more information.

Warning: Configuration options will change in 2019.2.0.

The kubernetes module is used to manage different kubernetes resources.

my-nginx:
  kubernetes.deployment_present:
    - namespace: default
      metadata:
        app: frontend
      spec:
        replicas: 1

salt.states.kubernetes.configmap_absent(name, namespace='default', **kwargs)
    Ensures that the named configmap is absent from the given namespace.
    name The name of the configmap
    namespace The namespace holding the configmap. The 'default' one is going to be used unless a different one
        is specified.
salt.states.kubernetes.configmap_present(name, namespace='default', data=None,
    source=None, template=None, **kwargs)
Ensures that the named configmap is present inside of the specified namespace with the given data. If the configmap exists it will be replaced.

**name**  The name of the configmap.

**namespace**  The namespace holding the configmap. The 'default' one is going to be used unless a different one is specified.

**data**  The dictionary holding the configmaps.

**source**  A file containing the data of the configmap in plain format.

**template**  Template engine to be used to render the source file.

```python
salt.states.kubernetes.deployment_absent(name, namespace='default', **kwargs)
```

Ensures that the named deployment is absent from the given namespace.

**name**  The name of the deployment

**namespace**  The name of the namespace

```python
salt.states.kubernetes.deployment_present(name, namespace='default', metadata=None, spec=None, source='', template='', **kwargs)
```

Ensures that the named deployment is present inside of the specified namespace with the given metadata and spec. If the deployment exists it will be replaced.

**name**  The name of the deployment.

**namespace**  The namespace holding the deployment. The 'default' one is going to be used unless a different one is specified.

**metadata**  The metadata of the deployment object.

**spec**  The spec of the deployment object.

**source**  A file containing the definition of the deployment (metadata and spec) in the official kubernetes format.

**template**  Template engine to be used to render the source file.

```python
salt.states.kubernetes.namespace_absent(name, **kwargs)
```

Ensures that the named namespace is absent.

**name**  The name of the namespace

```python
salt.states.kubernetes.namespace_present(name, **kwargs)
```

Ensures that the named namespace is present.

**name**  The name of the namespace

```python
salt.states.kubernetes.node_label_absent(name, node, **kwargs)
```

Ensures that the named label is absent from the node.

**name**  The name of the label

**node**  The name of the node

```python
salt.states.kubernetes.node_label_folder_absent(name, node, **kwargs)
```

Ensures the label folder doesn’t exist on the specified node.

**name**  The name of label folder

**node**  The name of the node

```python
salt.states.kubernetes.node_label_present(name, node, value, **kwargs)
```

Ensures that the named label is set on the named node with the given value. If the label exists it will be replaced.

**name**  The name of the label.

**value**  Value of the label.

**node**  Node to change.

```python
salt.states.kubernetes.pod_absent(name, namespace='default', **kwargs)
```

Ensures that the named pod is absent from the given namespace.

**name**  The name of the pod

**namespace**  The name of the namespace

```python
salt.states.kubernetes.pod_present(name, namespace='default', metadata=None, spec=None, source='', template='', **kwargs)
```

Ensures that the named pod is present inside of the specified namespace with the given metadata and spec. If
the pod exists it will be replaced.

name The name of the pod.
namespace The namespace holding the pod. The 'default' one is going to be used unless a different one is specified.
metadata The metadata of the pod object.
spec The spec of the pod object.
source A file containing the definition of the pod (metadata and spec) in the official kubernetes format.
template Template engine to be used to render the source file.

salt.states.kubernetes.secret_absent(name, namespace='default', **kwargs)
Ensures that the named secret is absent from the given namespace.

name The name of the secret
namespace The name of the namespace

class secret_present:

salt.states.kubernetes.secret_present(name, namespace='default', data=None, source=None, template=None, **kwargs)
Ensures that the named secret is present inside of the specified namespace with the given data. If the secret exists it will be replaced.

name The name of the secret.
namespace The namespace holding the secret. The 'default' one is going to be used unless a different one is specified.
data The dictionary holding the secrets.
source A file containing the data of the secret in plain format.
template Template engine to be used to render the source file.

salt.states.kubernetes.service_absent(name, namespace='default', **kwargs)
Ensures that the named service is absent from the given namespace.

name The name of the service
namespace The name of the namespace

class service_present:

salt.states.kubernetes.service_present(name, namespace='default', metadata=None, spec=None, source=None, template=None, **kwargs)
Ensures that the named service is present inside of the specified namespace with the given metadata and spec. If the deployment exists it will be replaced.

name The name of the service.
namespace The namespace holding the service. The 'default' one is going to be used unless a different one is specified.
metadata The metadata of the service object.
spec The spec of the service object.
source A file containing the definition of the service (metadata and spec) in the official kubernetes format.
template Template engine to be used to render the source file.

21.19.144 salt.states.layman

Management of Gentoo Overlays using layman

A state module to manage Gentoo package overlays via layman

sunrise:
    layman.present

salt.states.layman.absent(name)
Verify that the overlay is absent

name The name of the overlay to delete
salt.states.layman.present(name)
Verify that the overlay is present
name The name of the overlay to add

21.19.145 salt.states.ldap

Manage entries in an LDAP database

New in version 2016.3.0.

The **states.ldap** state module allows you to manage LDAP entries and their attributes.

salt.states.ldap.managed(name, entries, connect_spec=None)
Ensure the existence (or not) of LDAP entries and their attributes

Example:

```
ldap://://:
    ldap.managed:
        - connect_spec:
            bind:
                method: sasl
        - entries:
            # make sure the entry doesn't exist
            - cn=foo,ou=users,dc=example,dc=com:
                delete_others: True
            # make sure the entry exists with only the specified
            # attribute values
            - cn=admin,dc=example,dc=com:
                delete_others: True
                replace:
                    cn:
                        admin
                    description:
                        LDAP administrator
                    objectClass:
                        - simpleSecurityObject
                        - organizationalRole
                    userPassword:
                        - {{pillar.ldap_admin_password}}
            # make sure the entry exists, its olcRootDN attribute
            # has only the specified value, the olcRootDN attribute
            # doesn't exist, and all other attributes are ignored
            - 'olcDatabase={1}hdb,cn=config':
                replace:
                    olcRootDN:
                        cn=admin,dc=example,dc=com
                    # the admin entry has its own password attribute
                    olcRootPW: []
            # note the use of 'default'. also note how you don't
            # have to use list syntax if there is only one attribute
            # value
```
- cn=foo,ou=users,dc=example,dc=com:
  - delete_others: True
  - default:
    - userPassword: changeme
    - shadowLastChange: 0
    # keep sshPublicKey if present, but don't create
    # the attribute if it is missing
    - sshPublicKey: []
  - replace:
    - cn: foo
    - uid: foo
    - uidNumber: 1000
    - gidNumber: 1000
    - gecos: Foo Bar
    - givenName: Foo
    - sn: Bar
    - homeDirectory: /home/foo
    - loginShell: /bin/bash
    - objectClass:
      - inetOrgPerson
      - posixAccount
      - top
      - ldapPublicKey
      - shadowAccount

Parameters

- **name** – The URL of the LDAP server. This is ignored if connect_spec is either a connection object or a dict with a 'url' entry.
- **entries** – A description of the desired state of zero or more LDAP entries.

`entries` is an iterable of dicts. Each of these dict’s keys are the distinguished names (DNs) of LDAP entries to manage. Each of these dicts is processed in order. A later dict can reference an LDAP entry that was already mentioned in an earlier dict, which makes it possible for later dicts to enhance or alter the desired state of an LDAP entry.

The DNs are mapped to a description of the LDAP entry’s desired state. These LDAP entry descriptions are themselves iterables of dicts. Each dict in the iterable is processed in order. They contain directives controlling the entry’s state. The key names the directive type and the value is state information for the directive. The specific structure of the state information depends on the directive type.

The structure of `entries` looks like this:

```python
[{
  dn1: [
    {directive1: directive1_state, 
     directive2: directive2_state},
    {directive3: directive3_state}],
  dn2: [
    {directive4: directive4_state, 
     directive5: directive5_state}],
  dn3: [
    {directive6: directive6_state}]
}]
```

These are the directives:

- **delete_others** Boolean indicating whether to delete attributes not mentioned in this dict or any of the other directive dicts for this DN. Defaults to False.

  If you don’t want to delete an attribute if present, but you also don’t want to add it if it is missing or modify it if it is present, you can use either the
'default' directive or the 'add' directive with an empty value list.

- 'default' A dict mapping an attribute name to an iterable of default values for that attribute. If the attribute already exists, it is left alone. If not, it is created using the given list of values.

An empty value list is useful when you don’t want to create an attribute if it is missing but you do want to preserve it if the 'delete_others' key is True.

- 'add' Attribute values to add to the entry. This is a dict mapping an attribute name to an iterable of values to add.

An empty value list is useful when you don’t want to create an attribute if it is missing but you do want to preserve it if the 'delete_others' key is True.

- 'delete' Attribute values to remove from the entry. This is a dict mapping an attribute name to an iterable of values to delete from the attribute. If the iterable is empty, all of the attribute’s values are deleted.

- 'replace' Attributes to replace. This is a dict mapping an attribute name to an iterable of values. Any existing values for the attribute are deleted, then the given values are added. The iterable may be empty.

In the above directives, the iterables of attribute values may instead be None, in which case an empty list is used, or a scalar such as a string or number, in which case a new list containing the scalar is used.

Note that if all attribute values are removed from an entry, the entire entry is deleted.

- connect_spec – See the description of the connect_spec parameter of the ldap3.connect function in the ldap3 execution module. If this is a dict and the 'url' entry is not specified, the 'url' entry is set to the value of the name parameter.

Returns

A dict with the following keys:

- 'name' This is the same object passed to the name parameter.

- 'changes' This is a dict describing the changes made (or, in test mode, the changes that would have been attempted). If no changes were made (or no changes would have been attempted), then this dict is empty. Only successful changes are included.

Each key is a DN of an entry that was changed (or would have been changed). Entries that were not changed (or would not have been changed) are not included. The value is a dict with two keys:

- 'old' The state of the entry before modification. If the entry did not previously exist, this key maps to None. Otherwise, the value is a dict mapping each of the old entry’s attributes to a list of its values before any modifications were made. Unchanged attributes are excluded from this dict.

- 'new' The state of the entry after modification. If the entry was deleted, this key maps to None. Otherwise, the value is a dict mapping each of the entry’s attributes to a list of its values after the modifications were made. Unchanged attributes are excluded from this dict.

Example 'changes' dict where a new entry was created with a single attribute containing two values:

```
{ 'dn1': { 'old': None, 'new': { 'attr1': ['val1', 'val2'] } }}
```

Example 'changes' dict where a new attribute was added to an existing en-
try:

```python
{'dn1': {'old': {},
         'new': {'attr2': ['val3']}}}
```

- `'result'` One of the following values:
  - `True` if no changes were necessary or if all changes were applied successfully.
  - `False` if at least one change was unable to be applied.
  - `None` if changes would be applied but it is in test mode.

## 21.19.146 salt.states.libcloud_dns module

Manage DNS records and zones using libcloud

**codeauthor** Anthony Shaw <anthonyshaw@apache.org>

New in version 2016.11.0.

Create and delete DNS records or zones through Libcloud. Libcloud’s DNS system supports over 20 DNS providers including Amazon, Google, GoDaddy, Softlayer

This module uses `libcloud`, which can be installed via package, or pip.

**configuration** This module uses a configuration profile for one or multiple DNS providers

```yaml
libcloud_dns:
  profile1:
    driver: godaddy
    key: 2orgk34kgk34g
  profile2:
    driver: route53
    key: blah
    secret: blah
```

Example:

```yaml
my-zone:
  libcloud_dns.zone_present:
    - name: mywebsite.com
    - profile: profile1
my-website:
  libcloud_dns.record_present:
    - name: www
    - zone: mywebsite.com
    - type: A
    - data: 12.34.32.3
    - profile: profile1
    - require:
      - libcloud_dns: my-zone
```

**depends** apache-libcloud

salt.states.libcloud_dns.record_absent(`name`, `zone`, `type`, `data`, `profile`)

Ensures a record is absent.

**Parameters**

- `name (str)` – Record name without the domain name (e.g. www). Note: If you want to create a record for a base domain name, you should specify empty string ("") for this argument.
• **zone** (str) – Zone where the requested record is created, the domain name
• **type** (str) – DNS record type (A, AAAA, ...).
• **data** (str) – Data for the record (depends on the record type).
• **profile** (str) – The profile key

```
salt.states.libcloud_dns.record_present(name, zone, type, data, profile)
```
Ensures a record is present.

Parameters

• **name** (str) – Record name without the domain name (e.g. www). Note: If you want to create a record for a base domain name, you should specify empty string ("") for this argument.
• **zone** (str) – Zone where the requested record is created, the domain name
• **type** (str) – DNS record type (A, AAAA, ...).
• **data** (str) – Data for the record (depends on the record type).
• **profile** (str) – The profile key

```
salt.states.libcloud_dns.state_result(result, message, name, changes=None)
```

```
salt.states.libcloud_dns.zone_absent(domain, profile)
```
Ensures a record is absent.

Parameters

• **domain** (str) – Zone name, i.e. the domain name
• **profile** (str) – The profile key

```
salt.states.libcloud_dns.zone_present(domain, type, profile)
```
Ensures a record is present.

Parameters

• **domain** (str) – Zone name, i.e. the domain name
• **type** (str) – Zone type (master / slave), defaults to master
• **profile** (str) – The profile key

### 21.19.147 salt.states.libcloud_loadbalancer module

Apache Libcloud Load Balancer State

Manage load balancers using libcloud

**codeauthor** Anthony Shaw <anthonyshaw@apache.org>

Apache Libcloud load balancer management for a full list of supported clouds, see [http://libcloud.readthedocs.io/en/latest/loadbalancer/supported_providers.html](http://libcloud.readthedocs.io/en/latest/loadbalancer/supported_providers.html)

Clouds include Amazon ELB, ALB, Google, Aliyun, CloudStack, Softlayer

New in version 2018.3.0.

**configuration** This module uses a configuration profile for one or multiple Cloud providers

```python
libcloud_loadbalancer:
  profile_test1:
    driver: gce
    key: G006G0123456789ABCXYZ
    secret: mysecret
  profile_test2:
    driver: alb
    key: 12345
    secret: mysecret
```
Example:

Using States to deploy a load balancer with extended arguments to specify region

```bash
lb_test:
    libcloud_loadbalancer.balancer_present:
      - name: example
      - port: 80
      - protocol: http
      - profile: google
      - ex_region: us-east1
```

depends apache-libcloud

```
salt.states.libcloud_loadbalancer.balancer_absent(name, profile, **libcloud_kwargs)
Ensures a load balancer is absent.
Parameters
  - name (str) – Load Balancer name
  - profile (str) – The profile key
```

```
salt.states.libcloud_loadbalancer.balancer_present(name, port, protocol, profile, algorithm=None, members=None, **libcloud_kwargs)
Ensures a load balancer is present.
Parameters
  - name (str) – Load Balancer name
  - port (str) – Port the load balancer should listen on, defaults to 80
  - protocol (str) – Loadbalancer protocol, defaults to http.
  - profile (str) – The profile key
  - algorithm (str) – Load balancing algorithm, defaults to ROUND_ROBIN. See Algorithm type in Libcloud documentation for a full listing.
  - members (list of dict (ip, port)) – An optional list of members to create on deployment
```

```
salt.states.libcloud_loadbalancer.member_absent(ip, port, balancer_id, profile, **libcloud_kwargs)
Ensure a load balancer member is absent, based on IP and Port
Parameters
  - ip (str) – IP address for the member
  - port (int) – Port for the member
  - balancer_id (str) – id of a load balancer you want to detach the member from
  - profile (str) – The profile key
```

```
salt.states.libcloud_loadbalancer.member_present(ip, port, balancer_id, profile, **libcloud_kwargs)
Ensure a load balancer member is present
Parameters
  - ip (str) – IP address for the new member
  - port (int) – Port for the new member
  - balancer_id (str) – id of a load balancer you want to attach the member to
  - profile (str) – The profile key
```

```
salt.states.libcloud_loadbalancer.state_result(result, message, name, changes=None)
21.19.148 salt.states.libcloud_storage module
```

3536 Chapter 21. Salt Module Reference
Apache Libcloud Storage State

Manage cloud storage using libcloud

codeauthor Anthony Shaw <anthonyshaw@apache.org>

Apache Libcloud Storage (object/blob) management for a full list of supported clouds, see [http://libcloud.readthedocs.io/en/latest/storage/supported_providers.html](http://libcloud.readthedocs.io/en/latest/storage/supported_providers.html)

Clouds include Amazon S3, Google Storage, Aliyun, Azure Blobs, Ceph, OpenStack swift

New in version 2018.3.0.

configuration This module uses a configuration profile for one or multiple Storage providers

```yaml
libcloud_storage:
  profile_test1:
    driver: google_storage
    key: G00G0123456789ABCXYZ
    secret: mysecret
  profile_test2:
    driver: s3
    key: 12345
    secret: mysecret
```

Examples

Creating a container and uploading a file

```yaml
web_things:
  libcloud_storage.container_present:
    name: my_container_name
    profile: profile1
  libcloud_storage.object_present:
    name: my_file.jpg
    container: my_container_name
    path: /path/to/local/file.jpg
    profile: profile1
```

Downloading a file

This example will download the file from the remote cloud and keep it locally

```yaml
web_things:
  libcloud_storage.file_present:
    name: my_file.jpg
    container: my_container_name
    path: /path/to/local/file.jpg
    profile: profile1
```

depends apache-libcloud

salt.states.libcloud_storage.container_absent(name, profile)
Ensures a container is absent.

Parameters

- name (str) – Container name
• profile (str) – The profile key

salt.states.libcloud_storage.container_present(name, profile)
Ensures a container is present.
Parameters
• name (str) – Container name
• profile (str) – The profile key

salt.states.libcloud_storage.file_present(container, name, path, profile, overwrite_existing=False)
Ensures a object is downloaded locally.
Parameters
• container (str) – Container name
• name (str) – Object name in cloud
• path (str) – Local path to file
• profile (str) – The profile key
• overwrite_existing (bool) – Replace if already exists

salt.states.libcloud_storage.object_absent(container, name, profile)
Ensures a object is absent.
Parameters
• container (str) – Container name
• name (str) – Object name in cloud
• profile (str) – The profile key

salt.states.libcloud_storage.object_present(container, name, path, profile)
Ensures a object is present.
Parameters
• container (str) – Container name
• name (str) – Object name in cloud
• path (str) – Local path to file
• profile (str) – The profile key

salt.states.libcloud_storage.state_result(result, message, name, changes)

21.19.149 salt.states.linux_acl

Linux File Access Control Lists
The Linux ACL state module requires the getfacl and setfacl binaries.

Ensure a Linux ACL is present

```
root:
  acl.present:
    - name: /root
    - acl_type: user
    - acl_name: damian
    - perms: rwx
```

Ensure a Linux ACL does not exist

```
root:
  acl.absent:
    - name: /root
    - acl_type: user
    - acl_name: damian
    - perms: rwx
```
Ensure a Linux ACL list is present

```yaml
root:
  acl.list_present:
    - name: /root
    - acl_type: user
    - acl_names:
      - damian
      - homer
    - perms: rwx
```

Ensure a Linux ACL list does not exist

```yaml
root:
  acl.list_absent:
    - name: /root
    - acl_type: user
    - acl_names:
      - damian
      - homer
    - perms: rwx
```

`salt.states.linux_acl.absent(name, acl_type, acl_name='', perms='', recurse=False)`  
Ensure a Linux ACL does not exist  
**name** The acl path  
**acl_type** The type of the acl is used for, it can be 'user' or 'group'  
**acl_name** The user or group  
**perms** Remove the permissions eg.: rwx  
**recurse** Set the permissions recursive in the path

`salt.states.linux_acl.list_absent(name, acl_type, acl_names=None, recurse=False)`  
Ensure a Linux ACL list does not exist  
Takes a list of acl names and remove them from the given path  
**name** The acl path  
**acl_type** The type of the acl is used for, it can be 'user' or 'group'  
**acl_names** The list of users or groups  
**perms** Remove the permissions eg.: rwx  
**recurse** Set the permissions recursive in the path

`salt.states.linux_acl.list_present(name, acl_type, acl_names=None, perms='', recurse=False, force=False)`  
Ensure a Linux ACL list is present  
Takes a list of acl names and add them to the given path  
**name** The acl path  
**acl_type** The type of the acl is used for it can be 'user' or 'group'  
**acl_names** The list of users or groups  
**perms** Set the permissions eg.: rwx  
**recurse** Set the permissions recursive in the path  
**force** Wipe out old permissions and ensure only the new permissions are set

`salt.states.linux_acl.present(name, acl_type, acl_name='', perms='', recurse=False, force=False)`  
Ensure a Linux ACL is present  
**name** The acl path  
**acl_type** The type of the acl is used for it can be 'user' or 'group'  
**acl_name** The user or group  
**perms** Set the permissions eg.: rwx
**recurse**  Set the permissions recursive in the path

**force**  Wipe out old permissions and ensure only the new permissions are set

### 21.19.150 salt.states.locale

**Management of languages/locales**

Manage the available locales and the system default:

```yaml
us_locale:
  locale.present:
    - name: en_US.UTF-8

default_locale:
  locale.system:
    - name: en_US.UTF-8
      require:
        - locale: us_locale

salt.states.locale.present(name)
  Generate a locale if it is not present
  New in version 2014.7.0.
  name  The name of the locale to be present. Some distributions require the charmap to be specified as part of the locale at this point.

salt.states.locale.system(name)
  Set the locale for the system
  name  The name of the locale to use
```

### 21.19.151 salt.states.logadm module

**Management of logs using Solaris logadm.**

**maintainer**  Jorge Schrauwen <sjorge@blackdot.be>

**maturity**  new

**depends**  salt.modulus.logadm

**platform**  Oracle Solaris, Sun Solaris, illumos

New in version nitrogen.

.. note::
  TODO

**salt.states.logadm.remove(name, log_file=None)**
  Remove a log from the logadm configuration
  name  [string] entryname
  log_file  [string] (optional) log file path
  Note:  If log_file is specified it will be used instead of the entry name.

**salt.states.logadm.rotate(name, **kwargs)**
  Add a log to the logadm configuration
name  [string] alias for entryname
kwargs  [boolean|string|int] optional additional flags and parameters

21.19.152  salt.states.logrotate module

Module for managing logrotate.
New in version 2017.7.0.
salt.states.logrotate.set_(name, key, value, setting=None, conf_file='/etc/logrotate.conf')
Set a new value for a specific configuration line.
Parameters
  • key (str) – The command or block to configure.
  • value (str) – The command value or command of the block specified by the key parameter.
  • setting (str) – The command value for the command specified by the value parameter.
  • conf_file (str) – The logrotate configuration file.
Example of usage with only the required arguments:

```
logrotate-rotate:
    logrotate.set:
      key: rotate
      value: 2
```

Example of usage specifying all available arguments:

```
logrotate-wtmp-rotate:
    logrotate.set:
      key: /var/log/wtmp
      value: rotate
      setting: 2
      conf_file: /etc/logrotate.conf
```

21.19.153  salt.states.loop module

Loop state
Allows for looping over execution modules.
New in version 2017.7.0.
In both examples below, the execution module function boto_elb.get_instance_health returns a list of dicts. The condition checks the state-key of the first dict in the returned list and compares its value to the string InService.

```
wait_for_service_to_be_healthy:
    loop.until:
      condition: m_ret[0]['state'] == 'InService'
      period: 5
      timeout: 20
      m_args:
        elb
      m_kwargs:
        access_key
```
key: {{ secret_key }}
instances: "{{ instance }}"

Warning: This state allows arbitrary python code to be executed through the condition parameter which is literally evaluated within the state. Please use caution.

Changed in version 3000.

A version that does not use eval is now available. It uses either the python operator to compare the result of the function called in name, which can be one of the following: lt, le, eq (default), ne, ge, gt. Alternatively, compare_operator can be filled with a function from an execution module in __salt__ or __utils__ like the example below. The function data.subdict_match checks if the expected expression matches the data returned by calling the name function (with passed args and kwargs).

Wait for service to be healthy:

```python
loop.until_no_eval:
    - name: boto_elb.get_instance_health
    - compare_operator: data.subdict_match
    - period: 5
    - timeout: 20
    - args:
        - {{ elb }}
    - kwargs:
        keyid: {{ access_key }}
        key: {{ secret_key }}
        instances: "{{ instance }}"
```

salt.states.loop.until(name, m_args=None, m_kwargs=None, condition=None, period=1, timeout=60)

Loop over an execution module until a condition is met.

Parameters

- name (str) – The name of the execution module
- m_args (list) – The execution module’s positional arguments
- m_kwargs (dict) – The execution module’s keyword arguments
- condition (str) – The condition which must be met for the loop to break. This should contain m_ret which is the return from the execution module.
- period (int or float) – The number of seconds to wait between executions
- timeout (int or float) – The timeout in seconds

salt.states.loop.until_no_eval(name, expected, compare_operator='eq', timeout=60, period=1, init_wait=0, args=None, kwargs=None)

Generic waiter state that waits for a specific salt function to produce an expected result. The state fails if the function does not exist or raises an exception, or does not produce the expected result within the allotted retries.

Parameters

- name (str) – Name of the module.function to call
- expected – Expected return value. This can be almost anything.
- compare_operator (str) – Operator to use to compare the result of the module.function call with the expected value. This can be anything present in __salt__ or __utils__ . Will be called with 2 args: result, expected.
- timeout (int or float) – Abort after this amount of seconds (excluding init_wait).
- period (int or float) – Time (in seconds) to wait between attempts.
• **init_wait** *(int or float)* – Time (in seconds) to wait before trying anything.
• **args** *(list)* – args to pass to the salt module.function.
• **kwargs** *(dict)* – kwargs to pass to the salt module.function.

New in version 3000.

### 21.19.154 salt.states.lvm

Management of Linux logical volumes

A state module to manage LVMs

```python
/dev/sda:
  lvm.pv_present

my_vg:
  lvm.vg_present:
    - devices: /dev/sda

lvroot:
  lvm.lv_present:
    - vgname: my_vg
    - size: 10G
    - stripes: 5
    - stripesize: 8K

salt.states.lvm.lv_absent(name, vgname=None)
    Remove a given existing Logical Volume from a named existing volume group
    name The Logical Volume to remove
    vgname The name of the Volume Group on which the Logical Volume resides

salt.states.lvm.lv_present(name, vgname=None, size=None, extents=None, snapshot=None, pv='',
    thinvolume=False, thinpool=False, force=False, **kwargs)
    Create a new Logical Volume
    name The name of the Logical Volume
    vgname The name of the Volume Group on which the Logical Volume resides
    size The initial size of the Logical Volume
    extents The number of logical extents to allocate
    snapshot The name of the snapshot
    pv The Physical Volume to use
    kwargs Any supported options to lvcreate. See linux_lvm for more details.
    New in version to_complete.
    thinvolume Logical Volume is thinly provisioned
    thinpool Logical Volume is a thin pool
    New in version 2018.3.0.
    force Assume yes to all prompts

salt.states.lvm.pv_absent(name)
    Ensure that a Physical Device is not being used by lvm
    name The device name to initialize.

salt.states.lvm.pv_present(name, **kwargs)
    Set a Physical Device to be used as an LVM Physical Volume
    name The device name to initialize.
    kwargs Any supported options to pvcreate. See linux_lvm for more details.
```
salt.states.lvm.vg_absent(name)
    Remove an LVM volume group
    name  The volume group to remove

salt.states.lvm.vg_present(name, devices=None, **kwargs)
    Create an LVM Volume Group
    name  The Volume Group name to create
devices  A list of devices that will be added to the Volume Group
kwargs  Any supported options to vgcreate. See linux_lvm for more details.

21.19.155  salt.states.lvs_server

Management of LVS (Linux Virtual Server) Real Server

salt.states.lvs_server.absent(name, protocol=None, service_address=None, server_address=None)
    Ensure the LVS Real Server in specified service is absent.
    name  The name of the LVS server.
protocol  The service protocol(only support tcp, udp and fwmark service).
service_address  The LVS service address.
server_address  The LVS real server address.

salt.states.lvs_server.present(name, protocol=None, service_address=None, server_address=None, packet_forward_method='dr', weight=1)
    Ensure that the named service is present.
    name  The LVS server name
protocol  The service protocol
service_address  The LVS service address
server_address  The real server address.
packet_forward_method  The LVS packet forwarding method(dr for direct routing, tunnel for tunneling, nat for network access translation).
weight  The capacity of a server relative to the others in the pool.

```
lvsrs:
    lvs_server.present:
        - protocol: tcp
        - service_address: 1.1.1.1:80
        - server_address: 192.168.0.11:8080
        - packet_forward_method: dr
        - weight: 10
```

21.19.156  salt.states.lvs_service

Management of LVS (Linux Virtual Server) Service

salt.states.lvs_service.absent(name, protocol=None, service_address=None)
    Ensure the LVS service is absent.
    name  The name of the LVS service
protocol  The service protocol
service_address  The LVS service address

salt.states.lvs_service.present(name, protocol=None, service_address=None, scheduler='wlc')
    Ensure that the named service is present.
    name  The LVS service name
The service protocol
The LVS service address
Algorithm for allocating TCP connections and UDP datagrams to real servers.

```yaml
lvstest:
  lvs_service.present:
    - service_address: 1.1.1.1:80
    - protocol: tcp
    - scheduler: rr
```

## 21.19.157 salt.states.lxc

Manage Linux Containers

### `salt.states.lxc.absent(name, stop=False, path=None)`

Ensure a container is not present, destroying it if present

- **name** Name of the container to destroy
- **stop** stop before destroying default: false

New in version 2015.5.2.

- **path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```yaml
web01:
  lxc.absent
```

### `salt.states.lxc.edited_conf(name, lxc_conf=None, lxc_conf_unset=None)`

- **Warning:** This state is unsuitable for setting parameters that appear more than once in an LXC config file, or parameters which must appear in a certain order (such as when configuring more than one network interface).

Issue #35523 was opened to track the addition of a suitable replacement or fix.

Edit LXC configuration options

Deprecated since version 2015.5.0.

- **path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```yaml
setconf:
  lxc.edited_conf:
    - name: ubuntu
      lxc_conf:
        - network.ipv4.ip: 10.0.3.6
      lxc_conf_unset:
        - lxc.utsname
```

### `salt.states.lxc.frozen(name, start=True, path=None)`

New in version 2015.5.0.

Ensure that a container is frozen

```yaml
```
Note: This state does not enforce the existence of the named container, it just freezes the container if it is running. To ensure that the named container exists, use `lxc.present`.

**name** The name of the container

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

**start** [True] Start container first, if necessary. If False, then this state will fail if the container is not running.

```
web01:
  lxc.frozen
web02:
  lxc.frozen:
    - start: False
```

salt.states.lxc.present(name, running=None, clone_from=None, snapshot=False, profile=None, network_profile=None, template=None, options=None, image=None, config=None, fstype=None, size=None, backing=None, vgname=None, lvname=None, thinpool=None, path=None)

Changed in version 2015.8.0: The `lxc.created` state has been renamed to `lxc.present`, and the `lxc.cloned` state has been merged into this state.

Create the named container if it does not exist

**name** The name of the container to be created

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

**running** [False]

- If True, ensure that the container is running
- If False, ensure that the container is stopped
- If None, do nothing with regards to the running state of the container

New in version 2015.8.0.

**clone_from** Create named container as a clone of the specified container

**snapshot** [False] Use Copy On Write snapshots (LVM). Only supported with `clone_from`.

**profile** Profile to use in container creation (see the LXC Tutorial for more information). Values in a profile will be overridden by the parameters listed below.

**network_profile** Network Profile to use in container creation (see the LXC Tutorial for more information). Values in a profile will be overridden by the parameters listed below.

New in version 2015.5.2.

**Container Creation Arguments**

**template** The template to use. For example, ubuntu or fedora. For a full list of available templates, check out the `lxc.templates` function.

Conflicts with the `image` argument.

Note: The `download` template requires the following three parameters to be defined in `options`:

- `dist` - The name of the distribution
- `release` - Release name/version
- `arch` - Architecture of the container

The available images can be listed using the `lxc.images` function.

**options**

New in version 2015.5.0.
Template-specific options to pass to the lxc-create command. These correspond to the long options (ones beginning with two dashes) that the template script accepts. For example:

```
web01:
  lxc.present:
    - template: download
    - options:
      dist: centos
      release: 6
      arch: amd64
```

Remember to double-indent the options, due to how PyYAML works.

For available template options, refer to the lxc template scripts which are usually located under /usr/share/lxc/templates, or run `lxc-create -t <template> -h`.

**image**  A tar archive to use as the rootfs for the container. Conflicts with the `template` argument.

**backing**  The type of storage to use. Set to `lvm` to use an LVM group. Defaults to filesystem within `/var/lib/lxc`.

**fstype**  Filesystem type to use on LVM logical volume

**size**  Size of the volume to create. Only applicable if `backing` is set to `lvm`.

**vgname**  [lxc] Name of the LVM volume group in which to create the volume for this container. Only applicable if `backing` is set to `lvm`.

**lvname**  Name of the LVM logical volume in which to create the volume for this container. Only applicable if `backing` is set to `lvm`.

**thinpool**  Name of a pool volume that will be used for thin-provisioning this container. Only applicable if `backing` is set to `lvm`.

`salt.states.lxc.running(name, restart=False, path=None)`  
Changed in version 2015.5.0: The `lxc.started` state has been renamed to `lxc.running`  
Ensure that a container is running

**Note:** This state does not enforce the existence of the named container, it just starts the container if it is not running. To ensure that the named container exists, use `lxc.present`.

**name**  The name of the container

**path**  path to the container parent default: `/var/lib/lxc` (system default)

  New in version 2015.8.0.

**restart**  [False] Restart container if it is already running

```
web01:
  lxc.running

web02:
  lxc.running:
    - restart: True
```

`salt.states.lxc.set_pass(name, **kwargs)`  
Deprecated since version 2015.5.0.

This state function has been disabled, as it did not conform to design guidelines. Specifically, due to the fact that `lxc.set_password` uses `chpasswd(8)` to set the password, there was no method to make this action idempotent (in other words, the password would be changed every time). This makes this state redundant, since the following state will do the same thing:
setpass:
  module.run:
    - name: set_pass
    - m_name: root
    - password: secret

salt.states.lxc.stopped(name, kill=False, path=None)

Ensure that a container is stopped

Note: This state does not enforce the existence of the named container, it just stops the container if it running or frozen. To ensure that the named container exists, use lxc.present, or use the lxc.absent state to ensure that the container does not exist.

name The name of the container
path path to the container parent default: /var/lib/lxc (system default)
  New in version 2015.8.0.
kill [False] Do not wait for the container to stop, kill all tasks in the container. Older LXC versions will stop containers like this irrespective of this argument.
  New in version 2015.5.0.

web01:
lxc.stopped

21.19.158 salt.states.mac_assistive module

Allows you to manage assistive access on macOS minions with 10.9+

Install, enable and disable assistive access on macOS minions

/usr/bin/osascript:
  assistive.installed:
    - enabled: True

salt.states.mac_assistive.installed(name, enabled=True)

Make sure that we have the given bundle ID or path to command installed in the assistive access panel.
name The bundle ID or path to command
enable Should assistive access be enabled on this application?

21.19.159 salt.states.macdefaults

Writing/reading defaults from a macOS minion

salt.states.macdefaults.absent(name, domain, user=None)

Make sure the defaults value is absent
name The key of the given domain to remove
domain The name of the domain to remove from
user The user to write the defaults to

salt.states.macdefaults.write(name, domain, value, vtype='string', user=None)

Write a default to the system
name The key of the given domain to write to
domain The name of the domain to write to
value The value to write to the given key
vtype The type of value to be written, valid types are string, data, int[eger], float, bool[ean], date, array,
array-add, dict, dict-add
user The user to write the defaults to

21.19.160 salt.states.mac_keychain module

Installing of certificates to the keychain

Install certificates to the macOS keychain

```
/mnt/test.p12:
  keychain.installed:
    - password: test123
```

```
salt.states.mac_keychain.default_keychain(name, domain='user', user=None)
    Set the default keychain to use
    name The chain in which to use as the default
    domain The domain to use valid values are user|system|common|dynamic, the default is user
    user The user to run as

salt.states.mac_keychain.installed(name, password, keychain='/Library/Keychains/System.keychain', **kwargs)
    Install a p12 certificate file into the macOS keychain
    name The certificate to install
    password The password for the certificate being installed formatted in the way described for openssl command
    in the PASS PHRASE ARGUMENTS section
    keychain The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain
    allow_any Allow any application to access the imported certificate without warning
    keychain_password If your keychain is likely to be locked pass the password and it will be unlocked before
    running the import

salt.states.mac_keychain.uninstalled(name, password, keychain='/Library/Keychains/System.keychain', keychain_password=None)
    Uninstall a p12 certificate file from the macOS keychain
    name The certificate to uninstall, this can be a path for a .p12 or the friendly name
    password The password for the certificate being installed formatted in the way described for openssl command
    in the PASS PHRASE ARGUMENTS section
    cert_name The friendly name of the certificate, this can be used instead of giving a certificate
    keychain The keychain to remove the certificate from, this defaults to /Library/Keychains/System.keychain
    keychain_password If your keychain is likely to be locked pass the password and it will be unlocked before
    running the import
```

21.19.161 salt.states.macpackage

Installing of mac pkg files

Install any kind of pkg, dmg or app file on macOS:
```
/mnt/test.pkg:
  macpackage.installed:
```

(continues on next page)
- store: True

/mnt/test.dmg:
  macpackage.installed:
    - dmg: True

/mnt/xcode.dmg:
  macpackage.installed:
    - dmg: True
    - app: True
    - target: /Applications/Xcode.app
    - version_check: xcodebuild -version=Xcode 7.1

salt.states.macpackage.installed(name, target='LocalSystem', dmg=False, store=False, app=False, mpkg=False, user=None, onlyif=None, unless=None, force=False, allow_untrusted=False, version_check=None)

Install a Mac OS Package from a pkg or dmg file, if given a dmg file it will first be mounted in a temporary location

name The pkg or dmg file to install

name The location in which to install the package. This can be a path or LocalSystem
dmg Is the given file a dmg file?

store Should the pkg be installed as if it was from the Mac OS Store?

app Is the file a .app? If so then we'll just copy that to /Applications/ or the given target

mpkg Is the file a .mpkg? If so then we'll check all of the .pkg files found are installed

user Name of the user performing the unless or onlyif checks

onlyif A command to run as a check, run the named command only if the command passed to the onlyif option returns true

unless A command to run as a check, only run the named command if the command passed to the unless option returns false

force Force the package to be installed even if its already been found installed

allow_untrusted Allow the installation of untrusted packages

version_check The command and version that we want to check against, the version number can use regex.

version_check: python --version_check=2.7.[0-9]

21.19.162 salt.states.mac_xattr module

Allows you to manage extended attributes on files or directories

Install, enable and disable assistive access on macOS minions

/path/to/file:
  xattr.exists:
    - attributes:
      - com.file.attr=test
      - com.apple.quarantine=0x00001111

salt.states.mac_xattr.delete(name, attributes)

Make sure the given attributes are deleted from the file/directory

name The path to the file/directory

attributes The attributes that should be removed from the file/directory, this is accepted as an array.

salt.states.mac_xattr.exists(name, attributes)

Make sure the given attributes exist on the file/directory
name  The path to the file/directory
attributes The attributes that should exist on the file/directory, this is accepted as an array, with key and value split with an equals sign, if you want to specify a hex value then add 0x to the beginning of the value.

21.19.163  salt.states.makeconf

Management of Gentoo make.conf

A state module to manage Gentoo’s make.conf file

```yaml
makeopts:
    makeconf.present:
        - value: '-j3'
```

salt.states.makeconf.absent(name)
Verify that the variable is not in the make.conf.
name  The variable name. This will automatically be converted to upper case since variables in make.conf are in upper case

salt.states.makeconf.present(name, value=none, contains=none, excludes=none)
Verify that the variable is in the make.conf and has the provided settings. If value is set, contains and excludes will be ignored.
name  The variable name. This will automatically be converted to upper case since variables in make.conf are in upper case
value  Enforce that the value of the variable is set to the provided value
contains  Enforce that the value of the variable contains the provided value
excludes  Enforce that the value of the variable does not contain the provided value.

21.19.164  salt.states.marathon_app module

Configure Marathon apps via a salt proxy.

```yaml
my_app:
    marathon_app.config:
        - config:
            cmd: "while [ true ]; do echo 'Hello Marathon'; sleep 5; done"
            cpus: 0.1
            mem: 10
            instances: 3
```

New in version 2015.8.2.

salt.states.marathon_app.absent(name)
Ensure that the marathon app with the given id is not present.
Parameters name  – The app name/id
Returns  A standard Salt changes dictionary

salt.states.marathon_app.config(name, config)
Ensure that the marathon app with the given id is present and is configured to match the given config values.
Parameters
  * name  – The app name/id
  * config  – The configuration to apply (dict)
Returns  A standard Salt changes dictionary
salt.states.marathon_app.running(name, restart=False, force=True)

Ensure that the marathon app with the given id is present and restart if set.

Parameters

- **name** – The app name/id
- **restart** – Restart the app
- **force** – Override the current deployment

Returns A standard Salt changes dictionary

21.19.165 salt.states.mdadm_raid

Managing software RAID with mdadm

depends mdadm

A state module for creating or destroying software RAID devices.

```
/dev/md0:
  raid.present:
    - level: 5
    - devices:
      - /dev/xvdd
      - /dev/xvde
      - /dev/xvdf
    - chunk: 256
    - run: True
```

salt.states.mdadm_raid.absent(name)

Verify that the raid is absent

name The name of raid device to be destroyed

```
/dev/md0:
  raid:
    - absent
```

salt.states.mdadm_raid.present(name, level, devices, **kwargs)

Verify that the raid is present

Changed in version 2014.7.0.

name The name of raid device to be created

level The RAID level to use when creating the raid.

devices A list of devices used to build the array.

kwargs Optional arguments to be passed to mdadm.

Example:

```
/dev/md0:
  raid.present:
    - level: 5
    - devices:
      - /dev/xvdd
      - /dev/xvde
      - /dev/xvdf
    - chunk: 256
    - run: True
```
21.19.166 salt.states.memcached

States for Management of Memcached Keys

New in version 2014.1.0.

salt.states.memcached.absent(name, value=None, host='127.0.0.1', port=11211, time=0)
Ensure that a memcached key is not present.

- name The key
- value [None] If specified, only ensure that the key is absent if it matches the specified value.
- host The memcached server IP address
- port The memcached server port

```
foo:
    memcached.absent

bar:
    memcached.absent:
        - host: 10.0.0.1
```

salt.states.memcached.managed(name, value=None, host='127.0.0.1', port=11211, time=0, min_compress_len=0)
Manage a memcached key.

- name The key to manage
- value The value to set for that key
- host The memcached server IP address
- port The memcached server port

```
foo:
    memcached.managed:
        - value: bar
```

21.19.167 salt.states.modjk

State to control Apache modjk

salt.states.modjk.worker_activated(name, workers=None, profile='default')
Activate all the workers in the modjk load balancer

Example:

```
loadbalancer:
    modjk.worker_activated:
        - workers:
            - app1
            - app2
```

salt.states.modjk.worker_disabled(name, workers=None, profile='default')
Disable all the workers in the modjk load balancer

Example:

```
loadbalancer:
    modjk.worker_disabled:
        - workers:
            - app1
            - app2
```
salt.states.modjk.worker_recover(name, workers=None, profile='default')

Recover all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_recover:
    - workers:
      - app1
      - app2
```

salt.states.modjk.worker_stopped(name, workers=None, profile='default')

Stop all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_stopped:
    - workers:
      - app1
      - app2
```

21.19.168 salt.states.modjk_worker

Manage modjk workers

Send commands to a modjk load balancer via the peer system.

This module can be used with the prereq requisite to remove/add the worker from the load balancer before deploying/restarting service.

Mandatory Settings:

- The minion needs to have permission to publish the modjk.* functions (see here for information on configuring peer publishing permissions)
- The modjk load balancer must be configured as stated in the modjk execution module documentation

salt.states.modjk_worker.activate(name, lbn, target, profile='default', tgt_type='glob')

Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.

Activate the named worker from the lbn load balancers at the targeted minions

Example:

```
disable-before-deploy:
  modjk_worker.activate:
    - name: {{ grains['id'] }}
    - lbn: application
    - target: 'roles:balancer'
    - tgt_type: grain
```

salt.states.modjk_worker.disable(name, lbn, target, profile='default', tgt_type='glob')

Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.

Disable the named worker from the lbn load balancers at the targeted minions. The worker will get traffic only for current sessions and won’t get new ones.
Example:

```yaml
disable-before-deploy:
  modjk_worker.disable:
    - name: {{ grains['id'] }}
    - lbn: application
    - target: 'roles:balancer'
    - tgt_type: grain
```

```
salt.states.modjk_worker.stop(name, lbn, target, profile='default', tgt_type='glob')
```

Changed in version 2017.7.0: The *expr_form* argument has been renamed to *tgt_type*, earlier releases must use *expr_form*.

Stop the named worker from the lbn load balancers at the targeted minions The worker won’t get any traffic from the lbn

Example:

```yaml
disable-before-deploy:
  modjk_worker.stop:
    - name: {{ grains['id'] }}
    - lbn: application
    - target: 'roles:balancer'
    - tgt_type: grain
```

### 21.19.169 salt.states.module

**Execution of Salt modules from within states**

**Note:** There are two styles of calling *module.run*. The legacy style will no longer be available starting in the Sodium release. To opt-in early to the new style you must add the following to your `/etc/salt/minion` config file:

```bash
use_superseded:
  - module.run
```

With *module.run* these states allow individual execution module calls to be made via states. Here’s a contrived example, to show you how it’s done:

```bash
# New Style
test.random_hash:
  module.run:
    - test.random_hash:
      - size: 42
      - hash_type: sha256

# Legacy Style
test.random_hash:
  module.run:
    - size: 42
    - hash_type: sha256
```

In the new style, the state ID (*test.random_hash*, in this case) is irrelevant when using *module.run*. It could have very well been written:
Generate a random hash:

```python
module.run:
  - test.random_hash:
    - size: 42
    - hash_type: sha256
```

For a simple state like that it’s not a big deal, but if the module you’re using has certain parameters, things can get cluttered, fast. Using the contrived custom module (stuck in `/srv/salt/_modules/foo.py`, or your configured `file_roots`):

```python
def bar(name, names, fun, state, saltenv):
    return "Name: {name} Names: {names} Fun: {fun} State: {state} Saltenv: {saltenv}".format(**locals())
```

Your legacy state has to look like this:

```
# Legacy style
Unfortunate example:
module.run:
  - name: foo.bar
  - m_name: Some name
  - m_names:
    - Such names
    - very wow
  - m_state: Arkansas
  - m_fun: Such fun
  - m_saltenv: Salty
```

With the new style it’s much cleaner:

```
# New style
Better:
module.run:
  - foo.bar:
    - name: Some name
    - names:
      - Such names
      - very wow
    - state: Arkansas
    - fun: Such fun
    - saltenv: Salty
```

The new style also allows multiple modules in one state. For instance, you can do this:

```python
Do many things:
module.run:
  - test.random_hash:
    - size: 10
    - hash_type: md5
    # Note the `:` at the end
  - test.true:
  - test.arg:
    - this
    - has
    - args
    - and: kwargs
    - isn't: that neat?
```

(continues on next page)
Where in the legacy style you would have had to split your states like this:

```
# Note the `:` at the end, too
- test.version:
- test.fib:
  - 4
```

```
test.random_hash:
  module.run:
    - size: 10
    - hash_type: md5

test.nop:
  module.run

test.arg:
  module.run:
    - args:
      - this
      - has
      - args
    - kwargs:
      and: kwargs
      isn't: that neat?

test.version:
  module.run
```

Another difference is that in the legacy style, unconsumed arguments to the `module` state were simply passed into the module function being executed:

```
show off module.run with args:
  module.run:
    - name: test.random_hash
    - size: 42
    - hash_type: sha256
```

The new style is much more explicit, with the arguments and keyword arguments being nested under the name of the function:

```
show off module.run with args:
  module.run:
    # Note the lack of `name:`, and trailing `:`
    - test.random_hash:
      - size: 42
      - hash_type: sha256
```

If the function takes `*args`, they can be passed in as well:

```
args and kwargs:
  module.run:
    - test.arg:
      - isn't
      - this
      - fun
      - this: that
      - salt: stack
```
Modern Examples

Here are some other examples using the modern `module.run`:

```yaml
fetch_out_of_band:
  module.run:
    - git.fetch:
      - cwd: /path/to/my/repo
      - user: myuser
      - opts: '--all'
```

A more complex example:

```yaml
eventsviewer:
  module.run:
    - task.create_task:
      - name: 'events-viewer'
      - user_name: System
      - action_type: Execute
      - cmd: 'c:\netops\scripts\events_viewer.bat'
      - trigger_type: 'Daily'
      - start_date: '2017-1-20'
      - start_time: '11:59PM'
```

It is sometimes desirable to trigger a function call after a state is executed, for this the `module.wait` state can be used:

```yaml
add example to hosts:
  file.append:
    - name: /etc/hosts
    - text: 203.0.113.13 example.com

# New Style
mine.send:
  module.wait:
    # Again, note the trailing `:`
    - hosts.list_hosts:
    - watch:
      - file: add example to hosts
```

Legacy (Default) Examples

If you’re using the legacy `module.run`, due to how the state system works, if a module function accepts an argument called, `name`, then `m_name` must be used to specify that argument, to avoid a collision with the `name` argument.

Here is a list of keywords hidden by the state system, which must be prefixed with `m_`:

- fun
- name
- names
- state
- saltenv

For example:
disable_nfs:
  module.run:
    - name: service.disable
    - m_name: nfs

Note that some modules read all or some of the arguments from a list of keyword arguments. For example:

mine.send:
  module.run:
    - func: network.ip_addrs
    - kwargs:
      interface: eth0

cloud.create:
  module.run:
    - func: cloud.create
    - provider: test-provider
    - m_names:
      - test-vlad
    - kwargs: {
        ssh_username: 'ubuntu',
        image: 'ami-8d6d9daa',
        securitygroup: 'default',
        size: 'c3.large',
        location: 'ap-northeast-1',
        delvol_on_destroy: 'True'
    }

Other modules take the keyword arguments using this style:

mac_enable_ssh:
  module.run:
    - name: system.set_remote_login
    - enable: True

Another example that creates a recurring task that runs a batch file on a Windows system:

eventsviewer:
  module.run:
    - name: task.create_task
    - m_name: 'events-viewer'
    - user_name: System
    - kwargs: {
        action_type: 'Execute',
        cmd: 'c:\netops\scripts\events_viewer.bat',
        trigger_type: 'Daily',
        start_date: '2017-1-20',
        start_time: '11:59PM'
    }

salt.states.module.run(**kwargs)
Run a single module function or a range of module functions in a batch. Supersedes module.run function, which requires m_ prefix to function-specific parameters.

Parameters
  • returner – Specify a common returner for the whole batch to send the return data
  • kwargs – Pass any arguments needed to execute the function(s)
some_id_of_state:
module.run:
  - network.ip_addrs:
    - interface: eth0
  - cloud.create:
    - names:
      - test-isbm-1
      - test-isbm-2
    - ssh_username: sles
    - image: sles12sp2
    - securitygroup: default
    - size: 'c3.large'
    - location: ap-northeast-1
    - delvol_on_destroy: True

Returns

salt.states.module.wait(name, **kwargs)
Run a single module function only if the watch statement calls it
name The module function to execute
**kwargs Pass any arguments needed to execute the function

Note: Like the cmd.run state, this state will return True but not actually execute, unless one of the following two things happens:
1. The state has a watch requisite, and the state which it is watching changes.
2. Another state has a watch_in requisite which references this state, and the state with the watch_in changes.

21.19.170 salt.states.mongodb_database

Management of MongoDB Databases

depends
  - pymongo Python module

Only deletion is supported, creation doesn’t make sense and can be done using mongodb_user.present.
salt.states.mongodb_database.absent(name, user=None, password=None, host=None, port=None, authdb=None)
Ensure that the named database is absent. Note that creation doesn’t make sense in MongoDB.
name The name of the database to remove
user The user to connect as (must be able to create the user)
password The password of the user
host The host to connect to
port The port to connect to
authdb The database in which to authenticate

21.19.171 salt.states.mongodb_user

Management of MongoDB Users

depends
- pymongo Python module

salt.states.mongodb_user.absent(name, user=None, password=None, host=None, port=None, database='admin', authdb=None)

Ensure that the named user is absent
name The name of the user to remove
user MongoDB user with sufficient privilege to create the user
password Password for the admin user specified by the user parameter
host The hostname/IP address of the MongoDB server
port The port on which MongoDB is listening
database The database from which to remove the user specified by the name parameter
authdb The database in which to authenticate

salt.states.mongodb_user.present(name, passwd, database='admin', user=None, password=None, host='localhost', port=27017, authdb=None, roles=None)

Ensure that the user is present with the specified properties
name The name of the user to manage
passwd The password of the user to manage
user MongoDB user with sufficient privilege to create the user
password Password for the admin user specified with the user parameter
host The hostname/IP address of the MongoDB server
port The port on which MongoDB is listening
database The database in which to create the user

Note: If the database doesn’t exist, it will be created.

authdb The database in which to authenticate
roles The roles assigned to user specified with the name parameter

Example:

```
mongouser-myapp:
  mongodb_user.present:
    - name: myapp
    - passwd: password-of-myapp
    - database: admin
  # Connect as admin:sekrit
  - user: admin
  - password: sekrit
  - roles:
    - readWrite
    - userAdmin
    - dbOwner
```

21.19.172 salt.states.monit

Monit state

Manage monit states

```
monit_enable_service_monitoring:
  monit.monitor:
    - name: service

monit_disable_service_monitoring:
```

(continues on next page)
monit.unmonitor:
   - name: service

**Note:** Use of these states require that the `monit` execution module is available.

salt.states.monit.*monitor*(name)
Get the summary from module monit and try to see if service is being monitored. If not then monitor the service.

salt.states.monit.*unmonitor*(name)
Get the summary from module monit and try to see if service is being monitored. If it is then stop monitoring the service.

### 21.19.173 salt.states.mount

**Mounting of filesystems**

Mount any type of mountable filesystem with the mounted function:

```
/mnt/sdb:
    mount.mounted:
       - device: /dev/sdb1
       - fstype: ext4
       - mkmnt: True
       - opts:
           - defaults
/srv/bigdata:
    mount.mounted:
       - device: UUID=066e0200-2867-4ebe-b9e6-f30026ca2314
       - fstype: xfs
       - opts: nobootwait,noatime,nodiratime,nobarrier,logbufs=8
       - dump: 0
       - pass_num: 2
       - persist: True
       - mkmnt: True
/var/lib/bigdata:
    mount.mounted:
       - device: /srv/bigdata
       - fstype: none
       - opts: bind
       - dump: 0
       - pass_num: 0
       - persist: True
       - mkmnt: True
```

salt.states.mount.*fstab_absent*(name, fs_file, mount_by=None, config='/etc/fstab')

Makes sure that a fstab mount point is absent.

- **name** The name of block device. Can be any valid fs_spec value.
- **fs_file** Mount point (target) for the filesystem.
- **mount_by** Select the final value for fs_spec. Can be [None, device, label, uuid, partlabel, partuuid]. If None, the value for fs_spec will be the parameter name, in other case will search
the correct value based on the device name. For example, for uuid, the value for fs_spec will be of type 'UUID=xxx' instead of the device name set in name.

config Place where the fstab file lives

salt.states.mount.fstab_present(name, fs_file, fs_vfstype, fs_mntops='defaults', fs_freq=0, fs_passno=0, mount_by=None, config='/etc/fstab', mount=True, match_on='auto', not_change=False)

Makes sure that a fstab mount point is present.
name The name of block device. Can be any valid fs_spec value.
fs_file Mount point (target) for the filesystem.
fs_vfstype The type of the filesystem (e.g. ext4, xfs, btrfs, ...)
fs_mntops The mount options associated with the filesystem. Default is defaults.
fs_freq Field is used by dump to determine which fs need to be dumped. Default is 0
fs_passno Field is used by fsck to determine the order in which filesystem checks are done at boot time. Default is 0
mount_by Select the final value for fs_spec. Can be [None, device, label, uuid, partlabel, partuuid]. If None, the value for fs_spec will be the parameter name, in other case will search the correct value based on the device name. For example, for uuid, the value for fs_spec will be of type 'UUID=xxx' instead of the device name set in name.
config Place where the fstab file lives. Default is /etc/fstab
mount Set if the mount should be mounted immediately. Default is True
match_on A name or list of fstab properties on which this state should be applied. Default is auto, a special value indicating to guess based on fstype. In general, auto matches on name for recognized special devices and device otherwise.
not_change By default, if the entry is found in the fstab file but is different from the expected content (like different options), the entry will be replaced with the correct content. If this parameter is set to True and the line is found, the original content will be preserved.

salt.states.mount.mod_watch(name, user=None, **kwargs)
The mounted watcher, called to invoke the watch command.

Note: This state exists to support special handling of the watch requisite. It should not be called directly.
Parameters for this function should be set by the state being triggered.

name The name of the mount point

salt.states.mount.mounted(name, device, fstype, mkmnt=False, opts='defaults', dump=0, pass_num=0, config='/etc/fstab', persist=True, mount=True, user=None, match_on='auto', device_name_regex=None, extra_mount_invisible_options=None, extra_mount_invisible_keys=None, extra_mount_ignore_fs_keys=None, extra_mount_translate_options=None, hidden_opts=None, **kwargs)

Verify that a device is mounted
name The path to the location where the device is to be mounted
device The device name, typically the device node, such as /dev/sdb1 or UUID=066e0200-2867-4ebe-b9e6-f30026ca2314 or LABEL=DATA
fstype The filesystem type, this will be xfs, ext2/3/4 in the case of classic filesystems, fuse in the case of fuse mounts, and nfs in the case of nfs mounts
mkmnt If the mount point is not present then the state will fail, set mkmnt: True to create the mount point if it is otherwise not present
opts A list object of options or a comma delimited list
dump The dump value to be passed into the fstab, Default is 0
pass_num The pass value to be passed into the fstab, Default is 0
config Set an alternative location for the fstab, Default is /etc/fstab
**persist** Set if the mount should be saved in the fstab, Default is True

**mount** Set if the mount should be mounted immediately, Default is True

**user** The account used to execute the mount; this defaults to the user salt is running as on the minion

**match_on** A name or list of fstab properties on which this state should be applied. Default is auto, a special value indicating to guess based on fstype. In general, auto matches on name for recognized special devices and device otherwise.

**device_name_regex** A list of device exact names or regular expressions which should not force a remount.

For example, glusterfs may be mounted with a comma-separated list of servers in fstab, but the /proc/self/mountinfo will show only the first available server.

```python
{% set glusterfs_ip_list = ['10.0.0.1', '10.0.0.2', '10.0.0.3'] %}

mount glusterfs volume:
    mount.mounted:
        - name: /mnt/glusterfs_mount_point
        - device: {{ glusterfs_ip_list|join(',') }}:/volume_name
        - fstype: glusterfs
        - opts: _netdev,rw,defaults,direct-io-mode=disable
        - mkmnt: True
        - persist: True
        - dump: 0
        - pass_num: 0
        - device_name_regex:
          - ({{ glusterfs_ip_list|join('|') }}):/volume_name

New in version 2016.11.0.

**extra_mount_invisible_options** A list of extra options that are not visible through the /proc/self/mountinfo interface.

If a option is not visible through this interface it will always remount the device. This option extends the builtin mount_invisible_options list.

**extra_mount_invisible_keys** A list of extra key options that are not visible through the /proc/self/mountinfo interface.

If a key option is not visible through this interface it will always remount the device. This option extends the builtin mount_invisible_keys list.

A good example for a key option is the password option:

```python
password=badsecret
```

**extra_mount_ignore_fs_keys** A dict of filesystem options which should not force a remount. This will update the internal dictionary. The dict should look like this:

```python
{ 'ramfs': ['size'] }
```

**extra_mount_translate_options** A dict of mount options that gets translated when mounted. To prevent a remount add additional options to the default dictionary. This will update the internal dictionary. The dictionary should look like this:

```python
{ 'tcp': 'proto=tcp',
  'udp': 'proto=udp'
}
```

**hidden_opts** A list of mount options that will be ignored when considering a remount as part of the state application
New in version 2015.8.2.

```python
salt.states.mount.swap(name, persist=True, config='/etc/fstab')
```

Activates a swap device

```
/root/swapfile:
mount.swap
```

**Note:** swap does not currently support LABEL

```python
salt.states.mount.unmounted(name, device=None, config='/etc/fstab', persist=False, user=None, **kwargs)
```

New in version 0.17.0.

Verify that a device is not mounted

- **name**: The path to the location where the device is to be unmounted from
- **device**: The device to be unmounted. This is optional because the device could be mounted in multiple places.

New in version 2015.5.0.

- **config**: Set an alternative location for the fstab, Default is `/etc/fstab`
- **persist**: Set if the mount should be purged from the fstab, Default is `False`
- **user**: The user to own the mount; this defaults to the user salt is running as on the minion

### 21.19.174 salt.states.msteams module

**Send a message card to Microsoft Teams**

This state is useful for sending messages to Teams during state runs.

New in version 2017.7.0.

```python
msteams.post_card(name, message, hook_url=None, title=None, theme_color=None)
```

Send a message to a Microsft Teams channel

```
send-msteams-message:
msteams.post_card:
  - message: 'This state was executed successfully.'
  - hook_url: https://outlook.office.com/webhook/837
```

The `hook_url` can be specified in the master or minion configuration like below:

```
msteams:
  hook_url: https://outlook.office.com/webhook/837
```

The following parameters are required:

- **message**: The message that is to be sent to the MS Teams channel.

The following parameters are optional:

- **hook_url**: The webhook URL given configured in Teams interface, if not specified in the configuration options of master or minion.
- **title**: The title for the card posted to the channel
theme_color  A hex code for the desired highlight color

21.19.175  salt.states.mysql_database

Management of MySQL databases (schemas)

depends
  • MySQLdb Python module

configuration  See salt.modules.mysql for setup instructions.

The mysql_database module is used to create and manage MySQL databases. Databases can be set as either absent or present.

```python
frank:
  mysql_database.present
```

salt.states.mysql_database.absent(name, **connection_args)
  Ensure that the named database is absent
  name  The name of the database to remove

salt.states.mysql_database.present(name, character_set=None, collate=None, **connection_args)
  Ensure that the named database is present with the specified properties
  name  The name of the database to manage

21.19.176  salt.states.mysql_grants

Management of MySQL grants (user permissions)

depends
  • MySQLdb Python module

configuration  See salt.modules.mysql for setup instructions.

The mysql_grants module is used to grant and revoke MySQL permissions.

The name you pass in purely symbolic and does not have anything to do with the grant itself.

The database parameter needs to specify a 'priv_level' in the same specification as defined in the MySQL documentation:
  • *
  • **
  • db_name.*
  • db_name.tbl_name
  • etc...

This state is not able to set password for the permission from the specified host. See salt.states.mysql_user for further instructions.
frank_exampledb:
    mysql_grants.present:
    - grant: select,insert,update
    - database: exampledb.*
    - user: frank
    - host: localhost

frank_otherdb:
    mysql_grants.present:
    - grant: all privileges
    - database: otherdb.*
    - user: frank

restricted_singletable:
    mysql_grants.present:
    - grant: select
    - database: somedb.sometable
    - user: joe

salt.states.mysql_grants.absent(name, grant=None, database=None, user=None, host='localhost', grant_option=False, escape=True, **connection_args)

Ensure that the grant is absent
name  The name (key) of the grant to add
grant  The grant priv_type (i.e. select,insert,update OR all privileges)
database  The database priv_level (i.e. db.tbl OR db.*)
user  The user to apply the grant to
host  The network/host that the grant should apply to

salt.states.mysql_grants.present(name, grant=None, database=None, user=None, host='localhost', grant_option=False, escape=True, revoke_first=False, ssl_option=False, **connection_args)

Ensure that the grant is present with the specified properties
name  The name (key) of the grant to add
grant  The grant priv_type (i.e. select,insert,update OR all privileges)
database  The database priv_level (i.e. db.tbl OR db.*)
user  The user to apply the grant to
host  The network/host that the grant should apply to
grant_option  Adds the WITH GRANT OPTION to the defined grant. Default is False
escape  Defines if the database value gets escaped or not. Default is True
revoke_first  By default, MySQL will not do anything if you issue a command to grant privileges that are more restrictive than what's already in place. This effectively means that you cannot downgrade permissions without first revoking permissions applied to a db.table/user pair first.

To have Salt forcibly revoke perms before applying a new grant, enable the 'revoke_first options.

WARNING: This will remove permissions for a database before attempting to apply new permissions. There is no guarantee that new permissions will be applied correctly which can leave your database security in an unknown and potentially dangerous state. Use with caution!

Default is False
ssl_option  Adds the specified ssl options for the connecting user as requirements for this grant. Value is a list of single-element dicts corresponding to the list of ssl options to use.

Possible key/value pairings for the dicts in the value:

- SSL: True
- X509: True

(continues on next page)
The non-boolean ssl options take a string as their values, which should be an appropriate value as specified by the MySQL documentation for these options.

Default is False (no ssl options will be used)

21.19.177 salt.states.mysql_query

Execution of MySQL queries

New in version 2014.7.0.

depends

• MySQLdb Python module

configuration See salt.modules.mysql for setup instructions.

The mysql_query module is used to execute queries on MySQL databases. Its output may be stored in a file or in a grain.

```
query_id:
  mysql_query.run
  - database: my_database
  - query: "SELECT * FROM table;"
  - output: "/tmp/query_id.txt"
```

salt.states.mysql_query.run(name, database, query, output=None, grain=None, key=None, overwrite=True, check_db_exists=True, **connection_args)

Execute an arbitrary query on the specified database

name Used only as an ID
database The name of the database to execute the query on
query The query to execute
output grain: output in a grain other: the file to store results None: output to the result comment (default)
grain: grain to store the output (need output=grain)
key: the specified grain will be treated as a dictionary, the result of this state will be stored under the specified key.
overwrite: The file or grain will be overwritten if it already exists (default)
check_db_exists: The state run will check that the specified database exists (default=True) before running any queries

salt.states.mysql_query.run_file(name, database, query_file=None, output=None, grain=None, key=None, overwrite=True, saltenv=None, check_db_exists=True, **connection_args)

Execute an arbitrary query on the specified database

New in version 2017.7.0.
name Used only as an ID
database The name of the database to execute the query_file on
query_file The file of mysql commands to run
output grain: output in a grain other: the file to store results None: output to the result comment (default)
grain: grain to store the output (need output=grain)
key: the specified grain will be treated as a dictionary, the result of this state will be stored under the specified key.
overwrite: The file or grain will be overwritten if it already exists (default)
saltenv: The saltenv to pull the query_file from
check_db_exists: The state run will check that the specified database exists (default=True) before running any queries

21.19.178 salt.states.mysql_user

Management of MySQL users

depends
• MySQLdb Python module

configuration See salt.modules.mysql for setup instructions.

```
frank:
  mysql_user.present:
  - host: localhost
  - password: bobcat
```

New in version 0.16.2: Authentication overrides have been added.

The MySQL authentication information specified in the minion config file can be overridden in states using the following arguments: connection_host, connection_port, connection_user, connection_pass, connection_db, connection_unix_socket, connection_default_file and connection_charset.

```
frank:
  mysql_user.present:
  - host: localhost
  - password: "bob@cat"
  - connection_user: someuser
  - connection_pass: somepass
  - connection_charset: utf8
  - saltenv:
    - LC_ALL: "en_US.utf8"
```

This state is not able to grant permissions for the user. See salt.states.mysql_grants for further instructions.

salt.states.mysql_user.absent(name, host='localhost', **connection_args)
Ensure that the named user is absent
name The name of the user to remove

salt.states.mysql_user.present(name, host='localhost', password=None, password_hash=None, allow_passwordless=False, unix_socket=False, password_column=None, auth_plugin='mysql_native_password', **connection_args)
Ensure that the named user is present with the specified properties. A passwordless user can be configured by omitting password and password_hash, and setting allow_passwordless to True.
name The name of the user to manage
host Host for which this user/password combo applies
password The password to use for this user. Will take precedence over the password_hash option if both are specified.

21.19. state modules 3569
**password_hash**  The password in hashed form. Be sure to quote the password because YAML doesn’t like the *
A password hash can be obtained from the mysql command-line client like so:

```sql
mysql> SELECT PASSWORD('mypass');
+-----------------------------+--------------|
| PASSWORD('mypass')           | +-----------------------------|
| *6C8989366EAF75BB670AD8EA7A7FC1176A95CEF4 | +-----------------------------|
+-----------------------------+--------------|
1 row in set (0.00 sec)
```

**allow_passwordless**  If True, then password and password_hash can be omitted to permit a passwordless login.

New in version 0.16.2.

**unix_socket**  If True and allow_passwordless is True, the unix_socket auth plugin will be used.

### 21.19.179  salt.states.netacl

**Network ACL**

Manage the firewall configuration on the network device managed through NAPALM. The firewall configuration is generated by Capirca.

New in version 2017.7.0.

- **codeauthor** Mircea Ulinic <ping@mirceaulinic.net>
- **maturity** new
- **depends** capirca, napalm
- **platform** unix

**Dependencies**

**Capirca**

To install Capirca, execute: `pip install capirca`.

**NAPALM**

To be able to load configuration on network devices, it requires NAPALM library to be installed: `pip install napalm`. Please check Installation for complete details.

```python
salt.states.netacl.filter(name, filter_name, filter_options=None, terms=None, prepend=True, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=False, only_lower_merge=False, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d', test=False, commit=True, debug=False)
```

Generate and load the configuration of a policy filter.

- **filter_name**  The name of the policy filter.
- **filter_options**  Additional filter options. These options are platform-specific. See the complete list of options.
- **terms**  Dictionary of terms for this policy filter. If not specified or empty, will try to load the configuration from the pillar, unless merge_pillar is set as False.
**prepend:** *True* When `merge_pillar` is set as `True`, the final list of terms generated by merging the terms from `terms` with those defined in the pillar (if any): new terms are prepended at the beginning, while existing ones will preserve the position. To add the new terms at the end of the list, set this argument to `False`.

**pillar_key:** *acl* The key in the pillar containing the default attributes values. Default: `acl`.

**pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

**merge_pillar:** *False* Merge `terms` with the corresponding value from the pillar. Default: `False`.

---

**Note:** By default this state does not merge, to avoid any unexpected behaviours.

The merge logic depends on the `prepend` argument.

The terms specified through the `terms` argument have higher priority than the pillar.

**only_lower_merge:** *False* Specify if it should merge only the terms fields. Otherwise it will try to merge also filters fields. Default: `False`. This option requires `merge_pillar`, otherwise it is ignored.

**revision_id** Add a comment in the filter config having the description for the changes applied.

**revision_no** The revision count.

**revision_date:** *True* Boolean flag: display the date when the filter configuration was generated. Default: `True`.

**revision_date_format:** `%Y/%m/%d` The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (`<year>/<month>/<day>`).

**test:** *False* Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit:** *True* Commit? Default: `True`.

**debug:** *False* Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

**CLI Example:**

```
salt 'edge01.flw01' state.sls router.acl test=True
```

**Output Example:**

```
edge01.flw01:
--------
   ID: my-filter
Function: netacl.filter

ipv6 access-list my-filter
  remark $Id: my-filter_state $
  remark $Revision: 5 $
  remark my-other-term
  permit tcp any range 5678 5680 any
exit

Summary for edge01.flw01
-------------
Succeeded: 1 (unchanged=1, changed=1)
Failed: 0
-------------
Total states run: 1
Total run time: 2.437 s

Pillar example:

```yaml
acl:
  - my-filter:
    options:
      - inet6
    terms:
      - my-term:
        source_port: [1234, 1235]
        protocol:
          - tcp
          - udp
        source_address: 1.2.3.4
        action: reject
      - my-other-term:
        source_port:
          - [5678, 5680]
        protocol: tcp
        action: accept
```

State SLS Example:

```yaml
{% set filter_name = 'my-filter' %}
{% set my_filter_cfg = salt.netacl.get_filter_pillar(filter_name, pillar_key='firewall') %}
my_first_filter_state:
  netacl.filter:
    - filter_name: {{ filter_name }}
    - options: {{ my_filter_cfg['options'] | json }}
    - terms: {{ my_filter_cfg['terms'] | json }}
    - revision_date: false
    - revision_no: 5
    - debug: true
```

Or:
my_first_filter_state:
  netacl.filter:
    - filter_name: my-filter
    - merge_pillar: true
    - pillar_key: firewall
    - revision_date: false
    - revision_no: 5
    - debug: true

In the example above, as inet6 has been specified in the filter_options, the configuration chunk referring to my-term has been ignored as it referred to IPv4 only (from source_address field).

Note: The first method allows the user to eventually apply complex manipulation and / or retrieve the data from external services before passing the data to the state. The second one is more straightforward, for less complex cases when loading the data directly from the pillar is sufficient.

Note: When passing retrieved pillar data into the state file, it is strongly recommended to use the json serializer explicitly ("| json"), instead of relying on the default Python serializer.

salt.states.netacl.managed(name, filters=None, prepend=True, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=False, only_lower_merge=False, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d', test=False, commit=True, debug=False)

Manage the whole firewall configuration.

filters Dictionary of filters for this policy. If not specified or empty, will try to load the configuration from the pillar, unless merge_pillar is set as False.

prepend: True When merge_pillar is set as True, the final list of filters generated by merging the filters from filters with those defined in the pillar (if any): new filters are prepended at the beginning, while existing ones will preserve the position. To add the new filters at the end of the list, set this argument to False.

pillar_key: acl The key in the pillar containing the default attributes values. Default: acl.

pillarenv Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

merge_pillar: False Merge the filters will the corresponding values from the pillar. Default: False.

Note: By default this state does not merge, to avoid any unexpected behaviours.

The merge logic depends on the prepend argument.

The filters specified through the filters argument have higher priority than the pillar.

only_lower_merge: False Specify if it should merge only the filters and terms fields. Otherwise it will try to merge everywhere at the policy level. Default: False. This option requires merge_pillar, otherwise it is ignored.

test: False Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.

revision_id Add a comment in the policy config having the description for the changes applied.

revision_no The revision count.

revision_date: True Boolean flag: display the date when the policy configuration was generated. Default: True.
revision_date_format: %Y/%m/%d The date format to be used when generating the perforce data. Default: %Y/%m/%d (<year>/<month>/<day>).

debuge False Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw configuration loaded on the device.

CLI Example:

```
salt 'edge01.bjm01' state.sls router.acl test=True
```

Output Example:

```
edge01.bjm01:

Summary for edge01.bjm01
-----------------------
Succeeded: 1 (unchanged=1, changed=1)
Failed: 0
-----------------------
Total states run: 1
Total run time: 5.569 s

The policy configuration has been loaded from the pillar, having the following structure:

```
firewall:
  - my-filter:
    terms:
      - my-term:
        source_port: [1234, 1235]
        protocol:
          - tcp
          - udp
        source_address: 1.2.3.4
        action: reject
      - my-other-term:
        source_port:
          - [5678, 5680]
        protocol: tcp
        action: accept
    - block-icmp:
      terms:
        - first-term:
          protocol:
            - icmp
          action: reject
```

Example SLS file:

```
{% set fw_filters = pillar.get('firewall', {}) %}
netacl_example:
  netacl.managed:
    - filters: {{ fw_filters | json }}
    - revision_no: 2
    - debug: true
```

Or:
**netacl_example:**

```
{netacl.managed:
  - pillar_key: firewall
  - merge_pillar: true
  - revision_no: 2
  - debug: true
```

**Note:** The first method allows the user to eventually apply complex manipulation and/or retrieve the data from external services before passing the data to the state. The second one is more straightforward, for less complex cases when loading the data directly from the pillar is sufficient.

**Note:** When passing retrieved pillar data into the state file, it is strongly recommended to use the json serializer explicitly ("|json"), instead of relying on the default Python serializer.

```python
salt.states.netacl.term(name, filter_name, term_name, filter_options=None, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=False, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d', test=False, commit=True, debug=False, source_service=None, destination_service=None, **term_fields)
```

Manage the configuration of a specific policy term.

- **filter_name** The name of the policy filter.
- **term_name** The name of the term.
- **filter_options** Additional filter options. These options are platform-specific. See the complete list of options.
- **pillar_key**: acl Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
- **pillarenv** Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.
- **saltenv** Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.
- **merge_pillar**: False Merge the CLI variables with the pillar. Default: False.
- **revision_id** Add a comment in the term config having the description for the changes applied.
- **revision_no** The revision count.
- **revision_date**: True Boolean flag: display the date when the term configuration was generated. Default: True.
- **revision_date_format**: %Y/%m/%d The date format to be used when generating the perforce data. Default: %Y/%m/%d (<year>/<month>/<day>).
- **test**: False Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.
- **commit**: True Commit? Default: True.
- **debug**: False Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw configuration loaded on the device.
- **source_service** A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a source_port and protocol.
  
  As this module is available on Unix platforms only, it reads the IANA port assignment from /etc/services.
  
  If the user requires additional shortcuts to be referenced, they can add entries under /etc/services, which can be managed using the file state.
- **destination_service** A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a destination_port and protocol. Allows the same options as source_service.
- **term_fields** Term attributes. To see what fields are supported, please consult the list of supported keywords.
Some platforms have few other optional keywords.

**Note:** The following fields are accepted:

- action
- address
- address_exclude
- comment
- counter
- expiration
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix
- forwarding_class
- forwarding_class_except
- logging
- log_name
- loss_priority
- option
- policer
- port
- precedence
- principals
- protocol
- protocol_except
- qos
- pan_application
- routing_instance
- source_address
- source_address_exclude
- source_port
- source_prefix
- verbatim
- packet_length
- fragment_offset
- hop_limit
- icmp_type
- ether_type
- traffic_class_count
- traffic_type
- translated
- dscp_set
- dscp_match
- dscp_except
- nextIp
- flexible_match_range
- source_prefix_except
- destination_prefix_except
- vpn
- source_tag
- destination_tag
- source_interface
- destination_interface
- flattened
- flattened_addr
- flattened_saddr
- flattened_daddr
- priority

---

**Note:** The following fields can be also a single value and a list of values:
- action
- address
- address_exclude
- comment
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix
- forwarding_class
- forwarding_class_except
- logging
- option
- port
- precedence
- principals
- protocol
- protocol_except
- pan_application
- source_address
- source_address_exclude
- source_port
- source_prefix
- verbatim
- icmp_type
- ether_type
- traffic_type
- dscp_match
- dscp_except
- flexible_match_range
- source_prefix_except
- destination_prefix_except
- source_tag
- destination_tag
- source_service
- destination_service

Example: `destination_address` can be either defined as:

```
destination_address: 172.17.17.1/24
```

or as a list of destination IP addresses:

```
destination_address:
- 172.17.17.1/24
- 172.17.19.1/24
```

or a list of services to be matched:
**source_service:**
- ntp
- snmp
- ldap
- bgpd

**Note:** The port fields **source_port** and **destination_port** can be used as above to select either a single value, either a list of values, but also they can select port ranges. Example:

**source_port:**
- `[1000, 2000]`
- `[3000, 4000]`

With the configuration above, the user is able to select the 1000-2000 and 3000-4000 source port ranges.

**CLI Example:**
```
salt 'edge01.bjm01' state.sls router.acl
```

**Output Example:**
```
edge01.bjm01:
----------
    ID: update_icmp_first_term
    Function: netacl.term
    Result: None
    Comment: Testing mode: Configuration discarded.
    Started: 12:49:09.174179
    Duration: 5751.882 ms
    Changes:  
          diff:
              [edit firewall]
              +   family inet {
              +   /*
              +   ** $Id: update_icmp_first_term $ 
              +   ** $Date: 2017/02/30 $ 
              +   ** 
              +   */
              +   filter block-icmp {
              +   term first-term {
              +     from {
              +     protocol icmp;
              +   }
              +   then {
              +     reject;
              +   }
              + }
              + }

Summary for edge01.bjm01
----------
Succeeded: 1 (unchanged=1, changed=1)
```
Failed: 0
---------
Total states run: 1
Total run time: 5.752 s

Pillar example:

```
firewall:
- block-icmp:
  terms:
    - first-term:
      protocol: icmp
      action: reject
```

State SLS example:

```
{% set filter_name = 'block-icmp' -%}
{% set term_name = 'first-term' -%}
{% set my_term_cfg = salt.netacl.get_term_pillar(filter_name, term_name) -%}

update_icmp_first_term:
  netacl.term:
    - filter_name: {{ filter_name }}
    - filter_options:
      - not-interface-specific
    - term_name: {{ term_name }}
    - {{ my_term_cfg | json }}
```

Or directly referencing the pillar keys:

```
update_icmp_first_term:
  netacl.term:
    - filter_name: block-icmp
    - filter_options:
      - not-interface-specific
    - term_name: first-term
    - merge_pillar: true
```

Note: The first method allows the user to eventually apply complex manipulation and / or retrieve the data from external services before passing the data to the state. The second one is more straightforward, for less complex cases when loading the data directly from the pillar is sufficient.

Note: When passing retrieved pillar data into the state file, it is strongly recommended to use the json serializer explicitly (" | json"), instead of relying on the default Python serializer.

21.19.180 salt.states.netconfig

Network Config

Manage the configuration on a network device given a specific static config or template.
codeauthor Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>
maturity new
depends napalm
platform unix

Dependencies

- NAPALM proxy minion
- Network-related basic features execution module

New in version 2017.7.0.
salt.states.netconfig.commit_cancelled(name)
New in version 2019.2.0.
Cancel a commit scheduled to be executed via the commit_in and commit_at arguments from the net.
load_template or net.load_config execution functions. The commit ID is displayed when the com-
mnit is scheduled via the functions named above.
State SLS Example:

```
'20180726083540640360':
    netconfig.commit_cancelled
```
salt.states.netconfig.commit_confirmed(name)
New in version 2019.2.0.
Confirm a commit scheduled to be reverted via the revert_in and revert_at arguments from the net.
load_template or net.load_config execution functions. The commit ID is displayed when the com-
mnit confirmed is scheduled via the functions named above.
State SLS Example:

```
'20180726083540640360':
    netconfig.commit_confirmed
```
salt.states.netconfig.managed(name, template_name=None, template_source=None, tem-
plate_hash=None, template_hash_name=None, saltenv='base', template_engine='jinja', skip_verify=False, context=None, defaults=None, test=False, commit=True, debug=False, replace=False, commit_in=None, commit_at=None, revert_in=None, revert_at=None, **template_vars)
Manages the configuration on network devices.

By default this state will commit the changes on the device. If there are no changes required, it does not
commit and the field already_configured from the output dictionary will be set as True to notify that.

To avoid committing the configuration, set the argument test to True (or via the CLI argument
test=True) and will discard (dry run).

To preserve the changes, set commit to False (either as CLI argument, either as state parameter). However,
this is recommended to be used only in exceptional cases when there are applied few consecutive states and/or
configuration changes. Otherwise the user might forget that the config DB is locked and the candidate config
buffer is not cleared/merged in the running config.

To replace the config, set replace to True. This option is recommended to be used with caution!
**template_name**  Identifies path to the template source. The template can be either stored on the local machine, either remotely. The recommended location is under the file_roots as specified in the master config file. For example, let’s suppose the file_roots is configured as:

```yaml
file_roots:
  base:
    - /etc/salt/states
```

Placing the template under `/etc/salt/states/templates/example.jinja`, it can be used as salt://templates/example.jinja. Alternatively, for local files, the user can specify the absolute path. If remotely, the source can be retrieved via http, https or ftp.

Examples:
- `salt://my_template.jinja`
- `/absolute/path/to/my_template.jinja`
- `http://example.com/template.cheetah`
- `https://example.com/template.mako`
- `ftp://example.com/template.py`

Changed in version 2019.2.0: This argument can now support a list of templates to be rendered. The resulting configuration text is loaded at once, as a single configuration chunk.

**template_source**: None  Inline config template to be rendered and loaded on the device.
**template_hash**: None  Hash of the template file. Format: `{hash_type: 'md5', 'hsum': <md5sum>}`
**template_hash_name**: None  When template_hash refers to a remote file, this specifies the filename to look for in that file.
**saltenv**: base  Specifies the template environment. This will influence the relative imports inside the templates.
**template_engine**: jinja  The following templates engines are supported:
  - cheetah
  - genshi
  - jinja
  - mako
  - py
  - wempy

**skip_verify**: False  If True, hash verification of remote file sources (http://, https://, ftp://) will be skipped, and the source_hash argument will be ignored.

Changed in version 2017.7.1.

**test**: False  Dry run? If set to True, will apply the config, discard and return the changes. Default: False (will commit the changes on the device).
**commit**: True  Commit? Default: True.
**debug**: False  Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw result after the template was rendered.

---

**Note**: This argument cannot be used directly on the command line. Instead, it can be passed through the pillar variable when executing either of the state.sls or state.apply (see below for an example).

**commit_in**: None  Commit the changes in a specific number of minutes / hours. Example of accepted formats:
- `5` (commit in 5 minutes), `2m` (commit in 2 minutes), `1h` (commit the changes in 1 hour), `5h30m` (commit the changes in 5 hours and 30 minutes).

**Note**: This feature works on any platforms, as it does not rely on the native features of the network operating system.
Note: After the command is executed and the `diff` is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the `net.cancel_commit` execution function, using the commit ID returned by this function.

**Warning:** Using this feature, Salt will load the exact configuration you expect, however the `diff` may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

**commit_at:** `None` Commit the changes at a specific time. Example of accepted formats: `1am` (will commit the changes at the next 1AM), `13:20` (will commit at 13:20), `1:20am`, etc.

Note: This feature works on any platforms, as it does not rely on the native features of the network operating system.

Note: After the command is executed and the `diff` is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the `net.cancel_commit` execution function, using the commit ID returned by this function.

**Warning:** Using this feature, Salt will load the exact configuration you expect, however the `diff` may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

**revert_in:** `None` Commit and revert the changes in a specific number of minutes / hours. Example of accepted formats: `5` (revert in 5 minutes), `2m` (revert in 2 minutes), `1h` (revert the changes in 1 hour), `5h30m` (revert the changes in 5 hours and 30 minutes).

Note: To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

**Warning:** This works on any platform, regardless if they have or don’t have native capabilities to confirming a commit. However, please be very cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don’t have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.
revert_at: None Commit and revert the changes at a specific time. Example of accepted formats: 1am (will commit and revert the changes at the next 1AM), 13:20 (will commit and revert at 13:20), 1:20am, etc.

Note: To confirm the commit, and prevent reverting the changes, you will have to execute the net.confirm_commit function, using the commit ID returned by this function.

Warning: This works on any platform, regardless if they have or don’t have native capabilities to confirming a commit. However, please be very cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don’t have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.
replace: False Load and replace the configuration. Default: False (will apply load merge).
context: None Overrides default context variables passed to the template.

New in version 2019.2.0.
defaults: None Default variables/context passed to the template.
template_vars Dictionary with the arguments/context to be used when the template is rendered. Do not explicitly specify this argument. This represents any other variable that will be sent to the template rendering system. Please see an example below! In both ntp_peers_example_using_pillar and ntp_peers_example, peers is sent as template variable.

Note: It is more recommended to use the context argument instead, to avoid any conflicts with other arguments.

SLS Example (e.g.: under salt://router/config.sls):

```
whole_config_example:
netconfig.managed:
  - template_name: salt://path/to/complete_config.jinja
  - debug: True
  - replace: True
bgp_config_example:
netconfig.managed:
  - template_name: /absolute/path/to/bgp_neighbors.mako
  - template_engine: mako
prefix_lists_example:
netconfig.managed:
  - template_name: prefix_lists.cheetah
  - debug: True
  - template_engine: cheetah
ntp_peers_example:
netconfig.managed:
  - template_name: http://bit.ly/2gK0j20
```
- `skip_verify`: False
- `debug`: True
- `peers`:
  - 192.168.0.1
  - 192.168.0.1

**ntp_peers_example_using_pillar**:
- `template_name`: http://bit.ly/2gKOj20
- `peers`: `pillar.get('ntp.peers', [])`

*Multi template example:*

**hostname_and_ntp**:
- `netconfig.managed`:
  - `template_name`:
  - `debug`: True
  - `context`:
    - `hostname`: `pillar.get('opts.id')`
    - `servers`:
      - 172.17.17.1
      - 172.17.17.2
    - `peers`:
      - 192.168.0.1
      - 192.168.0.2

*Usage examples:*

```bash
$ sudo salt 'juniper.device' state.sls router.config test=True
$ sudo salt -N all-routers state.sls router.config pillar="{'debug': True}"```

`router.config` depends on the location of the SLS file (see above). Running this command, will be executed all five steps from above. These examples above are not meant to be used in a production environment, their sole purpose is to provide usage examples.

*Output example:*

```bash
$ sudo salt 'juniper.device' state.sls router.config test=True
juniper.device:
----------
ID: ntp_peers_example_using_pillar
Function: netconfig.managed
Result: None
Comment: Testing mode: Configuration discarded.
Started: 12:01:40.744535
Duration: 8755.788 ms
Changes:
----------
diff:
[edit system ntp]
    peer 192.168.0.1 { ... }
+  peer 172.17.17.1;

```

(continues on next page)
Summary for juniper.device
-------------
Succeeded: 1 (unchanged=1, changed=1)
Failed: 0
-------------
Total states run: 1
Total run time: 8.756 s

Raw output example (useful when the output is reused in other states/execution modules):

```
$ sudo salt --out=pprint 'juniper.device' state.sls router.config test=True
debbug=True

{
    'juniper.device': {
        'netconfig_|-ntp_peers_example_using_pillar_|-ntp_peers_example_using_
        -pillar_|-managed': {
            '__id__': 'ntp_peers_example_using_pillar',
            '__run_num__': 0,
            'already_configured': False,
            'changes': {
                'diff': '[edit system ntp] peer 192.168.0.1 { ... }+ peer 172.17.17.1;+ peer 172.17.17.3;
                peer 172.17.17.3;',
                'comment': 'Testing mode: Configuration discarded.',
                'duration': 7400.759,
                'loaded_config': 'system { ntp { peer 172.17.17.1; peer 172.17.17.
                17.17.1; peer 172.17.17.3; } },
                name: 'ntp_peers_example_using_pillar',
                result: None,
                'start_time': '12:09:09.811445'
            }
        }
    }
}
```

**salt.states.netconfig.replace_pattern**

`name`, `pattern`, `repl`, `count=0`, `flags=8`,
`bufsize=1`, `append_if_not_found=False`,
`prepend_if_not_found=False`,
`not_found_content=None`, `search_only=False`,
`show_changes=True`, `backslash_literal=False`,
`source='running', path=None, test=False, replace=True`,
`debug=False, commit=True`

New in version 2019.2.0.

Replace occurrences of a pattern in the configuration source. If `show_changes` is `True`, then a diff of what changed will be returned, otherwise a `True` will be returned when changes are made, and `False` when no changes are made. This is a pure Python implementation that wraps Python’s `sub()`.

- **pattern**: A regular expression, to be matched using Python’s `search()`.
- **repl**: The replacement text.
- **count**: Maximum number of pattern occurrences to be replaced. If `count` is a positive integer `n`, only `n` occurrences will be replaced, otherwise all occurrences will be replaced.
- **flags**: A list of flags defined in the `re` module documentation from the Python standard library. Each list item should be a string that will correlate to the human-friendly flag name. E.g., `['IGNORECASE', 'MULTILINE']`. Optionally, `flags` may be an int, with a value corresponding to the XOR (`|`) of all the desired flags. Defaults to 8 (which supports 'MULTILINE').
- **bufsize**: How much of the configuration to buffer into memory at once. The default value 1
processes one line at a time. The special value `file` may be specified which will read the entire file into memory before processing.

**append_if_not_found**: `False` If set to `True`, and pattern is not found, then the content will be appended to the file.

**prepend_if_not_found**: `False` If set to `True` and pattern is not found, then the content will be prepended to the file.

**not_found_content** Content to use for append/prepend if not found. If None (default), uses `repl`. Useful when `repl` uses references to group in pattern.

**search_only**: `False` If set to true, this no changes will be performed on the file, and this function will simply return `True` if the pattern was matched, and `False` if not.

**show_changes**: `True` If `True`, return a diff of changes made. Otherwise, return `True` if changes were made, and `False` if not.

**backslash_literal**: `False` Interpret backslashes as literal backslashes for the repl and not escape characters.

This will help when using append/prepend so that the backslashes are not interpreted for the repl on the second run of the state.

**source**: `running` The configuration source. Choose from: `running`, `candidate`, or `startup`. Default: `running`.

**path** Save the temporary configuration to a specific path, then read from there.

**test**: `False` Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit**: `True` Commit the configuration changes? Default: `True`.

**debug**: `False` Debug mode. Will insert a new key in the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

**replace**: `True` Load and replace the configuration. Default: `True`.

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

State SLS Example:

```python
update_policy_name:
  netconfig.replace_pattern:
    - pattern: OLD-POLICY-NAME
    - repl: new-policy-name
    - debug: true
```

New in version 2019.2.0.

Save the configuration to a file on the local file system.

**name** Absolute path to file where to save the configuration. To push the files to the Master, use `cp.push` Execution function.

**user** The user to own the file, this defaults to the user salt is running as on the minion

**group** The group ownership set for the file, this defaults to the group salt is running as on the minion. On Windows, this is ignored

**mode** The permissions to set on this file, e.g. 644, 0775, or 4664. The default mode for new files and directories corresponds to the umask of the salt process. The mode of existing files and directories will only be changed if `mode` is specified.
Note: This option is not supported on Windows.

**attrs** The attributes to have on this file, e.g. `a`, `i`. The attributes can be any or a combination of the following characters: `aAcCdDeijPsStTu`.

Note: This option is not supported on Windows.

**makedirs** (Default: `false`) If set to `true`, then the parent directories will be created to facilitate the creation of the named file. If `false`, and the parent directory of the destination file doesn’t exist, the state will fail.

**dir_mode** If directories are to be created, passing this option specifies the permissions for those directories. If this is not set, directories will be assigned permissions by adding the execute bit to the mode of the files.

The default mode for new files and directories corresponds to the umask of the salt process. For existing files and directories it’s not enforced.

**replace** (Default: `true`) If set to `false` and the file already exists, the file will not be modified even if changes would otherwise be made. Permissions and ownership will still be enforced, however.

**backup** Overrides the default backup mode for this specific file. See backup mode documentation for more details.

**show_changes** (Default: `true`) Output a unified diff of the old file and the new file. If `false` return a boolean if any changes were made.

**create** (Default: `true`) If set to `false`, then the file will only be managed if the file already exists on the system.

**encoding** If specified, then the specified encoding will be used. Otherwise, the file will be encoded using the system locale (usually UTF-8). See https://docs.python.org/3/library/codecs.html#standard-encodings for the list of available encodings.

**encoding_errors** : `'strict'` Error encoding scheme. Default is `'strict'`. See https://docs.python.org/2/library/codecs.html#codec-base-classes for the list of available schemes.

**allow_empty** (Default: `true`) If set to `false`, then the state will fail if the contents specified by `contents_pillar` or `contents_grains` are empty.

**follow_symlinks** (Default: `true`) If the desired path is a symlink follow it and make changes to the file to which the symlink points.

**check_cmd** The specified command will be run with an appended argument of a temporary file containing the new managed contents. If the command exits with a zero status the new managed contents will be written to the managed destination. If the command exits with a nonzero exit code, the state will fail and no changes will be made to the file.

**tmp_dir** Directory for temp file created by `check_cmd`. Useful for checkers dependent on config file location (e.g. daemons restricted to their own config directories by an apparmor profile).

**tmp_ext** Suffix for temp file created by `check_cmd`. Useful for checkers dependent on config file extension (e.g. the init-checkconf upstart config checker).

**win_owner** : `None` The owner of the directory. If this is not passed, user will be used. If user is not passed, the account under which Salt is running will be used.

**win_perms** : `None` A dictionary containing permissions to grant and their propagation. For example:

```python
{'Administrators': {'perms': 'full_control'}}
```

Can be a single basic perm or a list of advanced perms. `perms` must be specified. `applies_to` does not apply to file objects.

**win_denial_perms** : `None` A dictionary containing permissions to deny and their propagation. For example:

```python
{'Administrators': {'perms': 'full_control'}}
```

Can be a single basic perm or a list of advanced perms. `perms` must be specified. `applies_to` does not apply to file objects.

**win_inherit** : `true` True to inherit permissions from the parent directory, False not to inherit permission.

**win_perms_reset** : `false` If `true` the existing DACL will be cleared and replaced with the settings defined in this function. If `false`, new entries will be appended to the existing DACL. Default is `false`.

State SLS Example:
The state SLS above would create a backup config grouping the files by the Minion ID, in chronological files. For example, if the state is executed at on the 3rd of August 2018, at 5:15PM, on the Minion core1.lon01, the configuration would saved in the file: 

```
/var/backups/core01.lon01/1533316558.cfg
```

### 21.19.181 salt.states.netntp

**Network NTP**

Manage the configuration of NTP peers and servers on the network devices through the NAPALM proxy.

- **codeauthor** Mircea Ulinic & Jerome Fleury

- **maturity** new

- **depends** napalm

- **platform** unix

#### Dependencies

- Requires netaddr to be installed: `pip install netaddr` to check if IP Addresses are correctly specified

- Requires dnspython to be installed: `pip install dnspython` to resolve the nameserver entities (in case the user does not configure the peers/servers using their IP addresses)

- NAPALM proxy minion

- NTP operational and configuration management module

salt.states.netntp.managed(name, peers=None, servers=None)

Manages the configuration of NTP peers and servers on the device, as specified in the state SLS file. NTP entities not specified in these lists will be removed whilst entities not configured on the device will be set.

SLS Example:

```
netntp_example:
    netntp.managed:
        - peers:
            - 192.168.0.1
            - 172.17.17.1
        - servers:
            - 24.124.0.251
            - 138.236.128.36
```

Output example:

```
{
    'edge01.nrt04': {
        'netntp_|-netntp_example_|-netntp_example_|-managed': {
            'comment': 'NTP servers already configured as needed.',
            'name': 'netntp_example',
            'start_time': '12:45:24.056659',
```
'duration': 2938.857,
'changes': {
  'peers': {
    'removed': [
      '192.168.0.2',
      '192.168.0.3'
    ],
    'added': [
      '192.168.0.1',
      '172.17.17.1'
    ]
  }
},
'result': None
}

21.19.182 salt.states.netsnmp

Network SNMP

Manage the SNMP configuration on network devices.

   codeauthor  Mircea Ulinic <ping@mirceaulinic.net>
   maturity    new
   depends     napalm
   platform    unix

Dependencies

   • napalm snmp management module (salt.modules.napalm_snmp)

salt.states.netsnmp.managed(name, config=None, defaults=None)
Con figura the SNMP on the devi ce as specifi ed in the SLS fl ie.

SLS Example:

```
snmp_example:
  netsnmp.managed:
    - config:
      location: Honolulu, HI, US
    - defaults:
      contact: noc@cloudflare.com
```

Output example (for the SLS above, e.g. called snmp.sls under /router/):

```
$ sudo salt edge01.hnl01 state.sls router.snmp test=True
edge01.hnl01:----------
    ID: snmp_example
    Function: snmp.managed
```
21.19.183 salt.states.netusers

Network Users

Manage the users configuration on network devices via the NAPALM proxy.

  codeauthor Mircea Ulinic <ping@mirceaulinic.net>
  maturity new
  depends napalm
  platform unix

Dependencies

  • NAPALM proxy minion
  • Users configuration management module

New in version 2016.11.0.

salt.states.netusers.managed(name, users=None, defaults=None)

Manages the configuration of the users on the device, as specified in the state SLS file. Users not defined in that file will be remove whilst users not configured on the device, will be added.

SLS Example:

```yaml
netusers_example:
  netusers.managed:
    - users:
      admin:
        level: 15
```

(continues on next page)
CLI Example:
```
salt 'edge01.kix01' state.sls router.users
```
Output example (raw python - can be reused in other modules):
```
{
  'netusers_|-netusers_example_|-netusers_example_|-managed': {
    'comment': 'Configuration updated!',
    'name': 'netusers_example',
    'start_time': '10:57:08.678811',
    '__id__': 'netusers_example',
    'duration': 1620.982,
    '__run_num__': 0,
    'changes': {
      'updated': {
        'admin': {
          'level': 15
        },
        'restricted': {
          'level': 1
        }
      }
    }
  }
}
```
},

Summary for edge01.kix01
------------
Succeeded: 1 (changed=1)
Failed: 0
------------
Total states run: 1
Total run time: 1.220 s
21.19.184  salt.states.network

Configuration of network interfaces

The network module is used to create and manage network settings, interfaces can be set as either managed or ignored. By default all interfaces are ignored unless specified.

Note:  RedHat-based systems (RHEL, CentOS, Scientific, etc.) have been supported since version 2014.1.0.

Debian-based systems (Debian, Ubuntu, etc.) have been supported since version 2017.7.0. The following options are not supported: ipaddr_start, and ipaddr_end.

Other platforms are not yet supported.

Note:  On Debian-based systems, networking configuration can be specified in /etc/network/interfaces or via included files such as (by default) /etc/network/interfaces.d/*. This can be problematic for configuration management. It is recommended to use either file.managed or network.managed.

If using network.managed, it can be useful to ensure interfaces.d/ is empty. This can be done using:

```
/etc/network/interfaces.d:

  file.directory:
    • clean: True
```

```
system:

  network.system:
    - enabled: True
    - hostname: server1.example.com
    - gateway: 192.168.0.1
    - gatewaydev: eth0
    - nozeroconf: True
    - nisdomain: example.com
    - require_reboot: True

eth0:
  network.managed:
    - enabled: True
    - type: eth
    - proto: static
    - ipaddr: 10.1.0.7
    - netmask: 255.255.255.0
    - gateway: 10.1.0.1
    - enable_ipv6: true
    - ipv6proto: static
    - ipv6ipaddrs:
      - 2001:db8:dead:beef::3/64
      - 2001:db8:dead:beef::7/64
    - ipv6gateway: 2001:db8:dead:beef::1
    - ipv6netmask: 64
    - dns:
      - 8.8.8.8
      - 8.8.4.4

eth0-range0:
```

(continues on next page)
network.managed:
  - type: eth
  - ipaddr_start: 192.168.1.1
  - ipaddr_end: 192.168.1.10
  - clonenum_start: 10

# IPv4
- **proto**: static
- **ipaddr**: 192.168.4.9
- **netmask**: 255.255.255.0
- **gateway**: 192.168.4.1
- **enable_ipv6**: True

# Ipv6
- **ipv6proto**: static
- **ipv6ipaddr**: 2001:db8:dead:c0::3
- **ipv6netmask**: 64
- **ipv6gateway**: 2001:db8:dead:c0::1

# override shared; makes those options v4-only
- **ipv6ttl**: 15

# Shared
- **mtu**: 1480
- **ttl**: 18
- **dns**: 8.8.8.8, 8.8.4.4

**eth7**:
- **type**: eth
- **proto**: static
- **ipaddr**: 10.1.0.7
- **netmask**: 255.255.255.0
- **gateway**: 10.1.0.1
- **enable_ipv6**: True
- **ipv6proto**: static
- **ipv6ipaddr**: 2001:db8:dead:beef::3
- **ipv6netmask**: 64
- **ipv6gateway**: 2001:db8:dead:beef::1
- **noifupdown**: True

**eth8**:
- **network.managed**:
  - **enabled**: True
  - **type**: eth
  - **proto**: static
  - **enable_ipv6**: true
  - **ipv6proto**: static
  - **ipv6ipaddrs**:
    - 2001:db8:dead:beef::3/64
    - 2001:db8:dead:beef::7/64
  - **ipv6gateway**: 2001:db8:dead:beef::1
  - **ipv6netmask**: 64
  - **dns**: 8.8.8.8, 8.8.4.4

**system**:
- **network.system**:
  - **enabled**: True
  - **hostname**: server1.example.com
  - **gateway**: 192.168.0.1
  - **gatewaydev**: eth0
- `nozeroconf`: True
- `nisdomain`: example.com
- `require_reboot`: True
- `apply_hostname`: True

**lo:**
```
network.managed:
- name: lo
- type: eth
- proto: loopback
- onboot: yes
- userctl: no
- ipv6_autoconf: no
- enable_ipv6: true
```

.. note::
   Apply changes to hostname immediately.

.. versionadded:: 2015.5.0

**system:**
```
network.system:
- hostname: server2.example.com
- apply_hostname: True
- retain_settings: True
```

.. note::
   Use `retain_settings` to retain current network settings that are not
   otherwise specified in the state. Particularly useful if only setting
   the hostname. Default behavior is to delete unspecified network
   settings.

.. versionadded:: 2016.11.0

**Note:** When managing bridged interfaces on a Debian or Ubuntu based system, the ports argument is required. Red Hat systems will ignore the argument.

salt.states.network.managed(name, type, enabled=True, **kwargs)

Ensure that the named interface is configured properly.

- **name**: The name of the interface to manage
- **type**: Type of interface and configuration.
- **enabled**: Designates the state of this interface.
- **kwargs**: The IP parameters for this interface.

salt.states.network.routes(name, **kwargs)

Manage network interface static routes.

- **name**: Interface name to apply the route to.
- **kwargs**: Named routes

salt.states.network.system(name, **kwargs)

Ensure that global network settings are configured properly.

- **name**: Custom name to represent this configuration change.
- **kwargs**: The global parameters for the system.
21.19.185 salt.states.net_napalm_yang

NAPALM YANG state

Manage the configuration of network devices according to the YANG models (OpenConfig/IETF).
New in version 2017.7.0.

Dependencies

- napalm-yang
- pyangbing > 0.5.11

To be able to load configuration on network devices, it requires NAPALM library to be installed: `pip install napalm`. Please check Installation for complete details.

`salt.states.net_napalm_yang.configured(name, data, **kwargs)`

Configure the network device, given the input data structured according to the YANG models.

**Note:** The main difference between this function and managed is that the later generates and loads the configuration only when there are differences between the existing configuration on the device and the expected configuration. Depending on the platform and hardware capabilities, one could be more optimal than the other. Additionally, the output of the managed is different, in such a way that the pchange field in the output contains structured data, rather than text.

- `data` YANG structured data.
- `models` A list of models to be used when generating the config.
- `profiles`: `None` Use certain profiles to generate the config. If not specified, will use the platform default profile(s).
- `test`: `False` Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.
- `debug`: `False` Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw configuration loaded on the device.
- `replace`: `False` Should replace the config with the new generate one?

State SLS example:

```yaml
{% set expected_config = pillar.get('openconfig_interfaces_cfg') -%}

interfaces_config:
  napalm_yang.configured:
    - data: {{ expected_config | json }}
    - models:
        - models.openconfig_interfaces
    - debug: true
```

Pillar example:

```yaml
openconfig_interfaces_cfg:
  _kwARGS:
    filter: true
  interfaces:
    interface:
      Et1:
```

(continues on next page)
salt.states.net_napalm.yang.managed(name, data, **kwargs)
Manage the device configuration given the input data structured according to the YANG models.

data: YANG structured data.
models: A list of models to be used when generating the config.
profiles: None Use certain profiles to generate the config. If not specified, will use the platform default profile(s).
compliance_report: False Return the compliance report in the comment.

New in version 2017.7.3.
test: False Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.
debug: False Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw configuration loaded on the device.
replace: False Should replace the config with the new generate one?

State SLS example:

```python
{% set expected_config = pillar.get('openconfig_interfaces_cfg') %}

interfaces_config:
  napalm_yang.managed:
    - data: {{ expected_config | json }}
    - models:
      - models.openconfig_interfaces
    - debug: true
```

Pillar example:

```python
openconfig_interfaces_cfg:
  _kwargs:
    filter: true
  interfaces:
    interface:
      Et1:
        config:
          mtu: 9000
      Et2:
        config:
          description: "description example"
```

21.19.186 salt.states.neutron_network

Management of OpenStack Neutron Networks

New in version 2018.3.0.
depends: shade
configuration: see salt.modules.neutronng for setup instructions
Example States

```
create network:
  neutron_network.present:
    - name: network1

delete network:
  neutron_network.absent:
    - name: network1

create network with optional params:
  neutron_network.present:
    - name: network1
    - vlan: 200
    - shared: False
    - external: False
    - project: project1
```

`salt.states.neutron_network.absent(name, auth=None, **kwargs)`
Ensure a network does not exist
- name Name of the network

`salt.states.neutron_network.present(name, auth=None, **kwargs)`
Ensure a network exists and is up-to-date
- name Name of the network
- provider A dict of network provider options.
- shared Set the network as shared.
- external Whether this network is externally accessible.
- admin_state_up Set the network administrative state to up.
- vlan Vlan ID. Alias for provider
  - physical_network: provider
  - network_type: vlan
  - segmentation_id: (vlan id)

21.19.187 salt.states.neutron_secgroup

Management of OpenStack Neutron Security Groups

New in version 2018.3.0.

- depends shade
- configuration see `salt.modules.neutronng` for setup instructions

Example States

```
create security group;
  neutron_secgroup.present:
    - name: security_group1
    - description: "Very Secure Security Group"

delete security group:
  neutron_secgroup.absent:
    - name_or_id: security_group1
    - project_name: Project1

create security group with optional params:
```
neutron_secgroup.present:
  - name: security_group1
  - description: "Very Secure Security Group"
  - project_id: 1dcac318a83b4610b7a7f7ba01465548

create security group with optional params:
neutron_secgroup.present:
  - name: security_group1
  - description: "Very Secure Security Group"
  - project_name: Project1

salt.states.neutron_secgroup.absent(name, auth=None, **kwargs)
Ensure a security group does not exist
name Name of the security group

salt.states.neutron_secgroup.present(name, auth=None, **kwargs)
Ensure a security group exists.
You can supply either project_name or project_id.
Creating a default security group will not show up as a change; it gets created through the lookup process.
name Name of the security group
description Description of the security group
project_name Name of Project
project_id ID of Project

21.19.188 salt.states.neutron_secgroup_rule

Management of OpenStack Neutron Security Group Rules

New in version 2018.3.0.

depends shade

collection see salt.modules.neutronng for setup instructions

Example States

create security group rule:
neutron_secgroup_rule.present:
  - name: security_group1
  - project_name: Project1
  - protocol: icmp

delete security group:
neutron_secgroup_rule.absent:
  - name_or_id: security_group1

create security group with optional params:
neutron_secgroup_rule.present:
  - name: security_group1
  - description: "Very Secure Security Group"
  - project_id: 1dcac318a83b4610b7a7f7ba01465548

salt.states.neutron_secgroup_rule.absent(name, auth=None, **kwargs)
Ensure a security group rule does not exist
name name or id of the security group rule to delete
rule_id  uuid of the rule to delete
project_id  id of project to delete rule from

salt.states.neutron_secgroup_rule.present(name, auth=None, **kwargs)
Ensure a security group rule exists
  defaults: port_range_min=None, port_range_max=None, protocol=None, remote_ip_prefix=None, remote_group_id=None, direction='ingress', ethertype='IPv4', project_id=None
name  Name of the security group to associate with this rule
project_name  Name of the project associated with the security group
protocol  The protocol that is matched by the security group rule. Valid values are None, tcp, udp, and icmp.

21.19.189 salt.states.neutron_subnet

Management of OpenStack Neutron Subnets

New in version 2018.3.0.

depends  shade

configuration  see salt.modules.neutronng for setup instructions

Example States

create subnet:
  neutron_subnet.present:
  - name: subnet1
  - network_name_or_id: network1
  - cidr: 192.168.199.0/24

delete subnet:
  neutron_subnet.absent:
  - name: subnet2

create subnet with optional params:
  neutron_subnet.present:
  - name: subnet1
  - network_name_or_id: network1
  - enable_dhcp: True
  - cidr: 192.168.199.0/24
  - allocation_pools:
  - start: 192.168.199.5
  - end: 192.168.199.250
  - host_routes:
  - destination: 192.168..0.0/24
  - nexthop: 192.168.0.1
  - gateway_ip: 192.168.199.1
  - dns_nameservers:
  - 8.8.8.8
  - 8.8.8.7

create ipv6 subnet:
  neutron_subnet.present:
  - name: v6subnet1
  - network_name_or_id: network1
  - ip_version: 6
salt.states.neutron_subnet.absent(name, auth=None)
   Ensure a subnet does not exists
   name Name of the subnet

salt.states.neutron_subnet.present(name, auth=None, **kwargs)
   Ensure a subnet exists and is up-to-date
   name Name of the subnet
   network_name_or_id The unique name or ID of the attached network. If a non-unique name is supplied, an exception is raised.
   allocation_pools A list of dictionaries of the start and end addresses for the allocation pools
   gateway_ip The gateway IP address.
   dns_nameservers A list of DNS name servers for the subnet.
   host_routes A list of host route dictionaries for the subnet.
   ipv6_ra_mode IPv6 Router Advertisement mode. Valid values are: 'dhcpv6-stateful', 'dhcpv6-stateless', or 'slaac'.
   ipv6_address_mode IPv6 address mode. Valid values are: 'dhcpv6-stateful', 'dhcpv6-stateless', or 'slaac'.

21.19.190 salt.states.nfs_export

Management of NFS exports

New in version 2018.3.0.

To ensure an NFS export exists:

```
add_simple_export:
   nfs_export.present:
       - name: '/srv/nfs'
       - hosts: '10.0.2.0/24'
       - options:
           - 'rw'
```

This creates the following in /etc/exports:

```
/srv/nfs 10.0.2.0/24(rw)
```

For more complex exports with multiple groups of hosts, use 'clients':

```
add_complex_export:
   nfs_export.present:
       - name: '/srv/nfs'
       - clients:
           # First export, same as simple one above
           - hosts: '10.0.2.0/24'
           options:
               - 'rw'
           # Second export
           - hosts: '*.example.com'
           options:
               - 'ro'
               - 'subtree_check'
```

This creates the following in /etc/exports:

```
/srv/nfs 10.0.2.0/24(rw) 192.168.0.0/24,172.19.0.0/16(ro,subtree_check)
```
Any export of the given path will be modified to match the one specified.

To ensure an NFS export is absent:

```yaml
delete_export:
  nfs_export.absent:
    - name: '/srv/nfs'
```

```yaml
salt.states.nfs_export.absent(name, exports='/etc/exports')

Ensure that the named path is not exported
name The export path to remove
```

```yaml
salt.states.nfs_export.present(name, clients=client, hosts=hosts, options=options, exports='/etc/exports')

Ensure that the named export is present with the given options
name The export path to configure
clients A list of hosts and the options applied to them. This option may not be used in combination with the
hosts or 'options' shortcuts.
```

```yaml
- clients:
  
  # First export
  - hosts: '10.0.2.0/24'
    options:
      - 'rw'
  
  # Second export
  - hosts: '*.example.com'
    options:
      - 'ro'
      - 'subtree_check'
```

hosts A string matching a number of hosts, for example:

```yaml
hosts: '10.0.2.123'
hosts: '10.0.2.0/24'
hosts: 'minion1.example.com'
hosts: '*.example.com'
hosts: '*'
```

options A list of NFS options, for example:

```yaml
options:
  - 'rw'
  - 'subtree_check'
```

### 21.19.191 salt.states.nftables

Management of nftables

This is an nftables-specific module designed to manage Linux firewalls. It is expected that this state module, and other system-specific firewall states, may at some point be deprecated in favor of a more generic firewall state.
httpd:
    nftables.append:
        - table: filter
        - chain: input
        - jump: accept
        - match: state
        - connstate: new
        - dport: 80
        - proto: tcp
        - sport: 1025:65535
        - save: True

httpd:
    nftables.append:
        - table: filter
        - family: ipv6
        - chain: INPUT
        - jump: ACCEPT
        - match: state
        - connstate: NEW
        - dport: 80
        - proto: tcp
        - sport: 1025:65535
        - save: True

httpd:
    nftables.insert:
        - position: 1
        - table: filter
        - chain: INPUT
        - jump: ACCEPT
        - match: state
        - connstate: NEW
        - dport: 80
        - proto: tcp
        - sport: 1025:65535
        - save: True

httpd:
    nftables.insert:
        - position: 1
        - table: filter
        - family: ipv6
        - chain: INPUT
        - jump: ACCEPT
        - match: state
        - connstate: NEW
        - dport: 80
        - proto: tcp
        - sport: 1025:65535
        - save: True

httpd:
    nftables.delete:
        - table: filter
        - chain: INPUT
        - jump: ACCEPT
- match: state
- connstate: NEW
- dport: 80
- proto: tcp
- sport: 1025:65535
- save: True

httpd:
  nftables.delete:
  - position: 1
  - table: filter
  - chain: INPUT
  - jump: ACCEPT
  - match: state
  - connstate: NEW
  - dport: 80
  - proto: tcp
  - sport: 1025:65535
  - save: True

httpd:
  nftables.delete:
  - table: filter
  - family: ipv6
  - chain: INPUT
  - jump: ACCEPT
  - match: state
  - connstate: NEW
  - dport: 80
  - proto: tcp
  - sport: 1025:65535
  - save: True

output:
  nftables.chain_present:
  - family: ip
  - table: filter

output:
  nftables.chain_absent:
  - family: ip
  - table: filter

salt.states.nftables.append(name, family='ipv4', **kwargs)

New in version 0.17.0.

Append a rule to a chain
name A user-defined name to call this rule by in another part of a state or formula. This should not be an
actual rule.
family Network family, ipv4 or ipv6.
All other arguments are passed in with the same name as the long option that would normally be used for
nftables, with one exception: –state is specified as connstate instead of state (not to be confused with ctstate).

salt.states.nftables.chain_absent(name, table='filter', family='ipv4')

New in version 2014.7.0.

Verify the chain is absent.
family Networking family, either ipv4 or ipv6
salt.states.nftables.chain_present(name, table='filter', table_type=None, hook=None, priority=None, family='ipv4')

New in version 2014.7.0.

Verify the chain is exist.

name  A user-defined chain name.

family  Networking family, either ipv4 or ipv6

salt.states.nftables.delete(name, family='ipv4', **kwargs)

New in version 2014.7.0.

Delete a rule to a chain

name  A user-defined name to call this rule by in another part of a state or formula. This should not be an

actual rule.

family  Networking family, either ipv4 or ipv6

All other arguments are passed in with the same name as the long option that would normally be used for
nftables, with one exception: –state is specified as connstate instead of state (not to be confused with ctstate).

salt.states.nftables.flush(name, family='ipv4', **kwargs)

New in version 2014.7.0.

Flush current nftables state

family  Networking family, either ipv4 or ipv6

salt.states.nftables.insert(name, family='ipv4', **kwargs)

New in version 2014.7.0.

Insert a rule into a chain

name  A user-defined name to call this rule by in another part of a state or formula. This should not be an

actual rule.

family  Networking family, either ipv4 or ipv6

All other arguments are passed in with the same name as the long option that would normally be used for
nftables, with one exception: –state is specified as connstate instead of state (not to be confused with ctstate).

21.19.192  salt.states.npm

Installation of NPM Packages

These states manage the installed packages for node.js using the Node Package Manager (npm). Note that npm must
be installed for these states to be available, so npm states should include a requisite to a pkg.installed state for the
package which provides npm (simply npm in most cases). Example:

```
-npm:
  pkg.installed

-yaml:
  npm.installed:
    - require:
      - pkg: npm
```

salt.states.npm.bootstrap(name, user=None, silent=True)

Bootstraps a node.js application.

Will execute ‘npm install –json’ on the specified directory.

user  The user to run NPM with

New in version 0.17.0.
salt.states.npm.cache_cleaned(name=None, user=None, force=False)

Ensure that the given package is not cached.

If no package is specified, this ensures the entire cache is cleared.

name The name of the package to remove from the cache, or None for all packages
user The user to run NPM with
force Force cleaning of cache. Required for npm@5 and greater

New in version 2016.11.6.

salt.states.npm.installed(name, pkgs=None, dir=None, user=None, force_reinstall=False, registry=None, env=None)

Verify that the given package is installed and is at the correct version (if specified).

```yaml
coffee-script:
  npm.installed:
    - user: someuser

coffee-script@1.0.1:
  npm.installed: []
```

name The package to install

Changed in version 2014.7.2: This parameter is no longer lowercased by salt so that case-sensitive NPM package names will work.

pkgs A list of packages to install with a single npm invocation; specifying this argument will ignore the name argument

New in version 2014.7.0.

dir The target directory in which to install the package, or None for global installation
user The user to run NPM with

New in version 0.17.0.

registry The NPM registry from which to install the package

New in version 2014.7.0.

env A list of environment variables to be set prior to execution. The format is the same as the cmd.run state function.

New in version 2014.7.0.

force_reinstall Install the package even if it is already installed

salt.states.npm.removed(name, dir=None, user=None)

Verify that the given package is not installed.

dir The target directory in which to install the package, or None for global installation
user The user to run NPM with

New in version 0.17.0.

21.19.193 salt.states.ntp

Management of NTP servers

New in version 2014.1.0.

This state is used to manage NTP servers. Currently only Windows is supported.
win_ntp:
  ntp.managed:
    - servers:
      - pool.ntp.org
      - us.pool.ntp.org

```
salt.states.ntp.managed(name, servers=None)

Manage NTP servers

servers A list of NTP servers
```

## 21.19.194 `salt.states.nxos` module

State module for Cisco NX OS Switches Proxy minions

For documentation on setting up the nxos proxy minion look in the documentation for `salt.proxy.nxos`.

```
salt.states.nxos.configAbsent(name)

Ensure a specific configuration line does not exist in the running config

name config line to remove

Examples:

add snmp group:
  nxos.configAbsent:
    - names:
      - snmp-server community randoSNMPstringHERE group network-operator
      - snmp-server community AnotherRandomSNMPString group network-admin

Note: For certain cases extra lines could be removed based on dependencies. In this example, included after the example for config_present, the ACLs would be removed because they depend on the existence of the group.

salt.states.nxos.configPresent(name)

Ensure a specific configuration line exists in the running config

name config line to set

Examples:

add snmp group:
  nxos.configPresent:
    - names:
      - snmp-server community randoSNMPstringHERE group network-operator
      - snmp-server community AnotherRandomSNMPString group network-admin

add snmp acl:
  nxos.configPresent:
    - names:
      - snmp-server community randoSNMPstringHERE use-acl snmp-acl-ro
      - snmp-server community AnotherRandomSNMPString use-acl snmp-acl-rw

salt.states.nxos.replace(name, repl, full_match=False)

Replace all instances of a string or full line in the running config

name String to replace

repl The replacement text

full_match Whether name will match the full line or only a subset of the line. Defaults to False. When False, .* is added around name for matching in the show run config.
Examples:

**replace snmp string:**
```
xos.replace:
  - name: randoSNMPstringHERE
  - repl: NEWrandoSNMPstringHERE
```

**replace full snmp string:**
```
xos.replace:
  - name: ^snmp-server community randoSNMPstringHERE group network-operator$
  - repl: snmp-server community NEWrandoSNMPstringHERE group network-operator
  - full_match: True
```

**Note:** The first example will replace the SNMP string on both the group and the ACL, so you will not lose the ACL setting. Because the second is an exact match of the line, when the group is removed, the ACL is removed, but not readded, because it was not matched.

**salt.states.nxos.user_absent**(name)

Ensure a user is not present

- **name** username to remove if it exists

Examples:
```
delete:
  nxos.user_absent:
    - name: daniel
```

**salt.states.nxos.user_present**(name, password=None, roles=None, encrypted=False, crypt_salt=None, algorithm='sha256')

Ensure a user is present with the specified groups

- **name** Name of user
- **password** Encrypted or Plain Text password for user
- **roles** List of roles the user should be assigned. Any roles not in this list will be removed
- **encrypted** Whether the password is encrypted already or not. Defaults to False
- **crypt_salt** Salt to use when encrypting the password. Default is None (salt is randomly generated for unhashed passwords)
- **algorithm** Algorithm to use for hashing password. Defaults to sha256. Accepts md5, blowfish, sha256, sha512

Examples:
```
create:
  nxos.user_present:
    - name: daniel
    - roles:
      - vdc-admin

set_password:
  nxos.user_present:
    - name: daniel
    - password: admin
    - roles:
      - network-admin

update:
  nxos.user_present:
    - name: daniel
    - password: AiN9jaoP
```

(continues on next page)
- **roles:**
  - network-admin
  - vdc-admin

### 21.19.195 salt.states.openstack_config

Manage OpenStack configuration file settings.

**maintainer** Jeffrey C. Ollie <jeff@ocjtech.us>

**maturity** new

**depends**

**platform** linux

**salt.states.openstack_config.absent**(name, filename, section, parameter=None)

Ensure a value is not set in an OpenStack configuration file.

- **filename** The full path to the configuration file
- **section** The section in which the parameter will be set
- **parameter (optional)** The parameter to change. If the parameter is not supplied, the name will be used as the parameter.

**salt.states.openstack_config.present**(name, filename, section, value, parameter=None)

Ensure a value is set in an OpenStack configuration file.

- **filename** The full path to the configuration file
- **section** The section in which the parameter will be set
- **parameter (optional)** The parameter to change. If the parameter is not supplied, the name will be used as the parameter.
- **value** The value to set

### 21.19.196 salt.states.openvswitch_bridge module

Management of Open vSwitch bridges.

**salt.states.openvswitch_bridge.absent**(name)

Ensures that the named bridge does not exist, eventually deletes it.

**Parameters**

- **name** – The name of the bridge.

**salt.states.openvswitch_bridge.present**(name)

Ensures that the named bridge exists, eventually creates it.

**Parameters**

- **name** – The name of the bridge.

### 21.19.197 salt.states.openvswitch_port module

Management of Open vSwitch ports.

**salt.states.openvswitch_port.absent**(name, bridge=None)

Ensures that the named port exists on bridge, eventually deletes it. If bridge is not set, port is removed from whatever bridge contains it.

**Parameters**

- **name** – The name of the port.
- **bridge** – The name of the bridge.
salt.states.openvswitch_port.present(name, bridge, tunnel_type=None, id=None, remote=None, dst_port=None, internal=False)

Ensures that the named port exists on bridge, eventually creates it.

Parameters
- **name** – The name of the port.
- **bridge** – The name of the bridge.
- **tunnel_type** – Optional type of interface to create, currently supports: vlan, vxlan and gre.
- **id** – Optional tunnel’s key.
- **remote** – Remote endpoint’s IP address.
- **dst_port** – Port to use when creating tunnelport in the switch.
- **internal** – Create an internal port if one does not exist

21.19.198 salt.states.opsgenie

Create/Close an alert in OpsGenie

New in version 2018.3.0.

This state is useful for creating or closing alerts in OpsGenie during state runs.

```
used_space:
  disk.status:
    - name: /
    - maximum: 79%
    - minimum: 20%

opsgenie_create_action_sender:
  opsgenie.create_alert:
    - api_key: XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX
    - reason: 'Disk capacity is out of designated range.'
    - name: disk.status
    - onfail:
      - disk: used_space

opsgenie_close_action_sender:
  opsgenie.close_alert:
    - api_key: XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX
    - name: disk.status
    - require:
      - disk: used_space
```

salt.states.opsgenie.close_alert(name=None, api_key=None, reason='Conditions are met.', action_type='Close')

Close an alert in OpsGenie. It’s a wrapper function for create_alert. Example usage with Salt’s requisites and other global state arguments could be found above.

Required Parameters:
- **name** It will be used as alert’s alias. If you want to use the close functionality you must provide name field for both states like in above case.

Optional Parameters:
- **api_key** It’s the API Key you’ve copied while adding integration in OpsGenie.
- **reason** It will be used as alert’s default message in OpsGenie.
- **action_type** OpsGenie supports the default values Create/Close for action_type. You can customize this field with OpsGenie’s custom actions for other purposes like adding notes or acknowledging alerts.
salt.states.opsgenie.create_alert(\(name=None, \ api\_key=None, \ reason=None, \ action\_type='Create')\)

Create an alert in OpsGenie. Example usage with Salt’s requisites and other global state arguments could be found above.

Required Parameters:
api_key It’s the API Key you’ve copied while adding integration in OpsGenie.
reason It will be used as alert’s default message in OpsGenie.

Optional Parameters:
name It will be used as alert’s alias. If you want to use the close functionality you must provide name field for both states like in above case.
action_type OpsGenie supports the default values Create/Close for action_type. You can customize this field with OpsGenie’s custom actions for other purposes like adding notes or acknowledging alerts.

21.19.199 salt.states.pagerduty

Create an Event in PagerDuty

New in version 2014.1.0.

This state is useful for creating events on the PagerDuty service during state runs.

```python
salt.states.pagerduty.create_event(\(name, \ details, \ service\_key, \ profile)\)

Create an event on the PagerDuty service
```

The following parameters are required:
name This is a short description of the event.
details This can be a more detailed description of the event.

```python
salt.states.pagerduty_escalation_policy

Manage PagerDuty escalation policies.

Schedules and users can be referenced by pagerduty ID, or by name, or by email address.

For example:

```python
ensure test escalation policy:
    pagerduty_escalation_policy.present:

(continues on next page)"
salt.states.pagerduty_escalation_policy.absent(profile='pagerduty', subdomain=None, api_key=None, **kwargs)

Ensure that a PagerDuty escalation policy does not exist. Accepts all the arguments that pagerduty_escalation_policy.present accepts; but ignores all arguments except the name.

Name can be the escalation policy id or the escalation policy name.

salt.states.pagerduty_escalation_policy.present(profile='pagerduty', subdomain=None, api_key=None, **kwargs)

Ensure that a pagerduty escalation policy exists. Will create or update as needed.

This method accepts as args everything defined in https://developer.pagerduty.com/documentation/rest/escalation_policies/create. In addition, user and schedule id’s will be translated from name (or email address) into PagerDuty unique ids. For example:

```
pagerduty_escalation_policy.present:
    • name: bruce test escalation policy
    • escalation_rules:
        − targets:
            • type: schedule id: 'bruce test schedule level1'
            • type: user id: 'Bruce Sherrod'
  escalation_delay_in_minutes: 15
```

In this example, ‘Bruce Sherrod’ will be looked up and replaced with the PagerDuty id (usually a 7 digit all-caps string, e.g. PX6GQL7)

21.19.201 salt.states.pagerduty_schedule

Manage PagerDuty schedules.

Example:
ensure test schedule:

```python
pagerduty_schedule.present:
  - name: 'bruce test schedule level1'
  - schedule:
      name: 'bruce test schedule level1'
      time_zone: 'Pacific Time (US & Canada)'
      schedule_layers:
        - name: 'Schedule Layer 1'
          start: '2015-01-01T00:00:00'
          users:
            - user:
                'id': 'Bruce TestUser1'
                member_order: 1
            - user:
                'id': 'Bruce TestUser2'
                member_order: 2
            - user:
                'id': 'bruce+test3@lyft.com'
                member_order: 3
            - user:
                'id': 'bruce+test4@lyft.com'
                member_order: 4
      rotation_virtual_start: '2015-01-01T00:00:00'
      priority: 1
      rotation_turn_length_seconds: 604800
```

salt.states.pagerduty_schedule.absent(profile='pagerduty', subdomain=None, api_key=None, **kwargs)

Ensure that a pagerduty schedule does not exist. Name can be pagerduty schedule id or pagerduty schedule name.

salt.states.pagerduty_schedule.present(profile='pagerduty', subdomain=None, api_key=None, **kwargs)

Ensure that a pagerduty schedule exists. This method accepts as args everything defined in https://developer.pagerduty.com/documentation/rest/schedules/create. This means that most arguments are in a dict called "schedule."

User id’s can be pagerduty id, or name, or email address.

### 21.19.202 salt.states.pagerduty_service

Manage PagerDuty services

Escalation policies can be referenced by pagerduty ID or by namea.

For example:

```python
ensure test service
  pagerduty_service.present:
    - name: 'my service'
    - escalation_policy_id: 'my escalation policy'
    - type: nagios
```

salt.states.pagerduty_service.absent(profile='pagerduty', subdomain=None, api_key=None, **kwargs)

Ensure a pagerduty service does not exist. Name can be the service name or pagerduty service id.

21.19. state modules 3619
salt.states.pagerduty_service.present(profile='pagerduty', subdomain=None, api_key=None, **kwargs)

Ensure pagerduty service exists. This method accepts as arguments everything defined in https://developer.pagerduty.com/documentation/rest/services/create

Note that many arguments are mutually exclusive, depending on the "type" argument.

Examples:

```python
# create a PagerDuty email service at test-email@DOMAIN.pagerduty.com
ensure generic email service exists:
    pagerduty_service.present:
        - name: my email service
        - service:
            description: "email service controlled by salt"
            escalation_policy_id: "my escalation policy"
            type: "generic_email"
            service_key: "test-email"
```

```python
# create a pagerduty service using cloudwatch integration
ensure my cloudwatch service exists:
    pagerduty_service.present:
        - name: my cloudwatch service
        - service:
            escalation_policy_id: "my escalation policy"
            type: aws_cloudwatch
            description: "my cloudwatch service controlled by salt"
```

21.19.203 salt.states.pagerduty_user

Manage PagerDuty users.

Example

```python
ensure bruce test user 1:
    pagerduty.user_present:
        - name: 'Bruce TestUser1'
        - email: bruce+test1@lyft.com
        - requester_id: P1GV5NT
```

salt.states.pagerduty_user.absent(profile='pagerduty', subdomain=None, api_key=None, **kwargs)

Ensure pagerduty user does not exist. Name can be pagerduty id, email address, or user name.

salt.states.pagerduty_user.present(profile='pagerduty', subdomain=None, api_key=None, **kwargs)

21.19.204  salt.states.panos

A state module to manage Palo Alto network devices.

codeauthor  Spencer Ervin <spencer_ervin@hotmail.com>
maturity  new
depends  none
platform  unix

About

This state module was designed to handle connections to a Palo Alto based firewall. This module relies on the Palo Alto proxy module to interface with the devices.

This state module is designed to give extreme flexibility in the control over XPATH values on the PANOS device. It exposes the core XML API commands and allows state modules to chain complex XPATH commands.

Below is an example of how to construct a security rule and move to the top of the policy. This will take a config lock to prevent execution during the operation, then remove the lock. After the XPATH has been deployed, it will commit to the device.

```plaintext
panos/take_lock:
  panos.add_config_lock

panos/service_tcp_22:
  panos.set_config:
    - xpath: /config/devices/entry[@name='localhost.localdomain']/vsys/
      entry[@name='vsys1']/service
    - value: <entry name='tcp-22'><protocol><tcp><port>22</port></tcp></protocol>
  - commit: False

panos/create_rule1:
  panos.set_config:
    - xpath: /config/devices/entry[@name='localhost.localdomain']/vsys/
      entry[@name='vsys1']/rulebase/security/rules
    - value: '
      <entry name="rule1">
        <from><member>trust</member></from>
        <to><member>untrust</member></to>
        <source><member>10.0.0.1</member></source>
        <destination><member>10.0.1.1</member></destination>
        <service><member/tcp-22</member></service>
        <application><member>any</member></application>
        <action>allow</action>
        <disabled>no</disabled>
      </entry>
    - commit: False

panos/move_rule_top:
  panos.move_config:
    - xpath: /config/devices/entry[@name='localhost.localdomain']/vsys/
      entry[@name='vsys1']/rulebase/security/rules/entry[@name='rule1']
    - where: top
    - commit: False

panos/remove_lock:
  panos.remove_config_lock

panos/commit:
  panos.commit
```
Version Specific Configurations

Palo Alto devices running different versions will have different supported features and different command structures. In order to account for this, the proxy module can be leveraged to check if the panos device is at a specific revision level.

The proxy['panos.is_required_version'] method will check if a panos device is currently running a version equal or greater than the passed version. For example, proxy['panos.is_required_version']('7.0.0') would match both 7.1.0 and 8.0.0.

```python
{% if proxy['panos.is_required_version']('8.0.0') %}
panos/deviceconfig/system/motd-and-banner:
  panos.set_config:
    - xpath: /config/devices/entry[@name='localhost.localdomain']/deviceconfig/system/
      motd-and-banner
    - value: |
      <banner-header>BANNER TEXT</banner-header>
      <banner-header-color>color2</banner-header-color>
      <banner-header-text-color>color18</banner-header-text-color>
      <banner-header-footer-match>yes</banner-header-footer-footer-match>
    - commit: False
{% endif %}
```

See also:

**Palo Alto Proxy Module**

salt.states.panos.add_config_lock(name)
Prevent other users from changing configuration until the lock is released.

- name: The name of the module function to execute.

SLS Example:

```yaml
panos/takelock:
  panos.add_config_lock
```

salt.states.panos.address_exists(name, addressname=None, vsys=1, ipnetmask=None, iprange=None, fqdn=None, description=None, commit=False)
Ensures that an address object exists in the configured state. If it does not exist or is not configured with the specified attributes, it will be adjusted to match the specified values.

This module will only process a single address type (ip-netmask, ip-range, or fqdn). It will process the specified value if the following order: ip-netmask, ip-range, fqdn. For proper execution, only specify a single address type.

- name: The name of the module function to execute.
- addressname(str): The name of the address object. The name is case-sensitive and can have up to 31 characters, which can be letters, numbers, spaces, hyphens, and underscores. The name must be unique on a firewall and, on Panorama, unique within its device group and any ancestor or descendant device groups.
- vsys(str): The string representation of the VSYS ID. Defaults to VSYS 1.
- ipnetmask(str): The IPv4 or IPv6 address or IP address range using the format ip_address/mask or ip_address where the mask is the number of significant binary digits used for the network portion of the address. Ideally, for IPv6, you specify only the network portion, not the host portion.
- iprange(str): A range of addresses using the format ip_address–ip_address where both addresses can be IPv4 or both can be IPv6.
fqdn(str): A fully qualified domain name format. The FQDN initially resolves at commit time. Entries are subsequently refreshed when the firewall performs a check every 30 minutes; all changes in the IP address for the entries are picked up at the refresh cycle.

description(str): A description for the policy (up to 255 characters).

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```yaml
panos/address/h-10.10.10.10:
  panos.address_exists:
    - addressname: h-10.10.10.10
    - vsys: 1
    - ipnetmask: 10.10.10.10
    - commit: False

panos/address/10.0.0.1-10.0.0.50:
  panos.address_exists:
    - addressname: r-10.0.0.1-10.0.0.50
    - vsys: 1
    - iprange: 10.0.0.1-10.0.0.50
    - commit: False

panos/address/foo.bar.com:
  panos.address_exists:
    - addressname: foo.bar.com
    - vsys: 1
    - fqdn: foo.bar.com
    - description: My fqdn object
    - commit: False
```

salt.states.panos.address_group_exists(name, groupname=None, vsys=1, members=None, description=None, commit=False)

Ensures that an address group object exists in the configured state. If it does not exist or is not configured with the specified attributes, it will be adjusted to match the specified values.

This module will enforce group membership. If a group exists and contains members this state does not include, those members will be removed and replaced with the specified members in the state.

name: The name of the module function to execute.

groupname(str): The name of the address group object. The name is case-sensitive and can have up to 31 characters, which can be letters, numbers, spaces, hyphens, and underscores. The name must be unique on a firewall and, on Panorama, unique within its device group and any ancestor or descendant device groups.

vsys(str): The string representation of the VSYS ID. Defaults to VSYS 1.

members(str, list): The members of the address group. These must be valid address objects or address groups on the system that already exist prior to the execution of this state.

description(str): A description for the policy (up to 255 characters).

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```yaml
panos/address-group/my-group:
  panos.address_group_exists:
    - groupname: my-group
    - vsys: 1
```
- **members:**
  - my-address-object
  - my-other-address-group
- **description:** A group that needs to exist
- **commit:** False

**salt.states.panos.clone_config**(name, xpath=None, newname=None, commit=False)
Clone a specific XPATH and set it to a new name.

- **name:** The name of the module function to execute.
- **xpath**(str): The XPATH of the configuration API tree to clone.
- **newname**(str): The new name of the XPATH clone.
- **commit**(bool): If true the firewall will commit the changes, if false do not commit changes.

**SLS Example:**

```yaml
panos/clonerule:
  panos.clone_config:
    - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/rulebase/security/rules&from=/config/devices/entry/vsys/entry[@name='vsys1']/rulebase/security/rules/entry[@name='rule1']
    - value: rule2
    - commit: True
```

**salt.states.panos.commit_config**(name)
Commits the candidate configuration to the running configuration.

- **name:** The name of the module function to execute.

**SLS Example:**

```yaml
panos/commit:
  panos.commit_config
```

**salt.states.panos.delete_config**(name, xpath=None, commit=False)
Deletes a Palo Alto XPATH to a specific value.

- **name:** The name of the module function to execute.
- **xpath**(str): The XPATH of the configuration API tree to control.
- **commit**(bool): If true the firewall will commit the changes, if false do not commit changes.

**SLS Example:**

```yaml
panos/deletegroup:
  panos.delete_config:
    - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/address-group/entry[@name='test']
    - commit: True
```

**salt.states.panos.download_software**(name, version=None, synch=False, check=False)
Ensures that a software version is downloaded.

- **name:** The name of the module function to execute.
version(str): The software version to check. If this version is not already downloaded, it will attempt to download the file from Palo Alto.

synch(bool): If true, after downloading the file it will be synched to its peer.

check(bool): If true, the PANOS device will first attempt to pull the most recent software inventory list from Palo Alto.

SLS Example:

```
panos/version8.0.0:
  panos.download_software:
    - version: 8.0.0
    - synch: False
    - check: True
```

```
salt.states.panos.edit_config(name, xpath=None, value=None, commit=False)
```

Edits a Palo Alto XPATH to a specific value. This will always overwrite the existing value, even if it is not changed.

You can replace an existing object hierarchy at a specified location in the configuration with a new value. Use the xpath parameter to specify the location of the object, including the node to be replaced.

This is the recommended state to enforce configurations on a xpath.

name: The name of the module function to execute.

xpath(str): The XPATH of the configuration API tree to control.

value(str): The XML value to edit. This must be a child to the XPATH.

commits(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/addressgroup:
  panos.edit_config:
    - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/address-group/
      →entry[@name='test']
    - value: <static><entry name='test'><member>abc</member><member>xyz</member></entry></static>
    - commit: True
```

```
salt.states.panos.move_config(name, xpath=None, where=None, dst=None, commit=False)
```

Moves a XPATH value to a new location.

Use the xpath parameter to specify the location of the object to be moved, the where parameter to specify type of move, and dst parameter to specify the destination path.

name: The name of the module function to execute.

xpath(str): The XPATH of the configuration API tree to move.

where(str): The type of move to execute. Valid options are after, before, top, bottom. The after and before options will require the dst option to specify the destination of the action. The top action will move the XPATH to the top of its structure. The bottom action will move the XPATH to the bottom of its structure.

dst(str): Optional. Specifies the destination to utilize for a move action. This is ignored for the top or bottom action.

commits(bool): If true the firewall will commit the changes, if false do not commit changes. If the operation is not successful, it will not commit.

SLS Example:
panos/moveruletop:
    panos.move_config:
        - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/rulebase/security/
                      rules/entry[@name='rule1']
        - where: top
        - commit: True

panos/moveruleafter:
    panos.move_config:
        - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/rulebase/security/
                      rules/entry[@name='rule1']
        - where: after
        - dst: rule2
        - commit: True

salt.states.panos.remove_config_lock(name)
    Release config lock previously held.
    name: The name of the module function to execute.

SLS Example:

salt.states.panos.rename_config(name, xpath=None, newname=None, commit=False)
    Rename a Palo Alto XPATH to a specific value. This will always rename the value even if a change is not needed.
    name: The name of the module function to execute.
    xpath(str): The XPATH of the configuration API tree to control.
    newname(str): The new name of the XPATH value.
    commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

salt.states.panos.security_rule_exists(name, rulename=None, vsys='1', action=None, disabled=None, sourcezone=None, destinationzone=None, source=None, destination=None, application=None, service=None, description=None, logsetting=None, logstart=None, logend=None, negatesource=None, negatedestination=None, profilegroup=None, datafilter=None, fileblock=None, spyware=None, urlfilter=None, virus=None, vulnerability=None, wildfire=None, move=None, movetarget=None, commit=False)
    Ensures that a security rule exists on the device. Also, ensure that all configurations are set appropriately.
    This method will create the rule if it does not exist. If the rule does exist, it will ensure that the configurations are set appropriately.
If the rule does not exist and is created, any value that is not provided will be provided as the default. The action, to, from, source, destination, application, and service fields are mandatory and must be provided.

This will enforce the exact match of the rule. For example, if the rule is currently configured with the log-end option, but this option is not specified in the state method, it will be removed and reset to the system default.

It is strongly recommended to specify all options to ensure proper operation.

When defining the profile group settings, the device can only support either a profile group or individual settings. If both are specified, the profile group will be preferred and the individual settings are ignored. If neither are specified, the value will be set to system default of none.

name: The name of the module function to execute.

rulename(str): The name of the security rule. The name is case-sensitive and can have up to 31 characters, which can be letters, numbers, spaces, hyphens, and underscores. The name must be unique on a firewall and, on Panorama, unique within its device group and any ancestor or descendant device groups.

vsys(str): The string representation of the VSYS ID. Defaults to VSYS 1.

action(str): The action that the security rule will enforce. Valid options are: allow, deny, drop, reset-client, reset-server, reset-both.

disabled(bool): Controls if the rule is disabled. Set 'True' to disable and 'False' to enable.

sourcezone(str, list): The source zone(s). The value 'any' will match all zones.

destinationzone(str, list): The destination zone(s). The value 'any' will match all zones.

source(str, list): The source address(es). The value 'any' will match all addresses.

destination(str, list): The destination address(es). The value 'any' will match all addresses.

application(str, list): The application(s) matched. The value 'any' will match all applications.

service(str, list): The service(s) matched. The value 'any' will match all services. The value 'application-default' will match based upon the application defined ports.

description(str): A description for the policy (up to 255 characters).

logsetting(str): The name of a valid log forwarding profile.

logstart(bool): Generates a traffic log entry for the start of a session (disabled by default).

logend(bool): Generates a traffic log entry for the end of a session (enabled by default).

negatesource(bool): Match all but the specified source addresses.

negatedestination(bool): Match all but the specified destination addresses.

profilegroup(str): A valid profile group name.

datafilter(str): A valid data filter profile name. Ignored with the profilegroup option set.

fileblock(str): A valid file blocking profile name. Ignored with the profilegroup option set.

spyware(str): A valid spyware profile name. Ignored with the profilegroup option set.

urlfilter(str): A valid URL filtering profile name. Ignored with the profilegroup option set.

virus(str): A valid virus profile name. Ignored with the profilegroup option set.

deviation(str): A valid vulnerability profile name. Ignored with the profilegroup option set.

wildfire(str): A valid vulnerability profile name. Ignored with the profilegroup option set.
move(str): An optional argument that ensure the rule is moved to a specific location. Valid options are 'top', 'bottom', 'before', or 'after'. The 'before' and 'after' options require the use of the 'movetarget' argument to define the location of the move request.

movetarget(str): An optional argument that defines the target of the move operation if the move argument is set to 'before' or 'after'.

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```python
panos/rulebase/security/rule01:
  panos.security_rule_exists:
    - rulename: rule01
    - vsys: 1
    - action: allow
    - disabled: False
    - sourcezone: untrust
    - destinationzone: trust
    - source:
      - 10.10.10.0/24
      - 1.1.1.1
    - destination:
      - 2.2.2.2-2.2.2.4
    - application:
      - any
    - service:
      - tcp-25
    - description: My test security rule
    - logsetting: logprofile
    - logstart: False
    - logend: True
    - negatesource: False
    - negatedestination: False
    - profilegroup: myprofilegroup
    - move: top
    - commit: False

panos/rulebase/security/rule01:
  panos.security_rule_exists:
    - rulename: rule01
    - vsys: 1
    - action: allow
    - disabled: False
    - sourcezone: untrust
    - destinationzone: trust
    - source:
      - 10.10.10.0/24
      - 1.1.1.1
    - destination:
      - 2.2.2.2-2.2.2.4
    - application:
      - any
    - service:
      - tcp-25
    - description: My test security rule
    - logsetting: logprofile
    - logstart: False
    - logend: False
```

(continues on next page)
Ensures that a service object exists in the configured state. If it does not exist or is not configured with the specified attributes, it will be adjusted to match the specified values.

name: The name of the module function to execute.

servicename(str): The name of the security object. The name is case-sensitive and can have up to 31 characters, which an be letters, numbers, spaces, hyphens, and underscores. The name must be unique on a firewall and, on Panorama, unique within its device group and any ancestor or descendant device groups.

vsys(str): The string representation of the VSYS ID. Defaults to VSYS 1.

protocol(str): The protocol that is used by the service object. The only valid options are tcp and udp.

port(str): The port number that is used by the service object. This can be specified as a single integer or a valid range of ports.

description(str): A description for the policy (up to 255 characters).

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/service/tcp-80:
    panos.service_exists:
        servicename: tcp-80
        vsys: 1
        protocol: tcp
        port: 80
        description: Hypertext Transfer Protocol
        commit: False

panos/service/udp-500-550:
    panos.service_exists:
        servicename: udp-500-550
        vsys: 3
        protocol: udp
        port: 500-550
        commit: False
```

Ensures that a service group object exists in the configured state. If it does not exist or is not configured with the specified attributes, it will be adjusted to match the specified values.

This module will enforce group membership. If a group exists and contains members this state does not include, those members will be removed and replaced with the specified members in the state.
name: The name of the module function to execute.

groupname(str): The name of the service group object. The name is case-sensitive and can have up to 31 characters, which can be letters, numbers, spaces, hyphens, and underscores. The name must be unique on a firewall and, on Panorama, unique within its device group and any ancestor or descendant device groups.

ersys(str): The string representation of the VSYS ID. Defaults to VSYS 1.

members(str, list): The members of the service group. These must be valid service objects or service groups on the system that already exist prior to the execution of this state.

description(str): A description for the policy (up to 255 characters).

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```yaml
panos/service-group/my-group:
  panos.service_group_exists:
    - groupname: my-group
    - vsys: 1
    - members:
      - tcp-80
      - custom-port-group
    - description: A group that needs to exist
    - commit: False
```

### salt.states.panos.set_config

Sets a Palo Alto XPATH to a specific value. This will always overwrite the existing value, even if it is not changed.

You can add or create a new object at a specified location in the configuration hierarchy. Use the xpath parameter to specify the location of the object in the configuration.

name: The name of the module function to execute.

xpath(str): The XPATH of the configuration API tree to control.

value(str): The XML value to set. This must be a child to the XPATH.

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```yaml
panos/hostname:
  panos.set_config:
    - xpath: /config/devices/entry[@name='localhost.localdomain']/deviceconfig/system
    - value: <hostname>foobar</hostname>
    - commit: True
```

### 21.19.205 salt.states.pcs module

Management of Pacemaker/Corosync clusters with PCS

A state module to manage Pacemaker/Corosync clusters with the Pacemaker/Corosync configuration system (PCS)

New in version 2016.110.

depends pcs

Requirements: PCS is installed, pcs service is started and the password for the hacluster user is set and known.

Remark on the cibname variable used in the examples: The use of the cibname variable is optional. Use it only if you want to deploy your changes into a cibfile first and then push it. This makes only sense if you want to deploy multiple changes (which require each other) at once to the cluster.

At first the cibfile must be created:

```yaml
mysql_pcs__cib_present_cib_for_galera:
  pcs.cib_present:
    - cibname: cib_for_galera
    - scope: None
    - extra_args: None
```

Then the cibfile can be modified by creating resources (creating only 1 resource for demonstration, see also 7.):

```yaml
mysql_pcs__resource_present_galera:
  pcs.resource_present:
    - resource_id: galera
    - resource_type: "ocf:heartbeat:galera"
    - resource_options:
      - 'wsrep_cluster_address=gcomm://node1.example.org,node2.example.org,node3.example.org'
      - '--master'
    - cibname: cib_for_galera
```

After modifying the cibfile, it can be pushed to the live CIB in the cluster:

```yaml
mysql_pcs__cib_pushed_cib_for_galera:
  pcs.cib_pushed:
    - cibname: cib_for_galera
    - scope: None
    - extra_args: None
```

Create a cluster from scratch:

1. Authorize nodes to each other:

```yaml
pcs_auth__auth:
  pcs.auth:
    - nodes:
      - node1.example.com
      - node2.example.com
    - pcsuser: hacluster
    - pcspasswd: hoonetorg
    - extra_args: []
```

2. Do the initial cluster setup:

```yaml
pcs_setup__setup:
  pcs.cluster_setup:
    - nodes:
      - node1.example.com
      - node2.example.com
    - pcsclustername: pcscluster
    - extra_args:
```

(continues on next page)
3. Optional: Set cluster properties:

```yaml
pcs_properties__prop_has_value_no-quorum-policy:
    pcs.prop_has_value:
        - prop: no-quorum-policy
        - value: ignore
        - cibname: cib_for_cluster_settings
```

4. Optional: Set resource defaults:

```yaml
pcs_properties__resource_defaults_to_resource-stickiness:
    pcs.resource_defaults_to:
        - default: resource-stickiness
        - value: 100
        - cibname: cib_for_cluster_settings
```

5. Optional: Set resource op defaults:

```yaml
pcs_properties__resource_op_defaults_to_monitor-interval:
    pcs.resource_op_defaults_to:
        - op_default: monitor-interval
        - value: 60s
        - cibname: cib_for_cluster_settings
```

6. Configure Fencing (is often not optional on production ready cluster!):

```yaml
pcs_stonith__created_eps_fence:
    pcs.stonith_present:
        - stonith_id: eps_fence
        - stonith_device_type: fence_eps
        - stonith_device_options:
            - 'pcmk_host_map=node1.example.org:01;node2.example.org:02'
            - 'ipaddr=myepsdevice.example.org'
            - 'power_wait=5'
            - 'verbose=1'
            - 'debug=/var/log/pcsd/eps_fence.log'
            - 'login=hidden'
            - 'passwd=hoonetorg'
        - cibname: cib_for_stonith
```

7. Add resources to your cluster:

```yaml
mysql_pcs__resource_present_galera:
    pcs.resource_present:
        - resource_id: galera
        - resource_type: "ocf:heartbeat:galera"
        - resource_options:
            - 'wsrep_cluster_address=gcomm://node1.example.org,node2.example.org,' +
              'node3.example.org'
            - 'wsrep_master_address=gcomm://node1.example.org,node2.example.org,
              node3.example.org'
        - cibname: cib_for_galera
```

8. Optional: Add constraints (locations, colocations, orders):
### pcs.constraint_present

- **constraint_id**: colocation-vip_galera-haproxy-clone-INFINITY
- **constraint_type**: colocation
- **constraint_options**:
  - 'add'
  - 'vip_galera'
  - 'with'
  - 'haproxy-clone'
- **cibname**: cib_for_haproxy

New in version 2016.3.0.

```python
salt.states.pcs.auth(name, nodes, pcsuser='hacluster', pcspasswd='hacluster', extra_args=None)
```

Ensure all nodes are authorized to the cluster

- **name**: Irrelevant, not used (recommended: pcs_auth__auth)
- **nodes**: a list of nodes which should be authorized to the cluster
- **pcsuser**: user for communication with pcs (default: hacluster)
- **pcspasswd**: password for pcsuser (default: hacluster)
- **extra_args**: list of extra args for the 'pcs cluster auth' command

Example:

```python
cs_auth__auth:
  pcs.auth:
  - nodes:
    - node1.example.com
    - node2.example.com
  - pcsuser: hacluster
  - pcspasswd: hoonetorg
  - extra_args: []
```

### pcs.cib_present

Ensure that a CIB-file with the content of the current live CIB is created

Should be run on one cluster node only (there may be races)

- **name**: Irrelevant, not used (recommended: {{formulaname}}__cib_present_{{cibname}})
- **cibname**: name/path of the file containing the CIB
- **scope**: specific section of the CIB (default:)
- **extra_args**: additional options for creating the CIB-file

Example:

```python
mysql_pcs__cib_present_cib_for_galera:
  pcs.cib_present:
  - cibname: cib_for_galera
  - scope: None
  - extra_args: []
```

### pcs.cib_pushed

Ensure that a CIB-file is pushed if it is changed since the creation of it with pcs.cib_present

Should be run on one cluster node only (there may be races)

- **name**: Irrelevant, not used (recommended: {{formulaname}}__cib_pushed_{{cibname}})
- **cibname**: name/path of the file containing the CIB
- **scope**: specific section of the CIB
- **extra_args**: additional options for creating the CIB-file

Example:

```python
salt.states.pcs.cib_pushed(name, cibname, scope=None, extra_args=None)
```
salt.states.pcs.cluster_node_present(name, node, extra_args=None)
Add a node to the Pacemaker cluster via PCS Should be run on one cluster node only (there may be races) Can only be run on a already setup/added node
name Irrelevant, not used (recommended: pcs_setup__node_add_{{node}})
node node that should be added
extra_args list of extra args for the 'pcs cluster node add' command
Example:

pcs_setup__node_add_node1.example.com:
  pcs.cluster_node_present:
    - node: node1.example.com
    - extra_args:
      - '--start'
      - '--enable'

salt.states.pcs.cluster_setup(name, nodes, pcsclustername='pcscluster', extra_args=None)
Setup Pacemaker cluster on nodes. Should be run on one cluster node only (there may be races)
name Irrelevant, not used (recommended: pcs_setup__setup)
nodes a list of nodes which should be set up
pcsclustername Name of the Pacemaker cluster
extra_args list of extra args for the 'pcs cluster setup' command
Example:

pcs_setup__setup:
  pcs.cluster_setup:
    - nodes:
      - node1.example.com
      - node2.example.com
    - pcsclustername: pcscluster
    - extra_args:
      - '--start'
      - '--enable'

salt.states.pcs.constraint_present(name, constraint_id, constraint_type, constraint_options=None, cibname=None)
Ensure that a constraint is created
Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync
name Irrelevant, not used (recommended: {{formulaname}}__constraint_present_{{constraint_id}})
constraint_id name for the constraint (try first to create manually to find out the autocreated name)
constraint_type constraint type (location, colocation, order)
constraint_options options for creating the constraint
cibname use a cached CIB-file named like cibname instead of the live CIB
Example:

haproxy_pcs__constraint_present_colocation-vip_galera-haproxy-clone-INFINITY:
  pcs.constraint_present:
    - constraint_id: colocation-vip_galera-haproxy-clone-INFINITY
    - constraint_type: colocation
- `constraint_options`:
  - `add`
  - `vip_galera`
  - `with`
  - `haproxy-clone`
- `cibname`: cib_for_haproxy

salt.states.pcs.prop_has_value(name, prop, value, extra_args=None, cibname=None)

Ensure that a property in the cluster is set to a given value

Should be run on one cluster node only (there may be races)

name Irrelevant, not used (recommended: pcs_properties__prop_has_value_{[prop]})

prop name of the property

value value of the property

extra_args additional options for the pcs property command

cibname use a cached CIB-file named like cibname instead of the live CIB

Example:

```bash
pcs_properties__prop_has_value_no-quorum-policy:
  pcs.prop_has_value:
    - prop: no-quorum-policy
    - value: ignore
    - cibname: cib_for_cluster_settings
```

salt.states.pcs.resource_defaults_to(name, default, value, extra_args=None, cibname=None)

Ensure a resource default in the cluster is set to a given value

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

name Irrelevant, not used (recommended: pcs_properties__resource_defaults_to_{[default]})

default name of the default resource property

value value of the default resource property

extra_args additional options for the pcs command

cibname use a cached CIB-file named like cibname instead of the live CIB

Example:

```bash
pcs_properties__resource_defaults_to_resource-stickiness:
  pcs.resource_defaults_to:
    - default: resource-stickiness
    - value: 100
    - cibname: cib_for_cluster_settings
```

salt.states.pcs.resource_op_defaults_to(name, op_default, value, extra_args=None, cibname=None)

Ensure a resource operation default in the cluster is set to a given value

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

name Irrelevant, not used (recommended: pcs_properties__resource_op_defaults_to_{[op_default]})

op_default name of the operation default resource property

value value of the operation default resource property

extra_args additional options for the pcs command

cibname use a cached CIB-file named like cibname instead of the live CIB

Example:
**pcs_properties__resource_op_defaults_to_monitor-interval:**
- **op_default**: monitor-interval
- **value**: 60s
- **cibname**: cib_for_cluster_settings

**salt.states.pcs.resource_present**(name, resource_id, resource_type, resource_options=None, cibname=None)

Ensure that a resource is created.

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

- **name**: Irrelevant, not used (recommended: {{formulaname}}__resource_present_{{resource_id}})
- **resource_id**: name for the resource
- **resource_type**: resource type (f.e. ocf:heartbeat:IPaddr2 or VirtualIP)
- **resource_options**: additional options for creating the resource
- **cibname**: use a cached CIB-file named like cibname instead of the live CIB

Example:

```
mysql_pcs__resource_present_galera:
  pcs.resource_present:
    - resource_id: galera
    - resource_type: "ocf:heartbeat:galera"
    - resource_options:
      - 'wsrep_cluster_address=gcomm://node1.example.org,node2.example.org,node3.example.org'
      - '--master'
    - cibname: cib_for_galera
```

**salt.states.pcs.stonith_present**(name, stonith_id, stonith_device_type, stonith_device_options=None, cibname=None)

Ensure that a fencing resource is created.

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

- **name**: Irrelevant, not used (recommended: pcs_stonith__created_{{stonith_id}})
- **stonith_id**: name for the stonith resource
- **stonith_device_type**: name of the stonith agent fence_eps, fence_xvm f.e.
- **stonith_device_options**: additional options for creating the stonith resource
- **cibname**: use a cached CIB-file named like cibname instead of the live CIB

Example:

```
pcs_stonith__created_eps_fence:
  pcs.stonith_present:
    - stonith_id: eps_fence
    - stonith_device_type: fence_eps
    - stonith_device_options:
      - 'pcmk_host_map=node1.example.org:01;node2.example.org:02'
      - 'ipaddr=myepsdevice.example.org'
      - 'power_wait=5'
      - 'verbose=1'
      - 'debug=/var/log/pcsd/eps_fence.log'
      - 'login=hidden'
      - 'passwd=hoonetorg'
    - cibname: cib_for_stonith
```
21.19.206 salt.states.pecl

Installation of PHP Extensions Using pecl

These states manage the installed pecl extensions. Note that php-pear must be installed for these states to be available, so pecl states should include a requisite to a pkg.installed state for the package which provides pecl (php-pear in most cases). Example:

```
php-pear:
    pkg.installed
mongo:
    pecl.installed:
        - require:
        - pkg: php-pear
```

```
salt.states.pecl.installed(name, version=None, defaults=False, force=False, preferred_state='stable')
```

New in version 0.17.0.

Make sure that a pecl extension is installed.

- **name**: The pecl extension name to install
- **version**: The pecl extension version to install. This option may be ignored to install the latest stable version.
- **defaults**: Use default answers for extensions such as pecl_http which ask questions before installation. Without this option, the pecl.installed state will hang indefinitely when trying to install these extensions.
- **force**: Whether to force the installed version or not
- **preferred_state**: The pecl extension state to install

```
salt.states.pecl.removed(name)
```

Make sure that a pecl extension is not installed.

- **name**: The pecl extension name to uninstall

21.19.207 salt.states.pdbedit

Manage accounts in Samba’s passdb using pdbedit

- **maintainer**: Jorge Schrauwen <sjorge@blackdot.be>
- **maturity**: new
- **depends**: pdbedit
- **platform**: posix

New in version 2017.7.0.

```
wash:
    pdbedit.absent
```

```
kaylee:
    pdbedit.managed:
        - password: A70C708517B5DD9EDB67714FE25336EB
        - password_hashed: True
        - drive: 'X:'
        - homedir: '\\serenity\mechanic\profile'
```

```
salt.states.pdbedit.absent(name)
```

Ensure user account is absent
name [string] username

salt.states.pdbedit.managed(name, **kwargs)
    Manage user account
    login [string] login name
    password [string] password
    password_hashed [boolean] set if password is a nt hash instead of plain text
    domain [string] users domain
    profile [string] profile path
    script [string] logon script
    drive [string] home drive
    homedir [string] home directory
    fullname [string] full name
    account_desc [string] account description
    machine_sid [string] specify the machines new primary group SID or rid
    user_sid [string] specify the users new primary group SID or rid
    account_control [string] specify user account control properties

    Note: Only the following can be set: - N: No password required - D: Account disabled - H: Home directory required - L: Automatic Locking - X: Password does not expire

    reset_login_hours [boolean] reset the users allowed logon hours
    reset_bad_password_count [boolean] reset the stored bad login counter

salt.states.pdbedit.present(name, **kwargs)
    Alias for pdbedit.managed

21.19.208 salt.states.pip_state

Installation of Python Packages Using pip

These states manage system installed python packages. Note that pip must be installed for these states to be available, so pip states should include a requisite to a pkg.installed state for the package which provides pip (python-pip in most cases). Example:

```python
python-pip:
    pkg.installed

virtualenvwrapper:
    pip.installed:
        - require:
            - pkg: python-pip
```
salt.states.pip_state.installed(name, pkgs=None, pip_bin=None, requirements=None, bin_env=None, use_wheel=False, no_use_wheel=False, log=None, proxy=None, timeout=None, repo=None, editable=None, find_links=None, index_url=None, extra_index_url=None, no_index=False, mirrors=None, build=None, target=None, download=None, download_cache=None, source=None, upgrade=False, force_reinstall=False, ignore_installed=False, exists_action=None, no_deps=False, no_install=False, no_download=False, install_options=None, global_options=None, user=None, cwd=None, pre_releases=False, cert=None, allow_all_external=False, allow_external=None, allow_unverified=None, process_dependency_links=False, env_vars=None, use_vt=False, trusted_host=None, no_cache_dir=False, cache_dir=None, no_binary=None, extra_args=None, **kwargs)

Make sure the package is installed

**name** The name of the python package to install. You can also specify version numbers here using the standard operators ==, >=, <=. If **requirements** is given, this parameter will be ignored.

Example:

```
django:
pip.installed:
  - name: django >= 1.6, <= 1.7
  - require:
  - pkg: python-pip
```

This will install the latest Django version greater than 1.6 but less than 1.7.

**requirements** Path to a pip requirements file. If the path begins with salt:// the file will be transferred from the master file server.

**user** The user under which to run pip

**use_wheel** [False] Prefer wheel archives (requires pip>=1.4)

**no_use_wheel** [False] Force to not use wheel archives (requires pip>=1.4)

**no_binary** Force to not use binary packages (requires pip >= 7.0.0) Accepts either :all: to disable all binary packages, :none: to empty the set, or a list of one or more packages

Example:

```
django:
pip.installed:
  - no_binary: ':all:'
flask:
pip.installed:
  - no_binary:
  - itsdangerous
  - click
```

**log** Log file where a complete (maximum verbosity) record will be kept

**proxy** Specify a proxy in the form user:passwd@proxy.server:port. Note that the user:password@ is optional and required only if you are behind an authenticated proxy. If you provide user@proxy.server:port then you will be prompted for a password.

**timeout** Set the socket timeout (default 15 seconds)

**editable** install something editable (i.e. git+https://github.com/worldcompany/djangoembed.git#egg=djangoembed)

**find_links** URL to look for packages at

**index_url** Base URL of Python Package Index

**extra_index_url** Extra URLs of package indexes to use in addition to **index_url**
no_index  Ignore package index
mirrors   Specific mirror URL(s) to query (automatically adds –use-mirrors)
build    Unpack packages into build dir
target   Install packages into target dir
download Download packages into download instead of installing them
download_cache Cache downloaded packages in download_cache dir
source   Check out editable packages into source dir
upgrade  Upgrade all packages to the newest available version
force_reinstall When upgrading, reinstall all packages even if they are already up-to-date.
ignore_installed Ignore the installed packages (reinstalling instead)
excists_action Default action when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup
no_deps  Ignore package dependencies
no_install Download and unpack all packages, but don’t actually install them
no_cache_dir: Disable the cache.
cwd  Current working directory to run pip from
pre_releases Include pre-releases in the available versions
cert  Provide a path to an alternate CA bundle
allow_all_external Allow the installation of all externally hosted files
allow_external Allow the installation of externally hosted files (comma separated list)
allow_unverified Allow the installation of insecure and unverifiable files (comma separated list)
process_dependency_links Enable the processing of dependency links
bin_env  [None] Absolute path to a virtual environment directory or absolute path to a pip executable. The example below assumes a virtual environment has been created at /foo/.virtualenvs/bar.
env_vars  Add or modify environment variables. Useful for tweaking build steps, such as specifying INCLUDE or LIBRARY paths in Makefiles, build scripts or compiler calls. This must be in the form of a dictionary or a mapping.
Example:

```yaml
django:
  pip.installed:
    - name: django_app
    - env_vars:
      CUSTOM_PATH: /opt/django_app
      VERBOSE: True
```

use_vt Use VT terminal emulation (see output while installing)
trusted_host Mark this host as trusted, even though it does not have valid or any HTTPS.
Example:

```yaml
django:
  pip.installed:
    - name: django >= 1.6, <= 1.7
    - bin_env: /foo/.virtualenvs/bar
    - require:
      - pkg: python-pip
```

Or

Example:

```yaml
django:
  pip.installed:
    - name: django >= 1.6, <= 1.7
    - bin_env: /foo/.virtualenvs/bar/bin/pip
    - require:
      - pkg: python-pip
```
Attention

The following arguments are deprecated, do not use.

**pip_bin**  [None] Deprecated, use `bin_env`

Changed in version 0.17.0: **use_wheel** option added.

**install_options**

Extra arguments to be supplied to the `setup.py` install command. If you are using an option with a directory path, be sure to use absolute path.

Example:

```python
django:
  pip.installed:
    - name: django
    - **install_options**:
      - --prefix=/blah
    - **require**:
      - pkg: python-pip
```

**global_options** Extra global options to be supplied to the `setup.py` call before the install command.

New in version 2014.1.3.

Attention

As of Salt 0.17.0 the pip state **needs** an importable pip module. This usually means having the system's pip package installed or running Salt from an active `virtualenv`.

The reason for this requirement is because pip already does a pretty good job parsing its own requirements. It makes no sense for Salt to do pip requirements parsing and validation before passing them to the pip library. It’s functionality duplication and it’s more error prone.

Attention

Please set **reload_modules**: True to have the salt minion import this module after installation.

Example:

```python
pyopenssl:
  pip.installed:
    - name: pyOpenSSL
    - **reload_modules**: True
    - **exists_action**: i
```

**extra_args** pip keyword and positional arguments not yet implemented in salt

```python
pandas:
  pip.installed:
    - name: pandas
    - **extra_args**:
      - --latest-pip-kwarg: param
      - --latest-pip-arg
```
Warning: If unsupported options are passed here that are not supported in a minion’s version of pip, a No such option error will be thrown.

salt.states.pip_state.pip_has_exceptions_mod(ver)
True when the pip version has the pip.exceptions module

salt.states.pip_state.pip_has_internal_exceptions_mod(ver)
True when the pip version has the pip._internal.exceptions module

salt.states.pip_state.purge_pip()
Purge pip and its sub-modules

salt.states.pip_state.removed(name, requirements=None, bin_env=None, log=None, proxy=None, timeout=None, user=None, cwd=None, use_vt=False)
Make sure that a package is not installed.
name The name of the package to uninstall
user The user under which to run pip
bin_env [None] the pip executable or virtualenv to use
use_vt Use VT terminal emulation (see output while installing)

salt.states.pip_state.uptodate(name, bin_env=None, user=None, cwd=None, use_vt=False)
New in version 2015.5.0.
Verify that the system is completely up to date.
name The name has no functional value and is only used as a tracking reference
user The user under which to run pip
bin_env the pip executable or virtualenv to use
use_vt Use VT terminal emulation (see output while installing)

21.19.209 salt.states.pkg

Installation of packages using OS package managers such as yum or apt-get

Note: On minions running systemd>=205, as of version 2015.8.12, 2016.3.3, and 2016.11.0, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon’s control group. This is done to keep systemd from killing the package manager commands spawned by Salt, when Salt updates itself (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.use_scope, with a value of False (no quotes).

Salt can manage software packages via the pkg state module, packages can be set up to be installed, latest, removed and purged. Package management declarations are typically rather simple:

vim:
  pkg.installed

A more involved example involves pulling from a custom repository.

base:
pkgrepo.managed:
  - name: ppa:wolfnet/logstash
  - dist: precise
  - file: /etc/apt/sources.list.d/logstash.list
  - keyid: 28B04E4A

(continues on next page)
Multiple packages can also be installed with the use of the pkgs state module

```yaml
dotdeb.repo:
  pkgrepo.managed:
    - name: deb http://packages.dotdeb.org wheezy-php55 all
    - dist: wheezy-php55
    - file: /etc/apt/sources.list.d/dotbeb.list
    - keyid: 89DF5277
    - keyserver: keys.gnupg.net
    - refresh_db: true

php.packages:
  pkg.installed:
    - fromrepo: wheezy-php55
    - pkgs:
      - php5-fpm
      - php5-cli
      - php5-curl
```

**Warning:** Package names are currently case-sensitive. If the minion is using a package manager which is not case-sensitive (such as `pkgng`), then this state will fail if the proper case is not used. This will be addressed in a future release of Salt.

salt.states.pkg.downloaded(name=None, version=None, pkgs=None, fromrepo=None, ignore_epoch=False, **kwargs)

New in version 2017.7.0.

Ensure that the package is downloaded, and that it is the correct version (if specified).

Currently supported for the following pkg providers: `yum`, `zypper` and `zypper`

Parameters

- **name** *(str)* – The name of the package to be downloaded. This parameter is ignored if either "pkgs" is used. Additionally, please note that this option can only be used to download packages from a software repository.

- **version** *(str)* – Download a specific version of a package.

**Important:** As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon must have the epoch included when specifying the version number. For example:

```yaml
vim-enhanced:
  pkg.downloaded:
    - version: 2:7.4.160-1.el7
```

An `ignore_epoch` argument has been added to which causes the epoch to be disregarded when the state checks to see if the desired version was installed.
You can install a specific version when using the `pkg` argument by including the version after the package:

```yaml
common_packages:
  pkg.downloaded:
    - pkgs:
      - unzip
      - dos2unix
    - salt-minion: 2015.8.5-1.el6
```

- `resolve_capabilities` *(bool)* – Turn on resolving capabilities. This allow one to name “provides” or alias names for packages.

New in version 2018.3.0.

CLI Example:

```zsh
pkg.downloaded:
  - version: 5.0.5-4.63
  - fromrepo: "myrepository"
```

### `salt.states.pkg.group_installed`

New in version 2015.8.0.

Changed in version 2016.11.0: Added support in `pacman`

Ensure that an entire package group is installed. This state is currently only supported for the `yum` and `pacman` package managers.

- `skip` Packages that would normally be installed by the package group ("default" packages), which should not be installed.

**Load Balancer:**

```yaml
pkg.group_installed:
  - skip:
    - piranha
```

- `include` Packages which are included in a group, which would not normally be installed by a `yum groupinstall` ("optional" packages). Note that this will not enforce group membership; if you include packages which are not members of the specified groups, they will still be installed.

**Load Balancer:**

```yaml
pkg.group_installed:
  - include:
    - haproxy
```

Changed in version 2016.3.0: This option can no longer be passed as a comma-separated list, it must now be passed as a list (as shown in the above example).

**Note:** Because this is essentially a wrapper around `pkg.install`, any argument which can be passed to `pkg.install` may also be included here, and it will be passed on to the call to `pkg.install`.

### `salt.states.pkg.installed`

Ensure that the package is installed, and that it is the correct version (if specified).

**Parameters**
• **name** *(str)* – The name of the package to be installed. This parameter is ignored if either "pkgs" or "sources" is used. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option detailed below.

• **version** *(str)* – Install a specific version of a package. This option is ignored if "sources" is used. Currently, this option is supported for the following pkg providers: *apt, ebuild, pacman, pkgin, win_pkg, yumpkg, and zypper*. The version number includes the release designation where applicable, to allow Salt to target a specific release of a given version. When in doubt, using the pkg.latest_version function for an uninstalled package will tell you the version available.

```
# salt myminion pkg.latest_version vim-enhanced
myminion:
    2:7.4.160-1.el7
```

**Important:** As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the pkg.latest_version output above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
    pkg.installed:
        - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an ignore_epoch argument has been added to pkg.installed, pkg.removed, and pkg.purged states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed.

Also, while this function is not yet implemented for all pkg frontends, pkg.list_repo_pkgs will show all versions available in the various repositories for a given package, irrespective of whether or not it is installed.

```
# salt myminion pkg.list_repo_pkgs bash
myminion:
    -----------
    bash:
        - 4.2.46-21.el7_3
        - 4.2.46-20.el7_2
```

This function was first added for pkg.list_repo_pkgs in 2014.1.0, and was expanded to Debian/Ubuntu and Arch Linux-based distros in the 2017.7.0 release.

The version strings returned by either of these functions can be used as version specifiers in pkg states.

You can install a specific version when using the pkgs argument by including the version after the package:

```
common_packages:
    pkg.installed:
        - pkgs:
            - unzip
            - dos2unix
            - salt-minion: 2015.8.5-1.el6
```
If the version given is the string `latest`, the latest available package version will be installed à la `pkg.latest`.

### WILDCARD VERSIONS

As of the 2017.7.0 release, this state now supports wildcards in package versions for SUSE SLES/Leap/Tumbleweed, Debian/Ubuntu, RHEL/CentOS, Arch Linux, and their derivatives. Using wildcards can be useful for packages where the release name is built into the version in some way, such as for RHEL/CentOS which typically has version numbers like `1.2.34-5.el7`. An example of the usage for this would be:

```yaml
mypkg:
  pkg.installed:
    version: '1.2.34*'
```

Keep in mind that using wildcard versions will result in a slower state run since Salt must gather the available versions of the specified packages and figure out which of them match the specified wildcard expression.

- `refresh (bool)` – This parameter controls whether or not the package repo database is updated prior to installing the requested package(s).
  
  If `True`, the package database will be refreshed (`apt-get update` or equivalent, depending on platform) before installing.
  
  If `False`, the package database will *not* be refreshed before installing.

  If unset, then Salt treats package database refreshes differently depending on whether or not a `pkg` state has been executed already during the current Salt run. Once a refresh has been performed in a `pkg` state, for the remainder of that Salt run no other refreshes will be performed for `pkg` states which do not explicitly set `refresh` to `True`. This prevents needless additional refreshes from slowing down the Salt run.

- `cache_valid_time (str)` – New in version 2016.11.0.

  This parameter sets the value in seconds after which the cache is marked as invalid, and a cache update is necessary. This overwrites the `refresh` parameter’s default behavior.

  Example:

  ```yaml
  httpd:
    pkg.installed:
      fromrepo: mycustomrepo
      skip_verify: True
      skip_suggestions: True
      version: 2.0.6-ubuntu3
      refresh: True
      cache_valid_time: 300
      allow_updates: True
      hold: False
  ```

  In this case, a refresh will not take place for 5 minutes since the last `apt-get update` was executed on the system.

**Note:** This parameter is available only on Debian based distributions and has no effect on the rest.

- `fromrepo (str)` – Specify a repository from which to install
Note: Distros which use APT (Debian, Ubuntu, etc.) do not have a concept of repositories, in the same way as YUM-based distros do. When a source is added, it is assigned to a given release. Consider the following source configuration:

```
deb http://ppa.launchpad.net/saltstack/salt/ubuntu precise main
```

The packages provided by this source would be made available via the `precise` release, therefore `fromrepo` would need to be set to `precise` for Salt to install the package from this source.

Having multiple sources in the same release may result in the default install candidate being newer than what is desired. If this is the case, the desired version must be specified using the `version` parameter.

If the `pkgs` parameter is being used to install multiple packages in the same state, then instead of using `version`, use the method of version specification described in the Multiple Package Installation Options section below.

Running the shell command `apt-cache policy pkgname` on a minion can help elucidate the APT configuration and aid in properly configuring states:

```
root@saltmaster:~# salt ubuntu01 cmd.run 'apt-cache policy ffmpeg'
ubuntu01:
   ffmpeg:
     Installed: (none)
     Candidate: 7:0.10.11-1-precise1
     Version table:
     7:0.10.11-1-precise1 0
      500 http://ppa.launchpad.net/jon-severinsson/
     --ffmpeg/ubuntu/ precise/main amd64 Packages
     4:0.8.10-0ubuntu0.12.04.1 0
      500 http://us.archive.ubuntu.com/ubuntu/ precise-
     --updates/main amd64 Packages
     500 http://security.ubuntu.com/ubuntu/ precise-
     --security/main amd64 Packages
     4:0.8.1-0ubuntu1 0
      500 http://us.archive.ubuntu.com/ubuntu/ precise/
     --main amd64 Packages
```

The release is located directly after the source’s URL. The actual release name is the part before the slash, so to install version `4:0.8.10-0ubuntu0.12.04.1` either `precise-updates` or `precise-security` could be used for the fromrepo value.

- **skip_verify (bool)** – Skip the GPG verification check for the package to be installed

New in version 2014.1.1.
- **resolve_capabilities (bool)** – Turn on resolving capabilities. This allows to name “provides” or alias names for packages.

New in version 2018.3.0.
- **allow_updates (bool)** – Allow the package to be updated outside Salt’s control (e.g. auto updates on Windows). This means a package on the Minion can have...
a newer version than the latest available in the repository without enforcing a re-
installation of the package.

New in version 2014.7.0.

Example:

```
httpd:
  pkg.installed:
    - fromrepo: mycustomrepo
    - skip_verify: True
    - skip_suggestions: True
    - version: 2.0.6-ubuntu3
    - refresh: True
    - allow_updates: True
    - hold: False
```

- `pkg_verify (bool)` – New in version 2014.7.0.

For requested packages that are already installed and would not be targeted for up-
grade or downgrade, use `pkg.verify` to determine if any of the files installed by the
package have been altered. If files have been altered, the reinstall option of `pkg.install`
is used to force a reinstall. Types to ignore can be passed to `pkg.verify`. Additionally,
`verify_options` can be used to modify further the behavior of `pkg.verify`. See
examples below. Currently, this option is supported for the following `pkg` providers:
`yumpkg`.

Examples:

```
httpd:
  pkg.installed:
    - version: 2.2.15-30.el6.centos
    - pkg_verify: True

mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
    - pkg_verify:
      - ignore_types:
        - config
        - doc

mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
    - pkg_verify:
      - ignore_types:
        - config
        - doc
      - verify_options:
        - nodelps
        - nofiledigest
```

- `ignore_types (list)` – List of types to ignore when verifying the package
New in version 2014.7.0.

- **verify_options** (list) – List of additional options to pass when verifying the package. These options will be added to the `rpm -V` command, prepended with `--` (for example, when `nodeps` is passed in this option, `rpm -V` will be run with `--nodeps`).

New in version 2016.11.0.

- **normalize** (bool) – Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2014.7.0.

Example:

```
gvfs.gplbin-2.6.32-279.31.1.el6.x86_64:
pkg.installed:
  - normalize: False
```

- **ignore_epoch** (bool) – When a package version contains a non-zero epoch (e.g. `1:3.14.159-2.el7`, and a specific version of a package is desired, set this option to `True` to ignore the epoch when comparing versions. This allows for the following SLS to be used:

```
# Actual vim-enhanced version: 2:7.4.160-1.el7
vim-enhanced:
pkg.installed:
  - version: 7.4.160-1.el7
  - ignore_epoch: True
```

Without this option set to `True` in the above example, the package would be installed, but the state would report as failed because the actual installed version would be `2:7.4.160-1.el7`. Alternatively, this option can be left as `False` and the full version string (with epoch) can be specified in the SLS file:

```
vim-enhanced:
pkg.installed:
  - version: 2:7.4.160-1.el7
```

New in version 2015.8.9.

MULTIPLE PACKAGE INSTALLATION OPTIONS: (not supported in pkgng)

Parameters

- **pkgs** (list) – A list of packages to install from a software repository. All packages listed under `pkgs` will be installed via a single command.

```
mpkgs:
pkg.installed:
  - pkgs:
    - foo
    - bar
```

(continues on next page)
NOTE: For `apt`, `ebuild`, `pacman`, `winrepo`, `yumpkg`, and `zypper`, version numbers can be specified in the `pkgs` argument. For example:

```yaml
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
```

Additionally, `ebuild`, `pacman`, `zypper`, `yum/dnf`, and `apt` support the `<`, `<=`, `>=`, and `>` operators for more control over what versions will be installed. For example:

```yaml
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: '>=1.2.3-4'
      - baz
```

NOTE: When using comparison operators, the expression must be enclosed in quotes to avoid a YAML render error.

With `ebuild` is also possible to specify a use flag list and/or if the given packages should be in package.accept_keywords file and/or the overlay from which you want the package to be installed. For example:

```yaml
mypkgs:
  pkg.installed:
    - pkgs:
      - foo: ~
      - bar: '~=1.2:slot::overlay[use,-otheruse]'
      - baz
```

• **sources (list)** – A list of packages to install, along with the source URI or local path from which to install each package. In the example below, `foo`, `bar`, `baz`, etc. refer to the name of the package, as it would appear in the output of the `pkg.version` or `pkg.list_pkgs` salt CLI commands.

```yaml
mypkgs:
  pkg.installed:
    - sources:
      - foo: salt://rpms/foo.rpm
      - bar: http://somesite.org/bar.rpm
      - baz: ftp://someothersite.org/baz.rpm
      - qux: /minion/path/to/qux.rpm
```

**PLATFORM-SPECIFIC ARGUMENTS**

These are specific to each OS. If it does not apply to the execution module for your OS, it is ignored.

**Parameters**

- **hold (bool)** – Force the package to be held at the current installed version. Currently works with YUM/DNF & APT based systems.
New in version 2014.7.0.

• **update_holds (bool)** – If True, and this function would update the package version, any packages which are being held will be temporarily unheld so that they can be updated. Otherwise, if this function attempts to update a held package, the held package(s) will be skipped and the state will fail. By default, this parameter is set to False.

Currently works with YUM/DNF & APT based systems.

New in version 2016.11.0.

• **names (list)** – A list of packages to install from a software repository. Each package will be installed individually by the package manager.

**Warning:** Unlike pkgs, the names parameter cannot specify a version. In addition, it makes a separate call to the package management frontend to install each package, whereas pkgs makes just a single call. It is therefore recommended to use pkgs instead of names to install multiple packages, both for the additional features and the performance improvement that it brings.

• **install_recommends (bool)** – Whether to install the packages marked as recommended. Default is True. Currently only works with APT-based systems.

New in version 2015.5.0.

```
httpd:
  pkg.installed:
    - install_recommends: False
```

• **only_upgrade (bool)** – Only upgrade the packages, if they are already installed. Default is False. Currently only works with APT-based systems.

New in version 2015.5.0.

```
httpd:
  pkg.installed:
    - only_upgrade: True
```

**Note:** If this parameter is set to True and the package is not already installed, the state will fail.

• **report_reboot_exit_codes (bool)** – If the installer exits with a recognized exit code indicating that a reboot is required, the module function

  `win_system.set_reboot_required_witnessed`

will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, `3010` is the only recognized exit code, but this is subject to future refinement. The value of this param defaults to True. This parameter has no effect on non-Windows systems.

New in version 2016.11.0.

```
ms vcpp installed:
  pkg.installed:
    - name: ms-vcpp
    - version: 10.0.40219
    - report_reboot_exit_codes: False
```

Returns A dictionary containing the state of the software installation
Note: The `pkg.installed` state supports the usage of `reload_modules`. This functionality allows you to force Salt to reload all modules. In many cases, Salt is clever enough to transparently reload the modules. For example, if you install a package, Salt reloads modules because some other module or state might require the package which was installed. However, there are some edge cases where this may not be the case, which is what `reload_modules` is meant to resolve.

You should only use `reload_modules` if your `pkg.installed` does some sort of installation where if you do not reload the modules future items in your state which rely on the software being installed will fail. Please see the *Reloading Modules* documentation for more information.

See also:

unless and `onlyif`

You can use the `unless` or `onlyif` syntax to skip a full package run. This can be helpful in large environments with multiple states that include requisites for packages to be installed.

```python
# Using `file.file_exists` for a single-factor check
install_nginx:
  pkg.installed:
    - name: nginx
    - unless:
      - fun: file.file_exists
        args:
          - /etc/nginx/nginx.conf

# Using `file.search` for a two-factor check
install_nginx:
  pkg.installed:
    - name: nginx
    - unless:
      - fun: file.search
        args:
          - /etc/nginx/nginx.conf
          - 'user www-data;'
```

The above examples use two different methods to reasonably ensure that a package has already been installed. First, with checking for a file that would be created with the package. Second, by checking for specific text within a file that would be created or managed by salt. With these requisists satisfied, unless will return `True` and the `pkg.installed` state will be skipped.

```python
# Example of state run without unless used
salt 'saltdev' state.apply nginx
saltdev:
  ---------
  ID: install_nginx
  Function: pkg.installed
  Name: nginx
  Result: True
  Comment: All specified packages are already installed
  Started: 20:11:56.388331
  Duration: 4290.0 ms
  Changes:

# Example of state run using unless requisite
```

(continues on next page)
The result is a reduction of almost 3 seconds. In larger environments, small reductions in waiting time can add up.

*Unless Requisite*

```python
salt.states.pkg.latest(name, refresh=None, fromrepo=None, skip_verify=False, pkgs=None, watch_flags=True, **kwargs)
```

Ensure that the named package is installed and the latest available package. If the package can be updated, this state function will update the package. Generally it is better for the `installed` function to be used, as `latest` will update the package whenever a new package is available.

- **name**  
The name of the package to maintain at the latest available version. This parameter is ignored if "pkgs" is used.
- **fromrepo**  
Specify a repository from which to install
- **skip_verify**  
Skip the GPG verification check for the package to be installed
- **refresh**  
This parameter controls whether or not the package repo database is updated prior to checking for the latest available version of the requested packages.

  If True, the package database will be refreshed (`apt-get update` or equivalent, depending on platform) before checking for the latest available version of the requested packages.

  If False, the package database will *not* be refreshed before checking.

  If unset, then Salt treats package database refreshes differently depending on whether or not a `pkg` state has been executed already during the current Salt run. Once a refresh has been performed in a `pkg` state, for the remainder of that Salt run no other refreshes will be performed for `pkg` states which do not explicitly set `refresh` to True. This prevents needless additional refreshes from slowing down the Salt run.

- **param str cache_valid_time**  
New in version 2016.11.0.

  This parameter sets the value in seconds after which the cache is marked as invalid, and a cache update is necessary. This overwrites the `refresh` parameter’s default behavior.

Example:

```bash
httpd:
  pkg.latest:
    - refresh: True
    - cache_valid_time: 300
```

In this case, a refresh will not take place for 5 minutes since the last `apt-get update` was executed on the system.

**Note:** This parameter is available only on Debian based distributions and has
no effect on the rest.

**param bool resolve_capabilities** Turn on resolving capabilities. This allow one to name "provides" or alias names for packages.

New in version 2018.3.0.

Multiple Package Installation Options:

(Not yet supported for: FreeBSD, OpenBSD, MacOS, and Solaris pkgutil)

- **pkgs** A list of packages to maintain at the latest available version.

  ```yaml
  mypkgs:
  pkg.latest:
   - pkgs:
     - foo
     - bar
     - baz
  ```

- **install_recommends** Whether to install the packages marked as recommended. Default is `True`.

  Currently only works with APT-based systems.

  New in version 2015.5.0.

  ```yaml
  httpd:
  pkg.latest:
   - install_recommends: False
  ```

- **only_upgrade** Only upgrade the packages, if they are already installed. Default is `False`.

  Currently only works with APT-based systems.

  New in version 2015.5.0.

  ```yaml
  httpd:
  pkg.latest:
   - only_upgrade: True
  ```

**Note:** If this parameter is set to True and the package is not already installed, the state will fail.

- **report_reboot_exit_codes** If the installer exits with a recognized exit code indicating that a reboot is required, the module function

  ```python
  win_system.set_reboot_required_witnessed
  ```

  will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, `3010` is the only recognized exit code, but this is subject to future refinement. The value of this param defaults to `True`. This parameter has no effect on non-Windows systems.

  New in version 2016.11.0.

  ```yaml
  ms vcpp installed:
  pkg.latest:
   - name: ms-vcpp
   - report_reboot_exit_codes: False
  ```

salt.states.pkg.mod_aggregate(low, chunks, running)

The mod_aggregate function which looks up all packages in the available low chunks and merges them into a single pkgs ref in the present low data.
**salt.states.pkg.mod_watch**(name, 
**kwargs)

Install/reinstall a package based on a watch requisite

**Note:** This state exists to support special handling of the watch `requisite`. It should not be called directly. Parameters for this function should be set by the state being triggered.

**salt.states.pkg.patch_downloaded**(name, advisory_ids=None, 
**kwargs)

New in version 2017.7.0.

Ensure that packages related to certain advisory ids are downloaded.

Currently supported for the following pkg providers: `yumpkg` and `zypper`

CLI Example:

```
preparing-to-fix-issues:
pkg.patch_downloaded:
  - advisory_ids:
    - SUSE-SLE-SERVER-12-SP2-2017-185
    - SUSE-SLE-SERVER-12-SP2-2017-150
    - SUSE-SLE-SERVER-12-SP2-2017-120
```

**salt.states.pkg.patch_installed**(name, advisory_ids=None, 
downloadonly=None, 
**kwargs)

New in version 2017.7.0.

Ensure that packages related to certain advisory ids are installed.

Currently supported for the following pkg providers: `yumpkg` and `zypper`

CLI Example:

```
issue-foo-fixed:
pkg.patch_installed:
  - advisory_ids:
    - SUSE-SLE-SERVER-12-SP2-2017-185
    - SUSE-SLE-SERVER-12-SP2-2017-150
    - SUSE-SLE-SERVER-12-SP2-2017-120
```

**salt.states.pkg.purged**(name, version=None, pkgs=None, 
normalize=True, ignore_epoch=False, 
**kwargs)

Verify that a package is not installed, calling `pkg.purge` if necessary to purge the package. All configuration files are also removed.

**name** The name of the package to be purged.

**version** The version of the package that should be removed. Don’t do anything if the package is installed with an unmatching version.

**Important:** As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the example above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
pkg.purged:
  - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an `ignore_epoch` argument has been added to `pkg.installed`, `pkg.removed`, and `pkg.purged` states, which causes the epoch to be disregarded when the state checks to see if the
desired version was installed. If ignore_epoch was not set to True, and instead of 2:7.4.160-1.el7 a version of 7.4.160-1.el7 were used, this state would report success since the actual installed version includes the epoch, and the specified version would not match.

**normalize** [True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

**ignore_epoch** [False] When a package version contains a non-zero epoch (e.g. 1:3.14.159-2.el7, and a specific version of a package is desired, set this option to True to ignore the epoch when comparing versions. This allows for the following SLS to be used:

```
# Actual vim-enhanced version: 2:7.4.160-1.el7
vim-enhanced:
  pkg.purged:
    - version: 7.4.160-1.el7
    - ignore_epoch: True
```

Without this option set to True in the above example, the state would falsely report success since the actual installed version is 2:7.4.160-1.el7. Alternatively, this option can be left as False and the full version string (with epoch) can be specified in the SLS file:

```
vim-enhanced:
  pkg.purged:
    - version: 2:7.4.160-1.el7
```

New in version 2015.8.9.

**Multiple Package Options:**

**pkgs** A list of packages to purge. Must be passed as a python list. The name parameter will be ignored if this option is passed. It accepts version numbers as well.

New in version 0.16.0.

```python
salt.states.pkg.removed(name, version=None, pkgs=None, normalize=True, ignore_epoch=False, **kwargs)
```

Verify that a package is not installed, calling pkg.remove if necessary to remove the package.

**name** The name of the package to be removed. Don’t do anything if the package is installed with an unmatching version.

**Important:** As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the example above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
  pkg.removed:
    - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an ignore_epoch argument has been added to pkg.installed, pkg.removed, and pkg.purged states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed. If ignore_epoch was not set to True, and instead of 2:7.4.160-1.el7 a version of 7.4.160-1.el7 were used, this state would report success since the actual installed version includes the epoch, and the specified version would not match.
normalize [True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

ignore_epoch [False] When a package version contains an non-zero epoch (e.g. `1:3.14.159-2.el7`, and a specific version of a package is desired, set this option to `True` to ignore the epoch when comparing versions. This allows for the following SLS to be used:

```
# Actual vim-enhanced version: 2:7.4.160-1.el7
vim-enhanced:
  pkg.removed:
    - version: 7.4.160-1.el7
    - ignore_epoch: True
```

Without this option set to `True` in the above example, the state would falsely report success since the actual installed version is `2:7.4.160-1.el7`. Alternatively, this option can be left as `False` and the full version string (with epoch) can be specified in the SLS file:

```
vim-enhanced:
  pkg.removed:
    - version: 2:7.4.160-1.el7
```

New in version 2015.8.9.

Multiple Package Options:

pkgs A list of packages to remove. Must be passed as a python list. The name parameter will be ignored if this option is passed. It accepts version numbers as well.

New in version 0.16.0.

salt.states.pkg.uptodate(name, refresh=False, pkgs=None, **kwargs)

New in version 2014.7.0.

Changed in version 2018.3.0: Added support for the pkgin provider.

Verify that the system is completely up to date.

name The name has no functional value and is only used as a tracking reference

refresh refresh the package database before checking for new upgrades

pkgs list of packages to upgrade

Parameters

- cache_valid_time (str) – This parameter sets the value in seconds after which cache marked as invalid, and cache update is necessary. This overwrite refresh parameter default behavior.

  In this case cache_valid_time is set, refresh will not take place for amount in seconds since last `apt-get update` executed on the system.

  **Note:** This parameter available only on Debian based distributions, and have no effect on the rest.

- resolve_capabilities (bool) – Turn on resolving capabilities. This allow one to name "provides" or alias names for packages.

  New in version 2018.3.0.

kwargs Any keyword arguments to pass through to pkg.upgrade.

New in version 2015.5.0.
## 21.19.210 salt.states.pkgbuild

The pkgbuild state is the front of Salt package building backend. It automatically builds DEB and RPM packages from specified sources.

New in version 2015.8.0.

```yaml
salt_2015.5.2:
  pkgbuild.built:
    - runas: thatch
    - results:
      - salt-2015.5.2-2.el7.centos.noarch.rpm
      - salt-api-2015.5.2-2.el7.centos.noarch.rpm
      - salt-cloud-2015.5.2-2.el7.centos.noarch.rpm
      - salt-master-2015.5.2-2.el7.centos.noarch.rpm
      - salt-minion-2015.5.2-2.el7.centos.noarch.rpm
      - salt-ssh-2015.5.2-2.el7.centos.noarch.rpm
      - salt-syndic-2015.5.2-2.el7.centos.noarch.rpm
    - dest_dir: /tmp/pkg
    - spec: salt://pkg/salt/spec/salt.spec
    - template: jinja
    - deps:
      - salt://pkg/salt/sources/required_dependency.rpm
    - tgt: epel-7-x86_64
    - sources:
      - salt://pkg/salt/sources/logrotate.salt
      - salt://pkg/salt/sources/README.fedora
      - salt://pkg/salt/sources/salt-2015.5.2.tar.gz
      - salt://pkg/salt/sources/salt-2015.5.2-tests.patch
      - salt://pkg/salt/sources/salt-api
      - salt://pkg/salt/sources/salt-api.service
      - salt://pkg/salt/sources/salt-master
      - salt://pkg/salt/sources/salt-master.service
      - salt://pkg/salt/sources/salt-minion
      - salt://pkg/salt/sources/salt-minion.service
      - salt://pkg/salt/sources/saltpkg.sls
      - salt://pkg/salt/sources/salt-syndic
      - salt://pkg/salt/sources/salt-syndic.service
      - salt://pkg/salt/sources/SaltTesting-2015.5.8.tar.gz
/tmp/pkg:
  pkgbuild.repo
```

The `salt.states.pkgbuild.built` state function can be used to ensure that the named package is built and exists in the named directory.

#### salt.states.pkgbuild.built

Ensure that the named package is built and exists in the named directory.

- **name**: The name to track the build, the name value is otherwise unused.
- **runas**: The user to run the build process as.
- **dest_dir**: The directory on the minion to place the built package(s).
- **spec**: The location of the spec file (used for rpms).
- **sources**: The list of package sources.
- **tgt**: The target platform to run the build on.
- **template**: Run the spec file through a templating engine.
- **deps**: Packages required to ensure that the named package is built can be hosted on either the salt master server or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading.

Changed in version 2015.8.2: This argument is now optional, allowing for no templating engine to be used if none is desired.
directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials

**env** A dictionary of environment variables to be set prior to execution. Example:

```yaml
- env:
  DEB_BUILD_OPTIONS: 'nocheck'
```

**Warning:** The above illustrates a common PyYAML pitfall, that `yes`, `no`, `on`, `off`, `true`, and `false` are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

**results** The names of the expected rpms that will be built

**force** [False] If `True`, packages will be built even if they already exist in the `dest_dir`. This is useful when building a package for continuous or nightly package builds.

New in version 2015.8.2.

**saltenv** The saltenv to use for files downloaded from the salt filesever

**log_dir** [/var/log/salt/rpmbuild] Root directory for log files created from the build. Logs will be organized by package name, version, OS release, and CPU architecture under this directory.

New in version 2015.8.2.

```python
salt.states.pkgbuild.repo(name, keyid=None, env=None, use_passphrase=False, gnuhome='/etc/salt/gpgkeys', runas='builder', timeout=15.0)
```

Make a package repository and optionally sign it and packages present

The name is directory to turn into a repo. This state is best used with onchanges linked to your package building states.

**name** The directory to find packages that will be in the repository

**keyid** Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. Utilizes Public and Private keys associated with keyid which have been loaded into the minion’s Pillar data.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```python
---BEGIN PGP PRIVATE KEY BLOCK-----
Version: GnuPG v1

lQ0+BFciIfQBCADAPCtzx7I5RL32escCMZsPzaEKWe7bIX1em4CKKkBoX47IG54b
w82PCE8Y1jf/9Uk2m3RKWwp3YClLC7A7p3gj6VO4ysvVz28UbnhPxsIk0lf2cq8qc
.

Ebe+8JQTqw5XPRTzXmy/b5WXDeM79CkLwvuGpXFOR76D+ECMRpV/rawnueEcNpntn
R50mgHqvyeNo4pWbn8JzQ09YY/Us0SMHBVzLCBeIi5ZIopzalvX
=JvW8
-----END PGP PRIVATE KEY BLOCK-----

gpg_pkg_keyname: gpg_pkg_key.pem
```

---BEGIN PGP PUBLIC KEY BLOCK-----
Version: GnuPG v1

mQENBFciIfQBCADAPCtzx7I5RL32escCMZsPzaEKWe7bIX1em4CKKkBoX47IG54b
w82PCE8Y1jf/9Uk2m3RKWwp3YClLC7A7p3gj6VO4ysvVz28UbnhPxsIk0lf2cq8qc
.

(continues on next page)
env  Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository. Example:

- env:
  OPTIONS: 'ask-passphrase'

**Warning:** The above illustrates a common PyYAML pitfall, that yes, no, on, off, true, and false are all loaded as boolean True and False values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Use of OPTIONS on some platforms, for example: `ask-passphrase`, will require `gpg-agent` or similar to cache passphrases.

**Note:** This parameter is not used for making yum repositories.

**use_passphrase** [False] New in version 2016.3.0.

Use a passphrase with the signing key presented in `keyid`. Passphrase is received from Pillar data which could be passed on the command line with `pillar` parameter. For example:

```
pillar='{ "gpg_passphrase" : "my_passphrase" }'
```

**gnupghome** [/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with `keyid`

**runas** [builder] New in version 2016.3.0.

User to create the repository as, and optionally sign packages.

**Note:** Ensure the user has correct permissions to any files and directories which are to be utilized.

**timeout** [15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

### 21.19.211 salt.states.pkgng

**Manage package remote repo using FreeBSD pkgng**

Salt can manage the URL pkgng pulls packages from. ATM the state and module are small so use cases are typically rather simple:
pkgng_clients:
  pkgng.update_packaging_site:
    - name: "http://192.168.0.2"

salt.states.pkgng.update_packaging_site(name)

21.19.212 salt.states.pkgrepo

Management of APT/DNF/YUM/Zypper package repos

States for managing software package repositories on Linux distros. Supported package managers are APT, DNF, YUM and Zypper. Here is some example SLS:

base:
  pkgrepo.managed:
    - humanname: CentOS-$releasever - Base
    - mirrorlist: http://mirrorlist.centos.org/?release=$releasever&arch=$basearch&repo=os
    - comments:
      - 'http://mirror.centos.org/centos/$releasever/os/$basearch/'
    - gpgcheck: 1
    - gpgkey: file:///etc/pki/rpm-gpg/RPM-GPG-KEY-CentOS-6

base:
  pkgrepo.managed:
    - name: deb http://ppa.launchpad.net/wolfnet/logstash/ubuntu precise main
    - dist: precise
    - file: /etc/apt/sources.list.d/logstash.list
    - keyid: 28B04E4A
    - keyserver: keyserver.ubuntu.com
    - require_in:
      - pkg: logstash

pkg.latest:
  - name: logstash
  - refresh: True

base:
  pkgrepo.managed:
    - name: deb http://www.deb-multimedia.org stable main
    - file: /etc/apt/sources.list.d/deb-multimedia.list
    - key_url: salt://deb-multimedia/files/marillat.pub

base:
  pkgrepo.managed:
    - name: deb http://dl.google.com/linux/chrome/deb/ stable main
    - dist: stable
    - file: /etc/apt/sources.list.d/chrome-browser.list
    - require_in:
      - pkg: google-chrome-stable
      - gpgcheck: 1
      - key_url: https://dl-ssl.google.com/linux/linux_signing_key.pub
**Note:** On Ubuntu systems, the `python-software-properties` package should be installed for better support of PPA repositories. To check if this package is installed, run `dpkg -l python-software-properties`.

Also, some Ubuntu releases have a bug in their `python-software-properties` package, a missing dependency on pycurl, so `python-pycurl` will need to be manually installed if it is not present once `python-software-properties` is installed.

On Ubuntu & Debian systems, the `python-apt` package is required to be installed. To check if this package is installed, run `dpkg -l python-apt`. `python-apt` will need to be manually installed if it is not present.

```python
salt.states.pkgrepo.absent(name, **kwargs)
```

This function deletes the specified repo on the system, if it exists. It is essentially a wrapper around `pkg.del_repo`.

- **name**: The name of the package repo, as it would be referred to when running the regular package manager commands.

**UBUNTU-SPECIFIC OPTIONS**

- **ppa**: On Ubuntu, you can take advantage of Personal Package Archives on Launchpad simply by specifying the user and archive name.

```python
logstash-ppa:
    pkgrepo.absent:
        - ppa: wolfnet/logstash
```

- **ppa_auth**: For Ubuntu PPAs there can be private PPAs that require authentication to access. For these PPAs the username/password can be specified. This is required for matching if the name format uses the `ppa:` specifier and is private (requires username/password to access, which is encoded in the URI).

```python
logstash-ppa:
    pkgrepo.absent:
        - ppa: wolfnet/logstash
        - ppa_auth: username:password
```

- **keyid**: If passed, then the GPG key corresponding to the passed KeyID will also be removed.

- **keyid_ppa**: False] If set to `True`, the GPG key’s ID will be looked up from ppa.launchpad.net and removed, and the `keyid` argument will be ignored.

**Note:** This option will be disregarded unless the `ppa` argument is present.

```python
salt.states.pkgrepo.managed(name, ppa=None, **kwargs)
```

This state manages software package repositories. Currently, `yum`, `apt`, and `zypper` repositories are supported.

**YUM/DNF/ZYPPER-BASED SYSTEMS**

**Note:** One of `baseurl` or `mirrorlist` below is required. Additionally, note that this state is not presently capable of managing more than one repo in a single repo file, so each instance of this state will manage a single
repo file containing the configuration for a single repo.

name  This value will be used in two ways: Firstly, it will be the repo ID, as seen in the entry in square brackets (e.g. `[foo]`) for a given repo. Secondly, it will be the name of the file as stored in `/etc/yum.repos.d` (e.g. `/etc/yum.repos.d/foo.conf`).

enabled  [True] Whether or not the repo is enabled. Can be specified as True/False or 1/0.

disabled  [False] Included to reduce confusion due to APT's use of the disabled argument. If this is passed for a YUM/DNF/Zypper-based distro, then the reverse will be passed as enabled. For example passing disabled=True will assume enabled=False.

humanname  This is used as the "name" value in the repo file in `/etc/yum.repos.d/` (or `/etc/zypp/repos.d` for SUSE distros).

baseurl  The URL to a yum repository

mirrorlist  A URL which points to a file containing a collection of baseurls

comments  Sometimes you want to supply additional information, but not as enabled configuration. Anything supplied for this list will be saved in the repo configuration with a comment marker (#) in front.

gpgautoimport  Only valid for Zypper package manager. If set to True, automatically trust and import public GPG key for the repository. The key should be specified with gpgkey parameter. See details below.

Additional configuration values seen in YUM/DNF/Zypper repo files, such as gpgkey or gpgcheck, will be used directly as key-value pairs. For example:

```yaml
foo:
  pkgrepo.managed:
    - humanname: Personal repo for foo
    - baseurl: https://mydomain.tld/repo/foo/$releasever/$basearch
    - gpgkey: file:///etc/pki/rpm-gpg/foo-signing-key
    - gpgcheck: 1
```

### APT-BASED SYSTEMS

**ppa**  On Ubuntu, you can take advantage of Personal Package Archives on Launchpad simply by specifying the user and archive name. The keyid will be queried from launchpad and everything else is set automatically. You can override any of the below settings by simply setting them as you would normally. For example:

```yaml
logstash-ppa:
  pkgrepo.managed:
    - ppa: wolfnet/logstash
```

**ppa_auth**  For Ubuntu PPAs there can be private PPAs that require authentication to access. For these PPAs the username/password can be passed as an HTTP Basic style username/password combination.

```yaml
logstash-ppa:
  pkgrepo.managed:
    - ppa: wolfnet/logstash
    - ppa_auth: username:password
```

**name**  On apt-based systems this must be the complete entry as it would be seen in the sources.list file. This can have a limited subset of components (i.e. 'main') which can be added/modified with the `comps` option.

```yaml
precise-repo:
  pkgrepo.managed:
    - name: deb http://us.archive.ubuntu.com/ubuntu precise main
```

**Note:** The above example is intended as a more readable way of configuring the SLS, it is equivalent to the following:
pkgrepo.managed

| disabled | [False] Toggles whether or not the repo is used for resolving dependencies and/or installing packages. |
| enabled  | [True] Included to reduce confusion due to YUM/DNF/Zypper's use of the enabled argument. If this is passed for an APT-based distro, then the reverse will be passed as disabled. For example, passing enabled=False will assume disabled=True. |
| architectures | On apt-based systems, architectures can restrict the available architectures that the repository provides (e.g. only amd64). architectures should be a comma-separated list. |
| comps | On apt-based systems, comps dictate the types of packages to be installed from the repository (e.g. main, nonfree, ...). For purposes of this, comps should be a comma-separated list. |
| file | The filename for the .list that the repository is configured in. It is important to include the full-path AND make sure it is in a directory that APT will look in when handling packages. |
| dist | This dictates the release of the distro the packages should be built for. (e.g. unstable). This option is rarely needed. |
| keyid | The KeyID or a list of KeyIDs of the GPG key to install. This option also requires the keyserver option to be set. |
| keysrsver | This is the name of the keyserver to retrieve gpg keys from. The keyid option must also be set for this option to work. |
| key_url | URL to retrieve a GPG key from. Allows the usage of http://, https:// as well as salt://. |

**Note:** Use either keyid/keyserver or key_url, but not both.

| key_text | The string representation of the GPG key to install. |
|          | New in version 2018.3.0. |

**Note:** Use either keyid/keyserver, key_url, or key_text but not more than one method.

| consolidate | [False] If set to True, this will consolidate all sources definitions to the sources.list file, cleanup the now unused files, consolidate components (e.g. main) for the same URI, type, and architecture to a single line, and finally remove comments from the sources.list file. The consolidate will run every time the state is processed. The option only needs to be set on one repo managed by salt to take effect. |
| clean_file | [False] If set to True, empty the file before config repo |

**Note:** Use with care. This can be dangerous if multiple sources are configured in the same file.

New in version 2015.8.0.

| refresh | [True] If set to False this will skip refreshing the apt package database on debian based systems. |
| refresh_db | [True] This argument has been deprecated. Please use refresh instead. The refresh_db argument will continue to work to ensure backwards compatibility, but we recommend using the preferred refresh argument instead. |
| require_in | Set this to a list of pkg.installed or pkg.latest to trigger the running of apt-get update prior to attempting to install these packages. Setting a require in the pkg state will not work for this. |

21.19.213 salt.states.portage_config

Management of Portage package configuration on Gentoo

A state module to manage Portage configuration on Gentoo
salt:
  portage_config.flags:
    - use:
      - openssl

salt.states.portage_config.flags(name, use=None, accept_keywords=None, env=None, license=None, properties=None, unmask=False, mask=False)

Enforce the given flags on the given package or DEPEND atom.

**Warning:** In most cases, the affected package(s) need to be rebuilt in order to apply the changes.

- name: The name of the package or its DEPEND atom
- use: A list of USE flags
- accept_keywords: A list of keywords to accept. `~ARCH` means current host arch, and will be translated into a line without keywords
- env: A list of environment files
- license: A list of accepted licenses
- properties: A list of additional properties
- unmask: A boolean to unmask the package
- mask: A boolean to mask the package

### 21.19.214 salt.states.ports

Manage software from FreeBSD ports

New in version 2014.1.0.

**Note:** It may be helpful to use a higher timeout when running a `ports.installed` state, since compiling the port may exceed Salt's timeout.

```bash
salt -t 1200 '*' state.highstate
```

salt.states.ports.installed(name, options=None)

Verify that the desired port is installed, and that it was compiled with the desired options.

- options: Make sure that the desired non-default options are set

**Warning:** Any build options not passed here assume the default values for the port, and are not just differences from the existing cached options from a previous `make config`.

Example usage:

```bash
security/nmap:
  ports.installed:
    - options:
      - IPV6: off
```

### 21.19.215 salt.states.postgres_cluster module
Management of PostgreSQL clusters

The postgres_cluster state module is used to manage PostgreSQL clusters. Clusters can be set as either absent or present.

```
create_cluster 9.3 main:
postgres_cluster.present:
  - name: 'main'
  - version: '9.3'
```

```
salt.states.postgres_cluster.absent(version, name)
  Ensure that the named cluster is absent
  version Version of the postgresql server of the cluster to remove
  name The name of the cluster to remove

  New in version 2015.XX.
```

```
salt.states.postgres_cluster.present(version, name, port=None, encoding=None, locale=None, datadir=None)
  Ensure that the named cluster is present with the specified properties. For more information about all of these
  options see man pg_createcluster(1)
  version Version of the postgresql cluster
  name The name of the cluster
  port Cluster port
  encoding The character encoding scheme to be used in this database
  locale Locale with which to create cluster
  datadir Where the cluster is stored

  New in version 2015.XX.
```

21.19.216 salt.states.postgres_database

Management of PostgreSQL databases

The postgres_database module is used to create and manage Postgres databases. Databases can be set as either absent or present.

```
frank:
  postgres_database.present
```

```
salt.states.postgres_database.absent(name, user=None, maintenance_db=None, db_password=None, db_host=None, db_port=None, db_user=None)
  Ensure that the named database is absent
  name The name of the database to remove
  db_user database username if different from config or default
  db_password user password if any password for a specified user
  db_host Database host if different from config or default
  db_port Database port if different from config or default
  user System user all operations should be performed on behalf of

  New in version 0.17.0.
```
salt.states.postgres_database.present(name, tablespace=None, encoding=None, lc_collate=None, lc_ctype=None, owner=None, owner recurse=False, template=None, user=None, maintenance_db=None, db_password=None, db_host=None, db_port=None, db_user=None)

Ensure that the named database is present with the specified properties. For more information about all of these options see man createdb(1).

- **name**: The name of the database to manage
- **tablespace**: Default tablespace for the database
- **encoding**: The character encoding scheme to be used in this database
- **lc_collate**: The LC_COLLATE setting to be used in this database
- **lc_ctype**: The LC_CTYPE setting to be used in this database
- **owner**: The username of the database owner
- **owner_recurse**: Recurse owner change to all relations in the database
- **template**: The template database from which to build this database
- **user**: System user all operations should be performed on behalf of
- **db_user**: Database username if different from config or default
- **db_password**: User password if any password for a specified user
- **db_host**: Database host if different from config or default
- **db_port**: Database port if different from config or default

New in version 0.17.0.

21.19.217 salt.states.postgres_extension

Management of PostgreSQL extensions

A module used to install and manage PostgreSQL extensions.

```
adminpack:
    postgres_extension.present
```

New in version 2014.7.0.

salt.states.postgres_extension.absent(name, if_exists=None, restrict=None, cascade=None, user=None, maintenance_db=None, db_user=None, db_password=None, db_host=None, db_port=None)

Ensure that the named extension is absent.

- **name**: Extension name of the extension to remove
- **if_exists**: Add if exist slug
- **restrict**: Add restrict slug
- **cascade**: Drop on cascade
- **user**: System user all operations should be performed on behalf of
- **maintenance_db**: Database to act on
- **db_user**: Database username if different from config or default
- **db_password**: User password if any password for a specified user
- **db_host**: Database host if different from config or default
- **db_port**: Database port if different from config or default

salt.states.postgres_extension.present(name, if_not_exists=None, schema=None, ext_version=None, from_version=None, user=None, maintenance_db=None, db_user=None, db_password=None, db_host=None, db_port=None)

Ensure that the named extension is present.
Note: Before you can use the state to load an extension into a database, the extension’s supporting files must be already installed.

For more information about all of these options see CREATE EXTENSION SQL command reference in the PostgreSQL documentation.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the extension to be installed</td>
</tr>
<tr>
<td>if_not_exists</td>
<td>Add an IF NOT EXISTS parameter to the DDL statement</td>

</tbody>
</table>

21.19.218 salt.states.postgres_group

Management of PostgreSQL groups (roles)

The postgres_group module is used to create and manage Postgres groups.

```python
salt.states.postgres_group.absent(name, user=None, maintenance_db=None, db_password=None, db_host=None, db_port=None)
```

Ensure that the named group is absent

- **name**: The groupname of the group to remove
- **user**: System user all operations should be performed on behalf of

    New in version 0.17.0.

- **db_user**: Database username if different from config or default
- **db_password**: User password if any password for a specified user
- **db_host**: Database host if different from config or default
- **db_port**: Database port if different from config or default

```python
salt.states.postgres_group.present(name, createdb=None, createroles=None, encrypted=None, superuser=None, inherit=None, login=None, replication=None, password=None, refresh_password=None, groups=None, user=None, maintenance_db=None, db_password=None, db_host=None, db_port=None, db_user=None)
```

Ensure that the named group is present with the specified privileges

- **name**: The name of the group to manage
- **createdb**: Is the group allowed to create databases?
- **createroles**: Is the group allowed to create other roles/users
- **encrypted**: Should the password be encrypted in the system catalog?
- **login**: Should the group have login perm
inherit Should the group inherit permissions
superuser Should the new group be a "superuser"
replication Should the new group be allowed to initiate streaming replication
password The group’s password It can be either a plain string or a md5 postgresql hashed password:

```bash
'md5{MD5OF({password}{role})}'
```

If encrypted is None or True, the password will be automatically encrypted to the previous format if it is not already done.
refresh_password Password refresh flag

Boolean attribute to specify whether to password comparison check should be performed.

If refresh_password is True, the password will be automatically updated without extra password change check.

This behaviour makes it possible to execute in environments without superuser access available, e.g. Amazon RDS for PostgreSQL.
groups A string of comma separated groups the group should be in
user System user all operations should be performed on behalf of

New in version 0.17.0.
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

21.19.219 salt.states.postgres_initdb

Initialization of PostgreSQL data directory

The postgres_initdb module is used to initialize the postgresql data directory.

New in version 2016.3.0.

```bash
pgsql-data-dir:

postgres_initdb.present:
  - name: /var/lib/pgsql/data
  - auth: password
  - user: postgres
  - password: strong_password
  - encoding: UTF8
  - locale: C
  - runas: postgres
```

salt.states.postgres_initdb.present(name, user=None, password=None, auth='password', encoding='UTF8', locale=None, runas=None, waldir=None, checksums=False)

Initialize the PostgreSQL data directory

name The name of the directory to initialize
user The database superuser name
password The password to set for the postgres user
auth The default authentication method for local connections
encoding The default encoding for new databases
locale The default locale for new databases
waldir The transaction log (WAL) directory (default is to keep WAL inside the data directory)
New in version 2019.2.0.

**checksums**  If True, the cluster will be created with data page checksums.

---

**Note:** Data page checksums are supported since PostgreSQL 9.3.

---

New in version 2019.2.0.

**runas**  The system user the operation should be performed on behalf of

---

### 21.19.220 salt.states.postgres_language

#### Management of PostgreSQL languages

The `postgres_language` module is used to create and manage Postgres languages. Languages can be set as either absent or present.

New in version 2016.3.0.

```python
plpgsql:
    postgres_language.present:
        - maintenance_db: testdb

plpgsql:
    postgres_language.absent:
        - maintenance_db: testdb
```

**salt.states.postgres_language.absent** *(name, maintenance_db, user=None, db_password=None, db_host=None, db_port=None, db_user=None)*

Ensure that a named language is absent in the specified database.

- **name**  The name of the language to remove
- **maintenance_db**  The name of the database in which the language is to be installed
- **user**  System user all operations should be performed on behalf of
- **db_user**  database username if different from config or default
- **db_password**  user password if any password for a specified user
- **db_host**  Database host if different from config or default
- **db_port**  Database port if different from config or default

**salt.states.postgres_language.present** *(name, maintenance_db, user=None, db_password=None, db_host=None, db_port=None, db_user=None)*

Ensure that a named language is present in the specified database.

- **name**  The name of the language to install
- **maintenance_db**  The name of the database in which the language is to be installed
- **user**  System user all operations should be performed on behalf of
- **db_user**  database username if different from config or default
- **db_password**  user password if any password for a specified user
- **db_host**  Database host if different from config or default
- **db_port**  Database port if different from config or default

---

### 21.19.221 salt.states.postgres_privileges
Management of PostgreSQL Privileges

The postgres_privileges module is used to manage Postgres privileges. Privileges can be set as either absent or present.

Privileges can be set on the following database object types:

- database
- schema
- tablespace
- table
- sequence
- language
- group

Setting the grant option is supported as well.

New in version 2016.3.0.

<table>
<thead>
<tr>
<th>User</th>
<th>postgres_privileges.present:</th>
</tr>
</thead>
<tbody>
<tr>
<td>baruwa</td>
<td></td>
</tr>
</tbody>
</table>
  object_name: awl  
  object_type: table  
  privileges:  
    - SELECT  
    - INSERT  
    - DELETE  
    - grant_option: False  
    - prepend: public  
    - maintenance_db: testdb |
| andrew |  
  object_name: admins  
  object_type: group  
  grant_option: False  
  maintenance_db: testdb |

<table>
<thead>
<tr>
<th>User</th>
<th>postgres_privileges.absent:</th>
</tr>
</thead>
<tbody>
<tr>
<td>baruwa</td>
<td></td>
</tr>
</tbody>
</table>
  object_name: awl  
  object_type: table  
  privileges:  
    - SELECT  
    - INSERT  
    - DELETE  
    - prepend: public  
    - maintenance_db: testdb |
| andrew |  
  object_name: admins  
  object_type: group  
  maintenance_db: testdb |
salt.states.postgres_privileges.absent(name, object_name, object_type, privileges=None, prepend='public', maintenance_db=None, user=None, db_password=None, db_host=None, db_port=None, db_user=None)

Revoke the requested privilege(s) on the specified object(s)

**name** Name of the role whose privileges should be revoked

**object_name** Name of the object on which the revoke is to be performed

**object_type** The object type, which can be one of the following:
- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

View permissions should specify `object_type: table`.

**privileges** Comma separated list of privileges to revoke, from the list below:
- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

**note** privileges should not be set when revoking group membership

**prepend** Table and Sequence object types live under a schema so this should be provided if the object is not under the default `public` schema

**maintenance_db** The name of the database in which the language is to be installed

**user** System user all operations should be performed on behalf of

**db_user** database username if different from config or default

**db_password** user password if any password for a specified user

**db_host** Database host if different from config or default

**db_port** Database port if different from config or default

salt.states.postgres_privileges.present(name, object_name, object_type, privileges=None, grant_option=None, prepend='public', maintenance_db=None, user=None, db_password=None, db_host=None, db_port=None, db_user=None)

Grant the requested privilege(s) on the specified object to a role

**name** Name of the role to which privileges should be granted

**object_name** Name of the object on which the grant is to be performed. 'ALL' may be used for objects of type 'table' or 'sequence'.

**object_type** The object type, which can be one of the following:
- table
- sequence
- schema
- tablespace
• language
• database
• group
• function

View permissions should specify `object_type: table`.

`privileges` List of privileges to grant, from the list below:
• INSERT
• CREATE
• TRUNCATE
• CONNECT
• TRIGGER
• SELECT
• USAGE
• TEMPORARY
• UPDATE
• EXECUTE
• REFERENCES
• DELETE
• ALL

Note: Privileges should not be set when granting group membership

`grant_option` If `grant_option` is set to True, the recipient of the privilege can in turn grant it to others

`prepend` Table and Sequence object types live under a schema so this should be provided if the object is not under the default `public` schema

`maintenance_db` The name of the database in which the language is to be installed

`user` System user all operations should be performed on behalf of

`db_user` Database username if different from config or default

`db_password` User password if any password for a specified user

`db_host` Database host if different from config or default

`db_port` Database port if different from config or default

## 21.19.222 `salt.states.postgres_schema`

Management of PostgreSQL schemas

The `postgres_schemas` module is used to create and manage Postgres schemas.

```python
public:
    postgres_schema.present 'dbname' 'name'
```

`salt.states.postgres_schema.absent`(*dbname*, *name*, *user=None*, *db_user=None*, *db_password=None*, *db_host=None*, *db_port=None*)

Ensure that the named schema is absent.

`dbname` The database’s name will work on

`name` The name of the schema to remove

`user` System user all operations should be performed on behalf of

`db_user` Database username if different from config or default

`db_password` User password if any password for a specified user

`db_host` Database host if different from config or default

`db_port` Database port if different from config or default

`salt.states.postgres_schema.present`(*dbname*, *name*, *owner=None*, *user=None*, *db_user=None*, *db_password=None*, *db_host=None*, *db_port=None*)

Ensure that the named schema is present in the database.

`dbname` The database’s name will work on
name  The name of the schema to manage
user  system user all operations should be performed on behalf of
db_user  database username if different from config or default
db_password  user password if any password for a specified user
db_host  Database host if different from config or default
db_port  Database port if different from config or default

21.19.223  salt.states.postgres_tablespace

Management of PostgreSQL tablespace

A module used to create and manage PostgreSQL tablespaces.

ssd-tablespace:
  postgres_tablespace.present:
    - name: indexes
    - directory: /mnt/ssd-data

New in version 2015.8.0.

salt.states.postgres_tablespace.absent(name, user=None, maintenance_db=None, db_user=None, db_password=None, db_host=None, db_port=None)

Ensure that the named tablespace is absent.

name  The name of the tablespace to remove
user  System user all operations should be performed on behalf of
maintenance_db  Database to act on
db_user  Database username if different from config or default
db_password  User password if any password for a specified user
db_host  Database host if different from config or default
db_port  Database port if different from config or default

salt.states.postgres_tablespace.present(name, directory, options=None, owner=None, user=None, maintenance_db=None, db_password=None, db_host=None, db_port=None, db_user=None)

Ensure that the named tablespace is present with the specified properties. For more information about all of these options run man 7 create_tablespace.

name  The name of the tablespace to create/manage.
directory  The directory where the tablespace will be located, must already exist
options  A dictionary of options to specify for the tablespace. Currently, the only tablespace options supported are seq_page_cost and random_page_cost. Default values are shown in the example below:

my_space:
  postgres_tablespace.present:
    - directory: /srv/my_tablespace
    - options:
      seq_page_cost: 1.0
      random_page_cost: 4.0

owner  The database user that will be the owner of the tablespace. Defaults to the user executing the command (i.e. the user option)
user  System user all operations should be performed on behalf of
maintenance_db  Database to act on
db_user  Database username if different from config or default
db_password  User password if any password for a specified user
db_host  Database host if different from config or default
db_port  Database port if different from config or default

21.19.224  salt.states.postgres_user

Management of PostgreSQL users (roles)

The postgres_user module is used to create and manage Postgres users.

```
frank:
  postgres_user.present
```

**salt.states.postgres_user.absent**

(name, user=None, maintenance_db=None, db_password=None,
 db_host=None, db_port=None, db_user=None)

Ensure that the named user is absent

**name**  The username of the user to remove

**user**  System user all operations should be performed on behalf of

New in version 0.17.0.

**db_user**  database username if different from config or default

**db_password**  user password if any password for a specified user

**db_host**  Database host if different from config or default

**db_port**  Database port if different from config or default

**salt.states.postgres_user.present**

(name, createdb=None, creatoroles=None, encrypted=None,
 superuser=None, replication=None, inherit=None, login=None, password=None,
 default_password=None, refresh_password=None, valid_until=None, groups=None,
 user=None, maintenance_db=None, db_password=None,
 db_host=None, db_port=None, db_user=None)

Ensure that the named user is present with the specified privileges Please note that the user/group notion in postgresql is just abstract, we have roles, where users can be seen as roles with the LOGIN privilege and groups the others.

**name**  The name of the system user to manage.

**createdb**  Is the user allowed to create databases?

**creatoroles**  Is the user allowed to create other users?

**encrypted**  Should the password be encrypted in the system catalog?

**login**  Should the group have login perm

**inherit**  Should the group inherit permissions

**superuser**  Should the new user be a "superuser"

**replication**  Should the new user be allowed to initiate streaming replication

**password**  The system user’s password. It can be either a plain string or a md5 postgresql hashed password:

```
'md5{{password}{role}}'
```

If encrypted is None or True, the password will be automatically encrypted to the previous format if it is not already done.

**default_password**  The password used only when creating the user, unless password is set.

New in version 2016.3.0.

**refresh_password**  Password refresh flag

Boolean attribute to specify whether to password comparison check should be performed.

If refresh_password is True, the password will be automatically updated without extra password change check.
This behaviour makes it possible to execute in environments without superuser access available, e.g. Amazon RDS for PostgreSQL.

<table>
<thead>
<tr>
<th>valid_until</th>
<th>A date and time after which the role’s password is no longer valid.</th>
</tr>
</thead>
<tbody>
<tr>
<td>groups</td>
<td>A string of comma separated groups the user should be in</td>
</tr>
<tr>
<td>user</td>
<td>System user all operations should be performed on behalf of</td>
</tr>
</tbody>
</table>

New in version 0.17.0.

<table>
<thead>
<tr>
<th>db_user</th>
<th>Postgres database username, if different from config or default.</th>
</tr>
</thead>
<tbody>
<tr>
<td>db_password</td>
<td>Postgres user’s password, if any password, for a specified db_user.</td>
</tr>
<tr>
<td>db_host</td>
<td>Postgres database host, if different from config or default.</td>
</tr>
<tr>
<td>db_port</td>
<td>Postgres database port, if different from config or default.</td>
</tr>
</tbody>
</table>

### 21.19.225 salt.states.powerpath

Powerpath configuration support

Allows configuration of EMC Powerpath. Currently only addition/deletion of licenses is supported.

```yaml
key:
  powerpath.license_present: []
```

salt.states.powerpath.license_absent(name)

Ensures that the specified PowerPath license key is absent on the host.

| name          | The license key to ensure is absent |

salt.states.powerpath.license_present(name)

Ensures that the specified PowerPath license key is present on the host.

| name          | The license key to ensure is present |

### 21.19.226 salt.states.probes

Network Probes

Configure RPM (JunOS)/SLA (Cisco) probes on the device via NAPALM proxy.

<table>
<thead>
<tr>
<th>codeauthor</th>
<th>Mircea Ulinic <a href="mailto:ping@mirceaulinic.net">ping@mirceaulinic.net</a> &amp; Jerome Fleury <a href="mailto:jf@cloudflare.com">jf@cloudflare.com</a></th>
</tr>
</thead>
<tbody>
<tr>
<td>maturity</td>
<td>new</td>
</tr>
<tr>
<td>depends</td>
<td>napalm</td>
</tr>
<tr>
<td>platform</td>
<td>unix</td>
</tr>
</tbody>
</table>

Dependencies

- napalm probes management module

salt.states.probes.managed(name, probes, defaults=None)

Ensure the networks device is configured as specified in the state SLS file. Probes not specified will be removed, while probes not configured as expected will trigger config updates.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>probes</strong> – Defines the probes as expected to be configured on the device. In order to ease the configuration and avoid repeating the same parameters for each probe, the next parameter (defaults) can be used, providing common characteristics.</td>
</tr>
<tr>
<td><strong>defaults</strong> – Specifies common parameters for the probes.</td>
</tr>
</tbody>
</table>

3676 Chapter 21. Salt Module Reference
SLS Example:

```yaml
rpmprobes:
  probes.managed:
    - probes:
      probe_name1:
        probe1_test1:
          source: 192.168.0.2
          target: 192.168.0.1
        probe1_test2:
          target: 172.17.17.1
        probe1_test3:
          target: 8.8.8.8
          probe_type: http-ping
      probe_name2:
        probe2_test1:
          test_interval: 100
      defaults:
        target: 10.10.10.10
        probe_count: 15
        test_interval: 3
        probe_type: icmp-ping
```

In the probes configuration, the only mandatory attribute is `target` (specified either in probes configuration, either in the defaults dictionary). All the other parameters will use the operating system defaults, if not provided:

- **source** - Specifies the source IP Address to be used during the tests. If not specified will use the IP Address of the logical interface loopback0.
- **target** - Destination IP Address.
- **probe_count** - Total number of probes per test (1..15). System defaults: 1 on both JunOS & Cisco.
- **probe_interval** - Delay between tests (0..86400 seconds). System defaults: 3 on JunOS, 5 on Cisco.
- **probe_type** - Probe request type. Available options:
  - `icmp-ping`
  - `tcp-ping`
  - `udp-ping`

Using the example configuration above, after running the state, on the device will be configured 4 probes, with the following properties:

```yaml
probe_name1:
  probe1_test1:
    source: 192.168.0.2
    target: 192.168.0.1
    probe_count: 15
    test_interval: 3
    probe_type: icmp-ping
  probe1_test2:
    target: 172.17.17.1
    probe_count: 15
    test_interval: 3
    probe_type: icmp-ping
  probe1_test3:
    target: 8.8.8.8
    probe_count: 15
    test_interval: 3
    probe_type: http-ping
probe_name2:
  probe2_test1:
```

(continues on next page)
21.19.227 salt.states.process

Process Management

Ensure a process matching a given pattern is absent.

```python
httpd-absent:
  process.absent:
    - name: apache2
```

```python
salt.states.process.absent(name, user=None, signal=None)
```

Ensures that the named command is not running.

- **name**: The pattern to match.
- **user**: The user to which the process belongs.
- **signal**: Signal to send to the process(es).

21.19.228 salt.states.proxy module

Allows you to manage proxy settings on minions

Setup proxy settings on minions

```python
192.168.1.4:
  proxy.managed:
    - port: 3128
    - bypass_domains: localhost 127.0.0.1
```

```python
salt.states.proxy.managed(name, port, services=None, user=None, password=None, bypass_domains=None, network_service='Ethernet')
```

Manages proxy settings for this minion.

- **name**: The proxy server to use.
- **port**: The port used by the proxy server.
- **services**: A list of the services that should use the given proxy settings, valid services include http, https and ftp. If no service is given all of the valid services will be used.
- **user**: The username to use for the proxy server if required.
- **password**: The password to use for the proxy server if required.
- **bypass_domains**: An array of the domains that should bypass the proxy.
- **network_service**: The network service to apply the changes to, this only necessary on macOS.

21.19.229 salt.states.pushover

Send a message to PushOver

This state is useful for sending messages to PushOver during state runs.
New in version 2015.5.0.

```yaml
pushover-message:
  pushover.post_message:
  - user: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
  - token: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
  - title: Salt Returner
  - device: phone
  - priority: -1
  - expire: 3600
  - retry: 5
  - message: 'This state was executed successfully.'
```

The api key can be specified in the master or minion configuration like below:
```
.. code-block:: yaml

  pushover:
    token: peWcBiMOS9HrZG15peWcBiMOS9HrZG15

salt.states.pushover.post_message(name, user=None, device=None, message=None, title=None, priority=None, expire=None, retry=None, sound=None, api_version=1, token=None)
```

Send a message to a PushOver channel.

The following parameters are required:
- **name** The unique name for this event.
- **user** The user or group of users to send the message to. Must be ID of user, not name or email address.
- **message** The message that is to be sent to the PushOver channel.

The following parameters are optional:
- **title** The title to use for the message.
- **device** The device for the user to send the message to.
- **priority** The priority for the message.
- **expire** The message should expire after specified amount of seconds.
- **retry** The message should be resent this many times.
- **token** The token for PushOver to use for authentication, if not specified in the configuration options of master or minion.

### 21.19.230 salt.states.pyenv

**Managing python installations with pyenv**

This module is used to install and manage python installations with pyenv. Different versions of python can be installed, and uninstalled. pyenv will be installed automatically the first time it is needed and can be updated later. This module will not automatically install packages which pyenv will need to compile the versions of python.

If pyenv is run as the root user then it will be installed to /usr/local/pyenv, otherwise it will be installed to the users ~/.pyenv directory. To make pyenv available in the shell you may need to add the pyenv/shims and pyenv/bin directories to the users PATH. If you are installing as root and want other users to be able to access pyenv then you will need to add pyenv_ROOT to their environment.
This is how a state configuration could look like:

```
pyenv-deps:
  pkg.installed:
    - pkgs:
      - make
      - build-essential
      - libssl-dev
      - zlib1g-dev
      - libbz2-dev
      - libreadline-dev
      - libsqlite3-dev
      - wget
      - curl
      - llvm
  python-2.6:
    pyenv.absent:
      - require:
        - pkg: pyenv-deps
  python-2.7.6:
    pyenv.installed:
      - default: True
      - require:
        - pkg: pyenv-deps
```

**Note:** Git needs to be installed and available via PATH if pyenv is to be installed automatically by the module.

**salt.states.pyenv.absent**(*name*, *user=None*)
Verify that the specified python is not installed with pyenv. pyenv is installed if necessary.

- **name** The version of python to uninstall
- **user** None The user to run pyenv as.

New in version 0.17.0.
New in version 0.16.0.

**salt.states.pyenv.install_pyenv**(*name*, *user=None*)
Install pyenv if not installed. Allows you to require pyenv be installed prior to installing the plugins. Useful if you want to install pyenv plugins via the git or file modules and need them installed before installing any rubies.

Use the pyenv.root configuration option to set the path for pyenv if you want a system wide install that is not in a user home dir.

- **user** None The user to run pyenv as.

**salt.states.pyenv.installed**(*name*, *default=False, user=None*)
Verify that the specified python is installed with pyenv. pyenv is installed if necessary.

- **name** The version of python to install
- **default** [False] Whether to make this python the default.
- **user** None The user to run pyenv as.

New in version 0.17.0.
New in version 0.16.0.

**21.19.231 salt.states.pyrax_queues**
Manage Rackspace Queues

New in version 2015.5.0.

Create and destroy Rackspace queues. Be aware that this interacts with Rackspace’s services, and so may incur charges.

This module uses pyrax, which can be installed via package, or pip. This module is greatly inspired by boto_* modules from SaltStack code source.

```
myqueue:
  pyrax_queues.present:
    - provider: my-pyrax

myqueue:
  pyrax_queues.absent:
    - provider: my-pyrax
```

salt.states.pyrax_queues.absent(name, provider)

Ensure the named Rackspace queue is deleted.

name Name of the Rackspace queue.
provider Salt Cloud provider

salt.states.pyrax_queues.present(name, provider)

Ensure the RackSpace queue exists.

name Name of the Rackspace queue.
provider Salt Cloud Provider

21.19.232 salt.states.quota

Management of POSIX Quotas

The quota can be managed for the system:

```
/: 
  quota.mode:
    mode: off
    quotatype: user
```

salt.states.quota.mode(name, mode, quotatype)

Set the quota for the system

name The filesystem to set the quota mode on
mode Whether the quota system is on or off
quotatype Must be user or group

21.19.233 salt.states.rabbitmq_cluster

Manage RabbitMQ Clusters

Example:

```
rabbit@rabbit.example.com:
  rabbitmq_cluster.join:
    - user: rabbit
    - host: rabbit.example.com
```
salt.states.rabbitmq_cluster.join(name, host, user='rabbit', ram_node=None, runas='root')

This function is an alias of joined.

Ensure the current node joined to a cluster with node user@host
name Irrelevant, not used (recommended: user@host)
user The user of node to join to (default: rabbit)
host The host of node to join to
ram_node Join node as a RAM node
runas The user to run the rabbitmq command as

salt.states.rabbitmq_cluster.joined(name, host, user='rabbit', ram_node=None, runas='root')

Ensure the current node joined to a cluster with node user@host
name Irrelevant, not used (recommended: user@host)
user The user of node to join to (default: rabbit)
host The host of node to join to
ram_node Join node as a RAM node
runas The user to run the rabbitmq command as

21.19.234 salt.states.rabbitmq_plugin

Manage RabbitMQ Plugins

New in version 2014.1.0.

Example:

```yaml
some_plugin:
  rabbitmq_plugin.enabled: []
```

salt.states.rabbitmq_plugin.disabled(name, runas=None)

Ensure the RabbitMQ plugin is disabled.
name The name of the plugin
runas The user to run the rabbitmq-plugin command as

salt.states.rabbitmq_plugin.enabled(name, runas=None)

Ensure the RabbitMQ plugin is enabled.
name The name of the plugin
runas The user to run the rabbitmq-plugin command as

21.19.235 salt.states.rabbitmq_policy

Manage RabbitMQ Policies

maintainer Benn Eichhorn <benn@getlocalmeasure.com>
maturity new
platform all

Example:

```yaml
rabbit_policy:
  rabbitmq_policy.present:
    - name: HA
    - pattern: '.*'
    - definition: '{"ha-mode": "all"}'
```
salt.states.rabbitmq_policy.absent(name, vhost='/', runas=None)

Ensure the named policy is absent

Reference: http://www.rabbitmq.com/ha.html
name The name of the policy to remove
runas Name of the user to run the command as

salt.states.rabbitmq_policy.present(name, pattern, definition, priority=0, vhost='/', runas=None, apply_to=None)

Ensure the RabbitMQ policy exists.

Reference: http://www.rabbitmq.com/ha.html
name Policy name
pattern A regex of queues to apply the policy to
definition A json dict describing the policy
priority Priority (defaults to 0)
vhost Virtual host to apply to (defaults to '/')
runas Name of the user to run the command as
apply_to Apply policy to 'queues', 'exchanges' or 'all' (default to 'all')

21.19.236 salt.states.rabbitmq_upstream

Manage RabbitMQ Upstreams

Example:

```
rabbit_upstream:
    rabbitmq_upstream.present:
        - name: upstream_1
        - uri: amqp://my_user:my_password@rabbitmq_host
        - trust_user_id: True
        - ack_mode: on-confirm
        - max_hops: 1
```

New in version 3000.

salt.states.rabbitmq_upstream.absent(name, runas=None)

Ensure the named upstream is absent.

Parameters
- **name** *(str)* – The name of the upstream to remove
- **runas** *(str)* – User to run the command

New in version 3000.

salt.states.rabbitmq_upstream.present(name, uri, prefetch_count=None, reconnect_delay=None, ack_mode=None, trust_user_id=None, exchange=None, max_hops=None, expires=None, message_ttl=None, ha_policy=None, queue=None, runas=None)

Ensure the RabbitMQ upstream exists.

Parameters
- **name** *(str)* – The name of the upstream connection
- **uri** *(str)* – The URI to connect to. If upstream is a cluster and can have several URIs, you can enter them here separated by spaces. Examples: - amqp://user:password@server_name - amqp://user:password@server_name/vhost
  When connecting with SSL, several URI-parameters need also be specified: - cacert-file = /path/to/cacert.pem - certfile = /path/to/cert.pem - keyfile = /part/to/key.pem -
example = verify_peer - fail_if_no_peer_cert = true | false - auth_mechanism = external
Example: - amqp://user:password@server_name?cacertfile=/path/to/cacert.pem&
certfile=/path/to/cert.pem&keyfile=/path/to/key.pem&verify=verify_peer
 - amqp://server-name?cacertfile=/path/to/cacert.pem&certfile=/path/to/cert.pem&
keyfile=/path/to/key.pem&verify=verify_peer&fail_if_no_peer_cert=true&auth_mechanism=external

- **prefetch_count** *(int)* – Maximum number of unacknowledged messages that
  may be in flight over a federation link at one time. Default: 1000
- **reconnect_delay** *(int)* – Time in seconds to wait after a network link goes down
  before attempting reconnection. Default: 5
- **ack_mode** *(str)* – The following values are allowed: on-confirm: Messages are
  acknowledged to the upstream broker after they have been confirmed downstream.
  Handles network errors and broker failures without losing messages. The slowest
  option, and the default. on-publish: Messages are acknowledged to the upstream broker
  after they have been published downstream. Handles network errors without losing
  messages, but may lose messages in the event of broker failures. no-ack: Message
  acknowledgements are not used. The fastest option, but you may lose messages in
  the event of network or broker failures.
- **trust_user_id** *(bool)* – Set *True* to preserve the "user-id" field across a federation
  link, even if the user-id does not match that used to republish the message. Set to
  *False* to clear the "user-id" field when messages are federated. Only set this to
  *True* if you trust the upstream broker not to forge user-ids.
- **exchange** *(str)* – The name of the upstream exchange. Default is to use the same
  name as the federated exchange.
- **max_hops** *(int)* – Maximum number of federation links that messages can traverse
  before being dropped. Defaults to 1 if not set.
- **expires** *(int)* – Time in milliseconds that the upstream should remember about
  this node for. After this time all upstream state will be removed. Set to *None* (Default)
  to mean "forever".
- **message_ttl** *(int)* – Time in milliseconds that undelivered messages should be
  held upstream when there is a network outage or backlog. Set to *None* (default) to
  mean "forever".
- **ha_policy** *(str)* – Determines the "x-ha-policy"-argument for the upstream queue
  for a federated exchange. Default is "none" meaning the queue is not HA.
- **queue** *(str)* – The name of the upstream queue. Default is to use the same name as
  the federated queue.

New in version 3000.

21.19.237 salt.states.rabbitmq_user

Manage RabbitMQ Users

Example:

```yaml
rabbit_user:
    rabbitmq_user.present:
        - password: password
        - force: True
        - tags:
            - monitoring
            - user
        - perms:
            - '/':
            - '*',
```

(continues on next page)
salt.states.rabbitmq_user.absent(name, runas=None)
Ensure the named user is absent
name The name of the user to remove
runas User to run the command

salt.states.rabbitmq_user.present(name, password=None, force=False, tags=None, perms=(), runas=None)
Ensure the RabbitMQ user exists.
name User name
password User’s password, if one needs to be set
force If user exists, forcibly change the password
tags Optional list of tags for the user
perms A list of dicts with vhost keys and 3-tuple values
runas Name of the user to run the command

21.19.238 salt.states.rabbitmq_vhost

Manage RabbitMQ Virtual Hosts

Example:

def __virtual__():
    return 'rabbitmq-

virtual_host:
    rabbitmq_vhost.present:
      - user: rabbit_user
      - conf: .*
      - write: .*
      - read: .*

salt.states.rabbitmq_vhost.absent(name)
Ensure the RabbitMQ Virtual Host is absent
name Name of the Virtual Host to remove
runas User to run the command

    Deprecated since version 2015.8.0.

salt.states.rabbitmq_vhost.present(name)
Ensure the RabbitMQ VHost exists.
name VHost name
user Initial user permission to set on the VHost, if present

    Deprecated since version 2015.8.0.
owner Initial owner permission to set on the VHost, if present

    Deprecated since version 2015.8.0.
cnf Initial conf string to apply to the VHost and user. Defaults to .*

    Deprecated since version 2015.8.0.
write Initial write permissions to apply to the VHost and user. Defaults to .*

    Deprecated since version 2015.8.0.
read Initial read permissions to apply to the VHost and user. Defaults to .*

    Deprecated since version 2015.8.0.

21.19. state modules
runas  Name of the user to run the command

  Deprecated since version 2015.8.0.

21.19.239 salt.states.rbac_solaris

Management of Solaris RBAC

  maintainer  Jorge Schrauwen <sjorge@blackdot.be>
  maturity  new
  depends  rbac_solaris,solaris_user
  platform  solaris,illumos

New in version 2016.11.0.

sjorge:

  rbac.managed:
    - roles:
    - netcfg
    - profiles:
      - System Power
    - authorizations:
      - solaris.audit.*

salt.states.rbac_solaris.managed(name, roles=\None, profiles=\None, authorizations=\None)

  Manage RBAC properties for user
  name  [string] username
  roles  [list] list of roles for user
  profiles  [list] list of profiles for user
  authorizations  [list] list of authorizations for user

  Warning:  All existing roles, profiles and authorizations will be replaced! An empty list will remove everything.
  Set the property to None to not manage it.

21.19.240 salt.states.rbenv

Managing Ruby installations with rbenv

This module is used to install and manage ruby installations with rbenv and the ruby-build plugin. Different versions of ruby can be installed, and uninstalled. Rbenv will be installed automatically the first time it is needed and can be updated later. This module will not automatically install packages which rbenv will need to compile the versions of ruby. If your version of ruby fails to install, refer to the ruby-build documentation to verify you are not missing any dependencies: https://github.com/rbenv/ruby-build/wiki

If rbenv is run as the root user then it will be installed to /usr/local/rbenv, otherwise it will be installed to the users ~/.rbenv directory. To make rbenv available in the shell you may need to add the rbenv/shims and rbenv/bin directories to the users PATH. If you are installing as root and want other users to be able to access rbenv then you will need to add RBENV_ROOT to their environment.

The following state configuration demonstrates how to install Ruby 1.9.x and 2.x using rbenv on Ubuntu/Debian:
rbenv-deps:
  pkg.installed:
    - names:
      - bash
      - git
      - openssl
      - libssl-dev
      - make
      - curl
      - autoconf
      - bison
      - build-essential
      - libffi-dev
      - libyaml-dev
      - libreadline6-dev
      - zlib1g-dev
      - libncurses5-dev

ruby-1.9.3-p429:
  rbenv.absent:
    - require:
      - pkg: rbenv-deps

ruby-2.0.0-p598:
  rbenv.installed:
    - default: True
    - require:
      - pkg: rbenv-deps

salt.states.rbenv.absent(name, user=None)
Verify that the specified ruby is not installed with rbenv. Rbenv is installed if necessary.
name The version of ruby to uninstall
user: None The user to run rbenv as.

New in version 0.17.0.
New in version 0.16.0.

salt.states.rbenv.install_rbenv(name, user=None)
Install rbenv if not installed. Allows you to require rbenv be installed prior to installing the plugins. Useful if you want to install rbenv plugins via the git or file modules and need them installed before installing any rubies.
Use the rbenv.root configuration option to set the path for rbenv if you want a system wide install that is not in a user home dir.
user: None The user to run rbenv as.

salt.states.rbenv.installed(name, default=False, user=None)
Verify that the specified ruby is installed with rbenv. Rbenv is installed if necessary.
name The version of ruby to install
default [False] Whether to make this ruby the default.
user: None The user to run rbenv as.

New in version 0.17.0.
New in version 0.16.0.
21.19.241  salt.states.rdp

Manage RDP Service on Windows servers

salt.states.rdp.disabled(name)
   Disable the RDP service

salt.states.rdp.enabled(name)
   Enable the RDP service and make sure access to the RDP port is allowed in the firewall configuration

21.19.242  salt.states.redismod

Management of Redis server

New in version 2014.7.0.

   depends
      • redis Python module

   configuration  See salt.modules.redis for setup instructions.

| key_in_redis: |
| redis.string: |
| - value: string data |

The redis server information specified in the minion config file can be overridden in states using the following arguments: host, port, db, password.

| key_in_redis: |
| redis.string: |
| - value: string data |
| - host: localhost |
| - port: 6379 |
| - db: 0 |
| - password: somuchkittycat |

salt.states.redismod.absent(name, keys=None, **connection_args)
   Ensure key absent from redis
      name  Key to ensure absent from redis
      keys  list of keys to ensure absent, name will be ignored if this is used

salt.states.redismod.slaveof(name, sentinel_host=None, sentinel_port=None, sentinel_password=None, **connection_args)
   Set this redis instance as a slave.
      name  Master to make this a slave of
      sentinel_host  Ip of the sentinel to check for the master
      sentinel_port  Port of the sentinel to check for the master

salt.states.redismod.string(name, value, expire=None, expireat=None, **connection_args)
   Ensure that the key exists in redis with the value specified
      name  Redis key to manage
      value  Data to persist in key
      expire  Sets time to live for key in seconds
      expireat  Sets expiration time for key via UNIX timestamp, overrides expire
21.19.243  salt.states.reg

Manage the Windows registry

Many python developers think of registry keys as if they were python keys in a dictionary which is not the case. The windows registry is broken down into the following components:

Hives

This is the top level of the registry. They all begin with HKEY.

- HKEY_CLASSES_ROOT (HKCR)
- HKEY_CURRENT_USER (HKCU)
- HKEY_LOCAL_MACHINE (HKLM)
- HKEY_USER (HKU)
- HKEY_CURRENT_CONFIG

Keys

Hives contain keys. These are basically the folders beneath the hives. They can contain any number of subkeys.

When passing the hivekey values they must be quoted correctly depending on the backslashes being used (\ vs \\). The way backslashes are handled in the state file is different from the way they are handled when working on the CLI. The following are valid methods of passing the hivekey:

- **Using single backslashes:** HKLM\SOFTWARE\Python 'HKLM\SOFTWARE\Python'
- **Using double backslashes:** "HKLM\SOFTWARE\Python"

Values or Entries

Values or Entries are the name/data pairs beneath the keys and subkeys. All keys have a default name/data pair. The name is *(Default)* with a displayed value of *(value not set)*. The actual value is Null.

Example

The following example is taken from the windows startup portion of the registry:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Run]
"RTHDVCPL"=""C:\Program Files\Realtek\Audio\HDA\RtkNGUI64.exe" -s"
"NvBackend"=""C:\Program Files (x86)\NVIDIA Corporation\Update Core\NvBackend.exe"
"BTMTrayAgent"="rundll32.exe "C:\Program Files (x86)\Intel\Bluetooth\btmshellex.dll",TrayApp"
```

In this example these are the values for each:

**Hive:** HKEY_LOCAL_MACHINE

**Key and subkeys:** SOFTWARE\Microsoft\Windows\CurrentVersion\Run

**Value:**
• There are 3 value names: RTHDVCPL, NvBackend, and BTMTrayAgent

• Each value name has a corresponding value

salt.states.reg.absent(name, vname=None, use_32bit_registry=False)
Ensure a registry value is removed. To remove a key use key_absent.

Parameters

- **name** (str) – A string value representing the full path of the key to include the HIVE, Key, and all Subkeys. For example:
  
  HKEY_LOCAL_MACHINE\SOFTWARE\Salt
  
  Valid hive values include:
  - HKEY_CURRENT_USER or HKCU
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_USERS or HKU
- **vname** (str) – The name of the value you’d like to create beneath the Key. If this parameter is not passed it will assume you want to set the (Default) value
- **use_32bitRegistry** (bool) – Use the 32bit portion of the registry. Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is False.

Returns A dictionary showing the results of the registry operation.

Return type dict

CLI Example:

```
'HKEY_CURRENT_USER\SOFTWARE\Salt':
  - reg.absent
    - vname: version
```

In the above example the value named version will be removed from the SOFTWARE\Salt key in the HKEY_CURRENT_USER hive. If vname was not passed, the (Default) value would be deleted.

salt.states.reg.key_absent(name, use_32bit_registry=False)
New in version 2015.5.4.

Ensure a registry key is removed. This will remove the key, subkeys, and all value entries.

Parameters

- **name** (str) – A string representing the full path to the key to be removed to include the hive and the keypath. The hive can be any of the following:
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
- **use_32bitRegistry** (bool) – Use the 32bit portion of the registry. Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is False.

Returns A dictionary showing the results of the registry operation.

Return type dict

CLI Example:

```
remove_key_demo:
  reg.key_absent:
    - name: HKEY_CURRENT_USER\SOFTWARE\DeleteMe
```

In the above example the path is interpreted as follows:

- HKEY_CURRENT_USER is the hive
- SOFTWARE\DeleteMe is the key
salt.states.reg.present(name, vname=None, vdata=None, vtype='REG_SZ', use_32bit_registry=False, win_owner=None, win_perms=None, win_deny_perms=None, win_inheritance=True, win_perms_reset=False)

Ensure a registry key or value is present.

Parameters

- **name (str)** – A string value representing the full path of the key to include the HIVE, Key, and all Subkeys. For example:

```plaintext
HKEY_LOCAL_MACHINE\SOFTWARE\Salt
```

Valid hive values include:
- HKEY_CURRENT_USER or HKCU
- HKEY_LOCAL_MACHINE or HKLM
- HKEY_USERS or HKU

- **vname (str)** – The name of the value you’d like to create beneath the Key. If this parameter is not passed it will assume you want to set the (Default) value.

- **vdata (str, int, list, bytes)** – The value you’d like to set. If a value name (vname) is passed, this will be the data for that value name. If not, this will be the (Default) value for the key.

The type of data this parameter expects is determined by the value type specified in vtype. The correspondence is as follows:
- REG_BINARY: Binary data (str in Py2, bytes in Py3)
- REG_DWORD: int
- REG_EXPAND_SZ: str
- REG_MULTI_SZ: list of str
- REG_QWORD: int
- REG_SZ: str

**Note:** When setting REG_BINARY, string data will be converted to binary automatically. To pass binary data, use the built-in yaml tag `!!binary` to denote the actual binary characters. For example, the following lines will both set the same data in the registry:

```plaintext
vdata: Salty Test
vdata: !!binary U2FsdHkgVGVzdA==
```

**Note:** The type for the (Default) value is always REG_SZ and cannot be changed. This parameter is optional. If not passed, the Key will be created with no associated item/value pairs.

- **vtype (str)** – The value type for the data you wish to store in the registry. Valid values are:
  - REG_BINARY
  - REG_DWORD
  - REG_EXPAND_SZ
  - REG_MULTI_SZ
  - REG_QWORD
  - REG_SZ (Default)

- **use_32bit_registry (bool)** – Use the 32bit portion of the registry. Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is False.

- **win_owner (str)** – The owner of the registry key. If this is not passed, the account under which Salt is running will be used.

21.19. state modules 3691
Note: Owner is set for the key that contains the value/data pair. You cannot set ownership on value/data pairs themselves.

New in version 2019.2.0.

- **win_perms (dict)** – A dictionary containing permissions to grant and their propagation. If not passed the 'Grant' permissions will not be modified.

Note: Permissions are set for the key that contains the value/data pair. You cannot set permissions on value/data pairs themselves.

For each user specify the account name, with a sub dict for the permissions to grant and the 'Applies to' setting. For example: {'Administrators': {'perms': 'full_control', 'applies_to': 'this_key_subkeys'}}. perms must be specified.

Registry permissions are specified using the perms key. You can specify a single basic permission or a list of advanced perms. The following are valid perms:

**Basic (passed as a string):**
- full_control
- read
- write

**Advanced (passed as a list):**
- delete
- query_value
- set_value
- create_subkey
- enum_subkeys
- notify
- create_link
- read_control
- write_dac
- write_owner

The 'Applies to' setting is optional. It is specified using the applies_to key. If not specified this_key_subkeys is used. Valid options are:

**Applies to settings:**
- this_key_only
- this_key_subkeys
- subkeys_only

New in version 2019.2.0.

- **win_deny_perms (dict)** – A dictionary containing permissions to deny and their propagation. If not passed the Deny permissions will not be modified.

Note: Permissions are set for the key that contains the value/data pair. You cannot set permissions on value/data pairs themselves.

Valid options are the same as those specified in win_perms

Note:
'Deny' permissions always take precedence over 'grant' permissions.
New in version 2019.2.0.

- **win_inheritance (bool)** – True to inherit permissions from the parent key. False to disable inheritance. Default is True.

  **Note:** Inheritance is set for the key that contains the value/data pair. You cannot set inheritance on value/data pairs themselves.

New in version 2019.2.0.

- **win_perms_reset (bool)** – If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False

  **Note:** Perms are reset for the key that contains the value/data pair. You cannot set permissions on value/data pairs themselves.

New in version 2019.2.0.

**Returns** A dictionary showing the results of the registry operation.

**Return type** dict

Example:

The following example will set the (Default) value for the SOFTWARE\\Salt key in the HKEY_CURRENT_USER hive to 2016.3.1:

```plaintext
HKEY_CURRENT_USER\\SOFTWARE\\Salt:
  reg.present:
    - vdata: 2016.3.1
```

Example:

The following example will set the value for the version entry under the SOFTWARE\\Salt key in the HKEY_CURRENT_USER hive to 2016.3.1. The value will be reflected in Wow6432Node:

```plaintext
HKEY_CURRENT_USER\\SOFTWARE\\Salt:
  reg.present:
    - vname: version
      vdata: 2016.3.1
```

In the above example the path is interpreted as follows:

- HKEY_CURRENT_USER is the hive
- SOFTWARE\\Salt is the key
- vname is the value name (‘version’) that will be created under the key
- vdata is the data that will be assigned to ‘version’

Example:

Binary data can be set in two ways. The following two examples will set a binary value of Salty Test

```plaintext
no_conversion:
  reg.present:
    - name: HKLM\\SOFTWARE\\SaltTesting
    - vname: test_reg_binary_state
    - vdata: Salty Test
    - vtype: REG_BINARY

conversion:
```

(continues on next page)
Example:

To set a `REG_MULTI_SZ` value:

```python
reg_multi_sz:
    reg.present:
      - name: HKLM\SOFTWARE\Salt
      - vname: reg_multi_sz
      - vdata:
        - list item 1
        - list item 2
```

Example:

To ensure a key is present and has permissions:

```python
set_key_permissions:
    reg.present:
      - name: HKLM\SOFTWARE\Salt
      - vname: version
      - vdata: 2016.3.1
      - win_owner: Administrators
      - win_perms:
        jsnuffy:
          perms: full_control
        sjones:
          perms:
            - read_control
            - enum_subkeys
            - query_value
          applies_to:
            - this_key_only
      - windeny_perms:
        bsimpson:
          perms: full_control
          applies_to: this_key_subkeys
      - win_inheritance: True
      - win_perms_reset: True
```

21.19.244 `salt.states.rsync`

State to synchronize files and directories with rsync.

New in version 2016.3.0.

```python
/opt/user-backups:
rsync.synchronized:
  - source: /home
  - force: True
```
salt.states.rsync.synchronized(name, source, delete=False, force=False, update=False, passwordfile=None, exclude=None, excludefrom=None, prepare=False, dryrun=False, additional_opts=None)

Guarantees that the source directory is always copied to the target.

name Name of the target directory.
source Source directory.
prepare Create destination directory if it does not exists.
delete Delete extraneous files from the destination dirs (True or False)
force Force deletion of dirs even if not empty
update Skip files that are newer on the receiver (True or False)
passwordfile Read daemon-access password from the file (path)
exclude Exclude files, that matches pattern.
excludefrom Read exclude patterns from the file (path)
dryrun Perform a trial run with no changes made. Is the same as doing test=True

New in version 2016.3.1.
additional_opts Pass additional options to rsync, should be included as a list.

New in version 2018.3.0.

21.19.245 salt.states.rvm

Managing Ruby installations and gemsets with Ruby Version Manager (RVM)

This module is used to install and manage ruby installations and gemsets with RVM, the Ruby Version Manager. Different versions of ruby can be installed and gemsets created. RVM itself will be installed automatically if it’s not present. This module will not automatically install packages that RVM depends on or ones that are needed to build ruby. If you want to run RVM as an unprivileged user (recommended) you will have to create this user yourself. This is how a state configuration could look like:

```yaml
rvm:
  group.present: []
user.present:
  - gid: rvm
  - home: /home/rvm
  - require:
    - group: rvm
rvm-deps:
  pkg.installed:
    - pkgs:
      - bash
      - coreutils
      - gzip
      - bzip2
      - gawk
      - sed
      - curl
      - git-core
      - subversion
mri-deps:
  pkg.installed:
    - pkgs:
      - build-essential
      - openssl
```

(continues on next page)
- libreadline6
- libreadline6-dev
- curl
- git-core
- zlib1g
- zlib1g-dev
- libssl-dev
- libyaml-dev
- libsqlite3-0
- libsqlite3-dev
- sqlite3
- libxml2-dev
- libxslt1-dev
- autoconf
- libc6-dev
- libncurses5-dev
- automake
- libtool
- bison
- subversion
- ruby

jruby-deps:
  pkg.installed:
    - pkgs:
      - curl
      - g++
      - openjdk-6-jre-headless

ruby-1.9.2:
  rvm.installed:
    - default: True
    - user: rvm
    - require:
      - pkg: rvm-deps
      - pkg: mri-deps
      - user: rvm

jruby:
  rvm.installed:
    - user: rvm
    - require:
      - pkg: rvm-deps
      - pkg: jruby-deps
      - user: rvm

jgemset:
  rvm.gemset_present:
    - ruby: jruby
    - user: rvm
    - require:
      - rvm: jruby

mygemset:
  rvm.gemset_present:
    - ruby: ruby-1.9.2
- **user**: `rvm`
- **require**:
  - **rvm**: `ruby-1.9.2`

salt.states.rvm.gemset_present(name, ruby='default', user=None)
Verify that the gemset is present.
- **name** The name of the gemset.
- **ruby**: `default` The ruby version this gemset belongs to.
- **user**: `None` The user to run rvm as.

New in version 0.17.0.

salt.states.rvm.installed(name, default=False, user=None, opts=None, env=None)
Verify that the specified ruby is installed with RVM. RVM is installed when necessary.
- **name** The version of ruby to install
- **default** [False] Whether to make this ruby the default.
- **user**: `None` The user to run rvm as.
- **env**: `None` A list of environment variables to set (ie, RUBY_CONFIGURE_OPTS)
- **opts**: `None` A list of option flags to pass to RVM (ie -C, -patch)

New in version 0.17.0.

### 21.19.246 salt.states.salt_proxy module

Salt proxy state
New in version 2015.8.2.
State to deploy and run salt-proxy processes on a minion.
Set up pillar data for your proxies per the documentation.
Run the state as below
..code-block:: yaml

    salt-proxy-configure:
      salt_proxy.configure_proxy:
        • proxyname: p8000
        • start: True

This state will configure the salt proxy settings within /etc/salt/proxy (if /etc/salt/proxy doesn’t exists) and start the salt-proxy process (default true), if it isn’t already running.

salt.states.salt_proxy.configure_proxy(name, proxyname='p8000', start=True)
Create the salt proxy file and start the proxy process if required
- **name** – The name of this state
- **proxyname** – Name to be used for this proxy (should match entries in pillar)
- **start** – Boolean indicating if the process should be started

Example:
..code-block:: yaml

    salt-proxy-configure:
      salt_proxy.configure_proxy:
        • proxyname: p8000
        • start: True

21.19. state modules
21.19.247  salt.states.saltmod

Control the Salt command interface

This state is intended for use from the Salt Master. It provides access to sending commands down to minions as well as access to executing master-side modules. These state functions wrap Salt’s Python API.

Support for masterless minions was added to the salt.state function, so they can run orchestration sls files. This is particularly useful when the rendering of a state is dependent on the execution of another state. Orchestration will render and execute each orchestration block independently, while honoring requisites to ensure the states are applied in the correct order.

See also:

More Orchestrate documentation

• Full Orchestrate Tutorial
• The Orchestrate runner

salt.states.saltmod.function(name, tgt, ssh=False, tgt_type='glob', ret='', ret_config=None, ret_kwargs=None, expect_minions=False, fail_minions=None, fail_function=None, arg=None, kwarg=None, timeout=None, batch=None, subset=None, failhard=None, **kwargs)

Execute a single module function on a remote minion via salt or salt-ssh
name  The name of the function to run, aka cmd.run or pkg.install
tgt  The target specification, aka '*' for all minions
tgt_type  The target type, defaults to glob
arg  The list of arguments to pass into the function
kwarg  The dict (not a list) of keyword arguments to pass into the function
ret  Optionally set a single or a list of returners to use
ret_config  Use an alternative returner configuration
ret_kwargs  Override individual returner configuration items
expect_minions  An optional boolean for failing if some minions do not respond
fail_minions  An optional list of targeted minions where failure is an option
fail_function  An optional string that points to a salt module that returns True or False based on the returned data dict for individual minions
ssh  Set to True to use the ssh client instead of the standard salt client
batch  Execute the command in batches. E.g.: 10%
subset  Number of minions from the targeted set to randomly use

New in version 2017.7.0.
failhard  pass failhard down to the executing state

New in version 2019.2.2.

salt.states.saltmod.parallel_runners(name, runners, **kwargs)

Executes multiple runner modules on the master in parallel.

New in version 2017.x.0: (Nitrogen)

A separate thread is spawned for each runner. This state is intended to be used with the orchestrate runner in place of the saltmod.runner state when different tasks should be run in parallel. In general, Salt states are not safe when used concurrently, so ensure that they are used in a safe way (e.g. by only targeting separate minions in parallel tasks).

name:  name identifying this state. The name is provided as part of the output, but not used for anything else.
runners:  list of runners that should be run in parallel. Each element of the list has to be a dictionary. This dictionary’s name entry stores the name of the runner function that shall be invoked. The optional kwarg entry stores a dictionary of named arguments that are passed to the runner function.
Salt documentation, Release 3000.2

parallel-state:
salt.parallel_runners:
  - runners:
    my_runner_1:
      - name: state.orchestrate
      - kwarg:
        mods: orchestrate_state_1
    my_runner_2:
      - name: state.orchestrate
      - kwarg:
        mods: orchestrate_state_2

salt.states.saltmod.run(runner, **kwargs)
Execute a runner module on the master
name The name of the function to run
kwarg Any keyword arguments to pass to the runner function

run-manage-up:
salt.runner:
  - name: manage.up

salt.states.saltmod.state(name, tgt, ssh=False, tgt_type='glob', ret='', ret_config=None, ret_kwarg=None, highstate=None, sls=None, top=None, saltenv=None, test=None, pillar=None, pillarenv=None, expect_minions=True, fail_minions=None, allow_fail=0, concurrent=False, timeout=None, batch=None, queue=False, subset=None, orchestration_jid=None, failhard=None, **kwargs)
Invoke a state run on a given target
name An arbitrary name used to track the state execution
tgt The target specification for the state run.

Masterless support: When running on a masterless minion, the tgt is ignored and will always be the local minion.
tgt_type The target type to resolve, defaults to glob
ret Optionally set a single or a list of returners to use
ret_config Use an alternative returner configuration
ret_kwarg Override individual returner configuration items
highstate Defaults to None, if set to True the target systems will ignore any sls references specified in the sls option and call state.highstate on the targeted minions
top Should be the name of a top file. If set state.top is called with this top file instead of state.sls
sls A group of sls files to execute. This can be defined as a single string containing a single sls file, or a list of sls files
test Pass test=true or test=false through to the state function. This can be used to override a test mode set in the minion’s config file. If left as the default of None and the ‘test’ mode is supplied on the command line, that value is passed instead.
pillar Pass the pillar kwarg through to the state function
pillarenv The pillar environment to grab pillars from

New in version 2017.7.0.
saltenv The default salt environment to pull sls files from
ssh Set to True to use the ssh client instead of the standard salt client
roster In the event of using salt-ssh, a roster system can be set
expect_minions An optional boolean for failing if some minions do not respond
fail_minions An optional list of targeted minions where failure is an option
allow_fail Pass in the number of minions to allow for failure before setting the result of the execution to False

allow_fail Pass in the number of minions to allow for failure before setting the result of the execution to False. Allow multiple state runs to occur at once.

WARNING: This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same Do not use this flag for performance optimization.

queue Pass `queue=true` through to the state function

batch Execute the command in batches. E.g.: 10%.

New in version 2016.3.0.

subset Number of minions from the targeted set to randomly use

New in version 2017.7.0.

failhard pass failhard down to the executing state

New in version 2019.2.2.

Examples:

Run a list of sls files via `state.sls` on target minions:

```
websevers:
  salt.state:
    - tgt: 'web*'
    - sls:
      - apache
      - django
      - core
    - saltenv: prod
```

Run a full `state.highstate` on target minions:

```
databases:
  salt.state:
    - tgt: role:database
    - tgt_type: grain
    - highstate: True
```

```
salt.states.saltmod.wait_for_event(name, id_list, event_id='id', timeout=300, node='master')
```

Watch Salt’s event bus and block until a condition is met

New in version 2014.7.0.

name An event tag to watch for; supports Reactor-style globbing.

id_list A list of event identifiers to watch for – usually the minion ID. Each time an event tag is matched the event data is inspected for `event_id`, if found it is removed from `id_list`. When `id_list` is empty this function returns success.

event_id [id] The name of a key in the event data. Default is `id` for the minion ID, another common value is `name` for use with orchestrating salt-cloud events.

timeout [300] The maximum time in seconds to wait before failing.

The following example blocks until all the listed minions complete a restart and reconnect to the Salt master:

```
reboot_all_minions:
  salt.function:
    - name: system.reboot
    - tgt: '*'

wait_for_reboots:
  salt.wait_for_event:
    - name: salt/minion/*/start
    - id_list:
      - jerry
```

(continues on next page)
salt.states.saltmod.wheel(name, **kwargs)
Execute a wheel module on the master

New in version 2014.7.0.

name  The name of the function to run
kwarg  Any keyword arguments to pass to the wheel function

accept_minion_key:
salt.wheel:
  - name: key.accept
  - match: frank

21.19.248  salt.states.saltutil
Saltutil State

This state wraps the saltutil execution modules to make them easier to run from a states. Rather than needing to to use module.run this state allows for improved change detection.

salt.states.saltutil.sync_all(name, **kwargs)
Performs the same task as saltutil.sync_all module See saltutil module for full list of options

sync_everything:
saltutil.sync_all:
  - refresh: True

salt.states.saltutil.sync_beacons(name, **kwargs)
Performs the same task as saltutil.sync_beacons module See saltutil module for full list of options

sync_everything:
saltutil.sync_beacons:
  - refresh: True

salt.states.saltutil.sync_clouds(name, **kwargs)
Performs the same task as saltutil.sync_clouds module See saltutil module for full list of options

sync_everything:
saltutil.sync_clouds:
  - refresh: True
salt.states.saltutil.sync_engines(name, **kwargs)
Performs the same task as saltutil.sync_engines module See saltutil module for full list of options

    sync_everything:
        saltutil.sync_utils:
            - refresh: True

21.19.249 salt.states.schedule

Management of the Salt scheduler

job3:
    schedule.present:
        - function: test.ping
        - seconds: 3600
        - splay: 10

This will schedule the command: test.ping every 3600 seconds (every hour) splaying the time between 0 and 10 seconds

job2:
    schedule.present:
        - function: test.ping
        - seconds: 15
        - splay:
            start: 10
            end: 20

This will schedule the command: test.ping every 15 seconds splaying the time between 10 and 20 seconds

job1:
    schedule.present:
        - function: state.sls
        - job_args:
            httpd
        - job_kwargs:
            test: True

(continues on next page)
This will schedule the command: state.sls httpd test=True at 5pm on Monday, Wednesday and Friday, and 3pm on Tuesday and Thursday. Requires that python-dateutil is installed on the minion.

```yaml
job1:
  schedule.present:
    - function: state.sls
    - job_args:
        - httpd
    - job_kwargs:
        - test: True
    - when:
        - Monday 5:00pm
        - Tuesday 3:00pm
        - Wednesday 5:00pm
        - Thursday 3:00pm
        - Friday 5:00pm
```

Scheduled jobs can also be specified using the format used by cron. This will schedule the command: state.sls httpd test=True to run every 5 minutes. Requires that python-croniter is installed on the minion.

```yaml
job1:
  schedule.present:
    - function: state.sls
    - job_args:
        - httpd
    - job_kwargs:
        - test: True
    - cron: '*/5 * * * *'
```

This will schedule the command: state.sls httpd test=True at 5pm on Monday, Wednesday and Friday, and 3pm on Tuesday and Thursday. Using the xmpp returner to return the results of the scheduled job, with the alternative configuration options found in the xmpp_state_run section.

```yaml
job1:
  schedule.present:
    - function: state.sls
    - job_args:
        - httpd
    - job_kwargs:
        - test: True
    - when:
        - Monday 5:00pm
        - Tuesday 3:00pm
        - Wednesday 5:00pm
        - Thursday 3:00pm
        - Friday 5:00pm
    - returner: xmpp
    - return_config: xmpp_state_run
    - return_kwargs:
        - recipient: user@domain.com
```

This will schedule the command: state.sls httpd test=True at 5pm on Monday, Wednesday and Friday, and 3pm on Tuesday and Thursday. Requires that python-dateutil is installed on the minion.
This will schedule the command: state.sls httpd test=True at 5pm on Monday, Wednesday and Friday, and 3pm on Tuesday and Thursday. Requires that python-dateutil is installed on the minion.

salt.states.schedule.absent(name, **kwargs)
Ensure a job is absent from the schedule
name The unique name that is given to the scheduled job.
persist Whether the job should persist between minion restarts, defaults to True.

salt.states.schedule.disabled(name, **kwargs)
Ensure a job is disabled in the schedule
name The unique name that is given to the scheduled job.
persist Whether the job should persist between minion restarts, defaults to True.

salt.states.schedule.enabled(name, **kwargs)
Ensure a job is enabled in the schedule
name The unique name that is given to the scheduled job.
persist Whether the job should persist between minion restarts, defaults to True.

salt.states.schedule.present(name, **kwargs)
Ensure a job is present in the schedule
name The unique name that is given to the scheduled job.
seconds The scheduled job will be executed after the specified number of seconds have passed.
minutes The scheduled job will be executed after the specified number of minutes have passed.
hours The scheduled job will be executed after the specified number of hours have passed.
days The scheduled job will be executed after the specified number of days have passed.
when This will schedule the job at the specified time(s). The when parameter must be a single value or a
dictionary with the date string(s) using the dateutil format. Requires python-dateutil.
cron This will schedule the job at the specified time(s) using the crontab format. Requires python-croniter.
run_on_start Whether the job will run when Salt minion starts, or the job will be skipped once and run at
the next scheduled run. Value should be a boolean.
function The function that should be executed by the scheduled job.
job_args The arguments that will be used by the scheduled job.
job_kwargs The keyword arguments that will be used by the scheduled job.
maxrunning Ensure that there are no more than N copies of a particular job running.
jid_include Include the job into the job cache.
splay The amount of time in seconds to splay a scheduled job. Can be specified as a single value in seconds
or as a dictionary range with 'start' and 'end' values.
rangef This will schedule the command within the range specified. The range parameter must be a dictionary
with the date strings using the dateutil format. Requires python-dateutil.
one This will schedule a job to run once on the specified date.
one_fmt The default date format is ISO 8601 but can be overridden by also specifying the once_fmt option.
enabled Whether the job should be enabled or disabled. Value should be a boolean.
return_job Whether to return information to the Salt master upon job completion.
metadata Using the metadata parameter special values can be associated with a scheduled job. These values
are not used in the execution of the job, but can be used to search for specific jobs later if combined with
the return_job parameter. The metadata parameter must be specified as a dictionary, otherwise it will be
ignored.
returner The returner to use to return the results of the scheduled job.
return_config The alternative configuration to use for returner configuration options.
return_kwargs Any individual returner configuration items to override. Should be passed as a dictionary.
persist  Whether the job should persist between minion restarts, defaults to True.

skip_during_range  This will ensure that the scheduled command does not run within the range specified. The range parameter must be a dictionary with the date strings using the dateutil format. Requires python-dateutil.

run_after_skip_range  Whether the job should run immediately after the skip_during_range time period ends.

21.19.250  salt.states.selinux

Management of SELinux rules

If SELinux is available for the running system, the mode can be managed and booleans can be set.

```python
enforcing:
    selinux.mode

samba_create_home_dirs:
    selinux.boolean:
        - value: True
        - persist: True

nginx:
    selinux.module:
        - enabled: False
```

Note:  Use of these states require that the selinux execution module is available.

salt.states.selinux.boolean(name, value, persist=False)

Set up an SELinux boolean

- name  The name of the boolean to set
- value  The value to set on the boolean
- persist  Defaults to False, set persist to true to make the boolean apply on a reboot

salt.states.selinux.fcontext_policy_absent(name, filetype='a', sel_type=None, sel_user=None, sel_level=None)

New in version 2017.7.0.

Makes sure an SELinux file context policy for a given filespec (name), filetype and SELinux context type is absent.

- name  filespec of the file or directory. Regex syntax is allowed.
- filetype  The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also man semanage-fcontext. Defaults to ‘a’ (all files).
- sel_type  The SELinux context type. There are many.
- sel_user  The SELinux user.
- sel_level  The SELinux MLS range.

salt.states.selinux.fcontext_policy_applied(name, recursive=False)

New in version 2017.7.0.

Checks and makes sure the SELinux policies for a given filespec are applied.

salt.states.selinux.fcontext_policy_present(name, sel_type, filetype='a', sel_user=None, sel_level=None)

New in version 2017.7.0.

Makes sure a SELinux policy for a given filespec (name), filetype and SELinux context type is present.

- name  filespec of the file or directory. Regex syntax is allowed.
sel_type  SELinux context type. There are many.

filetype  The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also man semanage-fcontext.
          Defaults to ’a’ (all files).

sel_user  The SELinux user.

sel_level  The SELinux MLS range.

salt.states.selinux.mode(name)
Verifies the mode SELinux is running in, can be set to enforcing, permissive, or disabled

Note:  A change to or from disabled mode requires a system reboot. You will need to perform this yourself.

name  The mode to run SELinux in, permissive, enforcing, or disabled.

salt.states.selinux.module(name, module_state=’Enabled’, version=’any’, **opts)
Enable/Disable and optionally force a specific version for an SELinux module
name  The name of the module to control
module_state  Should the module be enabled or disabled?
version  Defaults to no preference, set to a specified value if required. Currently can only alert if the version
          is incorrect.
install  Setting to True installs module
source  Points to module source file, used only when install is True
remove  Setting to True removes module

New in version 2016.3.0.

salt.states.selinux.module_install(name)
Installs custom SELinux module from given file
name  Path to file with module to install
New in version 2016.11.6.

salt.states.selinux.module_remove(name)
Removes SELinux module
name  The name of the module to remove
New in version 2016.11.6.

salt.states.selinux.port_policy_absent(name, sel_type=None, protocol=None, port=None)
New in version 2019.2.0.

Makes sure an SELinux port policy for a given port, protocol and SELinux context type is absent.
name  The protocol and port spec. Can be formatted as (tcp|udp)/(port|port-range).
sel_type  The SELinux Type. Optional; can be used in determining if policy is present, ignored by semanage
port --delete.
protocol  The protocol for the port, tcp or udp. Required if name is not formatted.
port  The port or port range. Required if name is not formatted.

salt.states.selinux.port_policy_present(name, sel_type, protocol=None, port=None, sel_range=None)
New in version 2019.2.0.

Makes sure an SELinux port policy for a given port, protocol and SELinux context type is present.
name  The protocol and port spec. Can be formatted as (tcp|udp)/(port|port-range).
sel_type  The SELinux Type.
protocol  The protocol for the port, tcp or udp. Required if name is not formatted.
port  The port or port range. Required if name is not formatted.
sel_range  The SELinux MLS/MCS Security Range.
21.19.251 salt.states.serverdensity_device

Monitor Server with Server Density

New in version 2014.7.0.

Server Density is a hosted monitoring service.

**Warning:** This state module is beta. It might be changed later to include more or less automation.

**Note:** This state module requires a pillar for authentication with Server Density To install a v1 agent:

```yaml
serverdensity:
  api_token: "b97da80a41c4f61bff05975ee51eb1aa"
  account_url: "https://your-account.serverdensity.io"
```

To install a v2 agent:

```yaml
serverdensity:
  api_token: "b97da80a41c4f61bff05975ee51eb1aa"
  account_name: "your-account"
```

**Note:** Although Server Density allows duplicate device names in its database, this module will raise an exception if you try monitoring devices with the same name.

Example:

```yaml
'server_name':
  serverdensity_device.monitored
```

salt.states.serverdensity_device.monitored(name, group=None, salt_name=True, salt_params=True, agent_version=1, **params)

Device is monitored with Server Density.

- **name** Device name in Server Density.
- **salt_name** If True (default), takes the name from the id grain. If False, the provided name is used.
- **group** Group name under with device will appear in Server Density dashboard. Default - None.
- **agent_version** The agent version you want to use. Valid values are 1 or 2. Default - 1.
- **salt_params** If True (default), needed config parameters will be sourced from grains and from status.all_status.
- **params** Add parameters that you want to appear in the Server Density dashboard. Will overwrite the salt_params parameters. For more info, see the API docs.

Usage example:

```yaml
'server_name':
  serverdensity_device.monitored
```

```yaml
'server_name':
  serverdensity_device.monitored:
    - group: web-servers
```
21.19.252 salt.states.service

Starting or restarting of services and daemons

Services are defined as system daemons and are typically launched using system init or rc scripts. This service state uses whichever service module is loaded on the minion with the virtualname of service. Services can be defined as either running or dead.

If you need to know if your init system is supported, see the list of supported service modules for your desired init system (systemd, sysvinit, launchctl, etc.).

Note that Salt’s service execution module, and therefore this service state, uses OS grains to ascertain which service module should be loaded and used to execute service functions. As existing distributions change init systems or new distributions are created, OS detection can sometimes be incomplete. If your service states are running into trouble with init system detection, please see the Overriding Virtual Module Providers section of Salt’s module documentation to work around possible errors.

Note: The current status of a service is determined by the return code of the init/rc script status command. A status return code of 0 it is considered running. Any other return code is considered dead.

httpd:
  service.running: []

The service can also be set to start at runtime via the enable option:

openvpn:
  service.running:
    - enable: True

By default if a service is triggered to refresh due to a watch statement the service is restarted. If the desired behavior is to reload the service, then set the reload value to True:

redis:
  service.running:
    - enable: True
    - reload: True
    - watch:
      - pkg: redis

Note: More details regarding watch can be found in the Requisites documentation.

salt.states.service.dead(name, enable=None, sig=None, init_delay=None, **kwargs)
Ensure that the named service is dead by stopping the service if it is running
name The name of the init or rc script used to manage the service
enable  Set the service to be enabled at boot time, True sets the service to be enabled, False sets the named service to be disabled. The default is None, which does not enable or disable anything.
sig  The string to search for when looking for the service process with ps
init_delay  Add a sleep command (in seconds) before the check to make sure service is killed.

New in version 2017.7.0.

no_block  [False] For systemd minions only. Stops the service using --no-block.

New in version 2017.7.0.

salt.states.service.disabled(name, **kwargs)
Ensure that the service is disabled on boot, only use this state if you don’t want to manage the running process, remember that if you want to disable a service to use the enable: False option for the running or dead function.
name  The name of the init or rc script used to manage the service

salt.states.service.enabled(name, **kwargs)
Ensure that the service is enabled on boot, only use this state if you don’t want to manage the running process, remember that if you want to enable a running service to use the enable: True option for the running or dead function.
name  The name of the init or rc script used to manage the service

salt.states.service.masked(name, runtime=False)
New in version 2017.7.0.

Note:  This state is only available on minions which use systemd.

Ensures that the named service is masked (i.e. prevented from being started).
name  Name of the service to mask
runtime  [False] By default, this state will manage an indefinite mask for the named service. Set this argument to True to runtime mask the service.

Note:  It is possible for a service to have both indefinite and runtime masks set for it. Therefore, this state will manage a runtime or indefinite mask independently of each other. This means that if the service is already indefinitely masked, running this state with runtime set to True will _not_ remove the indefinite mask before setting a runtime mask. In these cases, if it is desirable to ensure that the service is runtime masked and not indefinitely masked, pair this state with a service.unmasked state, like so:

```
mask_runtime_foo:
service.masked:
  - name: foo
  - runtime: True

unmask_indefinite_foo:
service.unmasked:
  - name: foo
  - runtime: False
```

salt.states.service.mod_watch(name, sfun=None, sig=None, reload=False, full_restart=False, init_delay=None, force=False, **kwargs)
The service watcher, called to invoke the watch command. When called, it will restart or reload the named service.

Note:  This state exists to support special handling of the watch requisite. It should not be called directly.
Parameters for this function should be set by the watching service. (i.e. service.running)
name  The name of the init or rc script used to manage the service

sfun  The original function which triggered the mod_watch call (service.running, for example).
sig  The string to search for when looking for the service process with ps
reload  When set, reload the service instead of restarting it. (i.e. service nginx reload)
full_restart  Perform a full stop/start of a service by passing --full-restart. This option is ignored if
reload is set and is supported by only a few service modules.
force  Use service.force_reload instead of reload (needs reload to be set to True)
init_delay  Add a sleep command (in seconds) before the service is restarted/reloaded

salt.states.service.running(name, enable=None, sig=None, init_delay=None, **kwargs)

Ensure that the service is running

name  The name of the init or rc script used to manage the service
enable  Set the service to be enabled at boot time, True sets the service to be enabled, False sets the named
service to be disabled. The default is None, which does not enable or disable anything.
sig  The string to search for when looking for the service process with ps
init_delay  Some services may not be truly available for a short period after their startup script indicates to the
system that they are. Provide an 'init_delay' to specify that this state should wait an additional given
number of seconds after a service has started before returning. Useful for requisite states wherein a
dependent state might assume a service has started but is not yet fully initialized.
no_block  [False] For systemd minions only. Starts the service using --no-block.

New in version 2017.7.0.

unmask  [False] For systemd minions only. Set to True to remove an indefinite mask before attempting to
start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before making any
changes. This behavior is no longer the default.

unmask_runtime  [False] For systemd minions only. Set to True to remove a runtime mask before attempting
to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before making any
changes. This behavior is no longer the default.

wait  [3] For systemd minions only. Passed through when using service.status to determine whether
the service is running or not.

New in version 2019.2.3.

Note:
watch can be used with service.running to restart a service when another state changes (example: a
file.managed state that creates the service’s config file). More details regarding watch can be found in
the Requisites documentation.

salt.states.service.unmasked(name, runtime=False)

New in version 2017.7.0.

Note: This state is only available on minions which use systemd.

Ensures that the named service is unmasked
name  Name of the service to unmask
runtime  [False] By default, this state will manage an indefinite mask for the named service. Set this argument
to True to ensure that the service is runtime masked.

Note: It is possible for a service to have both indefinite and runtime masks set for it. Therefore, this state will
manage a runtime or indefinite mask independently of each other. This means that if the service is indefinitely

masked, running this state with runtime set to True will _not_ remove the indefinite mask.

### 21.19.253 salt.states.slack

Send a message to Slack

This state is useful for sending messages to Slack during state runs.

New in version 2015.5.0.

```yaml
salt-message:
  slack.post_message:
    - channel: '#general'
    - from_name: SuperAdmin
    - message: 'This state was executed successfully.'
    - api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

The api key can be specified in the master or minion configuration like below:

```yaml
slack:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

**salt.states.slack**.post_message(name, **kwargs)

Send a message to a Slack channel.

```yaml
salt-message:
  slack.post_message:
    - channel: '#general'
    - from_name: SuperAdmin
    - message: 'This state was executed successfully.'
    - api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

The following parameters are required:

- **api_key** parameters:
  - name: The unique name for this event.
  - channel: The channel to send the message to. Can either be the ID or the name.
  - from_name: The name of that is to be shown in the "from" field.
  - message: The message that is to be sent to the Slack channel.
  - api_key: The api key for Slack to use for authentication, if not specified in the configuration options of master or minion.
  - icon: URL to an image to use as the icon for this message

- **webhook** parameters:
  - name: The unique name for this event.
  - message: The message that is to be sent to the Slack channel.
  - color: The color of border of left side
  - short: An optional flag indicating whether the value is short enough to be displayed side-by-side with other values.
  - identifier: The identifier of WebHook.
  - channel: The channel to use instead of the WebHook default.
  - username: Username to use instead of WebHook default.
  - icon_emoji: Icon to use instead of WebHook default.
21.19.254 salt.states.smartos

Management of SmartOS Standalone Compute Nodes

maintainer Jorge Schrauwen <sjorge@blackdot.be>
maturity new
depends vmadm, imgadm
platform smartos

New in version 2016.3.0.

```python
vmtest.example.org:
    smartos.vm_present:
        - config:
            reprovision: true
        - vmconfig:

        vlan_id: 10
    filesystems:
      "/config:
        source: "/vmdata/emby_config"
        type: lofs
        options:
          - nodevices

cleanup_images:
  smartos.image_vacuum

Note: Keep in mind that when removing properties from vmconfig they will not get removed from the vm’s current configuration, except for nics, disk, tags, ... they get removed via add_*, set_*, update_*, and remove_. Properties must be manually reset to their default value. The same behavior as when using `vmadm update`.

salt.states.smartos.config_absent(name)
  Ensure configuration property is absent in /usbkey/config
  name [string] name of property
salt.states.smartos.config_present(name, value)
   Ensure configuration property is set to value in /usbkey/config
   name  [string] name of property
   value [string] value of property

salt.states.smartos.image_absent(name)
   Ensure image is absent on the computenode
   name  [string] uuid of image

   Note: computenode.image_absent will only remove the image if it is not used by a vm.

salt.states.smartos.image_present(name)
   Ensure image is present on the computenode
   name  [string] uuid of image

salt.states.smartos.image_vacuum(name)
   Delete images not in use or installed via image_present

   Warning: Only image_present states that are included via the top file will be detected.

salt.states.smartos.source_absent(name)
   Ensure an image source is absent on the computenode
   name  [string] source url

salt.states.smartos.source_present(name, source_type='imgapi')
   Ensure an image source is present on the computenode
   name  [string] source url
   source_type  [string] source type (imgapi or docker)

salt.states.smartos.vm_absent(name, archive=False)
   Ensure vm is absent on the computenode
   name  [string] hostname of vm
   archive  [boolean] toggle archiving of vm on removal

   Note: State ID is used as hostname. Hostnames must be unique.

salt.states.smartos.vm_present(name, vmconfig, config=None)
   Ensure vm is present on the computenode
   name  [string] hostname of vm
   vmconfig  [dict] options to set for the vm
   config  [dict] fine grain control over vm_present

   Note:
   The following configuration properties can be toggled in the config parameter.
   - kvm_reboot (true) - reboots of kvm zones if needed for a config update
   - auto_import (false) - automatic importing of missing images
   - auto_lx_vars (true) - copy kernel_version and docker:* variables from image
   - reprovision (false) - reprovision on image_uuid changes
   - enforce_tags (true) - false = add tags only, true = add, update, and remove tags
   - enforce_routes (true) - false = add tags only, true = add, update, and remove routes
   - enforce_internal_metadata (true) - false = add metadata only, true = add, update, and remove metadata
• enforce_customer_metadata (true) - false = add metadata only, true = add, update, and remove metadata

Note: State ID is used as hostname. Hostnames must be unique.

Note: If hostname is provided in vmconfig this will take president over the State ID. This allows multiple states to be applied to the same vm.

Note: The following instances should have a unique ID.
  • nic: mac
  • filesystem: target
  • disk: path or diskN for zvols
  e.g. disk0 will be the first disk added, disk1 the 2nd,...

Changed in version 2019.2.0: Added support for docker image uuids, added auto_lx_vars configuration, documented some missing configuration options.

salt.states.smartos.vm_running(name)
  Ensure vm is in the running state on the computenode
  name [string] hostname of vm

  Note: State ID is used as hostname. Hostnames must be unique.

salt.states.smartos.vm_stopped(name)
  Ensure vm is in the stopped state on the computenode
  name [string] hostname of vm

  Note: State ID is used as hostname. Hostnames must be unique.

21.19.255 salt.states.smtp

Sending Messages via SMTP

New in version 2014.7.0.

This state is useful for firing messages during state runs, using the SMTP protocol

server-warning-message:
smtp.send_msg:
  - name: 'This is a server warning message'
  - profile: my-smtp-account
  - recipient: admins@example.com

salt.states.smtp.send_msg(name, recipient, subject, sender=None, profile=None, use_ssl='True', attachments=None)

Send a message via SMTP

21.19. state modules 3717
server-warning-message:
smtp.send_msg:
  - name: 'This is a server warning message'
  - profile: my-smtp-account

name  The message to send via SMTP

21.19.256 salt.states.snapper module

Managing implicit state and baselines using snapshots

New in version 2016.11.0.

Salt can manage state against explicitly defined state, for example if your minion state is defined by:

/etc/config_file:
  file.managed:
    - source: salt://configs/myconfig

If someone modifies this file, the next application of the highstate will allow the admin to correct this deviation and the file will be corrected.

Now, what happens if somebody creates a file /etc/new_config_file and deletes /etc/important_config_file? Unless you have a explicit rule, this change will go unnoticed.

The snapper state module allows you to manage state implicitly, in addition to explicit rules, in order to define a baseline and iterate with explicit rules as they show that they work in production.

The workflow is: once you have a working and audited system, you would create your baseline snapshot (eg. with salt tgt snapper.create_snapshot) and define in your state this baseline using the identifier of the snapshot (in this case: 20):

my_baseline:
  snapper.baseline_snapshot:
    - number: 20
    - include_diff: False
    - ignore:
      - /var/log
      - /var/cache

Baseline snapshots can be also referenced by tag. Most recent baseline snapshot is used in case of multiple snapshots with the same tag:

my_baseline_external_storage:
  snapper.baseline_snapshot:
    • tag: my_custom_baseline_tag
    • config: external
    • ignore: - /mnt/tmp_files/
If you have this state, and you haven’t done changes to the system since the snapshot, and you add a user, the state will show you the changes (including full diffs) to \texttt{/etc/passwd, /etc/shadow, etc} if you call it with \texttt{test=True} and will undo all changes if you call it without.

This allows you to add more explicit state knowing that you are starting from a very well defined state, and that you can audit any change that is not part of your explicit configuration.

So after you made this your state, you decided to introduce a change in your configuration:

```yaml
my_baseline:
    snapper.baseline_snapshot:
      - number: 20
      - ignore:
        - /var/log
        - /var/cache

hosts_entry:
    file.blockreplace:
      - name: /etc/hosts
      - content: 'First line of content'
      - append_if_not_found: True
```

The change in \texttt{/etc/hosts} will be done after any other change that deviates from the specified snapshot are reverted. This could be for example, modifications to the \texttt{/etc/passwd} file or changes in the \texttt{/etc/hosts} that could render your the \texttt{hosts_entry} rule void or dangerous.

Once you take a new snapshot and you update the baseline snapshot number to include the change in \texttt{/etc/hosts} the \texttt{hosts_entry} rule will basically do nothing. You are free to leave it there for documentation, to ensure that the change is made in case the snapshot is wrong, but if you remove anything that comes after the \texttt{snapper.baseline_snapshot} as it will have no effect; by the moment the state is evaluated, the baseline state was already applied and include this change.

\begin{table}[h]
\centering
\begin{tabular}{|l|l|}
\hline
**Warning:** Make sure you specify the baseline state before other rules, otherwise the baseline state will revert all changes if they are not present in the snapshot. \\
\hline
\end{tabular}
\end{table}

\begin{table}[h]
\centering
\begin{tabular}{|l|l|}
\hline
**Warning:** Do not specify more than one baseline rule as only the last one will affect the result. \\
\hline
\end{tabular}
\end{table}

\texttt{codeauthor}  Duncan Mac-Vicar P. \texttt{<dmacvicar@suse.de>}
\texttt{codeauthor}  Pablo Suárez Hernández \texttt{<psuarezhernandez@suse.de>}
\texttt{maturity}  new
\texttt{platform}  Linux

\texttt{salt.states.snapper.baseline_snapshot}(name, number=None, tag=None, include_diff=True, config='root', ignore=None)

Enforces that no file is modified comparing against a previously defined snapshot identified by number.

- \texttt{number} Number of selected baseline snapshot.
- \texttt{tag} Tag of the selected baseline snapshot. Most recent baseline baseline snapshot is used in case of multiple snapshots with the same tag. \texttt{(tag and number cannot be used at the same time)}
- \texttt{include_diff} Include a diff in the response \texttt{(Default: True)}
- \texttt{config} Snapper config name \texttt{(Default: root)}
- \texttt{ignore} List of files to ignore. \texttt{(Default: None)}
19.257 salt.states.solrcloud module

States for solrcloud alias and collection configuration
New in version 2017.7.0.

salt.states.solrcloud.alias(name, collections, **kwargs)
Create alias and enforce collection list.

Use the solrcloud module to get alias members and set them.

You can pass additional arguments that will be forwarded to http.query

name The collection name
collections list of collections to include in the alias

salt.states.solrcloud.collection(name, options=None, **kwargs)
Create collection and enforce options.

Use the solrcloud module to get collection parameters.

You can pass additional arguments that will be forwarded to http.query

name The collection name
options [{} options to ensure

21.9.258 salt.states.splunk

Splunk User State Module
New in version 2016.3.0..

This state is used to ensure presence of users in splunk.

```
splunk.present:
  - name: 'Example TestUser1'
  - email: example@domain.com
```

salt.states.splunk.absent(email, profile='splunk', **kwargs)
Ensure a splunk user is absent

```
splunk.absent:
  - email: 'example@domain.com'
  - name: 'exampleuser'
```

The following parameters are required:
email This is the email of the user in splunk
name This is the splunk username used to identify the user.

salt.states.splunk.present(email, profile='splunk', **kwargs)
Ensure a user is present

```
splunk.user_present:
  - realname: 'Example TestUser1'
  - name: 'exampleuser'
  - email: 'example@domain.com'
  - roles: ['user']
```

The following parameters are required:
email  This is the email of the user in splunk

21.19.259  salt.states.splunk_search

Splunk Search State Module
New in version 2015.5.0.
This state is used to ensure presence of splunk searches.

```
server-warning-message:
splunk_search.present:
- name: This is the splunk search name
- search: index=main sourcetype=
```

salt.states.splunk_search.absent(name, profile='splunk')
Ensure a search is absent

```
API Error Search:
splunk_search.absent
```

The following parameters are required:
name  This is the name of the search in splunk

salt.states.splunk_search.present(name, profile='splunk', **kwargs)
Ensure a search is present

```
API Error Search:
splunk_search.present:
    search: index=main sourcetype=blah
    template: alert_5min
```

The following parameters are required:
name  This is the name of the search in splunk

21.19.260  salt.states.sqlite3

Management of SQLite3 databases
New in version 2016.3.0.

depends
• SQLite3 Python Module

configuration  See salt.modules.sqlite3 for setup instructions

The sqlite3 module is used to create and manage sqlite3 databases and execute queries

Here is an example of creating a table using sql statements:

```
users:
sqlite3.table_present:
- db: /var/www/data/app.sqlite
- schema: CREATE TABLE `users` (`username` TEXT COLLATE NOCASE UNIQUE NOT NULL, `password` BLOB NOT NULL, `salt` BLOB NOT NULL, `last_login` INT)
```

Here is an example of creating a table using yaml/jinja instead of sql:
users:
  sqlite3.table_present:
  - db: /var/www/app.sqlite
  - schema:
    - email TEXT COLLATE NOCASE UNIQUE NOT NULL
    - firstname TEXT NOT NULL
    - lastname TEXT NOT NULL
    - company TEXT NOT NULL
    - password BLOB NOT NULL
    - salt BLOB NOT NULL

Here is an example of making sure a table is absent:

badservers:
  sqlite3.table_absent:
  - db: /var/www/data/users.sqlite

Sometimes you would to have specific data in tables to be used by other services Here is an example of making sure rows with specific data exist:

user_john_doe_xyz:
  sqlite3.row_present:
  - db: /var/www/app.sqlite
  - table: users
  - where_sql: email='john.doe@companyxyz.com'
  - data:
    - email: john.doe@companyxyz.com
    - lastname: doe
    - firstname: john
    - company: companyxyz.com
    - password: abcdef012934125
    - salt: abcdef012934125
  - require:
    - sqlite3: users

Here is an example of removing a row from a table:

user_john_doe_abc:
  sqlite3.row_absent:
  - db: /var/www/app.sqlite
  - table: users
  - where_sql: email="john.doe@companyabc.com"
  - require:
    - sqlite3: users

Note that there is no explicit state to perform random queries, however, this can be approximated with sqlite3’s module functions and module.run:

zone-delete:
  module.run:
  - name: sqlite3.modify
  - db: {{ db }}
  - sql: "DELETE FROM records WHERE id > {{ count[0] }} AND domain_id = {{ domain_id }}"
  - watch:
    - sqlite3: zone-insert-12

salt.states.sqlite3.row_absent(name, db, table, where_sql, where_args=None)
Makes sure the specified row is absent in db. If multiple rows match where_sql, then the state will fail.

- **name** Only used as the unique ID
- **db** The database file name
- **table** The table name to check
- **where_sql** The sql to select the row to check
- **where_args** The list parameters to substitute in where_sql

```
salt.states.sqlite3.row_present(name, db, table, data, where_sql, where_args=None, update=False)
```

Checks to make sure the given row exists. If row exists and update is True then row will be updated with data. Otherwise it will leave existing row unmodified and check it against data. If the existing data doesn’t match data_check the state will fail. If the row doesn’t exist then it will insert data into the table. If more than one row matches, then the state will fail.

- **name** Only used as the unique ID
- **db** The database file name
- **table** The table name to check the data
- **data** The dictionary of key/value pairs to check against if row exists, insert into the table if it doesn’t
- **where_sql** The sql to select the row to check
- **where_args** The list parameters to substitute in where_sql
- **update** True will replace the existing row with data When False and the row exists and data does not equal the row data then the state will fail

```
salt.states.sqlite3.table_absent(name, db)
```

Make sure the specified table does not exist

- **name** The name of the table
- **db** The name of the database file

```
salt.states.sqlite3.table_present(name, db, schema, force=False)
```

Make sure the specified table exists with the specified schema

- **name** The name of the table
- **db** The name of the database file
- **schema** The dictionary containing the schema information
- **force** If the name of the table exists and force is set to False, the state will fail. If force is set to True, the existing table will be replaced with the new table

### 21.19.261 salt.states.ssh_auth

**Control of entries in SSH authorized_key files**

The information stored in a user’s SSH authorized key file can be easily controlled via the ssh_auth state. Defaults can be set by the enc, options, and comment keys. These defaults can be overridden by including them in the name.

Since the YAML specification limits the length of simple keys to 1024 characters, and since SSH keys are often longer than that, you may have to use a YAML 'explicit key', as demonstrated in the second example below.

```
AAAAB3NzaC1kc3MAAAACBAL0sQ0fJ5BYTyY==:
  ssh_auth.present:
    - user: root
    - enc: ssh-dss

? AAAAB3NzaC1kc3MAAAACBAL0sQ9fJ5bYTYyY==...
:
  ssh_auth.present:
    - user: root
    - enc: ssh-dss
```

(continues on next page)
thatch:
- ssh_auth.present:
  - user: root
  - source: salt://ssh_keys/thatch.id_rsa.pub
  - config: '%h/.ssh/authorized_keys'

sshkeys:
- ssh_auth.present:
  - user: root
  - enc: ssh-rsa
  - options:
    - option1="value1"
    - option2="value2 flag2"
  - comment: myuser
  - names:
    - AAAAB3NzaC1kc3MAAACBAl0sQ9fJ5bYTeYY==
    - ssh-dss AAAAB3NzaC1kcQ9fJ5bYTeYY== user@domain
    - option3="value3" ssh-dss AAAAB3NzaC1kcQ9J5bYTeYY== other@testdomain
    - AAAAB3NzaC1kcQ9J5bfY435bYTeYY== newcomment

sshkeys:
- ssh_auth.manage:
  - user: root
  - enc: ssh-rsa
  - options:
    - option1="value1"
    - option2="value2 flag2"
  - comment: myuser
  - ssh_keys:
    - AAAAB3NzaC1kc3MAAACBAl0sQ9fJ5bYTeYY==
    - ssh-dss AAAAB3NzaC1kcQ9fJ5bYTeYY== user@domain
    - option3="value3" ssh-dss AAAAB3NzaC1kcQ9J5bYTeYY== other@testdomain
    - AAAAB3NzaC1kcQ9JFF435bYTeYY== newcomment

salt.states.ssh_auth.absent(name, user, enc='ssh-rsa', comment='', source='', options=None, config='.ssh/authorized_keys', fingerprint_hash_type=None)
Verifies that the specified SSH key is absent
name The SSH key to manage
user The user who owns the SSH authorized keys file to modify
enc Defines what type of key is being used; can be ed25519, edsa, ssh-rsa or ssh-dss
comment The comment to be placed with the SSH public key
options The options passed to the key, pass a list object
source The source file for the key(s). Can contain any number of public keys, in standard "authorized_keys" format. If this is set, comment, enc and options will be ignored.

New in version 2015.8.0.
cconfig The location of the authorized keys file relative to the user’s home directory, defaults to ”.ssh/authorized_keys”. Token expansion %u and %h for username and home path supported.
fingerprint_hash_type The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to sha256 if not specified.

New in version 2016.11.7.
salt.states.ssh_auth.manage(name, ssh_keys, user, enc='ssh-rsa', comment='', source='', options=None, config='.ssh/authorized_keys', fingerprint_hash_type=None, **kwargs)
New in version 3000.

Ensures that only the specified ssh_keys are present for the specified user

- **ssh_keys** The SSH key to manage
- **user** The user who owns the SSH authorized keys file to modify
- **enc** Defines what type of key is being used; can be ed25519, ecdsa, ssh-rsa or ssh-dss
- **comment** The comment to be placed with the SSH public key
- **source** The source file for the key(s). Can contain any number of public keys, in standard "authorized_keys" format. If this is set, comment and enc will be ignored.

**Note:** The source file must contain keys in the format `<enc> <key> <comment>`. If you have generated a keypair using PuTTYgen, then you will need to do the following to retrieve an OpenSSH-compatible public key.

1. In PuTTYgen, click Load, and select the private key file (not the public key), and click Open.
2. Copy the public key from the box labeled Public key for pasting into OpenSSH authorized_keys file.
3. Paste it into a new file.

- **options** The options passed to the keys, pass a list object
- **config** The location of the authorized keys file relative to the user’s home directory, defaults to ”.ssh/authorized_keys”. Token expansion %u and %h for username and home path supported.
- **fingerprint_hash_type** The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to sha256 if not specified.

```python
salt.states.ssh_auth.present(name, user, enc='ssh-rsa', comment=' ', source=' ', options=None, config='.ssh/authorized_keys', fingerprint_hash_type=None, **kwargs)
```

Verifies that the specified SSH key is present for the specified user

- **name** The SSH key to manage
- **user** The user who owns the SSH authorized keys file to modify
- **enc** Defines what type of key is being used; can be ed25519, ecdsa, ssh-rsa or ssh-dss
- **comment** The comment to be placed with the SSH public key
- **source** The source file for the key(s). Can contain any number of public keys, in standard "authorized_keys" format. If this is set, comment and enc will be ignored.

**Note:** The source file must contain keys in the format `<enc> <key> <comment>`. If you have generated a keypair using PuTTYgen, then you will need to do the following to retrieve an OpenSSH-compatible public key.

1. In PuTTYgen, click Load, and select the private key file (not the public key), and click Open.
2. Copy the public key from the box labeled Public key for pasting into OpenSSH authorized_keys file.
3. Paste it into a new file.

- **options** The options passed to the key, pass a list object
- **config** The location of the authorized keys file relative to the user’s home directory, defaults to ”.ssh/authorized_keys”. Token expansion %u and %h for username and home path supported.
- **fingerprint_hash_type** The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to sha256 if not specified.

### 21.19.262 salt.states.ssh_known_hosts

**Control of SSH known_hosts entries**

Manage the information stored in the known_hosts files.
github.com:
  ssh_known_hosts:
    - present
    - user: root
    - fingerprint_hash_type: md5

example.com:
  ssh_known_hosts:
    - absent
    - user: root

salt.states.ssh_known_hosts.absent(name, user=None, config=None)
Verifies that the specified host is not known by the given user
name The host name Note that only single host names are supported. If foo.example.com and bar.example.com
are the same machine and you need to exclude both, you will need one Salt state for each.
user The user who owns the ssh authorized keys file to modify
config The location of the authorized keys file relative to the user's home directory, defaults to
".ssh/known_hosts". If no user is specified, defaults to "/etc/ssh/ssh_known_hosts". If present, must
be an absolute path when a user is not specified.

salt.states.ssh_known_hosts.present(name, user=None, fingerprint=None,
  key=None, port=None, enc=None, config=None,
  hash_known_hosts=True, timeout=5, fingerprint_hash_type=None)
Verifies that the specified host is known by the specified user
On many systems, specifically those running with openssh 4 or older, the enc option must be set, only openssh
5 and above can detect the key type.
name The name of the remote host (e.g. "github.com") Note that only a single hostname is supported, if
foo.example.com and bar.example.com have the same host you will need two separate Salt States to
represent them.
user The user who owns the ssh authorized keys file to modify
fingerprint The fingerprint of the key which must be present in the known_hosts file (optional if key specified)
key The public key which must be present in the known_hosts file (optional if fingerprint specified)
port optional parameter, port which will be used to when requesting the public key from the remote host,
defaults to port 22.
enc Defines what type of key is being used, can be ed25519, ecdsa ssh-rsa or ssh-dss
config The location of the authorized keys file relative to the user's home directory, defaults to
".ssh/known_hosts". If no user is specified, defaults to "/etc/ssh/ssh_known_hosts". If present, must
be an absolute path when a user is not specified.
hash_known_hosts [True] Hash all hostnames and addresses in the known hosts file.
timeout [int] Set the timeout for connection attempts. If timeout seconds have elapsed since a connection
was initiated to a host or since the last time anything was read from that host, then the connection is
closed and the host in question considered unavailable. Default is 5 seconds.
New in version 2016.3.0.
fingerprint_hash_type The public key fingerprint hash type that the public key fingerprint was originally
hashed with. This defaults to sha256 if not specified.
New in version 2016.11.4.
Changed in version 2017.7.0: default changed from md5 to sha256

21.19.263 salt.states.stateconf
Stateconf System

The stateconf system is intended for use only with the stateconf renderer. This State module presents the set function. This function does not execute any functionality, but is used to interact with the stateconf renderer.

```python
salt.states.stateconf.context(name, **kwargs)
```
No-op state to support state config via the stateconf renderer.

```python
salt.states.stateconf.set(name, **kwargs)
```
No-op state to support state config via the stateconf renderer.

21.19.264 salt.states.status

Minion status monitoring

Maps to the status execution module.

```python
salt.states.status.loadavg(name, maximum=None, minimum=None)
```
Return the current load average for the specified minion. Available values for name are 1-min, 5-min and 15-min. minimum and maximum values should be passed in as strings.

```python
salt.states.status.process(name)
```
Return whether the specified signature is found in the process tree. This differs slightly from the services states, in that it may refer to a process that is not managed via the init system.

21.19.265 salt.states.statuspage

StatusPage

Manage the StatusPage configuration.

In the minion configuration file, the following block is required:

```
statuspage:
  api_key: <API_KEY>
  page_id: <PAGE_ID>
```

New in version 2017.7.0.

```python
salt.states.statuspage.create(name, endpoint='incidents', api_url=None, page_id=None, api_key=None, api_version=None, **kwargs)
```
Insert a new entry under a specific endpoint.

- **endpoint** (incidents): Insert under this specific endpoint.
- **page_id** (Page ID): Can also be specified in the config file.
- **api_key** (API key): Can also be specified in the config file.
- **api_version** (1): API version. Can also be specified in the config file.
- **api_url** (Custom API URL in case the user has a StatusPage service running in a custom environment).
- **kwargs** (Other params).

SLS Example:

```
create-my-component:
  statuspage.create:
    - endpoint: components
    - name: my component
    - group_id: 993vgplshj12
```
salt.states.statuspage.delete(name, endpoint='incidents', id=None, api_url=None, page_id=None, api_key=None, api_version=None)

Remove an entry from an endpoint.

endpoint: incidents  Request a specific endpoint.
page_id  Page ID. Can also be specified in the config file.
api_key  API key. Can also be specified in the config file.
api_version: 1  API version. Can also be specified in the config file.
api_url  Custom API URL in case the user has a StatusPage service running in a custom environment.

SLS Example:

```
delete-my-component:
  statuspage.delete:
    - endpoint: components
    - id: ftgks51sfs2d
```

salt.states.statuspage.managed(name, config, api_url=None, page_id=None, api_key=None, api_version=None, pace=1, allow_empty=False)

Manage the StatusPage configuration.

config  Dictionary with the expected configuration of the StatusPage. The main level keys of this dictionary represent the endpoint name. If a certain endpoint does not exist in this structure, it will be ignored or not configured.
page_id  Page ID. Can also be specified in the config file.
api_key  API key. Can also be specified in the config file.
api_version: 1  API version. Can also be specified in the config file.
api_url  Custom API URL in case the user has a StatusPage service running in a custom environment.
pace: 1  Max requests per second allowed by the API.
allow_empty: False  Allow empty config.

SLS example:

```
my-statuspage-config:
  statuspage.managed:
    - config:
      components:
        - name: component1
          group_id: uy4g37rf
        - name: component2
          group_id: 3n4uyu4gf
      incidents:
        - name: incident1
          status: resolved
          impact: major
          backfilled: false
        - name: incident2
          status: investigating
          impact: minor
```

salt.states.statuspage.update(name, endpoint='incidents', id=None, api_url=None, page_id=None, api_key=None, api_version=None, **kwargs)

Update attribute(s) of a specific endpoint.

id  The unique ID of the endpoint entry.
endpoint: incidents  Endpoint name.
page_id  Page ID. Can also be specified in the config file.
api_key  API key. Can also be specified in the config file.
api_version: 1  API version. Can also be specified in the config file.
api_url  Custom API URL in case the user has a StatusPage service running in a custom environment.

SLS Example:
**update-my-incident**:
```
statuspage.update:
  - id: dz959yz2nd4l
  - status: resolved
```

## 21.19.266 salt.states.supervisord

**Interaction with the Supervisor daemon**

```python
wsgi_server:
supervisord.running:
  - require:
    - pkg: supervisor
  - watch:
    - file: /etc/nginx/sites-enabled/wsgi_server.conf
```

**salt.states.supervisord.dead**(name, user=None, conf_file=None, bin_env=None, **kwargs)

Ensure the named service is dead (not running).

- **name**: Service name as defined in the supervisor configuration file
- **user**: Name of the user to run the supervisorctl command

New in version 0.17.0.

- **conf_file**: path to supervisorctl config file
- **bin_env**: path to supervisorctl bin or path to virtualenv with supervisor installed

**salt.states.supervisord.mod_watch**(name, restart=True, update=False, user=None, conf_file=None, bin_env=None, **kwargs)

The supervisord watcher, called to invoke the watch command. Always restart on watch

**Note**: This state exists to support special handling of the watch requisite. It should not be called directly.

Parameters for this function should be set by the state being triggered.

**salt.states.supervisord.running**(name, restart=False, update=False, user=None, conf_file=None, bin_env=None, **kwargs)

Ensure the named service is running.

- **name**: Service name as defined in the supervisor configuration file
- **restart**: Whether to force a restart
- **update**: Whether to update the supervisor configuration.
- **user**: Name of the user to run the supervisorctl command

New in version 0.17.0.

- **conf_file**: path to supervisorctl config file
- **bin_env**: path to supervisorctl bin or path to virtualenv with supervisor installed

## 21.19.267 salt.states.svn

**Manage SVN repositories**

Manage repository checkouts via the svn vcs system. Note that subversion must be installed for these states to be available, so svn states should include a requisite to a pkg.installed state for the package which provides subversion (subversion in most cases). Example:
salt.states.svn.dirty(name, target=None, username=None, password=None, ignore_unversioned=False)

Determine if the working directory has been changed.

salt.states.svn.export(name, target=None, rev=None, user=None, username=None, password=None, force=False, overwrite=False, externals=True, trust=False, trust_failures=None)

Export a file or directory from an SVN repository

name Address and path to the file or directory to be exported.
target Name of the target directory where the checkout will put the working directory
rev [None] The name revision number to checkout. Enable "force" if the directory already exists.
user [None] Name of the user performing repository management operations
username [None] The user to access the name repository with. The svn default is the current user
password Connect to the Subversion server with this password

force [False] Continue if conflicts are encountered
overwrite [False] Overwrite existing target
externals [True] Change to False to not checkout or update externals
trust [False] Automatically trust the remote server. SVN’s –trust-server-cert
trust_failures [None] Comma-separated list of certificate trust failures, that shall be ignored. This can be used
if trust=True is not sufficient. The specified string is passed to SVN’s –trust-server-cert-failures option as-is.

New in version 2019.2.0.

salt.states.svn.latest(name, target=None, rev=None, user=None, username=None, password=None, force=False, externals=True, trust=False, trust_failures=None)

Checkout or update the working directory to the latest revision from the remote repository.

name Address of the name repository as passed to "svn checkout"
target Name of the target directory where the checkout will put the working directory
rev [None] The name revision number to checkout. Enable "force" if the directory already exists.
user [None] Name of the user performing repository management operations
username [None] The user to access the name repository with. The svn default is the current user
password Connect to the Subversion server with this password

force [False] Continue if conflicts are encountered
externals [True] Change to False to not checkout or update externals
trust [False] Automatically trust the remote server. SVN’s –trust-server-cert
trust_failures [None] Comma-separated list of certificate trust failures, that shall be ignored. This can be used
if trust=True is not sufficient. The specified string is passed to SVN’s –trust-server-cert-failures option as-is.

New in version 2019.2.0.
Configuration of the kernel using sysctl

Control the kernel sysctl system.

```
vm.swappiness:
  sysctl.present:
    - value: 20
```

`salt.states.sysctl.present(name, value, config=\None)`

Ensure that the named sysctl value is set in memory and persisted to the named configuration file. The default sysctl configuration file is `/etc/sysctl.conf`

- `name` The name of the sysctl value to edit
- `value` The sysctl value to apply
- `config` The location of the sysctl configuration file. If not specified, the proper location will be detected based on platform.

**21.19.269 salt.states.syslog_ng**

State module for syslog_ng

- `maintainer` Tibor Benke <btibi@sch.bme.hu>
- `maturity` new
- `depends` cmd, ps, syslog_ng
- `platform` all

Users can generate syslog-ng configuration files from YAML format or use plain ones and reload, start, or stop their syslog-ng by using this module.

**Details**

The service module is not available on all system, so this module includes `syslog_ng.reloaded, syslog_ng.stopped,` and `syslog_ng.started` functions. If the service module is available on the computers, users should use that.

Users can generate syslog-ng configuration with `syslog_ng.config` function. For more information see `syslog-ng state usage`.

**Syslog-ng configuration file format**

The syntax of a configuration snippet in syslog-ng.conf:

```
object_type object_id {<options>};
```

These constructions are also called statements. There are options inside of them:

```
option(parameter1, parameter2); option2(parameter1, parameter2);
```

salt.states.syslog_ng.config(name, config, write=True)
Builds syslog-ng configuration.
  name : the id of the Salt document config : the parsed YAML code write : if True, it writes the config into the configuration file, otherwise just returns it

salt.states.syslog_ng.reloaded(name)
Reloads syslog-ng.

salt.states.syslog_ng.started(name=None, user=None, group=None, chroot=None, caps=None, no_caps=False, pidfile=None, enable_core=False, fd_limit=None, verbose=False, debug=False, trace=False, yydebug=False, persist_file=None, control=None, worker_threads=None, *args, **kwargs)
Ensures, that syslog-ng is started via the given parameters.
  Users shouldn’t use this function, if the service module is available on their system.

salt.states.syslog_ng.stopped(name=None)
Kills syslog-ng.

21.19.270 salt.states.sysrc
State to work with sysrc

salt.states.sysrc.absent(name, **kwargs)
  Ensure a sysrc variable is absent.
  name  The variable name to set
  file  (optional) The rc file to add the variable to.
  jail  (option) the name or JID of the jail to set the value in.

salt.states.sysrc.managed(name, value, **kwargs)
  Ensure a sysrc variable is set to a specific value.
  name  The variable name to set
  value  Value to set the variable to
  file  (optional) The rc file to add the variable to.
  jail  (option) the name or JID of the jail to set the value in.
  Example:

    syslogd:
    sysrc.managed:
      - name: syslogd_flags
      - value: -ss

21.19.271 salt.states.telemetry_alert
Manage Telemetry alert configurations

New in version 2016.3.0.
Create, Update and destroy Mongo Telemetry alert configurations.
This module uses requests, which can be installed via package, or pip.
This module accepts explicit credential (telemetry api key) or can also read api key credentials from a pillar. Example:
ensure telemetry alert X is defined on deployment Y:

```python
telemetry_alert.present:
    - deployment_id: "rs-XXXXXX"
    - metric_name: "testMetric"
    - alert_config:
        max: 1
        filter: SERVER_ROLE_MONGOD_PRIMARY
        escalate_to: "example@pagerduty.com"
    - name: "**MANAGED BY ORCA DO NOT EDIT BY HAND** manages alarm on testMetric"
```

salt.states.telemetry_alert.absent(name, deployment_id, metric_name, api_key=None, profile='telemetry')

Ensure the telemetry alert config is deleted.

- name: An optional description of the alarm (not currently supported by telemetry API)
- deployment_id: Specifies the ID of the root deployment resource (replica set cluster or sharded cluster) to which this alert definition is attached
- metric_name: Specifies the unique ID of the metric to whose values these thresholds will be applied
- api_key: Telemetry api key for the user
- profile: A dict with telemetry config data. If present, will be used instead of api_key.

salt.states.telemetry_alert.present(name, deployment_id, metric_name, alert_config, api_key=None, profile='telemetry')

Ensure the telemetry alert exists.

- name: An optional description of the alarm (not currently supported by telemetry API)
- deployment_id: Specifies the ID of the root deployment resource (replica set cluster or sharded cluster) to which this alert definition is attached
- metric_name: Specifies the unique ID of the metric to whose values these thresholds will be applied
- alert_config: Is a list of dictionaries where each dict contains the following fields:
  - filter: By default the alert will apply to the deployment and all its constituent resources. If the alert only applies to a subset of those resources, a filter may be specified to narrow this scope.
  - min: the smallest "ok" value the metric may take on; if missing or null, no minimum is enforced.
  - max: the largest "ok" value the metric may take on; if missing or null, no maximum is enforced.
  - notify_all: Used to indicate if you want to alert both onCallEngineer and apiNotifications
- api_key: Telemetry api key for the user
- profile: A dict of telemetry config information. If present, will be used instead of api_key.

### 21.19.272 salt.states.test

Test States

Provide test case states that enable easy testing of things to do with state calls, e.g. running, calling, logging, output filtering etc.

```python
always-passes-with-any-kwargs:
    test.nop:
        - name: foo
        - something: else
        - foo: bar

always-passes:
    test.succeed_without_changes:
        - name: foo

always-fails:
```

(continues on next page)
test.fail_without_changes:
- name: foo

always-changes-and-succeeds:
test.succeed_with_changes:
- name: foo

always-changes-and-fails:
test.fail_with_changes:
- name: foo

my-custom-combo:
test.configurable_test_state:
- name: foo
  changes: True
  result: False
  comment: bar.baz
  warnings: A warning

is-pillar-foo-present-and-bar-is-int:
test.check_pillar:
- present:
  - foo
- integer:
  - bar

salt.states.test.check_pillar(name, present=None, boolean=None, integer=None, string=None, listing=None, dictionary=None, verbose=False)
Checks the presence and, optionally, the type of given keys in Pillar. Supported kwargs for types are: boolean (bool) - integer (int) - string (str) - listing (list) - dictionary (dict)
Checking for None type pillars is not implemented yet.

salt.states.test.configurable_test_state(name, changes=True, result=True, comment="", warnings=None)
A configurable test state which determines its output based on the inputs.
New in version 2014.7.0.
name: A unique string.
changes: Do we return anything in the changes field? Accepts True, False, and 'Random' Default is True
result: Do we return successfully or not? Accepts True, False, and 'Random' Default is True If test is True and changes is True, this will be None. If test is True and and changes is False, this will be True.
comment: String to fill the comment field with. Default is "
New in version 3000.

Warning: A string (or a list of strings) to fill the warnings field with. Default is None

salt.states.test.fail_with_changes(name, **kwargs)
Returns failure and changes is not empty.

New in version 2014.7.0.

name: A unique string.

class salt.states.test.fail_without_changes(name, **kwargs):
    Returns failure.

    New in version 2014.7.0.
    name: A unique string.

class salt.states.test.mod_watch(name, sfun=None, **kwargs):
    Call this function via a watch statement.

    New in version 2014.7.0.

    Any parameters in the state return dictionary can be customized by adding the keywords result, comment, and changes.

    this_state_will_return_changes:
        test.succeed_with_changes

    this_state_will_NOT_return_changes:
        test.succeed_without_changes

    this_state_is_watching_another_state:
        test.succeed_without_changes:
            - comment: 'This is a custom comment'
            - watch:
                - test: this_state_will_return_changes
                - test: this_state_will_NOT_return_changes

    this_state_is_also_watching_another_state:
        test.succeed_without_changes:
            - watch:
                - test: this_state_will_NOT_return_changes

class salt.states.test.nop(name, **kwargs):
    A no-op state that does nothing. Useful in conjunction with the use requisite, or in templates which could otherwise be empty due to jinja rendering.

class salt.states.test.show_notification(name, text=None, **kwargs):
    Simple notification using text argument.

    New in version 2015.8.0.
    name: A unique string.
    text: Text to return in the comment.

class salt.states.test.succeed_with_changes(name, **kwargs):
    Returns successful and changes is not empty

    New in version 2014.7.0.
    name: A unique string.

class salt.states.test.succeed_without_changes(name, **kwargs):
    Returns successful.

    New in version 2014.7.0.
    name: A unique string.
21.19.273  salt.states.testinfra1mod module

21.19.274  salt.states.timezone

Management of timezones

The timezone can be managed for the system:

```
America/Denver:
    timezone.system
```

The system and the hardware clock are not necessarily set to the same time. By default, the hardware clock is set to localtime, meaning it is set to the same time as the system clock. If utc is set to True, then the hardware clock will be set to UTC, and the system clock will be an offset of that.

```
America/Denver:
    timezone.system:
        - utc: True
```

The Ubuntu community documentation contains an explanation of this setting, as it applies to systems that dual-boot with Windows. This is explained in greater detail [here](#).

```
salt.states.timezone.system(name, utc=True)
```

Set the timezone for the system.

- **name**: The name of the timezone to use (e.g.: America/Denver)
- **utc**: Whether or not to set the hardware clock to UTC (default is True)

21.19.275  salt.states.tls

Enforce state for SSL/TLS

```
salt.states.tls.valid_certificate(name, weeks=0, days=0, hours=0, minutes=0, seconds=0)
```

Verify that a TLS certificate is valid now and (optionally) will be valid for the time specified through weeks, days, hours, minutes, and seconds.

21.19.276  salt.states.tomcat

Manage Apache Tomcat web applications

**Note**: This state requires the Tomcat Manager webapp to be installed and running.

The following grains/pillars must be set for communication with Tomcat Manager to work:

```
tomcat-manager:
    user: 'tomcat-manager'
    passwd: 'Passw0rd'
```

Configuring Tomcat Manager

To manage webapps via the Tomcat Manager, you’ll need to configure a valid user in the file `conf/tomcat-users.xml`. 

```
Listing 1: conf/tomcat-users.xml

```xml
<?xml version='1.0' encoding='utf-8'?>
<tomcat-users>
    <role rolename="manager-script"/>
    <user username="tomcat-manager" password="Passw0rd" roles="manager-script"/>
</tomcat-users>
```

Notes

- Using multiple versions (aka. parallel deployments) on the same context path is not supported.
- If you use only this module for deployments you might want to restrict access to the manager so it's only accessible via localhost. For more info: http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring_Manager_Application_Access

- Last tested on:
  
  Tomcat Version: Apache Tomcat/7.0.54
  JVM Vendor: Oracle Corporation
  JVM Version: 1.8.0_101-b13
  OS Architecture: amd64
  OS Name: Linux
  OS Version: 3.10.0-327.22.2.el7.x86_64

salt.states.tomcat.mod_watch(name, url='http://localhost:8080/manager', timeout=180)

The tomcat watcher, called to invoke the watch command. When called, it will reload the webapp in question

Note: This state exists to support special handling of the watch requisite. It should not be called directly.
Parameters for this function should be set by the state being triggered.

salt.states.tomcat.undeployed(name, url='http://localhost:8080/manager', timeout=180)

Enforce that the WAR will be undeployed from the server

name The context path to undeploy.
timeout [180] Timeout for HTTP request to the Tomcat Manager.

Example:

```
jenkins:
  tomcat.undeployed:
    - name: /ran
    - require:
      - service: application-service
```

salt.states.tomcat.wait(name, url='http://localhost:8080/manager', timeout=180)

Wait for the Tomcat Manager to load.

Notice that if tomcat is not running we won’t wait for it start and the state will fail. This state can be required in the tomcat.war_deployed state to make sure tomcat is running and that the manager is running as well and ready for deployment.

21.19. state modules

timeout [180] Timeout for HTTP request to the Tomcat Manager.
Example:

```yaml
tomcat-service:
  service.running:
    - name: tomcat
      enable: True

wait-for-tomcatmanager:
  tomcat.wait:
    - timeout: 300
    - require:
      - service: tomcat-service

jenkins:
  tomcat.war_deployed:
    - name: /ran
    - war: salt://jenkins-1.2.4.war
    - require:
      - tomcat: wait-for-tomcatmanager
```

```
name The context path to deploy (incl. forward slash) the WAR to.
war Absolute path to WAR file (should be accessible by the user running Tomcat) or a path supported by the
  salt.modules.cp.get_url function.
force [False] Force deployment even if the version strings are the same. Disabled by default.
timeout [180] Timeout for HTTP requests to the Tomcat Manager.
temp_war_location [None] Use another location to temporarily copy the WAR file to. By default the system’s
temp directory is used.
version [''] Specify the WAR version. If this argument is provided, it overrides the version encoded in the
  WAR file name, if one is present.

  Use False or blank value to prevent guessing the version and keeping it blank.

  New in version 2016.11.0.
```

Example:

```
jenkins:
  tomcat.war_deployed:
    - name: /salt-powered-jenkins
    - war: salt://jenkins-1.2.4.war
    - require:
      - service: application-service
```
Note: Be aware that in the above example the WAR jenkins-1.2.4.war will be deployed to the context path salt-powered-jenkins##1.2.4. To avoid this either specify a version yourself, or set version to False.

21.19.277 salt.states.trafficserver

Control Apache Traffic Server

New in version 2015.8.0.

salt.states.trafficserver.bounce_cluster(name)

```
bounce_ats_cluster:
salt.modules.trafficserver.bounce_cluster
```

salt.states.trafficserver.bounce_local(name, drain=False)

This option modifies the behavior of traffic_line -b and traffic_line -L such that traffic_server is not shut down until the number of active client connections drops to the number given by the proxy.config.restart.active_client_threshold configuration variable.

```
bounce_ats_local:
salt.modules.trafficserver.bounce_local

bounce_ats_local:
salt.modules.trafficserver.bounce_local
    - drain: True
```

salt.states.trafficserver.clear_cluster(name)
Clears accumulated statistics on all nodes in the cluster.

```
clear_ats_cluster:
salt.modules.trafficserver.clear_cluster
```

salt.states.trafficserver.clear_node(name)
Clears accumulated statistics on the local node.

```
clear_ats_node:
salt.modules.trafficserver.clear_node
```

salt.states.trafficserver.config(name, value)
Set Traffic Server configuration variable values.

```
proxy.config.proxy_name:
salt.modules.trafficserver.config:
    - value: cdn.site.domain.tld

OR

traffic_server_setting:
```
(continues on next page)
trafficserver.config:
- name: proxy.config.proxy_name
  value: cdn.site.domain.tld

salt.states.trafficserver.offline(name, path)
Mark a cache storage device as offline. The storage is identified by a path which must match exactly a path specified in storage.config. This removes the storage from the cache and redirects requests that would have used this storage to other storage. This has exactly the same effect as a disk failure for that storage. This does not persist across restarts of the traffic_server process.

offline_ats_path:
  trafficserver.offline:
    - path: /path/to/cache

salt.states.trafficserver.refresh(name)
Initiate a Traffic Server configuration file reread. Use this command to update the running configuration after any configuration file modification.

The timestamp of the last reconfiguration event (in seconds since epoch) is published in the proxy.node.config.reconfigure_time metric.

refresh_ats:
  trafficserver.refresh

salt.states.trafficserver.restart_cluster(name)
Restart the traffic_manager process and the traffic_server process on all the nodes in a cluster.

restart_ats_cluster:
  trafficserver.restart_cluster

salt.states.trafficserver.restart_local(name, drain=False)
Restart the traffic_manager and traffic_server processes on the local node.

This option modifies the behavior of traffic_line -b and traffic_line -L such that traffic_server is not shut down until the number of active client connections drops to the number given by the proxy.config.restart.active_client_threshold configuration variable.

restart_ats_local:
  trafficserver.restart_local
restart_ats_local_drain:
  trafficserver.restart_local
    - drain: True

salt.states.trafficserver.shutdown(name)
Shut down Traffic Server on the local node.

shutdown_ats:
  trafficserver.shutdown

salt.states.trafficserver.startup(name)
Start Traffic Server on the local node.

startup_ats:
  trafficserver.startup
salt.states.trafficserver.zero_cluster(name)
   Reset performance statistics to zero across the cluster.

zero_ats_cluster:
   trafficserver.zero_cluster

salt.states.trafficserver.zero_node(name)
   Reset performance statistics to zero on the local node.

zero_ats_node:
   trafficserver.zero_node

21.19.278 salt.states.tuned

Interface to Red Hat tuned-adm module

   maintainer  Syed Ali <alicsyed@gmail.com>
   maturity    new
   depends     cmd.run
   platform    Linux

salt.states.tuned.off(name=None)
   Turns 'tuned' off. Example tuned.sls file for turning tuned off:
   tuned: tuned.off: []
   To see a valid list of states call execution module: tuned.list

salt.states.tuned.profile(name)
   This state module allows you to modify system tuned parameters

   Example tuned.sls file to set profile to virtual-guest
   tuned:
       profile
       name: virtual-guest
   name tuned profile name to set the system to
   To see a valid list of states call execution module: tuned.list

21.19.279 salt.states.uptime

Monitor Web Server with Uptime

Uptime is an open source remote monitoring application using Node.js, MongoDB, and Twitter Bootstrap.

   Warning:  This state module is beta. It might be changed later to include more or less automation.

Note:  This state module requires a pillar to specify the location of your uptime install

uptime:
   application_url: "http://uptime-url.example.org"
Example:

```
url:
  uptime.monitored
url/sitemap.xml:
  uptime.monitored:
    - polling: 600 # every hour
```

```
salt.states.uptime.monitored(name, **params)
    Makes sure an URL is monitored by uptime. Checks if URL is already monitored, and if not, adds it.
```

21.19.280 salt.states.user

Management of user accounts

The user module is used to create and manage user settings, users can be set as either absent or present

```
fred:
  user.present:
    - fullname: Fred Jones
    - shell: /bin/zsh
    - home: /home/fred
    - uid: 4000
    - gid: 4000
    - groups:
      - wheel
      - storage
      - games

testuser:
  user.absent
```

```
salt.states.user.absent(name, purge=False, force=False)
    Ensure that the named user is absent
    name The name of the user to remove
    purge Set purge to True to delete all of the user’s files as well as the user, Default is False.
    force If the user is logged in, the absent state will fail. Set the force option to True to remove the user even if
        they are logged in. Not supported in FreeBSD and Solaris, Default is False.
```

```
salt.states.user.present(name, uid=None, gid=None, gid_from_name=False, groups=None, optional_groups=None, remove_groups=True, home=None, createhome=True, password=None, hash_password=False, enforce_password=True, empty_password=False, shell=None, unique=True, system=False, full-name=None, roomnumber=None, workphone=None, homophone=None, other=None, loginclass=None, date=None, mindays=None, maxdays=None, inactdays=None, warndays=None, expire=None, win_homedrive=None, win_profile=None, win_logonscript=None, win_description=None, nologinit=False, allow_uid_change=False, allow_gid_change=False)
    Ensure that the named user is present with the specified properties
    name The name of the user to manage
    uid The user id to assign. If not specified, and the user does not exist, then the next available uid will be
        assigned.
    gid The id of the default group to assign to the user. Either a group name or gid can be used. If not specified,
        and the user does not exist, then the next available gid will be assigned.
```
gid_from_name [False] If True, the default group id will be set to the id of the group with the same name as the user. If the group does not exist the state will fail.

allow_uid_change [False] Set to True to allow the state to update the uid.

New in version 2018.3.1.

allow_gid_change [False] Set to True to allow the state to update the gid.

New in version 2018.3.1.

groups A list of groups to assign the user to, pass a list object. If a group specified here does not exist on the minion, the state will fail. If set to the empty list, the user will be removed from all groups except the default group. If unset, salt will assume current groups are still wanted (see issue #28706).

optional_groups A list of groups to assign the user to, pass a list object. If a group specified here does not exist on the minion, the state will silently ignore it.

NOTE: If the same group is specified in both "groups" and "optional_groups", then it will be assumed to be required and not optional.

remove_groups Remove groups that the user is a member of that weren’t specified in the state, Default is True.

home The custom login directory of user. Uses default value of underlying system if not set. Notice that this directory does not have to exist. This also the location of the home directory to create if createhome is set to True.

createhome [True] If set to False, the home directory will not be created if it doesn’t already exist.

<table>
<thead>
<tr>
<th>Warning:</th>
<th>Not supported on Windows or Mac OS.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Additionally, parent directories will not be created. The parent directory for home must already exist.</td>
</tr>
</tbody>
</table>

nologinit [False] If set to True, it will not add the user to lastlog and faillog databases.

Note: Not supported on Windows or Mac OS.

password A password hash to set for the user. This field is only supported on Linux, FreeBSD, NetBSD, OpenBSD, and Solaris. If the empty_password argument is set to True then password is ignored. For Windows this is the plain text password. For Linux, the hash can be generated with openssl passwd -1.

Changed in version 0.16.0: BSD support added.

hash_password Set to True to hash the clear text password. Default is False.

enforce_password Set to False to keep the password from being changed if it has already been set and the password hash differs from what is specified in the "password" field. This option will be ignored if "password" is not specified, Default is True.

empty_password Set to True to enable password-less login for user, Default is False.

shell The login shell, defaults to the system default shell

unique Require a unique UID, Default is True.

system Choose UID in the range of FIRST_SYSTEM_UID and LAST_SYSTEM_UID, Default is False.

loginclass The login class, defaults to empty (BSD only)

User comment field (GECOS) support (currently Linux, BSD, and MacOS only):

The below values should be specified as strings to avoid ambiguities when the values are loaded. (Especially the phone and room number fields which are likely to contain numeric data)

fullname The user’s full name

roomnumber The user’s room number (not supported in MacOS)

workphone The user’s work phone number (not supported in MacOS)

homephone The user’s home phone number (not supported in MacOS)

other The user’s other attribute (not supported in MacOS) If GECOS field contains more than 4 commas, this field will have the rest of ’em
Changed in version 2014.7.0: Shadow attribute support added.

Shadow attributes support (currently Linux only):

The below values should be specified as integers.

date  Date of last change of password, represented in days since epoch (January 1, 1970).

mindays  The minimum number of days between password changes.

maxdays  The maximum number of days between password changes.

inactdays  The number of days after a password expires before an account is locked.

warndays  Number of days prior to maxdays to warn users.

expire  Date that account expires, represented in days since epoch (January 1, 1970).

The below parameters apply to windows only:

win_homedrive (Windows Only)  The drive letter to use for the home directory. If not specified the home directory will be a unc path. Otherwise the home directory will be mapped to the specified drive. Must be a letter followed by a colon. Because of the colon, the value must be surrounded by single quotes. ie:

- win_homedrive: 'U:

Changed in version 2015.8.0.

win_profile (Windows Only)  The custom profile directory of the user. Uses default value of underlying system if not set.

Changed in version 2015.8.0.

win_logonscript (Windows Only)  The full path to the logon script to run when the user logs in.

Changed in version 2015.8.0.

win_description (Windows Only)  A brief description of the purpose of the users account.

Changed in version 2015.8.0.

21.19.281  salt.states.vagrant

Manage Vagrant VMs

Manage execution of Vagrant virtual machines on Salt minions.

Vagrant is a tool for building and managing virtual machine environments. It can use various providers, such as VirtualBox, Docker, or VMware, to run its VMs. Vagrant provides some of the functionality of a light-weight hypervisor. The combination of Salt modules, Vagrant running on the host, and a virtual machine provider, gives hypervisor-like functionality for developers who use Vagrant to quickly define their virtual environments.

New in version 2018.3.0.

The configuration of each virtual machine is defined in a file named Vagrantfile which must exist on the VM host machine. The essential parameters which must be defined to start a Vagrant VM are the directory where the Vagrantfile is located (argument cwd:), and the username which will own the Vagrant box created for the VM (argument vagrant_runas:).

A single Vagrantfile may define one or more virtual machines. Use the machine argument to chose among them. The default (blank) value will select the primary (or only) machine in the Vagrantfile.

[NOTE:] Each virtual machine host must have the following:

- a working salt-minion
- a Salt sdb database configured for vagrant_sdb_data.
- Vagrant installed and the vagrant command working
- a suitable VM provider
# EXAMPLE:
# file /etc/salt/minion.d/vagrant_sdb.conf on the host computer
# -- this sdb database is required by the Vagrant module --
vagrant_sdb_data: # The sdb database must have this name.
  driver: sqlite3  # Let's use SQLite to store the data ...
  database: /var/cache/salt/vagrant.sqlite  # ... in this file ...
  table: sdb  # ... using this table name.
  create_table: True  # if not present

salt.states.vagrant.destroyed(name)

  Stops a VM (or VMs) and removes all references to it (them). (Runs `vagrant destroy`.)

  Subsequent re-use of the same machine will require another operation of `vagrant.running` or a call to the `vagrant.init` execution module.

  Parameters `name` – May be a Salt_id node or a POSIX-style wildcard string.

    node_name:
    vagrant.destroyed

salt.states.vagrant.initialized(name,**kwargs)

  Defines a new VM with specified arguments, but does not start it.

  Parameters `name` – The Salt_id node name you wish your VM to have.

  Each machine must be initialized individually using this function or the "vagrant.running" function, or the `vagrant.init` execution module call.

  This command will not change the state of a running or paused machine.

  Possible keyword arguments:
  • `cwd`: The directory (path) containing the Vagrantfile
  • `machine`: ("") the name of the machine (in the Vagrantfile) if not default
  • `vagrant_runas`: ("root") the username who owns the vagrantbox file
  • `vagrant_provider`: the provider to run the VM (usually 'virtualbox')
  • `vm`: (()) a dictionary containing these or other keyword arguments

    node_name1:
    vagrant.initialized
      - `cwd`: /projects/my_project
      - `vagrant_runas`: my_username
      - `machine`: machine1

    node_name2:
    vagrant.initialized
      - `cwd`: /projects/my_project
      - `vagrant_runas`: my_username
      - `machine`: machine2

start_nodes:
  vagrant.start:
    - name: node_name?

salt.states.vagrant.paused(name)

  Stores the state of a VM (or VMs) for fast restart. (Runs `vagrant suspend`.)

  Parameters `name` – May be a Salt_id node or a POSIX-style wildcard string.

    node_name:
    vagrant.paused
salt.states.vagrant.powered_off(name)
    Stops a VM (or VMs) by power off. (Runs vagrant halt.)
    This method is provided for compatibility with other VM-control state modules. For Vagrant, the action is
    identical with stopped.
    Parameters name – May be a Salt_id node or a POSIX-style wildcard string.

    node_name:
    vagrant.unpowered

salt.states.vagrant.rebooted(name)
    Reboots a running, paused, or stopped VM (or VMs). (Runs vagrant reload.)
    The will re-run the provisioning
    Parameters name – May be a Salt_id node or a POSIX-style wildcard string.

    node_name:
    vagrant.reloaded

salt.states.vagrant.running(name, **kwargs)
    Defines and starts a new VM with specified arguments, or restart a VM (or group of VMs). (Runs vagrant up.)
    Parameters name – the Salt_id node name you wish your VM to have.
    If name contains a '?' or '*' then it will re-start a group of VMs which have been paused or stopped.
    Each machine must be initially started individually using this function or the vagrant.init execution module call.
    [NOTE:] Keyword arguments are silently ignored when re-starting an existing VM.
    Possible keyword arguments:
    • cwd: The directory (path) containing the Vagrantfile
    • machine: ('') the name of the machine (in the Vagrantfile) if not default
    • vagrant_runas: ('root') the username who owns the vagrantbox file
    • vagrant_provider: the provider to run the VM (usually 'virtualbox')
    • vm: ({}) a dictionary containing these or other keyword arguments

    node_name:
    vagrant.running

    node_name:
    vagrant.running:
    - cwd: /projects/my_project
    - vagrant_runas: my_username
    - machine: machine1

salt.states.vagrant.stopped(name)
    Stops a VM (or VMs) by shutting it (them) down nicely. (Runs vagrant halt)
    Parameters name – May be a Salt_id node, or a POSIX-style wildcard string.

    node_name:
    vagrant.stopped

21.19.282 salt.states.vault module

States for managing Hashicorp Vault. Currently handles policies. Configuration instructions are documented in the
execution module docs.
Salt Documentation, Release 3000.2

maintainer SaltStack
maturity new
platform all

New in version 2017.7.0.

salt.states.vault.policy_present(name, rules)
Ensure a Vault policy with the given name and rules is present.
name The name of the policy
rules Rules formatted as in-line HCL

demo-policy:
  vault.policy_present:
    - name: foo/bar
    - rules: |
      path "secret/top-secret/*" { 
        policy = "deny"
      }
      path "secret/not-very-secret/*" { 
        policy = "write"
      }

21.19.283 salt.states.vbox_guest

VirtualBox Guest Additions installer state

salt.states.vbox_guest.additions_installed(name, reboot=False, upgrade_os=False)
Ensure that the VirtualBox Guest Additions are installed. Uses the CD, connected by VirtualBox.
name The name has no functional value and is only used as a tracking reference.
reboot [False] Restart OS to complete installation.
upgrade_os [False] Upgrade OS (to ensure the latests version of kernel and developer tools installed).
salt.states.vbox_guest.additions_removed(name, force=False)
Ensure that the VirtualBox Guest Additions are removed. Uses the CD, connected by VirtualBox.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press 'Host+D' ('Host' is usually 'Right Ctrl').
name The name has no functional value and is only used as a tracking reference.
force Force VirtualBox Guest Additions removing.
salt.states.vbox_guest.grant_access_to_shared_folders_to(name, users=None)
Grant access to auto-mounted shared folders to the users.
User is specified by it’s name. To grant access for several users use argument users.
name Name of the user to grant access to auto-mounted shared folders to.
users List of names of users to grant access to auto-mounted shared folders to. If specified, name will not be taken into account.

21.19.284 salt.states.victorops

Create an Event in VictorOps

New in version 2015.8.0.
This state is useful for creating events on the VictorOps service during state runs.
Salt Documentation, Release 3000.2

webserver-warning-message:
  victorops.create_event:
    - message_type: 'CRITICAL'
    - entity_id: 'webserver/diskspace'
    - state_message: 'Webserver diskspace is low.'

salt.states.victorops.create_event(name, message_type, routing_key='everyone', **kwargs)
Create an event on the VictorOps service

webserver-warning-message:
  victorops.create_event:
    - message_type: 'CRITICAL'
    - entity_id: 'webserver/diskspace'
    - state_message: 'Webserver diskspace is low.'

database-server-warning-message:
  victorops.create_event:
    - message_type: 'WARNING'
    - entity_id: 'db_server/load'
    - state_message: 'Database Server load is high.'
    - entity_is_host: True
    - entity_display_name: 'dbdserver.example.com'

The following parameters are required:
name  This is a short description of the event.
message_type  One of the following values: INFO, WARNING, ACKNOWLEDGEMENT, CRITICAL, RECOVERY.

The following parameters are optional:
routing_key  The key for where messages should be routed. By default, sent to 'everyone' route.
entity_id  The name of alerting entity. If not provided, a random name will be assigned.
timestamp  Timestamp of the alert in seconds since epoch. Defaults to the time the alert is received at VictorOps.
timestamp_fmt  The date format for the timestamp parameter. Defaults to '%Y-%m-%dT%H:%M:%S'.
state_start_time  The time this entity entered its current state (seconds since epoch). Defaults to the time alert is received.
state_start_time_fmt  The date format for the timestamp parameter. Defaults to '%Y-%m-%dT%H:%M:%S'.
state_message  Any additional status information from the alert item.
entity_is_host  Used within VictorOps to select the appropriate display format for the incident.
entity_display_name  Used within VictorOps to display a human-readable name for the entity.
ack_message  A user entered comment for the acknowledgment.
ack_author  The user that acknowledged the incident.

21.19.285  salt.states.virt module

Manage virt

For the key certificate this state uses the external pillar in the master to call for the generation and signing of certificates for systems running libvirt:

libvirt_keys:
  virt.keys
salt.states.virt.keys(name, basepath='/etc/pki', **kwargs)
Manage libvirt keys.

- **name** The name variable used to track the execution
- **basepath** Defaults to /etc/pki, this is the root location used for libvirt keys on the hypervisor
The following parameters are optional:
  - **country** The country that the certificate should use. Defaults to US.
    New in version 2018.3.0.
  - **state** The state that the certificate should use. Defaults to Utah.
    New in version 2018.3.0.
  - **locality** The locality that the certificate should use. Defaults to Salt Lake City.
    New in version 2018.3.0.
  - **organization** The organization that the certificate should use. Defaults to Salted.
    New in version 2018.3.0.
  - **expiration_days** The number of days that the certificate should be valid for. Defaults to 365 days (1 year)
    New in version 2018.3.0.

salt.states.virt.network_running(name, bridge, forward, vport=None, tag=None, ipv4_config=None, ipv6_config=None, autostart=True, connection=None, username=None, password=None)
Defines and starts a new network with specified arguments.

Parameters
- **bridge** – Bridge name
- **forward** – Forward mode(bridge, router, nat)
- **vport** – Virtualport type (Default: 'None')
- **tag** – Vlan tag (Default: 'None')
- **ipv4_config** – IPv4 network configuration. See the `virt.network_define` function corresponding parameter documentation for more details on this dictionary. (Default: None).
  New in version 3000.
- **ipv6_config** – IPv6 network configuration. See the `virt.network_define` function corresponding parameter documentation for more details on this dictionary. (Default: None).
  New in version 3000.
- **autostart** – Network autostart (default 'True')
- **connection** – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  New in version 2019.2.0.

```python
domain_name:
  virt.network_define

network_name:
  virt.network_define:
    - bridge: main
    - forward: bridge
    - vport: openvswitch
    - tag: 180
    - autostart: True
```
network_name:

virt.network_define:
- bridge: natted
- forward: nat
- ipv4_config:
  cidr: 192.168.42.0/24
  dhcp_ranges:
    - start: 192.168.42.10
      end: 192.168.42.25
    - start: 192.168.42.100
      end: 192.168.42.150
- autostart: True

salt.states.virt.pool_deleted(name, purge=False, connection=None, username=None, password=None)

Deletes a virtual storage pool.

Parameters

- name – the name of the pool to delete.
- purge – if True, the volumes contained in the pool will be deleted as well as the pool itself. Note that these will be lost forever. If False the pool will simply be undefined. (Default: False)
- connection – libvirt connection URI, overriding defaults
- username – username to connect with, overriding defaults
- password – password to connect with, overriding defaults

In order to be purged a storage pool needs to be running to get the list of volumes to delete.

Some libvirt storage drivers may not implement deleting, those actions are implemented on a best effort idea. In any case check the result’s comment property to see if any of the action was unsupported.

New in version 3000.

salt.states.virt.pool_running(name, ptype=None, target=None, permissions=None, source=None, transient=False, autostart=True, connection=None, username=None, password=None)

Defines and starts a new pool with specified arguments.

New in version 2019.2.0.

Parameters

- ptype – libvirt pool type
- target – full path to the target device or folder. (Default: None)
- permissions – target permissions. See Permissions definition for more details on this structure.
- source – dictionary containing keys matching the source_* parameters in function salt.modules.virt.pool_define().
- transient – when set to True, the pool will be automatically undefined after being stopped. (Default: False)
- autostart – Whether to start the pool when booting the host. (Default: True)
- start – When True, define and start the pool, otherwise the pool will be left stopped.
- connection – libvirt connection URI, overriding defaults
- username – username to connect with, overriding defaults
- password – password to connect with, overriding defaults

pool_name:

virt.pool_define
pool_name:  
  virt.pool_define:  
    - ptype: netfs  
    - target: /mnt/cifs  
    - permissions:  
      - mode: 0770  
      - owner: 1000  
      - group: 100  
    - source:  
      dir: samba_share  
      hosts:  
      - one.example.com  
      - two.example.com  
    - format: cifs  
    - autostart: True

salt.states.virt.powered_off(name, connection=None, username=None, password=None)

Stops a VM by power off.

New in version 2016.3.0.

Parameters

- **connection** – libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  
  New in version 2019.2.0.

salt.states.virt.rebooted(name, connection=None, username=None, password=None)

Reboots VMs

New in version 2016.3.0.

Parameters

- **name** –
- **connection** – libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  
  New in version 2019.2.0.

salt.states.virt.reverted(name, snapshot=None, cleanup=False)

Deprecated since version 2016.3.0.

Reverts to the particular snapshot.

New in version 2016.3.0.
domain_name_1:
  virt.reverted:
    - snapshot: snapshot_name
    - cleanup: False

salt.states.virt.running(name, cpu=None, mem=None, image=None, vm_type=None, disk_profile=None, disks=None, nic_profile=None, interfaces=None, graphics=None, seed=True, install=True, pub_key=None, priv_key=None, update=False, connection=None, username=None, password=None, os_type=None, arch=None, boot=None)

Starts an existing guest, or defines and starts a new VM with specified arguments.

New in version 2016.3.0.

Parameters

- **name** – name of the virtual machine to run
- **cpu** – number of CPUs for the virtual machine to create
- **mem** – amount of memory in MiB for the new virtual machine
- **image** – disk image to use for the first disk of the new VM
  
  Deprecated since version 2019.2.0.
- **vm_type** – force virtual machine type for the new VM. The default value is taken from the host capabilities. This could be useful for example to use 'qemu' type instead of the 'kvm' one.
  
  New in version 2019.2.0.
- **disk_profile** – Name of the disk profile to use for the new virtual machine
  
  New in version 2019.2.0.
- **disks** – List of disk to create for the new virtual machine. See Disks Definitions for more details on the items on this list.
  
  New in version 2019.2.0.
- **nic_profile** – Name of the network interfaces profile to use for the new virtual machine
  
  New in version 2019.2.0.
- **interfaces** – List of network interfaces to create for the new virtual machine. See Network Interfaces Definitions for more details on the items on this list.
  
  New in version 2019.2.0.
- **graphics** – Graphics device to create for the new virtual machine. See Graphics Definition for more details on this dictionary
  
  New in version 2019.2.0.
- **saltenv** – Fileserver environment (Default: 'base'). See cp module for more details
  
  New in version 2019.2.0.
- **seed** – True to seed the disk image. Only used when the image parameter is provided. (Default: True)
  
  New in version 2019.2.0.
- **install** – install salt minion if absent (Default: True)
  
  New in version 2019.2.0.
- **pub_key** – public key to seed with (Default: None)
  
  New in version 2019.2.0.
Salt Documentation, Release 3000.2

- **priv_key** – public key to seed with (Default: None)
  
  New in version 2019.2.0.

- **seed_cmd** – Salt command to execute to seed the image. (Default: 'seed.apply')
  
  New in version 2019.2.0.

- **update** – set to True to update a defined module. (Default: False)
  
  New in version 2019.2.0.

- **connection** – libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.

- **username** – username to connect with, overriding defaults
  
  New in version 2019.2.0.

- **password** – password to connect with, overriding defaults
  
  New in version 2019.2.0.

- **os_type** – type of virtualization as found in the //os/type element of the libvirt definition. The default value is taken from the host capabilities, with a preference for hvm. Only used when creating a new virtual machine.
  
  New in version 3000.

- **arch** – architecture of the virtual machine. The default value is taken from the host capabilities, but x86_64 is preferred over i686. Only used when creating a new virtual machine.
  
  New in version 3000.

- **boot** – Specifies kernel for the virtual machine, as well as boot parameters for the virtual machine. This is an optional parameter, and all of the keys are optional within the dictionary. If a remote path is provided to kernel or initrd, salt will handle the downloading of the specified remote field, and will modify the XML accordingly.

```python
{
    'kernel': '/root/f8-i386-vmlinuz',
    'initrd': '/root/f8-i386-initrd',
    'cmdline': 'console=ttyS0 ks=http://example.com/f8-i386/os/
             → '
}
```

New in version 3000.

**Example States**

Make sure an already-defined virtual machine called domain_name is running:

```yaml
domain_name:
    virt.running
```

Do the same, but define the virtual machine if needed:

```yaml
domain_name:
    virt.running:
        - cpu: 2
        - mem: 2048
        - disk_profile: prod
        - disks:
```

(continues on next page)
- **name**: system  
  **size**: 8192  
  **overlay_image**: True  
  **pool**: default  
  **image**: /path/to/image.qcow2  
- **name**: data  
  **size**: 16834  
- **nic_profile**: prod  
- **interfaces**:  
  - **name**: eth0  
    **mac**: 01:23:45:67:89:AB  
  - **name**: eth1  
    **type**: network  
    **source**: admin  
- **graphics**:  
  **type**: spice  
  **listen**:  
    **type**: address  
    **address**: 192.168.0.125

salt.states.virt.saved(name, suffix=None)  
 Deprecated since version 2016.3.0: Use snapshot() instead.

Takes a snapshot of a particular VM or by a UNIX-style wildcard.

New in version 2016.3.0.

```yaml
domain_name:
  virt.saved:
    - suffix: periodic

domain*:
  virt.saved:
    - suffix: periodic
```

salt.states.virt.snapshot(name, suffix=None, connection=None, username=None, password=None)  
 Takes a snapshot of a particular VM or by a UNIX-style wildcard.

New in version 2016.3.0.

**Parameters**

- **connection** – libvirt connection URI, overriding defaults  
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults  
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults  
  New in version 2019.2.0.

```yaml
domain_name:
  virt.snapshot:
    - suffix: periodic

domain*:
  virt.snapshot:
    - suffix: periodic
```
salt.states.virt.stopped(name, connection=None, username=None, password=None)
Stops a VM by shutting it down nicely.
New in version 2016.3.0.
Parameters
  * connection – libvirt connection URI, overriding defaults
    New in version 2019.2.0.
  * username – username to connect with, overriding defaults
    New in version 2019.2.0.
  * password – password to connect with, overriding defaults
    New in version 2019.2.0.

salt.states.virt.unpowered(name)
Deprecated since version 2016.3.0: Use powered_off() instead.
Stops a VM by power off.
New in version 2016.3.0.

21.19.286 salt.states.virtualenv
Setup of Python virtualenv sandboxes.
New in version 0.17.0.
salt.states.virtualenv_mod.managed(name, venv_bin=None, requirements=None, system_site_packages=False, distribute=False, use_wheel=False, clear=False, python=None, extra_search_dir=None, never_download=None, prompt=None, user=None, cwd=None, index_url=None, extra_index_url=None, pre_releases=False, no_deps=False, pip_download=None, pip_download_cache=None, pip_exists_action=None, pip_ignore_installed=False, proxy=None, use_vt=False, env_vars=None, no_use_wheel=False, pip_upgrade=False, pip_pkgs=None, pip_no_cache_dir=False, pip_cache_dir=None, process_dependency_links=False, no_binary=None, **kwargs)
Create a virtualenv and optionally manage it with pip
name Path to the virtualenv.
venv_bin: virtualenv The name (and optionally path) of the virtualenv command. This can also be set globally in the minion config file as virtualenv.venv_bin.
requirements: None Path to a pip requirements file. If the path begins with salt:// the file will be transferred from the master file server.
use_wheel: False Prefer wheel archives (requires pip >= 1.4).
python [None] Python executable used to build the virtualenv
user: None The user under which to run virtualenv and pip.
cwd: None Path to the working directory where pip install is executed.
no_deps: False Pass --no-deps to pip install.
pip_exists_action: None  Default action of pip when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup.
proxy: None  Proxy address which is passed to pip install.
env_vars: None  Set environment variables that some builds will depend on. For example, a Python C-module may have a Makefile that needs INCLUDE_PATH set to pick up a header file while compiling.
no_use_wheel: False  Force to not use wheel archives (requires pip>=1.4)
no_binary  Force to not use binary packages (requires pip >= 7.0.0) Accepts either :all: to disable all binary packages, :none: to empty the set, or a list of one or more packages
pip_upgrade: False  Pass –upgrade to pip install.
pip_pkgs: None  As an alternative to requirements, pass a list of pip packages that should be installed.
process_dependency_links: False  Run pip install with the –process_dependency_links flag.

New in version 2017.7.0.
Also accepts any kwargs that the virtualenv module will. However, some kwargs, such as the pip option, require – distribute: True.

```
/var/www/myvirtualenv.com:
  virtualenv.managed:
    - system_site_packages: False
    - requirements: salt://REQUIREMENTS.txt
    - env_vars:
      PATH_VAR: '/usr/local/bin/
```

21.19.287 salt.states.webutil

Support for htpasswd module. Requires the apache2-utils package for Debian-based distros.

New in version 2014.7.0.

```
username:
  webutil.user_exists:
    - password: secr3t
    - htpasswd_file: /etc/nginx/htpasswd
    - options: d
    - force: true
```

salt.states.webutil.user_absent(name, htpasswd_file=None, runas=None)
Make sure the user is not in the specified htpasswd file
name  User name
htpasswd_file  Path to the htpasswd file
runas  The system user to run htpasswd command with

salt.states.webutil.user_exists(name, password=None, htpasswd_file=None, options=",", force=False, runas=None, update=False)
Make sure the user is inside the specified htpasswd file
name  User name
password  User password
htpasswd_file  Path to the htpasswd file
options  See salt.modules.htpasswd.useradd
force  Touch the file even if user already created
runas  The system user to run htpasswd command with
update  Update an existing user’s password if it’s different from what’s in the htpasswd file (unlike force, which updates regardless)

21.19.288 salt.states.win_certutil module
Installing of certificates to the Windows Certificate Manager

Install certificates to the Windows Certificate Manager

```python
salt://certs/cert.cer:
  - certutil.add_store:
    - store: TrustedPublisher
```

```python
salt.states.win_certutil.add_store(name, store, saltenv='base')
```

Store a certificate to the given store

- **name**: The certificate to store, this can use local paths or salt:// paths
- **store**: The store to add the certificate to
- **saltenv**: The salt environment to use, this is ignored if a local path is specified

```python
salt.states.win_certutil.del_store(name, store, saltenv='base')
```

Remove a certificate in the given store

- **name**: The certificate to remove, this can use local paths or salt:// paths
- **store**: The store to remove the certificate from
- **saltenv**: The salt environment to use, this is ignored if a local path is specified

### 21.19.289 salt.states.win_dacl

Windows Object Access Control Lists

Ensure an ACL is present

```python
addAcl:
  win_dacl.present:
    - name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
    - objectType: Registry
    - user: FakeUser
    - permission: FullControl
    - acetype: ALLOW
    - propagation: KEY&SUBKEYS
```

Ensure an ACL does not exist

```python
removeAcl:
  win_dacl.absent:
    - name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
    - objectType: Registry
    - user: FakeUser
    - permission: FullControl
    - acetype: ALLOW
    - propagation: KEY&SUBKEYS
```

Ensure an object is inheriting permissions
parameters: name - the path of the object objectType - Registry/File/Directory clear_existing_acl - True/False - when inheritance is enabled, should the existing ACL be kept or cleared out

```python
eInherit:
    win_dacl.enableinheritance:
        - name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
        - objectType: Registry
        - clear_existing_acl: True
```

Ensure an object is not inheriting permissions

parameters: name - the path of the object objectType - Registry/File/Directory copy_inherited_acl - True/False - if inheritance is enabled, should the inherited permissions be copied to the ACL when inheritance is disabled

```python
dInherit:
    win_dacl.disableinheritance:
        - name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
        - objectType: Registry
        - copy_inherited_acl: False
```

salt.states.win_dacl.absent(name, objectType, user, permission, acetype, propagation)
Ensure an ACL does not exist

code:
salt.states.win_dacl.disinherit(name, objectType, copy_inherited_acl=True)
Ensure an object is not inheriting ACLs from its parent

code:
salt.states.win_dacl.inherit(name, objectType, clear_existing_acl=False)
Ensure an object is inheriting ACLs from its parent

code:
salt.states.win_dacl.present(name, objectType, user, permission, acetype, propagation)
Ensure an ACE is present

**21.19.290 salt.states.win_dism module**

**Installing of Windows features using DISM**

Install windows features/capabilities with DISM

```python
Language.Basic~~~en-US-0.0.1.0:
    dism.capability_installed

NetFx3:
    dism.feature_installed
```

salt.states.win_dism.capability_installed(name, source=None, limit_access=False, image=None, restart=False)
Install a DISM capability

**Parameters**

- **name** (str) – The capability to install
- **source** (str) – The optional source of the capability
- **limit_access** (bool) – Prevent DISM from contacting Windows Update for online images
- **image** (Optional[str]) – The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- **restart** (Optional[bool]) – Reboot the machine if required by the install
Example

Run `dism.available_capabilities` to get a list of available capabilities. This will help you get the proper name to use.

```
install_dotnet35:
    dism.capability_installed:
        - name: NetFX3~~~~
```

```
salt.states.win_dism.capability_removed(name, image=None, restart=False)
```

Uninstall a DISM capability

Parameters

- `name (str)` - The capability to uninstall
- `image (Optional[str])` - The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is `None`.
- `restart (Optional[bool])` - Reboot the machine if required by the install

Example

Run `dism.installed_capabilities` to get a list of installed capabilities. This will help you get the proper name to use.

```
remove_dotnet35:
    dism.capability_removed:
        - name: NetFX3~~~~
```

```
salt.states.win_dism.feature_installed(name, package=None, source=None, limit_access=False, enable_parent=False, image=None, restart=False)
```

Install a DISM feature

Parameters

- `name (str)` - The feature in which to install
- `package (Optional[str])` - The parent package for the feature. You do not have to specify the package if it is the Windows Foundation Package. Otherwise, use package to specify the parent package of the feature
- `source (str)` - The optional source of the feature
- `limit_access (bool)` - Prevent DISM from contacting Windows Update for online images
- `enable_parent (Optional[bool])` - True will enable all parent features of the specified feature
- `image (Optional[str])` - The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is `None`.
- `restart (Optional[bool])` - Reboot the machine if required by the install

Example

Run `dism.available_features` to get a list of available features. This will help you get the proper name to use.

```
install_telnet_client:
    dism.feature_installed:
        - name: TelnetClient
```
salt.states.win_dism.feature_removed(name, remove_payload=False, image=None, restart=False)

Disables a feature.

Parameters

- **name** (str) – The feature to disable
- **remove_payload** (Optional[bool]) – Remove the feature’s payload. Must supply source when enabling in the future.
- **image** (Optional[str]) – The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- **restart** (Optional[bool]) – Reboot the machine if required by the install

Example

Run `dism.installed_features` to get a list of installed features. This will help you get the proper name to use.

```yaml
remove_telnet_client:
  dism.feature_removed:
    - name: TelnetClient
    - remove_payload: True
```

salt.states.win_dism.package_installed(name, ignore_check=False, prevent_pending=False, image=None, restart=False)

Install a package.

Parameters

- **name** (str) – The package to install. Can be a .cab file, a .msu file, or a folder
- **ignore_check** (Optional[bool]) – Skip installation of the package if the applicability checks fail
- **prevent_pending** (Optional[bool]) – Skip the installation of the package if there are pending online actions
- **image** (Optional[str]) – The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- **restart** (Optional[bool]) – Reboot the machine if required by the install

Example

```yaml
install_KB123123123:
  dism.package_installed:
    - name: C:\Packages\KB123123123.cab
```

salt.states.win_dism.package_removed(name, image=None, restart=False)

Uninstall a package.

Parameters

- **name** (str) – The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. This can also be the name of a package as listed in `dism.installed_packages`
- **image** (Optional[str]) – The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- **restart** (Optional[bool]) – Reboot the machine if required by the install
Example

```python
# Example using source
remove_KB1231231:
dism.package_installed:
    - name: C:\Packages\KB1231231.cab

# Example using name from ``dism.installed_packages``
remove_KB1231231:
dism.package_installed:
    - name: Package_for_KB1231231~31bf3856ad364e35~amd64~~10.0.1.3
```

---

**21.19.291 salt.states.win_dns_client**

Module for configuring DNS Client on Windows systems

```python
salt.states.win_dns_client.dns_dhcp(name, interface='Local Area Connection')
```

Configure the DNS server list from DHCP Server

```python
cfg_dns_servers:
    win_dns_client.dns_exists:
        - replace: True  #remove any servers not in the "servers" list, default is False
        - servers:
            - 8.8.8.8
            - 8.8.8.9
```

```python
salt.states.win_dns_client.primary_suffix(name, suffix=None, updates=False)
```

New in version 2014.7.0.

Configure the global primary DNS suffix of a DHCP client.

- **suffix** [None] The suffix which is advertised for this client when acquiring a DHCP lease. When none is set, the explicitly configured DNS suffix will be removed.
- **updates** [False] Allow syncing the DNS suffix with the AD domain when the client’s AD domain membership changes

```python
primary_dns_suffix:
    win_dns_client.primary_suffix:
        - suffix: sub.domain.tld
        - updates: True
```

---

**21.19.292 salt.states.win_firewall**

State for configuring Windows Firewall

```python
salt.states.win_firewall.add_rule(name, localport, protocol='tcp', action='allow', dir='in', remoteip='any')
```

Add a new inbound or outbound rule to the firewall policy

- **Parameters**
  - **name** (str) – The name of the rule. Must be unique and cannot be "all". Required.
• **localport** (*int*) – The port the rule applies to. Must be a number between 0 and 65535. Can be a range. Can specify multiple ports separated by commas. Required.

• **protocol** (*Optional[str]*) – The protocol. Can be any of the following:
  - A number between 0 and 255
  - icmpv4
  - icmpv6
  - tcp
  - udp
  - any

• **action** (*Optional[str]*) – The action the rule performs. Can be any of the following:
  - allow
  - block
  - bypass

• **dir** (*Optional[str]*) – The direction. Can be **in** or **out**.

• **remoteip** (*Optional[str]*) – The remote IP. Can be any of the following:
  - any
  - localsubnet
  - dns
  - dhcp
  - wins
  - defaultgateway
  - Any valid IPv4 address (192.168.0.12)
  - Any valid subnet (192.168.1.0/24)
  - Any valid range of IP addresses (192.168.0.1-192.168.0.12)
  - A list of valid IP addresses

Can be combinations of the above separated by commas.

New in version 2016.11.6.

Example:

```python
open_smb_port:
  win_firewall.add_rule:
    - name: SMB (445)
    - localport: 445
    - protocol: tcp
    - action: allow
```

```python
salt.states.win_firewall.disabled(name='allprofiles')
```
Disable all the firewall profiles (Windows only)

**Parameters** **profile** (*Optional[str]*) – The name of the profile to disable. Default is **allprofiles**. Valid options are:
  - allprofiles
  - domainprofile
  - privateprofile
  - publicprofile

Example:

```python
# To disable the domain profile
disable_domain:
  win_firewall.disabled:
    - name: domainprofile

# To disable all profiles
```

(continues on next page)
enable_all:
  - name: allprofiles

salt.states.win_firewall.enabled(name='allprofiles')
Enable all the firewall profiles (Windows only)
Parameters
  profile (Optional[str]) – The name of the profile to enable. Default is allprofiles. Valid options are:
  • allprofiles
  • domainprofile
  • privateprofile
  • publicprofile

Example:

# To enable the domain profile
enable_domain:
  - name: domainprofile

# To enable all profiles
enable_all:
  - name: allprofiles

21.19.293 salt.states.win_iis module

Microsoft IIS site management
This module provides the ability to add/remove websites and application pools from Microsoft IIS.
New in version 2016.3.0.
salt.states.win_iis.container_setting(name, container, settings=None)
Set the value of the setting for an IIS container.
Parameters
  • name (str) – The name of the IIS container.
  • container (str) – The type of IIS container. The container types are: AppPools, Sites, SslBindings
  • settings (str) – A dictionary of the setting names and their values. Example of usage for the AppPools container:

site0-apppool-setting:
  win_iis.container_setting:
    - name: site0
    - container: AppPools
    - settings:
      managedPipelineMode: Integrated
      processModel.maxProcesses: 1
      processModel.userName: TestUser
      processModel.password: TestPassword
      processModel.identityType: SpecificUser

Example of usage for the Sites container:
site0-site-setting:
  win_iis.container_setting:
  - name: site0
  - container: Sites
  - settings:
    logFile.logFormat: W3C
    logFile.period: Daily
    limits.maxUrlSegments: 32

salt.states.win_iis.create_app(name, site, sourcepath, apppool=\None)
Create an IIS application.
Parameters
  - name (str) – The IIS application.
  - site (str) – The IIS site name.
  - sourcepath (str) – The physical path.
  - apppool (str) – The name of the IIS application pool.
Example of usage with only the required arguments:

site0-v1-app:
  win_iis.create_app:
  - name: v1
  - site: site0
  - sourcepath: C:\inetpub\site0\v1

Example of usage specifying all available arguments:

site0-v1-app:
  win_iis.create_app:
  - name: v1
  - site: site0
  - sourcepath: C:\inetpub\site0\v1
  - apppool: site0

salt.states.win_iis.create_apppool(name)
Create an IIS application pool.
Parameters name (str) – The name of the IIS application pool.
Usage:

site0-apppool:
  win_iis.create_apppool:
  - name: site0

salt.states.win_iis.create_binding(name, site, hostheader=", ipaddress=", port=80, protocol='http', sslflags=0)
Create an IIS binding.
Parameters
  - site (str) – The IIS site name.
  - hostheader (str) – The host header of the binding.
  - ipaddress (str) – The IP address of the binding.
  - port (str) – The TCP port of the binding.
  - protocol (str) – The application protocol of the binding.
  - sslflags (str) – The flags representing certificate type and storage of the binding.
Example of usage with only the required arguments:

site0-https-binding:
  win_iis.create_binding:
Example of usage specifying all available arguments:

```
site0-https-binding:
  win_iis.create_binding:
    - site: site0
    - hostheader: site0.local
    - ipaddress: '*'
    - port: 443
    - protocol: https
    - sslflags: 0
```

```
salt.states.win_iis.create_cert_binding(name, site, hostheader='', ipaddress='*', port=443, sslflags=0)
```

Assign a certificate to an IIS binding.

Parameters

- **name** (*str*) – The thumbprint of the certificate.
- **site** (*str*) – The IIS site name.
- **hostheader** (*str*) – The host header of the binding.
- **ipaddress** (*str*) – The IP address of the binding.
- **port** (*str*) – The TCP port of the binding.
- **sslflags** (*str*) – Flags representing certificate type and certificate storage of the binding.

Example of usage with only the required arguments:

```
site0-cert-binding:
  win_iis.create_cert_binding:
    - name: 9988776655443322111000AAABBBCCCDDDEEEFFF
    - site: site0
```

Example of usage specifying all available arguments:

```
site0-cert-binding:
  win_iis.create_cert_binding:
    - name: 9988776655443322111000AAABBBCCCDDDEEEFFF
    - site: site0
    - hostheader: site0.local
    - ipaddress: 192.168.1.199
    - port: 443
    - sslflags: 1
```

New in version 2016.11.0.

```
salt.states.win_iis.create_vdir(name, site, sourcepath, app='/')
```

Create an IIS virtual directory.

Parameters

- **name** (*str*) – The virtual directory name.
- **site** (*str*) – The IIS site name.
- **sourcepath** (*str*) – The physical path.
- **app** (*str*) – The IIS application.

Example of usage with only the required arguments:

```
site0-foo-vdir:
  win_iis.create_vdir:
```

(continues on next page)
Example of usage specifying all available arguments:

```
site0-foo-vdir:
    win_iis.create_vdir:
        - name: foo
        - site: site0
        - sourcepath: C:\inetpub\vdirs\foo
```

salt.states.win_iis.deployed(name, sourcepath, apppool=", hostheader=", ipaddress="", port=80, protocol=\"http\")

Ensure the website has been deployed.

Parameters

- **name** *(str)* – The IIS site name.
- **sourcepath** *(str)* – The physical path of the IIS site.
- **apppool** *(str)* – The name of the IIS application pool.
- **hostheader** *(str)* – The host header of the binding.
- **ipaddress** *(str)* – The IP address of the binding.
- **port** *(str)* – The TCP port of the binding.
- **protocol** *(str)* – The application protocol of the binding.

Example of usage with only the required arguments. This will default to using the default application pool assigned by IIS:

```
site0-deployed:
    win_iis.deployed:
        - name: site0
        - sourcepath: C:\inetpub\site0
```

Example of usage specifying all available arguments:

```
site0-deployed:
    win_iis.deployed:
        - name: site0
        - sourcepath: C:\inetpub\site0
        - apppool: site0
        - hostheader: site0.local
        - ipaddress: '*'
        - port: 443
        - protocol: https
```

salt.states.win_iis.remove_app(name, site)

Remove an IIS application.

Parameters

- **name** *(str)* – The application name.
- **site** *(str)* – The IIS site name.

Usage:

```
site0-v1-app-remove:
    win_iis.remove_app:
        - name: v1
        - site: site0
```
salt.states.win_iis.remove_apppool(name)
Remove an IIS application pool.

Parameters
name (str) – The name of the IIS application pool.

Usage:

defaultapppool-remove:
  win_iis.remove_apppool:
    - name: DefaultAppPool

salt.states.win_iis.remove_binding(name, site, hostheader=", ipaddress=", port=80)
Remove an IIS binding.

Parameters
- site (str) – The IIS site name.
- hostheader (str) – The host header of the binding.
- ipaddress (str) – The IP address of the binding.
- port (str) – The TCP port of the binding.

Example of usage with only the required arguments:

site0-https-binding-remove:
  win_iis.remove_binding:
    - site: site0

Example of usage specifying all available arguments:

site0-https-binding-remove:
  win_iis.remove_binding:
    - site: site0
    - hostheader: site0.local
    - ipaddress: '*'
    - port: 443

salt.states.win_iis.remove_cert_binding(name, site, hostheader=", ipaddress=", port=443)
Remove a certificate from an IIS binding.

Parameters
- name (str) – The thumbprint of the certificate.
- site (str) – The IIS site name.
- hostheader (str) – The host header of the binding.
- ipaddress (str) – The IP address of the binding.
- port (str) – The TCP port of the binding.

Example of usage with only the required arguments:

site0-cert-binding-remove:
  win_iis.remove_cert_binding:
    - name: 9988776655443322111000AAABBBCCCDDDEEEFFF
    - site: site0

Example of usage specifying all available arguments:

site0-cert-binding-remove:
  win_iis.remove_cert_binding:
    - name: 9988776655443322111000AAABBBCCCDDDEEEFFF
    - site: site0
    - hostheader: site0.local
    - ipaddress: 192.168.1.199
    - port: 443

New in version 2016.11.0.
salt.states.win_iis.remove_site(name)
Delete a website from IIS.

Parameters
name (str) – The IIS site name.

Usage:

```python
defaultwebsite-remove:
    win_iis.remove_site:
        - name: Default Web Site
```

salt.states.win_iis.remove_vdir(name, site, app='/')
Remove an IIS virtual directory.

Parameters
- name (str) – The virtual directory name.
- site (str) – The IIS site name.
- app (str) – The IIS application.

Example of usage with only the required arguments:

```python
site0-foo-vdir-remove:
    win_iis.remove_vdir:
        - name: foo
        - site: site0
```

Example of usage specifying all available arguments:

```python
site0-foo-vdir-remove:
    win_iis.remove_vdir:
        - name: foo
        - site: site0
        - app: v1
```

salt.states.win_iis.set_app(name, site, settings=None)
New in version 2017.7.0.
Set the value of the setting for an IIS web application.

Note: This function only configures existing app. Params are case sensitive.

Parameters
- name (str) – The IIS application.
- site (str) – The IIS site name.
- settings (str) – A dictionary of the setting names and their values.

Available settings:
- physicalPath - The physical path of the webapp
- applicationPool - The application pool for the webapp
- userName "connectAs" user
- password "connectAs" password for user

Return type bool

Example of usage:

```python
site0-webapp-setting:
    win_iis.set_app:
        - name: app0
        - site: Default Web Site
```

(continues on next page)
salt.states.win_iis.webconfiguration_settings(name, settings=None)

Set the value of webconfiguration settings.

Parameters

- **name** (*str*) – The name of the IIS PSPath containing the settings. Possible PSPaths are: MACHINE, MACHINE/WEBROOT, IIS:, IIS:Site\sitename, ...
- **settings** (*dict*) – Dictionaries of dictionaries. You can match a specific item in a collection with this syntax inside a key: 'Collection[{name: site0}].logFile.directory'

Example of usage for the MACHINE/WEBROOT PSPath:

```
MACHINE-WEBROOT-level-security:
  win_iis.webconfiguration_settings:
    - name: 'MACHINE/WEBROOT'
    - settings:
        system.web/authentication/forms:
          requireSSL: True
          protection: "All"
          credentials.passwordFormat: "SHA1"
        system.web/httpCookies:
          httpOnlyCookies: True
```

Example of usage for the IIS:\Sites\site0 PSPath:

```
site0-IIS-Sites-level-security:
  win_iis.webconfiguration_settings:
    - name: 'IIS:\Sites\site0'
    - settings:
        system.webServer/httpErrors:
          errorMode: "DetailedLocalOnly"
        system.webServer/security/requestFiltering:
          allowDoubleEscaping: False
          verbs.Collection:
            - verb: TRACE
              allowed: False
          fileExtensions.allowUnlisted: False
```

Example of usage for the IIS:\ PSPath with a collection matching:

```
site0-IIS-level-security:
  win_iis.webconfiguration_settings:
    - name: 'IIS:\'
    - settings:
        system.applicationHost/sites:
          'Collection[{name: site0}].logFile.directory': 'C:\logs\iis\site0'
```

21.19.294 salt.states.win_lgpo module

Manage Windows Local Group Policy

New in version 2016.11.0.
This state allows configuring local Windows Group Policy
The state can be used to ensure the setting of a single policy or multiple policies in one pass.
Single policies must specify the policy name, the setting, and the policy class (Machine/User/Both)

Example single policy configuration

**Ensure Account Lockout Duration:**
```
lgpo.set:
- name: Account lockout duration
  setting: 90
  policy_class: Machine
```

**Account lockout duration:**
```
lgpo.set:
- setting: 120
  policy_class: Machine
```

Multiple policy configuration

**Company Local Group Policy:**
```
lgpo.set:
- computer_policy:
  Deny log on locally:
  - Guest
    Account lockout duration: 120
    Account lockout threshold: 10
    Reset account lockout counter after: 120
  Enforce password history: 24
  Maximum password age: 60
  Minimum password age: 1
  Minimum password length: 14
  Password must meet complexity requirements: Enabled
  Store passwords using reversible encryption: Disabled
  Configure Automatic Updates:
  - Configure automatic updating: 4 - Auto download and schedule the
  - install
    Scheduled install day: 7 - Every Saturday
    Scheduled install time: 17:00
  Specify intranet Microsoft update service location:
    Set the intranet update service for detecting updates: http://mywsus
    Set the intranet statistics server: http://mywsus
  - user_policy:
    Do not process the legacy run list: Enabled
```

**server_policy:**
```
lgpo.set:
- computer_policy:
  Maximum password age: 60
  Minimum password age: 1
  Minimum password length: 14
  Account lockout duration: 120
  Account lockout threshold: 10
  Reset account lockout counter after: 120
  Manage auditing and security log:
  - "BUILTIN\Administrators"
  Replace a process level token:
```

(continues on next page)
salt.states.win_lgpo.set_(name, setting=None, policy_class=None, computer_policy=None, user_policy=None, cumulative_rights_assignments=True, admv_language='en-US')

Ensure the specified policy is set.

Warning: The setting argument cannot be used in conjunction with the computer_policy or user_policy arguments

Parameters

- **name** *(str)* – The name of a single policy to configure
- **setting** *(str, dict, list)* – The configuration setting for the single named
policy. If this argument is used the `computer_policy` / `user_policy` arguments will be ignored

- **policy_class (str)** – The policy class of the single named policy to configure. This can be machine, user, or both
- **computer_policy (dict)** – A dictionary of containing the policy name and key/value pairs of a set of computer policies to configure. If this argument is used, the `name` / `policy_class` arguments will be ignored
- **user_policy (dict)** – A dictionary of containing the policy name and key/value pairs of a set of user policies to configure. If this argument is used, the `name` / `policy_class` arguments will be ignored
- **cumulative_rights_assignments (bool)** – If user rights assignments are being configured, determines if any user right assignment policies specified will be cumulative or explicit
- **adml_language (str)** – The adml language to use for AMDX policy data/display conversions. Default is `en-US`  

### 21.19.295 salt.states.win_license module

**Installation and activation of windows licenses**

Install and activate windows licenses

```
license.activate
```

salt.states.win_license.activate(name)

Install and activate the given product key

- name The 5x5 product key given to you by Microsoft

### 21.19.296 salt.states.win_network

**Configuration of network interfaces on Windows hosts**

New in version 2014.1.0.

This module provides the `network` state(s) on Windows hosts. DNS servers, IP addresses and default gateways can currently be managed.

Below is an example of the configuration for an interface that uses DHCP for both DNS servers and IP addresses:

```
Local Area Connection #2:
  network.managed:
    - dns_proto: dhcp
    - ip_proto: dhcp
```

**Note:** Both the `dns_proto` and `ip_proto` arguments are required.

Static DNS and IP addresses can be configured like so:

```
Local Area Connection #2:
  network.managed:
    - dns_proto: static
```

(continues on next page)
- **dns_servers**: 
  - 8.8.8.8
  - 8.8.4.4
- **ip_proto**: static
- **ip_addrs**: 
  - 10.2.3.4/24

**Note:** IP addresses are specified using the format `<ip-address>/<subnet-length>`. Salt provides a convenience function called `ip.get_subnet_length` to calculate the subnet length from a netmask.

Optionally, if you are setting a static IP address, you can also specify the default gateway using the `gateway` parameter:

```
Local Area Connection #2:
  network.managed:
    - **dns_proto**: static
    - **dns_servers**: 
      - 8.8.8.8
      - 8.8.4.4
    - **ip_proto**: static
    - **ip_addrs**: 
      - 10.2.3.4/24
    - **gateway**: 10.2.3.1
```

salt.states.win_network.managed(name, dns_proto=``None``, dns_servers=``None``, ip_proto=``None``, ip_addrs=``None``, gateway=``None``, enabled=True, **kwargs)

Ensure that the named interface is configured properly.

**Parameters**

- **name** (`str`) – The name of the interface to manage
- **dns_proto** (`str`) – None Set to `static` and use the `dns_servers` parameter to provide a list of DNS nameservers. Set to `dhcp` to use DHCP to get the DNS servers.
- **dns_servers** (`list`) – None A list of static DNS servers. To clear the list of DNS servers pass an empty list (`[]`). `None` will make no changes.
- **ip_proto** (`str`) – None Set to `static` and use the `ip_addrs` and (optionally) `gateway` parameters to provide a list of static IP addresses and the default gateway. Set to `dhcp` to use DHCP.
- **ip_addrs** (`list`) – None A list of static IP addresses with netmask flag, ie: 192.168.0.11/24
- **gateway** (`str`) – None The gateway to set for the interface
- **enabled** (`bool`) – True Set to `False` to ensure that this interface is disabled.

**Returns**

A dictionary of old and new settings

**Example:**

```
Ethernet1:
  network.managed:
    - **dns_proto**: static
    - **dns_servers**: 
      - 8.8.8.8
      - 8.8.4.4
    - **ip_proto**: static
    - **ip_addrs**: 
      - 192.168.0.100/24
```
Clear DNS entries example:

<table>
<thead>
<tr>
<th>Ethernet1:</th>
</tr>
</thead>
<tbody>
<tr>
<td>network.managed:</td>
</tr>
<tr>
<td>- dns_proto: static</td>
</tr>
<tr>
<td>- dns_servers: []</td>
</tr>
<tr>
<td>- ip_proto: dhcp</td>
</tr>
</tbody>
</table>

### 21.19.297 salt.states.win_path

Manage the Windows System PATH

salt.states.win_path.absent(name)

Remove the directory from the SYSTEM path

Example:

'C:\sysinternals':
  win_path.absent

salt.states.win_path.exists(name, index=None)

Add the directory to the system PATH at index location

**index** Position where the directory should be placed in the PATH. This is 0-indexed, so 0 means to prepend at the very start of the PATH.

**Note:** If the index is not specified, and the directory needs to be added to the PATH, then the directory will be appended to the PATH, and this state will not enforce its location within the PATH.

Examples:

'C:\python27':
  win_path.exists

'C:\sysinternals':
  win_path.exists:
    - index: 0

'C:\mystuff':
  win_path.exists:
    - index: -1

### 21.19.298 salt.states.win_pki module

Microsoft certificate management via the Pki PowerShell module.

**platform** Windows

New in version 2016.11.0.

salt.states.win_pki.import_cert(name, cert_format='cer', context='LocalMachine', store='My', exportable=True, password='', saltenv='base')

Import the certificate file into the given certificate store.

**Parameters**

- **name (str)** – The path of the certificate file to import.
- `cert_format (str)` – The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
- `context (str)` – The name of the certificate store location context.
- `store (str)` – The name of the certificate store.
- `exportable (bool)` – Mark the certificate as exportable. Only applicable to pfx format.
- `password (str)` – The password of the certificate. Only applicable to pfx format.
- `saltenv (str)` – The environment the file resides in.

Example of usage with only the required arguments:

```python
site0-cert-imported:
  win_pki.import_cert:
    - name: salt://win/webserver/certs/site0.cer
```

Example of usage specifying all available arguments:

```python
site0-cert-imported:
  win_pki.import_cert:
    - name: salt://win/webserver/certs/site0.pfx
    - cert_format: pfx
    - context: LocalMachine
    - store: My
    - exportable: True
    - password: TestPassword
    - saltenv: base
```

```python
salt.states.win_pki.remove_cert(name, thumbprint, context='LocalMachine', store='My')
```

Remove the certificate from the given certificate store.

Parameters

- `thumbprint (str)` – The thumbprint value of the target certificate.
- `context (str)` – The name of the certificate store location context.
- `store (str)` – The name of the certificate store.

Example of usage with only the required arguments:

```python
site0-cert-removed:
  win_pki.remove_cert:
    - thumbprint: 9988776655443322111000AAABBBCCCDDDDEEEFFF
```

Example of usage specifying all available arguments:

```python
site0-cert-removed:
  win_pki.remove_cert:
    - thumbprint: 9988776655443322111000AAABBBCCCDDDDEEEFFF
    - context: LocalMachine
    - store: My
```

21.19.299 `salt.states.win_powercfg`

This module allows you to control the power settings of a windows minion via powercfg.

New in version 2015.8.0.

```python
# Set timeout to 30 minutes on battery power
monitor:
  powercfg.set_timeout:
```

(continues on next page)
- `value`: 30
- `power`: dc

salt.states.win_powercfg.set_timeout(name, value, power='ac', scheme=None)

Set the sleep timeouts of specific items such as disk, monitor, etc.

Parameters

- `name` (str) – The setting to change, can be one of the following:
  - monitor
  - disk
  - standby
  - hibernate
- `value` (int) – The amount of time in minutes before the item will timeout
- `power` (str) – Set the value for AC or DC power. Default is ac. Valid options are:
  - ac (AC Power)
  - dc (Battery)
- `scheme` (str) – The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - SCHEME_BALANCED - Balanced
  - SCHEME_MAX - Power saver
  - SCHEME_MIN - High performance

CLI Example:

```bash
# Set monitor timeout to 30 minutes on Battery
monitor:
  powercfg.set_timeout:
    - value: 30
    - power: dc

# Set disk timeout to 10 minutes on AC Power
disk:
  powercfg.set_timeout:
    - value: 10
    - power: ac
```

21.19.300 salt.states.win_servermanager

Manage Windows features via the ServerManager powershell module. Can install and remove roles/features.

- maintainer Shane Lee <slee@saltstack.com>
- platform Windows Server 2008R2 or greater
- depends win_servermanager.install
- depends win_servermanager.remove

salt.states.win_servermanager.installed(name, features=None, recurse=False, restart=False, source=None, exclude=None, **kwargs)

Install the windows feature. To install a single feature, use the `name` parameter. To install multiple features, use the `features` parameter.

**Note:** Some features require reboot after un/installation. If so, until the server is restarted other features can not be installed!
Parameters

- **name** *(str)* – Short name of the feature (the right column in win_servermanager.list_available). This can be a single feature or a string of features in a comma delimited list (no spaces)

  **Note:** A list is not allowed in the name parameter of any state. Use the features parameter if you want to pass the features as a list

- **features** *(Optional[list]*) – A list of features to install. If this is passed it will be used instead of the name parameter.

  New in version 2018.3.0.

- **recurse** *(Optional[bool]*) – Install all sub-features as well. If the feature is installed but one of its sub-features are not installed set this will install additional sub-features. This argument was previously renamed from force. To ensure backwards compatibility force will continue to work but please update your states to use the preferred recurse arg.

- **source** *(Optional[str]*) – Path to the source files if missing from the target system. None means that the system will use windows update services to find the required files. Default is None

- **restart** *(Optional[bool]*) – Restarts the computer when installation is complete, if required by the role/feature installed. Default is False

- **exclude** *(Optional[str]*) – The name of the feature to exclude when installing the named feature. This can be a single feature, a string of features in a comma-delimited list (no spaces), or a list of features.

  **Warning:** As there is no exclude option for the Add-WindowsFeature or Install-WindowsFeature PowerShell commands the features named in exclude will be installed with other sub-features and will then be removed. If the feature named in “exclude” is not a sub-feature of one of the installed items it will still be removed.

Example

Do not use the role or feature names mentioned in the PKGMGR documentation. To get a list of available roles and features run the following command:

```
salt <minion_name> win_servermanager.list_available
```

Use the name in the right column of the results.

```
# Installs the IIS Web Server Role (Web-Server)
IIS-WebServerRole:
  win_servermanager.installed:
    - recurse: True
    - name: Web-Server

# Install multiple features, exclude the Web-Service
install_multiple_features:
  win_servermanager.installed:
    - recurse: True
    - features:
      - RemoteAccess
```

(continues on next page)
salt.states.win_servermanager.removed(name, features=None, remove_payload=False, restart=False)

Remove the windows feature

To remove a single feature, use the name parameter. To remove multiple features, use the features parameter.

Parameters

- **name** (str) – Short name of the feature (the right column in win_servermanager.list_available). This can be a single feature or a string of features in a comma-delimited list (no spaces)

  Note: A list is not allowed in the name parameter of any state. Use the features parameter if you want to pass the features as a list

- **features** (Optional[list]) – A list of features to remove. If this is passed it will be used instead of the name parameter.

  New in version 2018.3.0.

- **remove_payload** (Optional[bool]) – True will cause the feature to be removed from the side-by-side store. To install the feature in the future you will need to specify the source

- **restart** (Optional[bool]) – Restarts the computer when uninstall is complete if required by the role/feature uninstall. Default is False

  Note: Some features require a reboot after uninstall. If so the feature will not be completely uninstalled until the server is restarted.

Example

Do not use the role or feature names mentioned in the PKGMGR documentation. To get a list of available roles and features run the following command:

```
salt <minion_name> win_servermanager.list_available
```

Use the name in the right column of the results.

```bash
# Uninstall the IIS Web Server Rol (Web-Server)
IIS-WebserverRole:
    win_servermanager.removed:
        - name: Web-Server

# Uninstall multiple features, reboot if required
uninstall_multiple_features:
    win_servermanager.removed:
        - features:
          - RemoteAccess
          - XPS-Viewer
          - SNMP-Service
          - restart: True
```
21.19.301 salt.states.win_smtp_server module

Module for managing IIS SMTP server configuration on Windows servers.

**salt.states.win_smtp_server.active_log_format**(name, log_format, server='SmtpSvc/1')

Manage the active log format for the SMTP server.

**Parameters**
- **log_format**(str) – The log format name.
- **server**(str) – The SMTP server name.

**Example of usage:**

```yaml
smtp-log-format:
  win_smtp_server.active_log_format:
    - log_format: Microsoft IIS Log File Format
```

**salt.states.win_smtp_server.connection_ip_list**(name, addresses=None, grant_by_default=False, server='SmtpSvc/1')

Manage IP list for SMTP connections.

**Parameters**
- **addresses**(str) – A dictionary of IP + subnet pairs.
- **grant_by_default**(bool) – Whether the addresses should be a blacklist or whitelist.
- **server**(str) – The SMTP server name.

**Example of usage for creating a whitelist:**

```yaml
smtp-connection-whitelist:
  win_smtp_server.connection_ip_list:
    - addresses:
        127.0.0.1: 255.255.255.255
        172.16.1.98: 255.255.255.255
        172.16.1.99: 255.255.255.255
    - grant_by_default: False
```

**Example of usage for creating a blacklist:**

```yaml
smtp-connection-blacklist:
  win_smtp_server.connection_ip_list:
    - addresses:
        172.16.1.100: 255.255.255.255
        172.16.1.101: 255.255.255.255
    - grant_by_default: True
```

**Example of usage for allowing any source to connect:**

```yaml
smtp-connection-blacklist:
  win_smtp_server.connection_ip_list:
    - addresses: {}
    - grant_by_default: True
```

**salt.states.win_smtp_server.relay_ip_list**(name, addresses=None, server='SmtpSvc/1')

Manage IP list for SMTP relay connections.

Due to the unusual way that Windows stores the relay IPs, it is advisable to retrieve the existing list you wish to set from a pre-configured server.

For example, setting ’127.0.0.1’ as an allowed relay IP through the GUI would generate an actual relay IP list similar to the following:
Note: Setting the list to None corresponds to the restrictive 'Only the list below' GUI parameter with an empty access list configured, and setting an empty list/tuple corresponds to the more permissive 'All except the list below' GUI parameter.

Parameters

- **addresses (str)** – A list of the relay IPs. The order of the list is important.
- **server (str)** – The SMTP server name.

Example of usage:

```python
smtp-relay-list:
  win_smtp_server.relay_ip_list:
    - addresses:
        - 24.0.0.128
        - 32.0.0.128
        - 60.0.0.128
        - 1.0.0.0
        - 76.0.0.0
        - 0.0.0.0
        - 0.0.0.0
        - 1.0.0.0
        - 1.0.0.0
        - 2.0.0.0
        - 2.0.0.0
        - 4.0.0.0
        - 0.0.0.0
        - 76.0.0.128
        - 0.0.0.0
        - 127.0.0.1
```

Example of usage for disabling relaying:

```python
smtp-relay-list:
  win_smtp_server.relay_ip_list:
    - addresses: None
```

Example of usage for allowing relaying from any source:

```python
smtp-relay-list:
  win_smtp_server.relay_ip_list:
    - addresses: []
```

salt.states.win_smtp_server.server_setting(name, settings=None, server='SmtpSvc/1')

Ensure the value is set for the specified setting.
Note: The setting names are case-sensitive.

Parameters

- **settings**(str) – A dictionary of the setting names and their values.
- **server**(str) – The SMTP server name.

Example of usage:

```python
smtp-settings:
  win_smtp_server.server_setting:
    - settings:
      LogType: 1
      LogFilePeriod: 1
      MaxMessageSize: 16777216
      MaxRecipients: 10000
      MaxSessionSize: 16777216
```

### 21.19.302 salt.states.win_snmp module

Module for managing SNMP service settings on Windows servers.

**salt.states.win_snmp.agent_settings**(name, contact, location, services=None)

Manage the SNMP sysContact, sysLocation, and sysServices settings.

Parameters

- **contact**(str) – The SNMP contact.
- **location**(str) – The SNMP location.
- **services**(str) – A list of selected services.

Example of usage:

```python
snmp-agent-settings:
  win_snmp.agent_settings:
    - contact: Test Contact
    - location: Test Location
    - services:
      - Physical
      - Internet
```

**salt.states.win_snmp.auth_traps_enabled**(name, status=True)

Manage the sending of authentication traps.

Parameters

- **status**(bool) – The enabled status.

Example of usage:

```python
snmp-auth-traps:
  win_snmp.auth_traps_enabled:
    - status: True
```

**salt.states.win_snmp.community_names**(name, communities=None)

Manage the SNMP accepted community names and their permissions.

Parameters

- **communities**(str) – A dictionary of SNMP communities and permissions.

Example of usage:

```python
snmp-community-names:
  win_snmp.community_names:
    - communities:
```

(continues on next page)
21.19.303 salt.states.win_system

Management of Windows system information

New in version 2014.1.0.

This state is used to manage system information such as the computer name and description.

**ERIK-WORKSTATION:**

- **system.computer_name**: []
- **system.computer_desc**: []

This is Erik's computer, don't touch!

salt.states.win_system.computer_desc(name)

Manage the computer’s description field

- **name** The desired computer description

salt.states.win_system.computer_name(name)

Manage the computer’s name

- **name** The desired computer name

salt.states.win_system.hostname(name)

New in version 2016.3.0.

Manage the hostname of the computer

- **name** The hostname to set

salt.states.win_system.join_domain(name, username=None, password=None, account_ou=None, account_exists=False, restart=False)

Checks if a computer is joined to the Domain. If the computer is not in the Domain, it will be joined.

**Parameters**

- **name** (str) – The name of the Domain.
- **username** (str) – Username of an account which is authorized to join computers to the specified domain. Need to be either fully qualified like user@domain.tld or simply user.
- **password** (str) – Password of the account to add the computer to the Domain.
- **account_ou** (str) – The DN of the OU below which the account for this computer should be created when joining the domain, e.g. ou=computers,ou=departm_432,dc=my-company,dc=com.
- **account_exists** (bool) – Needs to be set to True to allow re-using an existing computer account.
- **restart** (bool) – Needs to be set to True to restart the computer after a successful join.

**Example:**

```
join_to_domain:
  system.join_domain:
    - name: mydomain.local.com
    - username: myaccount@mydomain.local.com
    - password: mysecretpassword
    - restart: True
```
salt.states.win_system.reboot(name, message=None, timeout=5, force_close=True, in_seconds=False, only_on_pending_reboot=True)

Reboot the computer

Parameters

- **message (str)** – An optional message to display to users. It will also be used as a comment in the event log entry.
  
The default value is None.
- **timeout (int)** – The number of minutes or seconds before a reboot will occur. Whether this number represents minutes or seconds depends on the value of in_seconds.
  
The default value is 5.
- **in_seconds (bool)** – If this is True, the value of timeout will be treated as a number of seconds. If this is False, the value of timeout will be treated as a number of minutes.
  
The default value is False.
- **force_close (bool)** – If this is True, running applications will be forced to close without warning. If this is False, running applications will not get the opportunity to prompt users about unsaved data.
  
The default value is True.
- **only_on_pending_reboot (bool)** – If this is True, the reboot will only occur if the system reports a pending reboot. If this is False, the reboot will always occur.
  
The default value is True.

salt.states.win_system.shutdown(name, message=None, timeout=5, force_close=True, reboot=False, in_seconds=False, only_on_pending_reboot=False)

Shutdown the computer

Parameters

- **message (str)** – An optional message to display to users. It will also be used as a comment in the event log entry.
  
The default value is None.
- **timeout (int)** – The number of minutes or seconds before a shutdown will occur. Whether this number represents minutes or seconds depends on the value of in_seconds.
  
The default value is 5.
- **in_seconds (bool)** – If this is True, the value of timeout will be treated as a number of seconds. If this is False, the value of timeout will be treated as a number of minutes.
  
The default value is False.
- **force_close (bool)** – If this is True, running applications will be forced to close without warning. If this is False, running applications will not get the opportunity to prompt users about unsaved data.
  
The default value is True.
- **reboot (bool)** – If this is True, the computer will restart immediately after shutting down. If False the system flushes all caches to disk and safely powers down the system.
  
The default value is False.
- **only_on_pending_reboot (bool)** – If this is True, the shutdown will only occur if the system reports a pending reboot. If this is False, the shutdown will always occur.
The default value is False.

21.19.304 salt.states.win_wua module

Installation of Windows Updates using the Windows Update Agent

New in version 2017.7.0.

Salt can manage Windows updates via the "wua" state module. Updates can be installed and removed. Update management declarations are as follows:

For installation:

```
# Install a single update using the KB
KB3194343:
  wua.installed

# Install a single update using the name parameter
install_update:
  wua.installed:
    - name: KB3194343

# Install multiple updates using the updates parameter and a combination of
# KB number and GUID
install_updates:
  wua.installed:
    - updates:
      - KB3194343
      - bb1dbb26-3fb6-45fd-bb05-e3c8e379195c
```

For removal:

```
# Remove a single update using the KB
KB3194343:
  wua.removed

# Remove a single update using the name parameter
remove_update:
  wua.removed:
    - name: KB3194343

# Remove multiple updates using the updates parameter and a combination of
# KB number and GUID
remove_updates:
  wua.removed:
    - updates:
      - KB3194343
      - bb1dbb26-3fb6-45fd-bb05-e3c8e379195c
```

salt.states.win_wua.installed(name, updates=None)

Ensure Microsoft Updates are installed. Updates will be downloaded if needed.

Parameters

- **name** (*str*) – The identifier of a single update to install.
- **updates** (*list*) – A list of identifiers for updates to be installed. Overrides name. Default is None.

Note: Identifiers can be the GUID, the KB number, or any part of the Title of the Microsoft update. GUIDs
and KBs are the preferred method to ensure you’re installing the correct update.

Warning: Using a partial KB number or a partial Title could result in more than one update being installed.

Returns A dictionary containing the results of the update
Return type dict

CLI Example:

```python
# using a GUID
install_update:
  wua.installed:
    - name: 28cf1b09-2b1a-458c-9bd1-971d1b26b211

# using a KB
install_update:
  wua.installed:
    - name: KB3194343

# using the full Title
install_update:
  wua.installed:
    - name: Security Update for Adobe Flash Player for Windows 10 Version 1607\[for x64-based Systems\] (KB3194343)

# Install multiple updates
install_updates:
  wua.installed:
    - updates:
      - KB3194343
      - 28cf1b09-2b1a-458c-9bd1-971d1b26b211
```

salt.states.win_wua.removed(name, updates=None)
Ensure Microsoft Updates are uninstalled.

Parameters

- **name**(str) – The identifier of a single update to uninstall.
- **updates**(list) – A list of identifiers for updates to be removed. Overrides name.
  Default is None.

Note: Identifiers can be the GUID, the KB number, or any part of the Title of the Microsoft update. GUIDs
and KBs are the preferred method to ensure you’re uninstalling the correct update.

Warning: Using a partial KB number or a partial Title could result in more than one update being removed.

Returns A dictionary containing the results of the removal
Return type dict

CLI Example:

```python
# using a GUID
uninstall_update:
  wua.removed:
    - name: 28cf1b09-2b1a-458c-9bd1-971d1b26b211
```

(continues on next page)
# using a KB
```
uninstall_update:
  wua.removed:
    - name: KB3194343
```

# using the full Title
```
uninstall_update:
  wua.removed:
    - name: Security Update for Adobe Flash Player for Windows 10 Version 1607 (for x64-based Systems) (KB3194343)
```

# Install multiple updates
```
uninstall_updates:
  wua.removed:
    - updates:
      - KB3194343
      - 28cf1b09-2b1a-458c-9bd1-971d1b26b211
```

salt.states.win_wua.uptodate(name, software=True, drivers=False, skip_hidden=False, skip_mandatory=False, skip_reboot=True, categories=None, severities=None)

Ensure Microsoft Updates that match the passed criteria are installed. Updates will be downloaded if needed.

This state allows you to update a system without specifying a specific update to apply. All matching updates will be installed.

Parameters

- **name (str)** – The name has no functional value and is only used as a tracking reference
- **software (bool)** – Include software updates in the results (default is True)
- **drivers (bool)** – Include driver updates in the results (default is False)
- **skip_hidden (bool)** – Skip updates that have been hidden. Default is False.
- **skip_mandatory (bool)** – Skip mandatory updates. Default is False.
- **skip_reboot (bool)** – Skip updates that require a reboot. Default is True.
- **categories (list)** – Specify the categories to list. Must be passed as a list. All categories returned by default.

Categories include the following:

- Critical Updates
- Definition Updates
- Drivers (make sure you set drivers=True)
- Feature Packs
- Security Updates
- Update Rollups
- Updates
- Update Rollups
- Windows 7
- Windows 8.1
- Windows 8.1 drivers
- Windows 8.1 and later drivers
- Windows Defender

- **severities (list)** – Specify the severities to include. Must be passed as a list. All severities returned by default.

Severities include the following:

- Critical
– **Important**

**Returns** A dictionary containing the results of the update

**Return type** dict

**CLI Example:**

```python
# Update the system using the state defaults
update_system:
    wua.uptodate

# Update the drivers
update_drivers:
    wua.uptodate:
        - software: False
        - drivers: True
        - skip_reboot: False

# Apply all critical updates
update_critical:
    wua.uptodate:
        - severities:
            - Critical
```

### 21.19.305 salt.states.win_wusa module

Microsoft Updates (KB) Management

This module provides the ability to enforce KB installations from files (.msu), without WSUS or Windows Update

New in version 2018.3.4.

**salt.states.win_wusa.installed(name, source)**

Ensure an update is installed on the minion

**Parameters**

- **name** *(str)* – Name of the Windows KB (“KB123456”)
- **source** *(str)* – Source of .msu file corresponding to the KB

**Example:**

```python
KB123456:
    wusa.installed:
        - source: salt://kb123456.msu
```

**salt.states.win_wusa.uninstalled(name)**

Ensure an update is uninstalled from the minion

**Parameters** **name** *(str)* – Name of the Windows KB (“KB123456”)

**Example:**

```python
KB123456:
    wusa.uninstalled
```

### 21.19.306 salt.states.winrepo

Manage Windows Package Repository

**salt.states.winrepo.genrepo(name, force=False, allow_empty=False)**

Refresh the winrepo.p file of the repository (salt-run winrepo.genrepo)
If `force` is `True` no checks will be made and the repository will be generated if `allow_empty` is `True` then the state will not return an error if there are 0 packages.

**Note:** This state only loads on minions that have the roles: `salt-master` grain set.

Example:

```
winrepo:
  winrepo.genrepo
```

### 21.19.307 salt.states.x509

Manage X509 Certificates

New in version 2015.8.0.

**depends** M2Crypto

This module can enable managing a complete PKI infrastructure including creating private keys, CAs, certificates and CRLs. It includes the ability to generate a private key on a server, and have the corresponding public key sent to a remote CA to create a CA signed certificate. This can be done in a secure manner, where private keys are always generated locally and never moved across the network.

Here is a simple example scenario. In this example `ca` is the ca server, and `www` is a web server that needs a certificate signed by `ca`.

For remote signing, peers must be permitted to remotely call the `sign_remote_certificate` function.

```
/etc/salt/master.d/peer.conf
```

```
peer:
  .*:
    - x509.sign_remote_certificate
```

```
/srv/salt/top.sls
```

```
base:
  '*':
    - cert
  'ca':
    - ca
  'www':
    - www
```

This state creates the CA key, certificate and signing policy. It also publishes the certificate to the mine where it can be easily retrieved by other minions.

```
/srv/salt/ca.sls
```

```
salt-minion:
  service.running:
    - enable: True
    - listen:
      - file: /etc/salt/minion.d/signing_policies.conf
```

```
/etc/salt/minion.d/signing_policies.conf:
  file.managed:
```

(continues on next page)
The signing policy defines properties that override any property requested or included in a CRL. It also can define a restricted list of minions which are allowed to remotely invoke this signing policy.

```
x509_signing_policies:
    www:
        - minions: 'www'
        - signing_private_key: /etc/pki/ca.key
        - signing_cert: /etc/pki/ca.crt
        - C: US
        - ST: Utah
        - L: Salt Lake City
        - basicConstraints: "critical CA:false"
        - keyUsage: "critical keyEncipherment"
        - subjectKeyIdentifier: hash
        - authorityKeyIdentifier: keyid,issuer:always
        - days_valid: 90
        - copypath: /etc/pki/issued_certs/
```

This state will instruct all minions to trust certificates signed by our new CA. Using Jinja to strip newlines from the
text avoids dealing with newlines in the rendered YAML, and the `sign_remote_certificate` state will handle properly formatting the text before writing the output.

```
/srv/salt/cert.sls
```

```
/usr/local/share/ca-certificates:
  file.directory
/usr/local/share/ca-certificates/intca.crt:
  x509.pem_managed:
    - text: {{ salt['mine.get']('ca', 'x509.get_pem_entries')['ca']['/etc/pki/ca.crt ']|replace('
', '') }}
```

This state creates a private key then requests a certificate signed by ca according to the www policy.

```
/srv/salt/www.sls
```

```
/etc/pki/www.crt:
  x509.certificate_managed:
    - ca_server: ca
    - signing_policy: www
    - public_key: /etc/pki/www.key
    - CN: www.example.com
    - days_remaining: 30
    - backup: True
    - managed_private_key:
      name: /etc/pki/www.key
      bits: 4096
      backup: True
```

```
salt.states.x509.certificate_managed(name, days_remaining=90, managed_private_key=None, append_certs=None, **kwargs)
```

Manage a Certificate

**name** Path to the certificate

**days_remaining** [90] The minimum number of days remaining when the certificate should be recreated. A value of 0 disables automatic renewal.

**managed_private_key** Manages the private key corresponding to the certificate. All of the arguments supported by `x509.private_key_managed` are supported. If `name` is not specified or is the same as the name of the certificate, the private key and certificate will be written together in the same file.

**append_certs**: A list of certificates to be appended to the managed file.

**kwargs**: Any arguments supported by `x509.create_certificate` or `file.managed` are supported.

Examples:

```
/etc/pki/ca.crt:
  x509.certificate_managed:
    - signing_private_key: /etc/pki/ca.key
    - CN: ca.example.com
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical CA:true"
    - keyUsage: "critical cRLSign, keyCertSign"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 3650
    - days_remaining: 0
    - backup: True
```

---

Chapter 21. Salt Module Reference
salt.states.x509.certificate_managed:

- ca_server: pki
- signing_policy: www
- public_key: /etc/ssl/www.key
- CN: www.example.com
- days_valid: 90
- days_remaining: 30
- backup: True

salt.states.x509.crl_managed:

Manage a Certificate Revocation List

name Path to the certificate
signing_private_key The private key that will be used to sign the CRL. This is usually your CA’s private key.
signing_private_key_passphrase Passphrase to decrypt the private key.
signing_cert The certificate of the authority that will be used to sign the CRL. This is usually your CA’s certificate.
revoked A list of certificates to revoke. Must include either a serial number or a the certificate itself. Can optionally include the revocation date and notAfter date from the certificate. See example below for details.
days_valid [100] The number of days the certificate should be valid for.
digest The digest to use for signing the CRL. This has no effect on versions of pyOpenSSL less than 0.14.
days_remaining [30] The CRL should be automatically recreated if there are less than days_remaining days until the CRL expires. Set to 0 to disable automatic renewal.
include_expired [False] If True, include expired certificates in the CRL.
**kwargs Any arguments supported by file.managed are supported.

Example:

salt.states.x509.csr_managed:

Manage a Certificate Signing Request

name: Path to the CSR
properties: The properties to be added to the certificate request, including items like subject, extensions and public key. See above for valid properties.
**kwargs Any arguments supported by file.managed are supported.

Example:
- **private_key**: /etc/pki/mycert.key
- **CN**: www.example.com
- **C**: US
- **ST**: Utah
- **L**: Salt Lake City
- **keyUsage**: ’critical dataEncipherment’

salt.states.x509.pem_managed(**name**, **text**, **backup=False**, **kwargs**)
Manage the contents of a PEM file directly with the content in text, ensuring correct formatting.

**name**: The path to the file to manage
**text**: The PEM formatted text to write.
**kwargs**: Any arguments supported by file.managed are supported.

salt.states.x509.private_key_managed(**name**, **bits=2048**, **passphrase=None**, **cipher='aes_128_cbc'**, **new=False**, **overwrite=False**, **verbose=True**, **kwargs**)
Manage a private key’s existence.

**name**: Path to the private key
**bits**: Key length in bits. Default 2048.
**passphrase**: Passphrase for encrypting the private key.
**cipher**: Cipher for encrypting the private key.
**new**: Always create a new key. Defaults to False. Combining new with prereq, or when used as part of a managed_private_key can allow key rotation whenever a new certificate is generated.
**overwrite**: Overwrite an existing private key if the provided passphrase cannot decrypt it.
**verbose**: Provide visual feedback on stdout, dots while key is generated. Default is True.

New in version 2016.11.0.

**kwargs**: Any kwargs supported by file.managed are supported.

Example:
The JINJA templating in this example ensures a private key is generated if the file doesn’t exist and that a new private key is generated whenever the certificate that uses it is to be renewed.

```
/etc/pki/www.key:
  x509.private_key_managed:
    - bits: 4096
    - new: True
{% if salt['file.file_exists']('/etc/pki/www.key') %}
    - prereq:
      - x509: /etc/pki/www.crt
{% endif %}
```

21.19.308 salt.states.xml

XML Manager

State management of XML files

salt.states.xml.value_present(**name**, **xpath**, **value**, **kwargs**)
Manages a given XML file

**name** [string] The location of the XML file to manage, as an absolute path.
**xpath** [string] xpath location to manage
**value** [string] value to ensure present
**21.19.309 salt.states.xmpp**

Sending Messages over XMPP

New in version 2014.1.0.

This state is useful for firing messages during state runs, using the XMPP protocol.

```python
server-warning-message:
    xmpp.send_msg:
        - name: 'This is a server warning message'
        - profile: my-xmpp-account
        - recipient: admins@xmpp.example.com/salt
```

salt.states.xmpp.send_msg(name, recipient, profile)
Send a message to an XMPP user

```python
server-warning-message:
    xmpp.send_msg:
        - name: 'This is a server warning message'
        - profile: my-xmpp-account
        - recipient: admins@xmpp.example.com/salt
```

name The message to send to the XMPP user

salt.states.xmpp.send_msg_multi(name, profile, recipients=None, rooms=None)
Send a message to an list of recipients or rooms

```python
server-warning-message:
    xmpp.send_msg:
        - name: 'This is a server warning message'
        - profile: my-xmpp-account
        - recipients:
            - admins@xmpp.example.com/salt
        - rooms:
            - qa@conference.xmpp.example.com
```

name The message to send to the XMPP user

**21.19.310 salt.states.zabbix_action**

New in version 2017.7.

Management of Zabbix Action object over Zabbix API.

codeauthor Jakub Sliva <jakub.sliva@ultimum.io>

salt.states.zabbix_action.absent(name, **kwargs)
Makes the Zabbix Action to be absent (either does not exist or delete it).

Parameters

---

21.19. state modules 3793
• **name** – Zabbix Action name
• **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
• **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
• **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

```
zabbix-action-absent:
zabbix_action.absent:
  - name: Action name
```

**salt.states.zabbix_action.present**(*name*, *params*, **kwargs*)

Creates Zabbix Action object or if differs update it according defined parameters

Parameters

• **name** – Zabbix Action name
• **params** – Definition of the Zabbix Action
• **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
• **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
• **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

If there is a need to get a value from current zabbix online (e.g. id of a hostgroup you want to put a discovered system into), put a dictionary with two keys "query_object" and "query_name" instead of the value. In this example we want to get object id of hostgroup named "Virtual machines" and "Databases".

```
zabbix-action-present:
zabbix_action.present:
  - name: VMs
    params:
      eventsource: 2
      status: 0
      filter:
        evaltype: 2
        conditions:
          - conditiontype: 24
            operator: 2
            value: 'virtual'
          - conditiontype: 24
            operator: 2
            value: 'kvm'
      operations:
        - operationtype: 2
        - operationtype: 4
        opgroup:
          - groupid:
            query_object: hostgroup
            query_name: Virtual machines
          - groupid:
            query_object: hostgroup
            query_name: Databases
```
21.19.311 salt.states.zabbix_host module

Management of Zabbix hosts.

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

salt.states.zabbix_host.absent(name, **kwargs)

Ensures that the host does not exists, eventually deletes host.

New in version 2016.3.0.

Param name: technical name of the host

Parameters
- _connection_user – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- _connection_password – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- _connection_url – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

```
TestHostWithInterfaces:
  zabbix_host.absent
```

salt.states.zabbix_host.assign_templates(host, templates, **kwargs)

Ensures that templates are assigned to the host.

New in version 2017.7.0.

Parameters
- host – technical name of the host
- _connection_user – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- _connection_password – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- _connection_url – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

```
add_zabbix_templates_to_host:
  zabbix_host.assign_templates:
    host: TestHost
    templates:
      - "Template OS Linux"
      - "Template App MySQL"
```

salt.states.zabbix_host.present(host, groups, interfaces, **kwargs)

Ensures that the host exists, eventually creates new host. NOTE: please use argument visible_name instead of name to not mess with name from salt sls. This function accepts all standard host properties: keyword argument names differ depending on your zabbix version, see: https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host

New in version 2016.3.0.

Parameters
- host – technical name of the host
- groups – groupids of host groups to add the host to
- interfaces – interfaces to be created for the host
- proxy_host – Optional proxy name or proxyid to monitor host
- inventory – Optional list of inventory names and values
- _connection_user – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
• _connection_password – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
• _connection_url – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)
• visible_name – Optional - string with visible name of the host, use 'visible_name' instead of 'name' parameter to not mess with value supplied from Salt sls file.

```yaml
create_test_host:
  zabbix_host.present:
    - host: TestHostWithInterfaces
    - proxy_host: 12345
    - groups:
      - 5
      - 6
      - 7
    - interfaces:
      - test1.example.com:
        - ip: '192.168.1.8'
        - type: 'Agent'
        - port: 92
      - testing2.create:
        - ip: '192.168.1.9'
        - dns: 'test2.example.com'
        - type: 'agent'
        - main: false
      - testovacíIPMI:
        - ip: '192.168.100.111'
        - type: 'ipmi'
    - inventory:
      - alias: some alias
      - asset_tag: jlm3937
```

21.19.312 salt.states.zabbix_hostgroup module

Management of Zabbix host groups.

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>
salt.states.zabbix_hostgroup.absent(name, **kwargs)
Ensures that the host group does not exist, eventually delete host group.

New in version 2016.3.0.

Parameters
• name – name of the host group
• _connection_user – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
• _connection_password – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
• _connection_url – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

delete_testing_host_group:
  zabbix_hostgroup.absent:
    - name: 'My hostgroup name'
```

salt.states.zabbix_hostgroup.present(name, **kwargs)
Ensures that the host group exists, eventually creates new host group.
New in version 2016.3.0.

Parameters

- **name** – name of the host group
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

```python
create_testing_host_group:
zabbix_hostgroup.present:
  - name: 'My hostgroup name'
```

21.19.313 salt.states.zabbix_mediatype module

Management of Zabbix mediatypes.

codeauthor Raymond Kuiper <qix@the-wired.net>

salt.states.zabbix_mediatype.absent(name, **kwargs)

Ensures that the mediatype does not exist, eventually deletes the mediatype.

Parameters

- **name** – name of the mediatype
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

```python
delete_mediatype:
zabbix_mediatype.absent:
  - name: 'Email'
```

salt.states.zabbix_mediatype.present(name, mediatype, **kwargs)

Creates new mediatype. NOTE: This function accepts all standard mediatype properties: keyword argument names differ depending on your zabbix version, see: https://www.zabbix.com/documentation/3.0/manual/api/reference/host/object#host_inventory

Parameters

- **name** – name of the mediatype
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

```python
make_new_mediatype:
zabbix_mediatype.present:
  - name: 'Email'
  - mediatype: 0
  - smtp_server: smtp.example.com
  - smtp_hello: zabbix.example.com
  - smtp_email: zabbix@example.com
```
21.19.314  salt.states.zabbix_template

New in version 2017.7.

Management of Zabbix Template object over Zabbix API.

**codeauthor** Jakub Sliva <jakub.sliva@ultimum.io>

salt.states.zabbix_template.absent(name, **kwargs)

Makes the Zabbix Template to be absent (either does not exist or delete it).

**Parameters**

- **name** – Zabbix Template name
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

```bash
does_zabbix-template-exist:
zabbix_template.is_present:
  - name: Template OS Linux
```

salt.states.zabbix_template.is_present(name, **kwargs)

Check if Zabbix Template already exists.

**Parameters**

- **name** – Zabbix Template name
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

```bash
does_zabbix-template-exist:
zabbix_template.is_present:
  - name: Template OS Linux
```

salt.states.zabbix_template.present(name, params, static_host_list=True, **kwargs)

Creates Zabbix Template object or if differs update it according defined parameters. See Zabbix API documentation.

Zabbix API version: >3.0

**Parameters**

- **name** – Zabbix Template name
- **params** – Additional parameters according to Zabbix API documentation
- **static_host_list** – If hosts assigned to the template are controlled only by this state or can be also assigned externally
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Note:** If there is a need to get a value from current zabbix online (e.g. ids of host groups you want the template to be associated with), put a dictionary with two keys "query_object" and "query_name" instead of the value.
In this example we want to create a template named "Testing Template", assign it to hostgroup Templates, link it to two Ceph nodes and create a macro.

Note: IMPORTANT NOTE: Objects (except for template name) are identified by name (or by other key in some exceptional cases) so changing name of object means deleting old one and creating new one with new ID !!

Note: NOT SUPPORTED FEATURES:
- linked templates
- trigger dependencies
- groups and group prototypes for host prototypes

SLS Example:

```yaml
zabbix-template-present:
  zabbix_template.present:
    - name: Testing Template
      # Do not touch existing assigned hosts
      # True will detach all other hosts than defined here
      - static_host_list: False
    - params:
      - description: Template for Ceph nodes
      - groups:
        - # groups must already exist
        - # template must be at least in one hostgroup
          - groupid:
            query_object: hostgroup
            query_name: Templates
      - macros:
        - macro: "${CEPH_CLUSTER_NAME}"
          value: ceph
      - hosts:
        - # hosts must already exist
          - hostid:
            query_object: host
            query_name: ceph-osd-01
          - hostid:
            query_object: host
            query_name: ceph-osd-02
      - applications:
        # templates:
        - name: Ceph OSD
          items:
            - name: Ceph OSD avg fill item
              key: ceph.osd_avg_fill
              type: 2
              value_type: 0
              delay: 60
              units: '%'
```

(continues on next page)
description: 'Average fill of OSD'
applications:
  - applicationid:
    query_object: application
    query_name: Ceph OSD

          query_object: graph
          query_name: Ceph OSD avg fill graph

21.19.315 salt.states.zabbix_user module

Management of Zabbix users.
salt.states.zabbix_user.absent(name, **kwargs)
Ensures that the user does not exist, eventually delete user.
New in version 2016.3.0.
Parameters
- name – user alias
- _connection_user – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- _connection_password – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- _connection_url – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

George:
zabbix_user.absent

salt.states.zabbix_user.admin_password_present(name, password=None, **kwargs)
Initial change of Zabbix Admin password to password taken from one of the sources (only the most prioritized one):

1. 'password' parameter
2. '_connection_password' parameter
3. pillar 'zabbix.password' setting

1) Tries to log in as Admin with password found in state password parameter or _connection_password or pillar or default zabbix password in this precise order, if any of them is present.
2) If one of above passwords matches, it tries to change the password to the most prioritized one.
3) If not able to connect with any password then it fails.
Parameters
- name – Just a name of state
- password – Optional - desired password for Admin to be set
- _connection_user – Optional - Ignored in this state (always assumed 'Admin')
- _connection_password – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- _connection_url – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

# password taken from pillar or _connection_password
zabbix-admin-password:
zabbix_user.admin_password_present

# directly set password
zabbix-admin-password:
zabbix_user.admin_password_present:
  - password: SECRET_PASS

salt.states.zabbix_user.present(alias, passwd, usgrgps, medias=None, password_reset=False, **kwargs)
Ensures that the user exists, eventually creates new user. NOTE: use argument firstname instead of name to not mess values with name from salt sls.
New in version 2016.3.0.
Parameters
- alias – user alias
- passwd – user’s password
- usgrgps – user groups to add the user to
• **medias** – Optional - user’s medias to create
• **password_reset** – whether or not to reset password at update
• **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
• **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
• **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)
• **firstname** – string with firstname of the user, use ‘firstname’ instead of ‘name’ parameter to not mess with value supplied from Salt sls file.

```yaml
make_user:
  zabbix_user.present:
    - alias: George
    - passwd: donottellanyonE@456x
    - password_reset: True
    - usgrps:
      - 13
      - 7
    - medias:
      - me@example.com:
        - mediatype: mail
        - period: '1-7,00:00-24:00'
        - severity: NIWAHD
      - make_jabber:
        - active: true
        - mediatype: jabber
        - period: '1-5,08:00-19:00'
        - sendto: jabbera@example.com
      - text_me_morning_disabled:
        - active: false
        - mediatype: sms
        - period: '1-5,09:30-10:00'
        - severity: D
        - sendto: '+42032132588568'
```

21.19.316 salt.states.zabbix_usergroup module

Management of Zabbix user groups.

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

salt.states.zabbix_usergroup.absent(*name, **kwargs*)

Ensures that the user group does not exist, eventually delete user group.

New in version 2016.3.0.

Parameters

• **name** – name of the user group
• **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
• **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
• **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)
**delete_thai_monks_usrgrp**:
```yaml
zabbix_usergroup.absent:
  - name: 'Thai monks'
```

salt.states.zabbix_usergroup.present(name, **kwargs)

Creates new user group. NOTE: This function accepts all standard user group properties: keyword argument names differ depending on your zabbix version, see: https://www.zabbix.com/documentation/2.0/manual/appendix/api/usergroup/definitions#user_group

New in version 2016.3.0.

**Parameters**

- **name** – name of the user group
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**make_new_thai_monks_usergroup**:
```yaml
zabbix_usergroup.present:
  - name: 'Thai monks'
  - gui_access: 1
  - debug_mode: 0
  - users_status: 0
```

21.19.317 salt.states.zabbix_valuemap

New in version 2017.7.

Management of Zabbix Valuemap object over Zabbix API.

**codeauthor** Jakub Sliva <jakub.sliva@ultimum.io>

salt.states.zabbix_valuemap.absent(name, **kwargs)

Makes the Zabbix Value map to be absent (either does not exist or delete it).

**Parameters**

- **name** – Zabbix Value map name
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**zabbix-valuemap-absent**:
```yaml
zabbix_valuemap.absent:
  - name: Value map name
```

salt.states.zabbix_valuemap.present(name, params, **kwargs)

Creates Zabbix Value map object or if differs update it according defined parameters

**Parameters**

- **name** – Zabbix Value map name
- **params** – Definition of the Zabbix Value map
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
• `_connection_password` – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
• `_connection_url` – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

```
zabbix-valuemap-present:
zabbix_valuemap.present:
  - name: Number mapping
  - params:
    mappings:
      - value: 1
        newvalue: one
      - value: 2
        newvalue: two
```

## 21.19.318 salt.states.zcbuildout

### Management of zc.buildout

This module is inspired from minitage’s buildout maker ([https://github.com/minitage/minitage/blob/master/src/minitage/core/makers/buildout.py](https://github.com/minitage/minitage/blob/master/src/minitage/core/makers/buildout.py))

New in version 2016.3.0.

**Note:** This state module is beta; the API is subject to change and no promise as to performance or functionality is yet present

### Available Functions

• `built`

```
installed1
buildout.installed:
  - name: /path/to/buildout

installed2
buildout.installed:
  - name: /path/to/buildout
  - parts:
    - a
    - b
  - python: /path/to/pythonpath/bin/python
  - unless: /bin/test_something_installed
  - onlyif: /bin/test_else_installed
```

**salt.states.zcbuildout.installed**(name, config='buildout.cfg', quiet=False, parts=None, user=None, env=(), buildout_ver=None, test_release=False, distribute=None, new_st=None, offline=False, newest=False, python='/builds/saltstack/open/docs/builddocs/venv/bin/python', debug=False, verbose=False, unless=None, onlyif=None, use_vt=False, loglevel='debug', **kwargs)

Install buildout in a specific directory
It is a thin wrapper to modules.buildout.buildout
name directory to execute in
quiet
do not output console & logs
config buildout config to use (default: buildout.cfg)
parts specific buildout parts to run
user user used to run buildout as

New in version 2014.1.4.
env environment variables to set when running
buildout_ver force a specific buildout version (1 | 2)
test_release buildout accept test release
new_st Forcing use of setuptools >= 0.7
distribute use distribute over setuptools if possible
offline does buildout run offline
python python to use
debug run buildout with -D debug flag
onlyif Only execute cmd if statement on the host return 0
unless Do not execute cmd if statement on the host return 0
newest run buildout in newest mode
verbose run buildout in verbose mode (-vvvvv)
use_vt Use the new salt VT to stream output [experimental]
loglevel loglevel for buildout commands

21.19.319 salt.states.zenoss

State to manage monitoring in Zenoss.
New in version 2016.3.0.
This state module depends on the 'zenoss' Salt execution module.
Allows for setting a state of minions in Zenoss using the Zenoss API. Currently Zenoss 4.x and 5.x are supported.

```yaml
enable_monitoring:
    zenoss.monitored:
      - name: web01.example.com
      - device_class: /Servers/Linux
      - collector: localhost
      - prod_state: 1000
```

salt.states.zenoss.monitored(name, device_class=None, collector='localhost', prod_state=None)
Ensure a device is monitored. The 'name' given will be used for Zenoss device name and should be resolvable.

```yaml
enable_monitoring:
    zenoss.monitored:
      - name: web01.example.com
      - device_class: /Servers/Linux
      - collector: localhost
      - prod_state: 1000
```

21.19.320 salt.states.zk_concurrency
Control concurrency of steps within state execution using zookeeper

depends kazoo

configuration See salt.modules.zookeeper for setup instructions.

This module allows you to "wrap" a state's execution with concurrency control. This is useful to protect against all hosts executing highstate simultaneously if your services don't all HUP restart. The common way of protecting against this is to run in batch mode, but that doesn't protect from another person running the same batch command (and thereby having 2x the number of nodes deploying at once).

This module will block while acquiring a slot, meaning that however the command gets called it will coordinate with zookeeper to ensure that no more than max_concurrency steps are executing with a single path.

```yaml
acquire_lock:
  zk_concurrency.lock:
    - name: /trafficeserver
    - zk_hosts: 'zookeeper:2181'
    - max_concurrency: 4
    - prereq:
      - service: trafficserver

trafficserver:
  service.running:
    - watch:
      - file: /etc/trafficserver/records.config

/etc/trafficserver/records.config:
  file.managed:
    - source: salt://records.config

release_lock:
  zk_concurrency.unlock:
    - name: /trafficeserver
    - require:
      - service: trafficserver
```

This example would allow the file state to change, but would limit the concurrency of the trafficserver service restart to 4.

salt.states.zk_concurrency.lock(name, zk_hosts=None, identifier=None, max_concurrency=1, timeout=None, ephemeral_lease=False, profile=None, scheme=None, username=None, password=None, default_acl=None)

Block state execution until you are able to get the lock (or hit the timeout)

salt.states.zk_concurrency.min_party(name, zk_hosts, min_nodes, blocking=False, profile=None, scheme=None, username=None, password=None, default_acl=None)

Ensure that there are min_nodes in the party at name, optionally blocking if not available.

salt.states.zk_concurrency.unlock(name, zk_hosts=None, identifier=None, max_concurrency=1, ephemeral_lease=False, profile=None, scheme=None, username=None, password=None, default_acl=None)

Remove lease from semaphore.

21.19.321 salt.states.zfs

States for managing zfs datasets
maintainer Jorge Schrauwen <sjorge@blackdot.be>
maturity new
depends salt.utils.zfs, salt.modules.zfs
platform smartos, illumos, solaris, freebsd, linux

New in version 2016.3.0.
Changed in version 2018.3.1: Big refactor to remove duplicate code, better type conversions and improved consistancy in output.

test/shares/yuki:
  zfs.filesystem_present:
    - create_parent: true
    - properties:
      quota: 16G

test/iscsi/haruhi:
  zfs.volume_present:
    - create_parent: true
    - volume_size: 16M
    - sparse: true
    - properties:
      readonly: on

test/shares/yuki@frozen:
  zfs.snapshot_present
moka_origin:
  zfs.hold_present:
    - snapshot: test/shares/yuki@frozen

test/shares/moka:
  zfs.filesystem_present:
    - cloned_from: test/shares/yuki@frozen

test/shares/moka@tsukune:
  zfs.snapshot_absent

salt.states.zfs.bookmark_absent(name, force=False, recursive=False)
ensure bookmark is absent on the system
  name [string] name of bookmark
  force [boolean] try harder to destroy the dataset (zfs destroy -f)
  recursive [boolean] also destroy all the child datasets (zfs destroy -r)

salt.states.zfs.bookmark_present(name, snapshot)
ensure bookmark exists
  name [string] name of bookmark
  snapshot [string] name of snapshot

salt.states.zfs.filesystem_absent(name, force=False, recursive=False)
ensure filesystem is absent on the system
  name [string] name of filesystem
  force [boolean] try harder to destroy the dataset (zfs destroy -f)
  recursive [boolean] also destroy all the child datasets (zfs destroy -r)
Warning: If a volume with name exists, this state will succeed without destroying the volume specified by name. This module is dataset type sensitive.

salt.states.zfs.filesystem_present(name, create_parent=False, properties=None, cloned_from=None)

ensure filesystem exists and has properties set
name [string] name of filesystem
create_parent [boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.
cloned_from [string] name of snapshot to clone
properties [dict] additional zfs properties (-o)

Note: cloned_from is only use if the filesystem does not exist yet, when cloned_from is set after the filesystem exists it will be ignored.

Note: Properties do not get cloned, if you specify the properties in the state file they will be applied on a subsequent run.

salt.states.zfs.hold_absent(name, snapshot, recursive=False)

ensure hold is absent on the system
name [string] name of hold
snapshot [string] name of snapshot
recursive [boolean] recursively releases a hold with the given tag on the snapshots of all descendent file systems.

salt.states.zfs.hold_present(name, snapshot, recursive=False)

ensure hold is present on the system
name [string] name of holdt
snapshot [string] name of snapshot
recursive [boolean] recursively add hold with the given tag on the snapshots of all descendent file systems.

salt.states.zfs.promoted(name)

ensure a dataset is not a clone
name [string] name of fileset or volume

Warning: only one dataset can be the origin, if you promote a clone the original will now point to the promoted dataset

salt.states.zfs.scheduled_snapshot(name, prefix, recursive=True, schedule=None)

maintain a set of snapshots based on a schedule
name [string] name of filesystem or volume
prefix [string] prefix for the snapshots e.g. ‘test’ will result in snapshots being named ‘test-yyyyymmdd_hhmm’
recursive [boolean] create snapshots for all children also
schedule [dict] dict holding the schedule, the following keys are available (minute, hour, day, month, and year) by default all are set to 0 the value indicated the number of snapshots of that type to keep around.

Warning: snapshots will only be created and pruned every time the state runs. a schedule must be setup to automatically run the state. this means that if you run the state daily the hourly snapshot will only be made once per day!
Changed in version 2018.3.0: switched to localtime from gmtime so times now take into account timezones.

```python
salt.states.zfs.snapshot_absent(name, force=False, recursive=False)
```
ensure snapshot is absent on the system

- **name** [string] name of snapshot
- **force** [boolean] try harder to destroy the dataset (zfs destroy -f)
- **recursive** [boolean] also destroy all the child datasets (zfs destroy -r)

```python
salt.states.zfs.snapshot_present(name, recursive=False, properties=None)
```
ensure snapshot exists and has properties set

- **name** [string] name of snapshot
- **recursive** [boolean] recursively create snapshots of all descendent datasets
- **properties** [dict] additional zfs properties (-o)

```python
salt.states.zfs.volume_absent(name, force=False, recursive=False)
```
ensure volume is absent on the system

- **name** [string] name of volume
- **force** [boolean] try harder to destroy the dataset (zfs destroy -f)
- **recursive** [boolean] also destroy all the child datasets (zfs destroy -r)

**Warning:** If a filesystem with `name` exists, this state will succeed without destroying the filesystem specified by `name`. This module is dataset type sensitive.

```python
salt.states.zfs.volume_present(name, volume_size, sparse=False, create_parent=False, properties=None, cloned_from=None)
```
ensure volume exists and has properties set

- **name** [string] name of volume
- **volume_size** [string] size of volume
- **sparse** [boolean] create sparse volume
- **create_parent** [boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.
- **cloned_from** [string] name of snapshot to clone
- **properties** [dict] additional zfs properties (-o)

**Note:** `cloned_from` is only use if the volume does not exist yet, when `cloned_from` is set after the volume exists it will be ignored.

**Note:** Properties do not get cloned, if you specify the properties in the state file they will be applied on a subsequent run.

- **volume_size** is considered a property, so the volume’s size will be corrected when the properties get updated if it differs from the original volume.
- The sparse parameter is ignored when using `cloned_from`.

---

**21.19.322** *salt.states.zone*

Management of Solaris Zones

- **maintainer** Jorge Schrauwen <sjorge@blackdot.be>
- **maturity** new
- **depends** salt.modules.zoneadm, salt.modules.zonecfg

---

**21.19. state modules** 3809
platform solaris

New in version 2017.7.0.

Below are some examples of how to use this state. Let's start with creating a zone and installing it.

```yaml
omipkg1_configuration:
  zone.present:
    - name: omipkg1
    - brand: ipkg
    - zonepath: /zones/omipkg1
    - properties:
      - autoboot: true
      - ip-type: exclusive
      - cpu-shares: 50
    - resources:
      - attr:
        - name: owner
        - value: Jorge Schrauwen
        - type: string
        - attr:
        - name: description
        - value: OmniOS ipkg zone for testing
        - type: string
        - capped-memory:
          - physical: 64M

omipkg1_installation:
  zone.installed:
    - name: omipkg1
    - require:
      - zone: omipkg1_configuration

omipkg1_running:
  zone.booted:
    - name: omipkg1
    - require:
      - zone: omipkg1_installation
```

A zone without network access is not very useful. We could update the zone.present state in the example above to add a network interface or we could use a separate state for this.

```yaml
omipkg1_network:
  zone.resource_present:
    - name: omipkg1
    - resource_type: net
    - resource_selector_property: mac-addr
    - resource_selector_value: "02:08:20:a2:a3:10"
    - physical: znic1
    - require:
      - zone: omipkg1_configuration
```

Since this is a single tenant system having the owner attribute is pointless. Let's remove that attribute.

**Note:** The following state run the omipkg1_configuration state will add it again! If the entire configuration is managed it would be better to add resource_prune and optionally the resource_selector_property properties to the resource.
Let's bump the zone's CPU shares a bit.

Note: The following state run the omipkg1_configuration state will set it to 50 again. Update the entire zone configuration is managed you should update it there instead.

Or we can remove the limit altogether!

Note: The following state run the omipkg1_configuration state will set it to 50 again. Update the entire zone configuration is managed you should set the property to None (nothing after the :) instead.

salt.states.zone.absent(name, uninstall=False)
Ensure a zone is absent
name [string] name of the zone
uninstall [boolean] when true, uninstall instead of detaching the zone first.

salt.states.zone.attached(name, force=False)
Ensure zone is attached
name [string] name of the zone
force [boolean] force attach the zone

salt.states.zone.booted(name, single=False)
Ensure zone is booted
name [string] name of the zone
single [boolean] boot in single usermode

salt.states.zone.detached(name)
Ensure zone is detached
name [string] name of the zone

salt.states.zone.export(name, path, replace=False)
Export a zones configuration
name [string] name of the zone
path [string] path of file to export too.
replace [boolean] replace the file if it exists
salt.states.zone.halted(name, graceful=True)

Ensure zone is halted

name [string] name of the zone
graceful [boolean] use shutdown instead of halt if true

salt.states.zone.import_(name, path, mode='import', nodataset=False, brand_opts=None)

Import a zones configuration

name [string] name of the zone
path [string] path of the configuration file to import
mode [string] either import, install, or attach
nodataset [boolean] do not create a ZFS file system
brand_opts [boolean] brand specific options to pass

Note: The mode argument can be set to import, install, or attach. import: will only import the configuration install: will import and then try to install the zone attach: will import and then try to attach of the zone

```
omipkg1:
    zone.import:
      - path: /foo/bar/baz
```

salt.states.zone.installed(name, nodataset=False, brand_opts=None)

Ensure zone is installed

name [string] name of the zone
nodataset [boolean] do not create a ZFS file system
brand_opts [boolean] brand specific options to pass

salt.states.zone.present(name, brand, zonepath, properties=None, resources=None)

Ensure a zone with certain properties and resources

name [string] name of the zone
brand [string] brand of the zone
zonepath [string] path of the zone
properties [list of key-value pairs] dict of properties
resources [list of key-value pairs] dict of resources

Note: If the zone does not exist it will not be installed. You can use the `zone.installed` state for this.

Note:
Default resource selectors:
- fs: dir
- net: mac-addr
- device: match
- rctl: name
- attr: name
- dataset: name
- admin: user

Warning: Properties and resource will not be removed when they are absent from the state!

For properties, simple set them to `None`.
For resources, add the `resource_prune` property and set it to `True`. Also specify the `resource_selector_property` if the default is not the one you want.

```python
salt.states.zone.property_absent(name, property)
```
Ensure property is absent

```python
name [string] name of the zone
property [string] name of property
```

**Note:** This does a zonectf clear call. So the property may be reset to a default value! Does has the side effect of always having to be called.

```python
salt.states.zone.property_present(name, property, value)
```
Ensure property has a certain value

```python
name [string] name of the zone
property [string] name of property
value [string] value of property
```

```python
salt.states.zone.resource_absent(name, resource_type, resource_selector_property, resource_selector_value)
```
Ensure resource is absent

```python
name [string] name of the zone
resource_type [string] type of resource
resource_selector_property [string] unique resource identifier
resource_selector_value [string] value for resource selection
```

**Warning:** Both resource_selector_property and resource_selector_value must be provided, some properties like `name` are already reserved by salt in there states.

**Note:** You can set both resource_selector_property and resource_selector_value to None for resources that do not require them.

```python
salt.states.zone.resource_present(name, resource_type, resource_selector_property, resource_selector_value, **kwargs)
```
Ensure resource exists with provided properties

```python
name [string] name of the zone
resource_type [string] type of resource
resource_selector_property [string] unique resource identifier
resource_selector_value [string] value for resource selection
kwargs [string|int|...] resource properties
```

**Warning:** Both resource_selector_property and resource_selector_value must be provided, some properties like `name` are already reserved by salt in states.

**Note:** You can set both resource_selector_property and resource_selector_value to None for resources that do not require them.

```python
salt.states.zone.uninstalled(name)
```
Ensure zone is uninstalled
name  [string] name of the zone

21.19.323 salt.states.zookeeper

depends kazoo
configuration See salt.modules.zookeeper for setup instructions.

ACLS

For more information about acls, please checkout the kazoo documentation.
http://kazoo.readthedocs.io/en/latest/api/security.html#kazoo.security.make_digest_acl

The following options can be included in the acl dictionary:

- param username Username to use for the ACL.
- param password A plain-text password to hash.
- param write Write permission.
  - type write bool
- param create Create permission.
  - type create bool
- param delete Delete permission.
  - type delete bool
- param admin Admin permission.
  - type admin bool
- param all All permissions.
  - type all bool

salt.states.zookeeper.absent (name, version=-1, recursive=False, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Make sure znode is absent
name path to znode
version Specify the version which should be deleted Default: -1 (always match)
recursive Boolean to indicate if children should be recursively deleted Default: False
profile Configured Zookeeper profile to authenticate with (Default: None)
hosts Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')
scheme Scheme to authenticate with (Default: 'digest')
username Username to authenticate (Default: None)
password Password to authenticate (Default: None)
default_acl Default acls to assign if a node is created in this connection (Default: None)

delete znode:
  zookeeper.absent:
    - name: /test
    - recursive: True

salt.states.zookeeper.acls (name, acls, version=-1, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Update acls on a znode
name path to znode
acls list of acl dictionaries to set on znode
version Specify the version which should be deleted Default: -1 (always match)
profile Configured Zookeeper profile to authenticate with (Default: None)
hosts Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')
scheme Scheme to authenticate with (Default: 'digest')
username Username to authenticate (Default: None)
password Password to authenticate (Default: None)
default_acl Default acls to assign if a node is created in this connection (Default: None)

update acls:
  zookeeper.acls:
    - name: /test/name
    - acls:
      - username: daniel
        password: test
        all: True
      - username: gtmanfred
        password: test
        all: True

salt.states.zookeeper.present(name, value, acls=None, ephemeral=False, sequence=False, makepath=False, version=-1, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Make sure znode is present in the correct state with the correct acls
name path to znode
value value znode should be set to
acls list of acl dictionaries to set on znode (make sure the ones salt is connected with are included) Default: None
ephemeral Boolean to indicate if ephemeral znode should be created Default: False
sequence Boolean to indicate if znode path is suffixed with a unique index Default: False
makepath Boolean to indicate if the parent paths should be created Default: False
version For updating, specify the version which should be updated Default: -1 (always match)
profile Configured Zookeeper profile to authenticate with (Default: None)
hosts Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')
scheme Scheme to authenticate with (Default: 'digest')
username Username to authenticate (Default: None)
password Password to authenticate (Default: None)
default_acl Default acls to assign if a node is created in this connection (Default: None)

add znode:
  zookeeper.present:
    - name: /test/name
    - value: gtmanfred
    - makepath: True

update znode:
  zookeeper.present:
    - name: /test/name
    - value: daniel
    - acls:
      - username: daniel
        password: test
        read: true
      - username: gtmanfred

(continues on next page)
password: test
read: true
write: true
create: true
delete: true
admin: true
- makepath: True

21.19.324 salt.states.zpool

States for managing zpools

maintainer Jorge Schrauwen <sjorge@blackdot.be>
maturity new
depends salt.utils.zfs, salt.modules.zpool
platform smartos, illumos, solaris, freebsd, linux

New in version 2016.3.0.

Changed in version 2018.3.1: Big refactor to remove duplicate code, better type conversions and improved consistency in output.

oldpool:
  zpool.absent:
    - export: true

newpool:
  zpool.present:
    - config:
      - import: false
      force: true
    - properties:
      - comment: salty storage pool
    - layout:
      - mirror:
        - /dev/disk0
        - /dev/disk1
      - mirror:
        - /dev/disk2
        - /dev/disk3

partitionpool:
  zpool.present:
    - config:
      - import: false
      force: true
    - properties:
      - comment: disk partition salty storage pool
      ashift: '12'
    - filesystem_properties:
      - compression: lz4
      atime: on
      relatime: on
- layout:
  - /dev/disk/by-uuid/3e43ce94-77af-4f52-a91b-6cddb0b0f41b

simplepool:
zpool.present:
- config:
  import: false
  force: true
- properties:
  comment: another salty storage pool
- layout:
  - /dev/disk0
  - /dev/disk1

Warning: The layout will never be updated, it will only be used at time of creation. It’s a whole lot of work to figure out if a devices needs to be detached, removed, etc. This is best done by the sysadmin on a case per case basis.

Filesystem properties are also not updated, this should be managed by the zfs state module.

salt.states.zpool.absent(name, export=False, force=False)
ensure storage pool is absent on the system
name [string] name of storage pool
export [boolean] export instead of destroy the zpool if present
force [boolean] force destroy or export
	salt.states.zpool.present(name, properties=None, filesystem_properties=None, layout=None, config=None)
ensure storage pool is present on the system
name [string] name of storage pool
properties [dict] optional set of properties to set for the storage pool
filesystem_properties [dict] optional set of filesystem properties to set for the storage pool (creation only)
layout: dict disk layout to use if the pool does not exist (creation only)
config [dict] fine grain control over this state

Note:
The following configuration properties can be toggled in the config parameter.
  • import (true) - try to import the pool before creating it if absent
  • import_dirs (None) - specify additional locations to scan for devices on import (comma-seperated)
  • device_dir (None, SunOS=/dev/dsk, Linux=/dev) - specify device directory to prepend for none absolute device paths
  • force (false) - try to force the import or creation

Note: It is no longer needed to give a unique name to each top-level vdev, the old layout format is still supported but no longer recommended.

- mirror:
  - /tmp/vdisk3
  - /tmp/vdisk2
- mirror:
  - /tmp/vdisk0
  - /tmp/vdisk1
The above yaml will always result in the following zpool create:

```bash
zpool create mypool mirror /tmp/vdisk3 /tmp/vdisk2 mirror /tmp/vdisk0 /tmp/vdisk1
```

**Warning:** The legacy format is also still supported but not recommended, because ID's inside the layout dict must be unique they need to have a suffix.

<table>
<thead>
<tr>
<th>mirror-0:</th>
<th>/tmp/vdisk3</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>/tmp/vdisk2</td>
</tr>
<tr>
<td>mirror-1:</td>
<td>/tmp/vdisk0</td>
</tr>
<tr>
<td></td>
<td>/tmp/vdisk1</td>
</tr>
</tbody>
</table>

**Warning:** Pay attention to the order of your dict!

- **mirror:**
  - /tmp/vdisk0  
  - /tmp/vdisk1  
  - /tmp/vdisk2

The above will result in the following zpool create:

```bash
zpool create mypool mirror /tmp/vdisk0 /tmp/vdisk1 /tmp/vdisk2
```

Creating a 3-way mirror! While you probably expect it to be mirror root vdev with 2 devices + a root vdev of 1 device!

### 21.20 thorium modules

</table>
21.20.1 salt.thorium.calc module

Used to manage the thorium register. The thorium register is where compound values are stored and computed, such as averages etc.

New in version 2016.11.0.

depends statistics PyPi module

salt.thorium.calc.add(name, num, minimum=0, maximum=0, ref=None)

Adds together the num most recent values. Requires a list.

USAGE:

```
foo:
  calc.add:
    - name: myregentry
    - num: 5
```

salt.thorium.calc.calc(name, num, oper, minimum=0, maximum=0, ref=None)

Perform a calculation on the num most recent values. Requires a list. Valid values for oper are:
- add: Add last num values together
- mul: Multiple last num values together
- mean: Calculate mean of last num values
- median: Calculate median of last num values
- median_low: Calculate low median of last num values
- median_high: Calculate high median of last num values
- median_grouped: Calculate grouped median of last num values
- mode: Calculate mode of last num values

USAGE:

```
foo:
  calc.calc:
    - name: myregentry
    - num: 5
    - oper: mean
```

salt.thorium.calc.mean(name, num, minimum=0, maximum=0, ref=None)

Calculates the mean of the num most recent values. Requires a list.

USAGE:

```
foo:
  calc.mean:
    - name: myregentry
    - num: 5
```

salt.thorium.calc.median(name, num, minimum=0, maximum=0, ref=None)

Calculates the mean of the num most recent values. Requires a list.

USAGE:

```
foo:
  calc.median:
    - name: myregentry
    - num: 5
```

salt.thorium.calc.median_grouped(name, num, minimum=0, maximum=0, ref=None)

Calculates the grouped mean of the num most recent values. Requires a list.
USAGE:

```yaml
foo:
  calc.median_grouped:
    - name: myregentry
    - num: 5
```

salt.thorium.calc.median_high(name, num, minimum=0, maximum=0, ref=None)
Calculates the high mean of the num most recent values. Requires a list.

USAGE:

```yaml
foo:
  calc.median_high:
    - name: myregentry
    - num: 5
```

salt.thorium.calc.median_low(name, num, minimum=0, maximum=0, ref=None)
Calculates the low mean of the num most recent values. Requires a list.

USAGE:

```yaml
foo:
  calc.median_low:
    - name: myregentry
    - num: 5
```

salt.thorium.calc.mode(name, num, minimum=0, maximum=0, ref=None)
Calculates the mode of the num most recent values. Requires a list.

USAGE:

```yaml
foo:
  calc.mode:
    - name: myregentry
    - num: 5
```

salt.thorium.calc.mul(name, num, minimum=0, maximum=0, ref=None)
Multiplies together the num most recent values. Requires a list.

USAGE:

```yaml
foo:
  calc.mul:
    - name: myregentry
    - num: 5
```

### 21.20.2 salt.thorium.check module

The check Thorium state is used to create gateways to commands, the checks make it easy to make states that watch registers for changes and then just succeed or fail based on the state of the register, this creates the pattern of having a command execution get gated by a check state via a requisite.

salt.thorium.check.contains(name, value, count_lt=None, count_lte=None, count_eq=None, count_gte=None, count_gt=None, count_ne=None)

Only succeed if the value in the given register location contains the given value

USAGE:

```yaml
foo:
  check.contains:
    - value: itni

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

salt.thorium.check.eq(name, value)

Only succeed if the value in the given register location is equal to the given value

USAGE:

```yaml
foo:
  check.eq:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

salt.thorium.check.event(name)

Checks for a specific event match and returns result True if the match happens

USAGE:

```yaml
salt/foo/*/bar:
  check.event

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: salt/foo/*/bar
```

salt.thorium.check.gt(name, value)

Only succeed if the value in the given register location is greater than the given value

USAGE:

```yaml
foo:
  check.gt:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```
**Salt Documentation, Release 3000.2**

**Salt.thorium.check.gte(name, value)**
Only succeed if the value in the given register location is greater or equal than the given value

**Usage:**

```
foo:
  check.gte:
    - value: 42
run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

**Salt.thorium.check.len_eq(name, value)**
Only succeed if the length of the given register location is equal to the given value.

**Usage:**

```
foo:
  check.len_eq:
    - value: 42
run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

**Salt.thorium.check.len_gt(name, value)**
Only succeed if length of the given register location is greater than the given value.

**Usage:**

```
foo:
  check.len_gt:
    - value: 42
run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

**Salt.thorium.check.len_gte(name, value)**
Only succeed if the length of the given register location is greater or equal than the given value.

**Usage:**

```
foo:
  check.len_gte:
    - value: 42
run_remote_ex:
  local.cmd:
```

(continues on next page)
salt.thorium.check.len_lt(name, value)
Only succeed if the length of the given register location is less than the given value.

Usage:

```
foo:
  check.len_lt:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

salt.thorium.check.len_lte(name, value)
Only succeed if the length of the given register location is less than or equal the given value

Usage:

```
foo:
  check.len_lte:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

cell.thorium.check.len_ne(name, value)
Only succeed if the length of the given register location is not equal to the given value.

Usage:

```
foo:
  check.len_ne:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

cell.thorium.check.lt(name, value)
Only succeed if the value in the given register location is less than the given value

Usage:
salt.thorium.check.lte(name, value)
Only succeed if the value in the given register location is less than or equal the given value

 USAGE:

```yaml
foo:
  check.lte:
    - value: 42
run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

salt.thorium.check.ne(name, value)
Only succeed if the value in the given register location is not equal to the given value

 USAGE:

```yaml
foo:
  check.ne:
    - value: 42
run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

### 21.20.3 salt.thorium.file module

 Writes matches to disk to verify activity, helpful when testing

 Normally this is used by giving the name of the file (without a path) that the data will be saved to. If for instance you use `foo` as the name:

```yaml
foo:
  file.save
```

Then the file will be saved to:

 `<salt cachedir>/thorium/saves/foo`
You may also provide an absolute path for the file to be saved to:

```
/tmp/foo.save:
  file.save
```

Files will be saved in JSON format. However, JSON does not support `set()`'s. If you are saving a register entry that contains a `'set()``, then it will fail to save to JSON format. However, you may pass data through a filter which makes it JSON compliant:

```
foo:
  file.save:
    filter: True
```

Be warned that if you do this, then the file will be saved, but not in a format that can be re-imported into Python.

```python
class_list = [1, 2, 3, {'set': True}]
```

```python
salt.thorium.file.save(name, filter=False)
```

Save the register to `<salt cachedir>/thorium/saves/<name>`, or to an absolute path.

If an absolute path is specified, then the directory will be created non-recursively if it doesn’t exist.

```python
USAGE:
```

```
foo:
  file.save
```

```
/tmp/foo:
  file.save
```

### 21.20.4 salt.thorium.key module

The key Thorium State is used to apply changes to the accepted/rejected/pending keys

New in version 2016.11.0.

```python
class_list = [1, 2, 3, {'set': True}]
```

```python
salt.thorium.key.timeout(name, delete=0, reject=0)
```

If any minion’s status is older than the timeout value then apply the given action to the timed out key. This example will remove keys to minions that have not checked in for 300 seconds (5 minutes)

```python
USAGE:
```

```
statreg:
  status.reg
```

```
clean_keys:
  key.timeout:
    - require:
      - status: statreg
      - delete: 300
```

### 21.20.5 salt.thorium.local module

Run remote execution commands via the local client

```python
class_list = [1, 2, 3, {'set': True}]
```

```python
class_list = [1, 2, 3, {'set': True}]
```

```python
salt.thorium.local.cmd(name, tgt, func, arg=(), tgt_type='glob', ret='', kwarg=None, **kwargs)
```

Execute a remote execution command

```python
USAGE:
```
Salt Documentation, Release 3000.2

```
run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.sleep
    - arg: 30

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.sleep
    - kwarg:
      length: 30
```

### 21.20.6 `salt.thorium.reg` module

Used to manage the thorium register. The thorium register is where compound values are stored and computed, such as averages etc.

**`salt.thorium.reg.clear(name)`**
Clear the namespace from the register

**Usage:**

```
clearns:
  reg.clear:
    - name: myregister
```

**`salt.thorium.reg.delete(name)`**
Delete the namespace from the register

**Usage:**

```
deletens:
  reg.delete:
    - name: myregister
```

**`salt.thorium.reg.list_(name, add, match, stamp=False, prune=0)`**
Add the specified values to the named list

If `stamp` is True, then the timestamp from the event will also be added if `prune` is set to an integer higher than 0, then only the last `prune` values will be kept in the list.

**Usage:**

```
foo:
  reg.list:
    - add: bar
    - match: my/custom/event
    - stamp: True
```
salt.thorium.reg.mean(name, add, match)
Accept a numeric value from the matched events and store a running average of the values in the given register. If the specified value is not numeric it will be skipped

 USAGE:

```
foo:
  reg.mean:
    - add: data_field
    - match: my/custom/event
```

salt.thorium.reg.set_(name, add, match)
Add a value to the named set

 USAGE:

```
foo:
  reg.set:
    - add: bar
    - match: my/custom/event
```

21.20.7 salt.thorium.runner module
React by calling asynchronous runners

salt.thorium.runner.cmd(name, func=None, arg=(), **kwargs)
Execute a runner asynchronous:

 USAGE:

```
run_cloud:
  runner.cmd:
    - func: cloud.create
    - arg:
      - my-ec2-config
      - myinstance

run_cloud:
  runner.cmd:
    - func: cloud.create
    - kwargs:
      provider: my-ec2-config
      instances: myinstance
```

21.20.8 salt.thorium.status module
This thorium state is used to track the status beacon events and keep track of the active status of minions
New in version 2016.11.0.

salt.thorium.status.reg(name)
Activate this register to turn on a minion status tracking register, this register keeps the current status beacon data and the time that each beacon was last checked in.
21.20.9 salt.thorium.timer module

Allow for flow based timers. These timers allow for a sleep to exist across multiple runs of the flow

```python
salt.thorium.timer.hold(name, seconds)
```

Wait for a given period of time, then fire a result of True, requiring this state allows for an action to be blocked for evaluation based on time

**USAGE:**

```yaml
hold_on_a_moment:
    timer.hold:
        - seconds: 30
```

21.20.10 salt.thorium.wheel module

React by calling asynchronous runners

```python
salt.thorium.wheel.cmd(name, fun=None, arg=(), **kwargs)
```

Execute a runner asynchronous:

**USAGE:**

```yaml
run_cloud:
  wheel.cmd:
    - fun: key.delete
    - match: minion_id
```

21.21 auth modules

<table>
<thead>
<tr>
<th>localfs</th>
<th>Stores eauth tokens in the filesystem of the master.</th>
</tr>
</thead>
<tbody>
<tr>
<td>rediscluster</td>
<td>Provide token storage in Redis cluster.</td>
</tr>
</tbody>
</table>

21.21.1 salt.tokens.localfs

Stores eauth tokens in the filesystem of the master. Location is configured by the master config option 'token_dir'

```python
salt.tokens.localfs.get_token(opts, tok)
```

Fetch the token data from the store.

- **Parameters**
  - `opts` – Salt master config options
  - `tok` – Token value to get

- **Returns** Token data if successful. Empty dict if failed.

```python
salt.tokens.localfs.list_tokens(opts)
```

List all tokens in the store.

- **Parameters**
  - `opts` – Salt master config options

- **Returns** List of dicts (tokens)

```python
salt.tokens.localfs.mk_token(opts, tdata)
```

Mint a new token using the config option hash_type and store tdata with 'token' attribute set to the token.

- **Parameters**
  - `opts` – Salt master config options
  - `tdata` – Token data to store
• **opts** – Salt master config options
• **tdata** – Token data to be stored with 'token' attribute of this dict set to the token.

Returns tdata with token if successful. Empty dict if failed.

```python
salt.tokens.localfs.rm_token(opts, tok)
```
Remove token from the store.

Parameters
• **opts** – Salt master config options
• **tok** – Token to remove

Returns Empty dict if successful. None if failed.

21.21.2 **salt.tokens.rediscluster**

Provide token storage in Redis cluster.

To get started simply start a redis cluster and assign all hashslots to the connected nodes. Add the redis hostname and port to master configs as eauth_redis_host and eauth_redis_port. Default values for these configs are as follow:

<table>
<thead>
<tr>
<th>eauth_redis_host:</th>
<th>localhost</th>
</tr>
</thead>
<tbody>
<tr>
<td>eauth_redis_port:</td>
<td>6379</td>
</tr>
</tbody>
</table>

depends
• redis-py-cluster Python package

```python
call.salt.tokens.rediscluster.get_token(opts, tok)
```
Fetch the token data from the store.

Parameters
• **opts** – Salt master config options
• **tok** – Token value to get

Returns Token data if successful. Empty dict if failed.

```python
call.salt.tokens.rediscluster.list_tokens(opts)
```
List all tokens in the store.

Parameters **opts** – Salt master config options

Returns List of dicts (token_data)

```python
call.salt.tokens.rediscluster.mk_token(opts, tdata)
```
Mint a new token using the config option hash_type and store tdata with 'token' attribute set to the token.
This module uses the hash of random 512 bytes as a token.

Parameters
• **opts** – Salt master config options
• **tdata** – Token data to be stored with 'token' attribute of this dict set to the token.

Returns tdata with token if successful. Empty dict if failed.

```python
call.salt.tokens.rediscluster.rm_token(opts, tok)
```
Remove token from the store.

Parameters
• **opts** – Salt master config options
• **tok** – Token to remove

Returns Empty dict if successful. None if failed.

21.22 **master tops modules**
Cobbler Tops

Cobbler Tops is a master tops subsystem used to look up mapping information from Cobbler via its API. The same `cobbler.*` parameters are used for both the Cobbler tops and Cobbler pillar modules.

```yaml
master_tops:
  cobbler: {}
cobbler.url: https://example.com/cobbler_api #default is http://localhost/cobbler_api
cobbler.user: username # default is no username
cobbler.password: password # default is no password
```

Module Documentation

`salt.tops.cobbler.top(**kwargs)`

Look up top data in Cobbler for a minion.

21.22.2 salt.tops.ext_nodes

External Nodes Classifier

The External Nodes Classifier is a master tops subsystem that retrieves mapping information from major configuration management systems. One of the most common external nodes classifiers system is provided by Cobbler and is called `cobbler-ext-nodes`.

The `cobbler-ext-nodes` command can be used with this configuration:

```yaml
master_tops:
  ext_nodes: cobbler-ext-nodes
```

It is noteworthy that the Salt system does not directly ingest the data sent from the `cobbler-ext-nodes` command, but converts the data into information that is used by a Salt top file.

Any command can replace the call to `cobbler-ext-nodes` above, but currently the data must be formatted in the same way that the standard `cobbler-ext-nodes` does.

See (admittedly degenerate and probably not complete) example:

```yaml
classes:
  - basepackages
  - database
```

The above essentially is the same as a top.sls containing the following:
base:
  '*' :
    - basepackages
    - database

salt.tops.ext_nodes.top(**kwargs)
  Run the command configured

21.22.3 salt.tops.mongo

Read tops data from a mongodb collection
This module will load tops data from a mongo collection. It uses the node's id for lookups.

Salt Master Mongo Configuration

The module shares the same base mongo connection variables as salt.returners.mongo_return. These variables go in your master config file.

- **mongo.db** - The mongo database to connect to. Defaults to 'salt'.
- **mongo.host** - The mongo host to connect to. Supports replica sets by specifying all hosts in the set, comma-delimited. Defaults to 'salt'.
- **mongo.port** - The port that the mongo database is running on. Defaults to 27017.
- **mongo.user** - The username for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''. 
- **mongo.password** - The password for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''. 

Configuring the Mongo Tops Subsystem

```
master_tops:
mongo:
  collection: tops
  id_field: _id
  re_replace: ""
  re_pattern: \.example\com
  states_field: states
  environment_field: environment
```

Module Documentation

salt.tops.mongo.top(**kwargs)
  Connect to a mongo database and read per-node tops data.
  Parameters
  - **collection**(*) - The mongodb collection to read data from. Defaults to 'tops'.
21.22.4 salt.tops.reclass_adapter

Read tops data from a reclass database

This master_tops plugin provides access to the reclass database, such that state information (top data) are retrieved from reclass.

You can find more information about reclass at http://reclass.pantsfullofunix.net.

To use the plugin, add it to the master_tops list in the Salt master config and tell reclass by way of a few options how and where to find the inventory:

```
master_tops:
  reclass:
    storage_type: yaml_fs
    inventory_base_uri: /srv/salt
```

This would cause reclass to read the inventory from YAML files in /srv/salt/nodes and /srv/salt/classes.

If you are also using reclass as ext_pillar plugin, and you want to avoid having to specify the same information for both, use YAML anchors (take note of the differing data types for ext_pillar and master_tops):

```
reclass: &reclass
  storage_type: yaml_fs
  inventory_base_uri: /srv/salt
  reclass_source_path: ~/code/reclass

ext_pillar:
  - reclass: &reclass

master_tops:
  reclass: &reclass
```

If you want to run reclass from source, rather than installing it, you can either let the master know via the PYTHONPATH environment variable, or by setting the configuration option, like in the example above.

```
salt.tops.reclass_adapter.top(**kwargs)
  Query reclass for the top data (states of the minions).
```

21.22.5 salt.tops.saltclass
Saltclass Configuration

```yaml
master_tops:
saltclass:
  path: /srv/saltclass
```

Description

This module clones the behaviour of reclass (http://reclass.pantsfullofunix.net/), without the need of an external app, and add several features to improve flexibility. Saltclass lets you define your nodes from simple yaml files (.yml) through hierarchical class inheritance with the possibility to override pillars down the tree.

Features

- Define your nodes through hierarchical class inheritance
- Reuse your reclass datas with minimal modifications
  - applications => states
  - parameters => pillars
- Use Jinja templating in your yaml definitions
- Access to the following Salt objects in Jinja
  - `__opts__`
  - `__salt__`
  - `__grains__`
  - `__pillars__`
  - `minion_id`
- Chose how to merge or override your lists using ^ character (see examples)
- Expand variables $[] with possibility to escape them if needed $[] (see examples)
- Ignores missing node/class and will simply return empty without breaking the pillar module completely - will be logged

An example subset of datas is available here: http://git.mauras.ch/salt/saltclass/src/master/examples

<table>
<thead>
<tr>
<th>Terms usable in yaml files</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>classes</td>
<td>A list of classes that will be processed in order</td>
</tr>
<tr>
<td>states</td>
<td>A list of states that will be returned by master_tops function</td>
</tr>
<tr>
<td>pillars</td>
<td>A yaml dictionary that will be returned by the ext_pillar function</td>
</tr>
<tr>
<td>environment</td>
<td>Node saltenv that will be used by master_tops</td>
</tr>
</tbody>
</table>

A class consists of:
- zero or more parent classes
- zero or more states
- any number of pillars

A child class can override pillars from a parent class. A node definition is a class in itself with an added `environment` parameter for `saltenv` definition.
Class names

Class names mimic the way of defining states and pillar files. This means that `default.users` class name will correspond to one of these:

- `<saltclass_path>/classes/default/users.yml`
- `<saltclass_path>/classes/default/users/init.yml`

Saltclass file hierarchy

A saltclass tree would look like this:

```
<saltclass_path>
|-- classes
|   |-- app
|       |-- borgbackup.yml
|       |-- ssh
|       |   |-- server.yml
|   |-- default
|       |-- init.yml
|       |-- motd.yml
|       |-- users.yml
|   |-- roles
|       |-- app.yml
|       |-- nginx
|           |-- init.yml
|           |-- server.yml
|   |-- subsidiaries
|       |-- gnv.yml
|       |-- qls.yml
|       |-- zrh.yml
|-- nodes
|   |-- geneva
|       |-- gnv.node1.yml
|   |-- lausanne
|       |-- qls.node1.yml
|       |-- qls.node2.yml
|       |-- node127.yml
|   |-- zurich
|       |-- zrh.node1.yml
|       |-- zrh.node2.yml
|       |-- zrh.node3.yml
```

Saltclass Examples

```
<saltclass_path>/nodes/lausanne/qls.node1.yml
```

```
environment: base

classes:
{% for class in ['default'] %}

(continues on next page)
```
<saltclass_path>/classes/default/init.yml

```
classes:
- default.users
- default.motd

states:
- openssh

pillars:
default:
network:
  dns:
    srv1: 192.168.0.1
    srv2: 192.168.0.2
    domain: example.com
  ntp:
    srv1: 192.168.10.10
    srv2: 192.168.10.20

pillars:
default:
network:
  sub: Geneva
  dns:
    srv1: 10.20.0.1
    srv2: 10.20.0.2
    srv3: 192.168.1.1
    domain: gnv.example.com
  users:
    adm1:
      uid: 1210
      gid: 1210
      gecos: 'Super user admin1'
      homedir: /srv/app/adm1
    adm3:
      uid: 1203
      gid: 1203
      gecos: 'Super user adm'
```

Variable expansions

Escaped variables are rendered as is: `{{ test }}`

Missing variables are rendered as is: `{{ net:dns:srv2 }}`
List override

Not using `^` as the first entry will simply merge the lists

```yaml
pillars:
  app:
    pkg:
      - ^
      - app-frontend
```

Note: Known limitation

Currently you can’t have both a variable and an escaped variable in the same string as the escaped one will not be correctly rendered - ‘${[xx]’ will stay as is instead of being rendered as ‘${xx]’

```python
salt.tops.saltclass.top(**kwargs)
```

Compile tops

### 21.22.6 salt.tops.varstack_top

Use Varstack to provide tops data

This `master_tops` plugin provides access to the varstack hierarchical yaml files, so you can use varstack as a full external node classifier and store state information (top data) in it.

**Configuring Varstack**

To use varstack as a master top external node classifier, install varstack as documented. Then, add to your master’s configuration:

```yaml
master_tops:
  varstack: /path/to/the/config/file/varstack.yaml
```

Varstack will then use `/path/to/the/config/file/varstack.yaml` (usually `/etc/varstack.yaml`) to determine which configuration data to return as adapter information. From there you can take a look at the README of varstack to learn how this file is evaluated. The ENC part will just return the ‘states’ dictionary for the node.

Ie, if my.fqdn.yaml file contains:
---
states:
- sudo
- openssh
- apache
- salt.minion

these will be returned as {'base': ['sudo', 'openssh', 'apache', 'salt.minion']} and managed by salt as if given from a top.sls file.

`salt.tops.varstack_top.top(**kwargs)`

Query `varstack` for the top data (states of the minions).

## 21.23  wheel modules

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>config</code></td>
<td>Manage the master configuration file</td>
</tr>
<tr>
<td><code>error</code></td>
<td>Error generator to enable integration testing of salt wheel error handling</td>
</tr>
<tr>
<td><code>file_roots</code></td>
<td>Read in files from the file_root and save files to the file root</td>
</tr>
<tr>
<td><code>key</code></td>
<td>Wheel system wrapper for the Salt key system to be used in interactions with the Salt Master programatically.</td>
</tr>
<tr>
<td><code>minions</code></td>
<td>Wheel system wrapper for connected minions</td>
</tr>
<tr>
<td><code>pillar_roots</code></td>
<td>The <code>pillar_roots</code> wheel module is used to manage files under the pillar roots directories on the master server.</td>
</tr>
</tbody>
</table>

### 21.23.1 salt.wheel.config

Manage the master configuration file

`salt.wheel.config.apply(key, value)`
Set a single key

**Note:** This will strip comments from your config file

`salt.wheel.config.update_config(file_name, yaml_contents)`
Update master config with `yaml_contents`.

Writes `yaml_contents` to a file named `file_name.conf` under the folder specified by `default_include`. This folder is named `master.d` by default. Please look at `include-configuration` for more information.

Example low data:

```python
data = {
    'username': 'salt',
    'password': 'salt',
    'fun': 'config.update_config',
    'file_name': 'gui',
    'yaml_contents': {'id': 1},
    'client': 'wheel',
}
```

(continues on next page)
s\texttt{alt.wheel.config.\texttt{values}()}

Return the raw values of the config file

### 21.23.2 \texttt{salt.wheel.error}

Error generator to enable integration testing of salt wheel error handling

\texttt{salt.wheel.error.error(name=\texttt{None}, message=\texttt{")\)}}

If name is \texttt{None} Then return empty dict

Otherwise raise an exception with \texttt{\_\_name\_\_} from name, message from message

CLI Example:

\begin{verbatim}
salt-wheel error
salt-wheel error.error name="Exception" message="This is an error."
\end{verbatim}

### 21.23.3 \texttt{salt.wheel.file_roots}

Read in files from the \texttt{file\_root} and save files to the file root

\texttt{salt.wheel.file_roots.\texttt{find}(\texttt{path}, \texttt{saltenv=\"base\")}}

Return a dict of the files located with the given path and environment

\texttt{salt.wheel.file_roots.\texttt{list\_env}(\texttt{saltenv=\"base\")}}

Return all of the file paths found in an environment

\texttt{salt.wheel.file_roots.\texttt{list\_roots}()}  

Return all of the files names in all available environments

\texttt{salt.wheel.file_roots.\texttt{read}(\texttt{path}, \texttt{saltenv=\"base\")}}

Read the contents of a text file, if the file is binary then

\texttt{salt.wheel.file_roots.\texttt{write}(\texttt{data}, \texttt{path}, \texttt{saltenv=\"base\", index=0})}

Write the named file, by default the first file found is written, but the index of the file can be specified to write to a lower priority file root

### 21.23.4 \texttt{salt.wheel.key}

Wheel system wrapper for the Salt key system to be used in interactions with the Salt Master programmatically.

The key module for the wheel system is meant to provide an internal interface for other Salt systems to interact with the Salt Master. The following usage examples assume that a \texttt{WheelClient} is available:

\begin{verbatim}
import \texttt{salt.config}
import \texttt{salt.wheel}
\texttt{opts = salt.config.master_config('/etc/salt/master')}\texttt{\)}
\texttt{wheel = salt.wheel.WheelClient(opts)}
\end{verbatim}

Note that importing and using the \texttt{WheelClient} must be performed on the same machine as the Salt Master and as the same user that runs the Salt Master, unless \texttt{external\_auth} is configured and the user is authorized to execute wheel functions.
The function documentation starts with the wheel reference from the code sample above and use the WheelClient functions to show how they can be called from a Python interpreter.

The wheel key functions can also be called via a salt command at the CLI using the saltutil execution module.

```python
salt.wheel.key.accept(match, include_rejected=False, include_denied=False)

Accept keys based on a glob match. Returns a dictionary.

match The glob match of keys to accept.
include_rejected To include rejected keys in the match along with pending keys, set this to True. Defaults to False.
include_denied To include denied keys in the match along with pending keys, set this to True. Defaults to False.
```

```python
>>> wheel.cmd('key.accept', ['minion1'])
{'minions': ['minion1']}
```

```python
salt.wheel.key.accept_dict(match, include_rejected=False, include_denied=False)

Accept keys based on a dict of keys. Returns a dictionary.

match The dictionary of keys to accept.
include_rejected To include rejected keys in the match along with pending keys, set this to True. Defaults to False.
include_denied To include denied keys in the match along with pending keys, set this to True. Defaults to False.

New in version 2016.3.4.
```

```python
>>> wheel.cmd('key.accept_dict',
          {
              'minions_pre': ['jerry', 'stuart', 'bob'],
          })
{'minions': ['jerry', 'stuart', 'bob']}
```

```python
salt.wheel.key.delete(match)

Delete keys based on a glob match. Returns a dictionary.

match The glob match of keys to delete.
```

```python
>>> wheel.cmd_async({'fun': 'key.delete', 'match': 'minion1'})
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

```python
salt.wheel.key.delete_dict(match)

Delete keys based on a dict of keys. Returns a dictionary.

match The dictionary of keys to delete.
```

```python
>>> wheel.cmd_async({'fun': 'key.delete_dict',
          'match': {
              'minions': ['jerry', 'stuart',
                         'bob',
          ]})
```

(continues on next page)
salt.wheel.key.finger(match, hash_type=None)
Return the matching key fingerprints. Returns a dictionary.
match  The key for with to retrieve the fingerprint.
hash_type  The hash algorithm used to calculate the fingerprint

>>> wheel.cmd('key.finger', [{'minion1']})

salt.wheel.key.finger_master(hash_type=None)
Return the fingerprint of the master’s public key
hash_type  The hash algorithm used to calculate the fingerprint

>>> wheel.cmd('key.finger_master')

salt.wheel.key.gen(id_=None, keysize=2048)
Generate a key pair. No keys are stored on the master. A key pair is returned as a dict containing pub and priv keys. Returns a dictionary containing the the pub and priv keys with their generated values.
id_  Set a name to generate a key pair for use with salt. If not specified, a random name will be specified.
keysize  The size of the key pair to generate. The size must be 2048, which is the default, or greater. If set to a value less than 2048, the key size will be rounded up to 2048.

>>> wheel.cmd('key.gen')
{'pub': '-----BEGIN PUBLIC KEY-----
MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBC
...
BBPfamX9gGPQTpN9e8HwczXQnmg80rcUl10WWhw095Dw10jnW+ueTWugEopPt\nqi道德AB7n
-----END PUBLIC KEY-----',
'priv': '-----BEGIN RSA PRIVATE KEY-----
MIIEpAIBAAKCAQEA42Kf+w9XeZWgguv
...
QH3/W74X1+WTBLx4RKGLYBiH+bCCFQvZvcu4Xp4bIOPtRkozEQ==\n-----END RSA PRIVATE KEY-----'}

salt.wheel.key.gen_accept(id_, keysize=2048, force=False)
Generate a key pair then accept the public key. This function returns the key pair in a dict, only the public key is preserved on the master. Returns a dictionary.
id_  The name of the minion for which to generate a key pair.
keysize  The size of the key pair to generate. The size must be 2048, which is the default, or greater. If set to a value less than 2048, the key size will be rounded up to 2048.
force  If a public key has already been accepted for the given minion on the master, then the gen_accept function will return an empty dictionary and not create a new key. This is the default behavior. If force is set to True, then the minion’s previously accepted key will be overwritten.

>>> wheel.cmd('key.gen_accept', ['foo'])
{'pub': '-----BEGIN PUBLIC KEY-----
MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBC
...
BBPfamX9gGPQTpN9e8HwczXQnmg80rcUl10WWhw095Dw10jnW+ueTWugEopPt\nqi道德AB7n
-----END PUBLIC KEY-----',
'priv': '-----BEGIN RSA PRIVATE KEY-----
MIIEpAIBAAKCAQEA42Kf+w9XeZWgguv
...
We can now see that the foo minion’s key has been accepted by the master:

```python
>>> wheel.cmd('key.list', ['accepted'])
{'minions': ['foo', 'minion1', 'minion2', 'minion3']}
```

salt.wheel.key.gen_keys(keydir=None, keyname=None, keysize=None, user=None)
Generate minion RSA public keypair

salt.wheel.key.gen_signature(priv, pub, signature_path, auto_create=False, keysize=None)
Generate master public-key-signature

salt.wheel.key.key_str(match)
Return information about the key. Returns a dictionary.

```python
>>> wheel.cmd('key.key_str', ['minion1'])
{'minions': {'minion1': '-----BEGIN PUBLIC KEY-----
MIIBIjANBgkqhkiG9w0BAQEAQAMBQg...fYaB
-----END PUBLIC KEY-----'}}
```

salt.wheel.key.list_(match)
List all the keys under a named status. Returns a dictionary.
`match` The type of keys to list. The `pre`, `un`, and `unaccepted` options will list unaccepted/unsigned keys. `acc` or `accepted` will list accepted/signed keys. `rej` or `rejected` will list rejected keys. Finally, `all` will list all keys.

```python
>>> wheel.cmd('key.list', ['accepted'])
{'minions': ['minion1', 'minion2', 'minion3']}
```

salt.wheel.key.list_all()
List all the keys. Returns a dictionary containing lists of the minions in each salt-key category, including `minions`, `minions_rejected`, `minions_denied`, etc. Returns a dictionary.

```python
>>> wheel.cmd('key.list_all')
{'local': ['master.pem', 'master.pub'], 'minions_rejected': [], 'minions_denied': [], 'minions': ['minion1', 'minion2', 'minion3']}
```

salt.wheel.key.name_match(match)
List all the keys based on a glob match

salt.wheel.key.reject(match, include_accepted=False, include_denied=False)
Reject keys based on a glob match. Returns a dictionary.
`match` The glob match of keys to reject.

```python
>>> wheel.cmd_async({'fun': 'key.reject', 'match': 'minion1'})
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

salt.wheel.key.reject_dict(match, include_accepted=False, include_denied=False)
Reject keys based on a dict of keys. Returns a dictionary.
match  The dictionary of keys to reject.
include_accepted To include accepted keys in the match along with pending keys, set this to True. Defaults to False.

New in version 2016.3.4.
include_denied To include denied keys in the match along with pending keys, set this to True. Defaults to False.

New in version 2016.3.4.

```python
>>> wheel.cmd_async({'fun': 'key.reject_dict',
                  'match': {
                    'minions': [
                      'jerry',
                      'stuart',
                      'bob',
                    ],
                  }}
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

21.23.5 **salt.wheel.minions**

Wheel system wrapper for connected minions

```python
salt.wheel.minions.connected()
```

List all connected minions on a salt-master

21.23.6 **salt.wheel.pillar_roots**

The *pillar_roots* wheel module is used to manage files under the pillar roots directories on the master server.

```python
salt.wheel.pillar_roots.find(path, saltenv='base')
```

Return a dict of the files located with the given path and environment

```python
salt.wheel.pillar_roots.list_env(saltenv='base')
```

Return all of the file paths found in an environment

```python
salt.wheel.pillar_roots.list_roots()
```

Return all of the files names in all available environments

```python
salt.wheel.pillar_roots.read(path, saltenv='base')
```

Read the contents of a text file, if the file is binary then

```python
salt.wheel.pillar_roots.write(data, path, saltenv='base', index=0)
```

Write the named file, by default the first file found is written, but the index of the file can be specified to write to a lower priority file root
APIS

22.1 Python client API

Salt provides several entry points for interfacing with Python applications. These entry points are often referred to as *Client() APIs. Each client accesses different parts of Salt, either from the master or from a minion. Each client is detailed below.

See also:

There are many ways to access Salt programmatically.

Salt can be used from CLI scripts as well as via a REST interface.

See Salt’s outputter system to retrieve structured data from Salt as JSON, or as shell-friendly text, or many other formats.

See the state.event runner to utilize Salt’s event bus from shell scripts.

Salt’s netapi module provides access to Salt externally via a REST interface. Review the netapi module documentation for more information.

22.1.1 Salt’s opts dictionary

Some clients require access to Salt’s opts dictionary. (The dictionary representation of the master or minion config files.)

A common pattern for fetching the opts dictionary is to defer to environment variables if they exist or otherwise fetch the config from the default location.

salt.config.client_config(path, env_var='SALT_CLIENT_CONFIG', defaults=None)

Load Master configuration data

Usage:

```python
import salt.config
master_opts = salt.config.client_config('/etc/salt/master')
```

Returns a dictionary of the Salt Master configuration file with necessary options needed to communicate with a locally-running Salt Master daemon. This function searches for client specific configurations and adds them to the data from the master configuration.

This is useful for master-side operations like LocalClient.
import salt.config
minion_opts = salt.config.minion_config('/etc/salt/minion')

22.1.2 Salt’s Loader Interface

Modules in the Salt ecosystem are loaded into memory using a custom loader system. This allows modules to have conditional requirements (OS, OS version, installed libraries, etc) and allows Salt to inject special variables (_salt__, __opts__, etc).

Most modules can be manually loaded. This is often useful in third-party Python apps or when writing tests. However some modules require and expect a full, running Salt system underneath. Notably modules that facilitate master-to-minion communication such as the mine, publish, and peer execution modules. The error KeyError: 'master_uri' is a likely indicator for this situation. In those instances use the Caller class to execute those modules instead.

Each module type has a corresponding loader function.

```python
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
__grains__ = salt.loader.grains(__opts__)
__opts__['grains'] = __grains__
__utils__ = salt.loader.utils(__opts__)
__salt__ = salt.loader.minion_mods(__opts__, __utils__)

__salt__['test.ping']()
```

salt.loader.raw_mod(opts, name, functions, mod='modules')

Returns a single module loaded raw and bypassing the __virtual__ function
```python
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('./etc/salt/minion')
testmod = salt.loader.raw_mod(__opts__, 'test', None)
testmod['test.ping']()
```

salt.loader.states

```
Returns the state modules
Parameters
- **opts** *(dict)* – The Salt options dictionary
- **functions** *(dict)* – A dictionary of minion modules, with module names as keys and funcs as values.
```

```python
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('./etc/salt/minion')
statemods = salt.loader.states(__opts__, None, None)
```

salt.loader.grains

```
Return the functions for the dynamic grains and the values for the static grains.
Since grains are computed early in the startup process, grains functions do not have __salt__ or __proxy__ available. At proxy-minion startup, this function is called with the proxymodule LazyLoader object so grains functions can communicate with their controlled device.
```

```python
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('./etc/salt/minion')
__grains__ = salt.loader.grains(__opts__)
print __grains__['id']
```

salt.loader.grain_funcs

```
Returns the grain functions
```

```python
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('./etc/salt/minion')
grainfuncs = salt.loader.grain_funcs(__opts__)
```

### 22.1.3 Salt’s Client Interfaces

**LocalClient**

class salt.client.LocalClient(c_path='./etc/salt/master', mopts=None, skip_perm_errors=False, io_loop=None, keep_loop=False, auto_reconnect=False)

The interface used by the salt CLI tool on the Salt Master

LocalClient is used to send a command to Salt minions to execute execution modules and return the results to the Salt Master.

Importing and using LocalClient must be done on the same machine as the Salt Master and it must be done using the same user that the Salt Master is running as. (Unless external_auth is configured and

22.1. Python client API 3845
authentication credentials are included in the execution).

Note: The LocalClient uses a Tornado IOLoop, this can create issues when using the LocalClient inside an existing IOLoop. If creating the LocalClient in partnership with another IOLoop either create the IOLoop before creating the LocalClient, or when creating the IOLoop use ioloop.current() which will return the ioloop created by LocalClient.

```python
import salt.client

local = salt.client.LocalClient()
local.cmd('*', 'test.fib', [10])

```

**cmd**

Synchronously execute a command on targeted minions

The cmd method will execute and wait for the timeout period for all minions to reply, then it will return all minion data at once.

```python
>>> import salt.client
>>> local = salt.client.LocalClient()
>>> local.cmd('*', 'cmd.run', ['whoami'])
{'jerry': 'root'}

```

With extra keyword arguments for the command function to be run:

```python
local.cmd('*', 'test.arg', ['arg1', 'arg2'], kwarg={'foo': 'bar'})

```

Compound commands can be used for multiple executions in a single publish. Function names and function arguments are provided in separate lists but the index values must correlate and an empty list must be used if no arguments are required.

```python
>>> local.cmd('*', [  
    'grains.items',  
    'sys.doc',  
    'cmd.run',  
    [  
      [],  
      [],  
      ['uptime'],  
    ])

```

**Parameters**

- **tgt** *(string or list)* - Which minions to target for the execution. Default is shell glob. Modified by the tgt_type option.
- **fun** *(string or list of strings)* - The module and function to call on the specified minions of the form module.function. For example test.ping or grains.items.

**Compound commands** Multiple functions may be called in a single publish by passing a list of commands. This can dramatically lower overhead and speed up the application communicating with Salt.

This requires that the **arg** param is a list of lists. The **fun** list and the **arg** list must correlate by index meaning a function that does not take
arguments must still have a corresponding empty list at the expected index.

- **arg**: A list of arguments to pass to the remote function. If the function takes no arguments, arg may be omitted except when executing a compound command.

- **timeout**: Seconds to wait after the last minion returns but before all minions return.

- **tgt_type**: The type of tgt. Allowed values:
  - `glob` - Bash glob completion - Default
  - `pcre` - Perl style regular expression
  - `list` - Python list of hosts
  - `grain` - Match based on a grain comparison
  - `pillar` - Pillar data comparison
  - `pillar_pcre` - Pillar data comparison with a regex
  - `nodegroup` - Match on nodegroup
  - `range` - Use a Range server for matching
  - `compound` - Pass a compound match string
  - `ipcidr` - Match based on Subnet (CIDR notation) or IPv4 address.

  Changed in version 2017.7.0: Renamed from `expr_form` to `tgt_type`

- **ret**: The returner to use. The value passed can be single returner, or a comma delimited list of returners to call in order on the minions.

- **kwarg**: A dictionary with keyword arguments for the function.

- **full_return**: Output the job return only (default) or the full return including exit code and other job metadata.

- **kwargs**: Optional keyword arguments. Authentication credentials may be passed when using `external_auth`.

For example:
```python
local.cmd('*', 'test.ping', username='saltdev', password='saltdev', eauth='pam').
```

Or:
```python
local.cmd('*', 'test.ping', token='5871821ea51754fdcea8153c1c745433')
```

Returns A dictionary with the result of the execution, keyed by minion ID. A compound command will return a sub-dictionary keyed by function name.

### cmd_async(tgt, fun, arg=(), tgt_type='glob', ret='-', jid='-', kwarg=None, **kwargs)

Asynchronously send a command to connected minions

The function signature is the same as `cmd()` with the following exceptions.

Returns A job ID or 0 on failure.

```python
>>> local.cmd_async('*','test.sleep',[300])
'20131219215921857715'
```

### cmd_batch(tgt, fun, arg=(), tgt_type='glob', ret='-', jid='-', kwarg=None, batch='10%', **kwargs)

Iteratively execute a command on subsets of minions at a time

The function signature is the same as `cmd()` with the following exceptions.

Parameters

- **batch**: The batch identifier of systems to execute on

Returns A generator of minion returns

```python
>>> returns = local.cmd_batch('*','state.highstate',batch='10%')
```

```python
>>> for ret in returns:
...     print(ret)
{'jerry': {...}}
{'dave': {...}}
{'stewart': {...}}
```
**cmd_iter** *(tgt, fun, arg=(), timeout=None, tgt_type='glob', ret='', kwarg=None, **kwargs)*

Yields the individual minion returns as they come in

The function signature is the same as **cmd()** with the following exceptions.

Normally **cmd_iter()** does not yield results for minions that are not connected. If you want it to return results for disconnected minions set **expect_minions=True** in **kwargs**.

**Returns**  
A generator yielding the individual minion returns

```python
>>> ret = local.cmd_iter('*', 'test.ping')
```

```python
>>> for i in ret:
...     print(i)
{'jerry': {'ret': True}}
{'dave': {'ret': True}}
{'stewart': {'ret': True}}
```

**cmd_iter_no_block** *(tgt, fun, arg=(), timeout=None, tgt_type='glob', ret='', kwarg=None, show_jid=False, verbose=False, **kwargs)*

Yields the individual minion returns as they come in, or **None** when no returns are available.

The function signature is the same as **cmd()** with the following exceptions.

**Returns**  
A generator yielding the individual minion returns, or **None** when no returns are available. This allows for actions to be injected in between minion returns.

```python
>>> ret = local.cmd_iter_no_block('*', 'test.ping')
```

```python
>>> for i in ret:
...     print(i)
None
{'jerry': {'ret': True}}
{'dave': {'ret': True}}
None
{'stewart': {'ret': True}}
```

**cmd_subset** *(tgt, fun, arg=(), tgt_type='glob', ret='', kwarg=None, sub=3, cli=False, progress=False, full_return=False, **kwargs)*

Execute a command on a random subset of the targeted systems

The function signature is the same as **cmd()** with the following exceptions.

**Parameters**
- **sub** – The number of systems to execute on
- **cli** – When this is set to True, a generator is returned, otherwise a dictionary of the minion returns is returned

```python
>>> SLC.cmd_subset('*', 'test.ping', sub=1)
{'jerry': True}
```

**get_cli_returns** *(jid, minions, timeout=None, tgt='*', tgt_type='glob', verbose=False, show_jid=False, **kwargs)*

Starts a watcher looking at the return data for a specified JID

**Returns**  
All of the information for the JID

**get_event_iter_returns** *(jid, minions, timeout=None)*

Gather the return data from the event system, break hard when timeout is reached.

**run_job** *(tgt, fun, arg=(), tgt_type='glob', ret='', timeout=None, jid='', kwarg=None, listen=False, **kwargs)*

Asynchronously send a command to connected minions

Prep the job directory and publish a command to any targeted minions.
Returns A dictionary of (validated) pub_data or an empty dictionary on failure. The pub_data contains the job ID and a list of all minions that are expected to return data.

```python
>>> local.run_job('*', 'test.sleep', [300])
{'jid': '20131219215650131543', 'minions': ['jerry']}
```

Salt Caller

class salt.client.Caller(c_path='/etc/salt/minion', mopts=None)
Caller is the same interface used by the salt-call command-line tool on the Salt Minion.

Changed in version 2015.8.0: Added the cmd method for consistency with the other Salt clients. The existing function and sminion.functions interfaces still exist but have been removed from the docs.

Importing and using Caller must be done on the same machine as a Salt Minion and it must be done using the same user that the Salt Minion is running as.

Usage:

```python
import salt.client
caller = salt.client.Caller()
caller.cmd('test.ping')
```

Note, a running master or minion daemon is not required to use this class. Running salt-call --local simply sets file_client to 'local'. The same can be achieved at the Python level by including that setting in a minion config file.

New in version 2014.7.0: Pass the minion config as the mopts dictionary.

```python
import salt.client
import salt.config
__opts__ = salt.config.minion_config('/etc/salt/minion')
__opts__['file_client'] = 'local'
caller = salt.client.Caller(mopts=__opts__)
```

cmd(fun, *args, **kwargs)
Call an execution module with the given arguments and keyword arguments.

Changed in version 2015.8.0: Added the cmd method for consistency with the other Salt clients. The existing function and sminion.functions interfaces still exist but have been removed from the docs.

```python
caller.cmd('test.arg', 'Foo', 'Bar', baz='Baz')
caller.cmd('event.send', 'myco/myevent/something',
          data={'foo': 'Foo'}, with_env=['GIT_COMMIT'], with_grains=True)
```

Salt Proxy Caller

class salt.client.ProxyCaller(c_path='/etc/salt/proxy', mopts=None)
ProxyCaller is the same interface used by the salt-call with the args --proxyid <proxyid> command-line tool on the Salt Proxy Minion.

Importing and using ProxyCaller must be done on the same machine as a Salt Minion and it must be done using the same user that the Salt Minion is running as.
Usage:

```python
import salt.client

caller = salt.client.Caller()

caller.cmd('test.ping')
```

Note, a running master or minion daemon is not required to use this class. Running `salt-call --local` simply sets `file_client` to `'local'`. The same can be achieved at the Python level by including that setting in a minion config file.

```python
import salt.client
import salt.config
__opts__ = salt.config.proxy_config('/etc/salt/proxy', minion_id='quirky_edison')
__opts__['file_client'] = 'local'
caller = salt.client.ProxyCaller(mopts=__opts__)
```

Note: To use this for calling proxies, the `is_proxy` functions requires that `--proxyid` be an argument on the commandline for the script this is used in, or that the string `proxy` is in the name of the script.

- **cmd**(fun, *args, **kwargs)
  Call an execution module with the given arguments and keyword arguments

```python
 caller.cmd('test.arg', 'Foo', 'Bar', baz='Baz')
 caller.cmd('event.send', 'myco/myevent/something',
             data={'foo': 'Foo'}, with_env=['GIT_COMMIT'], with_grains=True)
```

**RunnerClient**

```python
class salt.runner.RunnerClient(opts, context=None)
```

The interface used by the `salt-run` CLI tool on the Salt Master

- It executes runner modules which run on the Salt Master.
- Importing and using RunnerClient must be done on the same machine as the Salt Master and it must be done using the same user that the Salt Master is running as.
  - Salt’s `external_auth` can be used to authenticate calls. The eauth user must be authorized to execute runner modules: (@runner). Only the `master_call()` below supports eauth.

- **asynchronous**(fun, low, user='UNKNOWN', pub=None)
  Execute the function in a multiprocess and return the event tag to use to watch for the return

- **cmd**(fun, arg=None, pub_data=None, kwarg=None, print_event=True, full_return=False)
  Execute a function

- **cmd_async**(low)
  Execute a runner function asynchronously; eauth is respected

  This function requires that `external_auth` is configured and the user is authorized to execute runner functions: (@runner).

```python
runner.eauth_async({
    'fun': 'jobs.list_jobs',
    'username': 'saltdev',
    'password': 'saltdev',
})
```

(continues on next page)
cmd_sync(low, timeout=None, full_return=False)
Execute a runner function synchronously; eauth is respected
This function requires that `external_auth` is configured and the user is authorized to execute runner functions: (@runner).

runner.eauth_sync({
    'fun': 'jobs.list_jobs',
    'username': 'saltdev',
    'password': 'saltdev',
    'eauth': 'pam',
})

WheelClient

class salt.wheel.WheelClient(opts=None)
An interface to Salt’s wheel modules
Wheel modules interact with various parts of the Salt Master.
Importing and using WheelClient must be done on the same machine as the Salt Master and it must be
done using the same user that the Salt Master is running as. Unless `external_auth` is configured and the
user is authorized to execute wheel functions: (@wheel).
Usage:

```python
import salt.config
import salt.wheel
opts = salt.config.master_config('/etc/salt/master')
wheel = salt.wheel.WheelClient(opts)

asynchronous(fun, low, user='UNKNOWN', pub=None)
Execute the function in a multiprocess and return the event tag to use to watch for the return

```python
>>> wheel.asynchronous('key.finger', ['jerry'])
```  

```python
cmd(low)
Execute a function asynchronously; eauth is respected
This function requires that `external_auth` is configured and the user is authorized

```python
>>> wheel.cmd('key.finger', ['jerry'])
```
cmd_sync\((low, timeout=None, full_return=False)\)
Execute a wheel function synchronously; eauth is respected

This function requires that **external_auth** is configured and the user is authorized to execute runner functions: (@wheel).

```python
>>> wheel.cmd_sync({
    'fun': 'key.finger',
    'match': 'jerry',
    'eauth': 'auto',
    'username': 'saltdev',
    'password': 'saltdev',
})
```

CloudClient

class salt.cloud.CloudClient\(path=None, opts=None, config_dir=None, pillars=None\)
The client class to wrap cloud interactions

action\(fun=None, cloudmap=None, names=None, provider=None, instance=None, kwargs=None\)
Execute a single action via the cloud plugin backend

Examples:

```python
client.action(fun='show_instance', names=['myinstance'])
client.action(fun='show_image', provider='my-ec2-config',
    kwargs={'image': 'ami-10314d79'})
```

create\(provider, names, **kwargs\)
Create the named VMs, without using a profile

Example:

```python
client.create(provider='my-ec2-config', names=['myinstance'],
    image='ami-1624987f', size='t1.micro', ssh_username='ec2-user',
    securitygroup='default', delvol_on_destroy=True)
```

destroy\(names\)
Destroy the named VMs

extra_action\(names, provider, action, **kwargs\)
Perform actions with block storage devices

Example:

```python
client.extra_action(names=['myblock'], action='volume_create',
    provider='my-nova', kwargs={'voltype': 'SSD', 'size': 1000})
client.extra_action(names=['salt-net'], action='network_create',
    provider='my-nova', kwargs={'cidr': '192.168.100.0/24'})
```

full_query\(query_type='list_nodes_full'\)
Query all instance information

list_images\(provider=None\)
List all available images in configured cloud systems
**list_locations** *(provider=None)*  
List all available locations in configured cloud systems

**list_sizes** *(provider=None)*  
List all available sizes in configured cloud systems

**low** *(fun, low)*  
Pass the cloud function and low data structure to run

**map_run** *(path=None, **kwargs)*  
To execute a map

**min_query** *(query_type='list_nodes_min')*  
Query select instance information

**profile** *(profile, names, vm_overrides=None, **kwargs)*  
Pass in a profile to create, names is a list of vm names to allocate
vm_overrides is a special dict that will be per node options overrides
Example:

```Python
>>> client = salt.cloud.CloudClient(path='/etc/salt/cloud')
>>> client.profile('do_512_git', names=['minion01',])
{'minion01': {'backups_active': 'False',
    'created_at': '2014-09-04T18:10:15Z',
    'droplet': {'event_id': 31000502,
        'id': 2530006,
        'image_id': 5140006,
        'name': 'minion01',
        'size_id': 66},
    'id': '2530006',
    'image_id': '5140006',
    'ip_address': '107.XXX.XXX.XXX',
    'locked': 'True',
    'name': 'minion01',
    'private_ip_address': None,
    'region_id': '4',
    'size_id': '66',
    'status': 'new'}}
```

**query** *(query_type='list_nodes')*  
Query basic instance information

**select_query** *(query_type='list_nodes_select')*  
Query select instance information

### SSHClient

**class** *salt.client.ssh.client.SSHClient(c_path='/etc/salt/master', mopts=None, disable_custom_roster=False)*

Create a client object for executing routines via the salt-ssh backend

New in version 2015.5.0.

**cmd** *(tgt, fun, arg=(), timeout=None, tgt_type='glob', kwarg=None, **kwargs)*  
Execute a single command via the salt-ssh subsystem and return all routines at once

New in version 2015.5.0.

**cmd_iter** *(tgt, fun, arg=(), timeout=None, tgt_type='glob', ret='', kwarg=None, **kwargs)*  
Execute a single command via the salt-ssh subsystem and return a generator
New in version 2015.5.0.

## 22.2 netapi modules

### 22.2.1 Introduction to netapi modules

netapi modules provide API-centric access to Salt. Usually externally-facing services such as REST or WebSockets, XMPP, XMLRPC, etc.

In general netapi modules bind to a port and start a service. They are purposefully open-ended. A single module can be configured to run as well as multiple modules simultaneously.

netapi modules are enabled by adding configuration to your Salt Master config file and then starting the `salt-api` daemon. Check the docs for each module to see external requirements and configuration settings.

Communication with Salt and Salt satellite projects is done using Salt’s own *Python API*. A list of available client interfaces is below.

### salt-api

Prior to Salt’s 2014.7.0 release, netapi modules lived in the separate sister projected `salt-api`. That project has been merged into the main Salt project.

See also:

*The full list of netapi modules*

### 22.2.2 Client interfaces

Salt’s client interfaces expose executing functions by crafting a dictionary of values that are mapped to function arguments. This allows calling functions simply by creating a data structure. (And this is exactly how much of Salt’s own internals work!)

```python
class salt.netapi.NetapiClient(opts)

    Provide a uniform method of accessing the various client interfaces in Salt in the form of low-data data structures. For example:

    >>> client = NetapiClient(__opts__)
    >>> lowstate = {'client': 'local', 'tgt': '*', 'fun': 'test.ping', 'arg': ''}
    >>> client.run(lowstate)
```

- **local(**`*args,**kwargs)*
  - Run *execution modules* synchronously
  - See `salt.client.LocalClient.cmd()` for all available parameters.
  - Sends a command from the master to the targeted minions. This is the same interface that Salt’s own CLI uses. Note the `arg` and `kwarg` parameters are sent down to the minion(s) and the given function, `fun`, is called with those parameters.
  - Returns the result from the execution module

- **local_async(**`*args,**kwargs)*
  - Run *execution modules* asynchronously
  - Wraps `salt.client.LocalClient.run_job()`.
  - Returns job ID
**local_subset**(*args, **kwargs*)
Run execution modules against subsets of minions

New in version 2016.3.0.

Wraps `salt.client.LocalClient.cmd_subset()`

**runner**(*fun, timeout=None, full_return=False, **kwargs*)
Run runner modules <all-salt.runners> synchronously

Wraps `salt.runner.RunnerClient.cmd_sync()`.

Note that runner functions must be called using keyword arguments. Positional arguments are not supported.

**Returns** Returns the result from the runner module

**runner_async**(*fun, **kwargs*)
Run runner modules <all-salt.runners> asynchronously

Wraps `salt.runner.RunnerClient.cmd_async()`.

Note that runner functions must be called using keyword arguments. Positional arguments are not supported.

**Returns** event data and a job ID for the executed function

**ssh**(*args, **kwargs*)
Run salt-ssh commands synchronously

Wraps `salt.client.ssh.client.SSHClient.cmd_sync()`.

**Returns** Returns the result from the salt-ssh command

**wheel**(*fun, **kwargs*)
Run wheel modules synchronously

Wraps `salt.wheel.WheelClient.master_call()`.

Note that wheel functions must be called using keyword arguments. Positional arguments are not supported.

**Returns** Returns the result from the wheel module

**wheel_async**(*fun, **kwargs*)
Run wheel modules asynchronously

Wraps `salt.wheel.WheelClient.master_call()`.

Note that wheel functions must be called using keyword arguments. Positional arguments are not supported.

**Returns** Returns the result from the wheel module

**Writing netapi modules**

Netapi modules, put simply, bind a port and start a service. They are purposefully open-ended and can be used to present a variety of external interfaces to Salt, and even present multiple interfaces at once.

See also:

The full list of netapi modules

**Configuration**

All netapi configuration is done in the `Salt master config` and takes a form similar to the following:
rest_cherrypy:
  port: 8000
  debug: True
  ssl_crt: /etc/pki/tls/certs/localhost.crt
  ssl_key: /etc/pki/tls/certs/localhost.key

The __virtual__ function

Like all module types in Salt, netapi modules go through Salt’s loader interface to determine if they should be loaded into memory and then executed.

The __virtual__ function in the module makes this determination and should return False or a string that will serve as the name of the module. If the module raises an ImportError or any other errors, it will not be loaded.

The start function

The start() function will be called for each netapi module that is loaded. This function should contain the server loop that actually starts the service. This is started in a multiprocess.

Multiple instances

New in version 2016.11.0.

rest_cherrypy and rest_tornado support running multiple instances by copying and renaming entire directory of those. To start the copied multiple netapi modules, add configuration blocks for the copied netapi modules in the Salt Master config. The name of each added configuration block must match with the name of each directory of the copied netapi module.

Inline documentation

As with the rest of Salt, it is a best-practice to include liberal inline documentation in the form of a module docstring and docstrings on any classes, methods, and functions in your netapi module.

Loader “magic” methods

The loader makes the __opts__ data structure available to any function in a netapi module.
If you are used to configuration management tools that require you to plan down to the last detail before you install anything, you are probably wondering why this section doesn’t appear before the installation instructions. With Salt, you can switch to a high availability architecture at any time, and add additional components to scale your deployment as you go.

Since a single Salt master can manage thousands of systems, we usually recommend that you start by deploying a single Salt master, and then modifying your deployment as needed for redundancy, geographical distribution, and scale.

23.1 High Availability Features in Salt

Salt supports several features for high availability and fault tolerance. Brief documentation for these features is listed alongside their configuration parameters in Configuration file examples.

23.1.1 Multimaster

Salt minions can connect to multiple masters at one time by configuring the master configuration parameter as a YAML list of all the available masters. By default, all masters are "hot", meaning that any master can direct commands to the Salt infrastructure.

In a multimaster configuration, each master must have the same cryptographic keys, and minion keys must be accepted on all masters separately. The contents of file_roots and pillar_roots need to be kept in sync with processes external to Salt as well.

A tutorial on setting up multimaster with "hot" masters is here:

Multimaster Tutorial

23.1.2 Multimaster with Failover

Changing the master_type parameter from str to failover will cause minions to connect to the first responding master in the list of masters. Every master_alive_interval seconds the minions will check to make sure the current master is still responding. If the master does not respond, the minion will attempt to connect to the next master in the list. If the minion runs out of masters, the list will be recycled in case dead masters have been restored. Note that master_alive_interval must be present in the minion configuration, or else the recurring job to check master status will not get scheduled.

Failover can be combined with PKI-style encrypted keys, but PKI is NOT REQUIRED to use failover.

Multimaster with PKI and Failover is discussed in this tutorial
master_type: failover can be combined with master_shuffle: True to spread minion connections across all masters (one master per minion, not each minion connecting to all masters). Adding Salt Syndics into the mix makes it possible to create a load-balanced Salt infrastructure. If a master fails, minions will notice and select another master from the available list.

23.1.3 Syndic

Salt’s Syndic feature is a way to create differing infrastructure topologies. It is not strictly an HA feature, but can be treated as such.

With the syndic, a Salt infrastructure can be partitioned in such a way that certain masters control certain segments of the infrastructure, and "Master of Masters" nodes can control multiple segments underneath them.

Syndics are covered in depth in Salt Syndic.

23.1.4 Syndic with Multimaster

New in version 2015.5.0.

Syndic with Multimaster lets you connect a syndic to multiple masters to provide an additional layer of redundancy in a syndic configuration.

Syndics are covered in depth in Salt Syndic.

23.2 Salt Syndic

The most basic or typical Salt topology consists of a single Master node controlling a group of Minion nodes. An intermediate node type, called Syndic, when used offers greater structural flexibility and scalability in the construction of Salt topologies than topologies constructed only out of Master and Minion node types.

A Syndic node can be thought of as a special passthrough Minion node. A Syndic node consists of a salt-syndic daemon and a salt-master daemon running on the same system. The salt-master daemon running on the Syndic node controls a group of lower level Minion nodes and the salt-syndic daemon connects higher level Master node, sometimes called a Master of Masters.

The salt-syndic daemon relays publications and events between the Master node and the local salt-master daemon. This gives the Master node control over the Minion nodes attached to the salt-master daemon running on the Syndic node.

23.2.1 Configuring the Syndic

To setup a Salt Syndic you need to tell the Syndic node and its Master node about each other. If your Master node is located at 10.10.0.1, then your configurations would be:

On the Syndic node:

```
# /etc/salt/master
syndic_master: 10.10.0.1  # may be either an IP address or a hostname
```

```
# /etc/salt/minion

# id is shared by the salt-syndic daemon and a possible salt-minion daemon
```

(continues on next page)
On the Master node:

```bash
# /etc/salt/master
order_masters: True
```

The `syndic_master` option tells the Syndic node where to find the Master node in the same way that the `master` option tells a Minion node where to find a Master node.

The `id` option is used by the `salt-syndic` daemon to identify with the Master node and if unset will default to the hostname or IP address of the Syndic just as with a Minion.

The `order_masters` option configures the Master node to send extra information with its publications that is needed by Syndic nodes connected directly to it.

**Note:** Each Syndic must provide its own `file_roots` directory. Files will not be automatically transferred from the Master node.

### 23.2.2 Configuring the Syndic with Multimaster

New in version 2015.5.0.

Syndic with Multimaster lets you connect a syndic to multiple masters to provide an additional layer of redundancy in a syndic configuration.

Higher level masters should first be configured in a multimaster configuration. See [Multimaster Tutorial](#).

On the syndic, the `syndic_master` option is populated with a list of the higher level masters.

Since each syndic is connected to each master, jobs sent from any master are forwarded to minions that are connected to each syndic. If the `master_id` value is set in the master config on the higher level masters, job results are returned to the master that originated the request in a best effort fashion. Events/jobs without a `master_id` are returned to any available master.

### 23.2.3 Running the Syndic

The `salt-syndic` daemon is a separate process that needs to be started in addition to the `salt-master` daemon running on the Syndic node. Starting the `salt-syndic` daemon is the same as starting the other Salt daemons.

The Master node in many ways sees the Syndic as an ordinary Minion node. In particular, the Master will need to accept the Syndic’s Minion key as it would for any other Minion.

On the Syndic node:

```bash
# salt-syndic
or
# service salt-syndic start
```

On the Master node:

```bash
# salt-key -a my_syndic
```
The Master node will now be able to control the Minion nodes connected to the Syndic. Only the Syndic key will be listed in the Master node’s key registry but this also means that key activity between the Syndic’s Minions and the Syndic does not encumber the Master node. In this way, the Syndic’s key on the Master node can be thought of as a placeholder for the keys of all the Minion and Syndic nodes beneath it, giving the Master node a clear, high level structural view on the Salt cluster.

On the Master node:

```bash
# salt-key -L
Accepted Keys:
my_syndic

Denied Keys:

Unaccepted Keys:

Rejected Keys:

# salt '*' test.version

minion_1:
  2018.3.4

minion_2:
  2018.3.4

minion_4:
  2018.3.4

minion_3:
  2018.3.4
```

### 23.2.4 Topology

A Master node (a node which is itself not a Syndic to another higher level Master node) must run a `salt-master` daemon and optionally a `salt-minion` daemon.

A Syndic node must run `salt-syndic` and `salt-master` daemons and optionally a `salt-minion` daemon.

A Minion node must run a `salt-minion` daemon.

When a `salt-master` daemon issues a command, it will be received by the Syndic and Minion nodes directly connected to it. A Minion node will process the command in the way it ordinarily would. On a Syndic node, the `salt-syndic` daemon will relay the command to the `salt-master` daemon running on the Syndic node, which then propagates the command to the Minions and Syndics connected to it.

When events and job return data are generated by `salt-minion` daemons, they are aggregated by the `salt-master` daemon they are connected to, which `salt-master` daemon then relays the data back through its `salt-syndic` daemon until the data reaches the Master or Syndic node that issued the command.

### 23.2.5 Syndic wait

`syndic_wait` is a master configuration file setting that specifies the number of seconds the Salt client should wait for additional syndics to check in with their lists of expected minions before giving up. This value defaults to 5 seconds.

The `syndic_wait` setting is necessary because the higher-level master does not have a way of knowing which minions are below the syndics. The higher-level master has its own list of expected minions and the masters below them have their own lists as well, so the Salt client does not how long to wait for all returns. The `syndic_wait` option allows time for all minions to return to the Salt client.
Note: To reduce the amount of time the CLI waits for Minions to respond, install a Minion on the Syndic or tune the value of the `syndic_wait` configuration.

While it is possible to run a Syndic without a Minion installed on the same system, it is recommended, for a faster CLI response time, to do so. Without a Minion installed on the Syndic node, the timeout value of `syndic_wait` increases significantly - about three-fold. With a Minion installed on the Syndic, the CLI timeout resides at the value defined in `syndic_wait`.

Note: If you have a very large infrastructure or many layers of Syndics, you may find that the CLI doesn’t wait long enough for the Syndics to return their events. If you think this is the case, you can set the `syndic_wait` value in the Master configs on the Master or Syndic nodes from which commands are executed. The default value is 5, and should work for the majority of deployments.

In order for a Master or Syndic node to return information from Minions that are below their Syndics, the CLI requires a short wait time in order to allow the Syndics to gather responses from their Minions. This value is defined in the `syndic_wait` config option and has a default of five seconds.

### 23.2.6 Syndic config options

These are the options that can be used to configure a Syndic node. Note that other than `id`, Syndic config options are placed in the Master config on the Syndic node.

- **id**: Syndic id (shared by the `salt-syndic` daemon with a potential `salt-minion` daemon on the same system)
- **syndic_master**: Master node IP address or hostname
- **syndic_master_port**: Master node ret_port
- **syndic_log_file**: path to the logfile (absolute or not)
- **syndic_pidfile**: path to the pidfile (absolute or not)
- **syndic_wait**: time in seconds to wait on returns from this syndic

### 23.2.7 Minion Data Cache

Beginning with Salt 2016.11.0, the Pluggable Minion Data Cache was introduced. The minion data cache contains the Salt Mine data, minion grains, and minion pillar information cached on the Salt Master. By default, Salt uses the `localfs` cache module, but other external data stores can be used instead.

Using a pluggable minion cache modules allows for the data stored on a Salt Master about Salt Minions to be replicated on other Salt Masters the Minion is connected to. Please see the Minion Data Cache documentation for more information and configuration examples.

---

23.2. Salt Syndic 3861
New in version 2016.11.0.

The Minion data cache contains the Salt Mine data, minion grains and minion pillar information cached on the Salt Master. By default, Salt uses the `localfs` cache module to save the data in a `msgpack` file on the Salt Master.

### 24.1 Pluggable Data Cache

While the default Minion data cache is the `localfs` cache, other external data stores can also be used to store this data such as the `consul` module. To configure a Salt Master to use a different data store, the `cache` setting needs to be established:

```yaml
cache: consul
```

The pluggable data cache streamlines using various Salt topologies such as a Multi-Master or Salt Syndics configuration by allowing the data stored on the Salt Master about a Salt Minion to be available to other Salt Syndics or Salt Masters that a Salt Minion is connected to.

Additional minion data cache modules can be easily created by modeling the custom data store after one of the existing cache modules.

See `cache modules` for a current list.

### 24.2 Configuring the Minion Data Cache

The default `localfs` Minion data cache module doesn’t require any configuration. External data cache modules with external data stores such as Consul require a configuration setting in the master config.

Here’s an example config for Consul:

```yaml
consul.host: 127.0.0.1
consul.port: 8500
consul.token: None
consul.scheme: http
consul.consistency: default
consul.dc: dc1
consul.verify: True

cache: consul
```
New in version 2018.3.0.
Changed in version 3000.

Note: This functionality is under development and could be changed in the future releases

Many times it is useful to store the results of a command during the course of an execution. Salt Slots are designed to allow you to store this information and use it later during the highstate or other job execution.

Slots extend the state syntax and allows you to do things right before the state function is executed. So you can make a decision in the last moment right before a state is executed.

### 25.1 Execution functions

Note: Using execution modules return data as a state values is a first step of Slots development. Other functionality is under development.

Slots allow you to use the return from a remote-execution function as an argument value in states.

Slot syntax looks close to the simple python function call.

```
__slot__:salt:<module>.<function>(<args>, ..., <kwargs...>, ...)
```

For the 3000 release, this syntax has been updated to support parsing functions which return dictionaries and for appending text to the slot result.

```
__slot__:salt:<module>.<function>(<args>..., <kwargs...>, ...).dictionary ~ append
```

There are some specifics in the syntax coming from the execution functions nature and a desire to simplify the user experience. First one is that you don’t need to quote the strings passed to the slots functions. The second one is that all arguments handled as strings.

Here is a simple example:

```
copy-some-file:
  file.copy:
    - name: __slot__:salt:test.echo(text=/tmp/some_file)
    - source: __slot__:salt:test.echo(/etc/hosts)
```
This will execute the `test.echo` execution functions right before calling the state. The functions in the example will return `/tmp/some_file` and `/etc/hosts` strings that will be used as a target and source arguments in the state function `file.copy`.

Here is an example of result parsing and appending:

```
file-in-user-home:
  file.copy:
    - name: __slot__:salt:user.info(someuser).home ~ /subdirectory
    - source: salt://somefile
```
This section contains details on the Windows Package Manager, and specific information you need to use Salt on Windows.

26.1 Windows Software Repository

Note: In 2015.8.0 and later, the Windows Software Repository cache is compiled on the Salt Minion, which enables pillar, grains and other things to be available during compilation time. To support this new functionality, a next-generation (ng) package repository was created. See the Changes in Version 2015.8.0 for details.

The SaltStack Windows Software Repository provides a package manager and software repository similar to what is provided by yum and apt on Linux. This repository enables the installation of software using the installers on remote Windows systems.

In many senses, the operation is similar to that of the other package managers salt is aware of:

- the pkg.installed and similar states work on Windows.
- the pkg.install and similar module functions work on Windows.

High level differences to yum and apt are:

- The repository metadata (SLS files) is hosted through either salt or git.
- Packages can be downloaded from within the salt repository, a git repository or from HTTP(S) or FTP URLs.
- No dependencies are managed. Dependencies between packages needs to be managed manually.

Requirements:

- GitPython 0.3 or later, or pygit2 0.20.3 with libgit 0.20.0 or later installed on your Salt master. The Windows package definitions are downloaded and updated using Git.

26.1.1 Configuration

Populate the Repository

The SLS files used to install Windows packages are not distributed by default with Salt. Run the following command to initialize the repository on your Salt master:

```
salt-run winrepo.update_git_repos
```
Sync Repo to Windows Minions

Run `pkg.refresh_db` on each of your Windows minions to synchronize the package repository.

```
salt -G 'os:windows' pkg.refresh_db
```

**Note:** Use `pkg.refresh_db` from 2016.11 when developing new Windows package definitions to check for errors in the definitions against one or more Windows minions.

26.1.2 Install Windows Software

After completing the configuration steps, you are ready to manage software on your Windows minions.

**Show Installed Packages**

```
salt -G 'os:windows' pkg.list_pkgs
```

**Install a Package**

You can query the available version of a package using the Salt `pkg` module.

```
salt winminion pkg.list_available firefox
```

```
winminion:
  - 15.0.1
  - 16.0.2
  - 17.0.1
```

As you can see, there are three versions of Firefox available for installation. You can refer a software package by its name or its full_name surround by single quotes.

```
salt winminion pkg.install 'firefox'
```

The above line will install the latest version of Firefox.

```
salt winminion pkg.install 'firefox' version=16.0.2
```

The above line will install version 16.0.2 of Firefox.

If a different version of the package is already installed it will be replaced with the version in the winrepo (only if the package itself supports live updating).

You can also specify the full name:

```
salt winminion pkg.install 'Mozilla Firefox 17.0.1 (x86 en-US)'
```

26.1.3 Uninstall Windows Software

Uninstall software using the `pkg` module:
salt winminion pkg.remove firefox
salt winminion pkg.purge firefox

Note: pkg.purge just executes pkg.remove on Windows. At some point in the future pkg.purge may direct the installer to remove all configs and settings for software packages that support that option.

26.1.4 Repository Location

Salt maintains a repository of SLS files to install a large number of Windows packages:

- 2015.8.0 and later minions: https://github.com/saltstack/salt-winrepo-ng
- Earlier releases: https://github.com/saltstack/salt-winrepo

By default, these repositories are mirrored to /srv/salt/win/repo-ng and /srv/salt/win/repo.

This location can be changed in the master config file by setting the winrepo_dir_ng and winrepo_dir options.

26.1.5 Maintaining Windows Repo Definitions in Git Repositories

Windows software package definitions can be hosted in one or more Git repositories. The default repositories are hosted on GitHub by SaltStack. These include software definition files for various open source software projects. These software definition files are .sls files. There are two default repositories: salt-winrepo and salt-winrepo-ng. salt-winrepo contains software definition files for older minions (older than 2015.8.0). salt-winrepo-ng is for newer minions (2015.8.0 and newer).

Each software definition file contains all the information salt needs to install that software on a minion including the HTTP or FTP locations of the installer files, required command-line switches for silent install, etc. Anyone is welcome to send a pull request to this repo to add new package definitions. The repos can be browsed here: salt-winrepo salt-winrepo-ng

Note: The newer software definition files are run through the salt’s parser which allows for the use of jinja.

Configure which git repositories the master can search for package definitions by modifying or extending the winrepo_remotes and winrepo_remotes_ng options.

Important: winrepo_remotes was called win_gitrepos in Salt versions earlier than 2015.8.0

Package definitions are pulled down from the online git repository by running the winrepo.update_git_repos runner. This command is run on the master:

salt-run winrepo.update_git_repos

This will pull down the software definition files for older minions (salt-winrepo) and new minions (salt-winrepo-ng). They are stored in the file_roots under win/repo/salt-winrepo and win/repo-ng/salt-winrepo-ng respectively.

Important: If you have customized software definition files that aren’t maintained in a repository, those should be stored under win/repo for older minions and win/repo-ng for newer minions. The reason for this is that the
contents of `win/repo/salt-winrepo` and `win/repo-ng/salt-winrepo-ng` are wiped out every time you run `winrepo.update_git_repos`.

Additionally, when you run `winrepo.genrepo` and `pkg.refresh_db` the entire contents under `win/repo` and `win/repo-ng`, to include all subdirectories, are used to create the meta database file.

The next step (if you have older minions) is to create the meta database file for the repo (`winrepo.p`). This is done by running the `winrepo.genrepo` runner. This is also run on the master:

```shell
salt-run winrepo.genrepo
```

**Note:** If you have only 2015.8.0 and newer minions, you no longer need to run `salt-run winrepo.genrepo` on the master.

Finally, you need to refresh the minion database by running the `pkg.refresh_db` command. This is run on the master as well:

```shell
salt '*' pkg.refresh_db
```

On older minions (older than 2015.8.0) this will copy the winrepo.p file down to the minion. On newer minions (2015.8.0 and newer) this will copy all the software definition files (.sls) down to the minion and then create the meta database file (`winrepo.p`) locally. The reason this is done locally is because the jinja needs to be parsed using the minion’s grains.

**Important:** Every time you modify the software definition files on the master, either by running `salt-run winrepo.update_git_repos`, modifying existing files, or by creating your own, you need to refresh the database on your minions. For older minions, that means running `salt-run winrepo.genrepo` and then `salt '*' pkg.refresh_db`. For newer minions (2015.8.0 and newer) it is just `salt '*' pkg.refresh_db`.

**Note:** If the `winrepo.genrepo` or the `pkg.refresh_db` fails, it is likely a problem with the jinja in one of the software definition files. This will cause the operations to stop. You’ll need to fix the syntax in order for the meta database file to be created successfully.

To disable one of the repos, set it to an empty list `[]` in the master config. For example, to disable `winrepo_remotes` set the following in the master config file:

```yaml
winrepo_remotes: []
```

## 26.1.6 Creating a Package Definition SLS File

The package definition file is a YAML file that contains all the information needed to install a piece of software using salt. It defines information about the package to include version, full name, flags required for the installer and uninstaller, whether or not to use the Windows task scheduler to install the package, where to find the installation package, etc.

Take a look at this example for Firefox:
Each software definition file begins with a package name for the software. As in the example above `firefox`. The next line is indented two spaces and contains the version to be defined. As in the example above, a software definition file can define multiple versions for the same piece of software. The lines following the version are indented two more spaces and contain all the information needed to install that package.

**Warning:** The package name and the `full_name` must be unique to all other packages in the software repository.

The version line is the version for the package to be installed. It is used when you need to install a specific version of a piece of software.

**Warning:** The version must be enclosed in quotes, otherwise the YAML parser will remove trailing zeros.

**Note:** There are unique situations where previous versions are unavailable. Take Google Chrome for example. There is only one URL provided for a standalone installation of Google Chrome:

(https://dl.google.com/edgedl/chrome/install/GoogleChromeStandaloneEnterprise.msi)

When a new version is released, the URL just points to the new version. To handle situations such as these, set the version to `latest`. Salt will install the version of Chrome at the URL and report that version. Here’s an example:

```
chrome:
  latest:
    full_name: 'Google Chrome'
    installer: 'https://dl.google.com/edgedl/chrome/install/GoogleChromeStandaloneEnterprise.msi'
```
install_flags: '/qn /norestart'
uninstaller: 'https://dl.google.com/edgedl/chrome/install/
  GoogleChromeStandaloneEnterprise.msi'
uninstall_flags: '/qn /norestart'
msiexec: True
locale: en_US
reboot: False

Available parameters are as follows:

**param str full_name** The Full Name for the software as shown in "Programs and Features" in the control panel. You can also get this information by installing the package manually and then running `pkg.list_pkgs`. Here's an example of the output from `pkg.list_pkgs`:

```bash
salt 'test-2008' pkg.list_pkgs
test-2008
 -------
 7-Zip 9.20 (x64 edition):
  9.20.00.0
 Microsoft .NET Framework 4 Client Profile:
  4.0.30319,4.0.30319
 Microsoft .NET Framework 4 Extended:
  4.0.30319,4.0.30319
 Microsoft Visual C++ 2008 Redistributable - x64 9.0.21022:
  9.0.21022
 Mozilla Firefox 17.0.1 (x86 en-US):
  17.0.1
 Mozilla Maintenance Service:
  17.0.1
 NSClient++ (x64):
  0.3.8.76
 Notepad++:
  6.4.2
 Salt Minion 0.16.0:
  0.16.0
```

Notice the Full Name for Firefox: Mozilla Firefox 17.0.0 (x86 en-US). That's exactly what's in the full_name parameter in the software definition file.

If any of the software installed on the machine matches one of the software definition files in the repository, the full_name will be automatically renamed to the package name. The example below shows the `pkg.list_pkgs` for a machine that already has Mozilla Firefox 17.0.1 installed.

```bash
test-2008:
 -------
 7zip:
  9.20.00.0
 Microsoft .NET Framework 4 Client Profile:
  4.0.30319,4.0.30319
 Microsoft .NET Framework 4 Extended:
  4.0.30319,4.0.30319
 Microsoft Visual C++ 2008 Redistributable - x64 9.0.21022:
  9.0.21022
 Mozilla Maintenance Service:
  17.0.1
 Notepad++:
  6.4.2
```
Salt Minion 0.16.0:
  0.16.0
firefox:
  17.0.1
nsclient:
  0.3.9.328

Important: The version number and full_name need to match the output from pkg.
list_pkgs so that the status can be verified when running a highstate.

Note: It is still possible to successfully install packages using pkg.install, even if the
full_name or the version number don’t match. However, this can make troubleshooting is-

Tip: To force salt to display the full name when there’s already an existing package definition
file on the system, you can pass a bogus saltenv parameter to the command like so: pkg.
list_pkgs saltenv=NotARealEnv

param str installer The path to the .exe or .msi to use to install the package. This can be a path or a
URL. If it is a URL or a salt path (salt://), the package will be cached locally and then executed.
If it is a path to a file on disk or a file share, it will be executed directly.

Note: If storing software in the same location as the winrepo it is best practice to place each
installer in its own directory rather than the root of winrepo. Then you can place your package
definition file in the same directory. It is best practice to name the file init.sls. This will be
picked up by pkg.refresh_db and processed properly.

param str install_flags Any flags that need to be passed to the installer to make it perform a silent in-
stall. These can often be found by adding /? or /h when running the installer from the command-
line. A great resource for finding these silent install flags can be found on the WPKG project’s
wiki:

Warning: Salt will not return if the installer is waiting for user input so it is imperative that
the software package being installed has the ability to install silently.

param str uninstaller The path to the program used to uninstall this software. This can be the path to
the same exe or msi used to install the software. It can also be a GUID. You can find this value in
the registry under the following keys:
  • Software\Microsoft\Windows\CurrentVersion\Uninstall
  • Software\Wow6432None\Microsoft\Windows\CurrentVersion\Uninstall

param str uninstall_flags Any flags that need to be passed to the uninstaller to make it perform a silent
uninstall. These can often be found by adding /? or /h when running the uninstaller from the command-line. A great resource for finding these silent install flags can be found on the WPKG project’s wiki:
Warning: Salt will not return if the uninstaller is waiting for user input so it is imperative that the software package being uninstalled has the ability to uninstall silently.

Here are some examples of installer and uninstaller settings:

**7zip:**

9.20.00.0:
- installer: salt://win/repo/7zip/7z920-x64.msi
- full_name: 7-Zip 9.20 (x64 edition)
- reboot: False
- install_flags: '/qn /norestart'
- msiexec: True
- uninstaller: '{23170F69-40C1-2702-0920-000001000000}'
- uninstall_flags: '/qn /norestart'

Alternatively the uninstaller can also simply repeat the URL of an msi file:

**7zip:**

9.20.00.0:
- installer: salt://win/repo/7zip/7z920-x64.msi
- full_name: 7-Zip 9.20 (x64 edition)
- reboot: False
- install_flags: '/qn /norestart'
- msiexec: True
- uninstaller: salt://win/repo/7zip/7z920-x64.msi
- uninstall_flags: '/qn /norestart'

**param msiexec**  This tells salt to use msiexec /i to install the package and msiexec /x to uninstall. This is for .msi installations. Possible options are: True, False or the path to msiexec.exe on your system

**7zip:**

9.20.00.0:
- installer: salt://win/repo/7zip/7z920-x64.msi
- full_name: 7-Zip 9.20 (x64 edition)
- reboot: False
- install_flags: '/qn /norestart'
- msiexec: 'C:\Windows\System32\msiexec.exe'
- uninstaller: salt://win/repo/7zip/7z920-x64.msi
- uninstall_flags: '/qn /norestart'

**param bool allusers**  This parameter is specific to .msi installations. It tells msiexec to install the software for all users. The default is True.

**param bool cache_dir**  If True and the installer URL begins with salt://, the entire directory where the installer resides will be recursively cached. This is useful for installers that depend on other files in the same directory for installation.

Warning: Be aware that all files and directories in the same location as the installer file will be copied down to the minion. If you place your installer file in the root of winrepo (/srv/salt/win/repo-ng) and cache_dir: True the entire contents of winrepo will be cached to the minion. Therefore, it is best practice to place your installer files in a subdirectory if they are to be stored in winrepo.

**param str cache_file**  When the installer URL begins with salt://, this indicates a single file to copy
down for use with the installer. It is copied to the same location as the installer. Use this over `cache_dir` if there are many files in the directory and you only need a specific file and don’t want to cache additional files that may reside in the installer directory.

Here’s an example for a software package that has dependent files:

```plaintext
sqlexpress:
  '12.0.2000.8':
    installer: 'salt://win/repo/sqlexpress/setup.exe'
    full_name: Microsoft SQL Server 2014 Setup (English)
    reboot: False
    install_flags: '/ACTION=install /IACCEPTSQLSERVERLICENSETERMS /Q'
    cache_dir: True
```

**param bool use_scheduler** If `True`, Windows will use the task scheduler to run the installation. This is useful for running the Salt installation itself as the installation process kills any currently running instances of Salt.

**param str source_hash** This tells Salt to compare a hash sum of the installer to the provided hash sum before execution. The value can be formatted as `<hash_algorithm>=<hash_sum>`, or it can be a URI to a file containing the hash sum.

For a list of supported algorithms, see the `hashlib` documentation.

Here’s an example of `source_hash` usage:

```plaintext
messageanalyzer:
  '4.8.7551.0':
    full_name: 'Microsoft Message Analyzer'
    installer: 'salt://win/repo/messageanalyzer/MessageAnalyzer64.msi'
    install_flags: '/quiet /norestart'
    uninstaller: '{1CC02C23-8FCD-487E-860C-311EC0A0C933}'
    uninstall_flags: '/quiet /norestart'
    msiexec: True
    source_hash: 'sha1=62875ff451f13b10a8ff988f2943e76a4735d3d4'
```

**param bool reboot** Not implemented

**param str locale** Not implemented

Examples can be found at [https://github.com/saltstack/salt-winrepo-ng](https://github.com/saltstack/salt-winrepo-ng)

### 26.1.7 Managing Windows Software on a Standalone Windows Minion

The Windows Package Repository functions similar in a standalone environment, with a few differences in the configuration.

To replace the `winrepo` runner that is used on the Salt master, an `execution module` exists to provide the same functionality to standalone minions. The functions are named the same as the ones in the runner, and are used in the same way; the only difference is that `salt-call` is used instead of `salt-run`:

```bash
salt-call winrepo.update_git_repos
salt-call winrepo.genrepo
salt-call pkg.refresh_db
```

After executing the previous commands the repository on the standalone system is ready to use.
Custom Location for Repository SLS Files

If `file_roots` has not been modified in the minion configuration, then no additional configuration needs to be added to the minion configuration. The `winrepo.genrepo` function from the `winrepo` execution module will by default look for the filename specified by `winrepo_cachefile` within `C:\salt\srv\salt\win\repo`.

If the `file_roots` parameter has been modified, then `winrepo_dir` must be modified to fall within that path, at the proper relative path. For example, if the base environment in `file_roots` points to `D:\foo`, and `winrepo_source_dir` is `salt://win/repo`, then `winrepo_dir` must be set to `D:\foo\win\repo` to ensure that `winrepo.genrepo` puts the cachefile into right location.

### 26.1.8 Configuration options for Minions 2015.8.0 and later

On newer minions (2015.8.0 and later), the `winrepo_source_dir` config parameter (default: `salt://win/repo-ng`) controls where `pkg.refresh_db` looks for the software definition files that will be downloaded to the minion and used to generate the local database file (`winrepo.p`).

Software package definitions are automatically refreshed if stale after `winrepo_cache_expire_max`. Running a highstate normal forces the refresh of the package definition and generation of the meta database, unless the meta database is younger than `winrepo_cache_expire_max`. Refreshing the package definitions can take some time, these options were introduced to allow more control of when it occurs.

It’s important use `pkg.refresh_db` to check for errors and ensure the latest package definition is on any minion your testing new definitions on.

### 26.1.9 Configuration options for Minions before 2015.8.0

On older minions (before 2015.8.0), the `winrepo_source_dir` config parameter (default: `salt://win/repo`) controls where `pkg.refresh_db` looks for the cachefile (default: `winrepo.p`). This means that the default location for the winrepo cachefile would be `salt://win/repo/winrepo.p`. Both `:conf_minion: winrepo_source_dir` and `winrepo_cachefile` can be adjusted to match the actual location of this file on the Salt fileserver.

If connected to a master, the minion will by default look for the winrepo cachefile (the file generated by the `winrepo.genrepo runner`) at `salt://win/repo/winrepo.p`. If the cachefile is in a different path on the salt fileserver, then `win_repo_cachefile` will need to be updated to reflect the proper location.

### 26.1.10 Changes in Version 2015.8.0

Git repository management for the Windows Software Repository has changed in version 2015.8.0, and several master/minion config parameters have been renamed to make their naming more consistent with each other.

For a list of the winrepo config options, see here for master config options, and here for configuration options for masterless Windows minions.

On the master, the `winrepo.update_git_repos` runner has been updated to use either `pygit2` or `GitPython` to checkout the git repositories containing repo data. If `pygit2` or `GitPython` is installed, existing winrepo git checkouts should be removed after upgrading to 2015.8.0, to allow them to be checked out again by running `winrepo.update_git_repos`.

If neither `GitPython` nor `pygit2` are installed, then Salt will fall back to the pre-existing behavior for `winrepo.update_git_repos`, and a warning will be logged in the master log.
Note: Standalone Windows minions do not support the new `GitPython/pygit2` functionality, and will instead use the `git.latest` state to keep repositories up-to-date. More information on how to use the Windows Software Repo on a standalone minion can be found [here](#).

**Config Parameters Renamed**

Many of the legacy `winrepo` configuration parameters have changed in version 2015.8.0 to make the naming more consistent. The old parameter names will still work, but a warning will be logged indicating that the old name is deprecated.

Below are the parameters which have changed for version 2015.8.0:

**Master Config**

<table>
<thead>
<tr>
<th>Old Name</th>
<th>New Name</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>win_repo</code></td>
<td><code>winrepo_dir</code></td>
</tr>
<tr>
<td><code>win_repo_mastercachefile</code></td>
<td><code>winrepo_cachefile</code></td>
</tr>
<tr>
<td><code>win_gitrepos</code></td>
<td><code>winrepo_remotes</code></td>
</tr>
</tbody>
</table>

Note: `winrepo_cachefile` is no longer used by 2015.8.0 and later minions, and the `winrepo_dir` setting is replaced by `winrepo_dir_ng` for 2015.8.0 and later minions.

See [here](#) for detailed information on all master config options for the Windows Repo.

**Minion Config**

<table>
<thead>
<tr>
<th>Old Name</th>
<th>New Name</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>win_repo</code></td>
<td><code>winrepo_dir</code></td>
</tr>
<tr>
<td><code>win_repo_cachefile</code></td>
<td><code>winrepo_cachefile</code></td>
</tr>
<tr>
<td><code>win_gitrepos</code></td>
<td><code>winrepo_remotes</code></td>
</tr>
</tbody>
</table>

See [here](#) for detailed information on all minion config options for the Windows Repo.

**`pygit2/GitPython` Support for Maintaining Git Repos**

The `winrepo.update_git_repos` runner (and the corresponding `remote execution function` for standalone minions) now makes use of the same underlying code used by the `Git Fileserver Backend` and `Git External Pillar` to maintain and update its local clones of git repositories. If a compatible version of either `pygit2` (0.20.3 and later) or `GitPython` (0.3.0 or later) is installed, then Salt will use it instead of the old method (which invokes the `git.latest` state).

Note: If compatible versions of both `pygit2` and `GitPython` are installed, then Salt will prefer `pygit2`, to override this behavior use the `winrepo_provider` configuration parameter:
The `winrepo` execution module (discussed above in the Managing Windows Software on a Standalone Windows Minion section) does not yet officially support the new `pygit2/GitPython` functionality, but if either `pygit2` or `GitPython` is installed into Salt’s bundled Python then it should work. However, it should be considered experimental at this time.

To minimize potential issues, it is a good idea to remove any winrepo git repositories that were checked out by the old (pre-2015.8.0) winrepo code when upgrading the master to 2015.8.0 or later, and run `winrepo.update_git_repos` to clone them anew after the master is started.

Additional added features include the ability to access authenticated git repositories (NOTE: `pygit2` only), and to set per-remote config settings. An example of this would be the following:

```
winrepo_remotes:
 - https://github.com/saltstack/salt-winrepo.git
 - git@github.com:myuser/mymrepo.git:
   - pubkey: /path/to/key.pub
   - privkey: /path/to/key
   - passphrase: myaw3s0m3pa$$phr4$3
 - https://github.com/myuser/privaterepo.git:
   - user: mygithubuser
   - password: CorrectHorseBatteryStaple
```

Note: Per-remote configuration settings work in the same fashion as they do in gitfs, with global parameters being overridden by their per-remote counterparts (for instance, setting `winrepo_passphrase` would set a global passphrase for winrepo that would apply to all SSH-based remotes, unless overridden by a `passphrase` per-remote parameter).

See here for more a more in-depth explanation of how per-remote configuration works in gitfs, the same principles apply to winrepo.

There are a couple other changes in how Salt manages git repos using `pygit2/GitPython`. First of all, a `clean` argument has been added to the `winrepo.update_git_repos` runner, which (if set to `True`) will tell the runner to dispose of directories under the `winrepo_dir` which are not explicitly configured. This prevents the need to manually remove these directories when a repo is removed from the config file. To clean these old directories, just pass `clean=True`, like so:

```
salt-run winrepo.update_git_repos clean=True
```

However, if a mix of git and non-git Windows Repo definition files are being used, then this should not be used, as it will remove the directories containing non-git definitions.

The other major change is that collisions between repo names are now detected, and the `winrepo.update_git_repos` runner will not proceed if any are detected. Consider the following configuration:

```
winrepo_remotes:
 - https://foo.com/bar/baz.git
 - https://mydomain.tld/baz.git
 - https://github.com/foobar/baz
```

The `winrepo.update_git_repos` runner will refuse to update repos here, as all three of these repos would be checked out to the same directory. To work around this, a per-remote parameter called `name` can be used to resolve these conflicts:
26.1.11 Troubleshooting

Incorrect name/version

If the package seems to install properly, but Salt reports a failure then it is likely you have a version or full_name mismatch.

Check the exact full_name and version used by the package. Use `pkg.list_pkgs` to check that the names and version exactly match what is installed.

Changes to sls files not being picked up

Ensure you have (re)generated the repository cache file (for older minions) and then updated the repository cache on the relevant minions:

```
salt-run winrepo.genrepo
salt winminion pkg.refresh_db
```

Packages management under Windows 2003

On Windows server 2003, you need to install optional Windows component "wmi Windows installer provider" to have full list of installed packages. If you don’t have this, salt-minion can’t report some installed software.

How Success and Failure are Reported

The install state/module function of the Windows package manager works roughly as follows:

1. Execute `pkg.list_pkgs` and store the result
2. Check if any action needs to be taken. (i.e. compare required package and version against `pkg.list_pkgs` results)
3. If so, run the installer command.
4. Execute `pkg.list_pkgs` and compare to the result stored from before installation.
5. Success/Failure/Changes will be reported based on the differences between the original and final `pkg.list_pkgs` results.

If there are any problems in using the package manager it is likely due to the data in your sls files not matching the difference between the pre and post `pkg.list_pkgs` results.
26.2 Windows-specific Behaviour

Salt is capable of managing Windows systems, however due to various differences between the operating systems, there are some things you need to keep in mind.

This document will contain any quirks that apply across Salt or generally across multiple module functions. Any Windows-specific behavior for particular module functions will be documented in the module function documentation. Therefore this document should be read in conjunction with the module function documentation.

26.2.1 Group parameter for files

Salt was originally written for managing Unix-based systems, and therefore the file module functions were designed around that security model. Rather than trying to shoehorn that model on to Windows, Salt ignores these parameters and makes non-applicable module functions unavailable instead.

One of the commonly ignored parameters is the `group` parameter for managing files. Under Windows, while files do have a 'primary group' property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Because of this, any file module functions that typically require a group, do not under Windows. Attempts to directly use file module functions that operate on the group (e.g. `file.chgrp`) will return a pseudo-value and cause a log message to appear. No group parameters will be acted on.

If you do want to access and change the 'primary group' property and understand the implications, use the `file.get_pgid` or `file.get_pgroup` functions or the `pgroup` parameter on the `file.chown` module function.

26.2.2 Dealing with case-insensitive but case-preserving names

Windows is case-insensitive, but however preserves the case of names and it is this preserved form that is returned from system functions. This causes some issues with Salt because it assumes case-sensitive names. These issues generally occur in the state functions and can cause bizarre looking errors.

To avoid such issues, always pretend Windows is case-sensitive and use the right case for names, e.g. specify `user=Administrator` instead of `user=administrator`.

Follow issue #11801 for any changes to this behavior.

26.2.3 Dealing with various username forms

Salt does not understand the various forms that Windows usernames can come in, e.g. username, mydomain\username, username@mydomain.tld can all refer to the same user. In fact, Salt generally only considers the raw username value, i.e. the username without the domain or host information.

Using these alternative forms will likely confuse Salt and cause odd errors to happen. Use only the raw username value in the correct case to avoid problems.

Follow issue #11801 for any changes to this behavior.

26.2.4 Specifying the None group

Each Windows system has built-in _None_ group. This is the default 'primary group' for files for users not on a domain environment.
Unfortunately, the word _None_ has special meaning in Python - it is a special value indicating 'nothing', similar to null or nil in other languages.

To specify the None group, it must be specified in quotes, e.g. 
'/salt '*' file.chgrp C:\path\to\file "'None'"'.

### 26.2.5 Symbolic link loops

Under Windows, if any symbolic link loops are detected or if there are too many levels of symlinks (defaults to 64), an error is always raised.

For some functions, this behavior is different to the behavior on Unix platforms. In general, avoid symlink loops on either platform.
27.1 Overview

In its most typical use, Salt is a software application in which clients, called "minions" can be commanded and controlled from a central command server called a "master". Commands are normally issued to the minions (via the master) by calling a client script simply called, 'salt'. Salt features a pluggable transport system to issue commands from a master to minions. The default transport is ZeroMQ.

27.2 Salt Client

27.2.1 Overview

The salt client is run on the same machine as the Salt Master and communicates with the salt-master to issue commands and to receive the results and display them to the user.

The primary abstraction for the salt client is called 'LocalClient'.

When LocalClient wants to publish a command to minions, it connects to the master by issuing a request to the master's ReqServer (TCP: 4506)

The LocalClient system listens to responses for its requests by listening to the master event bus publisher (master_event_pub.ipc).

27.3 Salt Master

27.3.1 Overview

The salt-master daemon runs on the designated Salt master and performs functions such as authenticating minions, sending, and receiving requests from connected minions and sending and receiving requests and replies to the 'salt' CLI.

27.3.2 Moving Pieces

When a Salt master starts up, a number of processes are started, all of which are called 'salt-master' in a process-list but have various role categories.
Among those categories are:

- Publisher
- EventPublisher
- MWorker

### 27.3.3 Publisher

The Publisher process is responsible for sending commands over the designated transport to connected minions. The Publisher is bound to the following:

- TCP: port 4505
- IPC: publish_pull.ipc

Each salt minion establishes a connection to the master Publisher.

### 27.3.4 EventPublisher

The EventPublisher publishes master events out to any event listeners. It is bound to the following:

- IPC: master_event_pull.ipc
- IPC: master_event_pub.ipc

### 27.3.5 MWorker

Worker processes manage the back-end operations for the Salt Master.

The number of workers is equivalent to the number of 'worker_threads' specified in the master configuration and is always at least one.

Workers are bound to the following:

- IPC: workers.ipc

### 27.3.6 ReqServer

The Salt request server takes requests and distributes them to available MWorker processes for processing. It also receives replies back from minions.

The ReqServer is bound to the following:

- TCP: 4506
- IPC: workers.ipc

Each salt minion establishes a connection to the master ReqServer.

### 27.3.7 Job Flow

The Salt master works by always publishing commands to all connected minions and the minions decide if the command is meant for them by checking themselves against the command target.

The typical lifecycle of a salt job from the perspective of the master might be as follows:
1) A command is issued on the CLI. For example, 'salt my_minion test.version'.

2) The 'salt' command uses LocalClient to generate a request to the salt master by connecting to the ReqServer on TCP:4506 and issuing the job.

3) The salt-master ReqServer sees the request and passes it to an available MWorker over workers.ipc.

4) A worker picks up the request and handles it. First, it checks to ensure that the requested user has permissions to issue the command. Then, it sends the publish command to all connected minions. For the curious, this happens in ClearFuncs.publish().

5) The worker announces on the master event bus that it is about to publish a job to connected minions. This happens by placing the event on the master event bus (master_event_pull.ipc) where the EventPublisher picks it up and distributes it to all connected event listeners on master_event_pub.ipc.

6) The message to the minions is encrypted and sent to the Publisher via IPC on publish_pull.ipc.

7) Connected minions have a TCP session established with the Publisher on TCP port 4505 where they await commands. When the Publisher receives the job over publish_pull, it sends the jobs across the wire to the minions for processing.

8) After the minions receive the request, they decrypt it and perform any requested work, if they determine that they are targeted to do so.

9) When the minion is ready to respond, it publishes the result of its job back to the master by sending the encrypted result back to the master on TCP 4506 where it is again picked up by the ReqServer and forwarded to an available MWorker for processing. (Again, this happens by passing this message across workers.ipc to an available worker.)

10) When the MWorker receives the job it decrypts it and fires an event onto the master event bus (master_event_pull.ipc). (Again for the curious, this happens in AESFuncs._return().

11) The EventPublisher sees this event and re-publishes it on the bus to all connected listeners of the master event bus (on master_event_pub.ipc). This is where the LocalClient has been waiting, listening to the event bus for minion replies. It gathers the job and stores the result.

12) When all targeted minions have replied or the timeout has been exceeded, the salt client displays the results of the job to the user on the CLI.

### 27.4 Salt Minion

#### 27.4.1 Overview

The salt-minion is a single process that sits on machines to be managed by Salt. It can either operate as a stand-alone daemon which accepts commands locally via 'salt-call' or it can connect back to a master and receive commands remotely.

When starting up, salt minions connect back to a master defined in the minion config file. They connect to two ports on the master:

- **TCP: 4505** This is the connection to the master Publisher. It is on this port that the minion receives jobs from the master.

- **TCP: 4506** This is the connection to the master ReqServer. It is on this port that the minion sends job results back to the master.
27.4.2 Event System

Similar to the master, a salt-minion has its own event system that operates over IPC by default. The minion event system operates on a push/pull system with IPC files at minion_event_<unique_id>_pub.ipc and minion_event_<unique_id>_pull.ipc.

The astute reader might ask why have an event bus at all with a single-process daemon. The answer is that the salt-minion may fork other processes as required to do the work without blocking the main salt-minion process and this necessitates a mechanism by which those processes can communicate with each other. Secondarily, this provides a bus by which any user with sufficient permissions can read or write to the bus as a common interface with the salt minion.

27.4.3 Minion Job Flow

When a salt minion starts up, it attempts to connect to the Publisher and the ReqServer on the salt master. It then attempts to authenticate and once the minion has successfully authenticated, it simply listens for jobs.

Jobs normally come either from the `salt-call` script run by a local user on the salt minion or they can come directly from a master.

The job flow on a minion, coming from the master via a `salt` command is as follows:

1) A master publishes a job that is received by a minion as outlined by the master’s job flow above. 2) The minion is polling its receive socket that’s connected to the master Publisher (TCP 4505 on master). When it detects an incoming message, it picks it up from the socket and decrypts it. 3) A new minion process or thread is created and provided with the contents of the decrypted message. The _thread_return() method is provided with the contents of the received message. 4) The new minion thread is created. The _thread_return() function starts up and actually calls out to the requested function contained in the job. 5) The requested function runs and returns a result. [Still in thread.] 6) The result of the function’s run is encrypted and returned to the master’s ReqServer (TCP 4506 on master). [Still in thread.] 7) Thread exits. Because the main thread was only blocked for the time that it took to initialize the worker thread, many other requests could have been received and processed during this time.

27.5 A Note on ClearFuncs vs. AESFuncs

A common source of confusion is determining when messages are passed in the clear and when they are passed using encryption. There are two rules governing this behaviour:

1) ClearFuncs is used for intra-master communication and during the initial authentication handshake between a minion and master during the key exchange. 2) AESFuncs is used everywhere else.

27.6 Contributing

There is a great need for contributions to Salt and patches are welcome! The goal here is to make contributions clear, make sure there is a trail for where the code has come from, and most importantly, to give credit where credit is due!

There are a number of ways to contribute to Salt development, including (but not limited to):

• filing well-written bug reports
• enhancing the documentation
• providing workarounds, patches, and other code without tests
• engaging in constructive discussion
• helping out in #salt on Freenode, the Community Slack, the salt-users mailing list, a SaltStack meetup, or Server Fault.

• telling others about problems you solved with Salt

If this or other Salt documentation is unclear, please review Writing Salt Documentation. PRs are welcome!

## 27.6.1 Quickstart

If you just want to get started before reading the rest of this guide, you can get the process started by running the following:

```
python3 -m pip install --user pre-commit
git clone --origin upstream https://github.com/saltstack/salt.git
cd salt
pre-commit install
```

While those commands are running, finish reading the rest of this guide.

## 27.6.2 Pre-commit

To reduce friction during the development process, SaltStack uses pre-commit. This tool adds pre-commit hooks to git to automate several processes that used to be manual. Rather than having to remember to run several different tools before you commit, you only have to run git commit, and you will be notified about style and lint issues before you ever open a PR.

## 27.6.3 Salt Coding Style

After the 3000 release, SaltStack is joining the ranks of projects in adopting the Black code formatter in order to ease the adoption of a unified code formatting style.

Where Black is silent, SaltStack has its own coding style guide that informs contributors on various style points. Please review the Salt Coding Style documentation for information about Salt’s particular coding patterns.

Within the Salt Coding Style documentation, there is a section about running Salt’s .testing.pylintrc file. SaltStack recommends running the .testing.pylintrc file on any files you are changing with your code contribution before submitting a pull request to Salt’s repository.

If you’ve installed pre-commit, this will automatically happen before each commit. Otherwise, see the Linting documentation for more information.

## 27.6.4 Copyright Headers

Copyright headers are not needed for files in the Salt project. Files that have existing copyright headers should be considered legacy and not an example to follow.

## 27.6.5 Sending a GitHub pull request

Sending pull requests on GitHub is the preferred method for receiving contributions. The workflow advice below mirrors GitHub’s own guide and is well worth reading.

1. Fork saltstack/salt on GitHub.

2. Make a local clone of your fork. (Skip this step if you followed the Quickstart)
3. Add saltstack/salt as a git remote.

```bash
git remote add upstream https://github.com/saltstack/salt.git
```

If you followed the Quickstart, you'll add your own remote instead:

```bash
git remote add my-account git@github.com:my-account/salt.git
```

4. Create a new branch in your clone.

Note: A branch should have one purpose. For example, "Fix bug X," or "Add feature Y." Multiple unrelated fixes and/or features should be isolated into separate branches.

```bash
git fetch upstream
git checkout -b fix-broken-thing upstream/master
```

5. Edit and commit changes to your branch.

```bash
vim path/to/file1 path/to/file2 tests/test_file1.py tests/test_file2.py
git diff
git add path/to/file1 path/to/file2
git commit
```

Write a short, descriptive commit title and a longer commit message if necessary. Use an imperative style for the title.

GOOD

```
Fix broken things in file1 and file2

Fixes #31337

We needed to make this change because the underlying dependency changed. Now this uses the up-to-date API.
```

BAD

```
Fixes broken things

# Please enter the commit message for your changes. Lines starting
# with '#' will be ignored, and an empty message aborts the commit.
# On branch fix-broken-thing
# Changes to be committed:
#   modified:  path/to/file1
#   modified:  path/to/file2
```
Taking a few moments to explain why you made a change will save time and effort in the future when others come to investigate a change. A clear explanation of why something changed can help future developers avoid introducing bugs, or breaking an edge case.

**Note:** If your change fixes a bug or implements a feature already filed in the issue tracker, be sure to reference the issue number in the commit message body.

If you get stuck, there are many introductory Git resources on [http://help.github.com](http://help.github.com).

6. Push your locally-committed changes to your GitHub fork.

```bash
git push -u origin fix-broken-thing
```

or

```bash
git push -u origin add-cool-feature
```

**Note:** You may want to rebase before pushing to work out any potential conflicts:

```bash
git fetch upstream
git rebase upstream/master fix-broken-thing
git push -u origin fix-broken-thing
```

If you do rebase, and the push is rejected with a (non-fast-forward) comment, then run `git status`. You will likely see a message about the branches diverging:

```
On branch fix-broken-thing
Your branch and 'origin/fix-broken-thing' have diverged,
and have 1 and 2 different commits each, respectively.
  (use "git pull" to merge the remote branch into yours)
nothing to commit, working tree clean
```

Do **NOT** perform a `git pull` or `git merge` here. Instead, add `--force-with-lease` to the end of the `git push` command to get the changes pushed to your fork. Pulling or merging, while they will resolve the non-fast-forward issue, will likely add extra commits to the pull request which were not part of your changes.

7. Find the branch on your GitHub salt fork.

   https://github.com/my-account/salt/branches/fix-broken-thing

8. Open a new pull request.

   Click on **Pull Request** on the right near the top of the page,

   https://github.com/my-account/salt/pull/new/fix-broken-thing

   1. Choose **master** as the base Salt branch.
   2. Review that the proposed changes are what you expect.
   3. Write a descriptive comment. If you added good information to your git commit message, they will already be present here. Include links to related issues (e.g. 'Fixes #31337') in the comment field.
   4. Click **Create pull request**.

9. Salt project members will review your pull request and automated tests will run on it.

   If you recognize any test failures as being related to your proposed changes or if a reviewer asks for modifications:
1. Make the new changes in your local clone on the same local branch.
2. Push the branch to GitHub again using the same commands as before.
3. New and updated commits will be added to the pull request automatically.
4. Feel free to add a comment to the discussion.

Note: Jenkins
Pull request against saltstack/salt are automatically tested on a variety of operating systems and configurations. On average these tests take a couple of hours. Depending on your GitHub notification settings you may also receive an email message about the test results.
Test progress and results can be found at http://jenkins.saltstack.com/.

27.6.6 Salt’s Branch Topology
Salt will only have one active branch - master. This will include bug fixes, features and CVE “Common Vulnerabilities and Exposures”.

The release will be cut from the master when the time comes for a new release, which should be every 3 to 4 months.

To be able to merge code:
1. The code must have a well-written test. Note that you are only expected to write tests for what you did, not the whole modules or function.
2. All tests must pass.

The SaltStack employee that reviews your pull request might request changes or deny the pull request for various reasons.

Salt uses a typical branch strategy - master is the next expected release. Code should only make it to master once it’s production ready. This means that typical changes (fixes, features) should have accompanying tests.

Closing GitHub issues from commits
SaltStack encourages using the magic keywords to close a GitHub issue. These should appear in the commit message text directly.

27.6.7 Release Naming Convention
A new convention will start when Salt releases Salt 3000. Every new release name will increment by one ‘Salt last_release_number + 1’.

This naming convention is very different from past releases, which was 'YYYY.MM.PATCH'.

27.6.8 Handling CVE
If a CVE is discovered, Salt will create a new release that only contains the tests and patch for the CVE. This method should improve the upgrade process by reducing the chances of breaking something.
27.6.9 Backporting Pull Requests

On rare occasions, a serious bug will be found in the middle of a release cycle. These bugs will require a point release. Contributors should still submit fixes directly to master, but they should also call attention to the fact that it addresses a critical issue and will need to be back-ported.

27.6.10 Keeping Salt Forks in Sync

Salt advances quickly. It is therefore critical to pull upstream changes from upstream into your fork on a regular basis. Nothing is worse than putting hard work into a pull request only to see bunches of merge conflicts because it has diverged too far from upstream.

See also:

GitHub Fork a Repo Guide

The following assumes origin is the name of your fork and upstream is the name of the main saltstack/salt repository.

1. View existing remotes.

   ```bash
   git remote -v
   ```

2. Add the upstream remote.

   ```bash
   # For ssh github
   git remote add upstream git@github.com:saltstack/salt.git
   
   # For https github
   git remote add upstream https://github.com/saltstack/salt.git
   ```

3. Pull upstream changes into your clone.

   ```bash
   git fetch upstream
   ```

4. Update your copy of the master branch.

   ```bash
   git checkout master
   git merge --ff-only upstream/master
   ```

   If Git complains that a fast-forward merge is not possible, you have local commits.

   - Run `git pull --rebase origin master` to rebase your changes on top of the upstream changes.
   - Or, run `git branch <branch-name>` to create a new branch with your commits. You will then need to reset your master branch before updating it with the changes from upstream.

   If Git complains that local files will be overwritten, you have changes to files in your working directory. Run `git status` to see the files in question.

5. Update your fork.

   ```bash
   git push origin master
   ```

6. Repeat the previous two steps for any other branches you work with, such as the current release branch.
27.6.11 Posting patches to the mailing list

Patches will also be accepted by email. Format patches using `git format-patch` and send them to the `salt-users` mailing list. The contributor will then get credit for the patch, and the Salt community will have an archive of the patch and a place for discussion.

27.6.12 Issue and Pull Request Labeling System

SaltStack uses several labeling schemes to help facilitate code contributions and bug resolution. See the *Labels and Milestones* documentation for more information.

27.6.13 Mentionbot

SaltStack runs a mention-bot which notifies contributors who might be able to help review incoming pull-requests based on their past contribution to files which are being changed.

If you do not wish to receive these notifications, please add your GitHub handle to the blacklist line in the `.mention-bot` file located in the root of the Salt repository.

27.6.14 Bootstrap Script Changes

Salt’s Bootstrap Script, known as `bootstrap-salt.sh` in the Salt repo, has its own repository, contributing guidelines, and release cadence.

All changes to the Bootstrap Script should be made to `salt-bootstrap` repo. Any pull requests made to the `bootstrap-salt.sh` file in the Salt repository will be automatically overwritten upon the next stable release of the Bootstrap Script.

For more information on the release process or how to contribute to the Bootstrap Script, see the Bootstrap Script’s Contributing Guidelines.

27.7 Deprecating Code

Salt should remain backwards compatible, though sometimes, this backwards compatibility needs to be broken because a specific feature and/or solution is no longer necessary or required. At first one might think, let me change this code, it seems that it’s not used anywhere else so it should be safe to remove. Then, once there’s a new release, users complain about functionality which was removed and they where using it, etc. This should, at all costs, be avoided, and, in these cases, *that* specific code should be deprecated.

In order to give users enough time to migrate from the old code behavior to the new behavior, the deprecation time frame should be carefully determined based on the significance and complexity of the changes required by the user.

Salt feature releases are based on the Periodic Table. Any new features going into the develop branch will be named after the next element in the Periodic Table. For example, Beryllium was the feature release name of the develop branch before the 2015.8 branch was tagged. At that point in time, any new features going into the develop branch after 2015.8 was branched were part of the Boron feature release.

A deprecation warning should be in place for at least two major releases before the deprecated code and its accompanying deprecation warning are removed. More time should be given for more complex changes. For example, if the current release under development is Sodium, the deprecated code and associated warnings should remain in place and warn for at least Aluminum.
To help in this deprecation task, salt provides `salt.utils.versions.warn_until`. The idea behind this helper function is to show the deprecation warning to the user until salt reaches the provided version. Once that provided version is equaled `salt.utils.versions.warn_until` will raise a `RuntimeError` making salt stop its execution. This stoppage is unpleasant and will remind the developer that the deprecation limit has been reached and that the code can then be safely removed.

Consider the following example:

```python
def some_function(bar=False, foo=None):
    if foo is not None:
        salt.utils.versions.warn_until(
            'Aluminum',
            'The "foo" argument has been deprecated and its ' +
            'functionality removed, as such, its usage is no longer ' +
            'required.'
        )
```

Development begins on the Aluminum release when the Magnesium branch is forked from the develop branch. Once this occurs, all uses of the `warn_until` function targeting Aluminum, along with the code they are warning about should be removed from the code.

### 27.8 Installing Salt for development

Clone the repository using:

```
git clone https://github.com/saltstack/salt
```

**Note:** tags

Just cloning the repository is enough to work with Salt and make contributions. However, fetching additional tags from git is required to have Salt report the correct version for itself. To do this, first add the git repository as an upstream source:

```
git remote add upstream https://github.com/saltstack/salt
```

Fetching tags is done with the git 'fetch' utility:

```
git fetch --tags upstream
```

Create a new virtualenv:

```
virtualenv /path/to/your/virtualenv
```

Avoid making your `virtualenv path too long.`

On Arch Linux, where Python 3 is the default installation of Python, use the `virtualenv2` command instead of `virtualenv`.

On Gentoo you must use `--system-site-packages` to enable pkg and portage_config functionality

**Note:** Using system Python modules in the virtualenv

To use already-installed python modules in virtualenv (instead of having pip download and compile new ones), run `virtualenv --system-site-packages` Using this method eliminates the requirement to install the salt
dependencies again, although it does assume that the listed modules are all installed in the system PYTHONPATH at the time of virtualenv creation.

Note: Python development package

Be sure to install python devel package in order to install required Python modules. In Debian/Ubuntu run `sudo apt-get install -y python-dev`. In RedHat based system install `python-devel`.

Activate the virtualenv:

```
source /path/to/your/virtualenv/bin/activate
```

Install Salt (and dependencies) into the virtualenv:

```
pip install pyzmq PyYAML pycrypto msgpack-python jinja2 psutil futures tornado
pip install -e ./salt  # the path to the salt git clone from above
```

Note: Installing psutil

Python header files are required to build this module, otherwise the pip install will fail. If your distribution separates binaries and headers into separate packages, make sure that you have the headers installed. In most Linux distributions which split the headers into their own package, this can be done by installing the `python-dev` or `python-devel` package. For other platforms, the package will likely be similarly named.

Note: Installing dependencies on macOS.

You can install needed dependencies on macOS using homebrew or macports. See macOS Installation.

**Warning:** Installing on RedHat-based Distros

If installing from pip (or from source using `setup.py install`), be advised that the `yum-utils` package is needed for Salt to manage packages on RedHat-based systems.

### 27.8.1 Running a self-contained development version

During development it is easiest to be able to run the Salt master and minion that are installed in the virtualenv you created above, and also to have all the configuration, log, and cache files contained in the virtualenv as well.

The `/path/to/your/virtualenv` referenced multiple times below is also available in the variable `$VIRTUAL_ENV` once the virtual environment is activated.

Copy the master and minion config files into your virtualenv:

```
mkdir -p /path/to/your/virtualenv/etc/salt/pki/{master,minion}
cp ./salt/conf/master ./salt/conf/minion /path/to/your/virtualenv/etc/salt/
```

Edit the master config file:

1. Uncomment and change the `user: root` value to your own user.
2. Uncomment and change the `root_dir: /` value to point to `/path/to/your/virtualenv`. 

3894 Chapter 27. Developing Salt
3. Uncomment and change the `pki_dir: /etc/salt/pki/master` value to point to `/path/to/your/virtualenv/etc/salt/pki/master`.

4. If you are running version 0.11.1 or older, uncomment, and change the `pidfile: /var/run/salt-master.pid` value to point to `/path/to/your/virtualenv/salt-master.pid`.

5. If you are also running a non-development version of Salt you will have to change the `publish_port` and `ret_port` values as well.

Edit the minion config file:

1. Repeat the edits you made in the master config for the `user` and `root_dir` values as well as any port changes.

2. Uncomment and change the `pki_dir: /etc/salt/pki/minion` value to point to `/path/to/your/virtualenv/etc/salt/pki/minion`.

3. If you are running version 0.11.1 or older, uncomment, and change the `pidfile: /var/run/salt-minion.pid` value to point to `/path/to/your/virtualenv/salt-minion.pid`.

4. Uncomment and change the `master: salt` value to point at `localhost`.

5. Uncomment and change the `id:` value to something descriptive like "saltdev". This isn’t strictly necessary but it will serve as a reminder of which Salt installation you are working with.

6. If you changed the `ret_port` value in the master config because you are also running a non-development version of Salt, then you will have to change the `master_port` value in the minion config to match.

**Note:** Using `salt-call` with a Standalone Minion

If you plan to run `salt-call` with this self-contained development environment in a masterless setup, you should invoke `salt-call` with `-c /path/to/your/virtualenv/etc/salt` so that salt can find the minion config file. Without the `-c` option, Salt finds its config files in `/etc/salt`.

Start the master and minion, accept the minion’s key, and verify your local Salt installation is working:

```
cd /path/to/your/virtualenv
salt-master -c ./etc/salt -d
salt-minion -c ./etc/salt -d
salt-key -c ./etc/salt -L
salt-key -c ./etc/salt -A
salt -c ./etc/salt '*' test.version
```

Running the master and minion in debug mode can be helpful when developing. To do this, add `-l debug` to the calls to `salt-master` and `salt-minion`. If you would like to log to the console instead of to the log file, remove the `-d`.

**Note:** Too long socket path?

Once the minion starts, you may see an error like the following:

```
zmq.core.error.ZMQError: ipc path "/path/to/your/virtualenv/var/run/salt/minion/minion_event_7824dcbcf7a8f6755939af70b96249f_pub.ipc" is longer than 107 characters (sizeof(sockaddr_un.sun_path)).
```

This means that the path to the socket the minion is using is too long. This is a system limitation, so the only workaround is to reduce the length of this path. This can be done in a couple different ways:

1. Create your virtualenv in a path that is short enough.
2. Edit the `sock_dir` minion config variable and reduce its length. Remember that this path is relative to the value you set in `root_dir`.

**NOTE:** The socket path is limited to 107 characters on Solaris and Linux, and 103 characters on BSD-based systems.

---

**Note:** File descriptor limits

Ensure that the system open file limit is raised to at least 2047:

```
# check your current limit
ulimit -n

# raise the limit. persists only until reboot
# use 'limit descriptors 2047' for c-shell
ulimit -n 2047
```

To set file descriptors on macOS, refer to the *macOS Installation* instructions.

---

**Changing Default Paths**

Instead of updating your configuration files to point to the new root directory and having to pass the new configuration directory path to all of Salt’s CLI tools, you can explicitly tweak the default system paths that Salt expects:

```
GENERATE_SALT_SYSPATHS=1 pip install --global-option='--salt-root-dir=/path/to/your/virtualenv/' \ 
-e ./salt  # the path to the salt git clone from above
```

You can now call all of Salt’s CLI tools without explicitly passing the configuration directory.

**Additional Options**

If you want to distribute your virtualenv, you probably don’t want to include Salt’s clone `.git` directory, and, without it, Salt won’t report the accurate version. You can tell `setup.py` to generate the hardcoded version information which is distributable:

```
GENERATE_SALT_SYSPATHS=1 WRITE_SALT_VERSION=1 pip install --global-option='--salt-root-dir=/path/to/your/virtualenv/' \ 
-e ./salt  # the path to the salt git clone from above
```

Instead of passing those two environmental variables, you can just pass a single one which will trigger the other two:

```
MIMIC_SALT_INSTALL=1 pip install --global-option='--salt-root-dir=/path/to/your/virtualenv/' \ 
-e ./salt  # the path to the salt git clone from above
```

This last one will grant you an editable salt installation with hardcoded system paths and version information.

**27.8.2 Installing Salt from the Python Package Index**

If you are installing using `easy_install`, you will need to define a `USE_SETUPTOOLS` environment variable, otherwise dependencies will not be installed:
27.8.3 Editing and previewing the documentation

You need `sphinx-build` command to build the docs. In Debian/Ubuntu this is provided in the `python-sphinx` package. Sphinx can also be installed to a virtualenv using `pip`:

```
pip install Sphinx==1.3.1
```

Change to salt documentation directory, then:

```
cd doc; make html
```

- This will build the HTML docs. Run `make` without any arguments to see the available make targets, which include `html`, `man`, and `text`.
- The docs then are built within the `docs/_build/` folder. To update the docs after making changes, run `make` again.
- The docs use reStructuredText for markup. See a live demo at http://rst.ninjs.org/.
- The help information on each module or state is culled from the python code that runs for that piece. Find them in `salt/modules/` or `salt/states/`.
- To build the docs on Arch Linux, the `python2-sphinx` package is required. Additionally, it is necessary to tell `make` where to find the proper `sphinx-build` binary, like so:

```
makerTHINXBUILD=sphinx-build2 html
```

- To build the docs on RHEL/CentOS 6, the `python-sphinx10` package must be installed from EPEL, and the following make command must be used:

```
makerTHINXBUILD=sphinx-build html
```

Once you’ve updated the documentation, you can run the following command to launch a simple Python HTTP server to see your changes:

```
cd _build/html; python -m SimpleHTTPServer
```

27.8.4 Running unit and integration tests

Run the test suite with following command:

```
./setup.py test
```

See here for more information regarding the test suite.

27.8.5 Issue and Pull Request Labeling System

SaltStack uses several labeling schemes to help facilitate code contributions and bug resolution. See the Labels and Milestones documentation for more information.
27.9 GitHub Labels and Milestones

SaltStack uses several label categories, as well as milestones, to triage incoming issues and pull requests in the GitHub issue tracker. Labels are used to sort issues by type, priority, severity, status, functional area, functional group, and targeted release and pull requests by status, functional area, functional group, type of change, and test status. Milestones are used to indicate whether an issue is fully triaged or is scheduled to be fixed by SaltStack in an upcoming sprint.

27.9.1 Milestones

All issues are assigned to a milestone, whereas pull requests are almost never assigned to a milestone as the mean lifetime of pull requests is short enough that there is no need to track them temporally.

SaltStack uses milestones to indicate which issues are blocked on submitter or upstream actions, are approved, or are scheduled to be fixed or implemented in an upcoming sprint. If an issue is not attached to a sprint milestone, you are welcome to work on it at your own desire and convenience. If it is attached to a sprint milestone and you have already begun working on it or have a solution in mind or have other ideas related to the issue, you are encouraged to coordinate with the assignee via the GitHub issue tracker to create the best possible solution or implementation.

- **Approved** - The issue has been validated and has all necessary information.
- **Blocked** - The issue is waiting on actions by parties outside of SaltStack, such as receiving more information from the submitter or resolution of an upstream issue. This milestone is usually applied in conjunction with the labels `Info Needed`, `Question`, `Expected Behavior`, `Won't Fix For Now`, or `Upstream Bug`.

27.9.2 Labels

Labels are used to sort and describe issues and pull requests. Some labels are usually reserved for one or the other, though most labels may be applied to both.

New issues will receive at least one label and a milestone, and new pull requests will receive at least one label. Except for the `functional area` and `functional group` label categories, issues will generally receive only up to one label per category.

**Type**

Issues are categorized into one of several types. Type labels are almost never used for pull requests. GitHub treats pull requests like issues in many ways, so a pull request could be considered an issue with an implicit `Pull Request` type label applied.

- **Feature** - The issue is a request for new functionality including changes, enhancements, refactors, etc.
- **Bug** - The issue documents broken, incorrect, or confusing behavior. This label is always accompanied by a `severity label`.
- **Duplicate** - The issue is a duplicate of another feature request or bug report.
- **Upstream Bug** - The issue is a result of an upstream issue.
- **Question** - The issue is more of a question than a request for new features or a report of broken features, but can sometimes lead to further discussion or changes of confusing or incongruous behavior or documentation.
- **Expected Behavior** - The issue is a bug report of intended functionality.
Priority

An issue’s priority is relative to its **functional area**. If a bug report, for example, about `gitfs` indicates that all users of `gitfs` will encounter this bug, then a P1 label will be applied, even though users who are not using `gitfs` will not encounter the bug. If a feature is requested by many users, it may be given a high priority.

- **P1** - The issue will be seen by all users.
- **P2** - The issue will be seen by most users.
- **P3** - The issue will be seen by about half of users.
- **P4** - The issue will not be seen by most users. Usually the issue is a very specific use case or corner case.

Severity

Severity labels are almost always only applied to issues labeled **Bug**.

- **Blocker** - The issue is blocking an impending release.
- **Critical** - The issue causes data loss, crashes or hangs salt processes, makes the system unresponsive, etc.
- **High Severity** - The issue reports incorrect functionality, bad functionality, a confusing user experience, etc.
- **Medium Severity** - The issue reports cosmetic items, formatting, spelling, colors, etc.

Functional Area

Many major components of Salt have corresponding GitHub labels. These labels are applied to all issues and pull requests as is reasonably appropriate. They are useful in organizing issues and pull requests according to the source code relevant to issues or the source code changed by pull requests.

- **Execution Module**
- **File Servers**
- **Grains**
- **Multi-Master**
- **Packaging** Related to packaging of Salt, not Salt’s support for package management.
- **Pillar**
- **RAET**
- **Returners**
- **Runners**
- **SPM**
- **Salt-API**
- **Salt-Cloud**
- **Salt-SSH**
- **Salt-Syndic**
- **State Module**
- **Tests**
Functional Group

These labels sort issues and pull requests according to the internal SaltStack engineering teams.

- **Core** - The issue or pull request relates to code that is central or existential to Salt itself.
- **Platform** - The issue or pull request relates to support and integration with various platforms like traditional operating systems as well as containers, platform-based utilities like filesystems, command schedulers, etc., and system-based applications like webservers, databases, etc.
- **RIoT** - The issue or pull request relates to support and integration with various abstract systems like cloud providers, hypervisors, API-based services, etc.
- **Console** - The issue or pull request relates to the SaltStack enterprise console.
- **Documentation** - The issue or pull request relates to documentation.

Status

Status labels are used to define and track the state of issues and pull requests. Not all potential statuses correspond to a label, but some statuses are common enough that labels have been created for them. If an issue has not been moved beyond the **Blocked** milestone, it is very likely that it will only have a status label.

- **Bugfix - back-port** - The pull request needs to be back-ported to an older release branch. This is done by recreating the pull request against that branch. Once the back-port is completed, this label is replaced with a **Bugfix - [Done] back-ported** label. Normally, new features should go into the develop and bug fixes into the oldest supported release branch, see here.
- **Bugfix - [Done] back-ported** - The pull request has been back-ported to an older branch.
- **Cannot Reproduce** - The issue is a bug and has been reviewed by a SaltStack engineer, but it cannot be replicated with the provided information and context. Those involved with the bug will need to work through additional ideas until the bug can be isolated and verified.
- **Confirmed** - The issue is a bug and has been confirmed by a SaltStack engineer, who often documents a minimal working example that reproduces the bug.
- **Fixed Pending Verification** - The issue is a bug and has been fixed by one or more pull requests, which should link to the issue. Closure of the issue is contingent upon confirmation of resolution from the submitter. If the submitter reports a negative confirmation, this label is removed. If no response is given after a few weeks, then the issue will be assumed fixed and closed.
- **Info Needed** - The issue needs more information before it can be verified and resolved. For a feature request this may include a description of the use cases. Almost all bug reports need to include at least the versions of salt and its dependencies, the system type and version, commands used, debug logs, error messages, and relevant configs.
- **Pending Changes** - The pull request needs additional changes before it can be merged.
- **Pending Discussion** - The issue or pull request needs more discussion before it can be closed or merged. The status of the issue or pull request is not clear or apparent enough for definite action to be taken, or additional input from SaltStack, the submitter, or another party has been requested.
If the issue is not a pull request, once the discussion has arrived at a cogent conclusion, this label will be removed and the issue will be accepted. If it is a pull request, the results of the discussion may require additional changes and thus, a Pending Changes label.

- **Won't Fix for Now** - The issue is legitimate, but it is not something the SaltStack team is currently able or willing to fix or implement. Issues having this label may be revisited in the future.

**Type of Change**

Every pull request should receive a change label. These labels measure the quantity of change as well as the significance of the change. The amount of change and the importance of the code area changed are considered, but often the depth of secondary code review required and the potential repercussions of the change may also advise the label choice.

Core code areas include: state compiler, crypto engine, master and minion and syndic daemons, transport, pillar rendering, loader, transport layer, event system, salt.utils, client, cli, logging, netapi, runner engine, templating engine, top file compilation, file client, file server, mine, salt-ssh, test runner, etc.

Non-core code usually constitutes the specific set of plugins for each of the several plugin layers of Salt: execution modules, states, runners, returners, clouds, etc.

- **Minor Change**
  - Less than 64 lines changed, or
  - Less than 8 core lines changed

- **Medium Change**
  - Less than 256 lines changed, or
  - Less than 64 core lines changed

- **Master Change**
  - More than 256 lines changed, or
  - More than 64 core lines changed

- **Expert Change**
  - Needs specialized, in-depth review

**Test Status**

These labels relate to the status of the automated tests that run on pull requests. If the tests on a pull request fail and are not overridden by one of these labels, the pull request submitter needs to update the code and/or tests so that the tests pass and the pull request can be merged.

- **Lint** - The pull request has passed all tests except for the code lint checker.

- **Tests Passed** - The pull request has passed all tests even though some test results are negative. Sometimes the automated testing infrastructure will encounter internal errors unrelated to the code change in the pull request that cause test runs to fail. These errors can be caused by cloud host and network issues and also Jenkins issues like erroneously accumulating workspace artifacts, resource exhaustion, and bugs that arise from long running Jenkins processes.
Other

These labels indicate miscellaneous issue types or statuses that are common or important enough to be tracked and sorted with labels.

- **Awesome** - The pull request implements an especially well crafted solution, or a very difficult but necessary change.
- **Help Wanted** - The issue appears to have a simple solution. Issues having this label should be a good starting place for new contributors to Salt.
- **Needs Testcase** - The issue or pull request relates to a feature that needs test coverage. The pull request containing the tests should reference the issue or pull request having this label, whereupon the label should be removed.
- **Regression** - The issue is a bug that breaks functionality known to work in previous releases.
- **Story** - The issue is used by a SaltStack engineer to track progress on multiple related issues in a single place.
- **Stretch** - The issue is an optional goal for the current sprint but may not be delivered.
- **ZD** - The issue is related to a Zendesk customer support ticket.
- **<Release>** - The issue is scheduled to be implemented by <Release>. See here for a discussion of Salt’s release codenames.

### 27.10 Logging Internals

TODO

### 27.11 Package Providers

This page contains guidelines for writing package providers.

#### 27.11.1 Package Functions

One of the most important features of Salt is package management. There is no shortage of package managers, so in the interest of providing a consistent experience in *pkg* states, there are certain functions that should be present in a package provider. Note that these are subject to change as new features are added or existing features are enhanced.

**list_pkgs**

This function should declare an empty dict, and then add packages to it by calling *pkg_resource.add_pkg*, like so:

```
__salt__['pkg_resource.add_pkg'](ret, name, version)
```

The last thing that should be done before returning is to execute *pkg_resource.sort_pkglist*. This function does not presently do anything to the return dict, but will be used in future versions of Salt.

```
__salt__['pkg_resource.sort_pkglist'](ret)
```

`list_pkgs` returns a dictionary of installed packages, with the keys being the package names and the values being the version installed. Example return data:
latest_version

Accepts an arbitrary number of arguments. Each argument is a package name. The return value for a package will be an empty string if the package is not found or if the package is up-to-date. The only case in which a non-empty string is returned is if the package is available for new installation (i.e. not already installed) or if there is an upgrade available.

If only one argument was passed, this function return a string, otherwise a dict of name/version pairs is returned.

This function must also accept **kwargs, in order to receive the fromrepo and repo keyword arguments from pkg states. Where supported, these arguments should be used to find the install/upgrade candidate in the specified repository. The fromrepo kwarg takes precedence over repo, so if both of those kwargs are present, the repository specified in fromrepo should be used. However, if repo is used instead of fromrepo, it should still work, to preserve backwards compatibility with older versions of Salt.

version

Like latest_version, accepts an arbitrary number of arguments and returns a string if a single package name was passed, or a dict of name/value pairs if more than one was passed. The only difference is that the return values are the currently-installed versions of whatever packages are passed. If the package is not installed, an empty string is returned for that package.

upgrade_available

Deprecated and destined to be removed. For now, should just do the following:

```python
return __salt__['pkg.latest_version'](name) != ''
```

install

The following arguments are required and should default to None:

1. name (for single-package pkg states)
2. pkgs (for multiple-package pkg states)
3. sources (for binary package file installation)

The first thing that this function should do is call pkg_resource.parse_targets (see below). This function will convert the SLS input into a more easily parsed data structure. pkg_resource.parse_targets may need to be modified to support your new package provider, as it does things like parsing package metadata which cannot be done for every package management system.

```
pkg_params, pkg_type = __salt__['pkg_resource.parse_targets'](name, pkgs, sources)
```

Two values will be returned to the install function. The first of them will be a dictionary. The keys of this dictionary will be package names, though the values will differ depending on what kind of installation is being done:
• If name was provided (and pkgs was not), then there will be a single key in the dictionary, and its value will be None. Once the data has been returned, if the version keyword argument was provided, then it should replace the None value in the dictionary.

• If pkgs was provided, then name is ignored, and the dictionary will contain one entry for each package in the pkgs list. The values in the dictionary will be None if a version was not specified for the package, and the desired version if specified. See the Multiple Package Installation Options section of the pkg.installed state for more info.

• If sources was provided, then name is ignored, and the dictionary values will be the path/URI for the package.

The second return value will be a string with two possible values: repository or file. The install function can use this value (if necessary) to build the proper command to install the targeted package(s).

Both before and after the installing the target(s), you should run list_pkgs to obtain a list of the installed packages. You should then return the output of salt.utils.data.compare_dicts():

```
return salt.utils.data.compare_dicts(old, new)
```

remove

Removes the passed package and return a list of the packages removed.

### 27.11.2 Package Repo Functions

There are some functions provided by pkg which are specific to package repositories, and not to packages themselves. When writing modules for new package managers, these functions should be made available as stated below, in order to provide compatibility with the pkgrepo state.

All repo functions should accept a basedir option, which defines which directory repository configuration should be found in. The default for this is dictated by the repo manager that is being used, and rarely needs to be changed.

```
basedir = '/etc/yum.repos.d'
__salt__['pkg.list_repos'](basedir)
```

list_repos

Lists the repositories that are currently configured on this system.

```
__salt__['pkg.list_repos']()
```

Returns a dictionary, in the following format:

```
{'reponame': 'config_key_1': 'config value 1',
 'config_key_2': 'config value 2',
 'config_key_3': ['list item 1 (when appropriate)',
                  'list item 2 (when appropriate)']
```

get_repo

Displays all local configuration for a specific repository.

```
__salt__['pkg.get_repo'](repo='myrepo')
```
The information is formatted in much the same way as list_repos, but is specific to only one repo.

```plaintext
{'config_key_1': 'config value 1',
 'config_key_2': 'config value 2',
 'config_key_3': ['list item 1 (when appropriate)',
                  'list item 2 (when appropriate)']
```

del_repo

Removes the local configuration for a specific repository. Requires a repo argument, which must match the locally configured name. This function returns a string, which informs the user as to whether or not the operation was a success.

```python
__salt__['pkg.del_repo'](repo='myrepo')
```

mod_repo

Modify the local configuration for one or more option for a configured repo. This is also the way to create new repository configuration on the local system; if a repo is specified which does not yet exist, it will be created.

The options specified for this function are specific to the system; please refer to the documentation for your specific repo manager for specifics.

```python
__salt__['pkg.mod_repo'](repo='myrepo', url='http://myurl.com/repo')
```

### 27.11.3 Low-Package Functions

In general, the standard package functions as describes above will meet your needs. These functions use the system’s native repo manager (for instance, yum or the apt tools). In most cases, the repo manager is actually separate from the package manager. For instance, yum is usually a front-end for rpm, and apt is usually a front-end for dpkg. When possible, the package functions that use those package managers directly should do so through the low package functions.

It is normal and sane for pkg to make calls to lowpkgs, but lowpkg must never make calls to pkg. This is affects functions which are required by both pkg and lowpkg, but the technique in pkg is more performant than what is available to lowpkg. When this is the case, the lowpkg function that requires that technique must still use the lowpkg version.

list_pkgs

Returns a dict of packages installed, including the package name and version. Can accept a list of packages; if none are specified, then all installed packages will be listed.

```python
installed = __salt__['lowpkg.list_pkgs']('foo', 'bar')
```

Example output:

```plaintext
{'foo': '1.2.3-4',
 'bar': '5.6.7-8'}
```
verify

Many (but not all) package management systems provide a way to verify that the files installed by the package manager have or have not changed. This function accepts a list of packages; if none are specified, all packages will be included.

```python
installed = __salt__['lowpkg.verify']('httpd')
```

Example output:

```
{"/etc/httpd/conf/httpd.conf": {'mismatch': ['size', 'md5sum', 'mtime'],
  'type': 'config'}}
```

deleted

file_list

Lists all of the files installed by all packages specified. If not packages are specified, then all files for all known packages are returned.

```python
installed = __salt__['lowpkg.file_list']('httpd', 'apache')
```

This function does not return which files belong to which packages; all files are returned as one giant list (hence the `file_list` function name. However, This information is still returned inside of a dict, so that it can provide any errors to the user in a sane manner.

```
{'errors': ['package apache is not installed'],
 'files': ['/etc/httpd',
  '/etc/httpd/conf',
  '/etc/httpd/conf.d',
  '...SNIP...']}
```

deleted

deleted

file_dict

Lists all of the files installed by all packages specified. If not packages are specified, then all files for all known packages are returned.

```python
installed = __salt__['lowpkg.file_dict']('httpd', 'apache', 'kernel')
```

Unlike `file_list`, this function will break down which files belong to which packages. It will also return errors in the same manner as `file_list`.

```
{'errors': ['package apache is not installed'],
 'packages': {'httpd': ['/etc/httpd',
  '/etc/httpd/conf',
  '...SNIP...'],
  'kernel': ['/boot/vmlinux-2.6.32-279.el6.x86_64.hmac',
  '/boot/System.map-2.6.32-279.el6.x86_64',
  '...SNIP...']}
```

### 27.12 Pull Requests

Salt is a large software project with many developers working together. We encourage all Salt users to contribute new features, bug fixes and documentation fixes. For those who haven’t contributed to a large software project
before we encourage you to consider the following questions when preparing a pull request.

This isn’t an exhaustive list and these aren’t necessarily hard and fast rules, but these are things we consider when reviewing a pull request.

- Does this change work on all platforms? In cases where it does not, is an appropriate and easy-to-understand reason presented to the user? Is it documented as-such? Have we thought about all the possible ways this code might be used and accounted as best we can for them?

- Will this code work on versions of all Python we support? Will it work on future versions?

- Are Python reserved keywords used? Are variables named in a way that will make it easy for the next person to understand what’s going on?

- Does this code present a security risk in any way? What is the worst possible thing that an attacker could do with this code? If dangerous cases are possible, is it appropriate to document them? If so, has this been done? Would this change pass muster with a professional security audit? Is it obvious to a person using this code what the risks are?

- Is it readable? Does it conform to our style guide? Is the code documented such that the next person who comes along will be able to read and understand it? Most especially, are edge-cases documented to avoid regressions? Will it be immediately evident to the next person who comes along why this change was made?

- If appropriate, has the person who wrote the code which is being modified been notified and included in the process?

- What are the performance implications of this change? Is there a more efficient way to structure the logic and if so, does making the change balance itself against readability in a sensible way? Do the performance characteristics of the code change based on the way it is being invoked (i.e., through an API or various command-line tools.) Will it be easy to profile this change if it might be a problem?

- Are caveats considered and documented in the change?

- Will the code scale? More critically, will it scale in both directions? Salt runs in data-centers and on Raspberry Pi installations in the Sahara. It needs to work on big servers and tiny devices.

- Is appropriate documentation written both in public-facing docs and in-line? How will the user know how to use this? What will they do if it doesn’t work as expected? Is this something a new user will understand? Can a user know all they need to about this functionality by reading the public docs?

- Is this a change in behavior? If so, is it in the appropriate branch? Are deprecation warnings necessary? Have those changes been fully documented? Have we fully thought through what implications a change in behavior might have?

- How has the code been tested? If appropriate are there automated tests which cover this? Is it likely to regress? If so, how has the potential of that regression been mitigated? What is the plan for ensuring that this code works going forward?

- If it’s asynchronous code, what is the potential for a race condition?

- Is this code an original work? If it’s borrowed from another project or found online are the appropriate licensing/attribution considerations handled?

- Is the reason for the change fully explained in the PR? If not for review, this is necessary so that somebody in the future can go back and figure out why it was necessary.

- Is the intended behavior of the change clear? How will that behavior be known to future contributors and to users?

- Does this code handle errors in a reasonable way? Have we gone back through the stack as much as possible to make sure that an error cannot be raised that we do not account for? Are errors tested for as well as proper functionality?
• If the code relies on external libraries, do we properly handle old versions of them? Do we require a specific version and if so is this version check implemented? Is the library available on the same platforms that module in question claims to support? If the code was written and tested against a particular library, have we documented that fact?

• Can this code freeze/hang/crash a running daemon? Can it stall a state run? Are there infinite loops? Are appropriate timeouts implemented?

• Is the function interface well documented? If argument types can not be inferred by introspection, are they documented?

• Are resources such as file-handles cleaned-up after they are used?

• Is it possible that a reference-cycle exists between objects that will leak memory?

• Has the code been linted and does it pass all tests?

• Does the change fully address the problem or is it limited to a small surface area? By this, I mean that it should be clear that the submitter has looked for other cases in the function or module where the given case might also be addressed. If additional changes are necessary are they documented in the code as a FIXME or the PR and in Github as an issue to be tracked?

• Will the code throw errors/warnings/stacktraces to the console during normal operation?

• Has all the debugging been removed?

• Does the code log any sensitive data? Does it show sensitive data in process lists? Does it store sensitive data to disk and if so, does it do so in a secure manner? Are there potential race conditions in between writing the data to disk and setting the appropriate permissions?

• Is it clear from the solution that the problem is well-understood? How can somebody who has never seen the problem feel confident that this proposed change is the best one?

• What’s hard-coded that might not need to be? Are we making sensible decisions for the user and allowing them to tune and change things where appropriate?

• Are utility functions used where appropriate? Does this change re-implement something we already have code for?

• Is the right thing being fixed? There are cases where it’s appropriate to fix a test and cases where it’s appropriate to fix the code that’s under test. Which is best for the user? Is this change a shortcut or a solution that will be solid in the months and years to come?

• How will this code react to changes elsewhere in the code base? What is it coupled to and have we fully thought through how best to present a coherent interface to consumers of a given function or method?

• Does this PR try to fix too many bugs/problems at once?

• Should this be split into multiple PRs to make them easier to test and reason about?

### 27.13 Reporting Bugs

Salt uses GitHub to track open issues and feature requests.

To file a bug, please navigate to the new issue page for the Salt project.

In an issue report, please include the following information:

- The output of `salt --versions-report` from the relevant machines. This can also be gathered remotely by using `salt <my_tgt> test.versions_report`.
- A description of the problem including steps taken to cause the issue to occur and the expected behaviour.
- Any steps taken to attempt to remediate the problem.
- Any configuration options set in a configuration file that may be relevant.
- A reproduceable test case. This may be as simple as an SLS file that illustrates a problem or it may be a link to a repository that contains a number of SLS files that can be used together to re-produce a problem. If the problem is transitory, any information that can be used to try and reproduce the problem is helpful.
- [Optional] The output of each salt component (master/minion/CLI) running with the `-ldebug` flag set.

Note: Please be certain to scrub any logs or SLS files for sensitive data!

### 27.14 Salt Topology

Salt is based on a powerful, asynchronous, network topology using ZeroMQ. Many ZeroMQ systems are in place to enable communication. The central idea is to have the fastest communication possible.

#### 27.14.1 Servers

The Salt Master runs 2 network services. First is the ZeroMQ PUB system. This service by default runs on port 4505 and can be configured via the `publish_port` option in the master configuration.

Second is the ZeroMQ REP system. This is a separate interface used for all bi-directional communication with minions. By default this system binds to port 4506 and can be configured via the `ret_port` option in the master.

#### 27.14.2 PUB/SUB

The commands sent out via the salt client are broadcast out to the minions via ZeroMQ PUB/SUB. This is done by allowing the minions to maintain a connection back to the Salt Master and then all connections are informed to download the command data at once. The command data is kept extremely small (usually less than 1K) so it is not a burden on the network.

#### 27.14.3 Return

The PUB/SUB system is a one way communication, so once a publish is sent out the PUB interface on the master has no further communication with the minion. The minion, after running the command, then sends the command’s return data back to the master via the `ret_port`.

### 27.15 Developing Salt Tutorial

This tutorial assumes you have:
- a web browser
- a GitHub account (<my_account>)
27.15.1 Fork

In your browser, navigate to the saltstack/salt GitHub repository. Click on Fork (https://github.com/saltstack/salt/#fork-destination-box).

Note: If you have more than one GitHub presence, for example if you are a member of a team, GitHub will ask you into which area to clone Salt. If you don’t know where, then select your personal GitHub account.

27.15.2 Clone

In your CLI, navigate to the directory into which you want clone the Salt codebase and submit the following command:

```bash
$ git clone https://github.com/<my_account>/salt.git
```

where `<my_account>` is the name of your GitHub account. After the clone has completed, add SaltStack as a second remote and fetch any changes from upstream.

```bash
$ cd salt
$ git remote add upstream https://github.com/saltstack/salt.git
$ git fetch upstream
```

For this tutorial, we will be working off from the master branch, which is the default branch for the SaltStack GitHub project. This branch needs to track upstream/master so that we will get all upstream changes when they happen.

```bash
$ git checkout master
$ git branch --set-upstream-to upstream/master
```

27.15.3 Fetch

Fetch any upstream changes on the master branch and sync them to your local copy of the branch with a single command:

```bash
$ git pull --rebase
```

Note: For an explanation on pull vs pull --rebase and other excellent points, see this article by Mislav Marohnić.

27.15.4 Branch

Now we are ready to get to work. Consult the sprint beginner bug list and select an execution module whose __virtual__ function needs to be updated. I’ll select the alternatives module.
Create a new branch off from master. Be sure to name it something short and descriptive.

```bash
$ git checkout -b virt_ret
```

### 27.15.5 Edit

Edit the file you have selected, and verify that the changes are correct.

```bash
$ vim salt/modules/alternatives.py
$ git diff
```

```diff
diff --git a/salt/modules/alternatives.py b/salt/modules/alternatives.py
index 1653e5f..30c0a59 100644
--- a/salt/modules/alternatives.py
+++ b/salt/modules/alternatives.py
@@ -30,7 +30,7 @@ def __virtual__():
     ..
     if os.path.isdir('/etc/alternatives'):
         return True
-    return False
+    return (False, 'Cannot load alternatives module: /etc/alternatives dir not
    → found')

 def _get_cmd():
```

### 27.15.6 Commit

Stage and commit the changes. Write a descriptive commit summary, but try to keep it less than 50 characters. Review your commit.

```bash
$ git add salt/modules/alternatives.py
$ git commit -m 'modules.alternatives: __virtual__ return err msg'
$ git show
```

**Note:** If you need more room to describe the changes in your commit, run `git commit` (without the `-m`, message, option) and you will be presented with an editor. The first line is the commit summary and should still be 50 characters or less. The following paragraphs you create are free form and will be preserved as part of the commit.

### 27.15.7 Push

Push your branch to your GitHub account. You will likely need to enter your GitHub username and password.

```bash
$ git push origin virt_ret
```

**Username** for `https://github.com`: `<my_account>`

**Password** for `https://<my_account>@github.com`:

**Note:** If authentication over https does not work, you can alternatively set up ssh keys. Once you have done this, you may need to add the keys to your git repository configuration.
\$ git config ssh.key ~/.ssh/<key_name>

where <key_name> is the file name of the private key you created.

### 27.15.8 Merge

In your browser, navigate to the new pull request page on the saltstack/salt GitHub repository and click on compare across forks. Select <my_account> from the list of head forks and the branch you are wanting to merge into master (virt_ret in this case).

When you have finished reviewing the changes, click Create pull request.

If your pull request contains only a single commit, the title and comment will be taken from that commit’s summary and message, otherwise the branch name is used for the title. Edit these fields as necessary and click Create pull request.

**Note:** Although these instructions seem to be the official pull request procedure on github’s website, here are two alternative methods that are simpler.

- If you navigate to your clone of salt, https://github.com/<my_account>/salt, depending on how old your branch is or how recently you pushed updates on it, you may be presented with a button to create a pull request with your branch.
- I find it easiest to edit the following URL:
  https://github.com/saltstack/salt/compare/master...<my_account>:virt_ret

### 27.15.9 Resources

GitHub offers many great tutorials on various aspects of the git- and GitHub-centric development workflow:

https://help.github.com/

There are many topics covered by the Salt Developer documentation:

https://docs.saltstack.com/en/latest/topics/development/index.html

The contributing documentation presents more details on specific contributing topics:

https://docs.saltstack.com/en/latest/topics/development/contributing.html

### 27.16 Modular Systems

When first working with Salt, it is not always clear where all of the modular components are and what they do. Salt comes loaded with more modular systems than many users are aware of, making Salt very easy to extend in many places.

The most commonly used modular systems are execution modules and states. But the modular systems extend well beyond the more easily exposed components and are often added to Salt to make the complete system more flexible.
27.16.1 Developing New Modules

Interactive Debugging

Sometimes debugging with `print()` and extra logs sprinkled everywhere is not the best strategy.

IPython is a helpful debug tool that has an interactive python environment which can be embedded in python programs.

First the system will require IPython to be installed.

```bash
# Debian
apt-get install ipython

# Arch Linux
pacman -Syu ipython2

# RHEL/CentOS (via EPEL)
yum install python-ipython
```

Now, in the troubling python module, add the following line at a location where the debugger should be started:

```python
test = 'test123'
import IPython; IPython.embed_kernel()
```

After running a Salt command that hits that line, the following will show up in the log file:

```
[CRITICAL] To connect another client to this kernel, use:
[IPKernelApp] --existing kernel-31271.json
```

Now on the system that invoked `embed_kernel`, run the following command from a shell:

```
# NOTE: use ipython2 instead of ipython for Arch Linux
ipython console --existing
```

This provides a console that has access to all the vars and functions, and even supports tab-completion.

```python
print(test)
test123
```

To exit IPython and continue running Salt, press Ctrl-d to logout.

Special Module Contents

These are things that may be defined by the module to influence various things.

```python
__virtual__

__virtual_aliases__

__virtualname__

__init__
```

Called before `__virtual__()`. 

27.16. Modular Systems
 grains and proxy modules
__proxyenabled__ as a list containing the names of the proxy types that the module supports.

Dunder Dictionaries
Salt provides several special "dunder" dictionaries as a convenience for Salt development. These include __opts__, __context__, __salt__, and others. This document will describe each dictionary and detail where they exist and what information and/or functionality they provide.

The following dunder dictionaries are always defined, but may be empty
   • __context__
   • __grains__
   • __pillar__
   • __opts__

__opts__
Defined in: All modules
The __opts__ dictionary contains all of the options passed in the configuration file for the master or minion.

Note: In many places in salt, instead of pulling raw data from the __opts__ dict, configuration data should be pulled from the salt get functions such as config.get, aka __salt__['config.get']('foo:bar') The get functions also allow for dict traversal via the : delimiter. Consider using get functions whenever using __opts__, or __pillar__ and __grains__ (when using grains for configuration data)

The configuration file data made available in the __opts__ dictionary is the configuration data relative to the running daemon. If the modules are loaded and executed by the master, then the master configuration data is available, if the modules are executed by the minion, then the minion configuration is available. Any additional information passed into the respective configuration files is made available

__salt__
Defined in: Auth, Beacons, Engines, Execution, Executors, Outputters, Pillars, Proxies, Renderers, Returners, Runners, SDB, SSH Wrappers, State, Thorium
__salt__ contains the execution module functions. This allows for all functions to be called as they have been set up by the salt loader.
```python
__salt__['cmd.run']('fdisk -l')
__salt__['network.ip_addrs']()
```

**Note:** When used in runners or outputters, `__salt__` references other runner/outputter modules, and not execution modules.

---

**__grains__**

Filled in for: Execution, Pillar, Renderer, Returner, SSH Wrapper, State.

The `__grains__` dictionary contains the grains data generated by the minion that is currently being worked with. In execution modules, state modules and returners this is the grains of the minion running the calls, when generating the external pillar the `__grains__` is the grains data from the minion that the pillar is being generated for.

While `__grains__` is defined for every module, it’s only filled in for some.

---

**__pillar__**

Filled in for: Execution, Renderer, Returner, SSH Wrapper, State

The `__pillar__` dictionary contains the pillar for the respective minion.

While `__pillar__` is defined for every module, it’s only filled in for some.

---

**__ext_pillar__**

Filled in for: Pillar

The `__ext_pillar__` dictionary contains the external pillar modules.

---

**__context__**

During a state run the `__context__` dictionary persists across all states that are run and then is destroyed when the state ends.

When running an execution module `__context__` persists across all module executions until the modules are refreshed; such as when `saltutil.sync_all` or `state.apply` are executed.

A great place to see how to use `__context__` is in the `cp.py` module in `salt/modules/cp.py`. The fileclient authenticates with the master when it is instantiated and then is used to copy files to the minion. Rather than create a new fileclient for each file that is to be copied down, one instance of the fileclient is instantiated in the `__context__` dictionary and is reused for each file. Here is an example from `salt/modules/cp.py`:

```python
if not 'cp.fileclient' in __context__:
    __context__['cp.fileclient'] = salt.fileclient.get_file_client(__opts__)
```

**Note:** Because `__context__` may or may not have been destroyed, always be sure to check for the existence of the key in `__context__` and generate the key before using it.

---

27.16. Modular Systems
__utils__

Defined in: Cloud, Engine, Execution, File Server, Grain, Pillar, Proxy, Roster, Runner, SDB, State

__proxy__

Defined in: Beacon, Engine, Execution, Executor, Proxy, Renderer, Returner, State, Util

__runner__

Defined in: Engine, Roster, Thorium

**Note:** When used in engines, it should be called __runners__ (plural)

__executors__

Defined in: Executor

__ret__

Defined in: Proxy

__thorium__

Defined in: Thorium

__states__

Defined in: Renderers, State

__serializers__

Defined in: State

__sdb__

Defined in: SDB
### Additional Globals

Defined for: Runners, Execution Modules, Wheels

- `__jid__`: The job ID
- `__user__`: The user
- `__tag__`: The jid tag

#### 27.16.2 Configuration Options

A number of configuration options can affect the load process. This is a quick list of them:

- `autoload_dynamic_modules` (*Minion*)
- `cython_enable` (*Minion*, *Master*)
- `disable_modules` (*Minion*)
- `disable_returners` (*Minion*)
- `enable_zip_modules` (*Minion*)
- `extension_modules` (*Master*)
- `extmod_whitelist` (*Minion*, *Master*)
- `extmod_blacklist` (*Minion*, *Master*)
- `whitelist_modules` (*Minion*)
- `grains_dirs` (*Minion*)
- `module_dirs` (*Minion*, *Master*)
- `outputter_dirs` (*Minion*, *Master*)
- `providers` (*Minion*)
- `render_dirs` (*Minion*)
- `returner_dirs` (*Minion*)
- `runner_dirs` (*Master*)
- `states_dirs` (*Minion*)
- `utils_dirs` (*Minion*)

#### 27.16.3 Loading Modules

Modules come primarily from several sources:

- The Salt package itself
- The Salt File Server
- The extmods directory
- Secondary packages installed
Using one source to override another is not supported.

The Salt Package

Salt itself ships with a large number of modules. These are part of the Salt package itself and don’t require the user to do anything to use them. (Although a number of them have additional dependencies and/or configuration.)

The Salt File Server

The user may add modules by simply placing them in special directories in their fileserver.

The name of the directory inside of the file server is the directory name prepended by underscore, such as:

- _grains
- _modules
- _states

Modules must be synced before they can be used. This can happen a few ways, discussed below.

Note: Using saltenvs besides base may not work in all contexts.

Sync Via States

The minion configuration contains an option autoload_dynamic_modules which defaults to True. This option makes the state system refresh all dynamic modules when states are run. To disable this behavior set autoload_dynamic_modules to False in the minion config.

When dynamic modules are autoloaded via states, only the modules defined in the same saltenvs as the states currently being run.

Also it is possible to use the explicit saltutil.sync_* state functions to sync the modules (previously it was necessary to use the module.run state):

Sync Via the saltutil Module

The saltutil module has a number of functions that can be used to sync all or specific dynamic modules. The saltutil.sync_* execution functions and runner functions can be used to sync modules to minions and the master, respectively.

The extmods Directory

Any files places in the directory set by extension_modules settings (minion, master, default /var/cache/salt/*/extmods) can also be loaded as modules. Note that these directories are also used by the saltutil.sync_* functions (mentioned above) and files may be overwritten.
Secondary Packages

Third-party packages may also add modules to Salt if they are installed in the same system and Python environment as the Salt Minion or Master.

This is done via setuptools entry points:

```python
setup(
    # ...
    entry_points={
        'salt.loader': [
            'module_dirs=spirofs.loader:module',
        ],
    },
    # ...
)
```

Note that these are not synced from the Salt Master to the Minions. They must be installed independently on each Minion.

27.16.4 Module Types

The specific names used by each loading method above are as follows. See sections below for a short summary of each of these systems.

<table>
<thead>
<tr>
<th>Module Type</th>

Note: While it is possible to import modules directly with the import statement, it is strongly recommended that the appropriate dunder dictionary is used to access them instead. This is because a number of factors affect module names, module selection, and module overloading.

Auth

The auth module system allows for external authentication routines to be easily added into Salt. The auth function needs to be implemented to satisfy the requirements of an auth module. Use the pam module as an example.

See External Authentication System for more about authentication in Salt.

Beacon

- Writing Beacons

Beacons are polled by the Salt event loop to monitor non-salt processes. See Beacons for more information about the beacon system.

Cache

The minion cache is used by the master to store various information about minions. See Minion Data Cache for more information.

Cloud

Cloud modules are backend implementations used by Salt Cloud.

Engine

Engines are open-ended services managed by the Salt daemon (both master and minion). They may interact with event loop, call other modules, or a variety of non-salt tasks. See Salt Engines for complete details.

1 These modules cannot be loaded from the Salt File Server.
Execution

Execution modules make up the core of the functionality used by Salt to interact with client systems. The execution modules create the core system management library used by all Salt systems, including states, which interact with minion systems.

Execution modules are completely open ended in their execution. They can be used to do anything required on a minion, from installing packages to detecting information about the system. The only restraint in execution modules is that the defined functions always return a JSON serializable object.

Executor

Executors control how execution modules get called. The default is to just call them, but this can be customized.

File Server

The file server module system is used to create file server backends used by the Salt Master. These modules need to implement the functions used in the fileserver subsystem. Use the `gitfs` module as an example.

See File Server Backends for more information.

Grains

- **Writing Grains**

  Grain modules define extra routines to populate grains data. All defined public functions will be executed and MUST return a Python dict object. The dict keys will be added to the grains made available to the minion.

  See Grains for more.

Log Handler

Log handlers allow the logs from salt (master or minion) to be sent to log aggregation systems.

Matcher

Matcher modules are used to define the **minion targeting expressions**. For now, it is only possible to override the existing matchers (the required CLI plumbing for custom matchers is not implemented yet).

Metaproxy

Metaproxy is an abstraction layer above the existing proxy minion. It enables adding different types of proxy minions that can still load existing proxymodules.

Net API

Net API modules are the actual server implementation used by Salt API.
Output

The output modules supply the outputter system with routines to display data in the terminal. These modules are very simple and only require the `output` function to execute. The default system outputter is the `nested` module.

Pillar

External Pillars

Salt provides a mechanism for generating pillar data by calling external pillar interfaces. This document will describe an outline of an `ext_pillar` module.

Location

Salt expects to find your `ext_pillar` module in the same location where it looks for other python modules. If the `extension_modules` option in your Salt master configuration is set, Salt will look for a `pillar` directory under there and load all the modules it finds. Otherwise, it will look in your Python site-packages `salt/pillar` directory.

Configuration

The external pillars that are called when a minion refreshes its pillars is controlled by the `ext_pillar` option in the Salt master configuration. You can pass a single argument, a list of arguments or a dictionary of arguments to your pillar:

```yaml
ext_pillar:
  - example_a: some argument
  - example_b:
    - argumentA
    - argumentB
  - example_c:
    keyA: valueA
    keyB: valueB
```

The Module

Imports and Logging

Import modules your external pillar module needs. You should first include generic modules that come with stock Python:

```python
import logging
```

And then start logging. This is an idiomatic way of setting up logging in Salt:

```python
log = logging.getLogger(__name__)
```

Finally, load modules that are specific to what you are doing. You should catch import errors and set a flag that the `__virtual__` function can use later.
try:
    import weird_thing
    EXAMPLE_A_LOADED = True
except ImportError:
    EXAMPLE_A_LOADED = False

Options

If you define an `__opts__` dictionary, it will be merged into the `__opts__` dictionary handed to the `ext_pillar` function later. This is a good place to put default configuration items. The convention is to name things `modulename.option`.

`__opts__` = `{'example_a.someconfig': 137}`

Initialization

If you define an `__init__` function, it will be called with the following signature:

def __init__(__opts__):
    # Do init work here

Note: The `__init__` function is ran every time a particular minion causes the external pillar to be called, so don’t put heavy initialization code here. The `__init__` functionality is a side-effect of the Salt loader, so it may not be as useful in pillars as it is in other Salt items.

`__virtual__`

If you define a `__virtual__` function, you can control whether or not this module is visible. If it returns `False` then Salt ignores this module. If it returns a string, then that string will be how Salt identifies this external pillar in its `ext_pillar` configuration. If you’re not renaming the module, simply return `True` in the `__virtual__` function, which is the same as if this function did not exist, then, the name Salt’s `ext_pillar` will use to identify this module is its conventional name in Python.

This is useful to write modules that can be installed on all Salt masters, but will only be visible if a particular piece of software your module requires is installed.

```python
# This external pillar will be known as 'example_a'
def __virtual__():
    if EXAMPLE_A_LOADED:
        return True
    return False
```

```python
# This external pillar will be known as 'something_else'
__virtualname__ = 'something_else'
def __virtual__():
    if EXAMPLE_A_LOADED:
        return __virtualname__
    return False
```
**ext_pillar**

This is where the real work of an external pillar is done. If this module is active and has a function called `ext_pillar`, whenever a minion updates its pillar this function is called.

How it is called depends on how it is configured in the Salt master configuration. The first argument is always the current pillar dictionary, this contains pillar items that have already been added, starting with the data from `pillar_roots`, and then from any already-ran external pillars.

Using our example above:

```
ext_pillar( id, pillar, 'some argument' )   # example_a
ext_pillar( id, pillar, 'argumentA', 'argumentB' )   # example_b
ext_pillar( id, pillar, keyA='valueA', keyB='valueB' )   # example_c
```

In the example_a case, pillar will contain the items from the `pillar_roots`. In example_b pillar will contain that plus the items added by example_a, and in example_c pillar will contain that plus the items added by example_b. In all three cases, `id` will contain the ID of the minion making the pillar request.

This function should return a dictionary, the contents of which are merged in with all of the other pillars and returned to the minion. Note: this function is called once for each minion that fetches its pillar data.

```python
def ext_pillar( minion_id, pillar, *args, **kwargs ):
    my_pillar = {'external_pillar': {}}
    my_pillar['external_pillar'] = get_external_pillar_dictionary()
    return my_pillar
```

You can call pillar with the dictionary's top name to retrieve its data. From above example, 'external_pillar' is the top dictionary name. Therefore:

```
salt '*' pillar.get external_pillar
```

You shouldn’t just add items to pillar and return that, since that will cause Salt to merge data that already exists. Rather, just return the items you are adding or changing. You could, however, use pillar in your module to make some decision based on pillar data that already exists.

This function has access to some useful globals:

- `__opts__`: A dictionary of mostly Salt configuration options. If you had an `__opts__` dictionary defined in your module, those values will be included.
- `__salt__`: A dictionary of Salt module functions, useful so you don’t have to duplicate functions that already exist. E.g. `__salt__['cmd.run']('ls -l')` Note, runs on the master
- `__grains__`: A dictionary of the grains of the minion making this pillar call.

**Example configuration**

As an example, if you wanted to add external pillar via the `cmd_json` external pillar, add something like this to your master config:

```
ext_pillar:
    - cmd_json: 'echo {"arg":"value"}"
```
Reminder

Just as with traditional pillars, external pillars must be refreshed in order for minions to see any fresh data:

```
salt '*' saltutil.refresh_pillar
```

Used to define optional external pillar systems. The pillar generated via the filesystem pillar is passed into external pillars. This is commonly used as a bridge to database data for pillar, but is also the backend to the libvirt state used to generate and sign libvirt certificates on the fly.

Proxy

`Proxy Minions` are a way to manage devices that cannot run a full minion directly.

Renderers

Renderers are the system used to render sls files into salt highdata for the state compiler. They can be as simple as the `py` renderer and as complex as `stateconf` and `pydsl`.

Returners

Returners are used to send data from minions to external sources, commonly databases. A full returner will implement all routines to be supported as an external job cache. Use the `redis` returner as an example.

Roster

The `Roster system` is used by Salt SSH to enumerate devices.

Runners

Runners are purely master-side execution sequences.

SDB

- `Writing SDB Modules`

SDB is a way to store data that’s not associated with a minion. See `Storing Data in Other Databases`.

Serializer

Primarily used with `file.serialize`.

State

State modules are used to define the state interfaces used by Salt States. These modules are restrictive in that they must follow a number of rules to function properly.
Note: State modules define the available routines in sls files. If calling an execution module directly is desired, take a look at the module state.

**SPM pkgdb**

- *SPM Development Guide: Package Database*

pkgdb modules provide storage backends to the package database.

**SPM pkgfiles**

- *SPM Development Guide: Package Database*

pkgfiles modules handle the actual installation.

**SSH Wrapper**

Replacement execution modules for Salt SSH.

**Thorium**

Modules for use in the Thorium event reactor.

**Tokens**

Token stores for External Authentication. See the salt.tokens docstring for details.

Note: The runner to load tokens modules is saltutil.sync_eauth_tokens.

**Tops**

Tops modules are used to convert external data sources into top file data for the state system.

**Util**

Just utility modules to use with other modules via __utils__ (see Dunder Dictionaries).

**Wheel**

The wheel system is used to manage master side management routines. These routines are primarily intended for the API to enable master configuration.
27.17 Salt Extend

salt-extend is a templating tool for extending SaltStack. If you’re looking to add a module to SaltStack, then the salt-extend utility can guide you through the process.

You can use Salt Extend to quickly create templated modules for adding new behaviours to some of the module subsystems within Salt.

Salt Extend takes a template directory and merges it into a SaltStack source code directory.

27.17.1 Command line usage

See salt-extend

27.17.2 Choosing a template

The following templates are available:

module

Creates a new execution module within salt/modules/{{module_name}}.py

module_unit

Creates a new execution module unit test suite within tests/unit/modules/test_{{module_name}}.py

state

Creates a new state module within salt/states/{{module_name}}.py

state_unit

Creates a new state module unit test suite within tests/unit/states/test_{{module_name}}.py

27.17.3 Adding templates

1. Create a directory under <src>/templates
2. Create a file template.yml containing properties for
   • description - a description of the template
   • questions - a collection of additional questions to ask the user, the name of the item will be used as the key in the context dictionary within the jinja template.
     - question - The question to ask the user, as a string
     - default - (optional) the default value, can contain Jinja2 template syntax and has access to the default context properties
Example template.yml

```yaml
description: "Execution module"
questions:
  depending_libraries:
    question: "What libraries does this module depend upon?"
  virtual_name:
    question: "What module virtual name to use?"
    default: "{{module_name}}"

3. Create the files within <src>/templates/<your template> to match the target

Note: File names can contain Jinja 2 template syntax, e.g. `{{module_name}}.py`'

Example file in the template directory

```python
print('Hello {{module_name}}')
__virtual__ = '{{__virtual_name__}}'
```

Default context properties

The default context provides the following properties

- **description**: A description of the template
- **short_description**: A short description of the module as entered by the user
- **version**: The version name of the next release
- **module_name**: The module name as entered by the user
- **release_date**: The current date in the format YYYY-MM-DD
- **year**: The current year in the format YYYY

As well as any additional properties entered from the questions section of `template.yml`

### 27.17.4 API

**salt.utils.extend module**

**SaltStack Extend**

A templating tool for extending SaltStack.

Takes a template directory and merges it into a SaltStack source code directory. This tool uses Jinja2 for templating.

This tool is accessed using `salt-extend`

```python
codeauthor Anthony Shaw <anthonyshaw@apache.org>
salt.utils.extend.apply_template(template_dir, output_dir, context)
```

Apply the template from the template directory to the output using the supplied context dict.

**Parameters**

- **src** (str) – The source path
• **dst** (str) – The destination path
• **context** (dict) – The dictionary to inject into the Jinja template as context

```python
salt.utils.extend.run(extension=None, name=None, description=None, salt_dir=None, merge=False, temp_dir=None)
```

A template factory for extending the salt ecosystem

**Parameters**

- **extension** (str) – The extension type, e.g. 'module', 'state', if omitted, user will be prompted
- **name** (str) – Python-friendly name for the module, if omitted, user will be prompted
- **description** (str) – A description of the extension, if omitted, user will be prompted
- **salt_dir** (str) – The targeted Salt source directory
- **merge** (bool) – Merge with salt directory, False to keep separate, True to merge trees.
- **temp_dir** (str) – The directory for generated code, if omitted, system temp will be used

## 27.18 Salt’s Test Suite

Salt comes with a powerful integration and unit test suite allowing for the fully automated run of integration and/or unit tests from a single interface.

To learn the basics of how Salt’s test suite works, be sure to check out the *Salt’s Test Suite: An Introduction* tutorial.

### 27.18.1 Test Directory Structure

Salt’s test suite is located in the **tests** directory in the root of Salt’s codebase. The test suite is divided into two main groups:

- **Integration Tests**
- **Unit Tests**

Within each of these groups, the directory structure roughly mirrors the structure of Salt’s own codebase. Notice that there are directories for **states**, **modules**, **runners**, **output**, and more in each testing group.

The files that are housed in the **modules** directory of either the unit or the integration testing factions contain respective integration or unit test files for Salt execution modules.

**Note:** Salt’s test framework provides for the option to only run tests which correspond to a given file (or set of files), via the **--from-filenames** argument to **runtests.py**:

```
python /path/to/runtests.py --from-filenames=salt/modules/foo.py
```

Therefore, where possible, test files should be named to match the source files they are testing. For example, when writing tests for **salt/modules/foo.py**, unit tests should go into **tests/unit/modules/test_foo.py**, and integration tests should go into **tests/integration/modules/test_foo.py**.

However, integration tests are organized differently from unit tests, and this may not always be plausible. In these cases, to ensure that the proper tests are run for these files, they must be mapped in **tests/filename_map.yml**.

The filename map is used to supplement the test framework’s filename matching logic. This allows one to ensure that states corresponding to an execution module are also tested when **--from-filenames** includes that execution module. It can also be used for those cases where the path to a test file doesn’t correspond directly to the file which
is being tested (e.g. the `shell`, `spm`, and `ssh` integration tests, among others). Both glob expressions and regular expressions are permitted in the filename map.

**Important:** Test modules which don’t map directly to the source file they are testing (using the naming convention described above), must be added to the `ignore` tuple in `tests/unit/test_module_names.py`, in the `test_module_name_source_match` function. This unit test ensures that we maintain the naming convention for test files.

### Integration Tests

The Integration section of Salt’s test suite start up a number of Salt daemons to test functionality in a live environment. These daemons include two Salt Masters, one Syndic, and two Minions. This allows the Syndic interface to be tested and Master/Minion communication to be verified. All of the integration tests are executed as live Salt commands sent through the started daemons.

Integration tests are particularly good at testing modules, states, and shell commands, among other segments of Salt’s ecosystem. By utilizing the integration test daemons, integration tests are easy to write. They are also SaltStack’s generally preferred method of adding new tests.

The discussion in the *Integration vs. Unit* section of the testing tutorial is beneficial in learning why you might want to write integration tests vs. unit tests. Both testing arenas add value to Salt’s test suite and you should consider adding both types of tests if possible and appropriate when contributing to Salt.

- Integration Test Documentation

### Unit Tests

Unit tests do not spin up any Salt daemons, but instead find their value in testing singular implementations of individual functions. Instead of testing against specific interactions, unit tests should be used to test a function’s logic as well as any `return` or `raises` statements. Unit tests also rely heavily on mocking external resources.

The discussion in the *Integration vs. Unit* section of the testing tutorial is useful in determining when you should consider writing unit tests instead of, or in addition to, integration tests when contributing to Salt.

- Unit Test Documentation

### 27.18.2 Running The Tests

There are requirements, in addition to Salt’s requirements, which need to be installed in order to run the test suite. Install one of the lines below, depending on the relevant Python version:

```bash
pip install -r requirements/dev_python27.txt
pip install -r requirements/dev_python34.txt
```

To be able to run integration tests which utilizes ZeroMQ transport, you also need to install additional requirements for it. Make sure you have installed the C/C++ compiler and development libraries and header files needed for your Python version.

This is an example for RedHat-based operating systems:

```bash
yum install gcc gcc-c++ python-devel
pip install -r requirements/zeromq.txt
```
On Debian, Ubuntu or their derivatives run the following commands:

```
apt-get install build-essential python-dev
pip install -r requirements/zeromq.txt
```

This will install the latest `pycrypto` and `pyzmq` (with bundled `libzmq`) Python modules required for running integration tests suite.

Once all requirements are installed, use `runtests.py` script to run all of the tests included in Salt’s test suite:

```
python tests/runtests.py
```

For more information about options you can pass the test runner, see the `--help` option:

```
python tests/runtests.py --help
```

An alternative way of invoking the test suite is available in `setup.py`:

```
./setup.py test
```

### Running Test Subsections

Instead of running the entire test suite all at once, which can take a long time, there are several ways to run only specific groups of tests or individual tests:

- Run **unit tests only**: `python tests/runtests.py --unit-tests`
- Run unit and integration tests for states: `python tests/runtests.py --state`
- Run integration tests for an individual module: `python tests/runtests.py -n integration.modules.virt`
- Run unit tests for an individual module: `python tests/runtests.py -n unit.modules.virt_test`
- Run an individual test by using the class and test name (this example is for the `test_default_kvm_profile` test in the `integration.module.virt`): `python tests/runtests.py -n integration.module.virt.VirtTest.test_default_kvm_profile`

For more specific examples of how to run various test subsections or individual tests, please see the *Test Selection Options* documentation or the *Running Specific Tests* section of the *Salt’s Test Suite: An Introduction* tutorial.

### Running Unit Tests Without Integration Test Daemons

Since the unit tests do not require a master or minion to execute, it is often useful to be able to run unit tests individually, or as a whole group, without having to start up the integration testing daemons. Starting up the master, minion, and syndic daemons takes a lot of time before the tests can even start running and is unnecessary to run unit tests. To run unit tests without invoking the integration test daemons, simply run the `runtests.py` script with `--unit` argument:

```
python tests/runtests.py --unit
```

All of the other options to run individual tests, entire classes of tests, or entire test modules still apply.
Running Destructive Integration Tests

Salt is used to change the settings and behavior of systems. In order to effectively test Salt’s functionality, some integration tests are written to make actual changes to the underlying system. These tests are referred to as “destructive tests”. Some examples of destructive tests are changes may be testing the addition of a user or installing packages. By default, destructive tests are disabled and will be skipped.

Generally, destructive tests should clean up after themselves by attempting to restore the system to its original state. For instance, if a new user is created during a test, the user should be deleted after the related test(s) have completed. However, no guarantees are made that test clean-up will complete successfully. Therefore, running destructive tests should be done with caution.

Note: Running destructive tests will change the underlying system. Use caution when running destructive tests.

To run tests marked as destructive, set the --run-destructive flag:

```bash
python tests/runtests.py --run-destructive
```

Running Cloud Provider Tests

Salt’s testing suite also includes integration tests to assess the successful creation and deletion of cloud instances using Salt-Cloud for providers supported by Salt-Cloud.

The cloud provider tests are off by default and run on sample configuration files provided in tests/integration/files/conf/cloud.providers.d/. In order to run the cloud provider tests, valid credentials, which differ per provider, must be supplied. Each credential item that must be supplied is indicated by an empty string value and should be edited by the user before running the tests. For example, DigitalOcean requires a client key and an api key to operate. Therefore, the default cloud provider configuration file for DigitalOcean looks like this:

```
digitalocean-config:
    driver: digitalocean
    client_key: ''
    api_key: ''
    location: New York 1
```

As indicated by the empty string values, the client_key and the api_key must be provided:

```
digitalocean-config:
    driver: digitalocean
    client_key: wFGEwgregeqw3435gDger
    api_key: GDE43t43REGTrkilg43934t34qT43t4dgegerGEgg
    location: New York 1
```

Note: When providing credential information in cloud provider configuration files, do not include the single quotes.

Once all of the valid credentials for the cloud provider have been supplied, the cloud provider tests can be run by setting the --cloud-provider-tests flag:

```
./tests/runtests.py --cloud-provider-tests
```
Running The Tests In A Docker Container

The test suite can be executed under a docker container using the --docked option flag. The docker container must be properly configured on the system invoking the tests and the container must have access to the internet.

Here’s a simple usage example:

```
python tests/runtests.py --docked=ubuntu-12.04 -v
```

The full docker container repository can also be provided:

```
python tests/runtests.py --docked=salttest/ubuntu-12.04 -v
```

The SaltStack team is creating some containers which will have the necessary dependencies pre-installed. Running the test suite on a container allows destructive tests to run without making changes to the main system. It also enables the test suite to run under a different distribution than the one the main system is currently using.

The current list of test suite images is on Salt’s docker repository.

Custom docker containers can be provided by submitting a pull request against Salt’s docker Salt test containers repository.

27.18.3 Automated Test Runs

SaltStack maintains a Jenkins server to allow for the execution of tests across supported platforms. The tests executed from Salt’s Jenkins server create fresh virtual machines for each test run, then execute destructive tests on the new, clean virtual machine.

SaltStack’s Jenkins server continuously runs the entire test suite, including destructive tests, on an array of various supported operating systems throughout the day. Each actively supported branch of Salt’s repository runs the tests located in the respective branch’s code. Each set of branch tests also includes a pylint run. These branch tests help ensure the viability of Salt code at any given point in time as pull requests are merged into branches throughout the day.

In addition to branch tests, SaltStack’s Jenkins server also runs tests on pull requests. These pull request tests include a smaller set of virtual machines that run on the branch tests. The pull request tests, like the branch tests, include a pylint test as well.

When a pull request is submitted to Salt’s repository on GitHub, the suite of pull request tests are started by Jenkins. These tests are used to gauge the pull request’s viability to merge into Salt’s codebase. If these initial tests pass, the pull request can then merged into the Salt branch by one of Salt’s core developers, pending their discretion. If the initial tests fail, core developers may request changes to the pull request. If the failure is unrelated to the changes in question, core developers may merge the pull request despite the initial failure.

As soon as the pull request is merged, the changes will be added to the next branch test run on Jenkins.

For a full list of currently running test environments, go to http://jenkins.saltstack.com.

Using Salt-Cloud on Jenkins

For testing Salt on Jenkins, SaltStack uses Salt-Cloud to spin up virtual machines. The script using Salt-Cloud to accomplish this is open source and can be found here: https://github.com/saltstack/salt/blob/master/tests/jenkins.py.
27.18.4 Writing Tests

The salt testing infrastructure is divided into two classes of tests, integration tests and unit tests. These terms may be defined differently in other contexts, but for Salt they are defined this way:

- Unit Test: Tests which validate isolated code blocks and do not require external interfaces such as salt-call or any of the salt daemons.
- Integration Test: Tests which validate externally accessible features.

Salt testing uses unittest2 from the python standard library and MagicMock.

- Writing integration tests
- Writing unit tests

Naming Conventions

Any function in either integration test files or unit test files that is doing the actual testing, such as functions containing assertions, must start with test_:

```python
def test_user_present(self):
```

When functions in test files are not prepended with test_, the function acts as a normal, helper function and is not run as a test by the test suite.

Submitting New Tests

Which branch of the Salt codebase should new tests be written against? The location of where new tests should be submitted depends largely on the reason you’re writing the tests.

Tests for New Features

If you are adding new functionality to Salt, please write the tests for this new feature in the same pull request as the new feature. New features should always be submitted to the master branch.

If you have already submitted the new feature, but did not write tests in the original pull request that has already been merged, please feel free to submit a new pull request containing tests. If the feature was recently added to Salt’s master branch, then the tests should be added there as well. However, if the feature was added to master some time ago and is already present in one or more release branches, please refer to the Tests for Entire Files or Functions section below for more details about where to submit tests for functions or files that do not already have tests.

Tests to Accompany a Bugfix

If you are writing tests for code that fixes a bug in Salt, please write the test in the same pull request as the bugfix. If you’re unsure of where to submit your bugfix and accompanying test, please review the Which Salt Branch? documentation in Salt’s Contributing guide.

Tests for Entire Files or Functions

Sometimes entire files in Salt are completely untested. If you are writing tests for a file that doesn’t have any tests written for it, write your test against the earliest supported release branch that contains the file or function you’re testing.
Once your tests are submitted in a pull request and is merged into the branch in question, the tests you wrote will be merged-forward by SaltStack core engineers and the new tests will propagate to the newer release branches. That way the tests you wrote will apply to all current and relevant release branches, and not just the master branch, for example. This methodology will help protect against regressions on older files in Salt’s codebase.

There may be times when the tests you write against an older branch fail in the merge-forward process because functionality has changed in newer release branches. In these cases, a Salt core developer may reach out to you for advice on the tests in question if the path forward is unclear.

**Note:** If tests are written against a file in an older release branch and then merged forward, there may be new functionality in the file that is present in the new release branch that is untested. It would be wise to see if new functionality could use additional testing once the test file has propagated to newer release branches.

### Test Helpers

Several Salt-specific helpers are available. A full list is available by inspecting functions exported in tests.support.helpers.

- **@expensiveTest** – Designates a test which typically requires a relatively costly external resource, like a cloud virtual machine. This decorator is not normally used by developers outside of the Salt core team.
- **@destructiveTest** – Marks a test as potentially destructive. It will not be run by the test runner unless the --run-destructive test is expressly passed.
- **@requires_network** – Requires a network connection for the test to operate successfully. If a network connection is not detected, the test will not run.
- **@requires_salt_modules** – Requires all the modules in a list of modules in order for the test to be executed. Otherwise, the test is skipped.
- **@requires_system_grains** – Loads and passes the grains on the system as an keyword argument to the test function with the name grains.
- **@skip_if_binaries_missing([‘list’, ‘of’, ‘binaries’])** – If called from inside a test, the test will be skipped if the binaries are not all present on the system.
- **@skip_if_not_root** – If the test is not executed as root, it will be skipped.
- **@with_system_user** – Creates and optionally destroys a system user within a test case. See implementation details in tests.support.helpers for details.
- **@with_system_group** – Creates and optionally destroys a system group within a test case. See implementation details in tests.support.helpers for details.
- **@with_system_user_and_group** – Creates and optionally destroys a system user and group within a test case. See implementation details in tests.support.helpers for details.

### 27.19 Integration Tests

The Salt integration tests come with a number of classes and methods which allow for components to be easily tested. These classes are generally inherited from and provide specific methods for hooking into the running integration test environment created by the integration tests.

It is noteworthy that since integration tests validate against a running environment that they are generally the preferred means to write tests.
The integration system is all located under tests/integration in the Salt source tree. Each directory within tests/integration corresponds to a directory in Salt’s tree structure. For example, the integration tests for the test.py Salt module that is located in salt/modules should also be named test.py and reside in tests/integration/modules.

27.19.1 Preparing to Write Integration Tests

This guide assumes that your Salt development environment is already configured and that you have a basic understanding of contributing to the Salt codebase. If you’re unfamiliar with either of these topics, please refer to the Installing Salt for Development and the Contributing pages, respectively.

This documentation also assumes that you have an understanding of how to run Salt’s test suite, including running the test subsections, and running a single integration test file, class, or individual test.

27.19.2 Best Practices

Integration tests should be written to the following specifications.

What to Test?

Since integration tests are used to validate against a running Salt environment, integration tests should be written with the Salt components, and their various interactions, in mind.

• Isolate testing functionality. Don’t rely on the pass or failure of other, separate tests.

• Individual tests should test against a single behavior.

• Since it occasionally takes some effort to “set up” an individual test, it may be necessary to call several functions within a single test. However, be sure that once the work has been done to set up a test, make sure you are clear about the functionality that is being tested.

Naming Conventions

Test names and docstrings should indicate what functionality is being tested. Test functions are named test_<fcn>_test-name where <fcn> is the function being tested and <test-name> describes the behavior being tested.

In order for integration tests to get picked up during a run of the test suite, each individual test must be prepended with the test_ naming syntax, as described above.

If a function does not start with test_, then the function acts as a "normal" function and is not considered a testing function. It will not be included in the test run or testing output.

The setUp and tearDown Functions

There are two special functions that can be utilized in the integration side of Salt’s test suite: setUp and tearDown. While these functions are not required in all test files, there are many examples in Salt’s integration test suite illustrating the broad usefulness of each function.

The setUp function is used to set up any repetitive or useful tasks that the tests in a test class need before running. For example, any of the mac_* integration tests should only run on macOS machines. The setUp function can be used to test for the presence of the Darwin kernel. If the Darwin kernel is not present, then the test should be skipped.
def setUp(self):
    '''
    Sets up test requirements
    '''
    os_grain = self.run_function('grains.item', [{'kernel']])
    if os_grain['kernel'] not in 'Darwin':
        self.skipTest('Test not applicable to "{kernel}" kernel'.format(**os_grain))

The setUp function can be used for many things. The above code snippet is only one example. Another example might be to ensure that a particular setting is present before running tests that would require the setting.

The tearDown function is used to clean up after any tests. This function is useful for restoring any settings that might have been changed during the test run.

Note: The setUp and tearDown functions run before and after each test in the test class that the setUp and tearDown functions are defined.

Be sure to read the Destructive vs Non-Destructive Tests section when using any kind of destructive functions that might alter the system running the test suite in either the setUp or tearDown function definitions.

Testing Order

The test functions within a test class do not run in the order they were defined, but instead run in lexicographical order.

Note that if any setUp or tearDown functions are defined in the class, those functions will run before (for setUp) or after (for tearDown) each test case.

27.19.3 Integration Classes

The integration classes are located in tests/integration/__init__.py and can be extended therein. There are four classes available to extend:

- ModuleCase
- ShellCase
- SSHCase
- SyndicCase

ModuleCase

Used to define executions run via the master to minions and to call single modules and states. The available testing functions are:
run_function

Run a single salt function and condition the return down to match the behavior of the raw function call. This will run the command and only return the results from a single minion to verify.

run_state

Run the state.single command and return the state return structure.

minion_run

Run a single salt function on the 'minion' target and condition the return down to match the behavior of the raw function call.

ShellCase

Shell out to the scripts which ship with Salt. The testing functions are:

run_cp

Execute salt-cp. Pass in the argument string as it would be passed on the command line.

run_call

Execute salt-call, pass in the argument string as it would be passed on the command line.

run_cloud

Execute the salt-cloud command. Pass in the argument string as it would be passed on the command line.

run_key

Execute the salt-key command. Pass in the argument string as it would be passed on the command line.

run_run

Execute the salt-run command. Pass in the argument string as it would be passed on the command line.

run_run_plus

Execute the runner function the and return the return data and output in a dict
run_salt

Execute the salt command. Pass in the argument string as it would be passed on the command line.

run_script

Execute a salt script with the given argument string.

run_ssh

Execute the salt-ssh. Pass in the argument string as it would be passed on the command line.

SSHCase

Used to execute remote commands via salt-ssh. The available methods are as follows:

run_function

Run a single salt function via salt-ssh and condition the return down to match the behavior of the raw function call. This will run the command and only return the results from a single minion to verify.

SyndicCase

Used to execute remote commands via a syndic and is only used to verify the capabilities of the Salt Syndic. The available methods are as follows:

run_function

Run a single salt function and condition the return down to match the behavior of the raw function call. This will run the command and only return the results from a single minion to verify.

27.19.4 Examples

The following sections define simple integration tests present in Salt’s integration test suite for each type of testing class.

Module Example via ModuleCase Class

Import the integration module, this module is already added to the python path by the test execution. Inherit from the integration.ModuleCase class.

Now the workhorse method run_function can be used to test a module:
import os
import tests.integration as integration

class TestModuleTest(integration.ModuleCase):
    '''
    Validate the test module
    '''
    def test_ping(self):
        '''
test.ping
        '''
        test.ping
        self.assertTrue(self.run_function('test.ping'))

def test_echo(self):
    '''
test.echo
    '''
    test.echo
    self.assertEqual(self.run_function('test.echo', ['text']), 'text')

The first example illustrates the testing master issuing a `test.ping` call to a testing minion. The test asserts that the minion returned with a True value to the master from the `test.ping` call.

The second example similarly verifies that the minion executed the `test.echo` command with the text argument. The `assertEqual` call maintains that the minion ran the function and returned the data as expected to the master.

**Shell Example via ShellCase**

Validating the shell commands can be done via shell tests:

import sys
import shutil
import tempfile
import tests.integration as integration

class KeyTest(integration.ShellCase):
    '''
    Test salt-key script
    '''
    _call_binary_ = 'salt-key'

def test_list(self):
    '''
test salt-key -L
    '''
    test salt-key -L
    data = self.run_key('-L')
    expect = ['Unaccepted Keys:', 'Accepted Keys:', 'minion', 'sub_minion', 'Rejected:', '']
    self.assertEqual(data, expect)

This example verifies that the `salt-key` command executes and returns as expected by making use of the `run_key`
method.

**SSH Example via SSHCase**

Testing salt-ssh functionality can be done using the SSHCase test class:

```python
import tests.integration as integration

class SSHGrainsTest(integration.SSHCase):
    '''
    Test salt-ssh grains functionality
    Depend on proper environment set by integration.SSHCase class
    '''
    def test_grains_id(self):
        '''
        Test salt-ssh grains id work for localhost.
        '''
        cmd = self.run_function('grains.get', ['id'])
        self.assertEqual(cmd, 'localhost')
```

**Testing Event System via SaltMinionEventAssertsMixin**

The fundamentally asynchronous nature of Salt makes testing the event system a challenge. The SaltMinionEventAssertsMixin provides a facility for testing that events were received on a minion event bus.

```python
import tests.integration as integration
import salt.utils.event

class TestEvent(integration.SaltEventAssertsMixin):
    '''
    Example test of firing an event and receiving it
    '''
    def test_event(self):
        e = salt.utils.event.get_event('minion', sock_dir=self.minion_opts['sock_dir'], opts=self.minion_opts)
        e.fire_event({'a': 'b'}, '/test_event')
        self/assertMinionEventReceived({'a': 'b'})
```

**Syndic Example via SyndicCase**

Testing Salt’s Syndic can be done via the SyndicCase test class:

```python
import tests.integration as integration

class TestSyndic(integration.SyndicCase):
    '''
    Validate the syndic interface by testing the test module
    '''
    def test_ping(self):
```

(continues on next page)
This example verifies that a test.ping command is issued from the testing master, is passed through to the testing syndic, down to the minion, and back up again by using the run_function located within the SyndicCase test class.

### 27.19.5 Integration Test Files

Since using Salt largely involves configuring states, editing files, and changing system data, the integration test suite contains a directory named files to aid in testing functions that require files. Various Salt integration tests use these example files to test against instead of altering system files and data.

Each directory within tests/integration/files contains files that accomplish different tasks, based on the needs of the integration tests using those files. For example, tests/integration/files/ssh is used to bootstrap the test runner for salt-ssh testing, while tests/integration/files/pillar contains files storing data needed to test various pillar functions.

The tests/integration/files directory also includes an integration state tree. The integration state tree can be found at tests/integration/files/file/base.

The following example demonstrates how integration files can be used with ModuleCase to test states:

```python
# Import python libs
from __future__ import absolute_import
import os
import shutil

# Import Salt Testing libs
from tests.support.case import ModuleCase
from tests.support.paths import FILES, TMP
from tests.support.mixins import SaltReturnAssertsMixin

# Import salt libs
import salt.utils.files

HFILE = os.path.join(TMP, 'hosts')

class HostTest(ModuleCase, SaltReturnAssertsMixin):
    '''
    Validate the host state
    '''

    def setUp(self):
        shutil.copyfile(os.path.join(FILES, 'hosts'), HFILE)
        super(HostTest, self).setUp()

    def tearDown(self):
        if os.path.exists(HFILE):
            os.remove(HFILE)
            super(HostTest, self).tearDown()

    def test_present(self):
        '''
        Test that a host state is present
        '''
```

(continues on next page)
To access the integration files, a variable named FILES points to the tests/integration/files directory. This is where the referenced host.present sls file resides.

In addition to the static files in the integration state tree, the location TMP can also be used to store temporary files that the test system will clean up when the execution finishes.

### 27.19.6 Destructive vs Non-Destructive Tests

Since Salt is used to change the settings and behavior of systems, one testing approach is to run tests that make actual changes to the underlying system. This is where the concept of destructive integration tests comes into play. Tests can be written to alter the system they are running on. This capability is what fills in the gap needed to properly test aspects of system management like package installation.

Any test that changes the underlying system in any way, such as creating or deleting users, installing packages, or changing permissions should include the @destructive decorator to signal system changes and should be written with care. System changes executed within a destructive test should also be restored once the related tests have completed. For example, if a new user is created to test a module, the same user should be removed after the test is completed to maintain system integrity.

To write a destructive test, import, and use the destructiveTest decorator for the test method:

```python
import tests.integration as integration
from tests.support.helpers import destructiveTest, skip_if_not_root
class DestructiveExampleModuleTest(integration.ModuleCase):
    
    @destructiveTest
    @skip_if_not_root
    def test_user_not_present(self):
        
        # This is a DESTRUCTIVE TEST it creates a new user on the minion. And then destroys that user.

        ret = self.run_state('user.present', name='salt_test')
        self.assertIn(ret)
        
        ret = self.run_state('user.absent', name='salt_test')
        self.assertIn(ret)
```
27.19.7 Cloud Provider Tests

Cloud provider integration tests are used to assess Salt-Cloud’s ability to create and destroy cloud instances for various supported cloud providers. Cloud provider tests inherit from the ShellCase Integration Class.

Any new cloud provider test files should be added to the tests/integration/cloud/providers/ directory. Each cloud provider test file also requires a sample cloud profile and cloud provider configuration file in the integration test file directory located at tests/integration/files/conf/cloud.*.d/.

The following is an example of the default profile configuration file for Digital Ocean, located at: tests/integration/files/conf/cloud.profiles.d/digitalocean.conf:

```
adigitalocean-test:
  provider: digitalocean-config
  image: Ubuntu 14.04 x64
  size: 512MB
```

Each cloud provider requires different configuration credentials. Therefore, sensitive information such as API keys or passwords should be omitted from the cloud provider configuration file and replaced with an empty string. The necessary credentials can be provided by the user by editing the provider configuration file before running the tests.

The following is an example of the default provider configuration file for Digital Ocean, located at: tests/integration/files/conf/cloud.providers.d/digitalocean.conf:

```
digitalocean-config:
  driver: digitalocean
  client_key: ''
  api_key: ''
  location: New York 1
```

In addition to providing the necessary cloud profile and provider files in the integration test suite file structure, appropriate checks for if the configuration files exist and contain valid information are also required in the test class’s setUp function:

```python
from tests.support.case import ShellCase
from tests.support.paths import FILES

class LinodeTest(ShellCase):
    '''
    Integration tests for the Linode cloud provider in Salt-Cloud
    '''

    def setUp(self):
        '''
        Sets up the test requirements
        '''
        super(LinodeTest, self).setUp()

        # check if appropriate cloud provider and profile files are present
        profile_str = 'linode-config:
        provider = 'linode'
        providers = self.run_cloud('--list-providers')
        if profile_str not in providers:
            self.skipTest(
                'Configuration file for {0} was not found. Check {0}.conf files ' 
                'in tests/integration/files/conf/cloud.*.d/ to run these tests.' 
                .format(provider)
            )
```

(continues on next page)
Repeatedly creating and destroying instances on cloud providers can be costly. Therefore, cloud provider tests are off by default and do not run automatically. To run the cloud provider tests, the `--cloud-provider-tests` flag must be provided:

```
./tests/runtests.py --cloud-provider-tests
```

Since cloud provider tests do not run automatically, all provider tests must be preceded with the `@expensiveTest` decorator. The expensive test decorator is necessary because it signals to the test suite that the `--cloud-provider-tests` flag is required to run the cloud provider tests.

To write a cloud provider test, import, and use the `expensiveTest` decorator for the test function:

```python
from tests.support.helpers import expensiveTest

@expensiveTest
def test_instance(self):
    '''
    Test creating an instance on Linode
    '''
    name = 'linode-testing'

    # create the instance
    instance = self.run_cloud('-p linode-test {0}'.format(name))
    str = '{0}'.format(name)

    # check if instance with salt installed returned as expected
    try:
        self.assertIn(str, instance)
    except AssertionError:
        self.run_cloud('-d {0} --assume-yes'.format(name))
        raise

    # delete the instance
    delete = self.run_cloud('-d {0} --assume-yes'.format(name))
    str = 'True'
    try:
        self.assertIn(str, delete)
    except AssertionError:
        raise
```
27.19.8 Adding New Directories

If the corresponding Salt directory does not exist within tests/integration, the new directory must be created along with the appropriate test file to maintain Salt’s testing directory structure.

In order for Salt’s test suite to recognize tests within the newly created directory, options to run the new integration tests must be added to tests/runtests.py. Examples of the necessary options that must be added can be found here: https://github.com/saltstack/salt/blob/master/tests/runtests.py. The functions that need to be edited are setup_additional_options, validate_options, and run_integration_tests.

27.20 Writing Unit Tests

27.20.1 Introduction

Like many software projects, Salt has two broad-based testing approaches – integration testing and unit testing. While integration testing focuses on the interaction between components in a sandboxed environment, unit testing focuses on the singular implementation of individual functions.

Unit tests should be used specifically to test a function’s logic. Unit tests rely on mocking external resources.

While unit tests are good for ensuring consistent results, they are most useful when they do not require more than a few mocks. Effort should be made to mock as many external resources as possible. This effort is encouraged, but not required. Sometimes the isolation provided by completely mocking the external dependencies is not worth the effort of mocking those dependencies.

In these cases, requiring an external library to be installed on the system before running the test file is a useful way to strike this balance. For example, the unit tests for the MySQL execution module require the presence of the MySQL python bindings on the system running the test file before proceeding to run the tests.

Overly detailed mocking can also result in decreased test readability and brittleness as the tests are more likely to fail when the code or its dependencies legitimately change. In these cases, it is better to add dependencies to the test runner dependency state.

27.20.2 Preparing to Write a Unit Test

This guide assumes that your Salt development environment is already configured and that you have a basic understanding of contributing to the Salt codebase. If you’re unfamiliar with either of these topics, please refer to the Installing Salt for Development and the Contributing pages, respectively.

This documentation also assumes that you have an understanding of how to run Salt’s test suite, including running the unit test subsection, running the unit tests without testing daemons to speed up development wait times, and running a unit test file, class, or individual test.

27.20.3 Best Practices

Unit tests should be written to the following specifications.

What to Test?

Since unit testing focuses on the singular implementation of individual functions, unit tests should be used specifically to test a function’s logic. The following guidelines should be followed when writing unit tests for Salt’s test suite:
• Each `raise` and `return` statement needs to be independently tested.
• Isolate testing functionality. Don’t rely on the pass or failure of other, separate tests.
• Test functions should contain only one assertion.
• Many Salt execution modules are merely wrappers for distribution-specific functionality. If there isn’t any logic present in a simple execution module, consider writing an integration test instead of heavily mocking a call to an external dependency.

Mocking Test Data

A reasonable effort needs to be made to mock external resources used in the code being tested, such as APIs, function calls, external data either globally available or passed in through function arguments, file data, etc.
• Test functions should contain only one assertion and all necessary mock code and data for that assertion.
• External resources should be mocked in order to "block all of the exits". If a test function fails because something in an external library wasn’t mocked properly (or at all), this test is not addressing all of the "exits" a function may experience. We want the Salt code and logic to be tested, specifically.
• Consider the fragility and longevity of a test. If the test is so tightly coupled to the code being tested, this makes a test unnecessarily fragile.
• Make sure you are not mocking the function to be tested so vigorously that the test return merely tests the mocked output. The test should always be testing a function’s logic.

Mocking Loader Modules

Salt loader modules use a series of globally available dunder variables, `__salt__`, `__opts__`, `__pillar__`, etc. To facilitate testing these modules a mixin class was created, `LoaderModuleMockMixin` which can be found in `tests/support/mixins.py`. The reason for the existence of this class is because historically one would add these dunder variables directly on the imported module. This, however, introduces unexpected behavior when running the full test suite since those attributes would not be removed once we were done testing the module and would therefore leak to other modules being tested with unpredictable results. This is the kind of work that should be deferred to mock, and that’s exactly what this mixin class does.

As an example, if one needs to specify some options which should be available to the module being tested one should do:

```python
import salt.modules.somemodule as somemodule
class SomeModuleTest(TestCase, LoaderModuleMockMixin):
    def setup_loader_modules(self):
        return {
            somemodule: {
                '__opts__': {'test': True}
            }
        }
```

Consider this more extensive example from `tests/unit/modules/test_libcloud_dns.py`:

```python
# Import Python Libs
from __future__ import absolute_import

# Import Salt Testing Libs
(continues on next page)```
What happens in the above example is we mock a call to __salt__['config.option'] to return the configuration needed for the execution of the tests. Additionally, if the libcloud library is not available, since that’s not actually part of what’s being tested, we mocked that import by patching sys.modules when tests are running.

**Mocking Filehandles**

Note: This documentation applies to the 2018.3 release cycle and newer. The extended functionality for mock_open described below does not exist in the 2017.7 and older release branches.

Opening files in Salt is done using salt.utils.files.fopen(). When testing code that reads from files, the mock_open helper can be used to mock filehandles. Note that is not the same mock_open as unittest.mock.mock_open() from the Python standard library, but rather a separate implementation which has additional functionality.
from tests.support.unit import TestCase
from tests.support.mock import (
    patch
    mock_open,
)
import salt.modules.mymod as mymod
class MyAwesomeTestCase(TestCase):
    def test_something(self):
        fopen_mock = mock_open(read_data='foo
bar
baz
')
        with patch('salt.utils.files.fopen', fopen_mock):
            result = mymod.myfunc()
            assert result is True

This will force any filehandle opened to mimic a filehandle which, when read, produces the specified contents.

Important: String Types

When running tests on Python 2, mock_open will convert any unicode types to str types to more closely reproduce Python 2 behavior (file reads are always str types in Python 2, irrespective of mode).

However, when configuring your read_data, make sure that you are using bytestrings (e.g. b'foo
bar
baz
') when the code you are testing is opening a file for binary reading, otherwise the tests will fail on Python 3. The mocked filehandles produced by mock_open will raise a TypeError if you attempt to read a bytestring when opening for non-binary reading, and similarly will not let you read a string when opening a file for binary reading. They will also not permit bytestrings to be "written" if the mocked filehandle was opened for non-binary writing, and vice-versa when opened for non-binary writing. These enhancements force test writers to write more accurate tests.

More Complex Scenarios

Multiple File Paths

What happens when the code being tested reads from more than one file? For those cases, you can pass read_data as a dictionary:

import textwrap
from tests.support.unit import TestCase
from tests.support.mock import (
    patch
    mock_open,
)
import salt.modules.mymod as mymod
class MyAwesomeTestCase(TestCase):
    def test_something(self):
        contents = {
            '/etc/foo.conf': textwrap.dedent('''
''')
        }

(continues on next page)
This would make `salt.utils.files.fopen()` produce filehandles with different contents depending on which file was being opened by the code being tested. `/etc/foo.conf` and any file matching the pattern `/etc/b*.conf` would work, while opening any other path would result in a `FileNotFoundError` being raised (in Python 2, an `IOError`).

Since file patterns are supported, it is possible to use a pattern of `'*'` to define a fallback if no other patterns match the filename being opened. The below two `mock_open` calls would produce identical results:

```python
mock_open(read_data='foo
')
mock_open(read_data={'*': 'foo
'})
```

Note: Take care when specifying the `read_data` as a dictionary, in cases where the patterns overlap (e.g. when both `/etc/b*.conf` and `/etc/bar.conf` are in the `read_data`). Dictionary iteration order will determine which pattern is attempted first, second, etc., with the exception of `'*'` which is used when no other pattern matches.

If your test case calls for specifying overlapping patterns, and you are not running Python 3.6 or newer, then an `OrderedDict` can be used to ensure matching is handled in the desired way:

```python
contents = OrderedDict()
contents['/etc/bar.conf'] = 'foo\nbar\nbaz\n'
contents['/etc/b*.conf'] = IOError(errno.EACCES, 'Permission denied')
contents['*'] = 'This is a fallback for files not beginning with "/etc/b"\n'
fopen_mock = mock_open(read_data=contents)
```

### Raising Exceptions

Instead of a string, an exception can also be used as the `read_data`:

```python
import errno
from tests.support.unit import TestCase
from tests.support.mock import patch
mock_open,
)
import salt.modules.mymod as mymod
```
class MyAwesomeTestCase(TestCase):
    def test_something(self):
        exc = IOError(errno.EACCES, 'Permission denied')
        fopen_mock = mock_open(read_data=exc)
        with patch('salt.utils.files.fopen', fopen_mock):
            mymod.myfunc()

The above example would raise the specified exception when any file is opened. The expectation would be that mymod.myfunc() would gracefully handle the IOError, so a failure to do that would result in it being raised and causing the test to fail.

Multiple File Contents

For cases in which a file is being read more than once, and it is necessary to test a function’s behavior based on what the file looks like the second (or third, etc.) time it is read, just specify the the contents for that file as a list. Each time the file is opened, mock_open will cycle through the list and produce a mocked filehandle with the specified contents. For example:

```python
import errno
import textwrap

from tests.support.unit import TestCase
from tests.support.mock import (  
    patch,  
    mock_open,  
)

import salt.modules.mymod as mymod

class MyAwesomeTestCase(TestCase):
    def test_something(self):
        contents = {
            '/etc/foo.conf': [
                textwrap.dedent('''
                foo
                bar
                '''),
                textwrap.dedent('''
                foo
                bar
                baz
                '''),
            ],
            '/etc/b*.conf': [
                IOError(errno.ENOENT, 'No such file or directory'),
                textwrap.dedent('''
                one
                two
                three
                '''),
            ],
        }
        fopen_mock = mock_open(read_data=contents)
```

(continues on next page)
Using this example, the first time `/etc/foo.conf` is opened, it will simulate a file with the first string in the list as its contents, while the second time it is opened, the simulated file’s contents will be the second string in the list.

If no more items remain in the list, then attempting to open the file will raise a `RuntimeError`. In the example above, if `/etc/foo.conf` were to be opened a third time, a `RuntimeError` would be raised.

Note that exceptions can also be mixed in with strings when using this technique. In the above example, if `/etc/bar.conf` were to be opened twice, the first time would simulate the file not existing, while the second time would simulate a file with string defined in the second element of the list.

---

**Accessing the Mocked Filehandles in a Test**

**Note:** The code for the `MockOpen`, `MockCall`, and `MockFH` classes (referenced below) can be found in `tests/support/mock.py`. There are extensive unit tests for them located in `tests/unit/test_mock.py`.

The above examples simply show how to mock `salt.utils.files.fopen()` to simulate files with the contents you desire, but you can also access the mocked filehandles (and more), and use them to craft assertions in your tests. To do so, just add an `as` clause to the end of the `patch` statement:

```python
fopen_mock = mock_open(read_data='foo
bar
baz
')
with patch('salt.utils.files.fopen', fopen_mock) as m_open:
    # do testing here
    ...
```

When doing this, `m_open` will be a `MockOpen` instance. It will contain several useful attributes:

- `read_data` - A dictionary containing the `read_data` passed when `mock_open` was invoked. In the event that multiple file paths are not used, then this will be a dictionary mapping `*` to the `read_data` passed to `mock_open`.
- `call_count` - An integer representing how many times `salt.utils.files.fopen()` was called to open a file.
- `calls` - A list of `MockCall` objects. A `MockCall` object is a simple class which stores the arguments passed to it, making the positional arguments available via its `args` attribute, and the keyword arguments available via its `kwargs` attribute.
import salt.modules.mymod as mymod

class MyAwesomeTestCase(TestCase):
    def test_something(self):
        with patch('salt.utils.files.fopen', mock_open(read_data=b'foo\n')) as m_open:
            mymod.myfunc()
            # Assert that only two opens attempted
            assert m_open.call_count == 2
            # Assert that only /etc/foo.conf was opened
            assert all(call.args[0] == '/etc/foo.conf' for call in m_open.calls)
            # Assert that the first open was for binary read, and the
            # second was for binary write.
            assert m_open.calls == [
                MockCall('/etc/foo.conf', 'rb'),
                MockCall('/etc/foo.conf', 'wb'),
            ]

Note that MockCall is imported from tests.support.mock in the above example. Also, the second
assert above is redundant since it is covered in the final assert, but both are included simply as an example.

- **filehandles** - A dictionary mapping the unique file paths opened, to lists of MockFH objects. Each open creates
  a unique MockFH object. Each MockFH object itself has a number of useful attributes:
  - **filename** - The path to the file which was opened using salt.utils.files.fopen()
  - **call** - A MockCall object representing the arguments passed to salt.utils.files.fopen().
    Note that this MockCall is also available in the parent MockOpen instance’s calls list.

  - The following methods are mocked using unittest.mock.Mock objects, and Mock’s built-in asserts
    (as well as the call data) can be used as you would with any other Mock object:
    - **.read()**
    - **.readlines()**
    - **.readline()**
    - **.close()**
    - **.write()**
    - **.writelines()**
    - **.seek()**

    - The read functions (**.read()**, **.readlines()**, **.readline()**) all work as expected, as does iterating through the
      file line by line (i.e. for line in fh:).

    - The **.tell()** method is also implemented in such a way that it updates after each time the mocked filehandle
      is read, and will report the correct position. The one caveat here is that **.seek()** doesn’t actually work
      (it’s simply mocked), and will not change the position. Additionally, neither **.write()** or **.writelines()**
      will modify the mocked filehandle’s contents.

    - The attributes **.write_calls** and **.writelines_calls** (no parenthesis) are available as shorthands
      and correspond to lists containing the contents passed for all calls to **.write()** and **.writelines()**, respectively.
Examples

```python
with patch('salt.utils.files.fopen', mock_open(read_data=contents)) as m_open:
    # Run the code you are unit testing
    mymod.myfunc()
    # Check that only the expected file was opened, and that it was opened
    # only once.
    assert m_open.call_count == 1
    assert list(m_open.filehandles) == ['/etc/foo.conf']
    # "opens" will be a list of all the mocked filehandles opened
    opens = m_open.filehandles['/etc/foo.conf']
    # Check that we wrote the expected lines ("expected" here is assumed to
    # be a list of strings)
    assert opens[0].write_calls == expected

with patch('salt.utils.files.fopen', mock_open(read_data=contents)) as m_open:
    # Run the code you are unit testing
    mymod.myfunc()
    # Check that .readlines() was called (remember, it's a Mock)
    m_open.filehandles['/etc/foo.conf'][0].readlines().assert_called()

with patch('salt.utils.files.fopen', mock_open(read_data=contents)) as m_open:
    # Run the code you are unit testing
    mymod.myfunc()
    # Check that we read the file and also wrote to it
    m_open.filehandles['/etc/foo.conf'][0].read.assert_called_once()
    m_open.filehandles['/etc/foo.conf'][1].writelines.assert_called_once()
```

Naming Conventions

Test names and docstrings should indicate what functionality is being tested. Test functions are named `test_<fcn>_<test-name>` where `<fcn>` is the function being tested and `<test-name>` describes the raise or return being tested.

Unit tests for `salt/.../<module>.py` are contained in a file called `tests/unit/.../test_<module>.py`. E.g. the tests for `salt/modules/fib.py` are in `tests/unit/modules/test_fib.py`.

In order for unit tests to get picked up during a run of the unit test suite, each unit test file must be prefixed with `test_` and each individual test must be prepended with the `test_` naming syntax, as described above.

If a function does not start with `test_`, then the function acts as a "normal" function and is not considered a testing function. It will not be included in the test run or testing output. The same principle applies to unit test files that do not have the `test_*`.py naming syntax. This test file naming convention is how the test runner recognizes that a test file contains unit tests.

Imports

Most commonly, the following imports are necessary to create a unit test:

```python
from tests.support.unit import TestCase
```

If you need mock support to your tests, please also import:

```python
from tests.support.mock import MagicMock, patch, call
```
27.20.4 Evaluating Truth

A longer discussion on the types of assertions one can make can be found by reading Python’s documentation on unit testing.

27.20.5 Tests Using Mock Objects

In many cases, the purpose of a Salt module is to interact with some external system, whether it be to control a database, manipulate files on a filesystem or something else. In these varied cases, it’s necessary to design a unit test which can test the function whilst replacing functions which might actually call out to external systems. One might think of this as "blocking the exits" for code under tests and redirecting the calls to external systems with our own code which produces known results during the duration of the test.

To achieve this behavior, Salt makes heavy use of the MagicMock package.

To understand how one might integrate Mock into writing a unit test for Salt, let’s imagine a scenario in which we’re testing an execution module that’s designed to operate on a database. Furthermore, let’s imagine two separate methods, here presented in pseudo-code in an imaginary execution module called 'db.py'.

```python
def create_user(username):
    qry = 'CREATE USER {0}'.format(username)
    execute_query(qry)

def execute_query(qry):
    # Connect to a database and actually do the query...
```

Here, let’s imagine that we want to create a unit test for the create_user function. In doing so, we want to avoid any calls out to an external system and so while we are running our unit tests, we want to replace the actual interaction with a database with a function that can capture the parameters sent to it and return pre-defined values. Therefore, our task is clear – to write a unit test which tests the functionality of create_user while also replacing `execute_query` with a mocked function.

To begin, we set up the skeleton of our class much like we did before, but with additional imports for MagicMock:

```python
# Import Salt Testing libs
from tests.support.unit import TestCase

# Import Salt execution module to test
from salt.modules import db

# Import Mock libraries
from tests.support.mock import MagicMock, patch, call

# Create test case class and inherit from Salt's customized TestCase
# Skip this test case if we don't have access to mock!
class DbTestCase(TestCase):
    def test_create_user(self):
        # First, we replace 'execute_query' with our own mock function
        with patch.object(db, 'execute_query', MagicMock()) as db_exq:

            # Now that the exits are blocked, we can run the function under test.
            db.create_user('testuser')

            # We could now query our mock object to see which calls were made
            # to it.
            print(db_exq.mock_calls)
```

(continues on next page)
# Construct a call object that simulates the way we expected
# execute_query to have been called.
expected_call = call('CREATE USER testuser')

# Compare the expected call with the list of actual calls. The
# test will succeed or fail depending on the output of this
# assertion.
db_exq.assert_has_calls(expected_call)

## 27.20.6 Modifying `__salt__` In Place

At times, it becomes necessary to make modifications to a module’s view of functions in its own `__salt__` dictionary. Luckily, this process is quite easy.

Below is an example that uses `MagicMock`’s `patch` functionality to insert a function into `__salt__` that’s actually a `MagicMock` instance.

def show_patch(self):
    with patch.dict(my_module.__salt__,
        {'function.to_replace': MagicMock()}):
        # From this scope, carry on with testing, with a modified `__salt__`!

## 27.20.7 A Simple Example

Let’s assume that we’re testing a very basic function in an imaginary Salt execution module. Given a module called `fib.py` that has a function called `calculate(num_of_results)`, which given a `num_of_results`, produces a list of sequential Fibonacci numbers of that length.

A unit test to test this function might be commonly placed in a file called `tests/unit/modules/test_fib.py`. The convention is to place unit tests for Salt execution modules in `test/unit/modules/` and to name the tests module prefixed with `test_*`.py.

Tests are grouped around test cases, which are logically grouped sets of tests against a piece of functionality in the tested software. Test cases are created as Python classes in the unit test module. To return to our example, here’s how we might write the skeleton for testing `fib.py`:

```python
# Import Salt Testing libs
from tests.support.unit import TestCase

# Import Salt execution module to test
import salt.modules.fib as fib

# Create test case class and inherit from Salt's customized TestCase
class FibTestCase(TestCase):
    
        This class contains a set of functions that test salt.modules.fib.

    
    def test_fib(self):
        
            To create a unit test, we should prefix the name with 'test_' so
            that it's recognized by the test runner.

```
(continues on next page)
At this point, the test can now be run, either individually or as a part of a full run of the test runner. To ease development, a single test can be executed:

```
tests/runtests.py -v -n unit.modules.test_fib
```

This will report the status of the test: success, failure, or error. The `-v` flag increases output verbosity.

```
tests/runtests.py -n unit.modules.test_fib -v
```

To review the results of a particular run, take a note of the log location given in the output for each test:

```
Logging tests on /var/folders/nl/d809xbq577l3qr0bj3ymtpbq80000gn/T/salt-runtests.log
```

### 27.20.8 A More Complete Example

Consider the following function from `salt/modules/linux_sysctl.py`.

```python
def get(name):
    """
    Return a single sysctl parameter for this minion
    
    CLI Example:
    .. code-block:: bash
        .
        salt '*' sysctl.get net.ipv4.ip_forward
    """
    cmd = 'sysctl -n {}'.format(name)
    out = __salt__['cmd.run'](cmd)
    return out
```

This function is very simple, comprising only four source lines of code and having only one return statement, so we know only one test is needed. There are also two inputs to the function, the `name` function argument and the call to `__salt__['cmd.run']`(), both of which need to be appropriately mocked.

Mocking a function parameter is straightforward, whereas mocking a function call will require, in this case, the use of MagicMock. For added isolation, we will also redefine the `__salt__` dictionary such that it only contains `'cmd.run'`.

```python
# Import Salt Libs
import salt.modules.linux_sysctl as linux_sysctl

# Import Salt Testing Libs
from tests.support.mixins import LoaderModuleMockMixin
from tests.support.unit import TestCase
from tests.support.mock import (MagicMock, patch,
)

class LinuxSysctlTestCase(TestCase, LoaderModuleMockMixin):
    ""
```

def test_get(self):
    Tests the return of get function
    mock_cmd = MagicMock(return_value=1)
    with patch.dict(linux_sysctl.__salt__, {'cmd.run': mock_cmd}):
        self.assertEqual(linux_sysctl.get('net.ipv4.ip_forward'), 1)

Since `get()` has only one raise or return statement and that statement is a success condition, the test function is simply named `test_get()`. As described, the single function call parameter, `name` is mocked with `net.ipv4.ip_forward` and `__salt__['cmd.run']` is replaced by a MagicMock function object. We are only interested in the return value of `__salt__['cmd.run']`, which MagicMock allows us by specifying via `return_value=1`. Finally, the test itself tests for equality between the return value of `get()` and the expected return of 1. This assertion is expected to succeed because `get()` will determine its return value from `__salt__['cmd.run']`, which we have mocked to return 1.

### 27.20.9 A Complex Example

Now consider the `assign()` function from the same salt/modules/linux_sysctl.py source file.

```python
def assign(name, value):
    Assign a single sysctl parameter for this minion

    CLI Example:
    .. code-block:: bash

    salt '*' sysctl.assign net.ipv4.ip_forward 1

    value = str(value)
sysctl_file = '/proc/sys/{0}'.format(name.replace('.', '/'))
if not os.path.exists(sysctl_file):
    raise CommandExecutionError('sysctl {0} does not exist'.format(name))

ret = {}
cmd = 'sysctl -w {0}="{1}"'.format(name, value)
data = __salt__['__salt__']['cmd.run_all'](cmd)
out = data['stdout']
err = data['stderr']

# Example:
# # sysctl -w net.ipv4.tcp_rmem="4096 87380 16777216"
# net.ipv4.tcp_rmem = 4096 87380 16777216
regex = re.compile(r'^{0}s+=\s+{1}$'.format(re.escape(name),
                    re.escape(value)))

if not regex.match(out) or 'Invalid argument' in str(err):
    if data['retcode'] != 0 and err:
        error = err
else:

(continues on next page)
Salt Documentation, Release 3000.2

(continued from previous page)

This function contains two raise statements and one return statement, so we know that we will need (at least) three tests. It has two function arguments and many references to non-built-in functions. In the tests below you will see that MagicMock's patch() method may be used as a context manager or as a decorator. When patching the salt dunder however, please use the context manager approach.

There are three test functions, one for each raise and return statement in the source function. Each function is self-contained and contains all and only the mocks and data needed to test the raise or return statement it is concerned with.

```
# Import Salt Libs
import salt.modules.linux_sysctl as linux_sysctl
from salt.exceptions import CommandExecutionError

# Import Salt Testing Libs
from tests.support.mixins import LoaderModuleMockMixin
from tests.support.unit import TestCase
from tests.support.mock import (MagicMock, patch,
)

class LinuxSysctlTestCase(TestCase, LoaderModuleMockMixin):
    '''
    TestCase for salt.modules.linux_sysctl module
    '''
    @patch('os.path.exists', MagicMock(return_value=False))
    def test_assign_proc_sys_failed(self):
        '''
        Tests if /proc/sys/<kernel-subsystem> exists or not
        '''
        cmd = {'pid': 1337, 'retcode': 0, 'stderr': '', 'stdout': 'net.ipv4.ip_forward = 1'}
        mock_cmd = MagicMock(return_value=cmd)
        with patch.dict(linux_sysctl.__salt__, {'cmd.run_all': mock_cmd}):
            self.assertRaises(CommandExecutionError, linux_sysctl.assign, 'net.ipv4.ip_forward', 1)

    @patch('os.path.exists', MagicMock(return_value=True))
    def test_assign_cmd_failed(self):
        '''
        Tests if the assignment was successful or not
        '''
        cmd = {'pid': 1337, 'retcode': 0, 'stderr': 'sysctl: setting key "net.ipv4.ip_forward": Invalid argument', 'stdout': 'net.ipv4.ip_forward = backward'}
        mock_cmd = MagicMock(return_value=cmd)
        with patch.dict(linux_sysctl.__salt__, {'cmd.run_all': mock_cmd}):
            self.assertRaises(CommandExecutionError, linux_sysctl.assign, 'net.ipv4.ip_forward', 1)
```

(continues on next page)
self.assertRaises(CommandExecutionError,
    linux_sysctl.assign,
    'net.ipv4.ip_forward', 'backward')

@patch('os.path.exists', MagicMock(return_value=True))
def test_assign_success(self):
    
    Tests the return of successful assign function
    
    cmd = {'pid': 1337, 'retcode': 0, 'stderr': '',
           'stdout': 'net.ipv4.ip_forward = 1'}
    ret = {'net.ipv4.ip_forward': '1'}
    mock_cmd = MagicMock(return_value=cmd)
    with patch.dict(linux_sysctl.__salt__, {'cmd.run_all': mock_cmd}):
        self.assertEqual(linux_sysctl.assign('net.ipv4.ip_forward', 1), ret)

27.21 SaltStack Git Policy

The SaltStack team follows a git policy to maintain stability and consistency with the repository.

The git policy has been developed to encourage contributions and make contributing to Salt as easy as possible. Code contributors to SaltStack projects DO NOT NEED TO READ THIS DOCUMENT, because all contributions come into SaltStack via a single gateway to make it as easy as possible for contributors to give us code.

The primary rule of git management in SaltStack is to make life easy on contributors and developers to send in code. Simplicity is always a goal!

27.21.1 New Code Entry

All new SaltStack code should be submitted against either the develop branch or a point release branch, depending on the nature of the submission. Please see the Which Salt Branch? section of Salt's Contributing documentation or the Release Branching section below for more information.

27.21.2 Release Branching

SaltStack maintains two types of releases, Feature Releases and Point Releases (also commonly referred to as Bugfix Releases). A feature release is managed by incrementing the first or second release point number, so 2015.5.5 -> 2015.8.0 signifies a feature release and 2015.8.0 -> 2015.8.1 signifies a point release.

Feature Release Branching

Each feature release is maintained in a dedicated git branch derived from the last applicable release commit on develop. All file changes relevant to the feature release will be completed in the develop branch prior to the creation of the feature release branch. The feature release branch will be named after the relevant numbers to the feature release, which constitute the first two numbers. This means that the release branch for the 2015.8.0 series is named 2015.8.

A feature release branch is created with the following command:
Point Releases

Each point release is derived from its parent release branch. Constructing point releases is a critical aspect of Salt development and is managed by members of the core development team. Point releases comprise bug and security fixes. Bug fixes can be made against a point release branch in one of two ways: the bug fix can be submitted directly against the point release branch, or an attempt can be made to back-port the fix to the point release branch.

Bug fixes should be made against the earliest supported release branch on which the bug is present. The Salt development team regularly merges older point release branches forward into newer point release branches. That way, the bug fixes that are submitted to older release branches can cascade up through all related release branches.

For more information, please see the Which Salt Branch? section of Salt’s Contributing documentation.

Generally point releases are made every 2 months or if there is a security fix they can be made sooner.

The point release is designated by branching (ex 2019.2.1) and then tagging (v2019.2.1) from that newly created release branch when its determined the release is stable. From the tag point a new source tarball is generated and published to PyPI, and a release announcement is made.

27.22 Salt Conventions

27.22.1 Writing Salt Documentation

Salt’s documentation is built using the Sphinx documentation system. It can be built in a large variety of output formats including HTML, PDF, ePub, and manpage.

All the documentation is contained in the main Salt repository. Speaking broadly, most of the narrative documentation is contained within the https://github.com/saltstack/salt/blob/master/doc subdirectory and most of the reference and API documentation is written inline with Salt’s Python code and extracted using a Sphinx extension.

Style

The Salt project recommends the IEEE style guide as a general reference for writing guidelines. Those guidelines are not strictly enforced but rather serve as an excellent resource for technical writing questions. The NCBI style guide is another very approachable resource.

Point-of-view

Use third-person perspective and avoid "I", "we", "you" forms of address. Identify the addressee specifically e.g., "users should", "the compiler does", etc.

Active voice

Use active voice and present-tense. Avoid filler words.
Title capitalization

Document titles and section titles within a page should follow normal sentence capitalization rules. Words that are capitalized as part of a regular sentence should be capitalized in a title and otherwise left as lowercase. Punctuation can be omitted unless it aids the intent of the title (e.g., exclamation points or question marks).

For example:

This is a main heading
======================
Paragraph.
This is an exciting sub-heading!
==============================
Paragraph.

Serial Commas

According to Wikipedia: In English punctuation, a serial comma or series comma (also called Oxford comma and Harvard comma) is a comma placed immediately before the coordinating conjunction (usually "and", "or", or "nor") in a series of three or more terms. For example, a list of three countries might be punctuated either as "France, Italy, and Spain" (with the serial comma), or as "France, Italy and Spain" (without the serial comma).

When writing a list that includes three or more items, the serial comma should always be used.

Documenting modules

Documentation for Salt’s various module types is inline in the code. During the documentation build process it is extracted and formatted into the final HTML, PDF, etc format.

Inline documentation

Python has special multi-line strings called docstrings as the first element in a function or class. These strings allow documentation to live alongside the code and can contain special formatting. For example:

```python
def my_function(value):
    """
    Upper-case the given value
    """
    Usage:
    .. code-block:: python
       val = 'a string'
       new_val = myfunction(val)
       print(new_val) # 'A STRING'

    :param value: a string
    :return: a copy of ``value`` that has been upper-cased
    """
    return value.upper()```
Specify a release for additions or changes

New functions or changes to existing functions should include a marker that denotes what Salt release will be affected. For example:

```python
def my_function(value):
    
    """
    Upper-case the given value
    """
    .. versionadded:: 2014.7.0
    
    return value.upper()
```

For changes to a function:

```python
def my_function(value, strip=False):
    
    """
    Upper-case the given value
    """
    .. versionchanged:: 2016.3.0
    Added a flag to also strip whitespace from the string.
    
    return value.upper().strip()
```

Adding module documentation to the index

Each module type has an index listing all modules of that type. For example: `execution modules`, `state modules`, `renderer modules`. New modules must be added to the index manually.

1. Edit the file for the module type: `execution modules`, `state modules`, `renderer modules`, etc.
2. Add the new module to the alphabetized list.
3. Build the documentation which will generate an `.rst` file for the new module in the same directory as the `index.rst`.
4. Commit the changes to `index.rst` and the new `.rst` file and send a pull request.

Cross-references

The Sphinx documentation system contains a wide variety of cross-referencing capabilities.

Glossary entries

Link to `glossary entries` using the term role. A cross-reference should be added the first time a Salt-specific term is used in a document.

```
A common way to encapsulate master-side functionality is by writing a custom :term:`Runner Function`. Custom Runner Functions are easy to write.
```
Index entries

Sphinx automatically generates many kinds of index entries, but it is occasionally useful to manually add items to the index.

One method is to use the `index directive` above the document or section that should appear in the index.

```
.. index:: ! Event, event bus, event system
   see: Reactor; Event
```

Another method is to use the `index role` inline with the text that should appear in the index. The index entry is created and the target text is left otherwise intact.

```
Information about the :index:`Salt Reactor`
-------------------------------------------
Paragraph.
```

Documents and sections

Each document should contain a unique top-level label of the form:

```
.. _my-page:

My page
=======
Paragraph.
```

Unique labels can be linked using the `ref role`. This allows cross-references to survive document renames or movement.

```
For more information see :ref:`my-page`.
```

Note, the `:doc:` role should not be used to link documents together.

Modules

Cross-references to Salt modules can be added using Sphinx’s Python domain roles. For example, to create a link to the `test.ping` function:

```
A useful execution module to test active communication with a minion is the :py:func:`test.ping <salt.modules.test.ping>` function.
```

Salt modules can be referenced as well:

```
The :py:mod:`test module <salt.modules.test>` contains many useful functions for inspecting an active Salt connection.
```

The same syntax works for all modules types:

```
The same syntax works for all modules types:
```

```
One of the workhorse state module functions in Salt is the :py:func:`file.managed <salt.states.file.managed>` function.
```
**Settings**

Individual settings in the Salt Master or Salt Minion configuration files are cross-referenced using two custom roles, `conf_master` and `conf_minion`.

```
The :conf_minion:`minion ID <id>` setting is a unique identifier for a single minion.
```

**Documentation Changes and Fixes**

Documentation changes and fixes should be made against the earliest supported release branch that the update applies to. The practice of updating a release branch instead of making all documentation changes against Salt’s main, default branch, `develop`, is necessary in order for the docs to be as up-to-date as possible when the docs are built.

The workflow mentioned above is also in line with the recommendations outlined in Salt’s *Contributing* page. You can read more about how to choose where to submit documentation fixes by reading the *Salt’s Branch Topology* section.

For an explanation of how to submit changes against various branches, see the *Sending a GitHub pull request* section. Specifically, see the section describing how to *Create a new branch* and the steps that follow.

**Building the documentation**

1. Install Sphinx using a system package manager or pip. The package name is often of the form `python-sphinx`. There are no other dependencies.

2. Build the documentation using the provided Makefile or `.bat` file on Windows.

   ```
cd /path/to/salt/doc
make html
```

3. The generated documentation will be written to the `doc/_build/<format>` directory.

4. A useful method of viewing the HTML documentation locally is to start Python’s built-in HTTP server:

   **Python 3:**

   ```
cd /path/to/salt/doc/_build/html
python3 -m http.server
```

   **Python 2:**

   ```
cd /path/to/salt/doc/_build/html
python -m SimpleHTTPServer
```

Then pull up the documentation in a web browser at `http://localhost:8000/`.

**27.22.2 Salt Formulas**

Formulas are pre-written Salt States. They are as open-ended as Salt States themselves and can be used for tasks such as installing a package, configuring, and starting a service, setting up users or permissions, and many other common tasks.

All official Salt Formulas are found as separate Git repositories in the "saltstack-formulas" organization on GitHub:
https://github.com/saltstack-formulas

As a simple example, to install the popular Apache web server (using the normal defaults for the underlying distro) simply include the apache-formula from a top file:

```
base:
  'web*':
    - apache
```

### Installation

Each Salt Formula is an individual Git repository designed as a drop-in addition to an existing Salt State tree. Formulas can be installed in the following ways.

#### Adding a Formula as a GitFS remote

One design goal of Salt’s GitFS files server backend was to facilitate reusable States. GitFS is a quick and natural way to use Formulas.

1. Install any necessary dependencies and configure GitFS.
2. Add one or more Formula repository URLs as remotes in the `gitfs_remotes` list in the Salt Master configuration file:

```
  gitfs_remotes:
    - https://github.com/saltstack-formulas/apache-formula
    - https://github.com/saltstack-formulas/memcached-formula
```

We strongly recommend forking a formula repository into your own GitHub account to avoid unexpected changes to your infrastructure.

Many Salt Formulas are highly active repositories so pull new changes with care. Plus any additions you make to your fork can be easily sent back upstream with a quick pull request!

3. Restart the Salt master.

Beginning with the 2018.3.0 release, using formulas with GitFS is now much more convenient for deployments which use many different fileserver environments (i.e. saltenvs). Using the `all_saltenvs` parameter, files from a single git branch/tag will appear in all environments. See here for more information on this feature.

#### Adding a Formula directory manually

Formulas are simply directories that can be copied onto the local file system by using Git to clone the repository or by downloading and expanding a tarball or zip file of the repository. The directory structure is designed to work with `file_roots` in the Salt master configuration.

1. Clone or download the repository into a directory:

```
mkdir -p /srv/formulas
cd /srv/formulas
git clone https://github.com/saltstack-formulas/apache-formula.git
# or
mkdir -p /srv/formulas
```

(continues on next page)
cd /srv/formulas
wget https://github.com/saltstack-formulas/apache-formula/archive/master.tar.gz
tar xf apache-formula-master.tar.gz

2. Add the new directory to file_roots:

   file_roots:
   base:
   - /srv/salt
   - /srv/formulas/apache-formula

3. Restart the Salt Master.

Usage

Each Formula is intended to be immediately usable with sane defaults without any additional configuration. Many formulas are also configurable by including data in Pillar; see the pillar.example file in each Formula repository for available options.

Including a Formula in an existing State tree

Formula may be included in an existing sls file. This is often useful when a state you are writing needs to require or extend a state defined in the formula.

Here is an example of a state that uses the epel-formula in a require declaration which directs Salt to not install the python26 package until after the EPEL repository has also been installed:

   include:
   - epel

   python26:
   pkg.installed:
   - require:
     - pkg: epel

Including a Formula from a Top File

Some Formula perform completely standalone installations that are not referenced from other state files. It is usually cleanest to include these Formula directly from a Top File.

For example the easiest way to set up an OpenStack deployment on a single machine is to include the openstack-standalone-formula directly from a top.sls file:

   base:
   'myopenstackmaster':
   - openstack

Quickly deploying OpenStack across several dedicated machines could also be done directly from a Top File and may look something like this:
Base:
- controller:
  - openstack.horizon
  - openstack.keystone
- hyper-*:
  - openstack.nova
  - openstack.glance
- storage-*:
  - openstack.swift

Configuring Formula using Pillar

Salt Formulas are designed to work out of the box with no additional configuration. However, many Formula support additional configuration and customization through Pillar. Examples of available options can be found in a file named pillar.example in the root directory of each Formula repository.

Using Formula with your own states

Remember that Formula are regular Salt States and can be used with all Salt’s normal state mechanisms. Formula can be required from other States with require declarations, they can be modified using extend, they can made to watch other states with The _in versions of requisites.

The following example uses the stock apache-formula alongside a custom state to create a vhost on a Debian/Ubuntu system and to reload the Apache service whenever the vhost is changed.

```salt
# Include the stock, upstream apache formula.
include:
  - apache

# Use the watch_in requisite to cause the apache service state to reload
# apache whenever the my-example-com-vhost state changes.
my-example-com-vhost:
  file:
    - managed
    - name: /etc/apache2/sites-available/my-example-com
    - watch_in:
      - service: apache
```

Don’t be shy to read through the source for each Formula!

Reporting problems & making additions

Each Formula is a separate repository on GitHub. If you encounter a bug with a Formula please file an issue in the respective repository! Send fixes and additions as a pull request. Add tips and tricks to the repository wiki.

Writing Formulas

Each Formula is a separate repository in the saltstack-formulas organization on GitHub.
Get involved creating new Formulas

The best way to create new Formula repositories for now is to create a repository in your own account on GitHub and notify a SaltStack employee when it is ready. We will add you to the Contributors team on the saltstack-formulas organization and help you transfer the repository over. Ping a SaltStack employee on IRC (#salt on Freenode), join the #formulas channel on the salt-slack or send an email to the salt-users mailing list.

There are a lot of repositories in that organization! Team members can manage which repositories they are subscribed to on GitHub’s watching page: https://github.com/watching.

Members of the Contributors team are welcome to participate in reviewing pull requests across the Organization. Some repositories will have regular contributors and some repositories will not. As you get involved in a repository be sure to communicate with any other contributors there on pull requests that are large or have breaking changes.

In general it is best to have another Contributor review and merge any pull requests that you open. Feel free to at-mention other regular contributors to a repository and request a review. However, there are a lot of formula repositories so if a repository does not yet have regular contributors or if your pull request has stayed open for more than a couple days feel free to “selfie-merge” your own pull request.

Style

Maintainability, readability, and reusability are all marks of a good Salt sls file. This section contains several suggestions and examples.

```yaml
# Deploy the stable master branch unless version overridden by passing
# Pillar at the CLI or via the Reactor.

deploy_myapp:
  git.latest:
    - name: git@github.com/myco/myapp.git
    - version: {{ salt.pillar.get('myapp:version', 'master') }}
```

Use a descriptive State ID

The ID of a state is used as a unique identifier that may be referenced via other states in requises. It must be unique across the whole state tree (it is a key in a dictionary, after all).

In addition a state ID should be descriptive and serve as a high-level hint of what it will do, or manage, or change. For example, deploy_webapp, or apache, or reload_firewall.

Use module.function notation

So-called “short-declaration” notation is preferred for referencing state modules and state functions. It provides a consistent pattern of module.function shared between Salt States, the Reactor, Salt Mine, the Scheduler, as well as with the CLI.

```yaml
# Do
apache:
  pkg.installed:
    - name: httpd

# Don't
apache:
```

(continues on next page)
Salt’s state compiler will transform “short-decs” into the longer format when compiling the human-friendly highstate structure into the machine-friendly lowstate structure.

Specify the name parameter

Use a unique and permanent identifier for the state ID and reserve name for data with variability.

The name declaration is a required parameter for all state functions. The state ID will implicitly be used as name if it is not explicitly set in the state.

In many state functions the name parameter is used for data that varies such as OS-specific package names, OS-specific file system paths, repository addresses, etc. Any time the ID of a state changes all references to that ID must also be changed. Use a permanent ID when writing a state the first time to future-proof that state and allow for easier refactors down the road.

Comment state files

YAML allows comments at varying indentation levels. It is a good practice to comment state files. Use vertical whitespace to visually separate different concepts or actions.

Be careful to use Jinja comments for commenting Jinja code and YAML comments for commenting YAML code.
Easy on the Jinja!

Jinja templating provides vast flexibility and power when building Salt sls files. It can also create an unmaintainable tangle of logic and data. Speaking broadly, Jinja is best used when kept apart from the states (as much as is possible).

Below are guidelines and examples of how Jinja can be used effectively.

Know the evaluation and execution order

High-level knowledge of how Salt states are compiled and run is useful when writing states.

The default renderer setting in Salt is Jinja piped to YAML. Each is a separate step. Each step is not aware of the previous or following step. Jinja is not YAML aware, YAML is not Jinja aware; they cannot share variables or interact.

- Whatever the Jinja step produces must be valid YAML.
- Whatever the YAML step produces must be a valid highstate data structure. (This is also true of the final step for any of the alternate renderers in Salt.)
- Highstate can be thought of as a human-friendly data structure; easy to write and easy to read.
- Salt’s state compiler validates the highstate and compiles it to low state.
- Low state can be thought of as a machine-friendly data structure. It is a list of dictionaries that each map directly to a function call.
- Salt’s state system finally starts and executes on each “chunk” in the low state. Remember that requisites are evaluated at runtime.
- The return for each function call is added to the “running” dictionary which is the final output at the end of the state run.

The full evaluation and execution order:

Jinja -> YAML -> Highstate -> low state -> execution

Avoid changing the underlying system with Jinja

Avoid calling commands from Jinja that change the underlying system. Commands run via Jinja do not respect Salt’s dry-run mode (test=True)! This is usually in conflict with the idempotent nature of Salt states unless the command being run is also idempotent.
Inspect the local system

A common use for Jinja in Salt states is to gather information about the underlying system. The grains dictionary available in the Jinja context is a great example of common data points that Salt itself has already gathered. Less common values are often found by running commands. For example:

```jinja
{% set is_selinux_enabled = salt.cmd.run('sestatus') == '1' %}
```

This is usually best done with a variable assignment in order to separate the data from the state that will make use of the data.

Gather external data

One of the most common uses for Jinja is to pull external data into the state file. External data can come from anywhere like API calls or database queries, but it most commonly comes from flat files on the file system or Pillar data from the Salt Master. For example:

```jinja
{% set some_data = salt.pillar.get('some_data', {'sane default': True}) %}

{% import_yaml 'path/to/file.yaml' as some_data %}

{% import_json 'path/to/file.json' as some_data %}

{% import_text 'path/to/ssh_key.pub' as ssh_pub_key %}

{% from 'path/to/other_file.jinja' import some_data with context %}
```

This is usually best done with a variable assignment in order to separate the data from the state that will make use of the data.

Light conditionals and looping

Jinja is extremely powerful for programatically generating Salt states. It is also easy to overuse. As a rule of thumb, if it is hard to read it will be hard to maintain!

Separate Jinja control-flow statements from the states as much as is possible to create readable states. Limit Jinja within states to simple variable lookups.

Below is a simple example of a readable loop:

```jinja
{% for user in salt.pillar.get('list_of_users', []) %}

{{ user.name }}-{{ loop.index }}:
    user.present:
        - name: {{ user.name }}

{% endfor %}
```

(continues on next page)
Avoid putting a Jinja conditionals within Salt states where possible. Readability suffers and the correct YAML indentation is difficult to see in the surrounding visual noise. Parametrization (discussed below) and variables are both useful techniques to avoid this. For example:

```yaml
apache:
  pkg.installed:
    - name: {{ name }}

Dictionaries are useful to effectively "namespace" a collection of variables. This is useful with parametrization (discussed below). Dictionaries are also easily combined and merged. And they can be directly serialized into YAML which is often easier than trying to create valid YAML through templating. For example:

```yaml
haproxy_conf:
  file.managed:
    - name: /etc/haproxy/haproxy.cfg
    - template: jinja
    {% if 'external_loadbalancer' in grains.roles %}
    - source: salt://haproxy/external_haproxy.cfg
    {% endif %}
    {% elif 'internal_loadbalancer' in grains.roles %}
    - source: salt://haproxy/internal_haproxy.cfg
    {% endif %}
```
There is still room for improvement in the above example. For example, extracting into an external file or replacing the if-elif conditional with a function call to filter the correct data more succinctly. However, the state itself is simple and legible, the data is separate and also simple and legible. And those suggested improvements can be made at some future date without altering the state at all!

**Avoid heavy logic and programming**

Jinja is not Python. It was made by Python programmers and shares many semantics and some syntax but it does not allow for arbitrary Python function calls or Python imports. Jinja is a fast and efficient templating language but the syntax can be verbose and visually noisy.

Once Jinja use within an sls file becomes slightly complicated – long chains of if-elif-elif-else statements, nested conditionals, complicated dictionary merges, wanting to use sets – instead consider using a different Salt renderer, such as the Python renderer. As a rule of thumb, if it is hard to read it will be hard to maintain – switch to a format that is easier to read.
Using alternate renderers is very simple to do using Salt’s "she-bang" syntax at the top of the file. The Python renderer must simply return the correct highstate data structure. The following example is a state tree of two sls files, one simple and one complicated.

/srv/salt/top.sls:

```
base:
  '*':
    - common_configuration
    - roles_configuration
```

/srv/salt/common_configuration.sls:

```
common_users:
  user.present:
    - names:
      - larry
      - curly
      - moe
```

/srv/salt/roles_configuration:

```python
def run():
    list_of_roles = set()

    # This example has the minion id in the form 'web-03-dev'.
    # Easily access the grains dictionary:
    try:
        app, instance_number, environment = __grains__['id'].split('-')
        instance_number = int(instance_number)
    except ValueError:
        app, instance_number, environment = ['Unknown', 0, 'dev']

    list_of_roles.add(app)

    if app == 'web' and environment == 'dev':
        list_of_roles.add('primary')
        list_of_roles.add('secondary')
    elif app == 'web' and environment == 'staging':
        if instance_number == 0:
            list_of_roles.add('primary')
        else:
            list_of_roles.add('secondary')

    # Easily cross-call Salt execution modules:
    if __salt__['myutils.query_valid_ec2_instance']():
        list_of_roles.add('is_ec2_instance')

    return {
        'set_roles_grains': {
            'grains.present': [
                {'name': 'roles'},
                {'value': list(list_of_roles)},
            ],
        },
    }
```
Jinja Macros

In Salt sls files Jinja macros are useful for one thing and one thing only: creating mini templates that can be reused and rendered on demand. Do not fall into the trap of thinking of macros as functions; Jinja is not Python (see above). Macros are useful for creating reusable, parameterized states. For example:

```python
{% macro user_state(state_id, user_name, shell='/bin/bash', groups=[]) %}
  user.present:
    - name: {{ user_name }}
    - shell: {{ shell }}
    - groups: {{ groups | json() }}
{% endmacro %}

{% for user_info in salt.pillar.get('my_users', []) %}
  {{ user_state('user_number_' ~ loop.index, **user_info) }}
{% endfor %}
```

Macros are also useful for creating one-off "serializers" that can accept a data structure and write that out as a domain-specific configuration file. For example, the following macro could be used to write a php.ini config file:

```
/srv/salt/php.sls:

php_ini:
  file.managed:
    - name: /etc/php.ini
    - source: salt://php.ini.tmpl
    - template: jinja
    - context:
      php_ini_settings: {{ salt.pillar.get('php_ini', {}) | json() }}

/srv/pillar/php.sls:

php_ini:
  PHP:
    engine: 'On'
    short_open_tag: 'Off'
    error_reporting: 'E_ALL & ~E_DEPRECATED & ~E_STRICT'
```

```
/srv/salt/php.ini.tmpl:

{% macro php_ini_serializer(data) %}
{% for section_name, name_val_pairs in data.items() %}
  [{{ section_name }}]
  {%- for name, val in name_val_pairs.items() -%}
  {{ name }} = "{{ val }}"
  {%- endfor %}
{%- endfor %}
{%- endmacro %}

; File managed by Salt at {{ source }}.
; Your changes will be overwritten.
{{ php_ini_serializer(php_ini_settings) }}
```
Abstracting static defaults into a lookup table

Separate data that a state uses from the state itself to increases the flexibility and reusability of a state.

An obvious and common example of this is platform-specific package names and file system paths. Another example is sane defaults for an application, or common settings within a company or organization. Organizing such data as a dictionary (aka hash map, lookup table, associative array) often provides a lightweight namespace that allows for quick and easy lookups. In addition, using a dictionary allows for easily merging and overriding static values within a lookup table with dynamic values fetched from Pillar.

A strong convention in Salt Formulas is to place platform-specific data, such as package names and file system paths, into a file named `map.jinja` that is placed alongside the state files.

The following is an example from the MySQL Formula. The `grains.filter_by` function performs a lookup on that table using the `os_family` grain (by default).

The result is that the `mysql` variable is assigned to a subset of the lookup table for the current platform. This allows states to reference, for example, the name of a package without worrying about the underlying OS. The syntax for referencing a value is a normal dictionary lookup in Jinja, such as `{{ mysql['service'] }}` or the shorthand `{{ mysql.service }}`.

**map.jinja**

```jinja
{% set mysql = salt['grains.filter_by']({
    'Debian': {
        'server': 'mysql-server',
        'client': 'mysql-client',
        'service': 'mysql',
        'config': '/etc/mysql/my.cnf',
        'python': 'python-mysqldb',
    },
    'RedHat': {
        'server': 'mysql-server',
        'client': 'mysql',
        'service': 'mysqld',
        'config': '/etc/my.cnf',
        'python': 'MySQL-python',
    },
    'Gentoo': {
        'server': 'dev-db/mysql',
        'client': 'dev-db/mysql',
        'service': 'mysql',
        'config': '/etc/mysql/my.cnf',
        'python': 'dev-python/mysql-python',
    },
}, merge=salt['pillar.get']('mysql:lookup')) %}
```

Values defined in the map file can be fetched for the current platform in any state file using the following syntax:

```jinja
{% from "mysql/map.jinja" import mysql with context %}

mysql-server:
    pkg.installed:
        - name: {{ mysql.server }}
    service.running:
        - name: {{ mysql.service }}
```
Organizing Pillar data

It is considered a best practice to make formulas expect all formula-related parameters to be placed under second-level lookup key, within a main namespace designated for holding data for particular service/software/etc, managed by the formula:

```
mysql:
  lookup:
    version: 5.7.11
```

Collecting common values

Common values can be collected into a base dictionary. This minimizes repetition of identical values in each of the lookup_dict sub-dictionaries. Now only the values that are different from the base must be specified by the alternates:

```
map.jinja:
{% set mysql = salt['grains.filter_by']%}{
  'default': {
    'server': 'mysql-server',
    'client': 'mysql-client',
    'service': 'mysql',
    'config': '/etc/mysql/my.cnf',
    'python': 'python-mysqldb',
  },
  'Debian': {
  },
  'RedHat': {
    'client': 'mysql',
    'service': 'mysqld',
    'config': '/etc/my.cnf',
    'python': 'MySQL-python',
  },
  'Gentoo': {
    'server': 'dev-db/mysql',
    'client': 'dev-db/mysql',
    'python': 'dev-python/mysql-python',
  },
%}
merge=salt['pillar.get']('mysql:lookup'), base='default') %}
```

Overriding values in the lookup table

 Allow static values within lookup tables to be overridden. This is a simple pattern which once again increases flexibility and reusability for state files.

The merge argument in filter_by specifies the location of a dictionary in Pillar that can be used to override values returned from the lookup table. If the value exists in Pillar it will take precedence.

This is useful when software or configuration files is installed to non-standard locations or on unsupported platforms. For example, the following Pillar would replace the config value from the call above.
Note: Protecting Expansion of Content with Special Characters

When templating keep in mind that YAML does have special characters for quoting, flows, and other special structure and content. When a Jinja substitution may have special characters that will be incorrectly parsed by YAML care must be taken. It is a good policy to use the `yaml_encode` or the `yaml_dquote` Jinja filters:

```jinja
{% set foo = 7.7 %}
{% set bar = none %}
{% set baz = true %}
{% set zap = 'The word of the day is "salty".' %}
{% set zip = '"The quick brown fox . . ."' %}
```

```yaml
foo: {{ foo|yaml_encode }}
bar: {{ bar|yaml_encode }}
baz: {{ baz|yaml_encode }}
zap: {{ zap|yaml_encode }}
zip: {{ zip|yaml_dquote }}
```

The above will be rendered as below:

```yaml
foo: 7.7
bar: null
baz: true
zap: "The word of the day is "salty"."
zip: ""The quick brown fox . . .""
```

The `filter_by` function performs a simple dictionary lookup but also allows for fetching data from Pillar and overriding data stored in the lookup table. That same workflow can be easily performed without using `filter_by`; other dictionaries besides data from Pillar can also be used.

```jinja
{% set lookup_table = { ... } %}
{% do lookup_table.update(salt.pillar.get('my:custom:data')) %}
```

When to use lookup tables

The `map.jinja` file is only a convention within Salt Formulas. This greater pattern is useful for a wide variety of data in a wide variety of workflows. This pattern is not limited to pulling data from a single file or data source. This pattern is useful in States, Pillar and the Reactor, for example.

Working with a data structure instead of, say, a config file allows the data to be cobbled together from multiple sources (local files, remote Pillar, database queries, etc), combined, overridden, and searched.

Below are a few examples of what lookup tables may be useful for and how they may be used and represented.

Platform-specific information

An obvious pattern and one used heavily in Salt Formulas is extracting platform-specific information such as package names and file system paths in a file named `map.jinja`. The pattern is explained in detail above.
Sane defaults

Application settings can be a good fit for this pattern. Store default settings along with the states themselves and keep overrides and sensitive settings in Pillar. Combine both into a single dictionary and then write the application config or settings file.

The example below stores most of the Apache Tomcat server.xml file alongside the Tomcat states and then allows values to be updated or augmented via Pillar. (This example uses the BadgerFish format for transforming JSON to XML.)

```yaml
/srv/salt/tomcat/defaults.yaml:

Server:
  '@port': '8005'
  '@shutdown': SHUTDOWN

GlobalNamingResources:
  Resource:
    '@auth': Container
    '@description': User database that can be updated and saved
    '@factory': org.apache.catalina.users.MemoryUserDatabaseFactory
    '@name': UserDatabase
    '@pathname': conf/tomcat-users.xml
    '@type': org.apache.catalina.UserDatabase
# <...snip...>
```

```sls
/srv/pillar/tomcat.sls:

appX:
  server_xml_overrides:
    Server:
      Service:
        '@name': Catalina
      Connector:
        '@port': '8009'
        '@protocol': AJP/1.3
        '@redirectPort': '8443'
# <...snip...>
```

```sls
/srv/salt/tomcat/server_xml.sls:

{% import_yaml 'tomcat/defaults.yaml' as server_xml_defaults %}
{% set server_xml_final_values = salt.pillar.get(
    'appX:server_xml_overrides',
    default=server_xml_defaults,
    merge=True
)%}

appX_server_xml:
  file.serialize:
    - name: /etc/tomcat/server.xml
    - dataset: {{ server_xml_final_values | json() }}
    - formatter: xml_badgerfish
```

The `file.serialize` state can provide a shorthand for creating some files from data structures. There are also many examples within Salt Formulas of creating one-off "serializers" (often as Jinja macros) that reformat a data structure to a specific config file format. For example, look at the 'Nginx vhosts' states or the php.ini file template.
Environment specific information

A single state can be reused when it is parameterized as described in the section below, by separating the data the state will use from the state that performs the work. This can be the difference between deploying Application X and Application Y, or the difference between production and development. For example:

/srv/salt/app/deploy.sls:

```yaml
# Load the map file. 
import_yaml 'app/defaults.yaml' as app_defaults

# Extract the relevant subset for the app configured on the current machine (configured via a grain in this example). 
app = app_defaults.get(salt.grains.get('role'))

# Allow values from Pillar to (optionally) update values from the lookup table. 
do app_defaults.update(salt.pillar.get('myapp', {}))

deploy_application:
  git.latest:
    - name: {{ app.repo_url }}
    - version: {{ app.version }}
    - target: {{ app.deploy_dir }}

myco/myapp/deployed:
  event.send:
    - data:
      - version: {{ app.version }}
    - onchanges:
      - git: deploy_application

/srv/salt/app/defaults.yaml:

appX:
  repo_url: git@github.com/myco/appX.git
  target: /var/www/appX
  version: master

appY:
  repo_url: git@github.com/myco/appY.git
  target: /var/www/appY
  version: v1.2.3.4
```

Single-purpose SLS files

Each sls file in a Formula should strive to do a single thing. This increases the reusability of this file by keeping unrelated tasks from getting coupled together.

As an example, the base Apache formula should only install the Apache httpd server and start the httpd service. This is the basic, expected behavior when installing Apache. It should not perform additional changes such as set the Apache configuration file or create vhosts.

If a formula is single-purpose as in the example above, other formulas, and also other states can include and use that formula with Requisites and Other Global State Arguments without also including undesirable or unintended side-effects.
The following is a best-practice example for a reusable Apache formula. (This skips platform-specific options for brevity. See the full apache-formula for more.)

```yaml
# apache/init.sls
apache:
  pkg.installed:
    [...]
  service.running:
    [...]

# apache/mod_wsgi.sls
include:
  - apache

mod_wsgi:
  pkg.installed:
    [...]
    - require:
      - pkg: apache

# apache/conf.sls
include:
  - apache

apache_conf:
  file.managed:
    [...]
    - watch_in:
      - service: apache
```

To illustrate a bad example, say the above Apache formula installed Apache and also created a default vhost. The mod_wsgi state would not be able to include the Apache formula to create that dependency tree without also installing the unneeded default vhost.

*Formulas should be reusable.* Avoid coupling unrelated actions together.

### Parameterization

*Parameterization is a key feature of Salt Formulas* and also for Salt States. Parameterization allows a single Formula to be reused across many operating systems; to be reused across production, development, or staging environments; and to be reused by many people all with varying goals.

Writing states, specifying ordering and dependencies is the part that takes the longest to write and to test. Filling those states out with data such as users or package names or file locations is the easy part. How many users, what those users are named, or where the files live are all implementation details that *should be parameterized*. This separation between a state and the data that populates a state creates a reusable formula.

In the example below the data that populates the state can come from anywhere – it can be hard-coded at the top of the state, it can come from an external file, it can come from Pillar, it can come from an execution function call, or it can come from a database query. The state itself doesn’t change regardless of where the data comes from. Production data will vary from development data will vary from data from one company to another, however the state itself stays the same.

```yaml
{% set user_list = [
  {'name': 'larry', 'shell': 'bash'},
  {'name': 'curly', 'shell': 'bash'},
] %}
```
Configuration

Formulas should strive to use the defaults of the underlying platform, followed by defaults from the upstream project, followed by sane defaults for the formula itself.

As an example, a formula to install Apache should not change the default Apache configuration file installed by the OS package. However, the Apache formula should include a state to change or override the default configuration file.

Pillar overrides

Pillar lookups must use the safe `get()` and must provide a default value. Create local variables using the Jinja `set` construct to increase readability and to avoid potentially hundreds or thousands of function calls across a large state tree.

```
{% from "apache/map.jinja" import apache with context %}
{% set settings = salt['pillar.get']('apache', {}) %}

mod_status:
  file.managed:
    - name: {{ apache.conf_dir }}
    - source: {{ settings.get('mod_status_conf', 'salt://apache/mod_status.conf') }}
    - template: {{ settings.get('template_engine', 'jinja') }}
```

Any default values used in the Formula must also be documented in the `pillar.example` file in the root of the repository. Comments should be used liberally to explain the intent of each configuration value. In addition, users should be able copy-and-paste the contents of this file into their own Pillar to make any desired changes.
Scripting

Remember that both State files and Pillar files can easily call out to Salt execution modules and have access to all the system grains as well.

```jinja
{% if '/storage' in salt['mount.active']() %}
/usr/local/etc/myfile.conf:
  file:
    - symlink
    - target: /storage/myfile.conf
{% endif %}
```

Jinja macros to encapsulate logic or conditionals are discouraged in favor of writing custom execution modules in Python.

Repository structure

A basic Formula repository should have the following layout:

```
foo-formula
|-- foo/
  |-- map.jinja
  |-- init.sls
  | `-- bar.sls
  `-- CHANGELOG.rst
|-- LICENSE
|-- pillar.example
|-- README.rst
  `-- VERSION
```

See also:

template-formula

The template-formula repository has a pre-built layout that serves as the basic structure for a new formula repository. Just copy the files from there and edit them.

**README.rst**

The README should detail each available .sls file by explaining what it does, whether it has any dependencies on other formulas, whether it has a target platform, and any other installation or usage instructions or tips.

A sample skeleton for the README.rst file:

```rst
===
foo
===

Install and configure the FOO service.

**NOTE**

See the full `Salt Formulas installation and usage instructions <https://docs.saltstack.com/en/latest/topics/development/conventions/formulas.html>`_.
Available states
==============

.. contents::
   :local:

``foo``
-------
Install the `foo` package and enable the service.

``foo.bar``
----------
Install the `bar` package.

CHANGELOG.rst

The CHANGELOG.rst file should detail the individual versions, their release date and a set of bullet points for each version highlighting the overall changes in a given version of the formula.

A sample skeleton for the CHANGELOG.rst file:

CHANGELOG.rst:

``foo formula``

0.0.2 (2013-01-01)
- Re-organized formula file layout
- Fixed filename used for upstart logger template
- Allow for pillar message to have default if none specified

Versioning

Formula are versioned according to Semantic Versioning, `http://semver.org/`.

Note: Given a version number MAJOR.MINOR.PATCH, increment the:

1. MAJOR version when you make incompatible API changes,
2. MINOR version when you add functionality in a backwards-compatible manner, and
3. PATCH version when you make backwards-compatible bug fixes.

Additional labels for pre-release and build metadata are available as extensions to the MAJOR.MINOR.PATCH format.

Formula versions are tracked using Git tags as well as the VERSION file in the formula repository. The VERSION file should contain the currently released version of the particular formula.
Testing Formulas

A smoke-test for invalid Jinja, invalid YAML, or an invalid Salt state structure can be performed by with the `state.show_sls` function:

```
salt '*' state.show_sls apache
```

Salt Formulas can then be tested by running each `.sls` file via `state.apply` and checking the output for the success or failure of each state in the Formula. This should be done for each supported platform.

### 27.22.3 SaltStack Packaging Guide

Since Salt provides a powerful toolkit for system management and automation, the package can be split into a number of sub-tools. While packaging Salt as a single package containing all components is perfectly acceptable, the split packages should follow this convention.

#### Patching Salt For Distributions

The occasion may arise where Salt source and default configurations may need to be patched. It is preferable if Salt is only patched to include platform specific additions or to fix release time bugs. It is preferable that configuration settings and operations remain in the default state, as changes here lowers the user experience for users moving across distributions.

In the event where a packager finds a need to change the default configuration it is advised to add the files to the master.d or minion.d directories.

#### Source Files

Release packages should always be built from the source tarball distributed via pypi. Release packages should NEVER use a git checkout as the source for distribution.

#### Single Package

Shipping Salt as a single package, where the minion, master, and all tools are together is perfectly acceptable and practiced by distributions such as FreeBSD.

#### Split Package

Salt Should always be split in a standard way, with standard dependencies, this lowers cross distribution confusion about what components are going to be shipped with specific packages. These packages can be defined from the Salt Source as of Salt 2014.1.0:

#### Salt Common

The `salt-common` or `salt` package should contain the files provided by the salt python package, or all files distributed from the `salt/` directory in the source distribution packages. The documentation contained under the `doc/` directory can be a part of this package but splitting out a doc package is preferred. Since salt-call is the entry point to utilize the libs and is useful for all salt packages it is included in the salt-common package.
Name

- salt OR salt-common

Files

- salt/*
- man/salt.7
- scripts/salt-call
- tests/*
- man/salt-call.1

Depends

- Python 2.6-2.7
- PyYAML
- Jinja2

Salt Master

The salt-master package contains the applicable scripts, related man pages and init information for the given platform.

Name

- salt-master

Files

- scripts/salt-master
- scripts/salt
- scripts/salt-run
- scripts/salt-key
- scripts/salt-cp
- pkg/<master init data>
- man/salt.1
- man/salt-master.1
- man/salt-run.1
- man/salt-key.1
- man/salt-cp.1
- conf/master
Depends

- Salt Common
- ZeroMQ >= 3.2
- PyZMQ >= 2.10
- PyCrypto
- M2Crypto
- Python MessagePack (Messagepack C lib, or msgpack-pure)

Salt Syndic

The Salt Syndic package can be rolled completely into the Salt Master package. Platforms which start services as part of the package deployment need to maintain a separate salt-syndic package (primarily Debian based platforms). The Syndic may optionally not depend on the anything more than the Salt Master since the master will bring in all needed dependencies, but fall back to the platform specific packaging guidelines.

Name

- salt-syndic

Files

- scripts/salt-syndic
- pkg/<syndic init data>
- man/salt-syndic.1

Depends

- Salt Common
- Salt Master
- ZeroMQ >= 3.2
- PyZMQ >= 2.10
- PyCrypto
- M2Crypto
- Python MessagePack (Messagepack C lib, or msgpack-pure)

Salt Minion

The Minion is a standalone package and should not be split beyond the salt-minion and salt-common packages.
Name

- salt-minion

Files

- scripts/salt-minion
- pkg/<minion init data>
- man/salt-minion.1
- conf/minion

Depends

- Salt Common
- ZeroMQ >= 3.2
- PyZMQ >= 2.10
- PyCrypto
- M2Crypto
- Python MessagePack (Messagepack C lib, or msgpack-pure)

Salt SSH

Since Salt SSH does not require the same dependencies as the minion and master, it should be split out.

Name

- salt-ssh

Files

- scripts/salt-ssh
- man/salt-ssh.1
- conf/cloud*

Depends

- Salt Common
- Python MessagePack (Messagepack C lib, or msgpack-pure)
Salt Cloud

As of Salt 2014.1.0 Salt Cloud is included in the same repo as Salt. This can be split out into a separate package or it can be included in the salt-master package.

Name

- `salt-cloud`

Files

- `scripts/salt-cloud`
- `man/salt-cloud.1`

Depends

- `Salt Common`
- `apache libcloud >= 0.14.0`

Salt Doc

The documentation package is very distribution optional. A completely split package will split out the documentation, but some platform conventions do not prefer this. If the documentation is not split out, it should be included with the `Salt Common` package.

Name

- `salt-doc`

Files

- `doc/*`

Optional Depends

- `Salt Common`
- `Python Sphinx`
- `Make`

27.22.4 Salt Release Process

The goal for Salt projects is to cut a new feature release every six months. This document outlines the process for these releases, and the subsequent bug fix releases which follow.
Feature Release Process

When a new release is ready to be cut, the person responsible for cutting the release will follow the following steps (written using the 2019.2.0 release as an example):

1. Create first public draft of release notes with major features.
2. Remove any deprecations for the upcoming release.
3. Notify salt-users and salt-announce google groups when the feature freeze branch creation will occur so they can try to get their work merged.
4. Create QA test plan. Review features planned for the release and determine if there is sufficient test coverage.
5. Ensure all required features are merged.
6. Complete one last merge forward from the previous branch.
7. Create feature release branch with the name of the release. (ex. fluorine)
8. Create issue to start the process of deprecating for the next feature release.
9. Create jenkins jobs to test the new feature release branch.
10. Inform salt-users and salt-announce google groups feature branch and freeze is complete.
11. Add new feature branch to salt-jenkins repo and the kitchen yaml file.
12. Fix tests failing in jenkins test runs.
13. Finalize QA test plan and add all required tests.
14. Run through a manual test run based off of the head of the feature branch.
15. Convert the feature release branch to the version number. For example (v2019.2) This is based off of the year and month that is planned to release.
16. Migrate both the jenkins test jobs and salt-jenkins repo to the new branch number.
17. Notify salt-users and salt-announce google groups of the new version branch number and migrate any PRs to the new branch.
18. Delete old feature release branch name (ex. fluorine)
19. Update all name references to version number in the docs. For example all fluorine references in the docs needs to be moved to v2019.2.0
20. Create RC release branch. (ex. 2019.2.0.rc)
21. Create new jenkins test jobs with new RC release branch
22. Notify salt-users and salt-announce google groups of the new RC branch.
23. Fix tests failing in jenkins test runs.
24. Review the release notes with major features.
25. Generate the new man pages for the release.
26. Create internal RC tag for testing.
27. Build latest windows, mac, ubuntu, debian and redhat packages.
28. Run manual and package tests against new RC packages.
29. Update release candidate docs with the new version. (ex. 2019.2.0rc1)
30. Push the internal tag live to salt’s repo.
31. Publish release archive to pypi based off tag.
32. Push the RC packages live.
33. Announce new RC to salt-users and salt-announce google groups.
34. Triage incoming issues based on the new RC release.
35. Fix RC issues once they are categorized as a release blocker.
36. Depending on the issues found during the RC process make a decision on whether to release based off the RC or go through another RC process, repeating the steps starting at ensuring the tests are not failing.
37. If a RC is categorized as stable, build all required packages.
38. Test all release packages.
40. Update installation instructions with new release number at repo.saltstack.com.
41. Update and build docs to include new version (2019.2) as the latest.
42. Pre-announce on salt-users google group that we are about to update our repo.
43. Publish release (v2019.2.0) archive to pypi based off tag.
44. Publish all packages live to repo.
45. Publish the docs.
46. Create release at github
47. Update win-repo-ng with new salt versions.
48. Announce release is live to irc, salt-users, salt-announce and release slack community channel.

**Maintenance and Bugfix Releases**

Once a feature release branch has been cut from develop, the branch enters a "feature freeze" state. The new release branch enters the merge-forward chain and only bugfixes should be applied against the new branch. Once major bugs have been fixed, a bugfix release can be cut:

1. Ensure all required bug fixes are merged.
2. Inform salt-users and salt-announce we are going to branch for the release.
3. Complete one last merge forward from the previous branch.
4. Create release branch with the version of the release. (ex. 2019.2.1)
5. Create jenkins jobs that test the new release branch.
6. Fix tests failing in jenkins test runs.
7. Run through a manual test run based off of the head of the branch.
8. Generate the new man pages for the release.
9. Create internal tag for testing (ex v2019.2.1)
10. Build all release packages.
11. Run manual and package tests against new packages.
13. Update and build docs to include new version. (ex. 2019.2.1)
14. Pre-announce on salt-users google groups that we are about to update our repo.
15. Push the internal tag live to salt’s repo.
16. Publish release archive to pypi based off tag.
17. Push the packages live.
18. Publish release (v2019.2.1) archive to pypi based off tag.
19. Publish all packages live to repo.
20. Publish the docs.
21. Create release at github
22. Update win-repo-ng with new salt versions.
23. Announce release is live to irc, salt-users, salt-announce and release slack channel.

For more information about the difference between the develop branch and bugfix release branches, please refer to the Which Salt Branch? section of Salt’s Contributing documentation.

27.22.5 Salt Coding Style

To make it easier to contribute and read Salt code, SaltStack has adopted Black as its code formatter. There are a few places where Black is silent, and this guide should be used in those cases.

Coding style is NEVER grounds to reject code contributions, and is never grounds to talk down to another member of the community (There are no grounds to treat others without respect, especially people working to improve Salt)!

Linting

Most Salt style conventions are codified in Salt’s .testing.pylintrc file. Salt’s pylint file has two dependencies: pylint and saltpylint. You can install these dependencies with pip:

```
    pip install pylint
    pip install saltpylint
```

The .testing.pylintrc file is found in the root of the Salt project and can be passed as an argument to the pylint program as follows:

```
    pylint --rcfile=/path/to/salt/.testing.pylintrc salt/dir/to/lint
```

Note: There are two pylint files in the salt directory. One is the .pylintrc file and the other is the .testing.pylintrc file. The tests that run in Jenkins against GitHub Pull Requests use .testing.pylintrc. The testing.pylintrc file is a little less strict than the .pylintrc and is used to make it easier for contributors to submit changes. The .pylintrc file can be used for linting, but the testing.pylintrc is the source of truth when submitting pull requests.

Variables

Variables should be a minimum of three characters and should provide an easy-to-understand name of the object being represented.

When keys and values are iterated over, descriptive names should be used to represent the temporary variables.
Multi-word variables should be separated by an underscore. Variables which are two-letter words should have an underscore appended to them to pad them to three characters.

**Formatting Strings**

All strings which require formatting should use the `.format` string method:

```python
data = 'some text'
more = '{0} and then some'.format(data)
```

Make sure to use indices or identifiers in the format brackets, since empty brackets are not supported by python 2.6. Please do NOT use printf formatting.

**Docstring Conventions**

When adding a new function or state, where possible try to use a `versionadded` directive to denote when the function, state, or parameter was added.

```python
def new_func(msg=' '):
    '''
    .. versionadded:: 0.16.0
    Prints what was passed to the function.
    msg : None
    The string to be printed.
    '''
    print(msg)
```

If you are uncertain what version should be used, either consult a core developer in IRC or bring this up when opening your pull request and a core developer will let you know what version to add. Typically this will be the next element in the periodic table.

Similar to the above, when an existing function or state is modified (for example, when an argument is added), then under the explanation of that new argument a `versionadded` directive should be used to note the version in which the new argument was added. If an argument’s function changes significantly, the `versionchanged` directive can be used to clarify this:

```python
def new_func(msg=' ', signature=None):
    '''
    .. versionadded:: 0.16.0
    Prints what was passed to the function.
    msg : None
    The string to be printed. Will be prepended with 'Greetings! '.
    .. versionchanged:: 0.17.1
    signature : None
    An optional signature.
    .. versionadded 0.17.0
    ```

(continues on next page)
Dictionaries

Dictionaries should be initialized using `dict()` instead of `dict()`. See here for an in-depth discussion of this topic.

Imports

Salt code prefers importing modules and not explicit functions. This is both a style and functional preference. The functional preference originates around the fact that the module import system used by pluggable modules will include callable objects (functions) that exist in the direct module namespace. This is not only messy, but may unintentionally expose code python libs to the Salt interface and pose a security problem.

To say this more directly with an example, this is GOOD:

```python
import os
def minion_path():
    path = os.path.join(self.opts['cachedir'], 'minions')
    return path
```

This on the other hand is DISCOURAGED:

```python
from os.path import join
def minion_path():
    path = join(self.opts['cachedir'], 'minions')
    return path
```

The time when this is changed is for importing exceptions, generally directly importing exceptions is preferred:

This is a good way to import exceptions:

```python
from salt.exceptions import CommandExecutionError
```

Absolute Imports

Although absolute imports seem like an awesome idea, please do not use it. Extra care would be necessary all over salt’s code in order for absolute imports to work as supposed. Believe it, it has been tried before and, as a tried example, by renaming `salt.modules.sysmod` to `salt.modules.sys`, all other salt modules which needed to import `sys` would have to also import `absolute_import`, which should be avoided.

Note: An exception to this rule is the `absolute_import` from `__future__` at the top of each file within the Salt project. This import is necessary for Py3 compatibility. This particular import looks like this:

```python
from __future__ import absolute_import
```

This import is required for all new Salt files and is a good idea to add to any custom states or modules. However, the practice of avoiding absolute imports still applies to all other cases as to avoid a name conflict.
Code Churn

Many pull requests have been submitted that only churn code in the name of PEP 8. Code churn is a leading source of bugs and is strongly discouraged. While style fixes are encouraged they should be isolated to a single file per commit, and the changes should be legitimate, if there are any questions about whether a style change is legitimate please reference this document and the official PEP 8 (http://legacy.python.org/dev/peps/pep-0008/) document before changing code. Many claims that a change is PEP 8 have been invalid, please double check before committing fixes.

27.23 Salt code and internals

Reference documentation on Salt’s internal code.

27.23.1 Contents

salt.aggregation

salt.utils.aggregation

This library makes it possible to introspect dataset and aggregate nodes when it is instructed.

Note: The following examples will be expressed in YAML for convenience's sake:

- `!aggr-scalar` will refer to Scalar python function
- `!aggr-map` will refer to Map python object
- `!aggr-seq` will refer for Sequence python object

How to instructs merging

This yaml document has duplicate keys:

```yaml
foo: !aggr-scalar first
foo: !aggr-scalar second
bar: !aggr-map {first: foo}
bar: !aggr-map {second: bar}
baz: !aggr-scalar 42
```

but tagged values instruct Salt that overlapping values they can be merged together:

```yaml
foo: !aggr-seq [first, second]
bar: !aggr-map {first: foo, second: bar}
baz: !aggr-seq [42]
```

Default merge strategy is keep untouched

For example, this yaml document still has duplicate keys, but does not instruct aggregation:
foo: first
foo: second
bar: {first: foo}
bar: {second: bar}
baz: 42

So the late found values prevail:

foo: second
bar: {second: bar}
baz: 42

Limitations

Aggregation is permitted between tagged objects that share the same type. If not, the default merge strategy prevails.

For example, these examples:

foo: {first: value}
foo: !aggr-map {second: value}
bar: !aggr-map {first: value}
bar: 42
baz: !aggr-seq [42]
baz: [fail]
qux: 42
qux: !aggr-scalar fail

are interpreted like this:

foo: !aggr-map{second: value}
bar: 42
baz: [fail]
qux: !aggr-seq [fail]

Introspection

TODO: write this part

salt.utils.aggregation.aggregate(obj_a, obj_b, level=False, map_class=<class 'salt.utils.aggregation.Map'>, sequence_class=<class 'salt.utils.aggregation.Sequence'>)

Merge obj_b into obj_a.

>>> aggregate('first', 'second', True) == ['first', 'second']
True

class salt.utils.aggregation.Aggregate
Aggregation base.
class salt.utils.aggregation.Map
Map aggregation.
salt.utils.aggregation.Scalar(obj)
Shortcut for Sequence creation

>>> Scalar('foo') == Sequence(['foo'])
True

class salt.utils.aggregation.Sequence
Sequence aggregation.

Exceptions
Salt-specific exceptions should be thrown as often as possible so the various interfaces to Salt (CLI, API, etc) can handle those errors appropriately and display error messages appropriately.

salt.exceptions
This module is a central location for all salt exceptions

salt.exceptions

This module is a central location for all salt exceptions

exception salt.exceptions.ArgumentValueError(message=", info=None)
Used when an invalid argument was passed to a command execution

exception salt.exceptions.AuthenticationError(message=")
If sha256 signature fails during decryption

exception salt.exceptions.AuthorizationError(message=")
Thrown when runner or wheel execution fails due to permissions

exception salt.exceptions.CheckError(message=", info=None)
Used when a check fails

exception salt.exceptions.CommandExecutionError(message=", info=None)
Used when a module runs a command which returns an error and wants to show the user the output gracefully instead of dying

exception salt.exceptions.CommandNotFoundError(message=")
Used in modules or grains when a required binary is not available

exception salt.exceptions.EauthAuthenticationError(message=")
Thrown when eauth authentication fails

exception salt.exceptions.FileLockError(message, time_start=None, *args, **kwargs)
Used when an error occurs obtaining a file lock

exception salt.exceptions.FileserverConfigError(message=")
Used when invalid fileserv settings are detected

exception salt.exceptions.GitLockError(errno, message, *args, **kwargs)
Raised when an uncaught error occurs in the midst of obtaining an update/checkout lock in salt.utils.gitfs.

NOTE: While this uses the errno param similar to an OSError, this exception class is not as subclass of OSError. This is done intentionally, so that this exception class can be caught in a try/except without being caught as an OSError.
exception salt.exceptions.GitRemoteError(message="")
    Used by GitFS to denote a problem with the existence of the "origin" remote or part of its configuration

exception salt.exceptions.InvalidConfigError(message="", info=None)
    Used when the config is invalid

exception salt.exceptions.InvalidEntityError(message="", info=None)
    Used when an entity fails validation

exception salt.exceptions.LoaderError(message="")
    Problems loading the right renderers

exception salt.exceptions.LoggingRuntimeError
    Raised when we encounter an error while logging

exception salt.exceptions.MasterExit
    Rise when the master exits

exception salt.exceptions.MinionError(message="")
    Minion problems reading uris such as salt:// or http://

exception salt.exceptions.MissingSmb(message="")
    Raised when no smb library is found.

exception salt.exceptions.NotImplemented(message="")
    Used when a module runs a command which returns an error and wants to show the user the output gracefully
    instead of dying

exception salt.exceptions.PkgParseError(message="")
    Used when of the pkg modules cannot correctly parse the output from the CLI tool (pacman, yum, apt, aptitude,
    etc)

exception salt.exceptions.PublishError(message="")
    Problems encountered when trying to publish a command

exception salt.exceptions.SaltCacheError(message="")
    Thrown when a problem was encountered trying to read or write from the salt cache

exception salt.exceptions.SaltClientError(message="")
    Problem reading the master root key

exception salt.exceptions.SaltClientTimeout(message, jid=None, *args, **kwargs)
    Thrown when a job sent through one of the Client interfaces times out
    Takes the jid as a parameter

exception salt.exceptions.SaltCloudConfigError(message="")
    Raised when a configuration setting is not found and should exist.

exception salt.exceptions.SaltCloudException(message="")
    Generic Salt Cloud Exception

exception salt.exceptions.SaltCloudExecutionFailure(message="")
    Raised when too much failures have occurred while querying/waiting for data.

exception salt.exceptions.SaltCloudExecutionTimeout(message="")
    Raised when too much time has passed while querying/waiting for data.

exception salt.exceptions.SaltCloudNotFound(message="")
    Raised when some cloud provider function cannot find what’s being searched.

exception salt.exceptions.SaltCloudPasswordError(message="")
    Raise when virtual terminal password input failed
exception salt.exceptions.SaltCloudSystemExit(message, exit_code=1)
This exception is raised when the execution should be stopped.

exception salt.exceptions.SaltConfigurationError(message="")
Configuration error

exception salt.exceptions.SaltDaemonNotRunning(message="")
Throw when a running master/minion/syndic is not running but is needed to perform the requested operation (e.g., eauth).

exception salt.exceptions.SaltDeserializationError(message="")
Thrown when salt cannot deserialize data.

exception salt.exceptions.SaltException(message="")
Base exception class; all Salt-specific exceptions should subclass this

pack()
Pack this exception into a serializable dictionary that is safe for transport via msgpack

exception salt.exceptions.SaltInvocationError(message="")
Used when the wrong number of arguments are sent to modules or invalid arguments are specified on the command line

exception salt.exceptions.SaltMasterError(message="")
Problem reading the master root key

exception salt.exceptions.SaltMasterUnresolvableError(message="")
Problem resolving the name of the Salt master

exception salt.exceptions.SaltNoMinionsFound(message="")
An attempt to retrieve a list of minions failed

exception salt.exceptions.SaltRenderError(message, line_num=None, buf="", marker='----------
<------------------------', trace=None)
Used when a renderer needs to raise an explicit error. If a line number and buffer string are passed, get_context will be invoked to get the location of the error.

exception salt.exceptions.SaltReqTimeoutError(message="")
Thrown when a salt master request call fails to return within the timeout

exception salt.exceptions.SaltRunnerError(message="")
Problem in runner

exception salt.exceptions.SaltSyndicMasterError(message="")
Problem while proxying a request in the syndication master

exception salt.exceptions.SaltSystemExit(code=0, msg=None)
This exception is raised when an unsolvable problem is found. There's nothing else to do, salt should just exit.

exception salt.exceptions.SaltWheelError(message="")
Problem in wheel

exception salt.exceptions.TemplateError(message="")
Used when a custom error is triggered in a template

exception salt.exceptions.TimedProcTimeoutError(message="")
Thrown when a timed subprocess does not terminate within the timeout, or if the specified timeout is not an int or a float

exception salt.exceptions.TimeoutError(message="")
Thrown when an operation cannot be completed within a given time limit.

exception salt.exceptions.TokenAuthenticationError(message="")
Thrown when token authentication fails
exception salt.exceptions.VMwareApiError (message=", info=None)
    Used when representing a generic VMware API error

exception salt.exceptions.VMwareConnectionError (message=", info=None)
    Used when the client fails to connect to a either a VMware vCenter server or to a ESXi host

exception salt.exceptions.VMwareFileNotFoundException (message=", info=None)
    Used when representing a generic VMware error if a file not found

exception salt.exceptions.VMwareMultipleObjectsError (message=", info=None)
    Used when multiple objects were retrieved (and one was expected)

exception salt.exceptions.VMwareNotFoundError (message=", info=None)
    Used when a VMware object was not found

exception salt.exceptions.VMwareObjectExistsError (message=", info=None)
    Used when a VMware object already exists

exception salt.exceptions.VMwareObjectNotFoundError (message=", info=None)
    Used when a VMware object was not found

exception salt.exceptions.VMwareObjectRetrievalError (message=", info=None)
    Used when a VMware object cannot be retrieved

exception salt.exceptions.VMwarePowerOnError (message=", info=None)
    Used when error occurred during power on

exception salt.exceptions.VMwareRuntimeError (message=", info=None)
    Used when a runtime error is encountered when communicating with the vCenter

exception salt.exceptions.VMwareSaltError (message=", info=None)
    Used when a VMware object cannot be retrieved

exception salt.exceptions.VMwareSystemError (message=", info=None)
    Used when representing a generic VMware system error

exception salt.exceptions.VMwareVmCreationError (message=", info=None)
    Used when a configuration parameter is incorrect

exception salt.exceptions.VMwareVmRegisterError (message=", info=None)
    Used when a configuration parameter is incorrect

salt.exceptions.get_error_message (error)
    Get human readable message from Python Exception

The Salt Fileserver and Client

Introduction

Salt has a modular fileserver, and multiple client classes which are used to interact with it. This page serves as a
developer’s reference, to help explain how the fileserver and clients both work.

Fileserver

The fileserver is not a daemon, so the fileserver and client are not a true server and client in the traditional sense.
Instead, the fileserver is simply a class (salt.fileserver.Fileserver), located in salt/fileserver/__init__.py.
This class has access to the configured fileserver backends via a loader instance, referenced as self.servers.
When a request comes in from the fileclient, it will ultimately result in a Fileserver class function being run.
The functions in this class will run corresponding functions in the configured fileserver backends to perform the requested action. So, in summary:

1. A fileclient class makes a request...
2. which triggers the fileserver to run a function...
3. which runs a named function in each of the configured backends.

Not all of the functions will always execute on every configured backend. For instance, the find_file function in the fileserver will stop when it finds a match, so if it finds a match for the desired path in the first configured backend, it won’t proceed and try to find the file in the next backend in the list.

Additionally, not all backends implement all functions in the salt.fileserver.Fileserver class. For instance, there is a function called update, which exists to update remote file servers such as the git, hg, and svn backends. This action has no use however in the roots backend, so it is simply not implemented there, and thus the roots backend will be skipped if the update function is run on the fileserver.

Backends for the fileserver are located in salt/fileserver/ (the files not named __init__.py).

**Fileclient**

There are three fileclient classes:

**salt.fileclient.RemoteClient**

This client is used when file_client is set to remote. This is how minions request files from the master.

Functions in this client will craft a payload and send it to the master via the transport channel. This is the same way that the minion asks the master to do other things, such as updating and requesting data from the mine. The payload will be a dictionary with a key called cmd, and other values as needed.

Payloads sent via the transport channel are processed my an MWorker instance on the master, and the MWorker’s _handle_aes() function will execute the command. The command will be a function attribute of the salt.master.AESFuncs class. The AESFuncs class’ __setup_fileserver() function instantiates a salt.fileserver.Fileserver instance and maps its member functions to AESFuncs attributes. This is what makes the fileserver functions available remotely. The result of the function is returned back through the transport channel to the minion.

Transferring files is done in chunks, the size of which is decided by the file_buffer_size config option. If you look at the serve_file() function in any of the fileserver backends, you can see how the loc value in the payload determines the offset so that an intermediate chunk of the file can be served. The RemoteClient’s get_file() function will loop until the end of the file is reached, retrieving one chunk at a time.

**salt.fileclient.FSClient**

This client is used when file_client is set to local. This is how masterless minions request files.

This class inherits from the RemoteClient, but instead of using a transport channel (zmq, tcp, etc.), it uses a “fake” transport channel (salt.fileserver.FSChan), which implements its own send() function. Thus, when a function that the FSClient inherits from the RemoteClient runs self.channel.send(), it’s actually calling salt.fileserver.FSChan.send(), which calls corresponding functions in the salt.fileserver.Fileserver() class. The result is that local file requests use the same code as remote file requests, they just bypass sending them through an actual transport channel and instead call them on the FSChan’s Fileserver instance.
salties/client.LocalClient

This client is now used exclusively by Pillar. This used to be used when file_client was set to local, but the FSChan class was written to allow minions with file_client: local to access the full set of backends. This class will probably be renamed at some point as it is often confused with salt.client.LocalClient.

The cp Module

Most of the user-facing interaction with the fileclient happens via the cp module. The functions in this module instantiate a fileclient instance (if one is not already saved to the __context__ dunder) and run fileclient functions.

Updating the Fileserver

The master daemon spawns a process dedicated to routine maintenance tasks upon startup. This process runs an instance of salt/master.Maintenance, which loops forever, running a series of functions and then sleeping for a length of time determined by the loop_interval config option. One of the maintenance tasks is to update the fileserver, and it essentially runs salt/fileserver.Fileserver.update(), which as we know from above will run all configured backends' update() functions, if present. This is now remote fileservers like git, hg, and svn stay up-to-date.

For the local file_client (FSClient), since it does not interact with the master, upon spawning of its FSChan it will update the fileserver.

Salt opts dictionary

It is very common in the Salt codebase to see opts referred to in a number of contexts.

For example, it can be seen as __opts__ in certain cases, or simply as opts as an argument to a function in others.

Simply put, this data structure is a dictionary of Salt’s runtime configuration information that’s passed around in order for functions to know how Salt is configured.

When writing Python code to use specific parts of Salt, it may become necessary to initialize a copy of opts from scratch in order to have it available for a given function.

To do so, use the utility functions available in salt/config.

As an example, here is how one might generate and print an options dictionary for a minion instance:

```
import salt/config
opts = salt/config.minion_config('/etc/salt/minion')
print(opts)
```

To generate and display opts for a master, the process is similar:

```
import salt/config
opts = salt/config.master_config('/etc/salt/master')
print(opts)
```

Unicode in Salt

Though Unicode handling in large projects can often be complex, Salt adheres to several basic rules to help developers handle Unicode correctly.
Salt’s basic workflow for Unicode handling is as follows:

1) Salt should convert whatever data is passed on CLI/API to Unicode. Internally, everything that Salt does should be Unicode unless it is printing to the screen or writing to storage.

2) Modules and various Salt pluggable systems use incoming data assuming Unicode.

   2.1) For Salt modules that query an API, the module should convert the data received from the API into Unicode.

   2.2) For Salt modules that shell out to get output, the module should convert data received into Unicode. (This does not apply if using the cmd execution module, which should handle this for you.

   2.3) For Salt modules which print directly to the console (not via an outputter) or which write directly to disk, a string should be encoded when appropriate. To handle this conversion, the global variable `__salt_system_encoding__` is available, which declares the locale of the system that Salt is running on.

3) When a function in a Salt module returns a string, it should return a `unicode` type in Python 2.

4) When Salt delivers the data to an outputter or a returner, it is the job of the outputter or returner to encode the Unicode before displaying it on the console or writing it to storage.

### 27.24 Salt Community Projects

This page contains links to Salt-related projects created by community members. If you come across a useful project please add it to the list!

#### 27.24.1 Hubblestack

Hubble is a modular, open-source security compliance framework built on top of SaltStack. The project provides on-demand profile-based auditing, real-time security event notifications, automated remediation, alerting and reporting.

http://hubblestack.io/

#### 27.24.2 alkali

alkali is a collections of SaltStack states and pillar data that provide just the basics for provisioning Linux instances that may be built upon. alkali is a starter kit of sorts, to help new users to SaltStack get up-and-running quickly with the most commonly used, core packages.

https://github.com/zulily/alkali

#### 27.24.3 buoyant

buoyant leverages docker to provide an alternative to VM-centric SaltStack development environments. buoyant containers may be spun up nearly instantly, once an initial docker image has been built.

https://github.com/zulily/buoyant
27.24.4 Salt Sandbox

Salt Sandbox is a multi-VM Vagrant-based Salt development environment used for creating and testing new Salt state modules outside of your production environment. It’s also a great way to learn firsthand about Salt and its remote execution capabilities.

https://github.com/elasticdog/salt-sandbox

27.24.5 Salt Vagrant Demo

A Salt Demo using Vagrant.

https://github.com/UtahDave/salt-vagrant-demo
See the version numbers page for more information about the version numbering scheme.

28.1 Latest Branch Release

Release Candidate

28.2 Previous Releases

28.2.1 Salt 3000 Release Notes - Codename Neon

Security Advisory

For historical reasons, Salt requires PyCrypto as a "lowest common denominator". However, PyCrypto is unmain-
tained and best practice is to manually upgrade to use a more maintained library such as PyCryptodome. See Issue #52674 and Issue #54115 for more info

New Versioning

The neon release has removed the date versioning. Going forward we will use a non-date based version schema beginning at 3000. The version will be MAJOR.PATCH. For a planned release containing features and/or bug fixes the MAJOR version will be incremented. Please review the approved SEP for further details.

The new versioning scheme is PEP 440 compliant, but distutils.StrictVersion will result in an error invalid version number. If using StrictVersion to compare Salt’s versions, please use LooseVersion. There is also the packaging library you can use to compare versions. Another alternative is using the salt version module

Python 3.8 Not Supported

Please note that running Salt with Python 3.8 is currently not supported. It is recommended to not use a version higher than 3.7.

Vendored Tornado Code Base

The Tornado code base has been included as salt.ext.tornado. This was done to provide a consistent version of Tornado across all operating systems while we continue to work on upgrading Tornado to a recent version. New
code that uses Tornado should import the module from `salt.ext.tornado` instead of importing the system version of Tornado.

**Msgpack 1.0.0rc1 Incompatibility**

Salt is currently incompatible with msgpack 1.0.0rc1. We recommend using versions < 1.0.0. This impacts the Salt Master’s ability to run commands against minions. Please see Issue 56007 for more details and updates.

**Pip Installing Salt On Windows**

This release will not install correctly on windows when using pip to install salt. This issue is addressed in PR 56099. The workaround for this issue is:

```
pip install "pywin32==224" "WMI==1.4.9"
```

Those using the Salt Windows Installer are not affected by this issue.

**Saltcheck Updates**

Available since 2018.3, the `saltcheck` module has been enhanced to:

- Support saltenv environments
- Associate tests with states by naming convention
- `Adds report_highstate_tests` function
- Adds empty and notempty assertions
- Adds skip keyword
- Adds `print_result` keyword
- Adds `assertion_section` keyword
- Use saltcheck.state_apply to run state.apply for test setup or teardown
- Changes output to display test time
- Works with salt-ssh

Saltcheck provides unittest like functionality requiring only the knowledge of salt module execution and yaml. Saltcheck uses salt modules to return data, then runs an assertion against that return. This allows for testing with all the features included in salt modules.

In order to run state and highstate saltcheck tests, a sub-folder in the state directory must be created and named `saltcheck-tests`. Tests for a state should be created in files ending in `*.tst` and placed in the `saltcheck-tests` folder. tst files are run through the salt rendering system, enabling tests to be written in yaml (or renderer of choice), and include jinja, as well as the usual grain and pillar information. Like states, multiple tests can be specified in a `tst` file. Multiple `tst` files can be created in the `saltcheck-tests` folder, and should be named the same as the associated state. The `id` of a test works in the same manner as in salt state files and should be unique and descriptive.

**Usage**

Example file system layout:
Tests can be run for each state by name, for all apache/saltcheck/*.tst files, or for all states assigned to the minion in top.sls. Tests may also be created with no associated state. These tests will be run through the use of saltcheck.run_state_tests, but will not be automatically run by saltcheck.run_highstate_tests.

```
salt '*' saltcheck.run_state_tests apache,apache.config
salt '*' saltcheck.run_state_tests apache check_all=True
salt '*' saltcheck.run_highstate_tests
salt '*' saltcheck.run_state_tests apache.deployment_validation
```

**Example Tests**

```python
{{# will run the common salt state before further testing #}}
setup_test_environment:
  module_and_function: saltcheck.state_apply
  args:
    - common
  pillar-data:
    data: value

{% for package in ['apache2', 'openssh'] %}
  # or another example #
  # for package in salt['pillar.get']('packages') #
  jinja_test_{{ package }}_latest:
    module_and_function: pkg.upgrade_available
    args:
      - {{ package }}
    assertion: assertFalse
{% endfor %}

validate_user_present_and_shell:
  module_and_function: user.info
  args:
    - root
  assertion: assertEqual
  expected-return: /bin/bash
  assertion_section: shell
  print_result: False

skip_test:
  module_and_function: pkg.upgrade_available
  args:
    - apache2
  assertion: assertFalse
  skip: True
```
Output Format Changes

Saltcheck output has been enhanced to display the time taken per test. This results in a change to the output format.

Previous Output:

```
local:
  |------------------
  ntp:
      |------------------
      ntp-client-installed:
        Pass
      ntp-service-status:
        Pass
  |------------------
TEST RESULTS:
  ------------------
  Failed:
    0
  Missing Tests:
    0
  Passed:
    2
```

New output:

```
local:
  |------------------
  ntp:
      |------------------
      ntp-client-installed:
        duration: 1.0408
        status: Pass
      ntp-service-status:
        duration: 1.464
        status: Pass
  |------------------
TEST RESULTS:
  ------------------
  Execution Time: 2.5048
  Failed:
    0
  Missing Tests:
    0
  Passed:
    2
  Skipped:
```

(continues on next page)
Unless and onlyif Enhancements

The unless and onlyif requisites can now be operated with salt modules. The dictionary must contain an argument fun which is the module that is being run, and everything else must be passed in under the args key or will be passed as individual kwargs to the module function.

Note: Certain states have an unless/onlyif implementation that predates this feature, and may not work as expected:

- states.git
- states.cmd
- states.macpackage
- states.file
- states.docker_container

Examples:

```
check external ip address:
  http.query:
    - name: https://icanhazip.com
    - status: 200
    - onlyif:
      - fun: file.file_exists
        path: /usr/local/bin/whatever
```

is equivalent to

```
check another ip address:
  http.query:
    - name: https://icanhazip.com
    - status: 200
    - onlyif:
      - test -f /tmp/fnord.txt
```

Another example:

```
set mysql root password:
  debconf.set:
    - name: mysql-server-5.7
    - data:
      'mysql-server/root_password': {'type': 'password', 'value': {{pillar['mysql.' →'pass']]}}}
    - unless:
      - fun: pkg.version
        args:
          - mysql-server-5.7
```
Keystore State and Module

A new state and execution module for managing Java Keystore files is now included. It allows for adding/removing/listing as well as managing keystore files.

```shell
# salt-call keystore.list /path/to/keystore.jks changeit
local:
    --
    alias: hostname1
    expired: True
    type: TrustedCertEntry
    valid_start: August 22 2012
    valid_until: August 21 2017
```

```python
define_keystore:
    keystore.managed:
        - name: /tmp/statestore.jks
        - passphrase: changeit
        - force_remove: True
        - entries:
            - alias: hostname1
              certificate: /tmp/testcert.crt
            - alias: remotehost
              certificate: /tmp/512.cert
              private_key: /tmp/512.key
            - alias: stringhost
              certificate: |
                -----BEGIN CERTIFICATE-----
                MIICEjCCAX
                Hn+GmxZA
                -----END CERTIFICATE-----
```

XML Module

A new state and execution module for editing XML files is now included. Currently it allows for editing values from an xpath query, or editing XML IDs.

```shell
# salt-call xml.set_attribute /tmp/test.xml ".//actor[@id='3']" editedby "Jane Doe"
local: True
# salt-call xml.get_attribute /tmp/test.xml ".//actor[@id='3']"
local: 
    editedby:
        Jane Doe
    id:
        3
# salt-call xml.get_value /tmp/test.xml ".//actor[@id='2']"
(continues on next page)
local:
    Liam Neeson
# salt-call xml.set_value /tmp/test.xml "//actor[@id='2']" "Patrick Stewart"
local:
    True
# salt-call xml.get_value /tmp/test.xml "//actor[@id='2']"
local:
    Patrick Stewart

**ensure_value_true:**

xml.value_present:
    - name: /tmp/test.xml
    - xpath: .//actor[@id='1']
    - value: William Shatner

---

**LGPO Execution Module**

Multiple fixes were made to the `win_lgpo` to expand support for additional policies and improve performance. Issues with encoding and unsupported characters (smart-quotes, em-dash, etc) found in the ADML files as well as whitespace in some policies have been addressed.

Speed enhancements include:

- Caching the compiled xml from ADMX/ADML files in `__context__`
- Lowercasing all keys before compiling XML to remove an expensive XPath lookup

Additional functionality:

- Adds the `lgpo.get_policy` function that allows you to get the current settings for a single policy.
- Changes some policy names that were overly long

**LGPO State Module**

Multiple changes were made to the `win_lgpo` state to improve performance.

It now uses the `lgpo.get_policy` function instead of the `lgpo.get` to avoid reloading all settings on the machine at the beginning and end of each state run.

Supports the new shorter policy names but also attempts to resolve the older, longer policy names.

**Win_network Salt Util**

Now uses .NET libraries to obtain Interface information on Windows systems that support it. Unsupported systems fall back to the more expensive WMI calls. This is important as this data is gathered for grains and occurs each time a process is forked.

**Jinja enhancements**

**Troubleshooting Jinja map files**

A new execution module for `map.jinja` troubleshooting has been added.

Assuming the map is loaded in your formula SLS as follows:
The following command can be used to load the map and check the results:

    salt myminion jinja.load_map myformula/map.jinja myformula

The module can be also used to test json and yam l maps:

    salt myminion jinja.import_yaml myformula/defaults.yaml
    salt myminion jinja.import_json myformula/defaults.json

**json_query filter**

A port of Ansible `json_query` Jinja filter has been added. It allows making queries against JSON data using JMESPath language. Could be used to filter pillar data, yaml maps, and also useful with `http_query`.

Depends on the `jmespath` Python module.

**Slot Syntax Updates**

The slot syntax has been updated to support parsing dictionary responses and to append text.

```
demo dict parsing and append:
  test.configurable_test_state:
    - name: slot example
    - changes: False
    - comment: __slot__:salt:test.arg(shell="/bin/bash").kwargs.shell ~ /appended

local:
  ----------
  ID: demo dict parsing and append
  Function: test.configurable_test_state
    Name: slot example
  Result: True
  Comment: /bin/bash/appended
  Started: 09:59:58.623575
  Duration: 1.229 ms
  Changes:
```

Also, slot parsing is now supported inside of nested state data structures (dicts, lists, unless/onlyif args):

```
demo slot parsing for nested elements:
  file.managed:
    - name: /tmp/slot.txt
    - source: salt://slot.j2
    - template: jinja
      context:
        # Slot inside of the nested context dictionary
        variable: __slot__:salt:test.echo(a_value)
    - unless:
      fun: file.search
      args:
        # Slot as unless argument
```

(continues on next page)
- __slot__: salt:test.echo(/tmp/slot.txt)
  - "DO NOT OVERRIDE"
  - ignore_if_missing: True

State Changes

- The file.symlink state was fixed to remove existing file system entries other than files, directories and symbolic links properly.
- The onchanges and prereq requisites now behave properly in test mode, due to removing pchanges.
- Added new ssh_auth.manage state to ensure only the specified ssh keys are present for the specified user.
- Added new saltutil state to use instead of module.run to more easily handle change.

Module Changes

- Added new boto_ssm module to set and query secrets in AWS SSM parameters.
- The file.remove module was fixed to remove file system entries other than files, directories and symbolic links properly.

Enhancements to Engines

Multiple copies of a particular Salt engine can be configured by including the engine_module parameter in the engine configuration.

```yaml
engines:
  - production_logstash:
    host: production_log.my_network.com
    port: 5959
    proto: tcp
    engine_module: logstash
  - develop_logstash:
    host: develop_log.my_network.com
    port: 5959
    proto: tcp
    engine_module: logstash

• A new fluent engine has been added to export Salt events to fluentd.

```yaml
engines:
  - fluent
    host: localhost
    port: 24224

<source>
  @type forward
  port 24224
</source>
<match saltstack.*>
  @type file
  path /var/log/td-agent/saltstack
</match>
```
Enhancements to Beacons

Multiple copies of a particular Salt beacon can be configured by including the `beacon_module` parameter in the beacon configuration.

```yaml
beacons:
  watch_importand_file:
    - files:
        /etc/important_file: {}
    - beacon_module: inotify
  watch_another_file:
    - files:
        /etc/another_file: {}
    - beacon_module: inotify
```

Enhancements to chroot

- New functions added to chroot apply, sls, and highstate that allow executing states in sls files or running apply/highstate inside of a chroot.

Minion-side ACL

Salt has had master-side ACL for the salt mine for some time, where the master configuration contained `mine_get` that specified which minions could request which functions. However, now you can specify which minions can access a function in the salt mine function definition itself (or when calling `mine.send`). This targeting works the same as the generic minion targeting as specified here. The parameters used are `allow_tgt` and `allow_tgt_type`. See also the documentation of the Salt Mine. Please note that if you want to use this new feature both your minion and masters will need to be on atleast version 3000.

Deprecations

Raet Deprecated

- The Raet transport has been deprecated. Please use the supported transport protocols tcp or zeromq.

Module Deprecations

- The hipchat module has been removed due to the service being retired. Google Chat, MS Teams, or Slack may be suitable replacements.
- The `dockermod` module has been changed as follows:
  - Support for the `tags` kwarg has been removed from the `dockermod.resolve_tag` function.
  - Support for the `network_id` kwarg has been removed from the `dockermod.connect_container_to_network` function. Please use `net_id` instead.
  - Support for the `name` kwarg has been removed from the `dockermod.sls_build` function. Please use `repository` and `tag` instead.
  - Support for the `image` kwarg has been removed from the following functions. In all cases, please use both the `repository` and `tag` options instead:
    - `dockermod.build`
- *dockermod.commit*
- *dockermod.import*
- *dockermod.load*
- *dockermod.tag*

- The heat module has removed the enviroment kwarg from the `heat.create_stack` and `heat.update_stack` functions due to a spelling error. Please use `environment` instead.

- The `ssh` execution module has been changed as follows:
  - Support for the `ssh.get_known_host` function has been removed. Please use the `ssh.get_known_host_entries` function instead.
  - Support for the `ssh.recv_known_host` function has been removed. Please use the `ssh.recv_known_host_entries` function instead.

- The `firewalld` module has been changed as follows:
  - The default setting for the `force_masquerade` option in the `firewalld.add_port` function has changed from `True` to `False`.
  - Support for the `force_masquerade` option in the `firewalld.add_port_fwd` function has been changed from `True` to `False`.

**State Deprecations**

- The hipchat state has been removed due to the service being retired. *MS Teams or Slack* may be suitable replacements.

- The cmd state module has removed the `quiet` kwarg from the `cmd.run` function. Please set `output_loglevel` to `quiet` instead.

- The heat state module has removed the enviroment kwarg from the `heat.deployed` function due to a spelling error. Please use `environment` instead.

- The `firewalld` state has been changed as follows:
  - The default setting for the `prune_services` option in the `firewalld.present` function has changed from `True` to `False`.

**Fileserver Deprecations**

- The hgfs fileserver had the following config options removed:
  - The `hgfs_env_whitelist` config option has been removed in favor of `hgfs_saltenv_whitelist`.
  - The `hgfs_env_blacklist` config option has been removed in favor of `hgfs_saltenv_blacklist`.

- The svnfs fileserver had the following config options removed:
  - The `svnfs_env_whitelist` config option has been removed in favor of `svnfs_saltenv_whitelist`.
  - The `svnfs_env_blacklist` config option has been removed in favor of `svnfs_saltenv_blacklist`.

- The gitfs fileserver had the following config options removed:
- The `gitfs_env_whitelist` config option has been removed in favor of `gitfs_saltenv_whitelist`.
- The `gitfs_env_blacklist` config option has been removed in favor of `gitfs_saltenv_blacklist`.

**Engine Removal**

- The hipchat engine has been removed due to the service being retired. For users migrating to Slack, the `slack` engine may be a suitable replacement.

**Returner Removal**

- The hipchat returner has been removed due to the service being retired. For users migrating to Slack, the `slack` returner may be a suitable replacement.

**Grain Deprecations**

For `smartos` some grains have been deprecated. These grains have been removed.

- The `hypervisor_uuid` has been replaced with `mdata:sdc:server_uuid` grain.
- The `datacenter` has been replaced with `mdata:sdc:datacenter_name` grain.

**Cloud Deprecations**

- The `nova` cloud driver has been removed in favor of the `openstack` cloud driver.

**Jinja Filter Deprecations**

- The following jinja filters are set to be removed in the Aluminium release:
  - `json_decode_dict` in favor of `tojson`
  - `json_decode_list` in favor of `tojson`

**Utils Deprecations**

- All of the functions in `salt.utils.__init__.py` have been removed. These include:
  - `salt.utils.option`
  - `salt.utils.required_module_list`
  - `salt.utils.required_modules_error`
  - `salt.utils.get_accumulator_dir`. Please use `salt.state.get_accumulator_dir()` instead.
  - `salt.utils.fnmatch_multiple`. Please use `salt.utils.itertools.fnmatch_multiple()` instead.
  - `salt.utils.appendproctitle`. Please use `salt.utils.process.appendproctitle()` instead.
  - `salt.utils.daemonize`. Please use `salt.utils.process.daemonize()` instead.
- `salt.utils.daemonize_if`. Please use `salt.utils.process.daemonize_if()` instead.
- `salt.utils.reinit_crypto`. Please use `salt.utils.crypt.reinit_crypto()` instead.
- `salt.utils.pem_finger`. Please use `salt.utils.crypt.pem_finger()` instead.
- `salt.utils.to_bytes`. Please use `salt.utils.stringutils.to_bytes()` instead.
- `salt.utils.to_str`. Please use `salt.utils.stringutils.to_str()` instead.
- `salt.utils.to_unicode`. Please use `salt.utils.stringutils.to_unicode()` instead.
- `salt.utils.str_to_num`. Please use `salt.utils.stringutils.to_num()` instead.
- `salt.utils.is_quoted`. Please use `salt.utils.stringutils.is_quoted()` instead.
- `salt.utils.dequote`. Please use `salt.utils.stringutils.dequote()` instead.
- `salt.utils.is_hex`. Please use `salt.utils.stringutils.is_hex()` instead.
- `salt.utils.is_bin_str`. Please use `salt.utils.stringutils.is_binary()` instead.
- `salt.utils.rand_string`. Please use `salt.utils.stringutils.random()` instead.
- `salt.utils.contains_whitespace`. Please use `salt.utils.stringutils.contains_whitespace()` instead.
- `salt.utils.build_whitespace_split_regex`. Please use `salt.utils.stringutils.build_whitespace_split_regex()` instead.
- `salt.utils.expr_match`. Please use `salt.utils.stringutils.expr_match()` instead.
- `salt.utils.check_whitelist_blacklist`. Please use `salt.utils.stringutils.check_whitelist_blacklist()` instead.
- `salt.utils.print_cli`. Please use `salt.utils.stringutils.print_cli()` instead.
- `salt.utils.clean_kwarg`. Please use `salt.utils.args.clean_kwarg()` instead.
- `salt.utils.invalid_kwarg`. Please use `salt.utils.args.invalid_kwarg()` instead.
- `salt.utils.shlex_split`. Please use `salt.utils.args.shlex_split()` instead.
- `salt.utils.arg_lookup`. Please use `salt.utils.args.arg_lookup()` instead.
- `salt.utils.split_input`. Please use `salt.utils.args.split_input()` instead.
- `salt.utils.test_mode`. Please use `salt.utils.args.test_mode()` instead.
- `salt.utils.format_call`. Please use `salt.utils.args.format_call()` instead.
- `salt.utils.which`. Please use `salt.utils.path.which()` instead.
- `salt.utils.which_bin`. Please use `salt.utils.path.which_bin()` instead.
- `salt.utils.path_join`. Please use `salt.utils.path.join()` instead.
- `salt.utils.check_or_die`. Please use `salt.utils.path.check_or_die()` instead.
- `salt.utils.sanitize_win_path_string`. Please use `salt.utils.path.sanitize_win_path()` instead.
- `salt.utils.rand_str`. Please use `salt.utils.hashutils.random_hash()` instead.
- `salt.utils.get_hash`. Please use `salt.utils.hashutils.get_hash()` instead.
- salt.utils.is_windows. Please use salt.utils.platform.is_windows() instead.
- salt.utils.is_proxy. Please use salt.utils.platform.is_proxy() instead.
- salt.utils.is_linux. Please use salt.utils.platform.is_linux() instead.
- salt.utils.is_darwin. Please use salt.utils.platform.is_darwin() instead.
- salt.utils.is_sunos. Please use salt.utils.platform.is_sunos() instead.
- salt.utils.is_smartos. Please use salt.utils.platform.is_smartos() instead.
- salt.utils.is_smartos_globalzone. Please use salt.utils.platform.is_smartos_globalzone() instead.
- salt.utils.is_smartos_zone. Please use salt.utils.platform.is_smartos_zone() instead.
- salt.utils.is_freebsd. Please use salt.utils.platform.is_freebsd() instead.
- salt.utils.is_netbsd. Please use salt.utils.platform.is_netbsd() instead.
- salt.utils.is_openbsd. Please use salt.utils.platform.is_openbsd() instead.
- salt.utils.is_aix. Please use salt.utils.platform.is_aix() instead.
- salt.utils.safe_rm. Please use salt.utils.files.safe_rm() instead.
- salt.utils.is_empty. Please use salt.utils.files.is_empty() instead.
- salt.utils.fopen. Please use salt.utils.files.fopen() instead.
- salt.utils.fopen. Please use salt.utils.files.fopen() instead.
- salt.utils.fpopen. Please use salt.utils.files.fpopen() instead.
- salt.utils.rm_rf. Please use salt.utils.files.rm_rf() instead.
- salt.utils.mkstemp. Please use salt.utils.files.mkstemp() instead.
- salt.utils.istextfile. Please use salt.utils.files.is_text_file() instead.
- salt.utils.is_bin_file. Please use salt.utils.files.is_binary() instead.
- salt.utils.list_files. Please use salt.utils.files.list_files() instead.
- salt.utils.safe_walk. Please use salt.utils.files.safe_walk() instead.
- salt.utils.st_mode_to_octal. Please use salt.utils.files.st_mode_to_octal() instead.
- salt.utils.normalize_mode. Please use salt.utils.files.normalize_mode() instead.
- salt.utils.human_size_to_bytes. Please use salt.utils.files.human_size_to_bytes() instead.
- salt.utils.backup_minion. Please use salt.utils.files.backup_minion() instead.
- salt.utils.str_version_to_evr. Please use salt.utils.pkg.rpm.version_to_evr() instead.
- salt.utils.parse_docstring. Please use salt.utils.doc.parse_docstring() instead.
- salt.utils.compare_versions. Please use salt.utils.versions.compare() instead.
- salt.utils.version_cmp. Please use salt.utils.versions.version_cmp() instead.
- salt.utils.warn_until. Please use salt.utils.versions.warn_until() instead.
- salt.utils.kwargs_warn_until. Please use salt.utils.versions.kwargs_warn_until() instead.
- salt.utils.get_color_theme. Please use salt.utils.color.get_color_theme() instead.
- `salt.utils.get_colors`. Please use `salt.utils.color.get_colors()` instead.
- `salt.utils.gen_state_tag`. Please use `salt.utils.state.gen_tag()` instead.
- `salt.utils.search_onfail_requisites`. Please use `salt.utils.state.search_onfail_requisites()` instead.
- `salt.utils.check_onfail_requisites`. Please use `salt.utils.state.check_onfail_requisites()` instead.
- `salt.utils.check_state_result`. Please use `salt.utils.state.check_result()` instead.
- `salt.utils.get_user`. Please use `salt.utils.user.get_user()` instead.
- `salt.utils.get_uid`. Please use `salt.utils.user.get_uid()` instead.
- `salt.utils.get_specific_user`. Please use `salt.utils.user.get_specific_user()` instead.
- `salt.utils.chugid`. Please use `salt.utils.user.chugid()` instead.
- `salt.utils.chugid_and_umask`. Please use `salt.utils.user.chugid_and_umask()` instead.
- `salt.utils.get_default_group`. Please use `salt.utils.user.get_default_group()` instead.
- `salt.utils.get_group_list`. Please use `salt.utils.user.get_group_list()` instead.
- `salt.utils.get_group_dict`. Please use `salt.utils.user.get_group_dict()` instead.
- `salt.utils.get_gid_list`. Please use `salt.utils.user.get_gid_list()` instead.
- `salt.utils.get_gid`. Please use `salt.utils.user.get_gid()` instead.
- `salt.utils.enable_ctrl_logoff_handler`. Please use `salt.utils.win_functions.enable_ctrl_logoff_handler()` instead.
- `salt.utils.traverse_dict`. Please use `salt.utils.data.traverse_dict()` instead.
- `salt.utils.traverse_dict_and_list`. Please use `salt.utils.data.traverse_dict_and_list()` instead.
- `salt.utils.filter_by`. Please use `salt.utils.data.filter_by()` instead.
- `salt.utils.subdict_match`. Please use `salt.utils.data.subdict_match()` instead.
- `salt.utils.substr_in_list`. Please use `salt.utils.data.substr_in_list()` instead.
- `salt.utils.is_dictlist`. Please use `salt.utils.data.is_dictlist()` instead.
- `salt.utils.repack_dictlist`. Please use `salt.utils.data.repack_dictlist()` instead.
- `salt.utils.compare_dicts`. Please use `salt.utils.data.compare_dicts()` instead.
- `salt.utils.compare_lists`. Please use `salt.utils.data.compare_lists()` instead.
- `salt.utils.decode_dict`. Please use `salt.utils.data.encode_dict()` instead.
- `salt.utils.decode_list`. Please use `salt.utils.data.encode_list()` instead.
- `salt.utils.exactly_n`. Please use `salt.utils.data.exactly_n()` instead.
- `salt.utils.exactly_one`. Please use `salt.utils.data.exactly_one()` instead.
- `salt.utils.is_list`. Please use `salt.utils.data.is_list()` instead.
- `salt.utils.is_iter`. Please use `salt.utils.data.is_iter()` instead.
- `salt.utils.isorted`. Please use `salt.utils.data.sorted_ignorecase()` instead.
- `salt.utils.is_true`. Please use `salt.utils.data.is_true()` instead.
- `salt.utils.mysql_to_dict`. Please use `salt.utils.data.mysql_to_dict()` instead.
- `salt.utils.simple_types_filter`. Please use `salt.utils.data.simple_types_filter()` instead.
- `salt.utils.ip_bracket`. Please use `salt.utils.zeromq.ip_bracket()` instead.
- `salt.utils.gen_mac`. Please use `salt.utils.network.gen_mac()` instead.
- `salt.utils.mac_str_to_bytes`. Please use `salt.utils.network.mac_str_to_bytes()` instead.
- `salt.utils.refresh_dns`. Please use `salt.utils.network.refresh_dns()` instead.
- `salt.utils.dns_check`. Please use `salt.utils.network.dns_check()` instead.
- `salt.utils.get_context`. Please use `salt.utils.stringutils.get_context()` instead.
- `salt.utils.get_master_key`. Please use `salt.utils.master.get_master_key()` instead.
- `salt.utils.date_cast`. Please use `salt.utils.dateutils.date_cast()` instead.
- `salt.utils.date_format`. Please use `salt.utils.dateutils.strftime()` instead.
- `salt.utils.total_seconds`. Please use `salt.utils.dateutils.total_seconds()` instead.
- `salt.utils.find_json`. Please use `salt.utils.json.find_json()` instead.
- `salt.utils.import_json`. Please use `salt.utils.json.import_json()` instead.
- `salt.utils.namespaced_function`. Please use `salt.utils.functools.namespaced_function()` instead.
- `salt.utils.alias_function`. Please use `salt.utils.functools.alias_function()` instead.
- `salt.utils.profile_func`. Please use `salt.utils.profile.profile_func()` instead.
- `salt.utils.activate_profile`. Please use `salt.utils.profile.activate_profile()` instead.
- `salt.utils.output_profile`. Please use `salt.utils.profile.output_profile()` instead.

### salt.auth.Authorize Class Removal

- The `salt.auth.Authorize` Class inside of the `salt/auth/__init__.py` file has been removed and the `any_auth` method inside of the file `salt/utils/minions.py`. These method and classes were not being used inside of the salt code base.

### 28.2.2 Salt 3000.1 Release Notes

Version 3000.1 is a bugfix release for 3000.

#### Statistics

- Contributors: 16 (Ch3LL, UtahDave, bryceml, cmcmarrow, dwoz, frogunder, garethgreenaway, lorengordon, mchugh19, oeufette, raddessi, s0undt3ch, sjorge, terminalmage, twangboy, waynew)
Changelog for v3000..v3000.1

Generated at: 2020-03-27 16:48:41 UTC

- **PR #56455**: (s0undt3ch) Fix gitpython windows requirement @ 2020-03-27 16:31:57 UTC
  - c5a700e01e Merge pull request #56455 from s0undt3ch/hotfix/gitpython
  - d9791c393f Revert and fix windows requirements
  - 4b573c1c94 Revert "Fix win deps"

- **PR #56446**: (frogunder) 3000.1 releasenotes updates @ 2020-03-24 20:28:23 UTC
  - 7ba36325d9 Merge pull request #56446 from frogunder/releasenotes_3000.1_updates
  - 6b4f747af 3000.1 releasenotes updates

- **PR #56435**: (twangboy) Update mac build scripts @ 2020-03-24 19:47:40 UTC
  - 4d2bc7004d Merge pull request #56435 from twangboy/update_mac_build_scripts
  - 5d24d0aa6 Merge branch 'master' into update_mac_build_scripts
  - 8fd52a243 Update gitpython to 2.1.15
  - afcedc5232 Remove --ignore-installed
  - e6cc2a6192 Separate pyobjc requirements
  - 262ad2e98a Compile static requirements
  - 22472d0f2 Update noxfile and .precommit
  - 68a36fe337 Add req_ext.txt
  - 5851a5c2cd Roll back changes, fix dependencies

- **ISSUE #56433**: (Ch3LL) integration.states.test_pip_state.PipStateTest.test_pip_installed_specific_env failing on MAC (refs: #56436)

- **PR #56436**: (Ch3LL) Fix #56433 - test_pip_installed_specific_env @ 2020-03-24 19:47:20 UTC
  - 8a8ae8eb4 Merge pull request #56436 from Ch3LL/pip_custom_pypi
  - 556559ff96 Merge branch 'master' into pip_custom_pypi

- **PR #56423**: (Ch3LL) Update changelog with package fixes @ 2020-03-24 16:42:17 UTC
  - 3a993d73a9 Merge pull request #56423 from Ch3LL/changelog_again
  - 963c16e1a7 update pr number for mac build changes in changelog
  - 83e22b77c7 Update changelog with package fixes

- **PR #56417**: (twangboy) Update mac build scripts @ 2020-03-23 18:45:34 UTC
  - d2a5db8add Merge pull request #56417 from twangboy/update_mac_build_scripts
  - 3bda8dbb82 Update noxfile and pre-commit
  - de58c52d66 Merge branch 'update_mac_build_scripts' of https://github.com/twangboy/salt into update_mac_build_scripts
    - e7f08d5349 Update static requirements
    - a53977de5b Merge branch 'update_mac_build_scripts' of github.com:twangboy/salt into update_mac_build_scripts
    - 04e5cde9dd pkg/osx/req_ext.txt no longer exists
* be4a272d07 Update static requirements
  - 02dfe4119c Add pyobjc in its own requirements file
  - 6b2ac2be64 Remove pyobjc, enforce pip install location
  - 30ca5d04ec Remove cryptography, it gets installed by pyopenssl
  - fda8abf4a8 Update static requirements
  - 732ec83c1 Update pre-commit config
  - 1fa9864e3d Don't set a version for pyopenssl
  - 461b198978 Update dependencies, remove req_ext.txt

- **PR #56418:** (Ch3LL) Ensure version.py included before we install @ 2020-03-23 18:27:46 UTC
  - 74575a6993 Merge pull request #56418 from Ch3LL/egg_version
  - 85d7c784ef Fix integration setup egg test
  - a8a22a0404 Ensure version.py included before we install
  - 86fe450c82 Fix #56433 - test_pip_installed_specific_env

- **PR #56403:** (frogunder) update 3000.1 releasenotes @ 2020-03-17 23:50:21 UTC
  - 249367b462 Merge pull request #56403 from frogunder/update_releasenotes_3000.1
  - 9d972e96e8 update 3000.1 releasenotes

- **PR #56398:** (Ch3LL) Add additional PRs to 3000.1 changelog @ 2020-03-17 18:08:15 UTC
  - 0de5c1e136 Merge pull request #56398 from Ch3LL/change_3000.1
  - 79c337b3db Add additional PRs to 3000.1 changelog

- **PR #56376:** (twangboy) Fix win deps @ 2020-03-17 17:02:46 UTC
  - 5ac09decdb9 Merge pull request #56376 from twangboy/fix_win_deps
  - 6c83bee9e Fix win deps

- **PR #56378:** (Ch3LL) Include _version.py if building wheel @ 2020-03-17 17:01:33 UTC
  - e72a8d2cbe Merge pull request #56378 from Ch3LL/wheel_version
  - 22ccdd2107 Use virtualenv test helper that already exists and fix setup.py
  - 293bf2fd2f cleanup code
  - ddfb065bf9 add bdist_wheel test
  - fceff0287c ensure name is included in new version
  - 0cb86d3246 Ensure SaltStackVersion attributes in _version.py correct
  - 39cf5382d Include _version.py if building wheel

- **PR #56387:** (bryceml) update gpg key expiration date @ 2020-03-17 16:59:30 UTC
  - 6a9326fb70 Merge pull request #56387 from bryceml/update_gpg_key
  - b74b26ccf3 update gpg key expiration date

- **PR #55822:** (cmcmarrow) fix_indefinitely_code @ 2020-03-16 17:34:11 UTC
  - fceee6424a Merge pull request #55822 from cmcmarrow/win_task_repeat
  - e257fb2804 Merge branch 'master' into win_task_repeat
- 07cada0f8f Merge branch 'master' into win_task_repeat
- 4b80301338 Merge branch 'master' into win_task_repeat
- 9df94569c4 Merge branch 'master' into win_task_repeat
- 22a2d0b9ec Merge branch 'master' into win_task_repeat
- dee9c134e7 Merge branch 'master' into win_task_repeat
- bea05d514 Update test_win_task.py
- 6e923f75fc Merge branch 'master' into win_task_repeat
- 5839da81ee add test
- 2aa638ed0 fix Indefinitely code

- **PR #56373**: (frogunder) update 3000.1 releasenotes @ 2020-03-13 18:58:43 UTC
  - c11ef89200 Merge pull request #56373 from frogunder/releasenotes_3000.1
  - a5ca8b5277 Fix doc test errors
  - 47e483187e update 3000.1 releasenotes

- **PR #56365**: (Ch3LL) Update 3000.1 changelog @ 2020-03-13 17:21:02 UTC
  - 62857a9f0e Merge pull request #56365 from Ch3LL/changelog_3000.1
  - 851d7d8fc7 Update 3000.1 changelog

- **PR #56360**: (Ch3LL) Use virtualenv 20.0.10 for macosx tests @ 2020-03-13 16:39:57 UTC
  - a660e96fb2 Merge pull request #56360 from Ch3LL/mac_virtual
  - abda125086 Update static requirements files
  - dca3390c0c skip zcbuildout state test when virtualenv 20.0.0
  - fdeae1f0e1 Use virtualenv 20.0.10 for macosx tests

- **ISSUE #56324**: (kiemlicz) Cannot use Saltcheck module (refs: #56327)

- **PR #56327**: (mchugh19) keep cache_copied_files variable a list @ 2020-03-13 16:39:32 UTC
  - d8fc07274c Merge pull request #56327 from mchugh19/56324
  - e1e2df2b1d Merge branch 'master' into 56324
  - 6d7572706d use includes for saltcheck integration test
  - 5b7073b01d keep cache_copied_files variable a list

- **PR #56023**: (cmcmarrow) add fix for bin_env @ 2020-03-13 16:39:09 UTC
  - 2d31d61ab9 Merge pull request #56023 from cmcmarrow/binary_fix_pip_bin_env
  - f780fd013e Merge branch 'master' into binary_fix_pip_bin_env
  - d642c7c270 Merge branch 'master' into binary_fix_pip_bin_env
  - 82b39d26f8 Merge branch 'binary_fix_pip_bin_env' of https://github.com/cmcmarrow/salt into binary_fix_pip_bin_env
    - a5fa22528a Merge branch 'master' into binary_fix_pip_bin_env
  - 10ca0fa5d6 fix space
  - 22f6f6c180 fix _pip_bin_env

**28.2. Previous Releases**
PR #56310: (twangboy) Only process ADMX files when loading policies @ 2020-03-11 23:47:50 UTC
- d5425e6630 Merge branch 'master' into binary_fix_pip_bin_env
- ceda3fde00 add full support for when missing kwargs or args
- cf4ab215b5 add fix for bin_env

PR #56272: (twangboy) Properly resolve the policy name @ 2020-03-11 22:11:02 UTC
- 19bb6aae0c Merge pull request #56272 from twangboy/fix_lgpo_admx
- 4bc5b05586 Fix some lint
- ce282f9754 Mark destructive test
- 8af09c31ca Add test case
- 547d35cf4c Only process ADMX files when loading policies

PR #56358: (s0undt3ch) Fix version instantiation when minor is an empty string @ 2020-03-11 22:10:04 UTC
- c6c6e2e3d9 Merge pull request #56358 from s0undt3ch/hotfix/version-parsing
- cb22e78502 Fix version instantiation when minor is an empty string

PR #56160: (twangboy) Fix issue with existing reg_dword entries @ 2020-03-11 22:09:21 UTC
- b33047c574 Merge pull request #56160 from twangboy/fix_reg_dword
- 80650c2a8c Make test more explicit
- 67dd1c18c7 Fix issue with existing reg_dword entries

PR #56337: (twangboy) Handle Adapter Type 53 and Undefined Types @ 2020-03-11 22:08:19 UTC
- 8f23706871 Merge pull request #56337 from twangboy/fix_win_network_type
- 18a31a0b22 Merge branch 'master' into fix_win_network_type
- d92914ad91 Merge branch 'master' into fix_win_network_type
- 224629bdeb Handle Adapter Type 53 and Undefined Types

PR #56060: (twangboy) Fix regex string for "**Del and **DelVals @ 2020-03-11 22:05:43 UTC
- e551ff6a31 Merge pull request #56060 from twangboy/fix_lgpo_regex
- ca260ef582 Use byte-strings in the test
- 7c81874a5b Add some tests
- 944b02ff33 Fix regex string for "**Del and **DelVals

ISSUE #56131: (thusoy) Salt v3000 crashes with unless clause if pip is missing (refs: #56215)
• **PR #56215**: (dwoz) Fix for unless requisite when pip is not installed @ 2020-03-11 22:04:30 UTC
  - c9bc9431c1 Merge pull request #56215 from dwoz/issue-56131
  - 5dd8f8eabe Fix linter
  - 7492c2f7c7 Remove crufty prints from test
  - 8ceaa66e5f Only remove pip related modules
  - 69b21e5e68 Add regression test for issue 56131
  - 9d2305f5d0 Fix for unless requisite when pip is not installed

• **PR #56339**: (twangboy) Fix win_dns_client when used with scheduler @ 2020-03-11 22:01:32 UTC
  - 74b67ea741 Merge pull request #56339 from twangboy/fix_win_dns_client
  - d64f8e85d Fix bad test (lint)
  - 47bd67373f Add some tests
  - 995975649a Add missing import, improve docs

• **ISSUE #56288**: (lorenborgordon) win_lgpo: lgpo.set with secedit policy always generates KeyError: u'lgpo.secedit_data' (refs: #56290)

• **PR #56290**: (lorenborgordon) Ensures popping lgpo.secedit_data does not throw KeyError @ 2020-03-11 17:27:04 UTC
  - 7701e8762d Merge pull request #56290 from lorenborgordon/pop-secdatas
  - 62453bb6ce Merge branch 'master' into pop-secdatas
  - 95d5ce9ff Merge branch 'master' into pop-secdatas
  - 2979158a8b Tests the if__secdits: logic path in lgpo.set_
  - d1f776178c Ensures popping lgpo.secedit_data does not throw KeyError

• **ISSUE #56119**: (finalduty) Release notes for v3000 do not mention changes to slspath variable (refs: #56341)

• **PR #56341**: (dwoz) Revert "Don’t remove one directory level from slspath" @ 2020-03-11 17:03:33 UTC
  - 84c60708cd Merge pull request #56341 from dwoz/issue-56119
  - afe6e83e66 Clarify slspath documentation
  - 6dfe098f0d Add debug for test asserts
  - 9fa9dab83f Fix linter warts
  - fd702b8d4d Add regression test for #56119
  - 3d3b6736cc Revert "Don’t remove one directory level from slspath"

• **PR #56185**: (terminalmage) Fix regression in service states with reload argument @ 2020-03-11 16:45:58 UTC
  - 49f813a4c9 Merge pull request #56185 from terminalmage/issue56167
  - 65b3f4c9a0 Merge branch 'master' into issue56167
  - 7b41a90b4f Merge branch 'master' into issue56167
  - 8f7034d946 Merge branch 'master' into issue56167
  - e9b6634e1 Skip on OSX for now
  - 5996280241 Add __opts__ and __grains__ just in case
  - af3e841d08 Fix failing test

28.2. Previous Releases
- 586f21aeced Add functional test
- 1a9b910f0 Fix regression in service states with reload argument

- **PR #56068**: (s0undt3ch) Update the bootstrap script to latest version, v2020.02.24 @ 2020-03-11 16:44:23 UTC
  - 74f8b2a926 Merge pull request #56068 from s0undt3ch/hotfix/update-bootstrap
  - ce83b190ed Merge branch ’master’ into hotfix/update-bootstrap
  - ccd231d82d Merge branch ’master’ into hotfix/update-bootstrap
  - 88a52f88ff Update the bootstrap script to latest version, v2020.02.24
  - 012f5bc4b Update the bootstrap script to latest version, v2020.02.04

- **PR #56321**: (oeufete) Tidy up formatting in boto_secgroup docs @ 2020-03-11 08:14:48 UTC
  - 154257e2e9 Merge pull request #56321 from oeufete/tidy-boto-secgroup-docs
  - 616f11b33e Merge branch ’master’ into tidy-boto-secgroup-docs
  - 412bb4d62d Tidy up formatting in boto_secgroup docs

- **PR #56336**: (Ch3LL) Fix test_issue_2594_non_invalidated_cache test (update zope.interface) @ 2020-03-11 00:08:43 UTC
  - 11d33e3d90 Merge pull request #56336 from Ch3LL/fix_56330
  - bbf37e90b Fix test_issue_2594_non_invalidated_cache test (update zope.interface)

- **PR #56346**: (frogunder) Update man pages to 3000.1 @ 2020-03-11 06:07:31 UTC
  - 6d7c16b482 Update man pages to 3000.1

- **PR #56099**: (s0undt3ch) Fix Windows and macOS requirements handling in setup.py @ 2020-03-11 00:04:37 UTC
  - 2f783d247e Merge pull request #56099 from s0undt3ch/hotfix/requirements
  - c19f4a3fae Merge branch ’master’ into hotfix/requirements
  - 1e7bc8f86f Also take into account macOS requirements
  - 7ee1f14952c Also include req_win.txt

- **PR #56218**: (raddessi) Changed StrictVersion checking of setuptools to LooseVersion @ 2020-03-10 23:59:54 UTC
  - 7c4d879073 Merge pull request #56218 from raddessi/master.v3000-conda
  - 4455f6d57 Merge branch ’master’ into master.v3000-conda
  - 566c03b786 Merge branch ’master’ into master.v3000-conda
  - 82773a9799 Removed now-unused StrictVersion import from setup.py
  - 31bb0f7cd1 Changed StrictVersion checking of setuptools to LooseVersion

- **PR #56128**: (waynew) Update CHANGELOG with release date and unreleased. @ 2020-03-10 23:58:15 UTC
  - acbd3556e5 Merge pull request #56128 from waynew/master
  - e3216db3e5 Update CHANGELOG with release date and unreleased.

- **PR #55937**: (twangboy) Update windows build scripts @ 2020-03-10 23:55:55 UTC
  - 12140545ab Merge pull request #55937 from twangboy/update_deps
- f00a504a48 Add back the pylauncher
- 30b9c32356 Revert changes to req and req_win
- 98dce970c Fix some warts in the build_env scripts
- 8404141f65 Update dependencies

- **PR #55906**: (sjorge) smartos.vm_present could not handle nics with vrrp_vrid property @ 2020-03-10 23:54:44 UTC
  - 485a47cdf1 Merge pull request #55906 from sjorge/smartos_vrrp
  - 5bd7dd009a Merge branch 'master' into smartos_vrrp
  - f77719c179 smartos state should handle vrrp config

- **ISSUE #55185**: (sjorge) salt.modules.pdbedit doesn't work on samba older than 4.8 (refs: #55894)

- **PR #55894**: (sjorge) #55185 pdbedit module should check for version 4.8.x or newer @ 2020-03-10 23:54:21 UTC
  - 1fa8555360 Merge pull request #55894 from sjorge/pdbedit_55185
  - 9dc7b71122 Merge branch 'master' into pdbedit_55185

- **ISSUE #56195**: (lorendordon) Windows: Using inline powershell in args with cmd.script and shell: powershell (refs: #56197)

- **PR #56197**: (lorendordon) Allows use of inline powershell for cmd.script args @ 2020-03-10 23:52:47 UTC
  - 3e57d58db2 Merge pull request #56197 from lorendordon/file-or-no-file
  - fcd16995e Allows use of inline powershell for cmd.script args
  - be2e67c0a0 Tests that powershell processes inline powershell in args

- **ISSUE #53152**: (jbeaird) daily highstate fails after 2019.2 upgrade (refs: #56149)

- **PR #56149**: (garethgreenaway) [master] Fix to scheduler for use of when and splay @ 2020-03-10 23:52:16 UTC
  - 547c73e4ec Merge pull request #56149 from garethgreenaway/53152_fix_schedule_when_splay
  - 8f068f6f9b Fix for when using a combination of when and splay. Previously comparing the wrong value when determining if the job should be run and next_fire_time updated. This resulted in multiple job runs when when and splay were used together. Code updated and test updated to ensure only one run at the specific time. Skip eval tests is dateutil.parser is unavailable.

- **PR #56345**: (s0undt3ch) Bump Windows Py3 builds timeout to 10 hours @ 2020-03-10 20:43:41 UTC
  - 192ce76a95 Merge pull request #56345 from s0undt3ch/hotfix/win-py3-timeouts
  - 11bdc38ae3 Bump Windows 2019 Py3 builds timeout to 10 hours

- **PR #55888**: (s0undt3ch) Disable codecov PR comments and status checks @ 2020-03-10 15:45:52 UTC
  - a204906c80 Merge pull request #55888 from s0undt3ch/hotfix/coverage-reporting
  - 4b8dca8a586 Disable codecov PR comments and status checks
  - cb0f4df887 Apply the suggestion given by the codecov team

- **ISSUE #56177**: (jodok) mysql states fail because conv is "" instead of None (refs: #56174)

- **ISSUE #56170**: (jeffdyke) mariadb socket access must be enabled before highstate - salt 3K still tries empty password (refs: #56174)

- **ISSUE #56124**: (ymasson) MySQL state and module broken after upgrade to 3000 (refs: #56174)

- **PR #56174**: (garethgreenaway) [master] MySQL module fixes @ 2020-03-10 04:03:23 UTC
- 3e913631bb Merge pull request #56174 from garethgreenaway/56124_mysql_module_state_fixes
- fcc061368b Removing quotes from the plugin_status query. Updating tests to reflect changes.
- 3dc6639b2 Adding better error reporting around plugins. Updating tests. Only attempt to delete a user if they exist.
- 1337da1e4e Ensure _mysql_user_exists is using auth_socket. Updating mysql and mariadb chpass functions to ensure that the respective plugins are enabled before attempting to use them.
- 34995ba4e8 Reworking the unix_socket code to support the differences between MySQL and MariaDB. Adding some functions to install, remove, and check the status of plugins which we can then use when adding users which will use the unix_socket & auth_socket plugins. Adding additional tests for these new functions as well as test to ensure the correct SQL is being generated when using passwordless and unix_socket options.
- 5bfd67c13e Minor tweak to mysql module. Fixing failing tests.
- e871a3fd1 Various fixes to the mysql module to break out the handling of user management into different functions based on MySQL variant.

- **ISSUE #56063**: (terminalmage) [master] Traceback in esxi grain module on import (refs: #56094)
- **PR #56094**: (dwoz) Fix type error in TornadoImporter @ 2020-03-10 01:39:08 UTC
  - 211e88bfbc Merge pull request #56094 from dwoz/fix_56063
  - 7b1632e8e3 Fix type error in TornadoImporter
- **PR #56172**: (Ch3LL) Only change mine data if using new allow_tgt feature @ 2020-03-10 01:34:27 UTC
  - fb5252fc53 Merge pull request #56172 from Ch3LL/mine_g
  - f4c9c2a5c9 Fix docs
  - 6c914ae8e8 Use different targeting for windows/linux
  - f6348127dc Only change mine data if using new allow_tgt feature

- **ISSUE #56121**: (githubcdr) salt-minion broken after upgrade to 3000 (refs: #56143)
- **ISSUE #51854**: (Oloremo) Fluorine: minion_pillar_cache: True leads to exception (refs: #56143, #52195)
- **PR #56143**: (waynew) Use encoding when caching pillar data @ 2020-03-10 01:33:37 UTC
  - PR #52195: (waynew) Use encoding when caching pillar data (refs: #56143)
  - 8a8e9c95cf Merge pull request #56143 from waynew/51854-minion-pillar-cache-exception
  - 58c9488a8c Merge branch ‘master’ into 51854-minion-pillar-cache-exception

28.2.3 Salt 3000.2 Release Notes

Version 3000.2 is a CVE-fix release for 3000.

Security Fix

CVE-2020-11651

An issue was discovered in SaltStack Salt before 2019.2.4 and 3000 before 3000.2. The salt-master process ClearFuncs class does not properly validate method calls. This allows a remote user to access some methods without authentication. These methods can be used to retrieve user tokens from the salt master and/or run arbitrary commands on salt minions.

CVE-2020-11652

An issue was discovered in SaltStack Salt before 2019.2.4 and 3000 before 3000.2. The salt-master process ClearFuncs class allows access to some methods that improperly sanitize paths. These methods allow arbitrary directory access to authenticated users.

Known Issue

Part of the fix for CVE-2020-11651 added better validation of the methods allowed to be called by remote clients. Both AESFuncs and ClearFuncs now have an explicit list of methods that can be called. The name of one of these whitelisted methods on AESFuncs had a typo. The _minion_runner method should be minion_runner (without the underscore prefix). This typo breaks the publish module’s runner method. Calling runners, for example:
salt minion publish.runner manage.down

Will not work, and you will receive and empty reply from the salt master.
This will be addressed in the Sodium release of Salt set for mid-June 2020.

28.2.4 Salt 2019.2.0 Release Notes - Codename Fluorine

Python 2.7 Deprecation

In light of Python 2.7 reaching its End of Life (EOL) on Jan 1st 2020, Python 2 will be deprecated from SaltStack no earlier than the Sodium release, that is either the Sodium release or a later release. This decision is pending further community discussion.

Non-Backward-Compatible Change to YAML Renderer

In earlier releases, this was considered valid usage in Python 2, assuming that data was a list or dictionary containing keys/values which are unicode types:

```yaml
/etc/foo.conf:
  file.managed:
    - source: salt://foo.conf.jinja
    - template: jinja
    - context:
      data: {{ data }}
```

One common use case for this is when using one of Salt’s custom Jinja filters which return lists or dictionaries, such as the `ipv4` filter.

In Python 2, Jinja will render the unicode string types within the list/dictionary with the "u" prefix (e.g. `{u'foo': u'bar'}`). While not valid YAML, earlier releases would successfully load these values.

As of this release, the above SLS would result in an error message. To allow for a data structure to be dumped directly into your SLS file, use the `tojson` Jinja filter:

```yaml
/etc/foo.conf:
  file.managed:
    - source: salt://foo.conf.jinja
    - template: jinja
    - context:
      data: {{ data|tojson }}
```

Another example where the new filter needs to be used is the following state example:

```yaml
grafana_packages:
  pkg.installed:
    - names: {{ server.pkgs }}
```

This will fail when pkgs is a list or dictionary. You will need to update the state:

```yaml
grafana_packages:
  pkg.installed:
    - names: {{ server.pkgs|tojson }}
```
This test case has also been tested with the `yaml` and `json` filters successfully.

**Note:** This filter was added in Jinja 2.9. However, fear not! The 2018.3.3 release added a `tojson` filter which will be used if this filter is not already present, making it available on platforms like RHEL 7 and Ubuntu 14.04 which provide older versions of Jinja.

---

**Important:** The `json_encode_dict` and `json_encode_list` filters do not actually dump the results to JSON. Since `tojson` accomplishes what those filters were designed to do, they are now deprecated and will be removed in the 3000 release. The `tojson` filter should be used in all cases where `json_encode_dict` and `json_encode_list` would have been used.

---

**Ansible Playbook State and Execution Modules**

Along with the including the `ansible modules` in the Oxygen release, running playbooks has been added in 2019.2.0 with the `playbooks` function. This also includes an `ansible playbooks state module` which can be used on a targeted host to run ansible playbooks, or used in an orchestration state runner.

```yaml
install nginx:
  ansible.playbooks:
    - name: install.yml
    - git_repo: git://github.com/gtmanfred/playbook.git
    - git_kwargs:
      rev: master
```

The playbooks modules also includes the ability to specify a git repo to clone and use, or a specific directory can to used when running the playbook.

**Network Automation**

Beginning with this release, Salt provides much broader support for a variety of network operating systems, and features for configuration manipulation or operational command execution.

**NetBox**

Added in the previous release, 2018.3.0, the capabilities of the `netbox` Execution Module have been extended, with a much longer list of available features:

- `netbox.create_circuit`
- `netbox.create_circuit_provider`
- `netbox.create_circuit_termination`
- `netbox.create_circuit_type`
- `netbox.create_device`
- `netbox.create_device_role`
- `netbox.create_device_type`
- `netbox.create_interface`
- `netbox.create_interface_connection`
Besides this Execution Module, Salt users can load data directly from NetBox into the device Pillar, via the `netbox` External Pillar module.

**Netmiko**

Netmiko, the multi-vendor library to simplify Paramiko SSH connections to network devices, is now officially integrated into Salt. The network community can use it via the `netmiko` Proxy Module or directly from any Salt Minions, passing the connection credentials - see the documentation for the `netmiko` Execution Module.

**Arista**

Arista switches can now be managed running under the `pyeapi` Proxy Module, and execute RPC requests via the `pyeapi` Execution Module.

**Cisco Nexus**

While support for SSH-based operations has been added in the release codename Carbon (2016.11), the new `nxos_api` Proxy Module and `nxos_api` allow management of Cisco Nexus switches via the NX-API.

It is important to note that these modules don’t have third party dependencies, therefore they can be used straight away from any Salt Minion. This also means that the user may be able to install the regular Salt Minion on the Nexus switch directly and manage the network devices like a regular server.
General-purpose Modules

The new `ciscoconfparse` Execution Module can be used for basic configuration parsing, audit or validation for a variety of network platforms having Cisco IOS style configuration (one space indentation), as well as brace-delimited configuration style.

The `iosconfig` can be used for various configuration manipulation for Cisco IOS style configuration, such as: `configuration cleanup`, `tree representation of the config`, etc.

NAPALM

Commit At and Commit Confirmed

Beginning with this release, NAPALM users are able to execute scheduled commits (broadly known as "commit at") and "commit confirmed" (revert the configuration change unless the user confirms by running another command). These features are available via the `commit_in`, `commit_at`, `revert_in`, or `revert_at` arguments for the `net.load_config` and `net.load_template` execution functions, or `netconfig.managed`.

The counterpart execution functions `net.confirm_commit`, or `net.cancel_commit`, as well as the State functions `netconfig.commit_cancelled`, or `netconfig.commit_confirmed` can be used to confirm or cancel a commit.

Please note that the commit confirmed and commit cancelled functionalities are available for any platform whether the network devices supports the features natively or not. However, be cautious and make sure you read and understand the caveats before using them in production.

Multiple Templates Rendered Simultaneously

The `template_name` argument of the `net.load_template` Execution and `netconfig.managed` State function now supports a list of templates. This is particularly useful when a very large Jinja template is split into multiple smaller and easier to read templates that can eventually be reused in other States. For example, the following syntax is not correct to manage the configuration of NTP and BGP simultaneously, using two different templates and changing the device configuration through one single commit:

```python
manage_bgp_and_ntp:
    netconfig.managed:
        - template_name:
            - salt://templates/bgp.jinja
            - salt://templates/ntp.jinja
        - context:
            bgp: {{ pillar.bgp }}
            ntp: {{ pillar.ntp }}
```

Connection Re-establishment on Demand

Beginning with this release, any NAPALM command executed when running under a NAPALM Proxy Minion supports the `force_reconnect` magic argument.

Proxy Minions generally establish a connection with the remote network device at the time of the Minion startup and that connection is going to be used forever.

If one would need to execute a command on the device but is connecting using different parameters (due to various causes, e.g., unable to authenticate the user specified in the Pillar as the authentication system - say TACACS+ is
not available, or the DNS resolver is currently down and would like to temporarily use the IP address instead, etc.), it implies updating the Pillar data and restarting the Proxy Minion process restart. In particular cases like that, you can pass the `force_reconnect=True` keyword argument, together with the alternative connection details, to enforce the command to be executed over a separate connection.

For example, if the usual command is `salt '*' net.arp`, you can use the following to connect using a different username instead:

```
salt '*' net.arp username=my-alt-usr force_reconnect=True
```

The same goes with any of the other configuration arguments required for the NAPALM connection - see NAPALM proxy documentation.

**Configuration Replace Features**

To replace various configuration chunks, you can use the new `net.replace_pattern` execution function, or the `netconfig.replace_pattern` State function. For example, if you want to update your configuration and rename a BGP policy referenced in many places, you can do so by running:

```
salt '*' net.replace_pattern OLD-POLICY-CONFIG new-policy-config
```

Similarly, you can also replace entire configuration blocks using the `net.blockreplace` function.

**Configuration Save Features**

The `net.save_config` function can be used to save the configuration of the managed device into a file. For the State subsystem, the `netconfig.saved` function has been added which provides a complete list of facilities when managing the target file where the configuration of the network device can be saved.

For example, backup the running configuration of each device under its own directory tree:

```
/var/backups/{{ opts.id }}/running.cfg:
  netconfig.saved:
    - source: running
    - madeirs: true
```

All the new network automation modules mentioned above are directly exposed to the NAPALM users, without requiring any architectural changes, just eventually install some requirements:

**Junos**

The features from the existing `junos` Execution Module are available via the following functions:

- `napalm.junos_cli`: Execute a CLI command and return the output as text or Python dictionary.
- `napalm.junos_rpc`: Execute an RPC request on the remote Junos device, and return the result as a Python dictionary, easy to digest and manipulate.
- `napalm.junos_install_os`: Install the given image on the device.
- `napalm.junos_facts`: The complete list of Junos facts collected by the `junos-eznc` underlying library.

**Note:** To be able to use these features, you must ensure that you meet the requirements for the `junos` module. As `junos-eznc` is already a dependency of NAPALM, you will only have to install `jxmlease`. 

---

4036 Chapter 28. Release Notes
Usage examples:

```bash
salt '*' napalm.junos_cli 'show arp' format=xml
salt '*' napalm.junos_rpc get-interface-information
```

**Netmiko**

The features from the newly added netmiko Execution Module are available as:

- *napalm.netmiko_commands*: Execute one or more commands to be execute on the remote device, via Netmiko, and return the output as a text.

- *napalm.netmiko_config*: Load a list of configuration command on the remote device, via Netmiko. The commands can equally be loaded from a local or remote path, and passed through Salt's template rendering pipeline (by default using Jinja as the template rendering engine).

Usage examples:

```bash
salt '*' napalm.netmiko_commands 'show version' 'show interfaces'
```

**Arista pyeapi**

For various operations and various extension modules, the following features have been added to gate functionality from the pyeapi module:

- *napalm.pyeapi_run_commands*: Execute a list of commands on the Arista switch, via the pyeapi library.

- *napalm.pyeapi_config*: Configure the Arista switch with the specified commands, via the pyeapi Python library. Similarly to napalm.netmiko_config, you can use both local and remote files, with or without templating.

Usage examples:

```bash
salt '*' napalm.pyeapi_run_commands 'show version' 'show interfaces'
salt '*' napalm.pyeapi_config config_file=salt://path/to/template.jinja
```

**Cisco NX-API**

In the exact same way as above, the user has absolute control by using the following primitives to manage Cisco Nexus switches via the NX-API:

- *napalm.nxos_api_show*: Execute one or more show (non-configuration) commands, and return the output as plain text or Python dictionary.

- *napalm.nxos_api_rpc*: Execute arbitrary RPC requests via the Nexus API.

- *napalm.nxos_api_config*: Configures the Nexus switch with the specified commands, via the NX-API. The commands can be loaded from the command line, or a local or remote file, eventually rendered using the templating engine of choice (default: Jinja).

Usage examples:

```bash
salt '*' napalm.nxos_api_show 'show bgp sessions' 'show processes' raw_text=False
```
Ciscoconfparse

The following list of function may be handy when manipulating Cisco IOS or Junos style configurations:

- **napalm.config_filter_lines**: Return a list of detailed matches, for the configuration blocks (parent-child relationship) whose parent and children respect the regular expressions provided.
- **napalm.config_find_lines**: Return the configuration lines that match the regular expression provided.
- **napalm.config_lines_w_child**: Return the configuration lines that match a regular expression, having child lines matching the child regular expression.
- **napalm.config_lines_wo_child**: Return the configuration lines that match a regular expression, that don’t have child lines matching the child regular expression.

**Note**: These functions require the `ciscoconfparse` Python library to be installed.

Usage example (find interfaces that are administratively shut down):

```
salt '*' napalm.config_lines_w_child 'interface' 'shutdown'
```

IOSConfig

For Cisco IOS style configuration, the following features have been added to the `napalm` Execution Module:

- **napalm.config_tree**: Transform Cisco IOS style configuration to structured Python dictionary, using the configuration of the interrogated network device.
- **napalm.config_merge_tree**: Return the merge tree of the configuration of the managed network device with a different configuration to be merged with (without actually loading any changes on the device).
- **napalm.config_merge_text**: Return the merge result (as text) of the configuration of the managed network device with a different configuration to be merged with.
- **napalm.config_merge_diff**: Return the merge diff after merging the configuration of the managed network device with a different configuration (without actually loading any changes on the device).

SCP

Reusing the already available connection credentials provided for NAPALM, the following features are now available:

- **napalm.scp_put**: Transfer files and directories to remote network device.
- **napalm.scp_get**: Transfer files and directories from remote network device to the localhost of the Minion.

PeeringDB

The `peeringdb` Execution Module is useful to gather information about other networks you can potentially peer with, and automatically establish BGP sessions, e.g., given just a specific AS number, the rest of the data (i.e., IP addresses, locations where the remote network is available, etc.) is retrieved from PeeringDB, and the session configuration is automated with minimal to no effort (typing the IP addresses manually can be both tedious and error prone).
New Docker Proxy Minion

Docker containers can now be treated as actual minions without installing salt in the container, using the new docker proxy minion.

This proxy minion uses the `docker executor` to pass commands to the docker container using `docker.call`. Any state module calls are passed through the corresponding function from the `docker` module.

```yaml
proxy:
  proxitype: docker
  name: keen_proskuriakova
```

Terraform Salt-SSH Roster

You can now dynamically generate aSalt-SSH roster from the terraform resources defined with `terraform-provider-salt`.

This allows you to combine both terraform and Salt-SSH to provision and configure your hosts. See the `terraform roster` for an example on how to setup and use.

Grains Dictionary Passed into Custom Grains

Starting in this release, if a custom grains function accepts a variable named `grains`, the Grains dictionary of the already compiled grains will be passed in. Because of the non-deterministic order that grains are rendered in, the only grains that can be relied upon to be passed in are `core.py` grains, since those are compiled first.

More Precise virtual Grain

This release improves the accuracy of the `virtual` grain when running Salt in a nested virtualization environment (e.g. `systemd-nspawn` container inside a VM) and having `virt-what` installed.

Until now, the `virtual` grain was determined by matching against all output lines of `virt-what` instead of individual items which could lead to not quite precise results (e.g. reporting HyperV inside a `systemd-nspawn` container running within a Hyper-V-based VM).

Configurable Module Environment

Salt modules (states, execution modules, returners, etc.) now can have custom environment variables applied when running shell commands. This can be configured by setting a `system-environment` key either in Grains or Pillar. The syntax is as follows:

```yaml
system-environment:
  <type>
    <module>: 
      # Namespace for all functions in the module
        _:
          <key>: <value>
    # Namespace only for particular function in the module
    <function>: 
      <key>: <value>
```

- `<type>` would be the type of module (i.e. `states`, `modules`, etc.).
- <module> would be the module's name.

Note: The module name can be either the virtual name (e.g. pkg), or the physical name (e.g. yumpkg).

- <function> would be the function name within that module. To apply environment variables to all functions in a given module, use an underscore (i.e. _) as the function name. For example, to set the same environment variable for all package management functions, the following could be used:

```yaml
system-environment:
  modules:
    pkg:
      _:
        SOMETHING: for_all
```

To set an environment variable in pkg.install only:

```yaml
system-environment:
  modules:
    pkg:
      install:
        LC_ALL: en_GB.UTF-8
```

To set the same variable but only for SUSE minions (which use zypper for package management):

```yaml
system-environment:
  modules:
    zypper:
      install:
        LC_ALL: en_GB.UTF-8
```

Note: This is not supported throughout Salt; the module must explicitly support this feature (though this may change in the future). As of this release, the only modules which support this are the following pkg virtual modules:

- aptpkg
- yumpkg
- zypper

"Virtual Package" Support Dropped for APT

In APT, some packages have an associated list of packages which they provide. This allows one to do things like run apt-get install foo when the real package name is foo1.0, and get the right package installed.

Salt has traditionally designated as "virtual packages" those which are provided by an installed package, but for which there is no real package by that name installed. Given the above example, if one were to run a pkg.installed state for a package named foo, then pkg.list_pkgs would show a package version of simply 1 for package foo, denoting that it is a virtual package.

However, while this makes certain aspects of package management convenient, there are issues with this approach that make relying on "virtual packages" problematic. For instance, Ubuntu has four different mutually-conflicting packages for nginx:

- nginx-core
- nginx-full
• nginx-light
• nginx-extras

All four of these provide nginx. Yet there is an nginx package as well, which has no actual content and merely has dependencies on any one of the above four packages. If one used nginx in a pkg.installed state, and none of the above four packages were installed, then the nginx metapackage would be installed, which would pull in nginx-core_. Later, if nginx were used in a pkg.removed state, the nginx metapackage would be removed, leaving nginx-core_ installed. The result would be that, since nginx-core_ provides nginx_, Salt would now see nginx as an installed virtual package, and the pkg.removed state would fail. Moreover, nginx would not actually have been removed, since nginx-core would remain installed.

Starting with this release, Salt will no longer support using "virtual package" names in pkg states, and package names will need to be specified using the proper package name. The pkg.list_repo_pkgs function can be used to find matching package names in the repositories, given a package name (or glob):

```
# salt myminion pkg.list_repo_pkgs 'nginx*'
myminion:
   ----------
   nginx:
      - 1.10.3-0ubuntu0.16.04.2
      - 1.9.15-0ubuntu1
   nginx-common:
      - 1.10.3-0ubuntu0.16.04.2
      - 1.9.15-0ubuntu1
   nginx-core:
      - 1.10.3-0ubuntu0.16.04.2
      - 1.9.15-0ubuntu1
   nginx-core-dbgs:
      - 1.10.3-0ubuntu0.16.04.2
      - 1.9.15-0ubuntu1
   nginx-doc:
      - 1.10.3-0ubuntu0.16.04.2
      - 1.9.15-0ubuntu1
   nginx-extras:
      - 1.10.3-0ubuntu0.16.04.2
      - 1.9.15-0ubuntu1
   nginx-extras-dbgs:
      - 1.10.3-0ubuntu0.16.04.2
      - 1.9.15-0ubuntu1
   nginx-full:
      - 1.10.3-0ubuntu0.16.04.2
      - 1.9.15-0ubuntu1
   nginx-full-dbgs:
      - 1.10.3-0ubuntu0.16.04.2
      - 1.9.15-0ubuntu1
   nginx-light:
      - 1.10.3-0ubuntu0.16.04.2
      - 1.9.15-0ubuntu1
   nginx-light-dbgs:
      - 1.10.3-0ubuntu0.16.04.2
      - 1.9.15-0ubuntu1
```

Alternatively, the newly-added pkg.show function can be used to get more detailed information about a given package and help determine what package name is correct:

```
# salt myminion pkg.show 'nginx*'
myminion:
   (continues on next page)
```

1.9.15-0ubuntu1:
Minion Startup Events

When a minion starts up it sends a notification on the event bus with a tag that looks like this: `salt/minion/<minion_id>/start`. For historical reasons the minion also sends a similar event with an event tag like this: `minion_start`. This duplication can cause a lot of clutter on the event bus when there are many minions. Set `enable_legacy_startup_events: False` in the minion config to ensure only the `salt/minion/<minion_id>/start` events are sent.

The new `enable_legacy_startup_events` minion config option defaults to `True`, but will be set to default to `False` beginning with the Sodium release of Salt.

The Salt Sydnic currently sends an old style `syndic_start` event as well. The syndic respects `enable_legacy_startup_events` as well.

Failhard changes

It is now possible to override a global failhard setting with a state-level failhard setting. This is most useful in case where global failhard is set to `True` and you want the execution not to stop for a specific state that could fail, by setting the state level failhard to `False`. This also allows for the use of `onfail*`-requisites, which would previously be ignored when a global failhard was set to `True`. This is a deviation from previous behavior, where the global failhard setting always resulted in an immediate stop whenever any state failed (regardless of whether the failing state had a failhard setting of its own, or whether any `onfail*`-requisites were used).

Pass Through Options to file.serialize State

This allows for more granular control over the way in which the dataset is serialized. See the documentation for the new `serializer_opts` and `deserializer_opts` options in the `file.serialize` state for more information.

file.patch State Rewritten

The `file.patch` state has been rewritten with several new features:

- Patch sources can now be remote files instead of only `salt://` URLs
- Multi-file patches are now supported
• Patch files can be templated

In addition, it is no longer necessary to specify what the hash of the patched file should be.

**New no_proxy Minion Configuration**

Pass a list of hosts using the `no_proxy` minion config option to bypass an HTTP proxy.

**Note:** This key does nothing unless `proxy_host` is configured and it does not support any kind of wildcards.

```
no_proxy: ['127.0.0.1', 'foo.tld']
```

**Changes to slack Engine**

The output returned to Slack from functions run using this engine is now formatted using that function’s proper outputter. Earlier releases would format the output in YAML for all functions except for when states were run.

**Enhancements to wtmp Beacon**

A new key, `action`, has been added to the events fired by this beacon, which will contain either the string `login` or `logout`. This will simplify reactors which use this beacon’s data, as it will no longer be necessary to check the integer value of the `type` key to know whether the event is a login or logout.

Additionally, in the event that your platform has a non-standard `utmp.h`, you can now configure which type numbers indicate a login and logout.

See the [wtmp beacon documentation](#) for more information.

**Deprecated and Removed Options**

**API Removed Arguments**

Support for `LocalClient`’s `expr_form` argument has been removed. Please use `tgt_type` instead. This change was made due to numerous reports of confusion among community members, since the targeting method is published to minions as `tgt_type`, and appears as `tgt_type` in the job cache as well.

Those who are using the `LocalClient` (either directly, or implicitly via a `netapi module`) need to update their code to use `tgt_type`.

```
>>> import salt.client
>>> local = salt.client.LocalClient()
>>> local.cmd('*', 'cmd.run', ['whoami'], tgt_type='glob')
{'jerry': 'root'}
```

**Minion Configuration Deprecated Option**

The `master_shuffle` configuration option is deprecated as of the `2019.2.0` release. Please use the `random_master` option instead.
Module Removed Options

- The `napalm_network` module has been changed as follows:
  - Support for the `template_path` has been removed from `net.load_template` function. This is because support for NAPALM native templates has been dropped.

- The `pip` module has been changed as follows:
  - Support for the `no_chown` option has been removed from `pip.install` function.

- The `trafficserver` module has been changed as follows:
  - The `trafficserver.match_var` function was removed. Please use `trafficserver.match_metric` instead.
  - The `trafficserver.read_var` function was removed. Please use `trafficserver.read_config` instead.
  - The `trafficserver.set_var` function was removed. Please use `trafficserver.set_config` instead.

- The `win_update` module has been removed. It has been replaced by `win_wua`.

- The `win_wua` module has been changed as follows:
  - The `win_wua.download_update` and `win_wua.download_updates` functions have been removed. Please use `win_wua.download` instead.
  - The `win_wua.install_update` and `win_wua.install_updates` functions have been removed. Please use `win_wua.install` instead.
  - The `win_wua.list_update` function has been removed. Please use functions have been removed. Please use `win_wua.get` instead.
  - The `win_wua.list_updates` function has been removed. Please use functions have been removed. Please use `win_wua.list` instead.

Pillar Removed Option

- The `vault` external pillar has been changed as follows:
  - Support for the `profile` argument was removed. Any options passed up until and following the first `path=` are discarded.

Roster Removed Option

- The `cache` roster has been changed as follows:
  - Support for `roster_order` as a list or tuple has been removed. As of the 2019.2.0 release, `roster_order` must be a dictionary.
  - The `roster_order` option now includes IPv6 in addition to IPv4 for the `private`, `public`, `global` or `local` settings. The syntax for these settings has changed to `ipv4-*` or `ipv6-*`, respectively.

State Removed Modules and Options

- The `docker` state module has been removed
In 2017.7.0, the states from this module were split into four separate state modules:

- `docker_container`
- `docker_image`
- `docker_volume`
- `docker_network`

The `docker` module remained, for backward-compatibility, but it has now been removed. Please update SLS files to use the new state names:

- `docker.running` => `docker_container.running`
- `docker.stopped` => `docker_container.stopped`
- `docker.absent` => `docker_container.absent`
- `docker.network_present` => `docker_network.present`
- `docker.network_absent` => `docker_network.absent`
- `docker.image_present` => `docker_image.present`
- `docker.image_absent` => `docker_image.absent`
- `docker.volume_present` => `docker_volume.present`
- `docker.volume_absent` => `docker_volume.absent`

The `docker_network` state module has been changed as follows:

- The `driver` option has been removed from `docker_network.absent`. It had no functionality, as the state simply deletes the specified network name if it exists.

- The deprecated `ref` option has been removed from the `git.detached` state. Please use `rev` instead.

- The k8s state module has been removed in favor of the `kubernetes` state module. Please update SLS files as follows:

  - In place of `k8s.label_present`, use `kubernetes.node_label_present`
  - In place of `k8s.label_absent`, use `kubernetes.node_label_absent`
  - In place of `k8s.label_folder_absent`, use `kubernetes.node_label_folder_absent`

Support for the `template_path` option in the `netconfig.managed` state has been removed. This is because support for NAPALM native templates has been dropped.

- Support for the `no_chown` option in the `pip.installed` state has been removed.

- The `trafficserver.set_var` state has been removed. Please use `trafficserver.config` instead.

- Support for the `no_chown` option in the `virtualenv.managed` state has been removed.

- The `win_update` state module has been removed. It has been replaced by `win_wua`.

- Support for virtual packages has been removed from the `virtualenv.managed` state.

**Utils Removed Options**

The `cloud.utils` module had the following changes:

- Support for the `cache_nodes_ip` function in `salt.utils` module has been removed. The function was incomplete and non-functional.
The `vault` utils module had the following changes:

- Support for specifying Vault connection data within a 'profile' has been removed. Please see the `vault` execution module documentation for details on the new configuration schema.

**Dependency Deprecations**

Salt-Cloud has been updated to use the `pypsexec` Python library instead of the `winexe` executable. Both `winexe` and `pypsexec` run remote commands against Windows OSes. Since `winexe` is not packaged for every system, it has been deprecated in favor of `pypsexec`.

Salt-Cloud has deprecated the use of `impacket` in favor of `smbprotocol`. This changes was made because `impacket` is not compatible with Python 3.

**SaltSSH Major Updates**

SaltSSH now works across different major Python versions. Python 2.7 – Python 3.x are now supported transparently. Requirement is, however, that the SaltMaster should have installed Salt, including all related dependencies for Python 2 and Python 3. Everything needs to be importable from the respective Python environment.

SaltSSH can bundle up an arbitrary version of Salt. If there would be an old box for example, running an outdated and unsupported Python 2.6, it is still possible from a SaltMaster with Python 3.5 or newer to access it. This feature requires an additional configuration in `/etc/salt/master` as follows:

```
ssh_ext_alternatives:
  2016.3:                  # Namespace, can be actually anything.
    py-version: [2, 6]     # Constraint to specific interpreter version
    path: /opt/2016.3/salt # Main Salt installation
    dependencies:         # List of dependencies and their installation paths
      jinja2: /opt/jinja2
      yaml: /opt/yaml
      tornado: /opt/tornado
      msgpack: /opt/msgpack
      certifi: /opt/certifi
      singledispatch: /opt/singledispatch.py
      singledispatch_helpers: /opt/singledispatch_helpers.py
      markupsafe: /opt/markupsafe
      backports_abc: /opt/backports_abc.py
```

It is also possible to use several alternative versions of Salt. You can for instance generate a minimal tarball using runners and include that. But this is only possible, when such specific Salt version is also available on the Master machine, although does not need to be directly installed together with the older Python interpreter.

SaltSSH now support private key’s passphrase. You can configure it by:

- `–priv-passwd` for salt-ssh cli
- `salt_priv_passwd` for salt master configure file
- `priv_passwd` for salt roster file

**State Module Changes**
**salt State Module (used in orchestration)**

The `test` option now defaults to None. A value of `True` or `False` set here is passed to the state being run and can be used to override a `test: True` option set in the minion's config file. In previous releases the minion's config option would take precedence and it would be impossible to run an orchestration on a minion with test mode set to True in the config file.

If a minion is not in permanent test mode due to the config file and the 'test' argument here is left as None then a value of `test=True` on the command-line is passed correctly to the minion to run an orchestration in test mode. At present it is not possible to pass `test=False` on the command-line to override a minion in permanent test mode and so the `test: False` option must still be set in the orchestration file.

**event.send State**

The `event.send` state does not know the results of the sent event, so returns changed every state run. It can now be set to return changed or unchanged.

**influxdb_user.present Influxdb User Module State**

The `password` parameter has been changed to `passwd` to remove the name collusion with the influxdb client configuration (`client_kwargs`) allowing management of users when authentication is enabled on the influxdb instance.

Old behavior:

```yaml
influxdb_user.present:
  - name: exampleuser
  - password: exampleuserpassword
  - user: admin
  - password: adminpassword
```

New behavior:

```yaml
influxdb_user.present:
  - name: exampleuser
  - passwd: exampleuserpassword
  - user: admin
  - password: adminpassword
```

**winrepo_cache_expire_min Windows Package Definitions Caching**

The `winrepo_cache_expire_min` has been changed from 0 to 1800 (30 minutes) For example if you run highstate the package definitions are normally updated, however now if the package definitions are younger than `winrepo_cache_expire_min` (30 minutes) the package definitions will not be refreshed, reducing the amount of time taken to run a 2nd highstate. To get the old behaviour change the value back to 0 in the minion configuration file. This also effects the behaviour of other functions which default to refresh. The `pkg.refresh_db` will always refresh the package definitions.

**LDAP External Authentication**
freeipa groupattribute support

Previously, if Salt was using external authentication against a freeipa LDAP system it could only search for users via the accountattribute field. This release add an additional search using the groupattribute field as well. The original accountattribute search is done first then the groupattribute allowing for backward compatibility with previous Salt releases.

Jinja Include Relative Paths

When a jinja include template name begins with ./ or ../ then the import will be relative to the importing file. Prior practices required the following construct:

{% from tpldir ~ '/foo' import bar %}

A more "natural" construct is now supported:

{% from './foo' import bar %}

Comparatively when importing from a parent directory - prior practice:

{% from tpldir ~ '/../foo' import bar %}

New style for including from a parent directory:

{% from '../foo' import bar %}

salt-api

salt-api Windows support

Previously, salt-api was not supported on the Microsoft Windows platforms. Now it is! salt-api provides a RESTful interface to a running Salt system. It allows for viewing minions, runners, and jobs as well as running execution modules and runners of a running Salt system through a REST API that returns JSON. See Salt-API documentation.

.. _Salt-API: https://docs.saltstack.com/en/latest/topics/netapi/index.html

Logging Changes

Include Job ID (JID) in Minion and Master Logs

The Job ID (JID) can now be optionally included in both the minion and master logs by including jid in either the log_fmt_console or log_fmt_logfile configuration option:

log_fmt_console: "[%(levelname)-8s] %(jid)s %(message)s"

The will cause the JID to be included in any log entries that are related to a particular Salt job. The JID will be included using the default format, [JID: %(jid)s] but can be overridden with the log_fmt_jid configuration item.

log_fmt_jid: "[JID: %(jid)s]"
Security

Windows runas changes

A password is no longer required with `runas` under normal circumstances. The password option is only needed if the minion process is run under a restricted (non-administrator) account. In the aforementioned case, a password is only required when using the `runas` argument to run command as a different user.

New Modules

Execution Modules

- `salt.modules.ciscoconfparse_mod`
- `salt.modules.jira`
- `salt.modules.google_chat`
- `salt.modules.iosconfig`
- `salt.modules.netmiko`
- `salt.modules.nxos_api`
- `salt.modules.peeringdb`
- `salt.modules.purefb`
- `salt.modules.pyeapi`

Pillar Modules

- `netbox`

Proxy Modules

- `salt.proxy.netmiko`
- `salt.proxy.nxos_api`
- `salt.proxy.pyeapi`

28.2.5 Salt 2019.2.1 Release Notes

Version 2019.2.1 is a bugfix release for 2019.2.0.

Known Issues

- **ISSUE #54751**: Proxy minion fails to start. Fix planned in 2019.2.2 release.
- **ISSUE #54762**: URIs with IPv6 addresses are broken, preventing master-minion communication in IPv6-only environments. Fix planned in 2019.2.2 release.
- **ISSUE #54776**: Minion fails to start when it contains `ping_interval` in minion configuration file. Fix planned in 2019.2.2 release.
• ISSUE #54731: Returners (except for default salt master returner) not loading properly in Py3. Fix planned in 2019.2.2 release.

• ISSUE #54758: salt-call state.show_states gives "Passed invalid arguments" error when a sls defined in top.sls file is missing. Fix planned in 2019.2.2 release.

• ISSUE #54765: Jinja from import is broken. Fix planned in 2019.2.2 release.

• ISSUE #54771: Affects only Debian 10. pkgrepo.managed does not work if used with proxy (configured at salt-minion). No fix date available yet.

• ISSUE #54759: Deprecation warnings for pyzmq. No fix date available yet.

Change to YAML Renderer

/etc/foo.conf:
file.managed:
  - source: salt://foo.conf.jinja
  - template: jinja
  - context:
    data: {{ data }}

In 2019.2.0, the above SLS will result in an error message following changes to the YAML renderer that now require the new Jinja filter tojson.

/etc/foo.conf:
file.managed:
  - source: salt://foo.conf.jinja
  - template: jinja
  - context:
    data: {{ data|tojson }}

In 2019.2.1, we introduce a new configuration option for both the Salt master and Salt minion configurations to be able to support the older YAML renderer. Using the option use_yammloader_old will allow the YAML renderer to function as before.

Statistics

• Total Merges: 541

- 80651d3 Fix linter
- 982ed3d Delete bad API token files

- **ISSUE #54256: (sleminov-tc)** Empty salt api token file breaks maintenance process. (refs: #54325, #54324, #54388, #54376)

- **ISSUE #37945: (gstachowiak)** Missing exception handling in salt.master.Maintenance. Process never completes. (refs: #54325, #54324, #54388, #54376)

- **PR #54376: (dwoz)** Move tokens in place with an atomic operation @ 2019-09-03 20:40:50 UTC
  - 11016ce Merge pull request #54376 from dwoz/tmp_token
  - 0b28c60 Fix linter complaints
  - 8e33343 Move tokens in place with an atomic operation

- **PR #54386: (twangboy)** Fix unit.utils.test_win_dacl (2019.2.1) @ 2019-09-03 16:57:25 UTC
  - 5161203 Merge pull request #54386 from twangboy/fix_test_win_dacl_2019.2.1
  - b8f7ad3 Sort the perms

- **PR #54355: (s0undt3ch) [2019.2.1] [GitPillar Tests]** Have the started processes log instead of just writing to stdout/stderr @ 2019-08-29 23:26:50 UTC
  - b4ac9ad Merge pull request #54355 from s0undt3ch/hotfix/test-daemons-2019.2.1
  - 561c0a2 Have the started processes log instead of just writing to stdout/stderr
  - c2a3115 Don’t overwrite the stderr logger

- **PR #54353: (cmcmarrow)** adds @skipIf not windows @ 2019-08-29 19:33:11 UTC
  - ce5b109 Merge pull request #54353 from cmcmarrow/2019_win_system_skip
  - 8e50874 adds @skipIf not windows

- **PR #54338: (dwoz)** Log server closes completely during shutdown @ 2019-08-29 17:14:05 UTC
  - 94e03e5 Merge pull request #54338 from dwoz/logging_fixup
  - a3e227e Log server closes completely during shutdown

- **PR #54327: (garethgreenaway) [2019.2.1]** Catch the AccessDenied exception and continue when running under Py3. @ 2019-08-29 16:59:34 UTC
  - 490ee69 Merge pull request #54327 from garethgreenaway/more_test_program_fixes
  - 97b4d86 Catch the AccessDenied exception and continue when running under Py3.

- **PR #54316: (Akm0d)** Azure cleanup @ 2019-08-27 16:14:09 UTC
  - bb911c3 Merge pull request #54316 from Akm0d/azure-cleanup
  - 2072773 pass longer timeout to msazuredestroyinstance
  - 34eb477 Merge branch '2019.2.1' of https://github.com/saltstack/salt into azure-cleanup
  - 7ae48b1 Allow azure tests enough time to clean up interfaces
  - b45ae74 Clean up azure instances properly

- **PR #54314: (garethgreenaway) [2019.2.1]** Do not raise the exception in testprogram.py @ 2019-08-26 23:59:37 UTC
  - 9334e4e Merge pull request #54314 from garethgreenaway/testprogram_access_denied_do_not_raise
- a53bacb Do not raise the exception if a process can not be access, just continue

- **PR #54305**: (dwoz) Fix wart in test_process tests on windows @ 2019-08-26 17:59:12 UTC
  - 71fb051 Merge pull request #54305 from dwoz/winfix
  - 4e68860 Fix wart in test_process tests on windows

- **PR #54303**: (dwoz) Fix wart in periodic callback interval @ 2019-08-24 20:04:35 UTC
  - 4d80f0a Merge pull request #54303 from dwoz/perodic_cb
  - bf5f7de Fix wart in periodic callback interval

- **ISSUE #54219**: (KChandrashekhar) integration.shell.test_call.py and tests/integration/shell/test_proxy.py (refs: #54259)

- **ISSUE #54153**: (KChandrashekhar) Ubuntu 16.04 Proxy failures (refs: #54259)

- **PR #54259**: (dwoz) Call os.fork less to avoid race conditions @ 2019-08-24 02:12:42 UTC
  - 5838851 Merge pull request #54259 from dwoz/less_forking
  - bf4d0dd Fix process list tests on windows py3
  - 316ec78 Allow more time for slow test
  - 9ba86f Do not remove attributes from process class
  - e7b6aa8 Clean up cruft
  - ed710a3 Attempt to fix integration.shell.test_call test
  - 659c805 Change noise log to debug
  - 0660b1a Clean up typos
  - 9f1fe42 Call os.fork less to avoid race conditions

- **ISSUE #50814**: (doesitblend) Minion continues trying down master (refs: #54239, #53417)

- **ISSUE #49680**: (doesitblend) Beacon events handled differently than event.send (refs: #53344, #54239)

- **ISSUE #49663**: (doesitblend) Beacon only fires to single random master in HA mode (refs: #53344, #54239)

- **PR #54247**: (DmitryKuzmenko) 2019.2.1 with multimaster bb fixes @ 2019-08-23 20:19:19 UTC
  - PR #54239: (DmitryKuzmenko) Multimaster tests with bb fixes (refs: #54247)
  - PR #53848: (DmitryKuzmenko) Features/multimaster tests (refs: #54239)
  - PR #53417: (DmitryKuzmenko) Multimaster minion hang on fire_master (refs: #54239, #53848)
  - PR #53344: (DmitryKuzmenko) Run beacons on the only one minion instance. Return to all masters. (refs: #54239, #53848)
  - 531f3aa Merge pull request #54247 from DSRCorporation/2019.2.1_with_multimaster_bb_fixes
  - 62cd8cd Merge branch '2019.2.1' into 2019.2.1_with_multimaster_bb_fixes

- **PR #54235**: (github-abcde) Fix 46034 2019.2.1 @ 2019-08-22 22:32:09 UTC
  - 993c341 Merge pull request #54235 from ogd-software/fix_46034-2019.2.1
  - 93bd30d Add alternative fix for "!" stomping Apparently (after watching Jenkins tests fail), what yaml.safe_load returns depends not on the version of salt, but on some other external dependency. Because of this, fix both possible return values.
  - c95dd4d Add test for this specific bugfix
- efc29d8 Prevent yamlify_arg from stomping "!"

- **PR #54282**: (Akm0d) clean up renamed instances in the teardown @ 2019-08-22 22:13:51 UTC
  - 5d1a4d0 Merge pull request #54282 from Akm0d/clean-up-renamed
  - 11c1117 Removed redundant parenthesis
  - 802235d don’t delete shutting down ec2 instances
  - 3602942 reversed the order in which an instance was renamed
  - 5500ede renamed _alt_name function
  - 23beab4 clean up renamed instances in the teardown

- **PR #54252**: (s0undt3ch) [2019.2.1] More control on spun test deamons on git pillar tests @ 2019-08-22 22:13:08 UTC
  - c181f5a Merge pull request #54252 from s0undt3ch/hotfix/git-pillar-2019.2.1
  - 4eb85fa Skip tests on RHEL family < 7
  - 64a1be8 Don’t even go through the transport to get the system grains
  - d08ef6a Don’t keep recreating the git repos. Restore from backup.
  - 6114e9d All prep work is done in setUpClass.
  - 5b030dd Daemons are now started/stopped on tests, not by salt
  - ed60f0d We don’t actually need grains
  - 911446d Lock uwsgi requirement.
  - *805f0ac Merge branch '2019.2.1' into 2019.2.1_with_multimaster_bb_fixes

- **PR #54214**: (Ch3LL) Remove unnecessary logging from minion.py @ 2019-08-22 18:08:26 UTC
  - b40cdbf Merge pull request #54214 from Ch3LL/fix_logging
  - 8fd24cf Remove unnecessary logging from minion.py
  - *9d28098 Merge branch '2019.2.1' into 2019.2.1_with_multimaster_bb_fixes

- **PR #54277**: (dwoz) Win runas plus @ 2019-08-21 23:59:16 UTC
  - de77762 Merge pull request #54277 from dwoz/win_runas_plus
  - f719591 Update tests
  - d8749d9 Do not remove attributes from process class
  - ac5a2a4 Only close handle if it got created

- **PR #54278**: (Akm0d) Correctly detect when an ms_azure instance is deleted @ 2019-08-21 23:14:01 UTC
  - 93fc40a Merge pull request #54278 from Akm0d/cloud-test-logging
  - 2dc1520 Merge branch '2019.2.1' into cloud-test-logging
  - 3867448 Fixed incorrect arguments
  - bdce5f4 Fix detecting msazure deletion with multiple tries

- **PR #54263**: (s0undt3ch) [2019.2.1] Exit test suite if test daemons fail to start @ 2019-08-21 22:06:52 UTC
  - 94f77a0 Merge pull request #54263 from s0undt3ch/hotfix/test-daemons-2019.2.1
  - 655efd6 Rearrange logging termination
- Prevent traceback on python interpreter shutdown
- Write to stderr a message with the exit code
- Exit the test suite if one of the test daemons fails to start

**PR #54270:** (s0undt3ch) [2019.2.1] Speedup testing helpers decorators @ 2019-08-20 20:33:25 UTC
- 3b9fd44 Merge pull request #54270 from s0undt3ch/hotfix/requires-system-grains-2019.2.1
- 9f99bff Speedup testing helpers decorators

**ISSUE #53931:** (KChandrashekhar) integration.states.test_pip_state.PipStateTest.test_issue_6912_wrong_owner_requirements_file (refs: #54274)

**PR #54274:** (felippeb) #53931 never fail on codecov curls @ 2019-08-21 18:12:19 UTC
- 2c4afa0 Merge pull request #54274 from felippeb/2019.2.1
- 9c0b216 #53931 never fail on codecov curls

**PR #54264:** (dwoz) Fix unit utils jinja when run on their own @ 2019-08-21 17:22:10 UTC
- b3c70c3 Merge pull request #54264 from dwoz/jinja_units
- 10a6d53 Fix unit utils jinja when run on thier own

**PR #54266:** (Akm0d) Fix incorrect types on failing cloud tests @ 2019-08-21 17:14:40 UTC
- 308ba55 Merge pull request #54266 from Akm0d/cloud_test_ultimate_fix
- f2125a Invert assertion to test for instance gone
- 82136a8 test for ec2 instance shutting down
- 283f631 run cloud –query if delete string is not available
- 33e6b6d changed deprecated assertEquals
- 41e6bc8 Cloud tests run correctly everywhere
- 03a8b2c reverted literal_eval

**PR #54251:** (Akm0d) reduced query calls to salt-cloud @ 2019-08-20 20:10:59 UTC
- 25db0b2 Merge pull request #54251 from Akm0d/cloud_test_optimization
- 5fe6bfc Optimized salt-cloud queries
- 43418a4 Merge pull request #7 from Ch3LL/cloud_provider_files
  - b93944b Remove joyent config cloud test files
  - bd37849 Rename provider azure-config to azurearm-config
- e7c06cb Added longer delays for ec2 tests
- 5cebe47e Correctly check for GCE and EC2 deletion
- 52c178c Added pretty yaml formatting to cloud-test logs
- 4fc5e9e re-fixed simultaneous GCE tests
- 326e9f2 Merge pull request #6 from Ch3LL/cloud_provider_files
  - adb1464 fix pylint
  - 51ce819 Move provider config setup into Setup/Teardown class
- e58b40a Merge pull request #5 from Ch3LL/cloud_provider_files
* ab8adcc Only use the provider conf.d file we are testing
  - 76609ad Merge branch '2019.2.1' into cloud_test_optimization
  - f764bc0 Clean up expensive queries
  - b3d02df reduced query calls to salt-cloud

- **PR #54240:** (Ch3LL) Fix TypeError python3 in get_image_id ec2 cloud @ 2019-08-20 20:10:01 UTC
  - ba81ca3 Merge pull request #54240 from Ch3LL/get_image_ec2
  - a3a39f3 Use ami variable instead in test
  - dc1ae52 Fix TypeError python3 in get_image_id
    - d6ad475 Merge branch '2019.2.1' into 2019.2.1_with_multimaster_bb_fixes

- **PR #54246:** (dwoz) Cut down on log noise @ 2019-08-19 17:20:03 UTC
  - 8404ec2 Merge pull request #54246 from dwoz/log_noise
  - e572711 Cut down on log noise

- **PR #54245:** (dwoz) Fix the sshd pid file @ 2019-08-19 17:19:32 UTC
  - 5b3e925 Merge pull request #54245 from dwoz/sshd_pid_file
  - df95347 Fix the sshd pid file

- **PR #54237:** (dwoz) Do not dup2 things without fileno @ 2019-08-18 17:13:29 UTC
  - 268803b Merge pull request #54237 from dwoz/dup2
  - 2ebd22b Fix linter
  - 63c616a Do not dup2 things without fileno
    - 0b33498 Workaround for beacons.list_available slowness.
    - b7a1058 Minor: Better support of named multimaster tests.
    - a5ccdf Minor: remove unneded logging
    - fcb8ff0 Properly set HAS_IPTABLES from __virtual__ return.
    - a75db01 Multimaster related fixup: don’t run test engine on minions
    - 8a88542 Multimaster beacons fix: put list into a dict to fire on the bus
    - 790fb41 Inotify beacons test logging and cleanup update
    - d84e8851 Inotify beacon test fixes and improvements.
    - 472ffe0 Give minion more time to handle beacon creation.
    - 17ceee0 Fixed Lint errors
    - 0bcf53c Fixed the unicode and timing inotify test issues.
    - f17bcf3 Improved assertion error diagnostic for master down test.
    - db0bae8 Run multimaster as well tests when no specific group is set
    - 723f363 Ignore the multimaster minion subgroup test in module names test.
    - 612191c Fixed lint failures
    - c1efae6 Multimaster test for events handling on master disconnect
• 1654fe8 Multimaster inotify beacons test
• 65dc47c Multimaster tests environment and test module test.
• 2c178b0 Moved annoying message to trace log level.
• 3e497c1 Handle minion events asynchronously.
• 909323a Tests fixes
• 6dad18f Cleanup event object
• 2bf55be Run beacons on the only one minion instance. Return to all masters.

- PR #54121: (Akm0d) Refactored cloud tests @ 2019-08-16 17:24:14 UTC
  - 27d89bd Merge pull request #54121 from Akm0d/gce_cloud_test
  - 48c57b3 Try multiple times to detect deletion of an instance
  - 74300eb return a valid set
  - 2d63b87 Wait for an instance to be fully created if necessary
  - 83ad8b3 Merge branch '2019.2.1' of github.com:SaltStack/salt into gce_cloud_test

- ISSUE #54174: (dwoz) SignalHandlingMultiprocessingProcess bugs (refs: #54204)

- PR #54204: (dwoz) Fix signal handling in subprocesses @ 2019-08-16 00:46:40 UTC
  - c5ee91c Merge pull request #54204 from dwoz/signal_proc
  - 09e5e49 Merge branch '2019.2.1' into signal_proc

- ISSUE #7745: (mgwilliams) yaml 'module' has no attribute 'Dumper' (refs: #54223)

- PR #54223: (dwoz) Test verify logs without a whole minion @ 2019-08-16 00:46:09 UTC
  - 99a8fc5 Merge pull request #54223 from dwoz/7754_test_removal
  - 4be711e Fix up linter warts
  - 7573826 Remove crufty un-needed tests
  - effa77d Test verify logs without a whole minion
    - b40f41f Revert fallback to default signals change
    - 1d83b10 Fix signal handling in subprocesses
      - f90fe66 Reverted foo/bar creds per #46265
      - 3f56bad Reduced the amount of informtaion in debuggings tatements
      - de53bf0 Merge branch '2019.2.1' of github.com:SaltStack/salt into gce_cloud_test

- PR #54203: (dwoz) Run transport test loops in single thread @ 2019-08-15 20:10:20 UTC
  - 8d440e0 Merge pull request #54203 from dwoz/transport_tests
  - 22b9d38 Run transport test loops in single thread
    - f6180a6 Even better logging of errors
    - a15dc4b better formatting and error reporting
    - 51fbc2a better logging on instance create failure
    - 1f7dd52 removed hack Fixes from gce
    - 31cdc7c WAR ROOM SKIP GCE TESTS
* 7d603be `hasattr` cannot find parent properties starting with \_
* 686cab9 Separated `assertInstanceDestroy` and `_destry_instance`
* 158a38c Revert "Removed subclass from cloud name"
* b7cf43d Removed subclass from cloud name
* 8c5eb18 fixed pylint error on format string
* 59e20bc Merge branch ‘2019.2.1’ of https://github.com/saltstack/salt into gce_cloud_test

- **PR #54191:** (garethgreenaway) [2019.2.1] Addition logging in testprogram used by integration.shell.test_minion.MinionTest.test_exit_status_correct_usage @ 2019-08-13 21:44:41 UTC
  - a05018e Merge pull request #54191 from garethgreenaway/test_program_test_mininion
  - 8463f84 Adding some additional logging when the call to "proc_cmline = proc.cmdline()" results in a AccessDenied exception, so we can see what the process is and who the process is running as.

- **PR #54202:** (waynew) Only run one filter test @ 2019-08-13 21:33:32 UTC
  - e5e9299 Merge pull request #54202 from waynew/shorter-jinja-ssh-tests
  - c333ac8 Only run one filter test
    - 5912f24 Switched to Azurearm over msazure

- **PR #54172:** (Ch3LL) Migrate from azure to azurearm tests @ 2019-08-13 20:07:34 UTC
  - a13cb3e Merge pull request #54172 from Ch3LL/azurearm_tests
  - 465523f Migrate from azure to azurearm tests

- **ISSUE #50535:** (wyardley) salt errors with current azure-storage because of no version set (refs: #50567)

- **PR #54173:** (Ch3LL) Cherry Pick #50567 and #53238 into 2019.2.1 @ 2019-08-13 20:07:09 UTC
  - **PR #53238:** (nicholasmhughes) Azure: Fixed ability to pass SSH key to Linux VMs (refs: #54173)
  - **PR #50567:** (rombert) azurefs: gracefully handle AttributeError (refs: #54173)
  - 39d0c59 Merge pull request #54173 from Ch3LL/azure_fixes
  - 9052eaf reverting log string handling
  - a1a61ee fixed ability to pass ssh key to Linux VMs
  - 4a141a1 azurefs: gracefully handle AttributeError
    - 6fa28de fixed underscore
      - c35379a Moved finding installer into class
    - 95484f8 Moved finding installer into class
    - a86ae34 moved installer finder to SetUp method
    - 933964a removed default user/pass from profitbricks test file
    - 2a2437d fixed dictionary access
    - 3a496ce Fixed broken tests
    - 80ed26 fixed misspelled provider information
    - 511779b removed unused imports
    - 1cd1c13 setUp all cloud tests the same way
    - d322408 Got rid of unnecessary delay
* 98ba18c fixed pylint error
* c34c17e Merge branch '2019.2.1' of https://github.com/saltstack/salt into gce_cloud_test

**PR #54178:** (dwoz) Fix flaky set_computer_name in mac_system module @ 2019-08-12 18:26:40 UTC
  - 19f4d5e Merge pull request #54178 from dwoz/mac_computer_name
  - e51100e Fix skip on non macos platforms
  - a3a9d92 Fix linter
  - c499d44 Revert unwanted flaky from non computer name tests
  - 941fcc8 Fix flaky set_computer_name in mac_system module
  - 90e8350 Merge branch '2019.2.1' of https://github.com/saltstack/salt into gce_cloud_test

**PR #54180:** (dwoz) Point test-kitchen to my keepalive_maxcount branch @ 2019-08-12 18:18:26 UTC
  - 6fe6799 Merge pull request #54180 from dwoz/keepalive_maxcount
  - dc9ee21 Add reminder about kitchen version
  - 19a1f1b Point test-kitchen to my keepalive_maxcount branch
    - 60f8351 Fixed failing Ec2 Tests
    - e2f085c removed py3-only function call
    - 4406c57 fixed lint errors, more descriptive fails
    - 6840d5f assert instances exist in unified way
    - 03da233 skip EOL joyent tests, secure delete instances
    - 3123bb1 Merge branch '2019.2.1' of https://github.com/saltstack/salt into gce_cloud_test

**ISSUE #53306:** (doesitblend) Fully Qualify CMD on Windows Minions (refs: #53311, #54033)

**PR #54033:** (twangboy) Backport #53311 to 2019.2.1 @ 2019-08-09 16:46:36 UTC
  - PR #53311: (doesitblend) Add fully qualified cmd call (refs: #54033)
  - 9f5302d Merge pull request #54033 from twangboy/fix_win_service_2019.2.1
  - 2850fab Merge branch '2019.2.1' into fix_win_service_2019.2.1
  - 0e2a2b8 Merge branch '2019.2.1' into fix_win_service_2019.2.1
  - 16c704e Backport #53311 to 2019.2.1

**PR #53900:** (twangboy) Fix inconsistent full names in LGPO @ 2019-08-09 09:15:41 UTC
  - c0e49d9 Merge pull request #53900 from twangboy/fix_lgpo
  - e05abdf Merge branch '2019.2.1' into fix_lgpo
  - e4e71cd Remove duplicate test
  - 68c632b Add some tests
  - 3c34075 Fall back to slower method if new method not available
  - 0108bcd Avoid using the lowercase method in XPath
  - fcc0405 Fix telemetry issue, add some timing logs

**PR #52818:** (twangboy) Add watchdog as a bundled dependency on Windows @ 2019-08-09 04:26:54 UTC
  - 9eb2938 Merge pull request #52818 from twangboy/add_watchdog
- 2658634 pre-commit
- 35691f2 Add watchdog to Linux and OSX .in files
- 5ef5969 Rremove opensuse 42 static files
- ec285d0 Remove watchdog from the rest of the .in files
- 86e64ae Remove unused import, remove Windows reference
- b934d53 Remove watchdog from windows.in
- cf8ee96 Fix and unify watchdog beacon tests for all OS’s
- cc73204 Put Windows tests in their own class
- 6bf1a3 Remove unused import... lint
- 832a1db Fix windowsisms
- 4f7d50 Update static requirements
- 762fe3b Remove some fluff
- 946076c Add watchdog for tests
- 02248dc Fix modified test to account for OS variances
- 15ee479 Compile static requirements
- 78a5723 Add watchdog to Linux and OSX .in files
- 9a0f08a Update static requirements
- 5cad13b Rremove opensuse 42 static files
- 10f5f3e Remove watchdog from the rest of the .in files
- 121595a Remove unused import, remove Windows reference
- c4104a4b Remove watchdog from windows.in
- 05a845 Fix and unify watchdog beacon tests for all OS’s
- 200e230 Put Windows tests in their own class
- 6cc8d96 Remove unused import... lint
- a4abb72 Fix windowsisms
- 005bed9 Update static requirements
- c1bc627 Remove some fluff
- 928d47 Add watchdog for tests
- 9544624 Add watchdog as a bundled dependency on Windows

• PR #54143: (Akm0d) Don’t call potentially missing shade library (#53734) @ 2019-08-09 01:05:26 UTC
  - PR #53734: (Akm0d) Don’t call potentially missing shade library (refs: #54143)
  - 5be5f20 Merge pull request #54143 from Akm0d/openstack_fix
  - 3f58885 Merge branch ’2019.2.1’ into openstack_fix
  - 71f5f38 Don’t call potentially missing shade library (#53734)
    * 29ee7ce removed print statements, optimized query
    * 14b7539 added back print statements for easy debug
- 823b3b2 Removed print statements and broken re
- 9696ed9 experiment with subclass names
- 2fa6157 more verbose instance names based on test
- 2ach2df undercased non-const variable and added print statements
- c5e875d Merge branch '2019.2.1' of https://github.com/saltstack/salt into gce_cloud_test

- PR #54001: (garethgreenaway) [2019.2.1] Porting metaproxy changes in #50183 to 2019.2.1 @ 2019-08-08 04:24:31 UTC
  - PR #50183: (cro) Allow proxy minion types to be dynamically loaded (refs: #54001)
  - 584e3f2 Merge pull request #54001 from garethgreenaway/add_metaproxy_2019_2_1
  - 8353467 Merge branch 'add_metaproxy_2019_2_1' of github.com:garethgreenaway/salt into add_metaproxy_2019_2_1
    - 1892d86 Merge branch '2019.2.1' into add_metaproxy_2019_2_1
- ab72e1b Adding unit.test_proxy_minion to ignore list
- 09f6fed Removing match tests, functionality does not exist in 2019.2.1
- 4af95e4 Adding tests to ensure _metaproxy_call to called when ProxyMinion objects are created.
- d162a88 Adding salt/metaproxy/proxy.py and tests/unit/modules/test_match.py
- 51726b1 PORting metaproxy changes in #50183 to 2019.2.1

- ISSUE #51008: (cdalvaro) cwd option not working with cmd.run and runas (refs: #52632, #54079)

- PR #54136: (ScoreUnder) Fix cmd.run on MacOS (rebased) @ 2019-08-08 04:20:31 UTC
  - PR #54079: (ScoreUnder) Fix cmd.run on MacOS – wrong environment variables (refs: #54136)
  - PR #52632: (cdalvaro) Prevent shell injection as root with cmd.run on macOS (refs: #54079)
  - PR #47212: (weswhet) fix macOS running as user. (refs: #54079)
  - bf863d0 Merge pull request #54136 from ScoreUnder/2019.2.1-patch-macos-cmd.run
  - 1182eb9 Add integration test justifying strange use of braces after cd in cmd.run
  - 733d2e7 Fixes to ITs
  - da38993 Add integration tests for cwd/runas changes on MacOS
  - ab8b39c Fix environment in cmd.run runas on MacOS
    - c9cb18f Don’t call potentially missing shade library (#53734)
    - 5ef8414 Added more verbose logging to cloud tests
    - 2f3942f better logging and fail messages
    - 9454f4c Fixed pylint errors and temporary print statements
    - fd13ce1 Further refactored cloud test code
    - b03cc48 Assume the instance exists and needs to be deleted
    - 0991ff5 fixed pylint errors and failed tests
    - 55e502a Merge branch '2019.2.1' of https://github.com/saltstack/salt into gce_cloud_test

- PR #53974: (Ch3LL) [2019.2.1] Add pygit2 requirement @ 2019-08-06 17:32:05 UTC
  - e268b95 Merge pull request #53974 from Ch3LL/add_pygit2

28.2. Previous Releases
- 11864a0 Merge branch ’2019.2.1’ into add_pygit2
- d1b1452 Merge branch ’2019.2.1’ into add_pygit2
- a5698cc Merge branch ’2019.2.1’ into add_pygit2
- 7dd97a6 Merge branch ’2019.2.1’ into add_pygit2
- 358974a Skip Pygit2 tests on windows
- bc64961 Use accurate file:/// URI on windows for gitfs tests
- 894f958 Fix GitFS support for pygit2 >= 0.28.0
- 4580030 [2019.2.1] Add pygit2 requirement
  * 4009bb5 fixed pylint errors
  * 459b16d put cloudtest base in separate file so that only one change needs to be made
  * 8e72335 Merge branch ’gee_cloud_test’ of github.com:Akm0d/salt into gce_cloud_test
    - 0e2621e Merge branch ’2019.2.1’ into gce_cloud_test
  * 9f98bb16 finished merge

• PR #54108: (dwoz) More robust azure instance deletion @ 2019-08-03 03:58:20 UTC
  - 46f5e2e Merge pull request #54108 from dwoz/azure_test
  - 754b719 Fix linter
  - 773235d Fix missing time import
  - 5a8f2ec More robust azure instance deletion

• PR #54017: (dmurphy18) Allow for main thread having terminated pid, before ThreadPoolExecutor threads @ 2019-08-02 18:11:48 UTC
  - 2cb5a0b Merge pull request #54017 from dmurphy18/fix_deb9_build90_tests
  - 2866520 Skip process kill tests on Windows
  - 557ff14 Clean up lint errors
  - 4ca709e Merge branch ’2019.2.1’ into fix_deb9_build90_tests
  - 264c767 Merge pull request #1 from dwoz/fix_deb9_build90_tests
    * 9bb9466 Add unit tests for weird pid does not exist cases
    * 64d9752 Add warning messages to help determine why pids do not exist
  - 406d382 Adjusted for review comments
  - 2d20f6e Adjusted try/except statements on process checking
  - e189177 Removed typos
  - 2e3ca43 Updated for review comments
  - 68c29af Allow for main thread having terminated pid, before ThreadPoolExecutor threads
    * e3158c8 refactored all cloud tests
    * 194e0c7 Refactored GCE cloud test

• PR #54080: (dmurphy18) Disabling random website tests till allow for quota usage @ 2019-07-31 21:16:54 UTC
  - 4e2efcd Merge pull request #54080 from dmurphy18/u1804_py3_random_skip
Disabling random website tests till allow for quota usage

- **PR #54063**: (twangboy) Make the skip apply to any system missing crypt @ 2019-07-30 19:22:07 UTC
  - 0660e6e Merge pull request #54063 from twangboy/fix_test_pycrypto_2019.2.1
  - 6efc035 Make the skip apply to any system missing crypt

- **PR #54050**: (cmcmarrow) Fixes integration terminate error @ 2019-07-30 13:38:55 UTC
  - 4df6271 Merge pull request #54050 from cmcmarrow/integration_terminate_fix
  - ebb07f4 Merge branch '2019.2.1' into integration_terminate_fix

- **PR #54057**: (dmurphy18) Added support for is_fedora and skip Minion test test_issue_7754 on Fedora @ 2019-07-29 22:41:25 UTC
  - 9d1bd63 Merge pull request #54057 from dmurphy18/fedora30_test
  - 30f3bda Added support for is_fedora and skip Minion test test_issue_7754
  - b3293a9 Merge branch '2019.2.1' into integration_terminate_fix

- **ISSUE #53948**: (KChandrashekhar) integration.shell.test_call.CallTest.test_issue_2731_masterless (refs: #54040)

- **ISSUE #2731**: (cwood) Masterless Broken in 0.10.5 (refs: #54040)

- **PR #54040**: (waynew) Remove dead test @ 2019-07-29 17:23:45 UTC
  - 5d3bcd7 Merge pull request #54040 from waynew/remove-dead-test
  - e9a5a57 Remove dead test
    - ba3e867 Merge branch '2019.2.1' into integration_terminate_fix

- **PR #54051**: (twangboy) Skip get time test @ 2019-07-29 16:54:50 UTC
  - 70ffcec Merge pull request #54051 from twangboy/fix_test_system
  - ceaba05 Skip get time test

- **PR #54038**: (Ch3LL) Pyton3 digital ocean test fix: to_str on key @ 2019-07-29 16:54:19 UTC
  - 4aed833 Merge pull request #54038 from Ch3LL/do_py3_fix
  - f7346db Pyton3 digital ocean test fix: to_str on key
    - 05cd93f fixes integration terminate error
    - 69c3106 fixes integration terminate error

- **PR #53735**: (twangboy) Fix Windows tests in test_system @ 2019-07-26 22:38:28 UTC
  - 3cedacd Merge pull request #53735 from twangboy/fix_test_system
  - a9e9c97 Add timeouts and account for those in assert
  - d3a160e Merge branch '2019.2.1' into fix_test_system
  - f950e7 Merge branch '2019.2.1' into fix_test_system
  - 87e02b8 Use setUpClass
  - 6a685bd Fix some tests in the Windows Class

- **PR #53953**: (Ch3LL) Send SIGTERM to webserver in teardown of gitfs tests @ 2019-07-25 21:12:42 UTC
  - cc1da1 Merge pull request #53953 from Ch3LL/improve_git_test
  - 347ea1e Use Sigkill and add time.sleep before check
– 637bf95 Merge branch '2019.2.1' into improve_git_test
– c0be147 Send SIGTERM webserver during teardown of gitfs tests
– b776c0c Check if gitfs server fails to setup for tests

• PR #53999: (Ch3LL) Generate new key each time for digital ocean key test @ 2019-07-25 21:07:45 UTC
  – 2324167 Merge pull request #53999 from Ch3LL/fix_digital_ocean
  – b0b6e3b Generate new key each time for digital ocean key test

• PR #53970: (garethgreenaway) [2019.2.1] Adding a WAR ROOM Skip for test_directory_clean_require_with_name @ 2019-07-25 21:03:49 UTC
  – 32fec66 Merge pull request #53970 from garethgreenaway/osx_skip_test_directory_clean_require_with_name
  – 362b84a Adding a WAR ROOM Skip for test_directory_clean_require_with_name

• PR #54003: (dwoz) War room skip for tcp build @ 2019-07-24 22:52:18 UTC
  – 213dff Merge pull request #54003 from dwoz/skip_test
  – 6cd8fa War room skip for tcp build

• PR #53897: (cmcmarrow) patches salt grains locale_info decode error @ 2019-07-23 13:19:00 UTC
  – 048c097 Merge pull request #53897 from cmcmarrow/timezone_fix
  – d9e402d Merge branch '2019.2.1' into timezone_fix

• PR #53920: (s0undt3ch) [2019.2.1] Update CI pipelines. Remove old jenkins cruft. @ 2019-07-20 12:33:01 UTC
  – 9a846b4 Merge pull request #53920 from s0undt3ch/hotfix/ci-pipelines-2019.2.1
  – b09963b Update CI pipelines. Remove old jenkins cruft.

• PR #53728: (garethgreenaway) [2019.2.1] Disabling test_set_computer_name on OS X and Py3 @ 2019-07-19 17:18:33 UTC
  – 15acecf Merge pull request #53728 from garethgreenaway/2019_2_1_mac_system_disable_test_set_computer_name
  – a6d853c Merge branch '2019.2.1' into 2019_2_1_mac_system_disable_test_set_computer_name
  – 5d537ed Missing six import. Updating skip message.
  – ac6dcd Disabling test_set_computer_name on OS X and Py3.

• PR #53913: (garethgreenaway) [2019.2.1] skip test_issue_2594_non_invalidated_cache on MacOS @ 2019-07-19 17:17:36 UTC
  – a54ec89 Merge pull request #53913 from garethgreenaway/disable_test_issue_2594_non_invalidated_cache_macos
  – c65c5d5 Skip the test test_issue_2594_non_invalidated_cache on MacOS where it is flakey.

• PR #53902: (twangboy) Skip tests that modify date or time @ 2019-07-18 17:53:31 UTC
  – b091eb7 Merge pull request #53902 from twangboy/skip_dt
  – 76cf936 Skip tests that modify date or time

• PR #53901: (s0undt3ch) [2019.2.1] Don’t fail when combining coverage files @ 2019-07-18 17:46:32 UTC
  – 22b7b1a Merge pull request #53901 from s0undt3ch/hotfix/wrap-coverage-combine
  – b459a48 Don’t fail when combining coverage files

• PR #53542: (dwoz) Fix leak of SaltMessageClient instances when using tcp transport @ 2019-07-18 17:44:44 UTC
- 84e798a Merge pull request #53542 from dwoz/tcp_leak
- 3daeb4f Update TCP pipelines
- 52f9556 Merge branch '2019.2.1' into tcp_leak
- 5f313fd Fix tcp message client test
- 3419bf5 Merge branch '2019.2.1' into tcp_leak
- 3125cd3 Merge branch '2019.2.1' into tcp_leak
- 9a33582 Merge branch '2019.2.1' into tcp_leak
- 7eb5d41 Merge branch '2019.2.1' into tcp_leak
- 481372b Fix torando loop thread issue
- aff15d4 Fix linter wart
- 9606db7 Comment the tcp message client test better
- dcf576f Add unit test for tcp message client close method
- 4420556 Download artifacts for tcp jobs
- e6a09dd Merge remote-tracking branch 'origin/tcp_leak' into tcp_leak
  * f484f3f Merge branch '2019.2.1' into tcp_leak
- 4a37234 Add tcp suffix to github notifications
- 4a2848b Add transport PR tests
- 9a4b407 Fix leak of SaltMessageClient instances when using tcp transport
  * 592f3fe undo test
  * bc550ad wip pytest test david
  * 75571e4 fixes timezone decode error
  * d041660 fixes timezone decode error
  * 1ddd1a9 fixes timezone decode error
  * e75dafa patches timezone grain
  * eaca473 patches salt grains locale_info decode error

- **PR #53873:** (bryceml) increase sleep time between kitchen create failures to account for api limits @ 2019-07-16 23:46:09 UTC
  - 61e9ef6 Merge pull request #53873 from bryceml/2019.2.1-increase-sleep
  - aae0bf6 increase sleep time between kitchen create failures to account for api limits

- **PR #53750:** (twangboy) Fix memory error when the test suite cleans up (2019.2.1) @ 2019-07-16 23:00:07 UTC
  - 3179d9a Merge pull request #53750 from twangboy/fix_helpers
  - fa0e9c3 Merge branch '2019.2.1’ into fix_helpers

- **PR #53851:** (dwoz) Master stats revert @ 2019-07-16 16:05:38 UTC
  - 6c2b3a5 Merge pull request #53851 from dwoz/master_stats_revert
  - 0bc72e4 Revert "Merge pull request #53822 from dwoz/master_stats_test"
  - 4553ba7 Revert "Merge pull request #53829 from saltstack/fix_stats_2019.2.1"
• PR #53829: (dwoz) Fix stats on windows @ 2019-07-12 01:03:47 UTC

**PR #53627:** (dmurphy18) Cherry pick pr 53370 from 2018.3 into 2019.2.1 @ 2019-06-28 19:54:13 UTC
- 164aaeb Merge pull request #53627 from dmurphy18/cherry-pick-pr-53370
- 450d23d Merge branch '2019.2.1' into cherry-pick-pr-53370

**ISSUE #53411:** (cro) Events can grow stale when event_listen_queue is set. (refs: #53587, #53412)

**PR #53587:** (cro) Forward port from 2018.3 Add event_listen_queue_max_seconds to fix #53411 @ 2019-06-28 16:49:46 UTC
- PR #53412: (cro) Stale events 53411 (refs: #53587)
- 6559e4c Merge pull request #53587 from cro/53412-2019.2.1
- 9e69bd4 Merge branch '2019.2.1' into 53412-2019.2.1
- 949a026 Merge branch '2019.2.1' into 53412-2019.2.1
- f5d81c9 Merge branch '2019.2.1' into 53412-2019.2.1
- d74c313 Merge branch '2019.2.1' into 53412-2019.2.1
- b3c3f52 Make doc build test pass.
- 8001130 Add event_listen_queue_max_seconds to fix #53411
  * 34e38d7 Merge branch '2019.2.1' into cherry-pick-pr-53370

**ISSUE #53283:** (Ch3LL) integration.states.test_file.FileTest.test_directory_broken_symlink (refs: #53295)
• PR #53295: (DmitryKuzmenko) Recurse kwarg of state.directory state shall be a list or None @ 2019-06-27 23:20:10 UTC
  - 14efced Merge pull request #53295 from DSRCorporation/bugs/test_file_recurse_set
  - 2927b78 Merge branch '2019.2.1' into bugs/test_file_recurse_set
  - 9c01670 Merge branch '2019.2.1' into bugs/test_file_recurse_set
  - 571d82a Merge branch '2019.2.1' into bugs/test_file_recurse_set
  - ee8f0e3 Merge branch '2019.2.1' into bugs/test_file_recurse_set
  - 013e04c Recurse kwarg of state.directory state shall be a list of None

• ISSUE #52926: (waynew) integration.states.test_beacon.BeaconStateTestCase.test_present_absent - Beacon "diskusage" is not available (refs: #53493, #53466)

• ISSUE #52245: (twangboy) integration.states.test_beacon.BeaconStateTestCase.test_present_absent (refs: #53493, #53466)

• PR #53466: (dwoz) More robust beacon state test @ 2019-06-27 23:17:01 UTC
  - 75175bb Merge pull request #53466 from dwoz/test_pres_abs
  - f24bf06 Use new pipeline format
  - a74580b Clean up cruft
  - 68958f5 Do not create duplicate minion ids
  - c47eeb4 Add amazon 2 to PR tests
  - dc90b47 More robust beacon state test
    * 95b1819 Initial working tests for gpg fixes and import keys, signing
    * b2c9ae2 Update access to str/bytes with to_unicode/to_bytes for Python 3

• PR #53609: (s0undt3ch) CI Pipelines. Timeout after getting a node. Report exit code. @ 2019-06-27 16:09:54 UTC
  - 582ac5f Merge pull request #53609 from s0undt3ch/fix-nox-bypass-2019.2.1
  - 024be84 CI Pipelines. Timeout after getting a node. Report exit code.

• PR #53574: (s0undt3ch) [2019.2.1] Minor fixes/adjustments to the new CI pipelines @ 2019-06-25 18:48:25 UTC
  - f568796 Merge pull request #53574 from s0undt3ch/fix-nox-bypass-2019.2.1
  - e85e2f4 Minor fixes/adjustments to the new CI pipelines

• PR #53584: (dwoz) Add unit tests for recent SaltCacheLoader changes @ 2019-06-24 23:40:43 UTC
  - PR #53563: (twangboy) SaltCacheLoader does not create multiple FileClients (refs: #53584)
    - 77b7fc4 Merge pull request #53584 from dwoz/client_cache
    - e9b61dc Add unit tests for recent SaltCacheLoader changes
      * 5558a0a Add reg to the whitelist

• PR #53563: (twangboy) SaltCacheLoader does not create multiple FileClients (refs: #53584) @ 2019-06-22 23:23:03 UTC
  - 6ed6c31 Merge pull request #53563 from twangboy/py3_windows_hang
  - 369720e Allow the file_client to be overridden
  - f6c592c Don’t instantiate the file_client every time
• **PR #53432**: (garethgreenaway) [2019.2.1] Various fixes for 2019.2.1 to ensure tests pass on Mac OS X @ 2019-06-21 13:47:41 UTC
  - c606952 Merge pull request #53432 from garethgreenaway/2019_2_1_mac_fixes
  - 1974f11 Disabling a couple more tests in integration.modules.test_cp that hang on OS X and Py2.
  - 7721151 Fixing lint.
  - 1d4e228 Updating various skips for tests to only skip if OS is OS X and Python is Python2.
  - 01dafdc Skipping integration.modules.test_cp.CPModuleTest.test_get_file_str_https on OS X
  - c02db20 Disabling integration.modules.test_state.StateModuleTest.test_parallel_state_with_long_tag
  - 8788877 Skip integration.states.test_file.FileTest.test_issue_11003 ImmutableLazyProxySum and integration.states.test_pip_state.PipStateTest.test_22359 pip_installed unless does not trigger warnings when running on OS X.
  - cf76027 Removing wrong import of skipIf
  - b10e1e7 Moving the skipIf for OS X from the beacon state tests to the renderer state tests.
  - d2fe9a Disabling beacon state tests on OS X for the time being.
  - 1741bb0 Adding some timeouts to see if it helps the tests pass on OS X.
  - fd0ba0a Ensure the user and group used by @with_system_user_and_group are consistent.
  - e03ab81 Using salt.utils.path.which to find false, on OSX it lives under /usr/bin/
  - 353f9d4 Fixing the beacons.reset function. Once the reset has taken place in beacons/__init__.py we need to fire an event back to complete the loop and ensure that everything worked as expected.
  - ee3bc7 Fix to how the depends decorator works. Only run the dependency commands for the module we’re checking.
  - 8440176 Fixing a log issue that pops up after test_gen_thin_compression_fallback_py3 on “OS X, need to ensure that salt.utils.thin.os.close is mocked.
  - 9767ddd Format for the sqlite3 database used for the assistive information changed in Mojave, additional columns added.
  - 9c8a76 Fixing a bug when the roots fileserver and the location is a symlink to another location. This fix ensures that when fsroot is referenced we are using the real path and not the symlink path.

• **PR #53526**: (s0undt3ch) [2019.2.1] Update pipelines to work on old and new jenkins @ 2019-06-20 15:29:13 UTC
  - 59e2a1f Merge pull request #53526 from s0undt3ch/hotfix/fix-nox-bypass-2019.2.1
  - 24d6d09 Update pipelines to work on old and new jenkins

• **PR #53210**: (Ch3LL) Cherry-Pick #52787 into 2019.2.1 @ 2019-06-20 13:33:13 UTC
  - PR #52787: (garethgreenaway) [2018.3] Fixes to test_pip state sls files (refs: #53210)
  - f5f80af Merge pull request #53210 from Ch3LL/cp-52787
  - f27c434 Merge branch ’2019.2.1’ into cp-52787

• **PR #53467**: (twangboy) Check valid username first (fixes failing symlink test) @ 2019-06-19 17:04:30 UTC
  - fd6cb35 Merge pull request #53467 from twangboy/fix_test_win_file
  - 92950c5 Merge branch ’2019.2.1’ into fix_test_win_file
  - 6a21ed9 Merge branch ’2019.2.1’ into fix_test_win_file
  - 31ce1fb Fix some lint, skip some tests
- 6de4db6 Monkeypatch in the class instead of globally
- d663a1f Fix the failing BlockReplace test cases on Windows
- 299f88f Update test_managed_contents
- 81110e5 Fix test_file_copy_make_dirs that was failing on Linux
- 8d0529d Fix some lint
- 4ac020 Fix issues with win_runs
- bceffa1 Remove privs message
- 54be0a6 Verify username early in win_runs

**PR #53475: (Ch3LL) Add pypsexec requirement for cloud tests @ 2019-06-19 13:30:25 UTC**
- 3230078 Merge pull request #53475 from Ch3LL/add_pypsexec
- ab59a55 Merge branch '2019.2.1' into add_pypsexec
- f954363 Merge branch '2019.2.1' into add_pypsexec

    * 5542fa8 Add the missing, and required, top pillar file.
    * 0ae2ef0 Under Py2 we still want raw to be set to True
    * 714d663 Re-submit #52934 fixed after being reverted in #52755
    * 243b512 Update msgpack calls for newer msgpack
      * 0f9077b Merge branch '2019.2.1' into cp-52787
• PR #53264: (s0undt3ch) [2019.2.1] Minion blackout tests - Add the missing, and required, top pillar file @ 2019-05-29 07:30:45 UTC
  - 50e31ec Merge pull request #53264 from s0undt3ch/2019.2.1
  - acabb70 Merge branch '2019.2.1' into 2019.2.1
• PR #52966: (s0undt3ch) Always run the full test suite on the 2019.2.1 release branch @ 2019-05-28 15:43:12 UTC
  - 749c626 Merge pull request #52966 from s0undt3ch/hotfix/full-test-run
  - 247c461 Always run the full test suite on the 2019.2.1 release branch
• PR #53138: (frogunder) vultr cloudtest fix @ 2019-05-28 14:34:22 UTC
  - a7af3d1 Merge pull request #53138 from frogunder/fix_vultr_cloudtest
  - 9df550c vultr cloudtest fix
    * 912b9b3 Add the missing, and required, top pillar file.
    * 9d21b75 Merge branch '2019.2.1' into cp-52787
• PR #53258: (s0undt3ch) [2019.2.1] Fix multiprocessing logging queue dict changing during iteration errors @ 2019-05-27 19:26:27 UTC
  - d011beb Merge pull request #53258 from s0undt3ch/2019.2.1
  - ad01dd2 More robust minion blackout tests
  - a0346d1 Try harder to get the minion grains
  - 36717bd Try and address the test flakyness
  - ce07d8c Add more information when the assertion fails
  - b99e914 Attempt to fix mine tests
  - fca981c One more known to return None
  - 951df48 One more known to return None
  - eb5fd3e Fix integration.modules.test_mine.MineTest.test_get for sub_minion
- 26314f5 Fix multiprocessing logging queue dict changing during iteration errors

• PR #53153: (s0undt3ch) [2019.2.1] Add Amazon Linux 2018.3 and 2 static requirements @ 2019-05-27 12:02:20 UTC
  - b69e080 Merge pull request #53153 from s0undt3ch/2019.2.1
  - 166067c Use currentBuild.resultIsBetterOrEqualTo instead
  - cefdd90 Stop error messages about missing roster file on syndic master
  - 6bf8f46 Don’t complain when attempting to close sockets at this stage
  - e3f3ca9 Add Amazon Linux 2018.3 and 2 static requirements
  - 872acc0 Switch the ubuntu-14.04 exception with amzn-1
  - PR saltstack/salt#52934: (twangboy) Update msgpack calls for newer msgpack (refs: #53235)

• PR #53235: (s0undt3ch) Revert "Update msgpack calls for newer msgpack" @ 2019-05-24 13:35:20 UTC
  - 14aeeea Merge pull request #53235 from saltstack/revert-52934-fix_msgpack
  - 3295aea Revert "Update msgpack calls for newer msgpack"

• PR #53131: (s0undt3ch) [2019.2.1] Update to salt-bootstrap v2019.05.20 @ 2019-05-24 07:45:57 UTC
  - 6923427 Merge pull request #53131 from s0undt3ch/hotfix/update-bootstrap-2019.2.1
  - 4cc4f4 Merge branch '2019.2.1' into hotfix/update-bootstrap-2019.2.1
  - 6751ee1 Merge branch '2019.2.1' into hotfix/update-bootstrap-2019.2.1
  - 6988e07 Update to salt-bootstrap v2019.05.20

• PR #52934: (twangboy) Update msgpack calls for newer msgpack (refs: #53242) @ 2019-05-23 23:18:23 UTC
  - a61db20 Merge pull request #52934 from twangboy/fix_msgpack
  - f02a12e Merge branch '2019.2.1' into fix_msgpack
  - 7e2cd34 Merge branch '2019.2.1' into fix_msgpack
  - bc9ce8e Merge branch '2019.2.1' into fix_msgpack
  - 0abd1ec Update msgpack calls for newer msgpack
    * 3366d59 update pylint exceptoin
    * 6c452b3 removing unwanted commits from this branch
    * e0b0ba8 Handling in flaky when maximum number of attempts raised and the exception should be raised. Different approaches depending on Py2 vs Py3.
    * 434dcd8a Disabling two tests when using Python 3 and OS X
    * 5784e80 Disabling integration.shell.test_minion.MinionTest.test_issue_7754 test on OS X because it hangs the test suite.
    * 78aeb61 Dropping the version check for InstallationError down to anything 1.0 or greater. Removing the test that simulates versions of pip below 1.0.
    * 4ee90c2 Adding an jinja if statement to only the python parameter if the result from get_python_executable is a valid value. Maintaining backwards compatibility to run tests without Nox.

• PR #53192: (twangboy) Skip test_gen_hash test on Windows @ 2019-05-23 05:33:13 UTC
  - 8a57270 Merge pull request #53192 from twangboy/skip_test_gen_hash
- 758d020 Skip test on Windows

- **PR #53157**: (twangboy) Fix `unit.modules.test_win_file.WinFileTestCase.test_issue_52002_check_file_remove_symlink` @ 2019-05-22 22:32:26 UTC
  - 446e70c Merge pull request #53157 from twangboy/fix_test_win_file_symlink
  - 5672076 Merge branch '2019.2.1' into fix_test_win_file_symlink

- **PR #53141**: (Ch3LL) Check for all non-word characters when calling `secure_password` @ 2019-05-22 17:24:54 UTC
  - 6fbe9aa Merge pull request #53141 from Ch3LL/shadow_fed_fix
  - a3c4066 Merge branch '2019.2.1' into shadow_fed_fix

- **PR #53161**: (Ch3LL) Add `HAS_REQUIRED_CRYPTO` var for m2crypto in `joyent` @ 2019-05-22 13:36:07 UTC
  - fb29512 Merge pull request #53161 from Ch3LL/joyent_m2crypto
  - 08d03e0 Add `HAS_REQUIRED_CRYPTO` var for m2crypto in `joyent`
  - 16ef3d2 Merge branch '2019.2.1' into shadow_fed_fix
  - 09ff8e7 Check for all non-word when calling `secure_password`
    - 334c93b Elevate token before creating symlink

- **PR #53073**: (Ch3LL) `salt-ssh`: python binary exists before version check @ 2019-05-20 22:36:34 UTC
  - 85e9b2f Merge pull request #53073 from Ch3LL/ssh_py3_log
  - 383e781 Improve logging in `salt-ssh gen_thin`
  - 4371434 `salt-ssh`: python binary exists before version check

- **PR #52957**: (Ch3LL) Set `default_flow_style=None` in `yaml.dump` calls @ 2019-05-16 19:42:35 UTC
  - bd02ea6 Merge pull request #52957 from Ch3LL/yaml_flow_style
  - 5f6581a Merge branch '2019.2.1' into yaml_flow_style

- **PR #53072**: (Ch3LL) Backport #52754 into 2019.2.1 @ 2019-05-16 19:29:22 UTC
  - **PR #52754**: (garethgreenaway) [2018.3] Fixes to multiprocessing queue when using MacOS (refs: #53072)
    - f410346 Merge pull request #52754 from Ch3LL/bp-52754-2019.2.1
    - 13e5e55 The maximum for the multiprocessing queue on MacOS is 32767, so if we running on MacOS then we use that maximum.

- **ISSUE #52817**: (waynew) `unit.modules.test_telegram.TelegramModuleTest.test_post_message` (refs: #52972)

- **PR #52972**: (garethgreenaway) [2019.2.1] Fix to `unit.modules.test_telegram` @ 2019-05-15 07:50:13 UTC
  - 06fa91b Merge pull request #52972 from garethgreenaway/52817_unit_modules_test_telegram_telegrammoduletest_test_post_message
  - cee7131 Removing global declaration.
  - 5bf9a95 Fixing lint.
  - 4d3c46d fixing broken `unit.modules.test_telegram` test.

- **PR #53025**: (Ch3LL) Change package name for suse pkg tests @ 2019-05-15 07:41:44 UTC
  - d340bc Merge pull request #53025 from Ch3LL/suse15_pkg_test
  - 0a213ee Change package name for suse pkg tests

- **PR #53020**: (Ch3LL) Change ssh tops log message to debug @ 2019-05-14 16:56:42 UTC
- c56fb0 Merge pull request #53020 from Ch3LL/ssh_tops
- cbcbc764 Merge branch '2019.2.1' into ssh_tops

**PR #52973: (twangboy) Fix integration.states.test_pip_state.PipStateTest.test_issue_2028_pip_installed_state on Windows @ 2019-05-13 20:56:28 UTC**
- ce099aa Merge pull request #52973 from twangboy/test_pip_state
- 21838a1 Merge branch '2019.2.1' into test_pip_state

**PR #52986: (Ch3LL) Revert "Make sure --run-expensive runtests.py arg works" @ 2019-05-13 19:38:17 UTC**
- 055d374 Merge pull request #52986 from Ch3LL/expensive_revert
- 368c012 Revert "Make sure --run-expensive runtests.py arg works"
- cce263e Merge branch '2019.2.1' into test_pip_state
- 351d415 Return path to Python instead of None
  * c053d2 Change ssh tops log message to debug
  * e317186 Merge branch '2019.2.1' into yaml_flow_style

**PR #52968: (s0undt3ch) [2019.2.1] Salt >= 2018.3.x supports Py3.7 @ 2019-05-12 21:44:57 UTC**
- ee05d5 Merge pull request #52968 from s0undt3ch/2019.2.1
- 73c3726 Salt >= 2018.3.x supports Py3.7

**ISSUE #50310: (xuhcc) acme.cert falsely reports changes (refs: #50400)**

**PR #52796: (Ch3LL) Backport #50400 and #50402 into 2019.2.1 @ 2019-05-10 19:30:12 UTC**
- PR #50402: (xuhcc) Fix typo in salt.modules.acme (refs: #52796)
- PR #50400: (xuhcc) Fix incorrect change reporting in acme.cert (refs: #50402, #52796)
- cae51c2 Merge pull request #52796 from Ch3LL/bp-50400
- 0c2e5e7 Merge branch '2019.2.1' into bp-50400
- 1268e3e Merge branch '2019.2.1' into bp-50400
- 09fa9e3 Fix typo
- 9be5c0c Fix incorrect change reporting in acme.cert
  * 9a27fb3 Merge branch '2019.2.1' into yaml_flow_style

**PR #52770: (twangboy) Fix test_file_managed_should_fall_back_to_binary on Windows @ 2019-05-09 20:35:02 UTC**
- 20cccd8 Merge pull request #52770 from twangboy/test_file
- ac27e69 Merge branch '2019.2.1' into test_file
- 30a5093 Merge branch '2019.2.1' into test_file
- c08b10d Merge branch '2019.2.1' into test_file
- 340ee23 Pass encoding to _validate_str_list
  * 0d0e354 Fix yamldumper test for both py2/py3
  * 20bc954 Update docs for yamldumper test
  * bf648e5 Update tests/unit/utils/test_yamldumper.py
  * 70d578a Set default_flow_style=None in yaml.dump calls
• **PR #52943**: (Ch3LL) Fix elasticsearch state module: allow user to define empty aliases @ 2019-05-09 15:46:38 UTC
  - 4437764 Merge pull request #52943 from Ch3LL/fix_elasticsearch
  - 451fb7e Merge branch '2019.2.1' into fix_elasticsearch
  - ebf9b9 Fix elasticsearch state module: allow user to define empty aliases

• **PR #52952**: (s0undt3ch) [2019.2.1] More nox changes and test fixes @ 2019-05-09 15:03:07 UTC
  - 9b290b6 Merge pull request #52952 from s0undt3ch/merge-forward/2018.3-to-2019.2.1-cherry
  - a06d7ce We need to call the decorator
  - 77185af Partial revert since this is a class method
  - f5c5771 Lint fixes
  - 3e43c87 Revert “fix compare_versions method”
  - 0e139bf Fix GOLDEN_IMAGES_CI_BRANCH value
  - 12a9408 Add Py3.7 static requirements
  - 8e505fb Move tests to existing test modules
  - 4681609 tests/unit/config/__init__.py -> tests/unit/config/test_config.py
  - b1dc7f6 Pin to moto<=1.3.7 because of https://github.com/spulec/moto/pull/1952
  - 0ffe7ca We no longer test against Ubuntu 14.04 which reached EOL
  - 33743fc Don’t traceback when trying to close a closed socket
  - da2e147 Always cleanup the changed environ
  - 087c74d No globals in tests, specially dictionaries!
  - a814fc0 Fix underscore wart (and linter)
  - 74b8f5f Fix deprecation warning in msgpack >= 0.5.2
  - 962b116 Try to address dict changing during iteration
  - c58af57 Tweak codeclimate settings for less noise
  - 5bb7869 fix linter
  - 0b81841 Cherry-pick test fix
  - 99f9e1c fix compare_versions method

• **PR #52853**: (s0undt3ch) [2019.2.1] Bring nox into 2019.2.1 @ 2019-05-09 09:52:42 UTC
  - a510edf Merge pull request #52853 from s0undt3ch/merge-forward/2018.3-to-2019.2.1-cherry
  - a8f7b46 Test is not destructive.
  - 63663cf We no longer test against Ubuntu 14.04 which reached EOL
  - 62574ee Typo
  - e3e3761 Proper english in requirements comments
  - e9f6a12 identical_signature_wrapper adds __wrapped__ to function globals
  - 10283b4 Upload coverage reports on full test runs
  - 6e0b61b Less flaky mine tests
- 3709cd7 msgpack returns string_types
- a36b15e Add regression test
- ce782ff Fix non raw msg pack msg decoding
- f193f0f Update Issue Template: questions removed
- 4417095 Fix underscore wart (and linter)
- e6c2ae4 Fix deprecation warning in msgpack >= 0.5.2
- 6375944 Add ubuntu1804 to pr tests
- 8fdb04d SIGKILL is not alwasy available use a local variable
- 4d6b8da Fix linter
- 759bccc Fix test_doc on windows by using grep yay!
- 0ce086d Fix remaining failures on ubuntu 1404 and add to PR tests
- fd80fd Change py3 windows timeout from 6 to 8 hours
- b0aa287 Fix missing class wart
- 21ecb74 fix linter
- 62c0f9f Skip tests when no libcloud
- 1d92290 Fix unused import
- 72cde91 Fix linter
- 238fd0f Fix broken pip state
- 89533ba Fix NOX_ENV_NAME
- 7cfe9e8 Fix NOX_ENV_NAME
- 2087c91 Fix NOX_ENV_NAME
- 2f1af5 Rename kitchen-centos6-py3 to kitchen-centos6-py2
- 1eea990 Fix linter
- 52ca668 Skip tests when no libcloud
- 2c4f6b98 Add centos-6-py2 and debain 8,9 py2 and 3 to PR tests
- 52259d DONT fail just because some random process died
- 34cef86 Ignore super not called
- b7ace9c Fix linter
- aceb6d3 Skip libcloud unit tests when no libcloud
- f73420b Install mock on Python < 3.6
- 28fbede1 Add moto to the windows dependencies
- 8cbec1 Pin kubernetes to <4.0
- 2acb0f3 Make sure –run-expensive runtests.py arg works
- 22cae20 Remove ref restriciton from kitche-salt
- 67095df Add ’runFull’ build parameter for PR tests
- 12d8d35 Stop w32time before and start after testing
- 7f1c22c Skip tests that fail on Windows
- f4ae97f Upgrade etcd to > 0.4.2
- 381f5fe Limit and reduce the amount of log records sent over the wire
- 0c94b5d More entries to ignore
- c3a21f5 As a script, not as a module
- 8948b69 Include COVERAGE_FILE as an env variable.
- 0af561e Each generated script is now prepared for code coverage
- 294d6f4 Use the system’s path separator
- e52ab87 Always combine and generate the XML coverage report
- 666ca9f Fix proxy minion startup issue on the test suite
- 7838ace impacket does not support Py3
- ba8d0fe Allow --install-only to gather the required information
- eed7d68 Create nox lint virtualenvs before running them
- e9e57cf Syndic roster not in 2017.7.9
- 11c63a4d Create the roster even when not running ssh
- 11c02a0 Fix unit.test_loader.LoaderGlobalsTest.test_states
- 8694db1 Fix windows tests
- 82e9ac5 Avoid race condition in even assertions
- 9443451 Revert part of 927219c since it is not a fix
- 5fee762 Fix timeout logic
- 517650f check timeout when queue empty
- 7c0a9af fix linter
- 961dc40 Ignore missing variable in six module
- 0f5a7f0 Fix typo
- 6c8c418 Do not limit event assert to first event
- 3042292 Wait longer for ping reaction
- 8c10f5f Fix xml block causing docs to fail
- 6e5768a Add a nox session for the Jenkins tornado jobs
- 43321e8 Add a cloud nox session for both runtests and pytest
- b6b4e95 Lint cleanup
- 0670614 Add tests for wraps
- 1670b5d Use functools.wraps with decorators
- 5ae263c Update static requirements for 2018.3 branch
- 3482c4d Disable code coverage uploads.
- 0e5bc67 Lint fixes
- 337c737 Update CI jobs to point to 2018.3
- 72e8603 Skip test if required crypto libs are not available
- e6bc9f8 Default to Cryptodome, fallback to PyCrypto
- b2b0764 Be aware of the different path separators
- 7e79b18 We need to make sure the virtualenv path entry is removed when searching
- ff6d3c6 We don’t need to be root to run these tests
- 5965ab4 Disable progress bars on pip installs
- f86a44e Use the real python executable path when running within a virtualenv
- 3d407e8 Add a helper to return the path to the real python executable
- ea9d246 We must also provide venv_bin when running within a virtualenv
- 31e91b0 Fix pip tests, in particular under windows
- 493f493 Don’t fail if pkg_resources is not importable
- a1eb400 Specify the SHA we need
- 0b01f21 Let’s fully unload pip
- 0b6f848 Fix docker entries
- 870b899 Remove unused argument
- 1656cb4 Disable re-running failed tests for now
- 6db4141 Also ignore multiprocessing coverage files
- 83dc97d Actually write the lint reports.
- 5f97270 Try to make sure some pip internal functions are always present in sys.modules after reloads
- 0090c55 Try and address the fact that some python packages are only provided by the distro
- 4a072fe These tests aren’t destructive
- 5c7a956 Don’t fail the build if the issue was sending a slack notification
- 361ef6e Don’t try to change ownership on non existing paths
- 7b17352 More insight(context) on failure reports
- 93b6b95 Lock supervisor to 3.3.5, last known working(passing tests) version
- 51114aa Watch out for too long shebang’s
- d97fe82 The output is important to know why it failed.
- 9fe385 Strings and integers are not comparable under Python 3
- d308dce Be verbose in a CI context
- 8b7105e Fix failed tests re-run logic
- d6d8db1 Blacklist enum34 on Py>=3.4. Update requirements.
- 1cd00c0 Update PR CI jobs for nox
- 19a83d5 Blacklist pycrypto and install pycryptodome instead
- 91376b3 Ignore the generated docs archive
- 207b83a Update compiled requirements
- 535e7a7 Add TCP transport nox sessions
Salt Documentation, Release 3000.2

- 680b3e5 Compile requirements for the TCP transport
- 49a1eb7 Throw error when running either on Py<2.7 or Py>=3.7
- 1052ba9 Don’t repeat file tests on missing/empty failed test files file
- 4886ba0 We currently only support running lint under Py2.7
- a769fb1 Remove dead code
- 7b2c1ce Don’t require six
- a27ed35 Add nox env to build docs
- e1b3f1d Lock docs python requirements
- c8de644 Fix lint issues under tests
- 0372718 Fix lint issues on salt
- 9eab9f4 Add nox session/env/target to run lint against Salt and it’s test suite
- 123f771 Lock lint requirements
- 8df33ad Back to +apache-libcloud==1.0.0 and skip windows for now
- 43e3ae6 Bump apache-libcloud requirement because 1.0.0 fails to install on windows
- d5f7813 Remove requirements for platforms which aren’t tested under Py3
- 8f02ee9 Recompile requirements
- 66626f2 Remove py2cryptodome from compiled requirements files
- 75693e5 Use py2cryptodome on windows and PyCrypto on the rest
- a4c19c Update(fix) requirements
- 3a34d76 We don’t test OSX nor Windows under Py3.4
- fd44fce We want a more verbose pip-compile output
- c2ae2d5 We now compile requirements for each of the supported minor version
- 6ee1260 Static requirements are now placed on py<major>-%minor% subdirectories
- 3504804 The required crypto library is pulled in from zeromq.txt or raet.txt
- 3fe03c PyZMQ is pulled in from zeromq.txt
- 7c2fe16 Instead of quoting session parameters, proxy nox sessions
- d3ae77b Add separate crypto sessions
- 0399620 Parametrize the transport
- d33fd03 Update/Generate static requirements to new layout
- 52ac533 Add pre-commit config to generate static requirements
- 3cfcb13 Be aware of the new static requirements layout
- dc7e16a Don’t lock the docker requirement. It’s not locked on the other platforms
- 5476ba2 Kubernetes 3.0.0 does include the requirements files. pip-compile chokes on that
- 79a8261 Previously generated requirements were py2 only
- 1e29666 IOFLO is pulled in from the raet requirements
- 4945e35 Fix pylint on 2017.7.9

28.2. Previous Releases 4087
- 036bf68 Rerun failed tests
- 03a9601 Ignore .nox directory
- 50cb630 We have long files
- db2392f Update CodeClimate settings
- 899c80e Fix integration.client.test_kwarg test timeouts

- ISSUE #52836: (Ch3LL) unit.utils.test_args.ArgsTestCase.test_argspec_report failing (refs: #52852)
- PR #52852: (garethgreenaway) [2019.2.1] Fixes to unit.utils.test_args.test_argspec_report @ 2019-05-07 19:25:48 UTC
- 77355e2 Merge pull request #52852 from garethgreenaway/52836_test_argspec_report_failing
- eee5a38 Merge branch ’2019.2.1’ into 52836_test_argspec_report_failing

- PR #52845: (Ch3LL) Backport #52780 into 2019.2.1 @ 2019-05-07 16:27:21 UTC
- PR #52780: (sbrennan4) Handle ipv6 in _netlink_tool_remote_on (refs: #52845)
- dcc5fde Merge pull request #52845 from Ch3LL/bp-52780
- dff09b Merge branch ’2019.2.1’ into bp-52780

- PR #52851: (Ch3LL) Reload matcher loader when ext_pillar_first set @ 2019-05-07 13:12:07 UTC
- 2e4f296 Merge pull request #52851 from Ch3LL/matcher_ext_pillar
- bdc45d Add docs for new reload kwarg
- fc70884 Reload matcher loader when ext_pillar_first set
- 8ac74e2 Merge branch ’2019.2.1’ into bp-52780
- 226c7ce Merge branch ’2019.2.1’ into bp-52780
- c1eae84 Add test
- 69fe65b Use rsplit
  - 8fcd48c Removing create_autospec and having salt.utils.args.argspec_report run against the _test_spec function directly. Depending on the python version, create_autospec gives different results and cause the test to fail. The test is now more accurate at testing the arguments for the function.

- PR #52842: (s0undt3ch) libcrypto.OpenSSL_version_num might be a callable @ 2019-05-06 17:00:37 UTC
- cc7a0d1 Merge pull request #52842 from s0undt3ch/2019.2.1
- a944017 libcrypto.OpenSSL_version_num might be a callable

- PR #52839: (twangboy) Add support for EC2 @ 2019-05-04 17:28:54 UTC
- b625a6a Merge pull request #52839 from twangboy/fix_test_grain
- 1c9b372 Add support for EC2

- ISSUE #51982: (arsiesys) topic (minion_id) need to be encoded before being hash and sent using zeroMQ (refs: #51983)

- PR #52767: (Ch3LL) [2019.2.1] Add tests to PR #51983 @ 2019-05-03 08:35:27 UTC
  - PR #51983: (arsiesys) encode topic before using hashlib (refs: #52767)
  - 6002939 Merge pull request #52767 from Ch3LL/zmq_filter_test
  - 1ee8f37 Merge branch ’2019.2.1’ into zmq_filter_test
- d74b6ee Merge branch '2019.2.1' into zmq_filter_test
- 3210274 Fix linter warnings
- e7c9d6e increase timeout when gathering results
- 784786d Add zmq_filter unit tests
- 805c5ee encode topic before using hashlib

**PR #52827**: (twangboy) Add pymssql dependency for Windows builds @ 2019-05-03 08:21:40 UTC
- 5996932 Merge pull request #52827 from twangboy/add_pymssql
- 6f0b8e2 Add pymssql dependency for Windows builds

**ISSUE #52717**: (Ch3LL) debian9 tests segmentation fault (refs: #52797)

**PR #52797**: (garethgreenaway) [2019.2.1] Only run the libcrypto init if less than OpenSSL 1.1.0 @ 2019-05-03 05:12:31 UTC
- e3918c5 Merge pull request #52797 from garethgreenaway/52717_debian_tests_segmentation_fault
- 7ab0961 Merge branch '52717_debian_tests_segmentation_fault' of github.com:garethgreenaway/salt into 52717_debian_tests_segmentation_fault
  - f8d816e Merge branch '2019.2.1' into 52717_debian_tests_segmentation_fault

**PR #52771**: (twangboy) Fix test_gpg tests on Windows @ 2019-05-02 13:30:18 UTC
- b68544f Merge pull request #52771 from twangboy/fix_test_gpg
- c7f45c2 Pass encoding to stringutils.to_unicode

**PR #52783**: (Ch3LL) Fix boto_apigateway tests for PyYAML 5.1 @ 2019-05-02 13:26:34 UTC
- 316d05b Merge pull request #52783 from Ch3LL/fix_boto_yaml
- cde29cb Fix boto_apigateway tests for PyYAML 5.1
- 6ffca5 Fixing lint.
- e24f2f8 Only run the libcrypto init if less than OpenSSL 1.1.0.

**PR #52769**: (twangboy) Remove domain grain from tests for Windows @ 2019-04-30 21:14:26 UTC
- 3509465 Merge pull request #52769 from twangboy/fix_test_core
- 0049f85 Remove domain grain from tests

**PR #52768**: (twangboy) Remove pchanges... again... @ 2019-04-30 20:24:27 UTC
- 30dc14b Merge pull request #52768 from twangboy/fix_test_win_dacl
- 123b607 Remove pchanges... again...

**PR #52753**: (twangboy) Skip test_gen_thin_compressionFallbackPy3 @ 2019-04-30 03:36:27 UTC
- 3e46f51 Merge pull request #52753 from twangboy/skip_test_gen_thin
- 811b381 Skip test_gen_thin_compressionFallbackPy3

**ISSUE #52721**: (Ch3LL) unit.cloud.clouds.test_ec2 test failing (refs: #52736)

**PR #52736**: (dwoz) Skip password decryption test when no libraries available @ 2019-04-29 17:07:56 UTC
- 6bfca94 Merge pull request #52736 from dwoz/ec2test
- 04ad027 Merge branch '2019.2.1' into ec2test

**PR #52624**: (tanlingyun2005) fix TypeError: argument of type int is not iterable @ 2019-04-29 13:15:42 UTC

28.2. Previous Releases
- 9a1ed78 Merge pull request #52624 from tanlingyun2005/2019.2.1
- 2c6867e add test case to tests/unit/cli/test_batch.py
- cb7742e Merge branch '2019.2.1' into 2019.2.1
- c943900 Merge branch '2019.2.1' into 2019.2.1
- d4abddd fix TypeError: argument of type int is not iterable
- ed908b3 Merge branch '2019.2.1' into 2019.2.1
- 463b60e Merge branch '2019.2.1' into 2019.2.1
- 65ee219 Merge branch '2019.2.1' of https://github.com/tanlingyun2005/salt into 2019.2.1
  - f71168d Merge branch '2019.2.1' into 2019.2.1
- 509c797 bug fix salt/cli/batch.py
- 211915c fix salt/cli/batch.py TypeError: argument of type int is not iterable
- 070ae84 fix TypeError: argument of type int is not iterable
  - b770f9e Skip test requiring crypto when none available
  - e52b390 Warn when password decryption requested but not possible

- **PR #52696**: (Ch3LL) Backport #50087 into 2019.2.1 @ 2019-04-25 20:33:13 UTC
  - PR #50087: (rbthomp) Fix applying of attributes for returner rawfile_json (refs: #52696)
  - 806307a Merge pull request #52696 from Ch3LL/bp-50087
  - 66e97e7 Fix applying of attributes for returner rawfile_json

- **PR #52659**: (twangboy) Fix issues with the win_file tests @ 2019-04-22 23:34:36 UTC
  - 17f5558 Merge pull request #52659 from twangboy/fix_test_win_file
  - 915c780 Fix issues with the win_file tests

- **PR #52655**: (dwoz) Parse chattr version and fix test case @ 2019-04-22 01:46:29 UTC
  - d1a61a6 Merge pull request #52655 from dwoz/cron_test_fix
  - e69fccc Fix typo
  - 859d088 Merge remote-tracking branch 'origin/cron_test_fix' into cron_test_fix
    - 7f7bb90 Merge branch '2019.2.1' into cron_test_fix

- **PR #52601**: (Ch3LL) Cherry-Pick #52415 into 2019.2.1 @ 2019-04-21 19:33:03 UTC
  - PR #52415: (Ch3LL) Backport #49832 into 2018.3 (refs: #52601)
  - PR #49832: (terminalmage) Replace pchanges with changes to make onchanges/prereq work in test mode (refs: #52415)
  - f7d823c Merge pull request #52601 from Ch3LL/cp-52415
  - ecd6802 Merge branch '2019.2.1' into cp-52415
  - 538d5cf Remove pchanges from win_dacl
  - 81b865f use same newfile message on linux for windows file state
  - 93bdd08 Update dict correctly in file state
  - f3c7f27 remove pchanges for windows file modules
- fb3b75d Fix tests for pchanges backport into 2018.3
- 0f296bb Update kernelpkg test to reflect pchanges removal
- 885d6ff Update file.touch unit tests to reflect addition of changes in test mode
- 4bc5fd0 Add integration tests for test mode onchanges/prereq
- ed214e4 Make it possible to use prereq with test and saltmod state mods
- ceb3f4d Add repack_state_returns to TestCase
- 982e693 Add exception logging in flaky decorator
- 0ba0ddf Add test mode changes to file.touch state
- 6db2beb Replace "pchanges" with "changes" to fix onchanges/prereq requisites
  * 169c2d5 Chattr version py3 fix
  * cf88c27 Fix linter issues
  * 0ea007d Parse chattr version and fix test case

- **ISSUE #52508**: (Ch3LL) integration.modules.test_publish test failures (refs: #52645)
- **PR #52645**: (dwoz) Fix salt.modules.publish and salt.states.x509 tests @ 2019-04-20 08:17:19 UTC
  - af4f204 Merge pull request #52645 from dwoz/test_fixes
  - 9b6f9f9 Clean up cruft
  - c3971a5 Fix salt.modules.publish and salt.states.x509 tests
- **PR #52629**: (dwoz) Fix event assertion race condition @ 2019-04-19 19:03:20 UTC
  - **PR #52540**: (dwoz) Fix race condition in event assertion (refs: #52629)
  - 0a4d2d9 Merge pull request #52629 from dwoz/ping_wait_2019.2.1
  - c001022 Fix linter
  - 423f6f9 Fix vent assertion race condition
- **PR #52619**: (dwoz) Remove unused method from pytest engine @ 2019-04-18 23:45:35 UTC
  - 4859e6c Merge pull request #52619 from dwoz/pytest_engine_2019.2.1
  - 105784a Remove unused method from pytest engine
- **PR #52614**: (Ch3LL) [2019.2.1] Update integration.modules.test_network.NetworkTest.test_network_ping... @ 2019-04-18 21:54:28 UTC
  - 77943e5 Merge pull request #52614 from Ch3LL/cp-test_network-2019.2.1
  - 27c79d2 Update integration.modules.test_network.NetworkTest.test_network_ping test address
- **ISSUE #52245**: (tkwilliams) git_pillar should permit automatic mapping of environment to branch a-la gitfs (refs: #50768)
- **PR #52615**: (twangboy) Bring 51661 into 2019.2.1 @ 2019-04-18 21:53:35 UTC
  - **PR #51661**: (sathieu) git_pillar: Fix all_saltenvs on base env (refs: #52615)
  - **PR #51597**: (sathieu) git_pillar: Fix all_saltenvs on base env (refs: #51661)
  - **PR #50768**: (sathieu) git_pillar: Add support for all_saltenvs parameter (refs: #51597, #51661)
  - c6b4986 Merge pull request #52615 from twangboy/gitfs_2019.2.1
  - d952674 Merge branch '2019.2.1' into gitfs_2019.2.1

28.2. Previous Releases
• ISSUE #52547: (cbosdo) virt.purge throws a libvirt exception on Xen hypervisor (refs: #52548)

• PR #52548: (cbosdo) Virt purge fix @ 2019-04-18 20:07:36 UTC
  - 8ee15a9 Merge pull request #52548 from cbosdo/virt-purge-fix
  - 6ca8f4b Try/except undefineFlags() as this operation is not supported on bhyve
    * 5a0464b Bring 51661 into 2019.2.1

• PR #52591: (Ch3LL) [2019.2.1] Update test_schema to mirror the new ValidationErrors in 3.0.0 @ 2019-04-18 16:34:22 UTC
  - e03aed5 Merge pull request #52591 from Ch3LL/fix_jsonschema_2019.2
  - e09be842 Update test_schema to mirror the new ValidationErrors in 3.0.0

• ISSUE #52525: (lomeroe) deserializer_opts are not passed the serializer in file.serialize (refs: #52526)

• PR #52526: (lomeroe) Fix use of deserializer_opts in file.serialize @ 2019-04-17 14:08:52 UTC
  - 21d6365 Merge pull request #52526 from lomeroe/deserializer_opts_fix
  - ea0520c update test for serialization opts
  - 84ff03a Correct attempting to use the serializer_name to pull deserializer_opts when deserializer_name is used as the key in the deserializer_options dict.

• ISSUE #49147: (furgerf) Log filled with "Exception occurred while Subscriber handling stream: Already reading" (refs: #51963)

• PR #52570: (DmitryKuzmenko) Simplify IPCClient and prevent corrupt messages (Turn 2) 2019.2 @ 2019-04-17 14:03:02 UTC
  - PR #52564: (DmitryKuzmenko) Simplify IPCClient and prevent corrupt messages (Turn 2) (refs: #52570)
  - PR #52445: (dwoz) Simplify IPCClient and prevent corrupt messages (refs: #52564)
  - PR #51963: (DmitryKuzmenko) Allow multiple instances of IPCMessageSubscriber in one process (refs: #52564)
  - e522ffe Merge pull request #52570 from DSRCorporation/bugs/revert_51963_2019.2
  - fabbcac A couple of race conditions fixes and a test update.
  - 9c85734 Drop singleton from IPCClient
  - 7cf6d54 Revert "Support parallel work of multiple IPCMessageSubscribers in one process"
  - 7f26e76 Revert "Update doc conf with the new import tornado.queues"
  - 69e9416 Revert "Minor: Fix typo in docstring"

• ISSUE #52449: (Ch3LL) integration.cloud.clouds.test_gce.GCETest.test_instance_extra failure (refs: #52551)

• PR #52551: (garethgreenaway) [2019.2] Marking the two tests in test_gce as flaky @ 2019-04-17 14:00:39 UTC
  - b173406 Merge pull request #52551 from garethgreenaway/52449_test_gce_random_failures
  - 28af717 Marking the two tests in test_gce as flaky.

• ISSUE #51842: (mattLLVW) salt.auth.django docs use wrong model name (refs: #52553)

• PR #52553: (mattLLVW) fix: #51842 @ 2019-04-17 13:59:45 UTC
  - 8352362 Merge pull request #52553 from mattLLVW/fix_django_auth_docs
  - 3baedf fix: #51842

• ISSUE #52134: (sploenix) Regression: Include list of pillar files under different keys in 2019.2 (refs: #52490)
• ISSUE #22063: (jeanpralo) Wildcard inside top.sls file for pillar (refs: #52490)

• PR #52490: (dwoz) Fix pillar include regression @ 2019-04-17 13:54:39 UTC
  - 9faa49c Merge pull request #52490 from dwoz/issue_52134
  - 876dd18 Fix merge wart
  - 2ed650b Merge remote-tracking branch 'saltstack/2019.2' into issue_52134
  - b0af11f Run include tests when pillar source changes
  - 307cec6 Fix pillar tests
  - 1a33bde import __future__.absolute_import
  - 5dc5de9 Use file encoding and add docstring
  - e84cd41 Fix pillar include wart
  - c79f496 Add pillar include tests
  - 7745242 Revert "Fix #22063: pillar wildcard support include"

• PR #52552: (twangboy) Bring 52170 into 2019.2 @ 2019-04-17 13:54:17 UTC
  - PR #52170: (twangboy) Fix issue when task doesn’t have delay_random defined (refs: #52552)
  - b0c0237 Merge pull request #52552 from twangboy/fix_win_task_2019.2
  - fd19cca Remove some warts in the docs
  - deb0b10 Fix some lint
  - a279d45 Final doc fixes
  - 58f0cd2 Fix docs... attempt 6
  - a66716e Fix docs... attempt 5
  - f6f3381 Fix docs... attempt 4
  - 18fc15 Fix docs... attempt 3
  - c691e0d More doc fixes
  - e01077b Fix docs issue... maybe...
  - b649495 Honor 80 character line limit
  - eba4507 Bring 52170 into 2019.2

• PR #52528: (Ch3LL) [2019.2] Merge forward from 2018.3 to 2019.2 @ 2019-04-17 13:53:46 UTC
  - cc0cd5d Merge pull request #52528 from Ch3LL/merge-2019.2
  - 87cf385 increase timeout on test_state for windows
  - 3442202 Increase timeout for test_kwarg tests
  - 2c3ff2f Merge branch '2019.2' into merge-2019.2

• PR #52534: (twangboy) Add TLS support up to TLS 1.2 @ 2019-04-13 22:56:41 UTC
  - e91240b Merge pull request #52534 from twangboy/tls_support_2019.2
  - 9ec54c4 Add TLS support up to TLS 1.2
    - 474efa1 Fix pylint and state test failure
    - 048a82e Merge branch '2019.2' into merge-2019.2
4094 Chapter 28. Release Notes

• PR #52536: (twangboy) Bring #52191 into 2019.2 branch @ 2019-04-12 21:31:23 UTC
  - PR #52191: (twangboy) Fix issue where version doesn’t detect when check_remote=True (refs: #52536)
  - 2c42e4d Merge pull request #52536 from twangboy/fix_choco_2019.2
  - b394ad5 Bring #52191 into 2019.2 branch
  - 795a7f6 Fix windows tests - increase timeout
  - c70772c Fix linux state tests- add new comment
  - 2941567 Merge branch ’2018.3’ into ’2019.2’
  - 262516c Merge pull request #52209 from twangboy/fix_choco_retcode
    • 7aec2d3 Merge branch ’2018.3’ into fix_choco_retcode
    • bfdc47b Handle new enhanced retcode 2
  - dd7a4ba Merge pull request #52046 from twangboy/use_reg_timezone
    • fc8e970 Merge branch ’2018.3’ into use_reg_timezone
    • d0987e6 Merge branch ’2018.3’ into use_reg_timezone
    • 1bf0cbc Merge branch ’2018.3’ into use_reg_timezone
    • b466f8a Merge branch ’2018.3’ into use_reg_timezone
    • 34bdae5 Merge branch ’2018.3’ into use_reg_timezone
    • 9a8afa6 Fix tests, add null byte test
    • 59b1d4f Revert back to using reg to get timezone
  - 0d09608 Merge pull request #52396 from dmurphy18/fix_aix_ssh
    • 8bfa340 Correct typo
    • 6d98577 Altered code to support salt-ssh on AIX
  - 576478e Merge pull request #52473 from Ch3LL/bp-49437
    • 781385f Merge branch ’2018.3’ into bp-49437
    • 3a3114d Fix merge conflict wart
    • bbfd412 Merge branch ’2018.3’ into bp-49437
    • 48ee82d Merge branch ’2018.3’ into bp-49437
    • f66d474 Add support to avoid calling refresh_db in opkg.del_repo
  - d830bc6 Merge pull request #52493 from dwoz/ping_reaction_test
    • 8b05e77 Merge branch ’2018.3’ into ping_reaction_test
    • 7083d21 Merge branch ’2018.3’ into ping_reaction_test
    • 7c963c1 Merge branch ’2018.3’ into ping_reaction_test
    • 75ddeb3 fix linter
    • e3e1d2e fix reactor ping test
  - 9b7a0d1 Merge pull request #52505 from bloomberg/2018_zmq_uri
    • b682ec5 transport.zmq: fix bug introduced by b7df7e75cf2
  - 452bbeb Merge pull request #52512 from dwoz/ supervisord_2018.3
- cd5cd7d The exit code matters.
  - 53228ae Merge pull request #52475 from Ch3LL/bp-49464
    - a891fd3 Make opkg.del_repo be compatible with pkrepo state module
  - 6e79c24 Merge pull request #52500 from terminalmage/invalid-archive-source
    - e9d175b Fix traceback when invalid source passed to archive.extracted
  - 2df74ca Merge pull request #52476 from bloomberg/win_cmd_2018
    - 0e0c42e 2018 backport: modules.cmdmod: handle windows environ better
  - 4dfb2f8 Merge pull request #52474 from Ch3LL/bp-49984
    - c8d547e Use prune option in Pygit2 provider when fetching
  - d699485 Merge pull request #52393 from terminalmage/invalid-archive-source
    - e3f5be3 Use uncommon item in mine delete test
  - 89bd258 Merge pull request #52445 from dwoz/ipc_fixes_2018.3
    - 1bdaf29 Ensure exceptions in service future are handled
    - c7ad73e Use six.reraise for py3 compatibility
    - 29999b0 Close message service on subscriber close
    - 47203f7 Fix ipc unit tests
    - 2b35437 Fix linter issues
    - 503cdd2 Remove IPCClient singleton
    - b374034 Re-raise queued exceptions with traceback

- ISSUE #51879: (whytwolf) 2019.2.0 binary pillar unicode error returns. (refs: #52334)
- PR #52334: (waynew) 51879 fix binary pillar return error @ 2019-04-12 03:45:17 UTC
  - 6eb2bce Merge pull request #52334 from waynew/51879-fix-binary-pillar-return-error
  - ead856e Merge branch '2019.2' into 51879-fix-binary-pillar-return-error
  - 2aa971d lint cleanup
  - 28c2945 keep_pillar not needed
  - fb010c0 Add binary pillar to the docs
  - f2aebf9 Assume file contents are binary
  - 2b8c782 Test gpg render with replace newlines
  - c4b385b Allow binary pillar data
  - 604b671 Return binary data from gpg renderer
  - 32aafab Ignore vscode and fix swap ignore

- ISSUE #52041: (arsiesys) 2019.2 influxdb_retention_policy.present broken when used extra arguments (refs: #52043)
- PR #52043: (arsiesys) fix missing client_args in influxdb module @ 2019-04-12 03:43:03 UTC
  - 2d59705 Merge pull request #52043 from arsiesys/fix_influxdb_state_rp
  - e617c5b Merge branch '2019.2' into fix_influxdb_state_rp
• PR #52146: (twangboy) Add missing symlink test @ 2019-04-12 00:51:16 UTC
  - 1b969c3 Merge pull request #52146 from twangboy/fix_test_symlink_2019.2
  - 8e1c882 Merge branch '2019.2' into fix_test_symlink_2019.2
  - a429542 Merge branch '2019.2' into fix_test_symlink_2019.2
  - 401c253 Merge branch '2019.2' into fix_test_symlink_2019.2
  - cce6200 Fixing lint
  - c7cb009 Merge branch '2019.2' into fix_test_symlink_2019.2
  - 3ea05a Merge branch '2019.2' into fix_test_symlink_2019.2
  - 83bed46 Add missing symlink test
• PR #52341: (cbosdo) virt.pool_running: fix pool start @ 2019-04-12 00:14:52 UTC
  - 7a1b8ca Merge pull request #52341 from cbosdo/virt-state-fixes
  - 89f0bd8 Merge branch '2019.2' into virt-state-fixes
  - 25b9681 virt.pool_running: fix pool start
  - 30981d2 Remove unneeded kwargs in virt states
  - 0871c02 virt: allow defining the VM type and arch when creating it
  - 1c65d25 Updating running domains in virt.running
  - 13d7819 Add missing virt states unit tests
  - 0681d86 virt.running support for all virt.init options
  - c6a444b Add test case for virt.running
  - 2db7a98 Let virt running state provide errors
• ISSUE #52350: (Ch3LL) Re-Add Python 2 unicode string literals in YAML renderer (refs: #52427)
• PR #52427: (garethgreenaway) [2019.2] Support for old yaml render @ 2019-04-12 00:06:37 UTC
  - 6040282 Merge pull request #52427 from garethgreenaway/52350_readd_and_gate_unicode_string_literal_support
  - 82f010a Merge branch '2019.2' into 52350_readd_and_gate_unicode_string_literal_support
  - ae81fee Merge branch '2019.2' into 52350_readd_and_gate_unicode_string_literal_support
  - b618d44 Merge branch '2019.2' into 52350_readd_and_gate_unicode_string_literal_support
  - b191bc0 Merge branch '2019.2' into 52350_readd_and_gate_unicode_string_literal_support
  - 38a9818 Merge branch '2019.2' into 52350_readd_and_gate_unicode_string_literal_support
  - 2767984 Removing logging entry
  - 71cd303 Adding missing yamlloader_old.py
  - f84aa4 Adding support back in with, a gated configuration option, for the old YAML Loader.
• ISSUE #51865: (magenbrot) salt.match.search_by resulting in 'None' since 2019.2 (refs: #52234)
• PR #52234: (garethgreenaway) [2019.2] Fixes to matchers when used in pillar @ 2019-04-12 00:05:48 UTC
  - 05ba7c5 Merge pull request #52234 from garethgreenaway/51865_match_search_by_master
  - 1760245 Merge branch '2019.2' into 51865_match_search_by_master
- d50f011 Merge branch '2019.2' into 51865_match_search_by_master
- b0cb660 Merge branch '2019.2' into 51865_match_search_by_master
- 799a08b Merge branch '2019.2' into 51865_match_search_by_master
- 21891d6 Merge branch '2019.2' into 51865_match_search_by_master
- a2173d7 Fixing a typo where attempting to get a list from __opts__ instead of an individual item
- 6a5b5b2 swapping out if...else approach for __opts__.get approach.
- aa2c626 With the change/addition of the matcher subsystem in 2019.2, the match.search_by when used in pillar broke when targeting the minion that was also the salt master. This was caused by the id in __opts__ being used in all cases. This change updates the glob_match function to use the preserved minion_id of the master if it is available so that targeting works as expected.

- **PR #52160**: (cbosdo) Virt whitespace fix @ 2019-04-12 00:04:25 UTC
  - 80d7aea Merge pull request #52160 from cbosdo/virt-whitespace-fix
  - fd1f539 Merge branch '2019.2' into virt-whitespace-fix
  - b297e7d virt: handle whitespaces in VM names

- **ISSUE #51832**: (nocturo) pillar include stopped working (refs: #52008)

- **PR #52008**: (waynew) Allow / in pillar includes @ 2019-04-12 00:02:40 UTC
  - b551bd Merge pull request #52008 from waynew/51832-re-allow-slash-includes
  - ee3115f Allow leading dots and / as pillar separators
  - 29c676d Ensure _closing exists
  - eb517e Swap ‘/’ for ‘‘ when matching

- **ISSUE #51821**: (OrangeDog) ‘comment’ is an invalid keyword argument for 'test.fail_without_changes' (refs: #51937)

- **PR #51937**: (garethgreenaway) [2019.2] Fix to test state functions to allow arguments that mod_watch uses @ 2019-04-11 23:57:44 UTC
  - d3159cb Merge pull request #51937 from garethgreenaway/51821_ensure_result_comment_changes_valid_arguments
  - 86c63b5 Merge branch '2019.2' into 51821_ensure_result_comment_changes_valid_arguments
  - 0966d61 Merge branch '2019.2' into 51821_ensure_result_comment_changes_valid_arguments
  - 5527df7 Ensure the comment, changes, and result are valid arguments for various test state functions as they are valid arguments for mod_watch.

- **ISSUE #51818**: (syphernl) salt.nacl.dec: expected str, bytearray, or unicode (refs: #51913)

- **PR #51913**: (garethgreenaway) [2019.2] Fixes to utils/nacl.py @ 2019-04-11 23:56:57 UTC
  - 7be0428 Merge pull request #51913 from garethgreenaway/51818_fix_when_sk_is_empty

    * 8461608 Updating the incron module, state module and tests to remove use of comments.
      - 855f31a Remove un-used file
      - affd9b8 Fix setup/teardown methods
      - 215bf93 Refresh after modifying tmp pillars
      - 95c3aba Add config for listener
      - 5d231f4 remove unused import
      - 8c1b1db Use tmp pillar for signing policies
      - a0e2458 fix unused import
      - 7f5f7dd Fix requisite path
      - 5630498 Fix signing policies path
      - 0bd0826 Fix issue #51869 and add cert signing test

• PR #52347: (Ch3LL) [2019.2] Merge forward from 2018.3 to 2019.2 @ 2019-03-28 16:41:53 UTC
  - 276e6cbf Merge pull request #52347 from Ch3LL/merge-2019.2
  - 63962b5 Merge branch '2018.3' into '2019.2'
  - bda3ca2 Merge pull request #51749 from terminal-labs/salt-cloud-map-alt-update
∗ 9ca0f72 Changed where to mention the map files compatibility for minion configuration options. This is a result of @Ch3LL suggestion on the PR itself for this doc change.
∗ 364ef06 Added mention of map file alternative for minion configuration options.
− a743fff Merge pull request #52113 from twangboy/fix/lgpo
  ∗ bb4a704 Merge branch '2018.3' into fix_lgpo
  ∗ 7186405 Merge branch '2018.3' into fix_lgpo
  ∗ 7656331 Change default language from 1033 to en_US
− 7040643 Merge pull request #52172 from garethgreenaway/51959_fix_acl_present_output
  ∗ 8e53890 Merge branch '2018.3' into 51959_fix_acl_present_output
  ∗ 0bdde94 Merge branch '2018.3' into 51959_fix_acl_present_output
  ∗ c5337e1 Merge branch '2018.3' into 51959_fix_acl_present_output
  ∗ 889660f Fixing lint.
  ∗ bfdb669 Updating the reverse octal lookup dictionary. Updating tests.
  ∗ 24c907b Adding additional permissions to the lookup.
  ∗ 4b99afa Fixing the output when there are changes for the ACL state so the permissions are shown and not the octal number.
− 45d6cad Merge pull request #52283 from dmurphy18/fix_cpe_name_amzn2
  ∗ cbe5f7d Update to allow for malformed CPE_NAME from some OS’s
− 14a6b9d Merge pull request #52306 from terminal-labs/replace-ping-with-version
  ∗ c04ba6e Changed a text artifact from the ping function to supporting text for the version function.
  ∗ 0b1eb00 Replaced test.ping with test.version Result of issue #52277
− 7b2b521 Merge pull request #51963 from DSRCorporation/bugs/49147_ipc_subscriber
  ∗ 37aeba3 Minor: Fix typo in docstring
  ∗ cc46e9c Merge branch '2018.3' into bugs/49147_ipc_subscriber
  ∗ 23733bd Regression test for parallel IPCMessageSubscriber support
  ∗ 2bc2a7d Merge branch '2018.3' into bugs/49147_ipc_subscriber
  ∗ 684bf58 Update doc conf with the new import tornado.queues
  ∗ 008cf49 Merge branch '2018.3' into bugs/49147_ipc_subscriber
  ∗ 01e9a3d Merge branch '2018.3' into bugs/49147_ipc_subscriber
  ∗ 710ab50 Support parallel work of multiple IPCMessageSubscribers in one process
− 87bb513 Fix failing symlink test (#52145)
− 8255901 document regex_replace Jinja filter (#52326)
− 3211397 Merge pull request #52310 from garethgreenaway/merge-2018.3
  ∗ 9324b83 Merge branch '2018.3' into merge-2018.3
− 71e9b66 Merge pull request #52312 from terminal-labs/zone-clarification
  ∗ ae0e18f Merge branch '2018.3' into zone-clarification
  ∗ e8c8dba Added in an explanation of the --zone flag approved in #52251
- 4908ed3 Merge branch '2017.7' into merge-2018.3
- b6a0161 Merge remote-tracking branch 'upstream/2017.7.9' into 2017.7
- 1f99e28 Let's not include raet by default
- 4306779 Merge branch '2017.7.9' into 2017.7
- 36ed50d Lock to unittest-xml-reporting 2.2.1
- 3e6cb79 Merge branch '2017.7.9' into 2017.7
- 57348ca Add static requirements for Arch linux
- cc6fb46 Additionally ignore files in nox virtualenvs and CI artifacts directories
- bf9c55e Previously have setuptools-git installed if ioflo is to be installed
- 973e1ca Merge remote-tracking branch 'upstream/2017.7.9' into 2017.7
- 981335a Revert "Avoid a traceback on tornado.testing test classes"
- f48ba6a Merge remote-tracking branch 'upstream/2017.7.9' into 2017.7
- b039ec Windows now has a static requirements file and no longer needs hacks
- a86af2b Merge pull request #52226 from dwoz/jenkins_build
- 8c0f46b Use windows state to bootstrap windows builds
- 7263956 Lock coverage and xml-unittest-reporting versions
- dce4fa Avoid a traceback on tornado.testing test classes

- **PR #52314** (twangboy) Add the ability to pass a timeout to beacons @ 2019-03-27 19:11:13 UTC
  - d3f4c9d Merge pull request #52314 from twangboy/fix_beacon_tests
  - a5fa99a Add missing **kwargs
  - 7e88d04 Add the ability to pass a timeout to beacons

- **PR #52311** (garethgreenaway) [2019.2] Merge forward from 2018.3 to 2019.2 @ 2019-03-26 18:31:32 UTC
  - bad4e47 Merge pull request #52311 from garethgreenaway/merge-2019.2
  - 11cd485 Merge branch '2018.3' into merge-2019.2
  - 582d306 Merge pull request #52307 from Akm0d/doc_fix
    - 4da0fd6 Fix x509 inconsistent file name in state example
  - 2cfd48e Merge pull request #52276 from terminal-labs/replace-github-dead-link
    - a2f8b0 Merge branch '2018.3' into replace-github-dead-link

    - f2b6abd Merge branch '2018.3' into docs-sphinx-ref-deadlink-fix
28.2. Previous Releases

- 9857f53 Merge branch '2018.3' into docs-sphinx-ref-deadlink-fix
- 8a11d27 Merge branch '2018.3' into docs-sphinx-ref-deadlink-fix
- 842ec84 Merge branch '2018.3' into docs-sphinx-ref-deadlink-fix
- 9275207 Merge branch '2017.7' into docs-sphinx-ref-deadlink-fix
- 2330c2a makefile had an old sphinx-doc link, updated to new general front page of sphinx docs.
- 8d70e3b Replaced all bad sphinx links with ones from the new sphinx doc site.
- ebdfcfd replaced two python sphinx deadlinks with sphinx new relevant documentation pages.
  - a4e3e34 Merge branch '2018.3' into docker-create-with-ip
- efb9ec0 Merge pull request #52215 from garethgreenaway/bp-52212
  - 65857ef Merge branch '2018.3' into bp-52212
  - a96bf24 Back-port PR #52212 to 2018.3
    - c6e553c add networking_config to container_create for custom network_mode
    - 5c99d9b add test to expose ip not added to custom network #51723
- 679c4b2 Merge pull request #52269 from garethgreenaway/merge-2018.3
  - ee58560 Merge branch '2018.3' into merge-2018.3
- 418e543 Merge pull request #52261 from dwoz/update_kitchen
  - a87c6ea Use windows state to bootstrap windows builds
  - 1aa1bd8 Merge branch '2017.7' into merge-2018.3
  - 2962e94 Lock coverage and xml-unittest-reporting versions
  - 595303b Merge remote-tracking branch 'upstream/2017.7.9' into 2017.7
    - 55e150c Proper setup and teardown
    - b9b6009 Don’t run distro on windows
    - 3cb5c82 Merge pull request #52208 from s0undt3ch/2017.7.9
- b14d9c9 Merge branch '2017.7.9' into 2017.7
  - 6a789a1 Update static requirements
  - cee9480 Lock PyYAML to < 5.1
  - a4f241d The kitchen nox verifier already takes care of the sinlge -v flag.
  - 0cb641e Fix static requirements search bad logic
  - 45a3e4a distro reports Opensuse 15 as Opensuse Leap 15
  - de7bb24 Ubuntu 18.04 locked requirements files
  - bc08e3c Ubuntu 16.04 locked requirements files
  - 0d353d2 Ubuntu 14.04 locked requirements files
  - 1186122 Opensuse 42 locked requirements files
  - fa6888b Opensuse 15 locked requirements files
  - b6578b8 Fedora 29 locked requirements files
  - 777dbb0 Fedora 28 locked requirements files
4388fa9 Debian 9 locked requirements files
2f9030f Debian 8 locked requirements files
1b18ec5 CentOS 7 locked requirements files
6e9f0c0 CentOS 6 locked requirements
7415846 Start handling static(and platform specific) requirements files
ea4d370 Allow overriding some requirements based on distro information
17017a1 Merge pull request #51361 from olipovch/cloud-sync-after-install
8fde3a0 Merge branch '2017.7' into cloud-sync-after-install
ab00151 Fix salt-cloud sync_after_install functionality
ff54f53 The kitchen nox verifier already takes care of the single -v flag.
a2aa708 Fix static requirements search bad logic
621b047 distro reports Opensuse 15 as Opensuse Leap 15
bc00a26 Ubuntu 18.04 locked requirements files
d5ed9e1 Ubuntu 16.04 locked requirements files
03879bf Ubuntu 14.04 locked requirements files
c3d7a18 Opensuse 42 locked requirements files
b29d986 Opensuse 15 locked requirements files
73154d0 Fedora 29 locked requirements files
bf36cd4 Fedora 28 locked requirements files
52cc5bb Debian 9 locked requirements files
cb4a823 Debian 8 locked requirements files
2128a79 CentOS 7 locked requirements files
4a29e93 CentOS 6 locked requirements
0d96e64 Start handling static(and platform specific) requirements files

  * 79962ab Merge branch '2017.7' into '2018.3'
    * fd6068e Allow overriding some requirements based on distro information
• 659ec11 Merge remote-tracking branch 'upstream/2017.7.9' into 2017.7
• 18bbbec We need to nest require req_win.txt
• 956a84c Merge pull request #51995 from s0undt3ch/2017.7
• 0bf9d62 Merge remote-tracking branch 'upstream/2017.7.9' into 2017.7
• baf776b Merge pull request #51974 from s0undt3ch/features/nox-2017.7
• ee4df3a Lint fixes
• 56f841f Windows needs special treatment
• c3cb447 Requirements fixes
• 6a67531 We need a fixed winrm-fs so that dotfiles are also included
• 15c6a53 use kitchen-salt from my fork for now
• b745332 Merge pull request #51800 from dwoz/typo_fix
• 5bbe5e0 Fix up docstring
• 9f3c583 Fix typo in docstring
• 75acce1 Rename obsolete beacon validation function
• d1700f3 Merge branch '2018.3' into bp-47005
  • 03f228d Merge pull request #52112 from Ch3LL/proxy_gs
    • 7ad4758 Update device names in proxy getting started docs
    • 25ae7c8 remove freebsd-upstream reference
    • b70c45c Remove salt FreeBSD repo which is now 2 years out of date
    • 62e5404 github issue tracker link and sends you to the url for listed issues.
    • ccf6a06 Replaced a dead link for github issue tracker with another github link for the issue tracker and added a link to show more options for closing issues in commit messages.

• PR #52190: (Ch3LL) [2019.2] Merge forward from 2018.3 to 2019.2 @ 2019-03-23 01:09:33 UTC
  • 3ac6dbd Merge pull request #52190 from Ch3LL/merge-2019.2
  • 68c02b9 Merge branch '2019.2' into merge-2019.2

• PR #52240: (soer7022) Fix Typos "swtich" to "switch" @ 2019-03-23 00:08:50 UTC
  • f5fc807 Merge pull request #52240 from soer7022/patch-2
  • d130832 Merge branch '2019.2' into patch-2
  • 3b6df8 Merge branch '2019.2' into patch-2
  • 5db7a3f Fix Typos "swtich" to "switch"
  • 34d601e Merge branch '2019.2' into merge-2019.2

• ISSUE #52036: (ghost) rsync.synchronized: "An exception occurred in this state: 'Changes' should be a dictionary." (refs: #52040)

• PR #52040: (garethgreenaway) [2019.2] Fix to rsync state @ 2019-03-21 19:08:19 UTC
  • a00245e Merge pull request #52040 from garethgreenaway/52036_rsync_state_no_changes_when_error
  • 09d1672 Merge branch '2019.2' into 52036_rsync_state_no_changes_when_error

• PR #51962: (Ch3LL) Update 2019.2.0 release notes with other tojson example @ 2019-03-21 16:37:43 UTC
– 5387821 Merge pull request #51962 from Ch3LL/rn_update
– f63b9e9 Merge branch '2019.2' into rn_update
• PR #52262: (dwoz) Use windows state to bootstrap windows builds @ 2019-03-20 22:12:25 UTC
  – 0f67278 Merge pull request #52262 from dwoz/update_kitchen_2019.2
  – 49d529a Use windows state to bootstrap windows builds
  – e23b09a Merge branch '2019.2' into rn_update

  * c0b1f7 Merge pull request #51850 from waynew/cherry-pick-ping-fix
  * 6da495f Fix linter
  * f78b360 fix reactor ping test
  * ad7a9ec Merge pull request #51893 from twangboy/gate_zfs_2017.7
  * e0d58eb Gate zfs module on Windows
  * f758a10 Avoid race condition when initializing OpenSSL
  * 0f125db Add __virtual__ to win_update
  * 864d4be Merge pull request #51770 from Ch3LL/doc_conf_2017
  * 25d9ca2 Update release versions for the 2017.7 branch
- 3cf3099 Merge pull request #51774 from terminal-labs/py3-server-docs-update
- 1f00c89 Added in python 3 server according to the consensus from #51748
- bfb9d87 added the python3 command for startign the python http server.
- b4153d3 Merge pull request #51757 from twangboy/fixed_case_2017.7
- 6b0b5d2 Fix failing py3 tests
- feb29f3 Make recurse and directory case sensitive
  - 2c4df6 Merge pull request #51905 from aplanas/fixed_mount
    - ac68df mount: fix extra -t parameter
  - 4b2e8cc Merge pull request #51815 from garethgreenaway/51673_multiple_file_sections_with_excludes
    - 58ef51d Merge branch '2018.3' into 51673_multiple_file_sections_with_excludes
    - 8c4485d Merge branch '2018.3' into 51673_multiple_file_sections_with_excludes
    - b55a894 Fixing some code that was not working correctly with Python 3.
    - 63da8be Fixing a bug that caused excludes to not work as expected when multiple file options were in place, the excludes of the last file section were being used over any previous ones. Including a test to ensure excludes work as expected when multiple file sections are in place.
- 1bf3fc8 Merge pull request #51867 from Oloremo/mysql-module-fix-for-python3
  - dfcebd Merge branch '2018.3' into mysql-module-fix-for-python3
  - b6d217c Merge branch '2018.3' into mysql-module-fix-for-python3
  - 9745b0a Fixed typo
  - 8149e9e Merge branch '2018.3' into mysql-module-fix-for-python3
  - 58d8a2e Merge branch '2018.3' into mysql-module-fix-for-python3
  - f964962 Added handling of empty server_version
  - 58791e9 Decode mysql_version for python3 compatibility
- 7f05abf Merge pull request #51908 from garethgreenaway/51862_icinga_fixes
  - 233dbaf Adding __salt__ to utils/icinga so cmd.run_all is available.
  - 1e7490c update kubernetesmod in index.rst
  - 1f3be1c fix import in test
  - 8572c17 rename kubernetes mod to kubernetesmod

- PR #52032: (Ch3LL) Add azure state and execution modules to doc index @ 2019-03-11 15:46:49 UTC
  - 7d6b53c Merge pull request #52032 from Ch3LL/fix_azure_docs
  - 8a8a5fa Add azure module ref pages and fix doc errors
  - 6a1d06a fix additional azure state module doc errors
  - 65d8f27 Update doc failures in azure modules
  - 92d8e2a Merge branch '2019.2' into fix_azure_docs

- PR #52037: (Ch3LL) Backport #51201 into 2019.2 @ 2019-03-07 19:45:18 UTC
  - PR #51201: (terminalmage) Lint: Fix str-format-in-logging, len-as-condition, etc. (2) (refs: #52037)
- 96935c9 Merge pull request #52037 from Ch3LL/bp-51201
- 1fb0697 Remove develop modules not needed in 2019.2
- e3adc2f Lint: Fix str-format-in-logging, len-as-condition, etc. (2)

**PR #52034:** *(terminalmage)* fileclient: Fix traceback when template file cannot be cached @ 2019-03-07 19:41:24 UTC

- 75398e4 Merge pull request #52034 from terminalmage/fix-get-template
- 744dfd9 fileclient: Fix traceback when template file cannot be cached

**PR #51984:** *(Ch3LL)* [2019.2] Merge forward from 2018.3 to 2019.2 @ 2019-03-07 17:58:42 UTC

- 7af4f5c Merge pull request #51984 from Ch3LL/merge-2019.2
- 54ea40a Merge branch '2019.2' into merge-2019.2
- 227ddbb Fix linter
- a168913 Merge branch '2018.3' into '2019.2'

* c68744a Merge pull request #51975 from s0undt3ch/features/nox-2018.3
  * af4ae91 Lint fixes
  * 33955c9 Windows needs special treatment
  * d4f899f Requirements fixes
  * e550c60 We need a fixed winrm-fs so that dotfiles are also included
  * ada1ef3 use kitchen-salt from my fork for now

* a689177 Merge pull request #51807 from Ch3LL/2018.3.5_rn
  * 2c0b85c Add 2018.3.5 release notes

* 6ae2c4 Merge pull request #51806 from twangboy/fix_beacon
  * 2bf6179 Fix some lint
  * 0f38ee8 Add lowercase test
  * 1459985 Make sure drive letter is uppercase for re compare
  * 7c6c669 Add some tests
  * 48ae8c6 Fix disk.usage beacon on Windows

* da815ba Merge pull request #51966 from twangboy/use_winapi_com
  * a38300b Use winapi.com instead of coinitialze

* 7673c69 Merge pull request #51920 from twangboy/add_zabbix
  * e2d496c Add zabbix to the Windows builds

* 77c2796 Merge pull request #51802 from garethgreenaway/merge-2018.3.4
  * 2e20939 Merge branch '2018.3' into merge-2018.3.4
  * 769f002 Merge branch '2018.3.4' into merge-2018.3.4
  * b53a843 Merge pull request #51713 from dwoz/gemstestagain_2018.3.4
  * f2cc631 Merge branch '2018.3.4' into gemstestagain_2018.3.4
  * 1c82d24 Fix ruby gems tests, again
* 496525d Merge pull request #51930 from Ch3LL/release_docs
  - 9a68136 Update release documentation
* a027c97 Merge pull request #51931 from Ch3LL/bp_51298
  - 873cabd Roll back some changes to _compat.py
  - 1fcb0ff Fix edge case when minion ID is a 16-character string
* 1fa2072 Merge pull request #51892 from twangboy/gate_zfs
  - fbc20c Gate zfs grain on Windows
* 89b0991 Merge pull request #51836 from stratusjerry/backport_49039_2018.3
  - 35fc4c Update win_pkg.py
* c1ab63d Merge pull request #51771 from Ch3LL/doc_conf_2018
  - 904beb3 [2018.3] change build_type and release in doc/conf.py
  - 3efcea5 Update release versions for the 2018.3 branch
* 98f1b03 Merge pull request #51775 from garethgreenaway/merge-2017.7
  - 92fe03 fixing lint
  - 73b601d Merge branch '2017.7' into merge-2017.7
  - e04f735 Merge pull request #51502 from ogd-software/51501-states-boto3_route53.py-fails-to-validate-ALIAS-A-records
  - e69ce9d Merge branch '2017.7' into 51501-states-boto3_route53.py-fails-to-validate-ALIAS-A-records
  - 5093406 Implement PEP8 E711 styling fix
  - 7640e90 Ensure boto3_route53 correctly validates existing ALIAS records
  - ff63b0 Ensure boto3_route53 survives attempts to validate ALIAS records
  - 9c128aa Merge pull request #51732 from s0undt3ch/features/nox-2017.7
  - 328989d Add initial nox configuration. Tell tox’ers to use nox’.
  - 99ce48d Merge pull request #51712 from dwoz/gemstestagain
  - 0d3b227 Fix ruby gems tests, again
  - 18452c4 Merge pull request #51528 from twangboy/backport_51471
  - 8c79f02 Merge branch '2017.7' into backport_51471
  - 20a7ee5 Backport 51471
    - ee80ce3 Merge pull request #51655 from garethgreenaway/49661_starting_salt_master_openssl
    - f647b95 Merge branch '2017.7' into 49661_starting_salt_master_openssl
    - 1831e64 Removing options from libcrypto.OPENSSL_init_crypto so it will simply use the defaults.
    - 8d0f801 removing salt.crypt from payload.py which is not used and causing salt-key to break.
    - a5a54c4 Removing unused import which is causing salt-master to not start when using openssl 1.1.1-1.
• c9c082c Fix azurearm field list doc error
• af0537f Add azure state and execution modules to doc index

• PR #52004: (chdamianos) Fixed comparison of None with constants (refs: #52030) @ 2019-03-06 17:41:52 UTC
  – 01bcf0 Merge pull request #52004 from chdamianos/fix-constants-comparison
  – 6fd60af Fixed comparison of None with constants
• PR #51981: (bryceml) Fix typo in 2019.2.0 release notes @ 2019-03-05 23:59:33 UTC
  – 8d6bb5d Merge pull request #51981 from bryceml/2019.2
  – ec0ef0 Fix typo in 2019.2.0 release notes
    * a65e621 Adding an additional note warning that the file will not be changed because test=True, but could be changed by other states.
    * 6c0dcf2 Swapping pchanges for changes in file state.

• ISSUE #51825: (OrangeDog) schedule.disable doesn’t work in 2019.2.0 (refs: #51855)
• PR #51855: (garethgreenaway) [2019.2] Global enable/disable was being ignored @ 2019-03-05 19:40:34 UTC
  – c3105df Merge pull request #51855 from garethgreenaway/51825_scheduled_global_enabled
  – 301e773 Merge branch '51825_scheduled_global_enabled' of github.com:garethgreenaway/salt into 51825_scheduled_global_enabled
    * ae7ab06 Merge branch '2019.2' into 51825_scheduled_global_enabled
    * ff13833 Merge branch '2019.2' into 51825_scheduled_global_enabled
  – 9e7e4ed Fixing broken add_job test.
  – 72466a5 Global enable/disable was being ignored

• ISSUE #51745: (fayak) Systemd update 241 on archlinux breaks systemd.py version() function (refs: #51946)
• PR #51946: (Ethyling) Fix retrieve systemd version using regex @ 2019-03-05 19:20:19 UTC
  – be28623 Merge pull request #51946 from Ethyling/fix-systemd-version
  – b557707 Add test for systemd version from git describe
  – 94809d0 Fix retrieve systemd version using regex

• ISSUE #51816: (jkrauz) pillar_ldap broken in 2019.2.0 (refs: #51964)
• PR #51964: (dwoz) [2019.2] Make sure ldap attrs are string types on python 2 @ 2019-03-05 19:18:30 UTC
  – c310022 Merge pull request #51964 from dwoz/issue_51816
  – a879140 Merge branch 'issue_51816' into issue_51816
  – 0e61cf3 Fix linter errors/warnings
  – 171217a Revert debug logging
  – 8c641c6 make LDAP attr defaults string types on py2

• PR #51976: (s0undt3ch) [2019.2] Nox fixes @ 2019-03-05 18:56:49 UTC
  – cb817f1 Merge pull request #51976 from s0undt3ch/features/nox-2019.2
  – 0b4e68c Lint fixes
  – 257b3fc Windows needs special treatment
  – b298da0 Requirements fixes
- 4f45a7e We need a fixed winrm-fs so that dotfiles are also included
- fa70af2 use kitchen-salt from my fork for now

**PR #51761:** (sdodsley) Add new module to release notes for 2019.2.0 @ 2019-03-05 09:44:56 UTC

**PR #51681:** (sdodsley) Add new module to release notes for 2019.2.0 (refs: #51761)

- f867e6e Merge pull request #51761 from sdodsley/cheery_pick_fb_releasenotes
- 80192c8 Add new module to release notes for 2019.2.0

**PR #51799:** (s0undt3ch) Catch attribute error @ 2019-03-05 09:38:08 UTC

- 08e3956 Merge pull request #51799 from s0undt3ch/2019.2
- 342244a Merge branch '2019.2' into 2019.2
- 3e8a17e Catch attribute error

**PR #51810:** (Ch3LL) Add 2019.2.1 release notes @ 2019-03-05 09:26:47 UTC

- ff5d7d6 Merge pull request #51810 from Ch3LL/2019.2.1_rn
- aae5fa Add 2019.2.1 release notes

**ISSUE #51824:** (OrangeDog) schedule.present state not idempotent in 2019.2.0 (refs: #51849)

**PR #51849:** (garethgreenaway) [2019.2] Fix to schedule.list function to filter out attributes that are None @ 2019-03-01 19:56:17 UTC

- PR #51647: (dwoz) [develop] increase batch test timeout on windows (refs: #51849)
- 3732004 Merge pull request #51849 from garethgreenaway/51824_splay_breaking_schedule_present
- a0af441 Merge branch '2019.2' into 51824_splay_breaking_schedule_present

**PR #51878:** (Ch3LL) Add new terraform salt-ssh roster feature to release notes @ 2019-02-27 19:18:49 UTC

- 3fdb564 Merge pull request #51878 from Ch3LL/terraform_rn
- 502d197 fix spelling error in release notes
- 4d53b41 Add new terraform salt-ssh roster feature to release notes

**PR #51837:** (stratusjerry) Update win_pkg.py @ 2019-02-26 16:51:35 UTC

- PR #49039: (stratusjerry) Update win_pkg.py (refs: #51836, #51837)
- e63ce82 Merge pull request #51837 from stratusjerry/backport_49039_2019.2
- 531b23d Update win_pkg.py
- 39b5645 Splay defaulting to None internally, broke schedule.present causing it to always report differences when a state is run. Updating the schedule.list function to check if an attribute is None and remove it.

**PR #51772:** (Ch3LL) Update release versions for the 2019.2 branch @ 2019-02-25 14:16:40 UTC

- 27dd9fb Merge pull request #51772 from Ch3LL/doc_conf_2019
- f281c99 [2019.2] change build_type and release in doc/conf.py
- 4c670e2 Update release versions for the 2019.2 branch

**PR #51776:** (garethgreenaway) [2019.2] Merge forward from 2018.3 to 2019.2 @ 2019-02-24 22:08:58 UTC

- 45425a4 Merge pull request #51776 from garethgreenaway/merge-2018.3
- 186306a reverting change in release notes, adding change to doc/ref/modules/all/index.rst.
- 1ef140a Fixing lint.
- 6173578 Fixing lint errors
- 38dcab9 fixing lint
- e37fc20 Merge branch '2018.3' into merge-2018.3
- 7e3e71c Merge pull request #51756 from twangboy/fix_case_sensitive
  * 4c55040 Fix failing py3 tests
  * 64f45f8 Make recurse and directory case sensitive
- e75fc1c Merge pull request #51747 from ymasson/fix_mysql_grants
  * f614dd7 Fix escaping for special charaters
- b1f7e85 Merge pull request #51387 from chirrux/fix-case-sensitive
  * 010393e Make binary data output possible
- 3475813 Merge pull request #51694 from assafshapira/2018.3
  * 895b97a Merge branch '2018.3' into 2018.3
  * bc2d27a fix minion bootstrapping issue "/usr/lib/python2.7/site-packages/salt/utils/cloud.py", line 472 Configuration value u’provider’ needs to be set
- c713cb Merge pull request #51738 from garethgreenaway/nftables_cleanup
  * 8201d1e Fixing lint.
  * d681064 Merge branch '2018.3' into nftables_cleanup
  * e378f8e Fixing a couple tests.
  * ed1b743 Additional cleanup. Adding additional documentation for state module.
  * dc4afbb More updates to nftables module, state modules, and unit tests.
  * 3ec96e3 initial work to cleanup the nftables module, state module, and the unit tests.
- 2121049 Merge pull request #51733 from s0undt3ch/features/nox-2018.3
  * 97532c2 Add initial nox configuration. Tell tox’ers to use nox’.
- f4adfd3 Merge pull request #51728 from gtmanfred/virtualnames
  * 61b4390 fix modulenames from virtualnames tests
- d6811f9 Merge pull request #51721 from dwoz/solarisipstests
  * 3263d31 Merge remote-tracking branch 'saltstack/2018.3' into solarisipstests
- fb0a538 Merge pull request #51676 from Ch3LL/merge-2018.3.4
  * 8111d79 Merge branch '2018.3' into merge-2018.3.4
- e08f08d Merge pull request #50812 from gtmanfred/virtualnames
  * d59952f Merge branch '2018.3' into virtualnames
  * 33bb5bf fix use of virtualname
    * 2ca1253 Merge branch 'merge-2018.3.4' of github.com:Ch3LL/salt into merge-2018.3.4
    * 6d6910e Merge branch '2018.3' into merge-2018.3.4
    * b5a6265 Fix ruby gems tests, again
05f2797 Merge branch ’2018.3’ into merge-2018.3.4
9f0999f Merge branch ’2018.3’ into merge-2018.3.4
139daa8 Merge branch ’2018.3.4’ into 2018.3
9741289 Merge pull request #51646 from dwoz/batch_exit_2018.3.4
a8f25bb increase batch test timeout on windows
9caafec Skip solarisips when not on solaris
- 31c6785 Merge pull request #51714 from dwoz/gemstestagain_2018.3
  * fab74bb Fix ruby gems tests, again
- 39aadfb Merge pull request #51689 from gtmanfred/2018.3
  * 8c35d51 fix import
  * 6a55cfdf specify minimum version of shade module
- a475b70 Merge pull request #51469 from s0undt3ch/hotfix.fix-suse-locale-docker
  * 14f49b5 Don’t prevent get_locale from working when running under docker
- a9585d Merge pull request #51671 from Ch3LL/merge-2018.3
  * 64322db Fix is_windows utils call
  * a5c8d0 Fix pylint
  * 547889b Merge branch ’2017.7’ into ’2018.3’
    * bcc13db Merge pull request #51562 from gilbrechbuhler/fix_rabbitmq_policy_change_check
    * ed2b1e1 Fix RabbitMQ policy definition update check
    * cafaa98 Merge pull request #51648 from dwoz/increase_wait
    * e2377a9 Merge branch ’2017.7’ into increase_wait
    * e3d28d9 Merge pull request #51643 from dwoz/batch_exit
    * 42d1d02 increase batch test timeout on windows
    * 7c2d7a4 Increase minion wait for slow boxes
    * b5ae53a Merge pull request #51631 from Ch3LL/lint-2017
    * c0aa4dc Fix linter by ignoring async await check.
    * 396622c Merge branch ’2017.7’ into lint-2017
    * ba8d0ea Merge pull request #51547 from s0undt3ch/2017.7
    * 8e009e0 Allow NOT to install pip dependencies
    * 30ce509 Merge pull request #51182 from lmf-mx/darwin-plist-update
    * 4297c0d Merge branch ’2017.7’ into darwin-plist-update
    * 68ac07f Merge pull request #51442 from dwoz/multi_master
    * 40cb4db Merge branch ’2017.7’ into multi_master
    * 2dc5171 Hanlde multi_master failover when daemonized
    * 8df083c Merge pull request #51608 from dwoz/wait_minions_2017.7
- c55359f fix linter
- 4702e22 Wait for minions to be pingable before starting tests
- 5afa0a1 Merge branch '2017.7' into darwin-plist-update
- f46e8be Fix service name in minion plist
- 1da9cd9 Fix pylint on 2017.7
- 39122ca Merge pull request #51589 from dwoz/script_fix_2017.7
- 8697ce7 Disable pylint checks, only for 2017.7
- e5972f5 Use the code directory instead of cwd for python path
  - b8764fd Merge pull request #51680 from Ch3LL/bp-50336
    - 3502dbb states.gpg: fix missing existing keys; modules.gpg: fix set trust level command
- PR #51734: (s0undt3ch) [2019.2] Add initial nox configuration. Tell tox’ers to use nox’. @ 2019-02-21 17:39:29 UTC
  - 1894082 Merge pull request #51734 from s0undt3ch/features/nox-2019.2
  - 01b74c0 Add initial nox configuration. Tell tox’ers to use nox’.
- PR #51707: (isbm) Bugfix: pillar refresh @ 2019-02-21 15:12:49 UTC
  - 74db589 Merge pull request #51707 from isbm/isbm-pillar-refresh-fix
  - 269ae76 Refresh matchers and beacons on pillar refresh
- PR #51674: (Ch3LL) [2019.2] Merge forward from 2018.3 to 2019.2 @ 2019-02-20 17:35:07 UTC
  - 82cbd98 Merge pull request #51674 from Ch3LL/merge-2019.2
  - 4171271 Fix pylint, remove unused import
  - 3f14619 Remove skipif and change expected return for solarisips test
  - d3660d5 Merge branch '2019.2' into merge-2019.2
- PR #51715: (dwoz) [2019.2] Fix ruby gems tests, again @ 2019-02-19 21:44:21 UTC
  - 7a82e65 Merge pull request #51715 from dwoz/gemstestagain_2019.2
  - 95ce288 Fix ruby gems tests, again
  - 043efa0 Skip solarisips when not on solaris
  - 7ed0d7d Fix ruby gems tests, again
  - b46eac3 Merge branch '2019.2' into merge-2019.2
- PR #51561: (isbm) SaltSSH: fix delay when creating thin TAR @ 2019-02-19 10:15:47 UTC
  - 0bd2d6e Merge pull request #51561 from isbm/isbm-saltssh-thintar-delay-fix
  - 2b02975 Give up on sync for Py3 because of the way tests for py2 are written here
  - f79c81a Update UT mocking, adjusting for temporary file
  - 2f90054 Use temporary filename instead of output directly to the "thin.tgz"
  - d841164 Copy over the result, cleanup afterwards
  - c6792ee Add a function that reserves temporary filename for further tarball generation
- PR #51678: (Ch3LL) [2019.2] Merge forward from 2019.2.0.rc1 to 2019.2 @ 2019-02-17 19:02:33 UTC
- f8372ca Merge branch '2019.2' into merge-2019.2.0.rc

- ISSUE #51503: (garethhowell) smartos.image_present fails with "does not exist" (refs: #51383)

- ISSUE #51351: (garethhowell) Exception using smartos.vm_present to create docker zone (refs: #51383)

- PR #51679: (Ch3LL) Backport #51383 into 2019.2 @ 2019-02-16 00:31:06 UTC

- PR #51383: (sjorge) imgadm module should deal with invalid images better (refs: #51679)

- 2036ca Merge pull request #51679 from Ch3LL/bp-51383

- e4971fc imgadm module should deal with invalid images better

- 58f2407 Merge branch '2019.2.0.rc1' into 2019.2

  - 6292f86 Revert "Remove custom grains module from 2018.3 branch"

  - 92bd6b9 Fix salt.utils.is_windows call

  - ffa2f5f Merge branch '2018.3' into '2019.2'

  - a88986 Merge pull request #51635 from lomeroe/lgpo_boolean_element_fix

    - 87c2b2 Merge branch '2018.3' into lgpo_boolean_element_fix

    - 5a98fb9 Merge branch '2018.3' into lgpo_boolean_element_fix

    - fbac635 Merge branch '2018.3' into 51266_schedule_enable_disable_break_save

  - 67656ea Merge pull request #51649 from dwoz/increase_wait_2018.3

    - 9c964ef Merge branch '2018.3' into increase_wait_2018.3

  - 852a6be Merge pull request #51644 from dwoz/batch_exit_2018.3

    - 1087d10 increase batch test timeout on windows

    - 918030e Increase minion wait for slow boxes

    - 3d52b26 Merge branch '2018.3' into 51266_schedule_enable_disable_break_save

  - dadf414 Merge pull request #51637 from twangboy/backport_50887_2018.3

    - d8db86 Merge branch '2018.3' into 51266_schedule_enable_disable_break_save

  - a55e8f6 Merge pull request #51626 from twangboy/fix_lgpo_2018.3

    - b2c9c3b Use makedirs instead of mkdir

    - 2be2f42 Merge branch '2018.3' into 51266_schedule_enable_disable_break_save

  - 0f1a411 Merge pull request #51187 from menglong81/fix-broken-thing

    - 298ad5c Merge branch '2018.3' into fix-broken-thing

    - d879d18 fix broken network.py

    - 76770f3 ss command replace to netstat command

    - 241707e ss command replace to netstat command

    - deeeef7 Merge branch '2018.3' into 51266_schedule_enable_disable_break_save

  - 7ed5189 Merge pull request #51613 from twangboy/fix_51566

    - 1206a94 Merge branch '2018.3' into fix_51566
8b06d06 Merge pull request #51630 from twangboy/add_tests_51534
  - ddc017c Merge branch '2018.3' into add_tests_51534
  
  c4bbe1a Merge pull request #51177 from nullify005/51069-ri-and-rdoc-removed
  - 6b1a201 Merge branch '2018.3' into 51069-ri-and-rdoc-removed
  - f339608 Merge branch '2018.3' into 51069-ri-and-rdoc-removed
  - e586370 Merge branch '2018.3' into 51069-ri-and-rdoc-removed
  - 13d3288 Fix lint issues
  - 5de5e64 Update tests
  - 22eda16 Fix lint violations
  - 2e6252c Support rubygems 3 cli param changes
  - 9e3a01b Use existing file instead of tzutil
  - 30c1832 Use tempfile to get temp dir
  - e3d3c5a Add tests for issue 51309
  - 1168141 Add test for explicit lists
  - 84f5d63 Merge branch '2018.3' into fix_51566
  - 7376cb9 Handle explicit lists properly
  - 28fc070 Merge branch '2018.3' into 51266_schedule_enable_disable_break_save
  - 0760133 adding integration.scheduler.test_helpers to various files to by pass the test_module_name_source_match check.
  - 1552fba lint cleanup
  - 086066b Adding a test to ensure _get_schedule which is used by the save functionality works when there is an enabled attribute.
  - 1c6d4fb When looping through the schedule to remove hidden attributes, we should only do that if the item in question is a dictionary. It could be the attribute that determines if the entire schedule is enabled or disable.
  - 5ed8eb6 Properly create the value for a "True" boolean element item

f1e29c8 Merge pull request #51548 from s0undt3ch/2018.3
  - 611065e Merge branch '2018.3' into 2018.3

00a6246 Merge pull request #51622 from brejoc/2018.3-empty-job-workaround
  - d263410 Prevents crash when there is no job entry
  - 5342305 Allow NOT to install pip dependencies

fdb13a3 Merge pull request #51523 from lomeroe/solarisips Fixes
  - e8e91e3 Merge branch '2018.3' into solarisips_fixes
  - b7bfe17 lint fixes
  - cdaccf4 add tests to validate command being sent to cmd.run_all
  - eaa229d add unit test
  - 432428d Don’t assume that each item in "pkgs" is a dict (as packed by pkg.installed state).

dacd1ea Merge pull request #51293 from Ch3LL/bp-51233-2
a155fd7 Accounting for when permissions are not returned from file.check_perms, eg. windows systems.
53ba068 When test=True and there are permissions changes, report it.
d2eba77 Remove network.py patch
d431c71 Add __context__ support
- de6c13d Handle spaces in fstab opts, similar fix to #39593
- 1abfbd2 Merge pull request #51278 from dwoz/issue51248
- c614198 Use pillar roots validation method
- 0d2b0c6 Fix linter warnings
- 5b98895 Fixwart in pillar_roots validation

* f7d50b1 Merge pull request #50784 from sathieu/dynamic_file_roots
  - 7ca2aa4 Allow dynamic file_roots

* 5e840a5 Merge pull request #51527 from garethgreenaway/bp-51475
  - 801abf2 Fix Elasticsearch retuner

* 1f6da6a Merge pull request #50921 from terminalmage/issue49894
  - a35c023 Don’t use a decorator that assumes /etc/apt/sources.list.d exists
  - 6a62e79 Add integration test for architecture support
  - 67ae5a5 Add support for architectures for APT pkgrepo.managed states

* 3f17776 Actually, remove python-ldap. It needs system deps. Have salt-jenkins do it.
  - afcb6bd Fix the ldap package name in requirements/tests.txt

* 588cb87 Merge pull request #51454 from terminalmage/fxt-deprecation-warning
  - 529ccc0 Fix deprecation warning in nested outputter

* 13de0b8 Merge pull request #50963 from terminalmage/issue50942
  - c84be3f Allow for kwargs to be used in object initialization
  - 2b9f3fd pip states: Use case-insensitive dictionaries for pip.list return
  - 792f054 Add a CaseInsensitiveDict implementation
  - 1410164 pip.installed: Fix traceback when _find_key doesn’t return a match

* 60953b7 Merge pull request #51366 from dwoz/cloud_config_merge
  - ae351eb Fix python 3 path for shell test cases
  - 48062c8 Merge branch '2018.3' into cloud_config_merge
  - eee5a289 Add testing path to run_script commands
  - 542d857 Fix linter issues
  - a8af3ba Cloud provider and profile configs are merged

* 9ab2ec6 Coverage on windows chokes with the tox env var COVERAGE_PROCESS_START

* 4994c38 Switch required PyTest dependency

* 89710a7 Merge pull request #51401 from dwoz/run_script_win
  - 77fd3f5 Add testing path to run_script commands

* 1438a62 Merge pull request #51389 from terminalmage/proxy-fixes
  - 3cc85e Normalize results if test proxy is enabled

* 8acd9e5 Merge pull request #51368 from s0undt3ch/hotfix/tests
  - f4e1692 Fix test
• ab60782 Merge pull request #51319 from terminalmage/issue51255
  • 04eb66b Merge branch '2018.3' into issue51255
• fdf2cf4 Merge pull request #51250 from yosnoop/fix-salt-utils-dns-lookup

  - 9fb7d6a Merge pull request #51408 from aplanas/backport_49804
  - 467daf2 parted: support variable length output for print
  - da2e30d parted: fix the ordering of list command
• ISSUE #50097: (aplanas) lowpkg.diff refers to a package name, but a package file is required (refs: #51410)
• PR #51410: (aplanas) Fix lowpkg.diff documentation and parameter name @ 2019-02-01 20:57:50 UTC
  - 7e14499 Merge pull request #51410 from aplanas/backport_50126
  - d38622e Fix lowpkg.diff documentation and parameter name
  - e61a077 states_pt3: fix rST link format
• PR #51404: (aplanas) blockdev: fix url from comment @ 2019-01-30 20:05:54 UTC
  - a16461b Merge pull request #51404 from aplanas/backport_49668
  - da2e30d blockdev: fix url from comment
• PR #51407: (aplanas) parted: fix _validate_partition_boundary @ 2019-01-30 20:05:02 UTC
  - 756c367 Merge pull request #51407 from aplanas/backport_49803
  - b004b33 parted: fix _validate_partition_boundary
• PR #51435: (damianosSemmle) Fixed not raised exceptions @ 2019-01-30 18:32:57 UTC
  - 1d45664 Merge pull request #51435 from damianosSemmle/fix-raise-exception
- 7a9ff59 Fixed not raised exceptions

- **PR #51336**: (Ch3LL) [2019.2] Merge Forward from 2019.2.0.rc1 to 2019.2 @ 2019-01-27 23:55:08 UTC
  - d4b9093 Merge pull request #51336 from Ch3LL/merge-2019.2.0rc1
  - 62a20b1 Remove unused import
  - 2284ea5 Merge branch '2019.2' into merge-2019.2.0rc1
  - 18bf236 Merge branch '2019.2.0.rc1' into 2019.2

- **PR #51334**: (Ch3LL) [2019.2] Merge forward from 2018.3 to 2019.2 @ 2019-01-27 23:49:32 UTC
  - 02b43a0 Merge pull request #51334 from Ch3LL/merge-2019.2
  - 25ec653 Merge branch '2018.3' into 2019.2

- **PR #51324** from garethgreenaway/1257_something_something_bytes_argh_python2

- **PR #51323** from garethgreenaway/network_dns_check_test

- **PR #51321** from terminalmage/issue51256
  - d9c4462 Fix 500 error when using wheel_async
  - c847f54 Swap passed addr for string rather than ipaddress object.
  - 87f3972 removing another debugging log.
  - ad64efb Use MagicMock
  - 172ad2e removing debugging
  - 5812eae Adding a test to ensure dns_check works as expected.
  - 0e542c5 Fixing various bits in x509 module and unit test to ensure tests are passing on python2 & python3

- **PR #51306** from s0undt3ch/2018.3

- **PR #51207** from twangboy/fix_test_pkg

- **PR #51252** from dwoz/issue-50221

- **PR #51264** from gtmanfred/2018.3

- **PR #51274** from twangboy/fix_network

28.2. Previous Releases
• 8a89cb2 Merge pull request #51279 from twangboy/backport_lgpo
  • 06b1545 Remove network.py patch
  • 2356f25 Add __context__ support
  • a5255f0 Merge remote-tracking branch 'saltstack/2018.3' into issue-50221
• 6796e65 Merge pull request #51276 from garethgreenaway/merge-2018.3
  • 44dc43 Merge branch '2018.3' into merge-2018.3
• 0adde9b Merge pull request #51220 from sathieu/artifactory-classifier-2018.3
  • a85f146 fixes #31179 by applying the same logic as used in the nexus module
• 6796e65 Merge pull request #51225 from astronouth7303/loader-docs-2018.3
  • 6e7da95 Add the tokens system.
  • 7e2838c Add reference to the execution module docs
  • f30f9e8 Remove search system
  • f0cc183 Fileserver modules can be loaded from the fileserver.
• 1a2f680 Merge pull request #51239 from garethgreenaway/51208_file_manage_escaped_double_quotes
  • 4251c0c Merge branch '2018.3' into 51208_file_manage_escaped_double_quotes
  • 6a9daa7 Merge branch '2018.3' into 51208_file_manage_escaped_double_quotes
  • 0bf468c Fixing lint. Using a constant instead of looking for the condition in the string.
  • a233dbc Ensuring we can handle a string that contains single quote + an escaped double quote.
• d614127 Merge pull request #51261 from OrangeDog/patch-2
  • d809b9b Avoid double-counting errors and ignore test runs
  • 6c7da95 Remove unused host parameter and average/disaster keys
  • 2d4527 Just let zabbix_sender use the config file
  • 6404e2c Fix fallback command so it's actually run
  • b79a55a Fix KeyError in Zabbix returner
  • 0971035 Merge branch '2018.3' into merge-2018.3
  • 243dc06 Merge branch '2017.7' into merge-2018.3
  • acfb7d8 Update pytest requirements
  • c19479b Move all of PyTest requirements to its own requirements file
  • 39e633f Merge pull request #51246 from garethgreenaway/bp-50358
  • c33c558 Backport #50358 to 2017.7
  • c1ea10f Fix py3 managed.file test failure
  • 537114c Remove un-needed log statement
  • ac978f0 Fix 50221 regression test on Windows
  • 65f38b5 preserve newlines from pillar data for file.managed
  • 464d813 Merge branch '2018.3' into fix_test_pkg
- 276d621 Merge pull request #51197 from Ch3LL/tag_manager
  - b9a0705 Merge branch '2018.3' into tag_manager
  - 210238b Merge branch '2018.3' into tag_manager
  - 827d6c3 Merge branch '2018.3' into tag_manager
  - fcdfe69 Add Google Tag Manager to Docs
- c8e70a9 Merge pull request #51206 from terminalmage/fix-reload
  - 8e23a6c Add missing import
  - 31ca7c6 Fix usage of reload for PY3 compatibility
- 41ae390 Merge pull request #51231 from terminalmage/issue51056
  - 4a61477 Clarify documentation for the the gitfs "all_saltenvs" config param
  - 0574476 Merge branch '2018.3' into fix_test_pkg
  - b91b2c6 Backport PR# 50771 to 2018.3 branch

- **PR #51314**: (s0undt3ch) [2019.2] Allow running runtests.py using tox @ 2019-01-25 18:56:01 UTC
  - 95607d1 Merge pull request #51314 from s0undt3ch/features/tox-runtests-2019.2
  - 39fb981 "Tell" coverage to track subprocesses.
  - f27589a Remove unused imports
  - 3000d20 Fix tests. We no longer get *ipaddress* instances back.
  - 8fcf235 Fix minion start issue
  - a26ba7f Don’t fail the test because of order
  - 138ca2e Show objects on assertion failure
  - 840b3d2 Add *pytest-salt-from-filenames* to pytest requirements
  - 716bad4 Remove duplicate dependency
  - 6d62156 Add .coveragerc
  - 6bb56ce Run tests from tox, wether runtests or pytest

- **PR #51307**: (s0undt3ch) Add 2019.2 codecov config @ 2019-01-24 13:34:25 UTC
  - b348034 Merge pull request #51307 from s0undt3ch/2019.2
  - 495aa5c Add 2019.2 codecov config

- **PR #51280**: (garethgreenaway) [2019.2] Merge forward from 2019.2.0.rc1 to 2019.2 @ 2019-01-23 07:08:32 UTC
  - d224096 Merge pull request #51280 from garethgreenaway/merge-2019.2-rc
  - e78ede2 Merge branch '2019.2' into merge-2019.2-rc
  - a425d6e Merge branch '2019.2.0.rc1' into merge-2019.2-rc

- **PR #51277**: (garethgreenaway) [2019.2] Merge forward from 2018.3 to 2019.2 @ 2019-01-23 07:01:29 UTC
  - 8596ee4 Merge pull request #51277 from garethgreenaway/merge-2019.2
  - f05e754 Merge branch '2019.2' into merge-2019.2

- **ISSUE #51273**: (isbm) How to properly fix API? (refs: #51285)
• PR #51285: (garethgreenaway) [2019.2] Add metadata to accepted keyword arguments @ 2019-01-22 23:07:44 UTC
  – 8cca51b Merge pull request #51285 from garethgreenaway/51273_metadata_auth_keyword_argument
  – bd82d80 Ensure metadata is an accepted keyword argument for authentication functions.
  – d0d5726 Merge branch '2018.3' into merge-2019.2
  – a6a9040 Merge pull request #51179 from terminalimage/fix-regex-chars
    * 9951b8d Fix possible oversight in nodegroup modifications
  – d5acd5b Merge pull request #51170 from dwoz/issue51158
    * b69c002 Fix saltmod roster test
    * 2594f24 Roster defines the roster system not a file
    * 05836b3 Merge branch '2018.3' into issue51158
    * bf47f6f Fix linter
    * 6223596 Honor roster file for ssh orchestrations
  – 5543a53 Update pytest requirements
  – f958df5 Move all of PyTest requirements to its own requiremnts file
  – 8f8ebbc Merge pull request #51226 from garethgreenaway/51195_handle_spaces_in_fstab_opts
    * 1902ce8 Merge branch '2018.3' into 51195_handle_spaces_in_fstab_opts
  – e3a9e99 Merge pull request #51233 from Ch3LL/bp-51105
    * eef49e8 Merge branch '2018.3' into bp-51105
  – e53e9b1 Merge pull request #51230 from Ch3LL/merge-2018.3
    * 0ef7675 Merge branch '2017.7' into '2018.3'
    * 4a12c5f Merge pull request #50852 from mirceaulinic/fix-capirca
      · fa91267 Merge branch '2017.7' into fix-capirca
      · 71913ff Merge branch '2017.7' into fix-capirca
      · 6fc3484 Lint?
      · 3d56750 Extra newline for lint
      · 5176cd8 Improve the Capirca and related modules for ACL config generation
    * 3f4759b Merge pull request #50923 from astronaut7303/patch-2
      · 4f631a6 Document { include %}
    * 210e817 Merge pull request #51111 from s0undt3ch/2017.7
      · 08e0ae7 Update to salt-bootstrap v2019.01.08
      · c3520aa Accounting for when permissions are not returned from file.check_perms, eg. windows systems.
      · cd80548 When test=True and there are permissions changes, report it.
      · 89345eb Handle spaces in fstab opts, similar fix to #39593
• ISSUE #50538: (sjorge) salt.modules.pdbedit broken on Samba 4.9.x (refs: #50540, #51221)

  * 1440cf Prevent crash by testing for 'manufacturer' in osdata on OpenBSD
  * 1a4e307 Ignore exceptions when generating the minion ID
* 5e37326 Merge pull request #51146 from terminalmage/fix-vsphere-tuple-issue
  * 5d60022 Fix invalid assignment in vsphere module
* fad8621 Merge pull request #51154 from twangboy/auditpol
  * 9064376 Add support for Advanced Audit policies
* f7a100c Merge pull request #51151 from Ch3LL/bp_51061
When writing output to stdout we want to ensure that the data is a string not bytes. Under py2 the salt.utils.data.encode function results in a string but under py3 the result is a bytestring. Swapping out salt.utils.data.encode for salt.utils.stringutils.to_str.

- 3a50a57 Merge pull request #51150 from Ch3LL/bp-49508
  - 7ae53ad Do not silently ignore errors.
  - deb0134 Convert to string before sending via 'publish'.
  - 651c551 Use to_str salt.utils when writing to a file.
- 8bb589d Merge pull request #51152 from garethgreenaway/50433_handle_grants_better
  - f7caa4d Fixing lint
  - e8c8c0f Adding some tests to ensure "ALL PRIVILEGES" is handled correctly in 8.0 and 5.6
  - b4bd9f Add additional grants. Adding logic to handle when ALL or ALL PRIVILEGES is passed for the grant, including some logic to handle the fact that the grants are split when show grants is run for a particular user.
  - 74edfd9 Fix pylint
  - 81a3d47 Merge branch '2017.7' into '2018.3'
  - 8a76a19 Merge pull request #50858 from jasonarewhy/bugfix-2017.7/ubuntu-networking-searchdomain
  - 3395a3d Merge branch '2017.7' into bugfix-2017.7/ubuntu-networking-searchdomain
  - 69d25aa update debian_ip test
  - a6b896c get searchdomain in Ubuntu 12+
- dda1ebbb Merge pull request #51133 from SuperShoot/issue-#50849
  - ec14e13 Fixes mysql server version comparison.
- 9d4321d Merge pull request #50878 from max-arnold/output-docs
  - d7403da Fix profile outputter docs
- cc87504 Merge pull request #51076 from OrangeDog/patch-1
  - 568e4fb Revert add -> check

28.2.6 Salt 2019.2.2 Release Notes

Version 2019.2.2 is a bugfix release for 2019.2.0.
Statistics

- Total Merges: 26
- Total Issue References: 12
- Total PR References: 26
- Contributors: 13 (Akm0d, Ch3LL, Oloremo, OrlandoArcapix, bryceml, dhiltonp, dwoz, frogunder, gareth-greenaway, javierbertoli, pizzapanther, s0undt3ch, twangboy)

Changelog for v2019.2.1..v2019.2.2

Generated at: 2019-10-11 20:54:15 UTC

- **PR #54919**: (twangboy) Add missing docs for win_wusa state and module (2019.2.1) @ 2019-10-11 18:28:11 UTC
  - 7d253bc Merge pull request #54919 from twangboy/update_docs
  - 57ff199 Add docs for win_wusa

- **ISSUE #54941**: (UtahDave) Pillar data is refreshed for EVERY salt command in 2019.2.1 and 2019.2.2 (refs: #54942)

- **PR #54942**: (dwoz) Fix for 54941 pillar_refresh regression @ 2019-10-11 18:27:31 UTC
  - 2f817bc Merge pull request #54942 from dwoz/fix-54941
  - cb5d326 Add a test for 54941 using test.ping
  - 348d1c4 Add regression tests for issue 54941
  - 766f3ca Initial commit of a potential fix for 54941

- **PR #54897**: (bryceml) update version numbers to be correct @ 2019-10-05 01:59:14 UTC
  - f783108 Merge pull request #54897 from bryceml/2019.2.1_fix_docs
  - e9a2a70 update version numbers to be correct

- **PR #54894**: (bryceml) 2019.2.1 fix docs @ 2019-10-04 22:31:26 UTC
  - 3233663 Merge pull request #54894 from bryceml/2019.2.1_fix_docs
  - 2456aaa Porting PR #52948 to 2019.2.1
  - 94a1e3b Porting PR #52752 to 2019.2.1
  - c7b7474 modifying saltconf ads
  - d48057b add new saltconf ads

- **PR #54858**: (frogunder) remove in progress from releasenotes 2019.2.2 @ 2019-10-02 20:42:59 UTC
  - 4b06eca Merge pull request #54858 from frogunder/releasenotes_remove2019.2.2
  - a697abd remove in progress from releasenotes 2019.2.2

- **PR #54854**: (frogunder) releasenotes 2019.2.2 @ 2019-10-02 18:58:21 UTC
  - aaf2d1c Merge pull request #54854 from frogunder/release_notes_2019.2.2
  - a41de59 Update 2019.2.2.rst
  - 9bea043 releasenotes 2019.2.2

- **PR #54852**: (frogunder) Update man pages for 2019.2.2 @ 2019-10-02 18:27:07 UTC
- 10d43f Merge pull request #54852 from frogunder/man_pages_2019.2.2
- 92bc4b2 Update man pages for 2019.2.2

**PR #54845:** (s0undt3ch) Remove debug print @ 2019-10-02 17:38:21 UTC
- 8ca6b20 Merge pull request #54845 from s0undt3ch/hotfix/event-return-fix-2019.2.1
- 3937890 Remove debug print

**ISSUE #54755:** (Reiner030) 2019.2.1/2019.2.0 pip failures even when not using pip (refs: #54826)

**PR #54826:** (dwoz) Fix issue 54755 and add regression tests @ 2019-10-01 20:07:46 UTC
- 9e3914a Merge pull request #54826 from dwoz/issue_54755
- 0bad9cb Handle locals and globals separately
- bcbe9a2 Only purge pip when needed
- d2f98ca Fix issue 54755 and add regression tests

**PR #54830:** (frogunder) Add known issues to 2019.2.1 release notes @ 2019-10-01 16:23:30 UTC
- ba569d0 Merge pull request #54830 from frogunder/update_relasenotes_2019.2.1
- 8cddf7b Update 2019.2.1.rst
- 14f955c Add known issues to 2019.2.1 release notes

**ISSUE #54521:** (Oloremo) [Regression] Failhard, batch and retcodes (refs: #54806)

**PR #54806:** (Oloremo) [Regression] Batch with failhard fix @ 2019-10-01 14:51:47 UTC
- 433b6fa Merge pull request #54806 from Oloremo/failhard-batch-fix-2019.2.1
- 6684793 Merge branch '2019.2.1' into failhard-batch-fix-2019.2.1
- 3e0e928 Added tests for cli and runner
- 2416516 Made batch work properly with failhard in cli and runner

**ISSUE #54820:** (OrangeDog) schedule.present not idempotent when scheduler disabled (refs: #54828)

**PR #54828:** (garethgreenaway) [2019.2.1] Fix global disabling code in scheduler @ 2019-10-01 09:27:49 UTC
- ed94aa5 Merge pull request #54828 from garethgreenaway/54820_fix_schedule_disabled_job_enabled_bug
- be15a28 Rework code that handles individual jobs being disabled and scheduler being globally being disabled. Previously disabling the schedule would result in individual jobs being disabled when they were run through eval. This change does not change schedule items.

**PR #54778:** (Akm0d) fix broken salt-cloud openstack query @ 2019-10-01 09:23:27 UTC
- 435b40c Merge pull request #54778 from Akm0d/master_openstack_query_fix
- ba4ba2a fixed pylint errors in openstack test
- d9a8517 Added openstack tests for openstack –query fix
- 59214ad Fallback to image id if we don’t have an image name
- 3a42a4d fixed pylint error
- 0074d18 created unit tests for openstack
- 4255e3e Merge branch '2019.2.1' of https://github.com/saltstack/salt into HEAD
- 1c2821b Return a configured provider, not a bool
- c585550 fix broken salt-cloud openstack query

  - 46bec3c Merge pull request #54731 from pizzapanther/not-so-__new__-and-shiny
  - bdf24f4 Make sure we tests salt-master’s event_return setting
  - 5499518 remove unnecessary import
  - 3f8a382 fix module import
  - 0746aa7 remove __new__ method since it was removed from parent class

- **PR #54706:** (bryceml) 2019.2.1 ruby @ 2019-09-23 16:00:27 UTC
  - e2b86bf Merge pull request #54706 from bryceml/2019.2.1_ruby
  - 168a0c1 switch to ruby 2.6.3
28.2.7 Salt 2019.2.3 Release Notes

Version 2019.2.3 is a CVE-fix release for 2019.2.0.

Security Fix

CVE-2019-17361
With the Salt NetAPI enabled in addition to having a SSH roster defined, unauthenticated access is possible when specifying the client as SSH. Additionally, when the raw_shell option is specified any arbitrary command may be run on the Salt master when specifying SSH options.

28.2.8 Salt 2019.2.4 Release Notes

Version 2019.2.4 is a CVE-fix release for 2019.2.0.

Security Fix

CVE-2020-11651
An issue was discovered in SaltStack Salt before 2019.2.4 and 3000 before 3000.2. The salt-master process ClearFuncs class does not properly validate method calls. This allows a remote user to access some methods without authentication. These methods can be used to retrieve user tokens from the salt master and/or run arbitrary commands on salt minions.

CVE-2020-11652
An issue was discovered in SaltStack Salt before 2019.2.4 and 3000 before 3000.2. The salt-master process ClearFuncs class allows access to some methods that improperly sanitize paths. These methods allow arbitrary directory access to authenticated users.

Known Issue

Part of the fix for CVE-2020-11651 added better validation of the methods allowed to be called by remote clients. Both AESFuncs and ClearFuncs now have an explicit list of methods that can be called. The name of one of these whitlisted methods on AESFuncs had a typo. The _minion_runner method should be minion_runner (without the underscore prefix). This typo breaks the publish module's runner method. Calling runners, for example:

```
salt minion publish.runner manage.down
```

Will not work, and you will receive and empty reply from the salt master.
This will be addressed in the Sodium release of Salt set for mid-June 2020.

28.2.9 Salt 2018.3.0 Release Notes - Codename Oxygen

**Warning:** If you are using Jinja to dump lists or dictionaries in your SLS files, this will now cause errors in Python 2 since Jinja does not produce YAML-compatible output when strings in the data structures contain unicode types. The dictionary must be passed through a Jinja filter to produce YAML-compatible strings.

The below is an example of invalid SLS:
Unicode/Python 3 Compatibility Improvements

This release fixes a number of nagging issues with Unicode strings in Salt under Python 2 (ex. 'ascii' codec can't decode byte 0xd0). For best results, use a UTF-8 locale (such as by setting the LANG environment variable to one which supports UTF-8. For example en_US.UTF-8, de_DE.UTF-8, ru_RU.UTF-8, C.UTF-8).

Additionally, a number of Python 3 compatibility fixes have been made, many of them having to do with file I/O and str/bytes mismatches.

We continue to work toward improving both Unicode and Python 3 compatibility and welcome any feedback.

Lots of Docker Improvements

Much Improved Support for Docker Networking

The docker_network.present state has undergone a full rewrite, which includes the following improvements:

Full API Support for Network Management

The improvements made to input handling in the docker_container.running state for 2017.7.0 have now been expanded to docker_network.present. This brings with it full support for all tunable configuration arguments.

Custom Subnets

Custom subnets can now be configured. Both IPv4 and mixed IPv4/IPv6 networks are supported. See here for more information.

Network Configuration in docker_container.running States

A long-requested feature has finally been added! It is now possible to configure static IPv4/IPv6 addresses, as well as links and labels. See here for more information.
Note: While the `containers` argument to `docker_network.present` will continue to be supported, it will no longer be the recommended way of ensuring that a container is attached to a network.

**Improved Handling of Images from Custom Registries**

Rather than attempting to parse the tag from the passed image name, Salt will now resolve that tag down to an image ID and use that ID instead.

**Important:** Due to this change, there are some backward-incompatible changes to image management. See below for a full list of these changes.

**Backward-incompatible Changes to Docker Image Management**

Passing image names to the following functions must now be done using separate `repository` and `tag` arguments:

- `docker.build`
- `docker.commit`
- `docker.import`
- `docker.load`
- `docker.tag`
- `docker.sls_build`

Additionally, the `tag` argument must now be explicitly passed to the `docker_image.present` state, unless the image is being pulled from a docker registry.

**State and Execution Module Support for `docker run` Functionality**

The `docker_container.running` state is good for containers which run services, but it is not as useful for cases in which the container only needs to run once. The `start` argument to `docker_container.running` can be set to `False` to prevent the container from being started again on a subsequent run, but for many use cases this is not sufficient. Therefore, the `docker.run_container` remote-execution function was added. When used on the Salt CLI, it will return information about the container, such as its name, ID, exit code, and any output it produces.

State support has also been added via the `docker_container.run` state. This state is modeled after the `cmd.run` state, and includes arguments like `onlyif`, `unless`, and `creates` to control whether or not the container is run.

**Full API Support for `docker.logs`**

This function now supports all of the functions that its Docker API counterpart does, allowing you to do things like include timestamps, and also suppress stdout/stderr, etc. in the return.
**start Argument Added to `docker.create` Function**

This removes the need to run `docker.start` separately when creating containers on the Salt CLI.

```bash
salt myminion docker.create image=foo/bar:baz command=/path/to/command start=True
```

**Use SaltSSH Minions like regular Master-Minions**

The Master process can now also call SSH minions as if they were connected to the master using ZeroMQ. By setting `enable_ssh_minions: True` in the master config file, the master will create a Salt SSH client process which connects to the minion and returns the output for the `salt` CLI to use like a regular minion. This can be used anywhere the LocalClient is used.

**Exceptions Raised for Authentication/Authorization Errors**

When sending `publish` commands via `master.py` and `masterapi.py` and an authorization or authentication problem is encountered, Salt will now raise the appropriate exceptions instead of returning an empty string: `''`.

The reasoning behind this change is to make it easier to debug various scenarios surrounding authentication and authorization issues more effectively.

**Comparison Operators in Package Installation**

Salt now supports using comparison operators (e.g. `>=1.2.3`) when installing packages on minions which use `yum/dnf` or `apt`. This is supported both in the `pkg.installed` state and in the `pkg.install` remote execution function.

**Master Tops Changes**

When both `Master Tops` and a `Top File` produce SLS matches for a given minion, the matches were being merged in an unpredictable manner which did not preserve ordering. This has been changed. The top file matches now execute in the expected order, followed by any master tops matches that are not matched via a top file.

To make master tops matches execute first, followed by top file matches, set the new `master_tops_first` minion config option to `True`.

**Several Jinja Filters Renamed**

The following Jinja filters (originally added in 2017.7.0) have been renamed due to the fact that they were inaccurately named when initially added. The original names will be supported until the 3000 release of Salt.

- `rand_str` renamed to `random_hash`
- `jinja_decode_dict` renamed to `jinja_encode_dict`
- `jinja_decode_list` renamed to `jinja_encode_list`
Return Codes for Runner/Wheel Functions

When using orchestration, runner and wheel functions used to report a True result if the function ran to completion without raising an exception. It is now possible to set a return code in the __context__ dictionary, allowing runner and wheel functions to report that they failed. Here’s some example pseudocode:

```python
def myrunner():
    ...
    do stuff
    ...
    if some_error_condition:
        __context__['retcode'] = 1
    return result
```

Variable Update Intervals for Fileserver Backends

Prior to this release, fileservers would be updated as part of a dedicated “maintenance” process, in which various routine maintenance tasks were performed. This tied the update interval to the loop_interval config option, and also forced all fileservers to update at the same interval.

2018.3.0 adds the following configuration options for the various fileserver backends:

- roots_update_interval
- azurefs_update_interval
- gitfs_update_interval
- hgfs_update_interval
- minionfs_update_interval
- s3fs_update_interval
- svnfs_update_interval

These allow for update intervals to be set for each individual backend. The default value for each of these is 60 seconds.

In addition, for GitFS it is also possible to apply intervals to individual remotes. See here for examples.

Note: git_pillar does not yet support variable update intervals, this is targeted for the next feature release (2019.2.0).

LDAP via External Authentication Changes

In this release of Salt, if LDAP Bind Credentials are supplied, then these credentials will be used for all LDAP access except the first authentication when a job is submitted. The first authentication will use the user’s credentials as passed on the CLI. This behavior is to accommodate certain two-factor authentication schemes where the authentication token can only be used once.

In previous releases the bind credentials would only be used to determine the LDAP user’s existence and group membership. The user’s LDAP credentials were used from then on.
Stormpath External Authentication Removed

Per Stormpath’s announcement, their API will be shutting down on 8/17/2017 at noon PST so the Stormpath external authentication module has been removed.

https://stormpath.com/oktaplusstormpath

New (Proxy) Minion Configuration Options

To be able to connect the Minion to the Master using a certain source IP address or port, the following options have been added:

- source_interface_name
- source_address
- source_ret_port
- source_publish_port

environment config option renamed to saltenv

The environment config option predates referring to a salt fileserver environment as a saltenv. To pin a minion to a single environment for running states, one would use environment, but overriding that environment would be done with the saltenv argument. For consistency, environment is now simply referred to as saltenv. There are no plans to deprecate or remove environment, if used it will log a warning and its value will be used as saltenv.

lock_saltenv config option added

If set to True, this option will prevent a minion from allowing the saltenv argument to override the value set in saltenv when running states.

Failed Minions for State/Function Orchestration Jobs Added to Changes Dictionary

For orchestration jobs which run states (or run remote execution functions and also use a fail function to indicate success or failure), minions which have False results were previously included as a formatted string in the comment field of the return for that orchestration job. This made the failed returns difficult to parse programatically. The failed returns in these cases are now included in the changes dictionary, making for much easier parsing.

Grains

- fc_wwn - Show all fibre channel world wide port names for a host, must be enabled with fibre_channel_grains
- iscsi_iqn - Show the iSCSI IQN name for a host
- swap_total - Show the configured swap_total for Linux, *BSD, OS X and Solaris/SunOS
- virtual:
  - identifies reports KVM and VMM hypervisors when running an OpenBSD guest
  - for detecting Solaris Logical Domains (LDOMs) running on T-Series SPARC hardware. The virtual_subtype grain is populated as a list of domain roles.
Salt Minion Auto-discovery

Using auto-discovery, the Salt Minion now no longer needs to be configured against a specific DNS name or IP address of a Master.

For this feature Salt Master now requires port 4520 for UDP broadcast packets to be opened and the Salt Minion be able to send UDP packets to the same port.

Configuration

By default, automatic discovery is disabled.

Warning: Due to the current limitations that will be changing in a future release, before you turn on auto-discovery, make sure your network is secured and trusted.

Auto-discovery is configured on Master and Minion. Both of them are configured via the discovery option as follows:

Master configuration

To use the default configuration, which accepts any minion, simply set discovery to True:

```
 discovery: true
```

A sub-option called mapping allows auto-discovery to help find the proper Master. The mapping contains an arbitrary set of key/value pairs, which the Minion configuration can target. By default, no mappings are set.

Example:

```
 discovery:       
    mapping: 
        description: SES 5.0  
        node: 1
```

It is also possible to change the port used from the default of 4520, by setting a port option under the Master's discovery configuration:

```
 discovery:       
    port: 4567
```

Note: When using a port number other than the default, the Minion’s discovery configuration must also have a port specified, otherwise the Minion will still attempt to contact the Master on port 4520.

Minion configuration

In addition to the mapping and port options, the following additional options are available to Minions:

- attempts - This option specifies how many broadcast requests should be sent to the network, waiting for any Master response. Each attempt takes a couple of seconds, so raising this value may result in a slower Minion startup. Note that, on a properly-configured network, autodiscovery should succeed on the first attempt. By default, this value is set to 3.

- match - This option can be set to either all or any, and it determines how the values configured in mapping are matched. If set to all, then all of the key/value pairs in the Minion’s mapping must match a given Master. If set to any (the default), then any match to a key/value mapping will constitute a match.
• pause - The interval in seconds between attempts (default: 5).
• fibre_channel_grains - Enables the fc_wwn grain. (Default: False)
• iscsi_grains - Enables the iscsi_iqn grain. (Default: False)

Connection to a type instead of DNS

By now each Minion was connecting to a Master by DNS or IP address. From now on it is possible also to connect to a _type_ of a Master. For example, in a network there are three different Masters, each corresponds for a particular niche or environment or specific role etc. The Minion is supposed to connect only to one of those Masters that is described appropriately.

To achieve such an effect, each /etc/salt/master configuration should have a discovery option, which should have a mapping element with arbitrary key/value pairs. The same configuration should be on the Minion, so then when mapping matches, Minion recognises Master as its connection target.

Example for Master configuration (/etc/salt/master):

```
discovery:
  mapping:
    description: SES 5.0
    node: 1
```

The example above describes a system that is running a particular product, where description is an arbitrary key and SES 5.0 is just a string. In order to match exactly this Master, the following configuration at Minion should be present:

```
discovery:
  match: all  # Can be "all" or "any"
  mapping:
    description: SES 5.0
    node: 1
```

Notice match criteria is set to all. This would mean that from all found Masters select only that, which description is set to SES 5.0 and node is set to 1. All other Masters will be ignored.

Limitations

This feature has a couple of _temporary_ limitations that are subject to change in the future:

• Only one Master on the network is supported. Currently the Minion cannot select which Master out of few the same to choose. This will change to choosing the Master that is least loaded.
• Minions will accept _any_ master that matches connection criteria without any particular security applied (priv/pub key check, signature, fingerprint etc). That implies that administrator is expected to know his network and make sure it is clean.

New Modules

• salt.modules.purefa

New NaCl Renderer

A new renderer has been added for encrypted data.
New support for Cisco UCS Chassis

The salt proxy minion now allows for control of Cisco USC chassis. See the cimc modules for details.

New support for Cassandra v3

The cassandra_cql module now supports Cassandra v3 which has changed its internal schema to define keyspaces and columns.

New salt-ssh roster

A new roster has been added that allows users to pull in a list of hosts for salt-ssh targeting from a ~/.ssh configuration. For full details, please see the sshconfig roster.

New GitFS Features

Two new features which affect how GitFS maps branches/tags to fileserver environments (i.e. saltenvs) have been added:

1. It is now possible to completely turn off Salt’s default mapping logic (aside from the mapping of the base saltenv). This can be triggered using the new gitfs_disable_saltenv_mapping config option.

   **Note:** When this is disabled, only the base saltenv and any configured using per-saltenv configuration parameters will be available.

2. The types of refs which Salt will use as saltenvs can now be controlled. In previous releases, branches and tags were both mapped as environments, and individual commit SHAs could be specified as saltenvs in states (and when caching files using cp.cache_file). Using the new gitfs_ref_types config option, the types of refs which are used as saltenvs can be restricted. This makes it possible to ignore all tags and use branches only, and also to keep SHAs from being made available as saltenvs.

Additional output modes

The state_output parameter now supports full_id, changes_id and terse_id. Just like mixed_id, these use the state ID as name in the highstate output. For more information on these output modes, see the docs for the Highstate Outputter.

Windows

Python Version

Python 2 Windows API was design when Windows did not support Unicode. Windows now supports Unicode however to keep backwards compatibility Python 2 Windows API has not been changed. Python 3 Windows API supports Unicode. Salt Python 3 installer is the recommend choice for users who need characters other than Non-ASCII (7bit) characters.
pkg Execution module changes

Significant changes have been made to the win_pkg execution module. Users should test this release against their existing package sls definition files. These changes are also in 2016.11.9 & 2017.7.3.

- pkg.list_available no longer defaults to refreshing the winrepo meta database.
- pkg.install without a version parameter no longer upgrades software if the software is already installed. Use pkg.install version=latest or in a state use pkg.latest to get the old behavior.
- pkg.list_pkgs now returns multiple versions if software installed more than once.
- pkg.list_pkgs now returns 'Not Found' when the version is not found instead of '(value not set)' which matches the contents of the sls definitions.
- pkg.remove() will wait up to 3 seconds (normally about a second) to detect changes in the registry after removing software, improving reporting of version changes.
- pkg.remove() can remove latest software, if latest is defined in sls definition.
- Documentation was update for the execution module to match the style in new versions, some corrections as well.
- All install/remove commands are prefix with cmd.exe shell and cmdmod is called with a command line string instead of a list. Some sls files in saltstack/salt-winrepo-ng expected the commands to be prefixed with cmd.exe (i.e. the use of &).
- Some execution module functions results, now behaviour more like their Unix/Linux versions.

Installer

Changes to config handling

Behavior with existing configuration has changed. With previous windows installers the existing config was used and the master and minion id could be modified via the installer. It was problematic in that it didn’t account for configuration that may be defined in the minion.d directory. This change gives you the option via a drop-down list to use one of the following:

- Default Config: Use the config that comes with the installer
- Existing Config: Use the current config without changes
- Custom Config: Select a custom config using the file picker

The existing config option will only be available if the installer detects an existing config. If there is an existing config, and you choose Default or Custom, the existing config will be deleted, including the minion.d directory, and replaced by your selection.

The Default Config and Custom Config options will allow you to modify the Master and the Minion ID. Existing Config will leave the existing configuration unchanged.

These settings can be defined on the command line using the following switches:

- /default-config
- /custom-config=C:\Path\To\Custom\Config\minion

If neither option is passed and there is an existing config, the default is to use the existing config. If there is no existing config (new install) the default config will be used.
Multi-master configuration

The installer now has the ability to apply a multi-master configuration either from the GUI or the command line. The master field in the GUI can accept either a single master or a comma-separated list of masters. The command-line switch (/master=) can accept the same.

Command-line help

The Windows installer will now display command-line help when a help switch (/?) is passed.

New utils module salt.utils.pkg.win

A new utils module has been added, which gathers information about windows installed software. This is currently not used by any salt execution module or state at this time. Users are encouraged to run this and report any issues. Running the command with the detail option will be useful for anyone developing windows package definitions. With salt installed in the default location the following command will print the help message.

```
chcp 65001
c:\salt\bin\python.exe c:\salt\bin\lib\site-packages\salt\utils\pkg\win.py
c:\salt\bin\python.exe c:\salt\bin\lib\site-packages\salt\utils\pkg\win.py detail
```

Salt Cloud Features

OpenStack Revamp

The OpenStack Driver has been rewritten mostly from scratch. Salt is now using the shade driver <https://docs.openstack.org/shade/latest/>.

With this, the nova driver is being deprecated.

openstack driver

There have also been several new modules and states added for managing OpenStack setups using shade as well.

```
keystone keystone role grant keystone group keystone role keystone service
keystone user keystone domain keystone project keystone endpoint glance
glance_image neutron neutron subnet neutron secgroup neutron secgroup rule
neutron network
```

Pre-Flight Commands

Support has been added for specified "preflight commands" to run on a VM before the deploy script is run. These must be defined as a list in a cloud configuration file. For example:

```
my-cloud-profile:
  provider: linode-config
  image: Ubuntu 16.04 LTS
  size: Linode 2048
  preflight_cmds:
    - whoami
    - echo 'hello world!'
```
These commands will run in sequence **before** the bootstrap script is executed.

**New salt-cloud Grains**

When salt-cloud creates a new minion, it will now add grain information to the minion configuration file, identifying the resources originally used to create it.

The generated grain information will appear similar to:

```plaintext
grains:
salt-cloud:
  driver: ec2
  provider: my_ec2:ec2
  profile: ec2-web
```

The generation of salt-cloud grains can be suppressed by the option `enable_cloud_grains: 'False'` in the cloud configuration file.

**Upgraded Saltify Driver**

The salt-cloud Saltify driver is used to provision machines which are not controlled by a dedicated cloud supervisor (such as typical hardware machines) by pushing a salt-bootstrap command to them and accepting them on the salt master. Creation of a node has been its only function and no other salt-cloud commands were implemented.

With this upgrade, it can use the salt-api to provide advanced control, such as rebooting a machine, querying it along with conventional cloud minions, and, ultimately, disconnecting it from its master.

After disconnection from ("destroying" on) one master, a machine can be re-purposed by connecting to ("creating" on) a subsequent master.

**New Vagrant Driver**

The salt-cloud Vagrant driver brings virtual machines running in a limited environment, such as a programmer’s workstation, under salt-cloud control. This can be useful for experimentation, instruction, or testing salt configurations.

Using salt-api on the master, and a salt-minion running on the host computer, the Vagrant driver can create (`vagrant up`), restart (`vagrant reload`), and destroy (`vagrant destroy`) VMs, as controlled by salt-cloud profiles which designate a Vagrantfile on the host machine.

The master can be a very limited machine, such as a Raspberry Pi, or a small VagrantBox VM.

**Python PyWinRM Module**

Versions of `pywinrm>=0.2.1` are finally able to disable validation of self signed certificates. [Here for more information.]

**DigitalOcean**

The DigitalOcean driver has been renamed to conform to the company name. The new driver name is `digitalocean`. The old name `digital_ocean` and a short one `do` will still be supported through virtual aliases, this is mostly cosmetic.
Arizona Cloud

The azure sdk used for the azurearm cloud driver now depends on azure-cli>=2.0.12

New saltclass pillar/master_tops modules

This module clones the behaviour of reclass (http://reclass.pantsfullofunix.net/), without the need of an external app, and add several features to improve flexibility. Saltclass lets you define your nodes from simple yaml files (.yml) through hierarchical class inheritance with the possibility to override pillars down the tree.

Features

- Define your nodes through hierarchical class inheritance
- Reuse your reclass data with minimal modifications
  - applications => states
  - parameters => pillars
- Use Jinja templating in your yaml definitions
- Access to the following Salt objects in Jinja
  - __opts__
  - __salt__
  - __grains__
  - __pillars__
  - minion_id
- Chose how to merge or override your lists using ^ character (see examples)
- Expand variables ${} with possibility to escape them if needed ${} (see examples)
- Ignores missing node/class and will simply return empty without breaking the pillar module completely - will be logged

An example subset of data is available here: http://git.mauras.ch/salt/saltclass/src/master/examples

<table>
<thead>
<tr>
<th>Terms usable in yaml files</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>classes</td>
<td>A list of classes that will be processed in order</td>
</tr>
<tr>
<td>states</td>
<td>A list of states that will be returned by master_tops function</td>
</tr>
<tr>
<td>pillars</td>
<td>A yaml dictionary that will be returned by the ext_pillar function</td>
</tr>
<tr>
<td>environment</td>
<td>Node saltenv that will be used by master_tops</td>
</tr>
</tbody>
</table>

A class consists of:

- zero or more parent classes
- zero or more states
- any number of pillars

A child class can override pillars from a parent class. A node definition is a class in itself with an added environment parameter for saltenv definition.

Class Names
Class names mimic salt way of defining states and pillar files. This means that `default.users` class name will correspond to one of these:

- `<saltclass_path>/classes/default/users.yml`
- `<saltclass_path>/classes/default/users/init.yml`

**Saltclass Tree**

A saltclass tree would look like this:

```markdown
<saltclass_path>
  └── classes
    ├── app
    │    └── borgbackup.yml
    │          └── ssh
    │          └── server.yml
    └── default
        ├── init.yml
        └── motd.yml
        └── users.yml
  ├── roles
  │    ├── app.yml
  │    └── nginx
  │            └── server.yml
  │                └── server.yml
  └── subsidiaries
      ├── gnv.yml
      ├── qls.yml
      └── zrh.yml
  └── nodes
     ├── geneva
     │    └── gnv.node1.yml
     └── lausanne
        ├── qls.node1.yml
        └── qls.node2.yml
        └── node127.yml
     └── zurich
         ├── zrh.node1.yml
         └── zrh.node2.yml
```

**Examples**

`<saltclass_path>/nodes/lausanne/qls.node1.yml`

```yaml
environment: base

classes:
{% for class in ['default'] %}
    - {{ class }}
{% endfor %}
    - subsidiaries.{{ __grains__['id'].split('.')[0] }}
```

`<saltclass_path>/classes/default/init.yml`
classes:
- default.users
- default.motd

states:
- openssh

pillars:
default:
  network:
    dns:
      srv1: 192.168.0.1
      srv2: 192.168.0.2
      domain: example.com
    ntp:
      srv1: 192.168.10.10
      srv2: 192.168.10.20

<saltclass_path>/classes/subsidiaries/gnv.yml

pillars:
default:
  network:
    sub: Geneva
    dns:
      srv1: 10.20.0.1
      srv2: 10.20.0.2
      srv3: 192.168.1.1
      domain: gnv.example.com
  users:
    adm1:
      uid: 1210
      gid: 1210
      gecos: 'Super user admin1'
      homedir: /srv/app/adm1
    adm3:
      uid: 1203
      gid: 1203
      gecos: 'Super user adm

Variable expansions:

Escaped variables are rendered as is - ${test}

Missing variables are rendered as is - ${net:dns:srv2}

pillars:
app:
  config:
    dns:
      srv1: ${default:network:dns:srv1}
      srv2: ${net:dns:srv2}
    uri: https://application.domain/call?\${test}
    prod_parameters:
    - p1
    - p2
    - p3
pkg:
List override:
Not using `^` as the first entry will simply merge the lists

```
pillars:
  app:
    pkg:
      - ^
      - app-frontend
```

Known limitation
Currently you can’t have both a variable and an escaped variable in the same string as the escaped one will not be correctly rendered - `${xx}` will stay as is instead of being rendered as `${xx}`

Lists of comments in state returns
State functions can now return a list of strings for the comment field, as opposed to only a single string. This is meant to ease writing states with multiple or multi-part comments.

Beacon configuration changes
