**blob_content_encoding**: Optional. Sets the blob's content encoding.

**blob_content_language**: Optional. Sets the blob's content language.

**lease_id**: Required if the blob has an active lease.

**blob_content_disposition**: Optional. Sets the blob's Content-Disposition header. The Content-Disposition response header field conveys additional information about how to process the response payload, and also can be used to attach additional metadata. For example, if set to attachment, it indicates that the
user-agent should not display the response, but instead show a Save As dialog with a filename other than the blob name specified.

```
salt.cloud.clouds.msazure.set_blob_service_properties(kwags=\None, stor-
age_conn=\None, call=\None)
```

New in version 2015.8.0.

Sets the properties of a storage account's Blob service, including Windows Azure Storage Analytics. You can also use this operation to set the default request version for all incoming requests that do not have a version specified.

CLI Example:
```
salt-cloud -f set_blob_service_properties my-azure
```

- **properties**: a StorageServiceProperties object.
- **timeout**: Optional. The timeout parameter is expressed in seconds.

```
salt.cloud.clouds.msazure.set_storage_container_acl(kwags=\None, stor-
age_conn=\None, call=\None)
```

New in version 2015.8.0.

Set a storage container's acl

CLI Example:
```
salt-cloud -f set_storage_container my-azure name=mycontainer
```

- **name**: Name of existing container.
- **signed_identifiers**: SignedIdentifiers instance
- **blob_public_access**: Optional. Possible values include: container, blob
- **lease_id**: If specified, set_storage_container_acl only succeeds if the container's lease is active and matches this ID.

```
salt.cloud.clouds.msazure.set_storage_container_metadata(kwags=\None, stor-
age_conn=\None, call=\None)
```

New in version 2015.8.0.

Set a storage container's metadata

CLI Example:
```
salt-cloud -f set_storage_container my-azure name=mycontainer \ x_ms_meta_name_values='{"my_name": "my_value"}'}
```

- **name**: Name of existing container.
- **meta_name_values**: A dict containing name, value for metadata. Example: {'category': 'test'}
- **lease_id**: If specified, set_storage_container_metadata only succeeds if the container's lease is active and matches this ID.

```
salt.cloud.clouds.msazure.show_affinity_group(kwags=\None, conn=\None, call=\None)
```

New in version 2015.8.0.
Show an affinity group associated with the account

CLI Example:

```
salt-cloud -f show_affinity_group my-azure service=myservice \
    deployment=mydeployment name=SSH
```

salt.cloud.clouds.msazure.show_blob_properties(**kwargs=None, **kwargs=None, **kwargs=None, call=None)

New in version 2015.8.0.

Returns all user-defined metadata, standard HTTP properties, and system properties for the blob.

CLI Example:

```
salt-cloud -f show_blob_properties my-azure container=mycontainer blob=myblob
```

container: Name of existing container.

blob: Name of existing blob.

lease_id: Required if the blob has an active lease.

salt.cloud.clouds.msazure.show_blob_service_properties(**kwargs=None, **storage_conn=None, **storage_conn=None, call=None)

New in version 2015.8.0.

Show a blob's service properties

CLI Example:

```
salt-cloud -f show_blob_service_properties my-azure
```

salt.cloud.clouds.msazure.show_deployment(**kwargs=None, **conn=None, call=None)

New in version 2015.8.0.

Return information about a deployment

CLI Example:

```
salt-cloud -f show_deployment my-azure name=my_deployment
```

salt.cloud.clouds.msazure.show_disk(**kwargs=None, **conn=None, call=None)

New in version 2015.8.0.

Return information about a disk

CLI Example:

```
salt-cloud -f show_disk my-azure name=my_disk
```

salt.cloud.clouds.msazure.show_input_endpoint(**kwargs=None, **conn=None, call=None)

New in version 2015.8.0.

Show an input endpoint associated with the deployment

CLI Example:

```
salt-cloud -f show_input_endpoint my-azure service=myservice \
    deployment=mydeployment name=SSH
```
salt.cloud.clouds.msazure.show_instance(name, call=None)
Show the details from the provider concerning an instance

salt.cloud.clouds.msazure.show_management_certificate(kwargs=None, conn=None, call=None)
New in version 2015.8.0.
Return information about a management_certificate
CLI Example:

```
salt-cloud -f get_management_certificate my-azure name=my_management_certificate \ 
        thumbalgorithm=sha1 thumbprint=0123456789ABCDEF
```

salt.cloud.clouds.msazure.show_service(kwargs=None, conn=None, call=None)
New in version 2015.8.0.
List hosted service properties
CLI Example:

```
salt-cloud -f show_service my-azure name=my_service
```

salt.cloud.clouds.msazure.show_service_certificate(kwargs=None, conn=None, call=None)
New in version 2015.8.0.
Return information about a service certificate
CLI Example:

```
salt-cloud -f show_service_certificate my-azure name=my_service_certificate \ 
        thumbalgorithm=sha1 thumbprint=0123456789ABCDEF
```

salt.cloud.clouds.msazure.show_storage(kwargs=None, conn=None, call=None)
New in version 2015.8.0.
List storage service properties
CLI Example:

```
salt-cloud -f show_storage my-azure name=my_storage
```

salt.cloud.clouds.msazure.show_storage_container(kwargs=None, storage_conn=None, call=None)
New in version 2015.8.0.
Show a container associated with the storage account
CLI Example:

```
salt-cloud -f show_storage_container my-azure name=myservice
```

name: Name of container to show.

salt.cloud.clouds.msazure.show_storage_container_acl(kwargs=None, storage_conn=None, call=None)
New in version 2015.8.0.
Show a storage container's acl
CLI Example:
salt-cloud -f show_storage_container_acl my-azure name=myservice

name: Name of existing container.

lease_id: If specified, show_storage_container_acl only succeeds if the container's lease is active and matches this ID.

salt.cloud.clouds.msazure.show_storage_container_metadata(**kwargs=None,**
storage_conn=None,**
call=None)

New in version 2015.8.0.
Show a storage container's metadata
CLI Example:
salt-cloud -f show_storage_container_metadata my-azure name=myservice

name: Name of container to show.

lease_id: If specified, show_storage_container_metadata only succeeds if the container's lease is active and matches this ID.

salt.cloud.clouds.msazure.show_storage_keys(**kwargs=None,**
conn=None,**
call=None)

New in version 2015.8.0.
Show storage account keys
CLI Example:
salt-cloud -f show_storage_keys my-azure name=my_storage

salt.cloud.clouds.msazure.update_affinity_group(**kwargs=None,**
conn=None,**
call=None)

New in version 2015.8.0.
Update an affinity group's properties
CLI Example:
salt-cloud -f update_affinity_group my-azure name=my_group label=my_group

salt.cloud.clouds.msazure.update_disk(**kwargs=None,**
conn=None,**
call=None)

New in version 2015.8.0.
Update a disk's properties
CLI Example:
salt-cloud -f update_disk my-azure name=my_disk label=my_disk
salt-cloud -f update_disk my-azure name=my_disk new_name=another_disk

salt.cloud.clouds.msazure.update_input_endpoint(**kwargs=None,**
conn=None,**
call=None,**
activity='update')

New in version 2015.8.0.
Update an input endpoint associated with the deployment. Please note that there may be a delay before the changes show up.
CLI Example:
salt-cloud -f update_input_endpoint my-azure service=myservice \
  deployment=mydeployment role=myrole name=HTTP local_port=80 \
  port=80 protocol=tcp enable_direct_server_return=False \
  timeout_for_tcp_idle_connection=4

salt.cloud.clouds.msazure.update_storage(kwarg=None, conn=None, call=None)

New in version 2015.8.0.

Update a storage account's properties

CLI Example:

salt-cloud -f update_storage my-azure name=my_storage label=my_storage

21.4.15 salt.cloud.clouds.oneandone

1&1 Cloud Server Module

The 1&1 SaltStack cloud module allows a 1&1 server to be automatically deployed and bootstrapped with Salt. It also has functions to create block storages and ssh keys.

depends 1and1 1.2.0

The module requires the 1&1 api_token to be provided. The server should also be assigned a public LAN, a private LAN, or both along with SSH key pairs.

Set up the cloud configuration at /etc/salt/cloud.providers or /etc/salt/cloud.providers.d/oneandone.conf:

my-oneandone-config:
  driver: oneandone
  # The 1&1 api token
  api_token: <your-token>
  # SSH private key filename
  ssh_private_key: /path/to/private_key
  # SSH public key filename
  ssh_public_key: /path/to/public_key

my-oneandone-profile:
  provider: my-oneandone-config
  # Either provide fixed_instance_size_id or vcore, cores_per_processor, ram, and hdds.
  # Size of the ID desired for the server
  fixed_instance_size: S
  # Total amount of processors
  vcore: 2
  # Number of cores per processor
  cores_per_processor: 2
  # RAM memory size in GB
  ram: 4
  # Hard disks
  hdds:
    - is_main: true
      size: 20
    -
is_main: false
size: 20
# ID of the appliance image that will be installed on server
appliance_id: <ID>
# ID of the datacenter where the server will be created
datacenter_id: <ID>
# Description of the server
description: My server description
# Password of the server. Password must contain more than 8 characters
# using uppercase letters, numbers and other special symbols.
password: P4$$w0rD
# Power on server after creation - default True
power_on: true
# Firewall policy ID. If it is not provided, the server will assign
# the best firewall policy, creating a new one if necessary.
# If the parameter is sent with a 0 value, the server will be created with all ports blocked.
firewall_policy_id: <ID>
# IP address ID
ip_id: <ID>
# Load balancer ID
load_balancer_id: <ID>
# Monitoring policy ID
monitoring_policy_id: <ID>

Set deploy to False if Salt should not be installed on the node.

my-oneandone-profile:
  deploy: False

Create an SSH key

```bash
tsudo salt-cloud -f create_ssh_key my-oneandone-config name='SaltTest' description='SaltTestDescription'
```

Create a block storage

```bash
tsudo salt-cloud -f create_block_storage my-oneandone-config name='SaltTest2' description='SaltTestDescription' size=50 datacenter_id='5091F6D8CBFEF9C26ACE957C652D5D49'
```

salt.cloud.clouds.oneandone.avail_images(conn=None, call=None)
Return a list of the server appliances that are on the provider

salt.cloud.clouds.oneandone.avail_locations(conn=None, call=None)
List available locations/datacenters for 1&1

salt.cloud.clouds.oneandone.avail_sizes(call=None)
Return a dict of all available VM sizes on the cloud provider with relevant data.

salt.cloud.clouds.oneandone.create(vm_)
Create a single VM from a data dict

salt.cloud.clouds.oneandone.create_block_storage(kwargs=None, call=None)
Create a block storage

salt.cloud.clouds.oneandone.create_ssh_key(kwargs=None, call=None)
Create an ssh key
Salt Documentation, Release 3001.1

```
salt.cloud.clouds.oneandone.destroy(name, call=None)
    destroy a server by name

Parameters
    • name -- name given to the server
    • call -- call value in this case is ‘action’

Returns array of booleans, true if successfully stopped and true if successfully removed

CLI Example:
salt-cloud -d vm_name
```

```
salt.cloud.clouds.oneandone.get_configured_provider()
    Return the first configured instance.

salt.cloud.clouds.oneandone.get_conn()  
    Return a conn object for the passed VM data

salt.cloud.clouds.oneandone.get_dependencies()  
    Warn if dependencies are not met.

salt.cloud.clouds.oneandone.get_image(vm_)
    Return the image object to use

salt.cloud.clouds.oneandone.get_key_filename(vm_)
    Check SSH private key file and return absolute path if exists.

salt.cloud.clouds.oneandone.get_node(conn, name)
    Return a node for the named VM

salt.cloud.clouds.oneandone.get_size(vm_)
    Return the VM’s size object

salt.cloud.clouds.oneandone.get_wait_timeout(vm_)
    Return the wait_for_timeout for resource provisioning.

salt.cloud.clouds.oneandone.list_nodes(conn=None, call=None)
    Return a list of VMs that are on the provider

salt.cloud.clouds.oneandone.list_nodes_full(conn=None, call=None)
    Return a list of the VMs that are on the provider, with all fields

salt.cloud.clouds.oneandone.list_nodes_select(conn=None, call=None)
    Return a list of the VMs that are on the provider, with select fields

salt.cloud.clouds.oneandone.load_public_key(vm_)
    Load the public key file if exists.

salt.cloud.clouds.oneandone.reboot(name, call=None)
    reboot a server by name
    :param name: name given to the machine
    :param call: call value in this case is ‘action’
    :return: true if successful

CLI Example:
salt-cloud -a reboot vm_name
```

```
salt.cloud.clouds.oneandone.script(vm_)
    Return the script deployment object

salt.cloud.clouds.oneandone.show_instance(name, call=None)
    Show the details from the provider concerning an instance
```
**salt.cloud.clouds.oneandone.start**(*name*, *call=None*)

Start a server by name:
- :param name: name given to the machine
- :param call: call value in this case is 'action'
- :return: true if successful

CLI Example:
```
salt-cloud -a start vm_name
```

**salt.cloud.clouds.oneandone.stop**(*name*, *call=None*)

Stop a server by name:
- :param name: name given to the machine
- :param call: call value in this case is 'action'
- :return: true if successful

CLI Example:
```
salt-cloud -a stop vm_name
```

---

**21.4.16 salt.cloud.clouds.opennebula**

**OpenNebula Cloud Module**

The OpenNebula cloud module is used to control access to an OpenNebula cloud.

New in version 2014.7.0.

- **depends** lxml
- **depends** OpenNebula installation running version 4.14 or later.

Use of this module requires the `xml_rpc`, `user`, and `password` parameters to be set.

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/opennebula.conf`:

```yaml
my-opennebula-config:
  xml_rpc: http://localhost:2633/RPC2
  user: oneadmin
  password: JHGhgsayu32jsa
  driver: opennebula
```

This driver supports accessing new VM instances via DNS entry instead of IP address. To enable this feature, in the provider or profile file add `fqdn_base` with a value matching the base of your fully-qualified domain name. Example:

```yaml
my-opennebula-config:
  [...]
  fqdn_base: <my.basedomain.com>
  [...]
```

The driver will prepend the hostname to the `fqdn_base` and do a DNS lookup to find the IP of the new VM.

```
salt-cloud -f image_allocate opennebula datastore_name=default \
  data='NAME="My New Image" DESCRIPTION="Description of the image." \
  PATH=/home/one_user/images/image_name.img'
salt-cloud -f secgroupAllocate opennebula \
  data="Name = test RULE = [PROTOCOL = TCP, RULE_TYPE = inbound, \
  RANGE = 1000:2000]"
salt.cloud.clouds.opennebula.avail_images(call=None)
```

Return available OpenNebula images.
CLI Example:

```bash
salt-cloud --list-images opennebula
salt-cloud --function avail_images opennebula
salt-cloud -f avail_images opennebula
```

```
salt.cloud.clouds.opennebula.avail_locations(call=None)
Return available OpenNebula locations.
```

CLI Example:

```bash
salt-cloud --list-locations opennebula
salt-cloud --function avail_locations opennebula
salt-cloud -f avail_locations opennebula
```

```
salt.cloud.clouds.opennebula.avail_sizes(call=None)
Because sizes are built into templates with OpenNebula, there will be no sizes to return here.
```

```
salt.cloud.clouds.opennebula.create(vm_)
Create a single VM from a data dict.

vm_  The dictionary use to create a VM.

Optional vm_ dict options for overwriting template:

region_id  Optional - OpenNebula Zone ID
memory  Optional - In MB
cpu  Optional - Percent of host CPU to allocate
vcpu  Optional - Amount of vCPUs to allocate
```

CLI Example:

```bash
salt-cloud -p my-opennebula-profile vm_name
salt-cloud -p my-opennebula-profile vm_name memory=16384 cpu=2.5 vcpu=16
```

```
salt.cloud.clouds.opennebula.destroy(name, call=None)
Destroy a node. Will check termination protection and warn if enabled.

name  The name of the vm to be destroyed.
```

CLI Example:

```bash
salt-cloud --destroy vm_name
salt-cloud -d vm_name
salt-cloud --action destroy vm_name
salt-cloud -a destroy vm_name
```

```
salt.cloud.clouds.opennebula.get_cluster_id(kwargs=None, call=None)
Returns a cluster's ID from the given cluster name.

New in version 2016.3.0.
```

CLI Example:

```bash
salt-cloud -f get_cluster_id opennebula name=my-cluster-name
```
salt.cloud.clouds.opennebula.get_configured_provider()
Return the first configured instance.

salt.cloud.clouds.opennebula.get_datastore_id(**kwargs=None, **call=None)
Returns a data store's ID from the given data store name.
New in version 2016.3.0.
CLI Example:
```
salt-cloud -f get_datastore_id opennebula name=my-datastore-name
```

salt.cloud.clouds.opennebula.get_dependencies()
Warn if dependencies aren't met.

salt.cloud.clouds.opennebula.get_host_id(**kwargs=None, **call=None)
Returns a host's ID from the given host name.
New in version 2016.3.0.
CLI Example:
```
salt-cloud -f get_host_id opennebula name=my-host-name
```

salt.cloud.clouds.opennebula.get_image(**vm_)
Return the image object to use.
  **vm_** The VM dictionary for which to obtain an image.

salt.cloud.clouds.opennebula.get_image_id(**kwargs=None, **call=None)
Returns an image's ID from the given image name.
New in version 2016.3.0.
CLI Example:
```
salt-cloud -f get_image_id opennebula name=my-image-name
```

salt.cloud.clouds.opennebula.get_location(**vm_)
Return the VM's location.
  **vm_** The VM dictionary for which to obtain a location.

salt.cloud.clouds.opennebula.get_one_version(**kwargs=None, **call=None)
Returns the OpenNebula version.
New in version 2016.3.5.
CLI Example:
```
salt-cloud -f get_one_version one_provider_name
```

salt.cloud.clouds.opennebula.get_secgroup_id(**kwargs=None, **call=None)
Returns a security group's ID from the given security group name.
New in version 2016.3.0.
CLI Example:
```
salt-cloud -f get_secgroup_id opennebula name=my-secgroup-name
```

salt.cloud.clouds.opennebula.get_template(**vm_)
Return the template id for a VM.
New in version 2016.11.0.

vm_ The VM dictionary for which to obtain a template.

```
salt.cloud.clouds.opennebula.get_template_id(**kwargs=None, call=None)
```

Returns a template's ID from the given template name.

New in version 2016.3.0.

CLI Example:

```
salt-cloud -f get_template_id opennebula name=my-template-name
```

```
salt.cloud.clouds.opennebula.get_template_image(**kwargs=None, call=None)
```

Returns a template's image from the given template name.

New in version 2018.3.0.

CLI Example:

```
salt-cloud -f get_template_image opennebula name=my-template-name
```

```
salt.cloud.clouds.opennebula.get_vm_id(**kwargs=None, call=None)
```

Returns a virtual machine's ID from the given virtual machine's name.

New in version 2016.3.0.

CLI Example:

```
salt-cloud -f get_vm_id opennebula name=my-vm
```

```
salt.cloud.clouds.opennebula.get_vn_id(**kwargs=None, call=None)
```

Returns a virtual network's ID from the given virtual network's name.

New in version 2016.3.0.

CLI Example:

```
salt-cloud -f get_vn_id opennebula name=my-vn-name
```

```
salt.cloud.clouds.opennebula.image_allocate(**kwargs=None, call=None)
```

Allocates a new image in OpenNebula.

New in version 2016.3.0.

path The path to a file containing the template of the image to allocate. Syntax within the file can be the usual attribute=value or XML. Can be used instead of data.

data The data containing the template of the image to allocate. Syntax can be the usual attribute=value or XML. Can be used instead of path.

datastore_id The ID of the data-store to be used for the new image. Can be used instead of datastore_name.

datastore_name The name of the data-store to be used for the new image. Can be used instead of datastore_id.

CLI Example:

```
salt-cloud -f image_allocate opennebula path=/path/to/image_file.txt datastore_id=1
```

```
salt-cloud -f image_allocate opennebula datastore_name=default \\
    data='NAME="Ubuntu 14.04" PATH="/home/one_user/images/ubuntu_desktop.img" \\
    DESCRIPTION="Ubuntu 14.04 for development."'
```
salt.cloud.clouds.opennebula.image_clone(call=None, kwargs=None)
Clones an existing image.
New in version 2016.3.0.
name The name of the new image.
image_id The ID of the image to be cloned. Can be used instead of image_name.
image_name The name of the image to be cloned. Can be used instead of image_id.
CLI Example:
salt-cloud -f image_clone opennebula name=my-new-image image_id=10
salt-cloud -f image_clone opennebula name=my-new-image image_name=my-image-to-clone

salt.cloud.clouds.opennebula.image_delete(call=None, kwargs=None)
Deletes the given image from OpenNebula. Either a name or an image_id must be supplied.
New in version 2016.3.0.
name The name of the image to delete. Can be used instead of image_id.
image_id The ID of the image to delete. Can be used instead of name.
CLI Example:
salt-cloud -f image_delete opennebula name=my-image
salt-cloud --function image_delete opennebula image_id=100

salt.cloud.clouds.opennebula.image_info(call=None, kwargs=None)
Retrieves information for a given image. Either a name or an image_id must be supplied.
New in version 2016.3.0.
name The name of the image for which to gather information. Can be used instead of image_id.
image_id The ID of the image for which to gather information. Can be used instead of name.
CLI Example:
salt-cloud -f image_info opennebula name=my-image
salt-cloud --function image_info opennebula image_id=5

salt.cloud.clouds.opennebula.image_persistent(call=None, kwargs=None)
Sets the Image as persistent or not persistent.
New in version 2016.3.0.
name The name of the image to set. Can be used instead of image_id.
image_id The ID of the image to set. Can be used instead of name.
persist A boolean value to set the image as persistent or not. Set to true for persistent, false for non-persistent.
CLI Example:
salt-cloud -f image.persistent opennebula name=my-image persist=True
salt-cloud --function image.persistent opennebula image_id=5 persist=False

salt.cloud.clouds.opennebula.image_snapshot_delete(call=None, kwargs=None)
Deletes a snapshot from the image.
New in version 2016.3.0.
**image_id**  The ID of the image from which to delete the snapshot. Can be used instead of `image_name`.

**image_name**  The name of the image from which to delete the snapshot. Can be used instead of `image_id`.

**snapshot_id**  The ID of the snapshot to delete.

CLI Example:

```
salt-cloud -f image_snapshot_delete vm_id=106 snapshot_id=45
salt-cloud -f image_snapshot_delete vm_name=my-vm snapshot_id=111
```

```
salt.cloud.clouds.opennebula.image_snapshot_flatten(call=None, kwargs=None)
```

Flattens the snapshot of an image and discards others.

New in version 2016.3.0.

**image_id**  The ID of the image. Can be used instead of `image_name`.

**image_name**  The name of the image. Can be used instead of `image_id`.

**snapshot_id**  The ID of the snapshot to flatten.

CLI Example:

```
salt-cloud -f image_snapshot_flatten vm_id=106 snapshot_id=45
salt-cloud -f image_snapshot_flatten vm_name=my-vm snapshot_id=45
```

```
salt.cloud.clouds.opennebula.image_snapshot_revert(call=None, kwargs=None)
```

Reverts an image state to a previous snapshot.

New in version 2016.3.0.

**image_id**  The ID of the image to revert. Can be used instead of `image_name`.

**image_name**  The name of the image to revert. Can be used instead of `image_id`.

**snapshot_id**  The ID of the snapshot to which the image will be reverted.

CLI Example:

```
salt-cloud -f image_snapshot_revert vm_id=106 snapshot_id=45
salt-cloud -f image_snapshot_revert vm_name=my-vm snapshot_id=120
```

```
salt.cloud.clouds.opennebula.image_update(call=None, kwargs=None)
```

Replaces the image template contents.

New in version 2016.3.0.

**image_id**  The ID of the image to update. Can be used instead of `image_name`.

**image_name**  The name of the image to update. Can be used instead of `image_id`.

**path**  The path to a file containing the template of the image. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

**data**  Contains the template of the image. Syntax can be the usual attribute=value or XML. Can be used instead of `path`.

**update_type**  There are two ways to update an image: replace the whole template or merge the new template with the existing one.

CLI Example:
salt-cloud -f image_update opennebula 
  image_id=0 file=/path/to/image_update_file.
  update_type=replace
salt-cloud -f image_update opennebula 
  image_name="Ubuntu 14.04" update_type=merge
data='NAME="Ubuntu Dev" PATH="/home/one_user/images/ubuntu_desktop.img" 
  DESCRIPTION = "Ubuntu 14.04 for development."'

salt.cloud.clouds.opennebula.list_clusters
Returns a list of clusters in OpenNebula.

New in version 2016.3.0.

CLI Example:
salt-cloud -f list_clusters opennebula

salt.cloud.clouds.opennebula.list_datastores
Returns a list of data stores on OpenNebula.

New in version 2016.3.0.

CLI Example:
salt-cloud -f list_datastores opennebula

salt.cloud.clouds.opennebula.list_hosts
Returns a list of hosts on OpenNebula.

New in version 2016.3.0.

CLI Example:
salt-cloud -f list_hosts opennebula

salt.cloud.clouds.opennebula.list_nodes
Return a list of VMs on OpenNebula.

CLI Example:
salt-cloud -Q
salt-cloud --query
salt-cloud --function list_nodes opennebula
salt-cloud -f list_nodes opennebula

salt.cloud.clouds.opennebula.list_nodes_full
Return a list of the VMs on OpenNebula.

CLI Example:
salt-cloud -F
salt-cloud --full-query
salt-cloud --function list_nodes_full opennebula
salt-cloud -f list_nodes_full opennebula

salt.cloud.clouds.opennebula.list_nodes_select
Return a list of the VMs that are on the provider, with select fields.

salt.cloud.clouds.opennebula.list_security_groups
Lists all security groups available to the user and the user's groups.

New in version 2016.3.0.
CLI Example:
```
salt-cloud -f list_security_groups opennebula
```

salt.cloud.clouds.opennebula.list_templates(call=None)
Lists all templates available to the user and the user's groups.
New in version 2016.3.0.
CLI Example:
```
salt-cloud -f list_templates opennebula
```

salt.cloud.clouds.opennebula.list_vns(call=None)
Lists all virtual networks available to the user and the user's groups.
New in version 2016.3.0.
CLI Example:
```
salt-cloud -f list_vns opennebula
```

salt.cloud.clouds.opennebula.reboot(name, call=None)
Reboot a VM.
New in version 2016.3.0.
name  The name of the VM to reboot.
CLI Example:
```
salt-cloud -a reboot my-vm
```

salt.cloud.clouds.opennebula.secgroup_allocate(call=None, kwargs=None)
Allocates a new security group in OpenNebula.
New in version 2016.3.0.
path  The path to a file containing the template of the security group. Syntax within the file can be the usual attribute=value or XML. Can be used instead of data.
data  The template data of the security group. Syntax can be the usual attribute=value or XML. Can be used instead of path.
CLI Example:
```
salt-cloud -f secgroup_allocate opennebula path=/path/to/secgroup_file.txt
salt-cloud -f secgroup_allocate opennebula \ 
    data="NAME = test RULE = [PROTOCOL = TCP, RULE_TYPE = inbound, \ 
    RANGE = 1000:2000]"
```

salt.cloud.clouds.opennebula.secgroup_clone(call=None, kwargs=None)
Clones an existing security group.
New in version 2016.3.0.
name  The name of the new template.
secgroup_id  The ID of the security group to be cloned. Can be used instead of secgroup_name.
secgroup_name  The name of the security group to be cloned. Can be used instead of secgroup_id.
CLI Example:
salt-cloud -f secgroup_clone opennebula name=my-cloned-secgroup secgroup_id=0
salt-cloud -f secgroup_clone opennebula name=my-cloned-secgroup secgroup_name=my-secgroup

salt.cloud.clouds.opennebula.secgoup_delete(*call=None, kwargs=None*)
Deletes the given security group from OpenNebula. Either a name or a secgroup_id must be supplied.

New in version 2016.3.0.

name The name of the security group to delete. Can be used instead of secgroup_id.
secgroup_id The ID of the security group to delete. Can be used instead of name.

CLI Example:
salt-cloud -f secgroup_delete opennebula name=my-secgroup
salt-cloud --function secgroup_delete opennebula secgroup_id=100

salt.cloud.clouds.opennebula.secgoup_info(*call=None, kwargs=None*)
Retrieves information for the given security group. Either a name or a secgroup_id must be supplied.

New in version 2016.3.0.

name The name of the security group for which to gather information. Can be used instead of secgroup_id.
secgroup_id The ID of the security group for which to gather information. Can be used instead of name.

CLI Example:
salt-cloud -f secgroup_info opennebula name=my-secgroup
salt-cloud --function secgroup_info opennebula secgroup_id=5

salt.cloud.clouds.opennebula.secgoup_update(*call=None, kwargs=None*)
Replaces the security group template contents.

New in version 2016.3.0.

secgroup_id The ID of the security group to update. Can be used instead of secgroup_name.
secgroup_name The name of the security group to update. Can be used instead of secgroup_id.
path The path to a file containing the template of the security group. Syntax within the file can be the usual attribute=value or XML. Can be used instead of data.
data The template data of the security group. Syntax can be the usual attribute=value or XML. Can be used instead of path.
update_type There are two ways to update a security group: replace the whole template or merge the new template with the existing one.

CLI Example:
salt-cloud --function secgroup_update opennebula secgroup_id=100 \
    path=/path/to/secgroup_update_file.txt \
    update_type=replace
salt-cloud -f secgroup_update opennebula secgroup_name=my-secgroup update_ \
    type=merge \
    data="Name = test RULE = [PROTOCOL = TCP, RULE_TYPE = inbound, RANGE =0 \
    1000:2000]"

salt.cloud.clouds.opennebula.show_instance(name, call=None)
Show the details from OpenNebula concerning a named VM.
name  The name of the VM for which to display details.
call  Type of call to use with this function such as function.

CLI Example:

```
salt-cloud --action show_instance vm_name
salt-cloud -a show_instance vm_name
```

```
salt.cloud.clouds.opennebula.start(name, call=None)
Start a VM.
New in version 2016.3.0.
name  The name of the VM to start.

CLI Example:

```
salt-cloud -a start my-vm
```

```
salt.cloud.clouds.opennebula.stop(name, call=None)
Stop a VM.
New in version 2016.3.0.
name  The name of the VM to stop.

CLI Example:

```
salt-cloud -a stop my-vm
```

```
salt.cloud.clouds.opennebula.template_allocate(call=None, kwargs=None)
Allocates a new template in OpenNebula.
New in version 2016.3.0.
path  The path to a file containing the elements of the template to be allocated. Syntax within the file can be the usual attribute=value or XML. Can be used instead of data.

data  Contains the elements of the template to be allocated. Syntax can be the usual attribute=value or XML. Can be used instead of path.

CLI Example:

```
salt-cloud -f template_allocate opennebula path=/path/to/template_file.txt
salt-cloud -f template_allocate opennebula \
    data='CPU="1.0" DISK=[IMAGE="Ubuntu-14.04"] GRAPHICS=[LISTEN="0.0.0.0",TYPE="vnc"] \ 
    MEMORY="1024" NETWORK="yes" NIC=[NETWORK="192net",NETWORK_UNAME="oneadmin"] \ 
    OS=[ARCH="x86_64"] SUNSTONE_CAPACITY_SELECT="YES" SUNSTONE_NETWORK_SELECT="YES \ 
    VCPU="1"
```

```
salt.cloud.clouds.opennebula.template_clone(call=None, kwargs=None)
Clones an existing virtual machine template.
New in version 2016.3.0.
name  The name of the new template.
template_id  The ID of the template to be cloned. Can be used instead of template_name.
template_name  The name of the template to be cloned. Can be used instead of template_id.
clone_images Optional, defaults to False. Indicates if the images attached to the template should be cloned as well.

CLI Example:

```
salt-cloud -f template_clone opennebula name=my-new-template template_id=0
salt-cloud -f template_clone opennebula name=my-new-template template_name=my-template
```

call:
salt.cloud.clouds.opennebula.template_delete(call=None, kwargs=None)

Deletes the given template from OpenNebula. Either a name or a template_id must be supplied.

New in version 2016.3.0.

name The name of the template to delete. Can be used instead of template_id.

template_id The ID of the template to delete. Can be used instead of name.

CLI Example:

```
salt-cloud -f template_delete opennebula name=my-template
salt-cloud --function template_delete opennebula template_id=5
```

call:
salt.cloud.clouds.opennebula.template_instantiate(call=None, kwargs=None)

Instantiates a new virtual machine from a template.

New in version 2016.3.0.

Note: template_instantiate creates a VM on OpenNebula from a template, but it does not install Salt on the new VM. Use the create function for that functionality: salt-cloud -p opennebula-profile vm-name.

vm_name Name for the new VM instance.

template_id The ID of the template from which the VM will be created. Can be used instead of template_name.

template_name The name of the template from which the VM will be created. Can be used instead of template_id.

CLI Example:

```
salt-cloud -f template_instantiate opennebula vm_name=my-new-vm template_id=0
```

call:
salt.cloud.clouds.opennebula.template_update(call=None, kwargs=None)

Replaces the template contents.

New in version 2016.3.0.

template_id The ID of the template to update. Can be used instead of template_name.

template_name The name of the template to update. Can be used instead of template_id.

path The path to a file containing the elements of the template to be updated. Syntax within the file can be the usual attribute=value or XML. Can be used instead of data.

data Contains the elements of the template to be updated. Syntax can be the usual attribute=value or XML. Can be used instead of path.

update_type There are two ways to update a template: replace the whole template or merge the new template with the existing one.
CLI Example:

```
salt-cloud --function template_update opennebula template_id=1 update_  
  type=replace path=/path/to/template_update_file.txt
salt-cloud -f template_update opennebula template_name=my-template update_  
  type=merge data='CPU="1.0" DISK=[IMAGE="Ubuntu-14.04"] GRAPHICS=[LISTEN="0.0.0.0",TYPE=  
  "vnc"] MEMORY="1024" NETWORK="yes" NIC=[NETWORK="192net",NETWORK_UNAME="oneadmin"] \  
  OS=[ARCH="x86_64"] SUNSTONE_CAPACITY_SELECT="YES" SUNSTONE_NETWORK_SELECT="YES  
  VCPU="1"'
```

class `salt.cloud.clouds.opennebula.vm_action` *(name, kwargs=None, call=None)*

Submits an action to be performed on a given virtual machine.

New in version 2016.3.0.

**name**  The name of the VM to action.

**action**

The action to be performed on the VM. Available options include:

- boot
- delete
- delete-recreate
- hold
- poweroff
- poweroff-hard
- reboot
- reboot-hard
- release
- resched
- resume
- shutdown
- shutdown-hard
- stop
- suspend
- undeploy
- undeploy-hard
- unresched

CLI Example:

```
salt-cloud -a vm_action my-vm action='release'
```
salt.cloud.clouds.opennebula.vm_allocate(call=None, kwargs=None)

Allocates a new virtual machine in OpenNebula.

New in version 2016.3.0.

- **path** The path to a file defining the template of the VM to allocate. Syntax within the file can be the usual attribute=value or XML. Can be used instead of **data**.
- **data** Contains the template definitions of the VM to allocate. Syntax can be the usual attribute=value or XML. Can be used instead of **path**.

- **hold** If this parameter is set to True, the VM will be created in the HOLD state. If not set, the VM is created in the PENDING state. Default is False.

CLI Example:

```
salt-cloud -f vm_allocate path=/path/to/vm_template.txt
salt-cloud --function vm_allocate path=/path/to/vm_template.txt hold=True
```

salt.cloud.clouds.opennebula.vm_attach(name, kwargs=None, call=None)

Attaches a new disk to the given virtual machine.

New in version 2016.3.0.

- **name** The name of the VM for which to attach the new disk.
- **path** The path to a file containing a single disk vector attribute. Syntax within the file can be the usual attribute=value or XML. Can be used instead of **data**.
- **data** Contains the data needed to attach a single disk vector attribute. Syntax can be the usual attribute=value or XML. Can be used instead of **path**.

CLI Example:

```
salt-cloud -a vm_attach my-vm path=/path/to/disk_file.txt
salt-cloud -a vm_attach my-vm data="DISK=[DISK_ID=1]"
```

salt.cloud.clouds.opennebula.vm_attach_nic(name, kwargs=None, call=None)

Attaches a new network interface to the given virtual machine.

New in version 2016.3.0.

- **name** The name of the VM for which to attach the new network interface.
- **path** The path to a file containing a single NIC vector attribute. Syntax within the file can be the usual attribute=value or XML. Can be used instead of **data**.
- **data** Contains the single NIC vector attribute to attach to the VM. Syntax can be the usual attribute=value or XML. Can be used instead of **path**.

CLI Example:

```
salt-cloud -a vm_attach_nic my-vm path=/path/to/nic_file.txt
salt-cloud -a vm_attach_nic my-vm data="NIC=[NETWORK_ID=1]"
```

salt.cloud.clouds.opennebula.vm_deploy(name, kwargs=None, call=None)

Initiates the instance of the given VM on the target host.

New in version 2016.3.0.

- **name** The name of the VM to deploy.
- **host_id** The ID of the target host where the VM will be deployed. Can be used instead of **host_name**.
- **host_name** The name of the target host where the VM will be deployed. Can be used instead of **host_id**.
capacity_maintained  True to enforce the Host capacity is not over-committed. This parameter is only acknowledged for users in the oneadmin group. Host capacity will be always enforced for regular users.

datastore_id  The ID of the target system data-store where the VM will be deployed. Optional and can be used instead of datastore_name. If neither datastore_id nor datastore_name are set, OpenNebula will choose the data-store.

datastore_name  The name of the target system data-store where the VM will be deployed. Optional, and can be used instead of datastore_id. If neither datastore_id nor datastore_name are set, OpenNebula will choose the data-store.

CLI Example:

```
salt-cloud -a vm_deploy my-vm host_id=0
salt-cloud -a vm_deploy my-vm host_id=1 capacity_maintained=False
salt-cloud -a vm_deploy my-vm host_name=host01 datastore_id=1
```

salt.cloud.clouds.opennebula.vm_detach(name, kwargs=None, call=None)
Detaches a disk from a virtual machine.

New in version 2016.3.0.

name  The name of the VM from which to detach the disk.

disk_id  The ID of the disk to detach.

CLI Example:

```
salt-cloud -a vm_detach my-vm disk_id=1
```

salt.cloud.clouds.opennebula.vm_detach_nic(name, kwargs=None, call=None)
Detaches a disk from a virtual machine.

New in version 2016.3.0.

name  The name of the VM from which to detach the network interface.

nic_id  The ID of the nic to detach.

CLI Example:

```
salt-cloud -a vm_detach_nic my-vm nic_id=1
```

salt.cloud.clouds.opennebula.vm_disk_save(name, kwargs=None, call=None)
Sets the disk to be saved in the given image.

New in version 2016.3.0.

name  The name of the VM containing the disk to save.

disk_id  The ID of the disk to save.

image_name  The name of the new image where the disk will be saved.

image_type  The type for the new image. If not set, then the default ONED Configuration will be used. Other valid types include: OS, CDROM, DATABLOCK, KERNEL, RAMDISK, and CONTEXT.

snapshot_id  The ID of the snapshot to export. If not set, the current image state will be used.

CLI Example:

```
salt-cloud -a vm_disk_save my-vm disk_id=1 image_name=my-new-image
salt-cloud -a vm_disk_save my-vm disk_id=1 image_name=my-new-image image_type=CONTEXT snapshot_id=10
```
(continues on next page)
salt.cloud.clouds.opennebula.vm_disk_snapshot_create(name, kwargs=None, call=None)

Takes a new snapshot of the disk image.

New in version 2016.3.0.

name  The name of the VM of which to take the snapshot.

disk_id  The ID of the disk to save.

description  The description for the snapshot.

CLI Example:
```
salt-cloud -a vm_disk_snapshot_create my-vm disk_id=0 description="My Snapshot Description"
```

salt.cloud.clouds.opennebula.vm_disk_snapshot_delete(name, kwargs=None, call=None)

Deletes a disk snapshot based on the given VM and the disk_id.

New in version 2016.3.0.

name  The name of the VM containing the snapshot to delete.

disk_id  The ID of the disk to save.

snapshot_id  The ID of the snapshot to be deleted.

CLI Example:
```
salt-cloud -a vm_disk_snapshot_delete my-vm disk_id=0 snapshot_id=6
```

salt.cloud.clouds.opennebula.vm_disk_snapshot_revert(name, kwargs=None, call=None)

Reverts a disk state to a previously taken snapshot.

New in version 2016.3.0.

name  The name of the VM containing the snapshot.

disk_id  The ID of the disk to revert its state.

snapshot_id  The ID of the snapshot to which the snapshot should be reverted.

CLI Example:
```
salt-cloud -a vm_disk_snapshot_revert my-vm disk_id=0 snapshot_id=6
```

salt.cloud.clouds.opennebula.vm_info(name, call=None)

Retrieves information for a given virtual machine. A VM name must be supplied.

New in version 2016.3.0.

name  The name of the VM for which to gather information.

CLI Example:
```
salt-cloud -a vm_info my-vm
```
salt.cloud.clouds.opennebula.vm_migrate(name, kwargs=None, call=None)
Migrates the specified virtual machine to the specified target host.

New in version 2016.3.0.

name The name of the VM to migrate.
host_id The ID of the host to which the VM will be migrated. Can be used instead of host_name.
host_name The name of the host to which the VM will be migrated. Can be used instead of host_id.
live_migration If set to True, a live-migration will be performed. Default is False.
capacity_maintained True to enforce the Host capacity is not over-committed. This parameter is only acknowledged for users in the oneadmin group. Host capacity will be always enforced for regular users.
datastore_id The target system data-store ID where the VM will be migrated. Can be used instead of datastore_name.
datastore_name The name of the data-store target system where the VM will be migrated. Can be used instead of datastore_id.

CLI Example:
salt-cloud -a vm_migrate my-vm host_id=0 datastore_id=1
salt-cloud -a vm_migrate my-vm host_id=0 datastore_id=1 live_migration=True
salt-cloud -a vm_migrate my-vm host_name=host01 datastore_name=default

salt.cloud.clouds.opennebula.vm_monitoring(name, call=None)
Returns the monitoring records for a given virtual machine. A VM name must be supplied.

The monitoring information returned is a list of VM elements. Each VM element contains the complete dictionary of the VM with the updated information returned by the poll action.

New in version 2016.3.0.

name The name of the VM for which to gather monitoring records.

CLI Example:
salt-cloud -a vm_monitoring my-vm

salt.cloud.clouds.opennebula.vm_resize(name, kwargs=None, call=None)
Changes the capacity of the virtual machine.

New in version 2016.3.0.

name The name of the VM to resize.
path The path to a file containing new capacity elements CPU, VCPU, MEMORY. If one of them is not present, or its value is 0, the VM will not be re-sized. Syntax within the file can be the usual attribute=value or XML. Can be used instead of data.
data Contains the new capacity elements CPU, VCPU, and MEMORY. If one of them is not present, or its value is 0, the VM will not be re-sized. Can be used instead of path.
capacity_maintained True to enforce the Host capacity is not over-committed. This parameter is only acknowledged for users in the oneadmin group. Host capacity will be always enforced for regular users.

CLI Example:
salt.cloud.clouds.opennebula.vm_snapshot_create(\texttt{vm\_name}, \texttt{kwargs=None, call=None})
Creates a new virtual machine snapshot from the provided VM.
New in version 2016.3.0.
\textbf{vm\_name} The name of the VM from which to create the snapshot.
\textbf{snapshot\_name} The name of the snapshot to be created.
CLI Example:
\begin{verbatim}
salt-cloud -a vm\_snapshot\_create my-vm snapshot\_name=my-new-snapshot
\end{verbatim}

salt.cloud.clouds.opennebula.vm_snapshot_delete(\texttt{vm\_name}, \texttt{kwargs=None, call=None})
Deletes a virtual machine snapshot from the provided VM.
New in version 2016.3.0.
\textbf{vm\_name} The name of the VM from which to delete the snapshot.
\textbf{snapshot\_id} The ID of the snapshot to be deleted.
CLI Example:
\begin{verbatim}
salt-cloud -a vm\_snapshot\_delete my-vm snapshot\_id=8
\end{verbatim}

salt.cloud.clouds.opennebula.vm_snapshot_revert(\texttt{vm\_name}, \texttt{kwargs=None, call=None})
Reverts a virtual machine to a snapshot
New in version 2016.3.0.
\textbf{vm\_name} The name of the VM to revert.
\textbf{snapshot\_id} The snapshot ID.
CLI Example:
\begin{verbatim}
salt-cloud -a vm\_snapshot\_revert my-vm snapshot\_id=42
\end{verbatim}

salt.cloud.clouds.opennebula.vm_update(\texttt{name, kwargs=None, call=None})
Replaces the user template contents.
New in version 2016.3.0.
\textbf{name} The name of the VM to update.
\textbf{path} The path to a file containing new user template contents. Syntax within the file can be the usual attribute=value or XML. Can be used instead of data.
\textbf{data} Contains the new user template contents. Syntax can be the usual attribute=value or XML. Can be used instead of path.
\textbf{update\_type} There are two ways to update a VM: replace the whole template or merge the new template with the existing one.
CLI Example:
\begin{verbatim}
salt-cloud -a vm\_update my-vm path=/path/to/user\_template\_file.txt update\_type='replace'
\end{verbatim}
salt.cloud.clouds.opennebula.vn_add_ar(call=None, kwargs=None)
Adds address ranges to a given virtual network.
New in version 2016.3.0.

- **vn_id** The ID of the virtual network to add the address range. Can be used instead of **vn_name**.
- **vn_name** The name of the virtual network to add the address range. Can be used instead of **vn_id**.
- **path** The path to a file containing the template of the address range to add. Syntax within the file can be the usual attribute=value or XML. Can be used instead of **data**.
- **data** Contains the template of the address range to add. Syntax can be the usual attribute=value or XML. Can be used instead of **path**.

CLI Example:

```bash
salt-cloud -f vn_add_ar opennebula vn_id=3 path=/path/to/address_range.txt
salt-cloud -f vn_add_ar opennebula vn_name=my-vn \
   data="AR=[TYPE=IP4, IP=192.168.0.5, SIZE=10]"
```

salt.cloud.clouds.opennebula.vn_allocate(call=None, kwargs=None)
Allocates a new virtual network in OpenNebula.
New in version 2016.3.0.

- **path** The path to a file containing the template of the virtual network to allocate. Syntax within the file can be the usual attribute=value or XML. Can be used instead of **data**.
- **data** Contains the template of the virtual network to allocate. Syntax can be the usual attribute=value or XML. Can be used instead of **path**.
- **cluster_id** The ID of the cluster for which to add the new virtual network. Can be used instead of **cluster_name**. If neither **cluster_id** nor **cluster_name** are provided, the virtual network won't be added to any cluster.
- **cluster_name** The name of the cluster for which to add the new virtual network. Can be used instead of **cluster_id**. If neither **cluster_name** nor **cluster_id** are provided, the virtual network won't be added to any cluster.

CLI Example:

```bash
salt-cloud -f vn_allocate opennebula path=/path/to/vn_file.txt
```

salt.cloud.clouds.opennebula.vn_delete(call=None, kwargs=None)
Deletes the given virtual network from OpenNebula. Either a name or a vn_id must be supplied.
New in version 2016.3.0.

- **name** The name of the virtual network to delete. Can be used instead of **vn_id**.
- **vn_id** The ID of the virtual network to delete. Can be used instead of **name**.

CLI Example:

```bash
salt-cloud -f vn_delete opennebula name=my-virtual-network
salt-cloud --function vn_delete opennebula vn_id=3
```

salt.cloud.clouds.opennebula.vn_free_ar(call=None, kwargs=None)
Frees a reserved address range from a virtual network.
New in version 2016.3.0.

- **vn_id** The ID of the virtual network from which to free an address range. Can be used instead of **vn_name**.
vn_name  The name of the virtual network from which to free an address range. Can be used instead of vn_id.

ar_id  The ID of the address range to free.

CLI Example:

```bash
salt-cloud -f vn_free_ar opennebula vn_id=3 ar_id=1
salt-cloud -f vn_free_ar opennebula vn_name=my-vn ar_id=1
```

salt.cloud.clouds.opennebula.vn_hold(call=None, kwargs=None)

Holds a virtual network lease as used.

New in version 2016.3.0.

- **vn_id**  The ID of the virtual network from which to hold the lease. Can be used instead of vn_name.
- **vn_name**  The name of the virtual network from which to hold the lease. Can be used instead of vn_id.
- **path**  The path to a file defining the template of the lease to hold. Syntax within the file can be the usual attribute=value or XML. Can be used instead of data.
- **data**  Contains the template of the lease to hold. Syntax can be the usual attribute=value or XML. Can be used instead of path.

CLI Example:

```bash
salt-cloud -f vn_hold opennebula vn_id=3 path=/path/to/vn_hold_file.txt
salt-cloud -f vn_hold opennebula vn_name=my-vn data="LEASES=[IP=192.168.0.5]"
```

salt.cloud.clouds.opennebula.vn_info(call=None, kwargs=None)

Retrieves information for the virtual network.

New in version 2016.3.0.

- **name**  The name of the virtual network for which to gather information. Can be used instead of vn_id.
- **vn_id**  The ID of the virtual network for which to gather information. Can be used instead of name.

CLI Example:

```bash
salt-cloud -f vn_info opennebula vn_id=3
salt-cloud --function vn_info opennebula name=public
```

salt.cloud.clouds.opennebula.vn_release(call=None, kwargs=None)

Releases a virtual network lease that was previously on hold.

New in version 2016.3.0.

- **vn_id**  The ID of the virtual network from which to release the lease. Can be used instead of vn_name.
- **vn_name**  The name of the virtual network from which to release the lease. Can be used instead of vn_id.
- **path**  The path to a file defining the template of the lease to release. Syntax within the file can be the usual attribute=value or XML. Can be used instead of data.
- **data**  Contains the template defining the lease to release. Syntax can be the usual attribute=value or XML. Can be used instead of path.

CLI Example:

```bash
salt-cloud -f vn_release opennebula vn_id=3 path=/path/to/vn_release_file.txt
salt-cloud -f vn_release opennebula vn_name=my-vn data="LEASES=[IP=192.168.0.5]"
```
salt.cloud.clouds.opennebula.vn_reserve(call=None, kwargs=None)
Reserve network addresses.

New in version 2016.3.0.

vn_id  The ID of the virtual network from which to reserve addresses. Can be used instead of vn_name.

vn_name  The name of the virtual network from which to reserve addresses. Can be used instead of vn_id.

path  The path to a file defining the template of the address reservation. Syntax within the file can be the usual attribute=value or XML. Can be used instead of data.

data  Contains the template defining the address reservation. Syntax can be the usual attribute=value or XML. Data provided must be wrapped in double quotes. Can be used instead of path.

CLI Example:

```
salt-cloud -f vn_reserve opennebula vn_id=3 path=/path/to/vn_reserve_file.txt
salt-cloud -f vn_reserve opennebula vn_name=my-vn data="SIZE=10 AR_ID=8 NETWORK_ID=1"
```

21.4.17 salt.cloud.clouds.openstack

Openstack Cloud Driver

depends  shade>=1.19.0

OpenStack is an open source project that is in use by a number a cloud providers, each of which have their own ways of using it.

This OpenStack driver uses a the shade python module which is managed by the OpenStack Infra team. This module is written to handle all the different versions of different OpenStack tools for salt, so most commands are just passed over to the module to handle everything.

Provider

There are two ways to configure providers for this driver. The first one is to just let shade handle everything, and configure using os-client-config and setting up /etc/openstack/clouds.yml.

```
clouds:
  democloud:
    region_name: RegionOne
    auth:
      username: 'demo'
      password: secret
      project_name: 'demo'
      auth_url: 'http://openstack/identity'
```

And then this can be referenced in the salt provider based on the democloud name.

```
myopenstack:
  driver: openstack
  cloud: democloud
  region_name: RegionOne
```

This allows for just using one configuration for salt-cloud and for any other openstack tools which are all using /etc/openstack/clouds.yml
The other method allows for specifying everything in the provider config, instead of using the extra configuration file. This will allow for passing salt-cloud configs only through pillars for minions without having to write a clouds.yml file on each minion.abs

```yaml
myopenstack:
  driver: openstack
  region_name: RegionOne
  auth:
    username: 'demo'
    password: secret
    project_name: 'demo'
    user_domain_name: default,
    project_domain_name: default,
    auth_url: 'http://openstack/identity'
```

Or if you need to use a profile to setup some extra stuff, it can be passed as a profile to use any of the vendor config options.

```yaml
myrackspace:
  driver: openstack
  profile: rackspace
  auth:
    username: rackusername
    api_key: myapikey
    region_name: ORD
    auth_type: rackspace_apikey
```

And this will pull in the profile for rackspace and setup all the correct options for the auth_url and different api versions for services.

**Profile**

Most of the options for building servers are just passed on to the `create_server` function from shade. The salt specific ones are:

- ssh_key_file: The path to the ssh key that should be used to login to the machine to bootstrap it
- ssh_key_file: The name of the keypair in openstack
- userdata_template: The renderer to use if the userdata is a file that is templated. Default: False
- ssh_interface: The interface to use to login for bootstrapping: public_ips, private_ips, floating_ips, fixed_ips

```yaml
centos:
  provider: myopenstack
  image: CentOS 7
  size: ds1G
  ssh_key_name: mykey
  ssh_key_file: /root/.ssh/id_rsa
```

This is the minimum setup required.

If metadata is set to make sure that the host has finished setting up the `wait_for_metadata` can be set.

```yaml
centos:
  provider: myopenstack
  image: CentOS 7
```

(continues on next page)
Anything else from the `create_server` docs can be passed through here.

- **image**: Image dict, name or ID to boot with. `image` is required unless `boot_volume` is given.
- **flavor**: Flavor dict, name or ID to boot onto.
- **auto_ip**: Whether to take actions to find a routable IP for the server. (defaults to True)
- **ips**: List of IPs to attach to the server (defaults to None)
- **ip_pool**: Name of the network or floating IP pool to get an address from. (defaults to None)
- **root_volume**: Name or ID of a volume to boot from (defaults to None - deprecated, use `boot_volume`)
- **boot_volume**: Name or ID of a volume to boot from (defaults to None)
- **terminate_volume**: If booting from a volume, whether it should be deleted when the server is destroyed. (defaults to False)
- **volumes**: (optional) A list of volumes to attach to the server
- **meta**: (optional) A dict of arbitrary key/value metadata to store for this server. Both keys and values must be <=255 characters.
- **files**: (optional, deprecated) A dict of files to overwrite on the server upon boot. Keys are file names (i.e. `/etc/passwd`) and values are the file contents (either as a string or as a file-like object). A maximum of five entries is allowed, and each file must be 10k or less.
- **reservation_id**: a UUID for the set of servers being requested.
- **min_count**: (optional extension) The minimum number of servers to launch.
- **max_count**: (optional extension) The maximum number of servers to launch.
- **security_groups**: A list of security group names
- **userdata**: user data to pass to be exposed by the metadata server this can be a file type object as well or a string.
- **key_name**: (optional extension) name of previously created keypair to inject into the instance.
- **availability_zone**: Name of the availability zone for instance placement.
- **block_device_mapping**: (optional) A dict of block device mappings for this server.
- **block_device_mapping_v2**: (optional) A dict of block device mappings for this server.
- **nics**: (optional extension) an ordered list of nics to be added to this server, with information about connected networks, fixed IPs, port etc.
- **scheduler_hints**: (optional extension) arbitrary key-value pairs specified by the client to help boot an instance
- **config_drive**: (optional extension) value for config drive either boolean, or volume-id

```python
size: ds1G
ssh_key_name: mykey
ssh_key_file: /root/.ssh/id_rsa
meta:
  build_config: rack_user_only
wait_for_metadata:
  rax_service_level_automation: Complete
  rackconnect_automation_status: DEPLOYED
```
- **disk_config**: (optional extension) control how the disk is partitioned when the server is created. Possible values are 'AUTO' or 'MANUAL'.

- **admin_pass**: (optional extension) add a user supplied admin password.

- **timeout**: (optional) Seconds to wait, defaults to 60. See the wait parameter.

- **reuse_ips**: (optional) Whether to attempt to reuse pre-existing floating ips should a floating IP be needed (default to True)

- **network**: (optional) Network dict or name or ID to attach the server to. Mutually exclusive with the nics parameter. Can also be be a list of network names or IDs or network dicts.

- **boot_from_volume**: Whether to boot from volume. 'boot_volume' implies True, but boot_from_volume=True with no boot_volume is valid and will create a volume from the image and use that.

- **volume_size**: When booting an image from volume, how big should the created volume be? Defaults to 50.

- **nat_destination**: Which network should a created floating IP be attached to, if it’s not possible to infer from the cloud’s configuration. (Optional, defaults to None)

- **group**: ServerGroup dict, name or id to boot the server in. If a group is provided in both scheduler_hints and in the group param, the group param will win. (Optional, defaults to None)

---

**Note**: If there is anything added, that is not in this list, it can be added to an extras dictionary for the profile, and that will be to the create_server function.

---

**salt.cloud.clouds.openstack.avail_images**(conn=None, call=None)
List available images for OpenStack

CLI Example

```
salt-cloud -f avail_images myopenstack
salt-cloud --list-images myopenstack
```

**salt.cloud.clouds.openstack.avail_sizes**(conn=None, call=None)
List available sizes for OpenStack

CLI Example

```
salt-cloud -f avail_sizes myopenstack
dsalt-cloud --list-sizes myopenstack
```

**salt.cloud.clouds.openstack.call**(conn=None, call=None, kwargs=None)
Call function from shade.

```
func
```

function to call from shade.openstackcloud library

CLI Example

```
salt-cloud -f call myopenstack func=list_images
salt-cloud -f call myopenstack func=create_network name=mysubnet
```

**salt.cloud.clouds.openstack.create**(vm_)
Create a single VM from a data dict

**salt.cloud.clouds.openstack.destroy**(name, conn=None, call=None)
Delete a single VM
salt.cloud.clouds.openstack.get_configured_provider()  
Return the first configured instance.

salt.cloud.clouds.openstack.get_conn()  
Return a conn object for the passed VM data

salt.cloud.clouds.openstack.get_dependencies()  
Warn if dependencies aren't met.

salt.cloud.clouds.openstack.list_networks(conn=None, call=None)  
List networks for OpenStack  
CLI Example  
```
salt-cloud -f list_networks myopenstack
```

salt.cloud.clouds.openstack.list_nodes(conn=None, call=None)  
Return a list of VMs  
CLI Example  
```
salt-cloud -f list_nodes myopenstack
```

salt.cloud.clouds.openstack.list_nodes_full(conn=None, call=None)  
Return a list of VMs with all the information about them  
CLI Example  
```
salt-cloud -f list_nodes_full myopenstack
```

salt.cloud.clouds.openstack.list_nodes_min(conn=None, call=None)  
Return a list of VMs with minimal information  
CLI Example  
```
salt-cloud -f list_nodes_min myopenstack
```

salt.cloud.clouds.openstack.list_nodes_select(conn=None, call=None)  
Return a list of VMs with the fields from `query.selection`  
CLI Example  
```
salt-cloud -f list_nodes_full myopenstack
```

salt.cloud.clouds.openstack.list_subnets(conn=None, call=None, kwargs=None)  
List subnets in a virtual network  
```
```

salt.cloud.clouds.openstack.preferred_ip(vm_, ips)  
Return the preferred Internet protocol. Either 'ipv4' (default) or 'ipv6'.

salt.cloud.clouds.openstack.request_instance(vm_, conn=None, call=None)  
Request an instance to be built

salt.cloud.clouds.openstack.show_instance(name, conn=None, call=None)  
Get VM on this OpenStack account  
```
```
name of the instance

CLI Example

```
salt-cloud -a show_instance myserver
```

```
salt.cloud.clouds.openstack.ssh_interface(vm_)
```

Return the ssh_interface type to connect to. Either 'public_ips' (default) or 'private_ips'.

### 21.4.18 salt.cloud.clouds.packet

Packet Cloud Module Using Packet's Python API Client

The Packet cloud module is used to control access to the Packet VPS system.

Use of this module only requires the `token` parameter.

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/packet.conf`:

The Packet profile requires `size`, `image`, `location`, `project_id`

Optional profile parameters:

- `storage_size` - min value is 10, defines Gigabytes of storage that will be attached to device.
- `storage_tier` - storage_1 - Standard Plan, storage_2 - Performance Plan
- `snapshot_count` - int
- `snapshot_frequency` - string - possible values:
  - 1min
  - 15min
  - 1hour
  - 1day
  - 1week
  - 1month
  - 1year

This driver requires Packet's client library: [https://pypi.python.org/pypi/packet-python](https://pypi.python.org/pypi/packet-python)

```
packet-provider:
  minion:
    master: 192.168.50.10
  driver: packet
  token: ewr23rdf35wC8oNjJrhmHa87rjSXzJyi
  private_key: /root/.ssh/id_rsa

packet-profile:
  provider: packet-provider
  size: baremetal_0
  image: ubuntu_16_04_image
  location: ewr1
  project_id: a64d00b-d47c-4d26-9870-46aac43010a6
  storage_size: 10
```

(continues on next page)
salt.cloud.clouds.packet_avail_images(call=None)
Return available Packet os images.

CLI Example:

```
salt-cloud --list-images packet-provider
salt-cloud -f avail_images packet-provider
```

salt.cloud.clouds.packet_avail_locations(call=None)
Return available Packet datacenter locations.

CLI Example:

```
salt-cloud --list-locations packet-provider
salt-cloud -f avail_locations packet-provider
```

salt.cloud.clouds.packet_avail_projects(call=None)
Return available Packet projects.

CLI Example:

```
salt-cloud -f avail_projects packet-provider
```

salt.cloud.clouds.packet_avail_sizes(call=None)
Return available Packet sizes.

CLI Example:

```
salt-cloud --list-sizes packet-provider
salt-cloud -f avail_sizes packet-provider
```

salt.cloud.clouds.packet_create(vm_)
Create a single Packet VM.

salt.cloud.clouds.packet_destroy(name, call=None)
Destroys a Packet device by name.

name The hostname of VM to be destroyed.

CLI Example:

```
salt-cloud -d name
```

salt.cloud.clouds.packet_get_configured_provider()
Return the first configured instance.

salt.cloud.clouds.packet_get_devices_by_token()

salt.cloud.clouds.packet_get_image(conn, vm_)
Return the image object to use

salt.cloud.clouds.packet_get_size(conn, vm_)
Return the VM's size object

salt.cloud.clouds.packet_is_profile_configured(vm_)
**salt.cloud.clouds.packet.list_nodes** (*call=None*)

Returns a list of devices, keeping only a brief listing. CLI Example:

```
salt-cloud -Q
salt-cloud --query
salt-cloud -f list_nodes packet-provider
```

**salt.cloud.clouds.packet.list_nodes_full** (*call=None*)

List devices, with all available information.

CLI Example:

```
salt-cloud -F
salt-cloud --full-query
salt-cloud -f list_nodes_full packet-provider
```

**salt.cloud.clouds.packet.list_nodes_min** (*call=None*)

Return a list of the VMs that are on the provider. Only a list of VM names and their state is returned. This is the minimum amount of information needed to check for existing VMs.

New in version 2015.8.0.

CLI Example:

```
salt-cloud -f list_nodes_min packet-provider
salt-cloud --function list_nodes_min packet-provider
```

**salt.cloud.clouds.packet.list_nodes_select** (*call=None*)

Return a list of the VMs that are on the provider, with select fields.

**salt.cloud.clouds.packet.script** (*vm_*)

Return the script deployment object

**salt.cloud.clouds.packet.show_instance** (*name, call=None*)

Show the details from the provider concerning an instance

### 21.4.19 salt.cloud.clouds.parallels

**Parallels Cloud Module**

The Parallels cloud module is used to control access to cloud providers using the Parallels VPS system.

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/parallels.conf`:

```
my-parallels-config:
    # Parallels account information
    user: myuser
    password: mypassword
    url: https://api.cloud.xmission.com:4465/paci/v1.0/
    driver: parallels
```

**salt.cloud.clouds.parallels.avail_images** (*call=None*)

Return a list of the images that are on the provider

**salt.cloud.clouds.parallels.create** (*vm_*)

Create a single VM from a data dict
salt.cloud.clouds.parallels.create_node(vm_)
    Build and submit the XML to create a node

salt.cloud.clouds.parallels.destroy(name, call=None)
    Destroy a node.
    CLI Example:
    
    salt-cloud --destroy mymachine

salt.cloud.clouds.parallels.get_configured_provider()
    Return the first configured instance.

salt.cloud.clouds.parallels.get_image(vm_)
    Return the image object to use

salt.cloud.clouds.parallels.list_nodes(call=None)
    Return a list of the VMs that are on the provider

salt.cloud.clouds.parallels.list_nodes_full(call=None)
    Return a list of the VMs that are on the provider

salt.cloud.clouds.parallels.list_nodes_select(call=None)
    Return a list of the VMs that are on the provider, with select fields

salt.cloud.clouds.parallels.query(action=None, command=None, args=None, method='GET',
    data=None)
    Make a web call to a Parallels provider

salt.cloud.clouds.parallels.script(vm_)
    Return the script deployment object

salt.cloud.clouds.parallels.show_image(kwargs, call=None)
    Show the details from Parallels concerning an image

salt.cloud.clouds.parallels.show_instance(name, call=None)
    Show the details from Parallels concerning an instance

salt.cloud.clouds.parallels.start(name, call=None)
    Start a node.
    CLI Example:
    
    salt-cloud -a start mymachine

salt.cloud.clouds.parallels.stop(name, call=None)
    Stop a node.
    CLI Example:
    
    salt-cloud -a stop mymachine

salt.cloud.clouds.parallels.wait_until(name, state, timeout=300)
    Wait until a specific state has been reached on a node
21.4.20 salt.cloud.clouds.profitbricks

ProfitBricks Cloud Module

The ProfitBricks SaltStack cloud module allows a ProfitBricks server to be automatically deployed and bootstrapped with Salt.

```
depends profitbrick >= 3.1.0
```

The module requires ProfitBricks credentials to be supplied along with an existing virtual datacenter UUID where the server resources will reside. The server should also be assigned a public LAN, a private LAN, or both along with SSH key pairs. ...

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/profitbricks.conf`:

```
my-profitbricks-config:
  driver: profitbricks
  # The ProfitBricks login username
  username: user@example.com
  # The ProfitBricks login password
  password: secretpassword
  # The ProfitBricks virtual datacenter UUID
  datacenter_id: <UUID>
  # SSH private key filename
  ssh_private_key: /path/to/private.key
  # SSH public key filename
  ssh_public_key: /path/to/public.key

my-profitbricks-profile:
  provider: my-profitbricks-config
  # Name of a predefined server size.
  size: Micro Instance
  # Assign CPU family to server.
  cpu_family: INTEL_XEON
  # Number of CPU cores to allocate to node (overrides server size).
  cores: 4
  # Amount of RAM in multiples of 256 MB (overrides server size).
  ram: 4096
  # The server availability zone.
  availability_zone: ZONE_1
  # Name or UUID of the HDD image to use.
  image: <UUID>
  # Image alias could be provided instead of image.
  # Example 'ubuntu:latest'
  #image_alias: <IMAGE_ALIAS>
  # Size of the node disk in GB (overrides server size).
  disk_size: 40
  # Type of disk (HDD or SSD).
  disk_type: SSD
  # Storage availability zone to use.
  disk_availability_zone: ZONE_2
  # Assign the server to the specified public LAN.
  public_lan: <ID>
  # Assign firewall rules to the network interface.
  public_firewall_rules:
    SSH:
      protocol: TCP
```

To use a private IP for connecting and bootstrapping node:

```yaml
my-profitbricks-profile:
  ssh_interface: private_lan
```

Set `deploy` to False if Salt should not be installed on the node.

```yaml
my-profitbricks-profile:
  deploy: False
```

salt.cloud.clouds.profitbricks.avail_images(call=None)
Return a list of the images that are on the provider

salt.cloud.clouds.profitbricks.avail_locations(call=None)
Return a dict of all available VM locations on the cloud provider with relevant data

salt.cloud.clouds.profitbricks.avail_sizes(call=None)
Return a dict of all available VM sizes on the cloud provider with relevant data. Latest version can be found at:

salt.cloud.clouds.profitbricks.create(vm_)
Create a single VM from a data dict

salt.cloud.clouds.profitbricks.create_datacenter(call=None, kwargs=None)
Creates a virtual datacenter based on supplied parameters.

CLI Example:

```
salt-cloud -f create_datacenter profitbricks name=mydatacenter location=us/las description="my description"
```

salt.cloud.clouds.profitbricks.create_loadbalancer(call=None, kwargs=None)
Creates a loadbalancer within the datacenter from the provider config.

CLI Example:

```
salt-cloud -f create_loadbalancer profitbricks name=mylb
```

salt.cloud.clouds.profitbricks.destroy(name, call=None)
 destroy a machine by name

Parameters

- **name** -- name given to the machine
• **call** -- call value in this case is 'action'

  **Returns** array of booleans, true if successfully stopped and true if successfully removed

  CLI Example:

  ```
salt-cloud -d vm_name
  ```

  python

  salt.cloud.clouds.profitbricks.get_configured_provider()
  Return the first configured instance.

  salt.cloud.clouds.profitbricks.get_conn()
  Return a conn object for the passed VM data

  salt.cloud.clouds.profitbricks.get_datacenter(conn)
  Return the datacenter from the config provider datacenter ID

  salt.cloud.clouds.profitbricks.get_datacenter_id()
  Return datacenter ID from provider configuration

  salt.cloud.clouds.profitbricks.get_dependencies()
  Warn if dependencies are not met.

  salt.cloud.clouds.profitbricks.get_disk_type(vm_)
  Return the type of disk to use. Either 'HDD' (default) or 'SSD'.

  salt.cloud.clouds.profitbricks.get_image(vm_)
  Return the image object to use

  salt.cloud.clouds.profitbricks.get_key_filename(vm_)
  Check SSH private key file and return absolute path if exists.

  salt.cloud.clouds.profitbricks.get_node(conn, name)
  Return a node for the named VM

  salt.cloud.clouds.profitbricks.get_public_keys(vm_)
  Retrieve list of SSH public keys.

  salt.cloud.clouds.profitbricks.get_size(vm_)
  Return the VM's size object

  salt.cloud.clouds.profitbricks.get_wait_timeout(vm_)
  Return the wait_for_timeout for resource provisioning.

  salt.cloud.clouds.profitbricks.list_datacenters(conn=None, call=None)
  List all the data centers

  CLI Example:

  ```
salt-cloud -f list_datacenters my-profitbricks-config
  ```

  salt.cloud.clouds.profitbricks.list_images(call=None, kwargs=None)
  List all the images with alias by location

  CLI Example:

  ```
salt-cloud -f list_images my-profitbricks-config location=us/las
  ```

  salt.cloud.clouds.profitbricks.list_loadbalancers(call=None)
  Return a list of the loadbalancers that are on the provider

  salt.cloud.clouds.profitbricks.list_nodes(conn=None, call=None)
  Return a list of VMs that are on the provider
salt.cloud.clouds.profitbricks.list_nodes_full(conn=None, call=None)
    Return a list of the VMs that are on the provider, with all fields
salt.cloud.clouds.profitbricks.reboot(name, call=None)
    reboot a machine by name :param name: name given to the machine :param call: call value in this case is 'action'
    :return: true if successful

    CLI Example:
    salt-cloud -a reboot vm_name

salt.cloud.clouds.profitbricks.reserve_ipblock(call=None, kwargs=None)
    Reserve the IP Block
salt.cloud.clouds.profitbricks.set_public_lan(lan_id)
    Enables public Internet access for the specified public_lan. If no public LAN is available, then a new public LAN is created.

salt.cloud.clouds.profitbricks.show_instance(name, call=None)
    Show the details from the provider concerning an instance
salt.cloud.clouds.profitbricks.signal_event(vm_, event, description)

salt.cloud.clouds.profitbricks.ssh_interface(vm_)
    Return the ssh_interface type to connect to. Either 'public_ips' (default) or 'private_ips'.

salt.cloud.clouds.profitbricks.start(name, call=None)
    start a machine by name :param name: name given to the machine :param call: call value in this case is 'action'
    :return: true if successful

    CLI Example:
    salt-cloud -a start vm_name

salt.cloud.clouds.profitbricks.stop(name, call=None)
    stop a machine by name :param name: name given to the machine :param call: call value in this case is 'action'
    :return: true if successful

    CLI Example:
    salt-cloud -a stop vm_name

salt.cloud.clouds.profitbricks.version_compatible(version)
    Checks profitbricks version

21.4.21 salt.cloud.clouds.proxmox

Proxmox Cloud Module

New in version 2014.7.0.

The Proxmox cloud module is used to control access to cloud providers using the Proxmox system (KVM / OpenVZ / LXC).

Set up the cloud configuration at /etc/salt/cloud.providers or /etc/salt/cloud.providers.d/proxmox.conf:
my-proxmox-config:

# Proxmox account information
user: myuser@pam or myuser@pve
password: mypassword
url: hypervisor.domain.tld
driver: proxmox
verify_ssl: True

maintainer Frank Klaassen <frank@cloudright.nl>
depends requests >= 2.2.1
depends IPy >= 0.81

salt.cloud.clouds.proxmox.avail_images(call=None, location='local')
Return a list of the images that are on the provider
CLI Example:
salt-cloud --list-images my-proxmox-config

salt.cloud.clouds.proxmox.avail_locations(call=None)
Return a list of the hypervisors (nodes) which this Proxmox PVE machine manages
CLI Example:
salt-cloud --list-locations my-proxmox-config

salt.cloud.clouds.proxmox.create(vm_)
Create a single VM from a data dict
CLI Example:
salt-cloud -p proxmox-ubuntu vmhostname

salt.cloud.clouds.proxmox.create_node(vm_, newid)
Build and submit the requestdata to create a new node

salt.cloud.clouds.proxmox.destroy(name, call=None)
Destroy a node.
CLI Example:
salt-cloud --destroy mymachine

salt.cloud.clouds.proxmox.get_configured_provider()
Return the first configured instance.

salt.cloud.clouds.proxmox.get_dependencies()
Warn if dependencies aren’t met.

salt.cloud.clouds.proxmox.get_resources_nodes(call=None, resFilter=None)
Retrieve all hypervisors (nodes) available on this environment CLI Example:
salt-cloud -f get_resources_nodes my-proxmox-config

salt.cloud.clouds.proxmox.get_resources_vms(call=None, resFilter=None, includeConfig=True)
Retrieve all VMs available on this environment
CLI Example:
salt-cloud -f get_resources_vms my-proxmox-config

salt.cloud.clouds.proxmox.get_vm_status(vmid=None, name=None)
Get the status for a VM, either via the ID or the hostname

salt.cloud.clouds.proxmox.get_vmconfig(vmid, node=None, node_type='openvz')
Get VM configuration

salt.cloud.clouds.proxmox.list_nodes(call=None)
Return a list of the VMs that are managed by the provider

   CLI Example:
      salt-cloud -Q my-proxmox-config

salt.cloud.clouds.proxmox.list_nodes_full(call=None)
Return a list of the VMs that are on the provider

   CLI Example:
      salt-cloud -F my-proxmox-config

salt.cloud.clouds.proxmox.list_nodes_select(call=None)
Return a list of the VMs that are on the provider, with select fields

   CLI Example:
      salt-cloud -S my-proxmox-config

salt.cloud.clouds.proxmox.query(conn_type, option, post_data=None)
Execute the HTTP request to the API

salt.cloud.clouds.proxmox.script(vm_)
Return the script deployment object

salt.cloud.clouds.proxmox.set_vm_status(status, name=None, vmid=None)
Convenience function for setting VM status

salt.cloud.clouds.proxmox.show_instance(name, call=None)
Show the details from Proxmox concerning an instance

salt.cloud.clouds.proxmox.shutdown(name=None, vmid=None, call=None)
Shutdown a node via ACPI

   CLI Example:
      salt-cloud -a shutdown mymachine

salt.cloud.clouds.proxmox.start(name, vmid=None, call=None)
Start a node.

   CLI Example:
      salt-cloud -a start mymachine

salt.cloud.clouds.proxmox.stop(name, vmid=None, call=None)
Stop a node ("pulling the plug.")

   CLI Example:
**21.4.22 salt.cloud.clouds.pyrax**

Pyrax Cloud Module

PLEASE NOTE: This module is currently in early development, and considered to be experimental and unstable. It is not recommended for production use. Unless you are actively developing code in this module, you should use the OpenStack module instead.

- `salt.cloud.clouds.pyrax.get_configured_provider()`: Return the first configured instance.
- `salt.cloud.clouds.pyrax.get_conn(conn_type)`: Return a conn object for the passed VM data.
- `salt.cloud.clouds.pyrax.get_dependencies()`: Warn if dependencies aren't met.
- `salt.cloud.clouds.pyrax.queues_create(call, kwargs)`
- `salt.cloud.clouds.pyrax.queues_delete(call, kwargs)`
- `salt.cloud.clouds.pyrax.queues_exists(call, kwargs)`
- `salt.cloud.clouds.pyrax.queues_show(call, kwargs)`

**21.4.23 salt.cloud.clouds.qingcloud**

QingCloud Cloud Module

New in version 2015.8.0.

The QingCloud cloud module is used to control access to the QingCloud. [http://www.qingcloud.com/](http://www.qingcloud.com/)

Use of this module requires the `access_key_id`, `secret_access_key`, `zone` and `key_filename` parameter to be set.

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/qingcloud.conf`:

```
my-qingcloud:
    driver: qingcloud
    access_key_id: AKIDMRTGYONNLFFTFRBPQJ
    secret_access_key: clYwH21US0mcoY4aNV2X0cAHCG3JZGcxEyFu
    zone: pek2
    key_filename: /path/to/your.pem
```

depends requests
salt.cloud.clouds.qingcloud.avail_images(kwargs=None, call=None)
Return a list of the images that are on the provider.

CLI Examples:
```
salt-cloud --list-images my-qingcloud
salt-cloud -f avail_images my-qingcloud zone=gd1
```

salt.cloud.clouds.qingcloud.avail_locations(call=None)
Return a dict of all available locations on the provider with relevant data.

CLI Examples:
```
salt-cloud --list-locations my-qingcloud
```

salt.cloud.clouds.qingcloud.avail_sizes(kwargs=None, call=None)
Return a list of the instance sizes that are on the provider.

CLI Examples:
```
salt-cloud --list-sizes my-qingcloud
salt-cloud -f avail_sizes my-qingcloud zone=pek2
```

salt.cloud.clouds.qingcloud.create(vm_)
Create a single instance from a data dict.

CLI Examples:
```
salt-cloud -p qingcloud-ubuntu-c1m1 hostname1
salt-cloud -m /path/to/mymap.sls -P
```

salt.cloud.clouds.qingcloud.destroy(instance_id, call=None)
Destroy an instance.

CLI Example:
```
salt-cloud -a destroy i-2f733r5n
salt-cloud -d i-2f733r5n
```

salt.cloud.clouds.qingcloud.get_configured_provider()
Return the first configured instance.

salt.cloud.clouds.qingcloud.get_dependencies()
Warn if dependencies aren’t met.

salt.cloud.clouds.qingcloud.list_nodes(call=None)
Return a list of the instances that are on the provider.

CLI Examples:
```
salt-cloud -Q my-qingcloud
```

salt.cloud.clouds.qingcloud.list_nodes_full(call=None)
Return a list of the instances that are on the provider.

CLI Examples:
```
salt-cloud -F my-qingcloud
```

salt.cloud.clouds.qingcloud.list_nodes_min(call=None)
Return a list of the instances that are on the provider. Only a list of instances names, and their state, is returned.
CLI Examples:

```
salt-cloud -f list_nodes_min my-qingcloud
```

salt.cloud.clouds.qingcloud.list_nodes_select(call=None)

Return a list of the instances that are on the provider, with selected fields.

CLI Examples:

```
salt-cloud -S my-qingcloud
```

salt.cloud.clouds.qingcloud.query(params=None)

Make a web call to QingCloud IaaS API.

salt.cloud.clouds.qingcloud.reboot(instance_id, call=None)

Reboot an instance.

CLI Examples:

```
salt-cloud -a reboot i-2f733r5n
```

salt.cloud.clouds.qingcloud.script(vm_)

Return the script deployment object.

salt.cloud.clouds.qingcloud.show_image(kwargs, call=None)

Show the details from QingCloud concerning an image.

CLI Examples:

```
salt-cloud -f show_image my-qingcloud image=trustysrvx64c
salt-cloud -f show_image my-qingcloud image=trustysrvx64c,coreos4
salt-cloud -f show_image my-qingcloud image=trustysrvx64c zone=ap1
```

salt.cloud.clouds.qingcloud.show_instance(instance_id, call=None, kwargs=None)

Show the details from QingCloud concerning an instance.

CLI Examples:

```
salt-cloud -a show_instance i-2f733r5n
```

salt.cloud.clouds.qingcloud.start(instance_id, call=None)

Start an instance.

CLI Examples:

```
salt-cloud -a start i-2f733r5n
```

salt.cloud.clouds.qingcloud.stop(instance_id, force=False, call=None)

Stop an instance.

CLI Examples:

```
salt-cloud -a stop i-2f733r5n
salt-cloud -a stop i-2f733r5n force=True
```
21.4.24 salt.cloud.clouds.saltify

Saltify Module

The Saltify module is designed to install Salt on a remote machine, virtual or bare metal, using SSH. This module is useful for provisioning machines which are already installed, but not Salted.

Changed in version 2018.3.0: The wake_on_lan capability, and actions destroy, reboot, and query functions were added.

Use of this module requires some configuration in cloud profile and provider files as described in the Getting Started with Saltify documentation.

salt.cloud.clouds.saltify.avail_images(call=None)
This function returns a list of images available for this cloud provider.

```
salt-cloud --list-images saltify
```

returns a list of available profiles.

New in version 2018.3.0.

salt.cloud.clouds.saltify.avail_locations(call=None)
This function returns a list of locations available.

```
salt-cloud --list-locations my-cloud-provider
```

[saltify will always return an empty dictionary]

salt.cloud.clouds.saltify.avail_sizes(call=None)
This function returns a list of sizes available for this cloud provider.

```
salt-cloud --list-sizes saltify
```

[saltify always returns an empty dictionary]

salt.cloud.clouds.saltify.create(vm_)
if configuration parameter deploy is True,

    Provision a single machine, adding its keys to the salt master

else,

    Test ssh connections to the machine

Configuration parameters:

- deploy: (see above)
- provider: name of entry in salt/cloudproviders.d/???.xml file
- ssh_host: IP address or DNS name of the new machine
- ssh_username: name used to log in to the new machine
- ssh_password: password to log in (unless key_filename is used)
- key_filename: (optional) SSH private key for passwordless login
- ssh_port: (default=22) TCP port for SSH connection
- wake_on_lan_mac: (optional) hardware (MAC) address for wake on lan
- wol_sender_node: (optional) salt minion to send wake on lan command
• wol_boot_wait: (default=30) seconds to delay while client boots

• force_minion_config: (optional) replace the minion configuration files on the new machine

See also Miscellaneous Salt Cloud Options and Getting Started with Saltify

CLI Example:

```
salt-cloud -p mymachine my_new_id
```

```
salt.cloud.clouds.saltify.destroy(name, call=None)
```

Destroy a node.

New in version 2018.3.0.

Disconnect a minion from the master, and remove its keys.

**Optionally, (if remove_config_on_destroy is True)**, disables salt-minion from running on the minion, and erases the Salt configuration files from it.

**Optionally, (if shutdown_on_destroy is True)**, orders the minion to halt.

CLI Example:

```
salt-cloud --destroy mymachine
```

```
salt.cloud.clouds.saltify.get_configured_provider()
```

Return the first configured instance.

```
salt.cloud.clouds.saltify.list_nodes(call=None)
```

List the nodes which have salt-cloud:driver:saltify grains.

```
salt-cloud -Q
```

returns a list of dictionaries of defined standard fields.

New in version 2018.3.0.

```
salt.cloud.clouds.saltify.list_nodes_full(call=None)
```

Lists complete information for all nodes.

```
salt-cloud -F
```

returns a list of dictionaries.

for 'saltify' minions, returns dict of grains (enhanced).

New in version 2018.3.0.

```
salt.cloud.clouds.saltify.list_nodes_select(call=None)
```

Return a list of the minions that have salt-cloud grains, with select fields.

```
salt.cloud.clouds.saltify.reboot(name, call=None)
```

Reboot a saltify minion.

New in version 2018.3.0.

**name**  The name of the VM to reboot.

CLI Example:

```
salt-cloud -a reboot vm_name
```
salt.cloud.clouds.saltify.show_instance(name, call=None)
   List the a single node, return dict of grains.

21.4.25 salt.cloud.clouds.scaleway

Scaleway Cloud Module

New in version 2015.8.0.

The Scaleway cloud module is used to interact with your Scaleway BareMetal Servers.

Use of this module only requires the api_key parameter to be set. Set up the cloud configuration at /etc/salt/cloud.providers or /etc/salt/cloud.providers.d/scaleway.conf:

```
scaleway-config:
   # Scaleway organization and token
   access_key: 0e604a2c-aea6-4081-acb2-e1d1258ef95c
   token: be8fd96b-04eb-4d39-b6ba-a9edbcf17f12
   driver: scaleway
```

salt.cloud.clouds.scaleway_avail_images(call=None)
   Return a list of the images that are on the provider.

salt.cloud.clouds.scaleway.create(server_)
   Create a single BareMetal server from a data dict.

salt.cloud.clouds.scaleway.create_node(args)
   Create a node.

salt.cloud.clouds.scaleway.destroy(name, call=None)
   Destroy a node. Will check termination protection and warn if enabled.
   CLI Example: .. code-block:: bash
      salt-cloud --destroy mymachine

salt.cloud.clouds.scaleway.get_configured_provider()
   Return the first configured instance.

salt.cloud.clouds.scaleway.get_image(server_)
   Return the image object to use.

salt.cloud.clouds.scaleway.list_nodes(call=None)
   Return a list of the BareMetal servers that are on the provider.

salt.cloud.clouds.scaleway.list_nodes_full(call=None)
   Return a list of the BareMetal servers that are on the provider.

salt.cloud.clouds.scaleway.list_nodes_select(call=None)
   Return a list of the BareMetal servers that are on the provider, with select fields.

salt.cloud.clouds.scaleway.query(method='servers', server_id=None, command=None, args=None, http_method='GET', root='api_root')
   Make a call to the Scaleway API.

salt.cloud.clouds.scaleway.script(server_)
   Return the script deployment object.

salt.cloud.clouds.scaleway.show_instance(name, call=None)
   Show the details from a Scaleway BareMetal server.
21.4.26 salt.cloud.clouds.softlayer

SoftLayer Cloud Module

The SoftLayer cloud module is used to control access to the SoftLayer VPS system.

Use of this module only requires the `apikey` parameter. Set up the cloud configuration at:

/etc/salt/cloud.providers or /etc/salt/cloud.providers.d/softlayer.conf:

```
my-softlayer-config:
    # SoftLayer account api key
    user: MYLOGIN
    apikey: JVkbSJDGHDKUKSDJfhsdklfjgsjdkflhjlsdffhgdgjkenrtuin
    driver: softlayer
```

The SoftLayer Python Library needs to be installed in order to use the SoftLayer salt.cloud modules. See: https://pypi.python.org/pypi/SoftLayer

```
deps: softlayer
```

salt.cloud.clouds.softlayer.avail_images(call=None)
Return a dict of all available VM images on the cloud provider.

salt.cloud.clouds.softlayer.avail_locations(call=None)
List all available locations

salt.cloud.clouds.softlayer.avail_sizes(call=None)
Return a dict of all available VM sizes on the cloud provider with relevant data. This data is provided in three dicts.

salt.cloud.clouds.softlayer.create(vm_)
Create a single VM from a data dict

salt.cloud.clouds.softlayer.destroy(name, call=None)
Destroy a node.

CLI Example:
```
salt-cloud --destroy mymachine
```

salt.cloud.clouds.softlayer.get_configured_provider()
Return the first configured instance.

salt.cloud.clouds.softlayer.get_conn(service='SoftLayer_Virtual_Guest')
Return a conn object for the passed VM data

salt.cloud.clouds.softlayer.get_dependencies()
Warn if dependencies aren’t met.

salt.cloud.clouds.softlayer.get_location(vm_=None)
Return the location to use, in this order:

- CLI parameter
- VM parameter
- Cloud profile setting

salt.cloud.clouds.softlayer.list_custom_images(call=None)
Return a dict of all custom VM images on the cloud provider.
salt.cloud.clouds.softlayer.list_nodes(call=None)
    Return a list of the VMs that are on the provider
salt.cloud.clouds.softlayer.list_nodes_full(mask='mask[id]', call=None)
    Return a list of the VMs that are on the provider
salt.cloud.clouds.softlayer.list_nodes_select(call=None)
    Return a list of the VMs that are on the provider, with select fields
salt.cloud.clouds.softlayer.list_vlans(call=None)
    List all VLANs associated with the account
salt.cloud.clouds.softlayer.script(vm_)
    Return the script deployment object
salt.cloud.clouds.softlayer.show_instance(name, call=None)
    Show the details from SoftLayer concerning a guest

21.4.27 salt.cloud.clouds.softlayer_hw

SoftLayer HW Cloud Module

The SoftLayer HW cloud module is used to control access to the SoftLayer hardware cloud system

Use of this module only requires the apikey parameter. Set up the cloud configuration at:
/etc/salt/cloud.providers or /etc/salt/cloud.providers.d/softlayer.conf:

```
my-softlayer-config:
    # SoftLayer account api key
    user: MYLOGIN
    apikey: JVkbSJDGHSDKUKSDJfhsdklflgsjkdflhjlsdffffffgjkenrultinv
    driver: softlayer_hw
```

The SoftLayer Python Library needs to be installed in order to use the SoftLayer salt.cloud modules. See: https://pypi.python.org/pypi/SoftLayer

depends softlayer

salt.cloud.clouds.softlayer_hw.avail_images(call=None)
    Return a dict of all available VM images on the cloud provider.
salt.cloud.clouds.softlayer_hw.avail_locations(call=None)
    List all available locations
salt.cloud.clouds.softlayer_hw.avail_sizes(call=None)
    Return a dict of all available VM sizes on the cloud provider with relevant data. This data is provided in three
dicts.
salt.cloud.clouds.softlayer_hw.create(vm_)
    Create a single VM from a data dict
salt.cloud.clouds.softlayer_hw.destroy(name, call=None)
    Destroy a node.
    CLI Example:

        salt-cloud --destroy mymachine

salt.cloud.clouds.softlayer_hw.get_configured_provider()
    Return the first configured instance.
salt.cloud.clouds.softlayer_hw.get_conn(service='SoftLayer_Hardware')
    Return a conn object for the passed VM data

salt.cloud.clouds.softlayer_hw.get_dependencies()
    Warn if dependencies aren't met.

salt.cloud.clouds.softlayer_hw.get_location(vm_=None)
    Return the location to use, in this order:
    • CLI parameter
    • VM parameter
    • Cloud profile setting

salt.cloud.clouds.softlayer_hw.list_nodes(call=None)
    Return a list of the VMs that are on the provider

salt.cloud.clouds.softlayer_hw.list_nodes_full(mask='mask[id, hostname, primaryIpAddress, primaryBackendIpAddress, processorPhysicalCoreAmount, memoryCount]', call=None)
    Return a list of the VMs that are on the provider

salt.cloud.clouds.softlayer_hw.list_nodes_select(call=None)
    Return a list of the VMs that are on the provider, with select fields

salt.cloud.clouds.softlayer_hw.list_vlans(call=None)
    List all VLANs associated with the account

salt.cloud.clouds.softlayer_hw.script(vm_)
    Return the script deployment object

salt.cloud.clouds.softlayer_hw.show_all_categories(call=None)
    Return a dict of all available categories on the cloud provider.
    New in version 2016.3.0.

salt.cloud.clouds.softlayer_hw.show_all_prices(call=None, kwargs=None)
    Return a dict of all prices on the cloud provider.

salt.cloud.clouds.softlayer_hw.show_instance(name, call=None)
    Show the details from SoftLayer concerning a guest

salt.cloud.clouds.softlayer_hw.show_pricing(kwargs=None, call=None)
    Show pricing for a particular profile. This is only an estimate, based on unofficial pricing sources.

    CLI Examples:

    salt-cloud -f show_pricing my-softlayerhw-config profile=my-profile

    If pricing sources have not been cached, they will be downloaded. Once they have been cached, they will not be updated automatically. To manually update all prices, use the following command:

    salt-cloud -f update_pricing <provider>

    New in version 2015.8.0.
21.4.28 salt.cloud.clouds.tencentcloud

Tencent Cloud Cloud Module

New in version 3000.

The Tencent Cloud Cloud Module is used to control access to the Tencent Cloud instance. https://intl.cloud.tencent.com/

To use this module, set up the cloud configuration at /etc/salt/cloud.providers or /etc/salt/cloud.providers.d/*.*.conf:

```
my-tencentcloud-config:
  driver: tencentcloud
  # Tencent Cloud Secret Id
  id: AKIDA64p0I09BMemkApevX0HS169S4b750A
  # Tencent Cloud Secret Key
  key: Br2xmPn0C5FDVRAImc3imiTZKVRsk260
  # Tencent Cloud Region
  location: ap-guangzhou
```

depends tencentcloud-sdk-python

salt.cloud.clouds.tencentcloud.avail_images(call=) (call=None)
Return Tencent Cloud available image

CLI Example:

```
salt-cloud --list-images my-tencentcloud-config
dsalt-cloud -f avail_images my-tencentcloud-config
```

salt.cloud.clouds.tencentcloud.avail_locations(call=) (call=None)
Return Tencent Cloud available region

CLI Example:

```
salt-cloud --list-locations my-tencentcloud-config
dsalt-cloud -f avail_locations my-tencentcloud-config
```

salt.cloud.clouds.tencentcloud.avail_sizes(call=) (call=None)
Return Tencent Cloud available instance type

CLI Example:

```
salt-cloud --list-sizes my-tencentcloud-config
dsalt-cloud -f avail_sizes my-tencentcloud-config
```

salt.cloud.clouds.tencentcloud.create(vm_)
Create a single Tencent Cloud instance from a data dict.

Tencent Cloud profiles require a provider, availability_zone, image and size. Set up profile at /etc/salt/cloud.profiles or /etc/salt/cloud.profiles.d/*.*.conf:

```
tencentcloud-guangzhou-s1sm1:
  provider: my-tencentcloud-config
  availability_zone: ap-guangzhou-3
  image: img-31tjrtp
  size: S1.SMALL1
  allocate_public_ip: True
```

(continues on next page)
CLI Examples:

```
salt-cloud -p tencentcloud-guangzhou-s1 myinstance
```

salt.cloud.clouds.tencentcloud.destroy(name, call=None)

Destroy a Tencent Cloud instance

CLI Example:

```
salt-cloud -a destroy myinstance
salt-cloud -d myinstance
```

salt.cloud.clouds.tencentcloud.get_configured_provider()

Return the first configured instance.

salt.cloud.clouds.tencentcloud.get_dependencies()

Warn if dependencies aren't met.

salt.cloud.clouds.tencentcloud.get_provider_client(name=None)

Return a new provider client

salt.cloud.clouds.tencentcloud.list_availability_zones(call=None)

Return all Tencent Cloud availability zones in current region

CLI Example:

```
salt-cloud -f list_availability_zones my-tencentcloud-config
```

salt.cloud.clouds.tencentcloud.list_custom_images(call=None)

Return all Tencent Cloud images in current region

CLI Example:

```
salt-cloud -f list_custom_images my-tencentcloud-config
```

salt.cloud.clouds.tencentcloud.list_nodes(call=None)

Return a list of instances that are on the provider

CLI Examples:

```
salt-cloud -Q
```

salt.cloud.clouds.tencentcloud.list_nodes_full(call=None)

Return a list of instances that are on the provider, with full details

CLI Examples:

```
salt-cloud -F
```

salt.cloud.clouds.tencentcloud.list_nodes_min(call=None)

Return a list of instances that are on the provider, Only names, and their state, is returned.

CLI Examples:
```
salt-cloud -f list_nodes_min my-tencentcloud-config
```

```python
salt.cloud.clouds.tencentcloud.list_nodes_select(call=None)
    Return a list of instances that are on the provider, with select fields
    CLI Examples:
    ```
salt-cloud -S
    ```
```

```python
salt.cloud.clouds.tencentcloud.list_securitygroups(call=None)
    Return all Tencent Cloud security groups in current region
    CLI Example:
    ```
salt-cloud -f list_securitygroups my-tencentcloud-config
    ```
```

```python
salt.cloud.clouds.tencentcloud.reboot(name, call=None)
    Reboot a Tencent Cloud instance
    CLI Examples:
    ```
salt-cloud -a reboot myinstance
    ```
```

```python
salt.cloud.clouds.tencentcloud.script(vm_)
    Return the script deployment object
```

```python
salt.cloud.clouds.tencentcloud.show_disk(name, call=None)
    Show the disk details of Tencent Cloud instance
    CLI Examples:
    ```
salt-cloud -a show_disk myinstance
    ```
```

```python
salt.cloud.clouds.tencentcloud.show_image(**kwargs, call=None)
    Show the details of Tencent Cloud image
    CLI Examples:
    ```
salt-cloud -f show_image tencentcloud image=img-31tjrtph
    ```
```

```python
salt.cloud.clouds.tencentcloud.show_instance(name, call=None)
    Show the details of Tencent Cloud instance
    CLI Examples:
    ```
salt-cloud -a show_instance myinstance
    ```
```

```python
salt.cloud.clouds.tencentcloud.start(name, call=None)
    Start a Tencent Cloud instance Notice: the instance state must be stopped
    CLI Examples:
    ```
salt-cloud -a start myinstance
    ```
```

```python
salt.cloud.clouds.tencentcloud.stop(name, force=False, call=None)
    Stop a Tencent Cloud running instance Note: use force=True to make force stop
    CLI Examples:
    ```
salt-cloud -a stop myinstance
salt-cloud -a stop myinstance force=True

21.4.29 salt.cloud.clouds.vagrant

Vagrant Cloud Driver

The Vagrant cloud is designed to "vagrant up" a virtual machine as a Salt minion.

Use of this module requires some configuration in cloud profile and provider files as described in the Getting Started with Vagrant documentation.

New in version 2018.3.0.

salt.cloud.clouds.vagrant.avail_images(call=None)
This function returns a list of images available for this cloud provider. vagrant will return a list of profiles.
salt-cloud --list-images my-cloud-provider

salt.cloud.clouds.vagrant.avail_locations(call=None)
This function returns a list of locations available.

CLI Example:
salt-cloud --list-locations my-cloud-provider
# \[ vagrant will always returns an empty dictionary \]

salt.cloud.clouds.vagrant.avail_sizes(call=None)
This function returns a list of sizes available for this cloud provider.

CLI Example:
salt-cloud --list-sizes my-cloud-provider
# \[ vagrant always returns an empty dictionary \]

salt.cloud.clouds.vagrant.create(vm_)
Provision a single machine

CLI Example:
salt-cloud -p my_profile new_node_1

salt.cloud.clouds.vagrant.destroy(name, call=None)
Destroy a node.

CLI Example:
salt-cloud --destroy mymachine

salt.cloud.clouds.vagrant.get_configured_provider()
Return the first configured instance.

salt.cloud.clouds.vagrant.list_nodes(call=None)
List the nodes which have salt-cloud:driver:vagrant grains.

CLI Example:
salt-cloud -Q

salt.cloud.clouds.vagrant.list_nodes_full(call=None)
List the nodes, ask all 'vagrant' minions, return dict of grains (enhanced).

CLI Example:
salt-call -F

salt.cloud.clouds.vagrant.list_nodes_select(call=None)
Return a list of the minions that have salt-cloud grains, with select fields.

salt.cloud.clouds.vagrant.reboot(name, call=None)
Reboot a vagrant minion.

name The name of the VM to reboot.

CLI Example:
salt-cloud -a reboot vm_name

salt.cloud.clouds.vagrant.show_instance(name, call=None)
List the a single node, return dict of grains.

21.4.30 salt.cloud.clouds.virtualbox

A salt cloud provider that lets you use virtualbox on your machine and act as a cloud.

depends vboxapi

For now this will only clone existing VMs. It's best to create a template from which we will clone.
Followed https://docs.saltstack.com/en/latest/topics/cloud/cloud.html#non-libcloud-based-modules to create this.

Dicts provided by salt:

__opts__ [contains the options used to run Salt Cloud,] as well as a set of configuration and environment variables

salt.cloud.clouds.virtualbox.create(vm_info)
creates a virtual machine from the given VM information

This is what is used to request a virtual machine to be created by the cloud provider, wait for it to become available, and then (optionally) log in and install Salt on it.

Events fired:
This function fires the event salt/cloud/vm_name/creating, with the payload containing the names of the VM, profile, and provider.

@param vm_info

```python
{
    name: <str>
    profile: <dict>
    driver: <provider>:<profile>
    clonefrom: <vm_name>
    clonemode: <mode> (default: state, choices: state, child, all)
}
```

@type vm_info dict @return dict of resulting vm. ‼!Passwords can and should be included‼!
salt.cloud.clouds.virtualbox.destroy(name, call=None)
This function irreversibly destroys a virtual machine on the cloud provider. Before doing so, it should fire an event on the Salt event bus.

The tag for this event is salt/cloud/<vm name>/destroying. Once the virtual machine has been destroyed, another event is fired. The tag for that event is salt/cloud/<vm name>/destroyed.

Dependencies: list_nodes

@param name: str @param call: @type call: @return: True if all went well, otherwise an error message @rtype: bool|str

salt.cloud.clouds.virtualbox.list_nodes(kwargs=None, call=None)
This function returns a list of nodes available on this cloud provider, using the following fields:
- id (str)
- image (str)
- size (str)
- state (str)
- private_ips (list)
- public_ips (list)

No other fields should be returned in this function, and all of these fields should be returned, even if empty. The private_ips and public_ips fields should always be of a list type, even if empty, and the other fields should always be of a str type. This function is normally called with the -Q option:

```
salt-cloud -Q
```

@param kwargs: @type kwargs: @param call: @type call: @return: @rtype:

salt.cloud.clouds.virtualbox.list_nodes_full(kwargs=None, call=None)
All information available about all nodes should be returned in this function. The fields in the list_nodes() function should also be returned, even if they would not normally be provided by the cloud provider.

This is because some functions both within Salt and 3rd party will break if an expected field is not present. This function is normally called with the -F option:

```
salt-cloud -F
```

@param kwargs: @type kwargs: @param call: @type call: @return: @rtype:

salt.cloud.clouds.virtualbox.list_nodes_select(call=None)
Return a list of the VMs that are on the provider, with select fields

salt.cloud.clouds.virtualbox.map_clonemode(vm_info)
Convert the virtualbox config file values for clone_mode into the integers the API requires

salt.cloud.clouds.virtualbox.show_image(kwargs, call=None)
Show the details of an image

salt.cloud.clouds.virtualbox.start(name, call=None)
Start a machine. @param name: Machine to start @type name: str @param call: Must be "action" @type call: str

salt.cloud.clouds.virtualbox.stop(name, call=None)
Stop a running machine. @param name: Machine to stop @type name: str @param call: Must be "action" @type call: str
21.4.31 salt.cloud.clouds.vmware

VMware Cloud Module

New in version 2015.5.4.

The VMware cloud module allows you to manage VMware ESX, ESXi, and vCenter.

See Getting started with VMware to get started.

**codeauthor** Nitin Madhok <nmadhok@clemson.edu>

Dependencies

- pyVmomi Python Module

**pyVmomi**

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See Issue #29537 for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original VMware cloud driver was developed against.

**Note:** Ensure python pyVmomi module is installed by running following one-liner check. The output should be 0.

```
python -c "import pyVmomi" ; echo $?
```

**Configuration**

To use this module, set up the vCenter or ESX/ESXi URL, username and password in the cloud configuration at /etc/salt/cloud.providers or /etc/salt/cloud.providers.d/vmware.conf:

```
my-vmware-config:
  driver: vmware
  user: 'DOMAIN\user'
  password: 'verybadpass'
  url: '10.20.30.40'

vcenter01:
```

(continues on next page)
driver: vmware
user: 'DOMAIN\user'
password: 'verybadpass'
url: 'vcenter01.domain.com'
protocol: 'https'
port: 443

vcenter02:
  driver: vmware
  user: 'DOMAIN\user'
  password: 'verybadpass'
  url: 'vcenter02.domain.com'
  protocol: 'http'
  port: 80

esx01:
  driver: vmware
  user: 'admin'
  password: 'verybadpass'
  url: 'esx01.domain.com'

# Required when adding a host system
esxi_host_user: 'root'
esxi_host_password: 'myhostpassword'
# Optional fields that can be specified when adding a host system

Note: Optionally, protocol and port can be specified if the vCenter server is not using the defaults. Default is protocol: https and port: 443.

Note: Changed in version 2015.8.0.

The provider parameter in cloud provider configuration was renamed to driver. This change was made to avoid confusion with the provider parameter that is used in cloud profile configuration. Cloud provider configuration now uses driver to refer to the salt-cloud driver that provides the underlying functionality to connect to a cloud provider, while cloud profile configuration continues to use provider to refer to the cloud provider configuration that you define.

To test the connection for my-vmware-config specified in the cloud configuration, run:

test_vcenter_connection()
salt.cloud.clouds.vmware.add_host(kwarg=None, call=None)

Add a host system to the specified cluster or datacenter in this VMware environment

Note: To use this function, you need to specify esxi_host_user and esxi_host_password under your provider configuration set up at /etc/salt/cloud.providers or /etc/salt/cloud.providers.d/vmware.conf:
The SSL thumbprint of the host system can be optionally specified by setting `esxi_host_ssl_thumbprint` under your provider configuration. To get the SSL thumbprint of the host system, execute the following command from a remote server:

```
!echo -n | openssl s_client -connect <YOUR-HOSTSYSTEM-DNS/IP>:443 2>/dev/null |
!openssl x509 -noout -fingerprint -sha1
```

**CLI Example:**

```
salt-cloud -f add_host my-vmware-config host="myHostSystemName" cluster="myClusterName"
salt-cloud -f add_host my-vmware-config host="myHostSystemName" datacenter="myDatacenterName"
```

### `salt.cloud.clouds.vmware.avail_images(call=None)`
Return a list of all the templates present in this VMware environment with basic details

**CLI Example:**

```
salt-cloud --list-images my-vmware-config
```

### `salt.cloud.clouds.vmware.avail_locations(call=None)`
Return a list of all the available locations/datacenters in this VMware environment

**CLI Example:**

```
salt-cloud --list-locations my-vmware-config
```

### `salt.cloud.clouds.vmware.avail_sizes(call=None)`
Return a list of all the available sizes in this VMware environment.

**CLI Example:**

```
salt-cloud --list-sizes my-vmware-config
```

**Note:** Since sizes are built into templates, this function will return an empty dictionary.

### `salt.cloud.clouds.vmware.build_clonespec(config_spec, object_ref, reloc_spec, template)`
Returns the clone spec

### `salt.cloud.clouds.vmware.connect_host(kwargs=None, call=None)`
Connect the specified host system in this VMware environment

**CLI Example:**

```
salt-cloud -f connect_host my-vmware-config host="myHostSystemName"
```

### `salt.cloud.clouds.vmware.convert_to_template(name, kwargs=None, call=None)`
Convert the specified virtual machine to template.

**CLI Example:**
salt-cloud -a convert_to_template vmname

salt.cloud.clouds.vmware.create(vm_)
To create a single VM in the VMware environment.
Sample profile and arguments that can be specified in it can be found here.
CLI Example:
salt-cloud -p vmware-centos6.5 vmname

salt.cloud.clouds.vmware.create_cluster(kwags=None, call=None)
Create a new cluster under the specified datacenter in this VMware environment
CLI Example:
salt-cloud -f create_cluster my-vmware-config name="myNewCluster" datacenter="datacenterName"

salt.cloud.clouds.vmware.create_datacenter(kwags=None, call=None)
Create a new data center in this VMware environment
CLI Example:
salt-cloud -f create_datacenter my-vmware-config name="MyNewDatacenter"

salt.cloud.clouds.vmware.create_datastore_cluster(kwags=None, call=None)
Create a new datastore cluster for the specified datacenter in this VMware environment
CLI Example:
salt-cloud -f create_datastore_cluster my-vmware-config name="datastoreClusterName" datacenter="datacenterName"

salt.cloud.clouds.vmware.create_folder(kwags=None, call=None)
Create the specified folder path in this VMware environment

Note: To create a Host and Cluster Folder under a Datacenter, specify path="/yourDatacenterName/host/yourFolderName"
To create a Network Folder under a Datacenter, specify path="/yourDatacenterName/network/yourFolderName"
To create a Storage Folder under a Datacenter, specify path="/yourDatacenterName/datastore/yourFolderName"
To create a VM and Template Folder under a Datacenter, specify path="/yourDatacenterName/vm/yourFolderName"

CLI Example:
salt-cloud -f create_folder my-vmware-config path="/Local/a/b/c"
salt-cloud -f create_folder my-vmware-config path="/MyDatacenter/vm/MyVMFolder"
salt-cloud -f create_folder my-vmware-config path="/MyDatacenter/host/MyHostFolder/MyNetworkFolder"
salt-cloud -f create_folder my-vmware-config path="/MyDatacenter/storage/MyStorageFolder"

(continues on next page)
salt.cloud.clouds.vmware.create_snapshot(name, kwargs=None, call=None)

Create a snapshot of the specified virtual machine in this VMware environment

Note: If the VM is powered on, the internal state of the VM (memory dump) is included in the snapshot by default which will also set the power state of the snapshot to "powered on". You can set memdump=False to override this. This field is ignored if the virtual machine is powered off or if the VM does not support snapshots with memory dumps. Default is memdump=True

Note: If the VM is powered on when the snapshot is taken, VMware Tools can be used to quiesce the file system in the virtual machine by setting quiesce=True. This field is ignored if the virtual machine is powered off; if VMware Tools are not available or if memdump=True. Default is quiesce=False

CLI Example:

```
salt-cloud -a create_snapshot vmname
```

salt.cloud.clouds.vmware.destroy(name, call=None)

To destroy a VM from the VMware environment

CLI Example:

```
salt-cloud -d vmname
salt-cloud --destroy vmname
salt-cloud -a destroy vmname
```

salt.cloud.clouds.vmware.disconnect_host(kwargs=None, call=None)

Disconnect the specified host system in this VMware environment

CLI Example:

```
salt-cloud -f disconnect_host my-vmware-config host="myHostSystemName"
```

salt.cloud.clouds.vmware.enter_maintenance_mode(kwargs=None, call=None)

To put the specified host system in maintenance mode in this VMware environment

CLI Example:

```
salt-cloud -f enter_maintenance_mode my-vmware-config host="myHostSystemName"
```

salt.cloud.clouds.vmware.exit_maintenance_mode(kwargs=None, call=None)

To take the specified host system out of maintenance mode in this VMware environment

CLI Example:

```
salt-cloud -f exit_maintenance_mode my-vmware-config host="myHostSystemName"
```

salt.cloud.clouds.vmware.get_clonespec_for_valid_snapshot(config_spec, object_ref, reloc_spec, template, vm_)

return clonespec only if values are valid
salt.cloud.clouds.vmware.get_vcenter_version(kwargs=None, call=None)
Show the vCenter Server version with build number.

CLI Example:
```
salt-cloud -f get_vcenter_version my-vmware-config
```

salt.cloud.clouds.vmware.handle_snapshot(config_spec, object_ref, reloc_spec, template, vm_)
Returns a clone spec for cloning from snapshots :rtype vim.vm.CloneSpec

salt.cloud.clouds.vmware.list_clusters(kwargs=None, call=None)
List all the clusters for this VMware environment

CLI Example:
```
salt-cloud -f list_clusters my-vmware-config
```

salt.cloud.clouds.vmware.list_clusters_by_datacenter(kwargs=None, call=None)
List clusters for each datacenter; or clusters for a specified datacenter in this VMware environment

To list clusters for each datacenter:

CLI Example:
```
salt-cloud -f list_clusters_by_datacenter my-vmware-config
```

To list clusters for a specified datacenter:

CLI Example:
```
salt-cloud -f list_clusters_by_datacenter my-vmware-config datacenter="datacenterName"
```

salt.cloud.clouds.vmware.list_datacenters(kwargs=None, call=None)
List all the data centers for this VMware environment

CLI Example:
```
salt-cloud -f list_datacenters my-vmware-config
```

salt.cloud.clouds.vmware.list_datastore_clusters(kwargs=None, call=None)
List all the datastore clusters for this VMware environment

CLI Example:
```
salt-cloud -f list_datastore_clusters my-vmware-config
```

salt.cloud.clouds.vmware.list_datastores(kwargs=None, call=None)
List all the datastores for this VMware environment

CLI Example:
```
salt-cloud -f list_datastores my-vmware-config
```

salt.cloud.clouds.vmware.list_dvs(kwargs=None, call=None)
List all the distributed virtual switches for this VMware environment

CLI Example:
```
salt-cloud -f list_dvs my-vmware-config
```

21.4. cloud modules
salt.cloud.clouds.vmware.list_folders(kwargs=None, call=None)
List all the folders for this VMware environment

CLI Example:
salt-cloud -f list_folders my-vmware-config

salt.cloud.clouds.vmware.list_hbas(kwargs=None, call=None)
List all HBAs for each host system; or all HBAs for a specified host system; or HBAs of specified type for each host system; or HBAs of specified type for a specified host system in this VMware environment

Note: You can specify type as either parallel, iscsi, block or fibre.

To list all HBAs for each host system:
CLI Example:
salt-cloud -f list_hbas my-vmware-config

To list all HBAs for a specified host system:
CLI Example:
salt-cloud -f list_hbas my-vmware-config host="hostSystemName"

To list HBAs of specified type for each host system:
CLI Example:
salt-cloud -f list_hbas my-vmware-config type="HBAType"

To list HBAs of specified type for a specified host system:
CLI Example:
salt-cloud -f list_hbas my-vmware-config host="hostSystemName" type="HBAtype"

salt.cloud.clouds.vmware.list_hosts(kwargs=None, call=None)
List all the hosts for this VMware environment

CLI Example:
salt-cloud -f list_hosts my-vmware-config

salt.cloud.clouds.vmware.list_hosts_by_cluster(kwargs=None, call=None)
List hosts for each cluster; or hosts for a specified cluster in this VMware environment

To list hosts for each cluster:
CLI Example:
salt-cloud -f list_hosts_by_cluster my-vmware-config

To list hosts for a specified cluster:
CLI Example:
salt-cloud -f list_hosts_by_cluster my-vmware-config cluster="clusterName"
salt.cloud.clouds.vmware.list_hosts_by_datacenter(kwargs=None, call=None)
List hosts for each datacenter; or hosts for a specified datacenter in this VMware environment

To list hosts for each datacenter:
CLI Example:
```
salt-cloud -f list_hosts_by_datacenter my-vmware-config
```

To list hosts for a specified datacenter:
CLI Example:
```
salt-cloud -f list_hosts_by_datacenter my-vmware-config datacenter="datacenterName"
```
	salt.cloud.clouds.vmware.list_networks(kwargs=None, call=None)
List all the standard networks for this VMware environment

CLI Example:
```
salt-cloud -f list_networks my-vmware-config
```
	salt.cloud.clouds.vmware.list_nodes(kwargs=None, call=None)
Return a list of all VMs and templates that are on the specified provider, with basic fields

CLI Example:
```
salt-cloud -f list_nodes my-vmware-config
```

To return a list of all VMs and templates present on ALL configured providers, with basic fields:
CLI Example:
```
salt-cloud -Q
```
	salt.cloud.clouds.vmware.list_nodes_full(kwargs=None, call=None)
Return a list of all VMs and templates that are on the specified provider, with full details

CLI Example:
```
salt-cloud -f list_nodes_full my-vmware-config
```

To return a list of all VMs and templates present on ALL configured providers, with full details:
CLI Example:
```
salt-cloud -F
```
	salt.cloud.clouds.vmware.list_nodes_min(kwargs=None, call=None)
Return a list of all VMs and templates that are on the specified provider, with no details

CLI Example:
```
salt-cloud -f list_nodes_min my-vmware-config
```
	salt.cloud.clouds.vmware.list_nodes_select(call=None)
Return a list of all VMs and templates that are on the specified provider, with fields specified under query.

selection in /etc/salt/cloud

CLI Example:
To return a list of all VMs and templates present on ALL configured providers, with fields specified under query.selection in /etc/salt/cloud:

CLI Example:

```bash
salt-cloud -S
```

```
salt.cloud.clouds.vmware.list_portgroups(kwargs=None, call=None)
    List all the distributed virtual portgroups for this VMware environment
CLI Example:

salt-cloud -f list_portgroups my-vmware-config
```

```
salt.cloud.clouds.vmware.list_resourcepools(kwargs=None, call=None)
    List all the resource pools for this VMware environment
CLI Example:

salt-cloud -f list_resourcepools my-vmware-config
```

```
salt.cloud.clouds.vmware.list_snapshots(kwargs=None, call=None)
    List snapshots either for all VMs and templates or for a specific VM/template in this VMware environment
To list snapshots for all VMs and templates:

CLI Example:

```
salt-cloud -f list_snapshots my-vmware-config
```

To list snapshots for a specific VM/template:

CLI Example:

```
salt-cloud -f list_snapshots my-vmware-config name="vmname"
```

```
salt.cloud.clouds.vmware.list_templates(kwargs=None, call=None)
    List all the templates present in this VMware environment
CLI Example:

```
salt-cloud -f list_templates my-vmware-config
```

```
salt.cloud.clouds.vmware.list_vapps(kwargs=None, call=None)
    List all the vApps for this VMware environment
CLI Example:

```
salt-cloud -f list_vapps my-vmware-config
```

```
salt.cloud.clouds.vmware.reboot_host(kwargs=None, call=None)
    Reboot the specified host system in this VMware environment

Note: If the host system is not in maintenance mode, it will not be rebooted. If you want to reboot the host system regardless of whether it is in maintenance mode, set force=True. Default is force=False.

CLI Example:
```
```
salt-cloud -f reboot_host my-vmware-config host="myHostSystemName" [force=True]
```

`salt.cloud.clouds.vmware.remove_all_snapshots(name, kwargs=None, call=None)`

Remove all the snapshots present for the specified virtual machine.

**Note:** All the snapshots higher up in the hierarchy of the current snapshot tree are consolidated and their virtual disks are merged. To override this behavior and only remove all snapshots, set `merge_snapshots=False`. Default is `merge_snapshots=True`

**CLI Example:**
```
salt-cloud -a remove_all_snapshots vmname [merge_snapshots=False]
```

`salt.cloud.clouds.vmware.remove_host(kwags=None, call=None)`

Remove the specified host system from this VMware environment

**CLI Example:**
```
salt-cloud -f remove_host my-vmware-config host="myHostSystemName"
```

`salt.cloud.clouds.vmware.remove_snapshot(name, kwargs=None, call=None)`

Remove a snapshot of the specified virtual machine in this VMware environment

**CLI Example:**
```
salt-cloud -a remove_snapshot vmname snapshot_name="mySnapshot"
salt-cloud -a remove_snapshot vmname snapshot_name="mySnapshot" [remove_children=True]
```

`salt.cloud.clouds.vmware.rescan_hba(kwags=None, call=None)`

To rescan a specified HBA or all the HBAs on the Host System

**CLI Example:**
```
salt-cloud -f rescan_hba my-vmware-config host="hostSystemName"
salt-cloud -f rescan_hba my-vmware-config hba="hbaDeviceName" host="hostSystemName"
```

`salt.cloud.clouds.vmware.reset(name, soft=False, call=None)`

To reset a VM using its name

**Note:** If `soft=True` then issues a command to the guest operating system asking it to perform a reboot. Otherwise hypervisor will terminate VM and start it again. Default is `soft=False`

For `soft=True` vmtools should be installed on guest system.

**CLI Example:**
```
salt-cloud -a reset vmname
salt-cloud -a reset vmname soft=True
```

`salt.cloud.clouds.vmware.revert_to_snapshot(name, kwargs=None, call=None)`

Revert virtual machine to its current snapshot. If no snapshot exists, the state of the virtual machine remains unchanged

**CLI Example:**
```
```
Note: The virtual machine will be powered on if the power state of the snapshot when it was created was set to "Powered On". Set `power_off=True` so that the virtual machine stays powered off regardless of the power state of the snapshot when it was created. Default is `power_off=False`.

If the power state of the snapshot when it was created was "Powered On" and if `power_off=True`, the VM will be put in suspended state after it has been reverted to the snapshot.

CLI Example:

```bash
salt-cloud -a revert_to_snapshot vmname [power_off=True]
salt-cloud -a revert_to_snapshot vmname snapshot_name="selectedSnapshot" [power_off=True]
```

salt.cloud.clouds.vmware.show_instance(name, call=call)
List all available details of the specified VM

CLI Example:

```bash
salt-cloud -a show_instance vmname
```

salt.cloud.clouds.vmware.shutdown_host(kwargs=None, call=call)
Shut down the specified host system in this VMware environment

Note: If the host system is not in maintenance mode, it will not be shut down. If you want to shut down the host system regardless of whether it is in maintenance mode, set `force=True`. Default is `force=False`.

CLI Example:

```bash
salt-cloud -f shutdown_host my-vmware-config host="myHostSystemName" [force=True]
```

salt.cloud.clouds.vmware.start(name, call=call)
To start/power on a VM using its name

CLI Example:

```bash
salt-cloud -a start vmname
```

salt.cloud.clouds.vmware.stop(name, soft=False, call=call)
To stop/power off a VM using its name

Note: If `soft=True` then issues a command to the guest operating system asking it to perform a clean shutdown of all services. Default is `soft=False`

For `soft=True` vmtools should be installed on guest system.

CLI Example:

```bash
salt-cloud -a stop vmname
salt-cloud -a stop vmname soft=True
```

salt.cloud.clouds.vmware.suspend(name, call=call)
To suspend a VM using its name

CLI Example:
salt-cloud -a suspend vmname

```

salt.cloud.clouds.vmware.terminate(name, call=None)
   To do an immediate power off of a VM using its name. A SIGKILL is issued to the vmx process of the VM
   CLI Example:
   salt-cloud -a terminate vmname

salt.cloud.clouds.vmware.test_vcenter_connection(kw.../etc/salt/cloud.providers or /etc/salt/cloud.providers.d/vmware.conf
   CLI Example:
   salt-cloud -f test_vcenter_connection my-vmware-config

salt.cloud.clouds.vmware.upgrade_tools(name, reboot=False, call=None)
   To upgrade VMware Tools on a specified virtual machine.
   **Note:** If the virtual machine is running Windows OS, use reboot=True to reboot the virtual machine after
   VMware tools upgrade. Default is reboot=False
   CLI Example:
   salt-cloud -a upgrade_tools vmname
   salt-cloud -a upgrade_tools vmname reboot=True

salt.cloud.clouds.vmware.upgrade_tools_all(call=None)
   To upgrade VMware Tools on all virtual machines present in the specified provider
   **Note:** If the virtual machine is running Windows OS, this function will attempt to suppress the automatic
   reboot caused by a VMware Tools upgrade.
   CLI Example:
   salt-cloud -f upgrade_tools_all my-vmware-config

21.4.32 salt.cloud.clouds.vultrpy

Vultr Cloud Module using python-vultr bindings

New in version 2016.3.0.
The Vultr cloud module is used to control access to the Vultr VPS system.
Use of this module only requires the api_key parameter.
Set up the cloud configuration at /etc/salt/cloud.providers or /etc/salt/cloud.providers.d/ vultr.conf:
my-vultr-config:
  # Vultr account api key
  api_key: <supersecretapi_key>
  driver: vultr

Set up the cloud profile at /etc/salt/cloud.profiles or /etc/salt/cloud.profiles.d/vultr.conf:

nyc-4gb-4cpu-ubuntu-14-04:
  location: 1
  provider: my-vultr-config
  image: 160
  size: 95
  enable_private_network: True

This driver also supports Vultr's startup script feature. You can list startup scripts in your account with

salt-cloud -f list_scripts <name of vultr provider>

That list will include the IDs of the scripts in your account. Thus, if you have a script called 'setup-networking' with an ID of 493234 you can specify that startup script in a profile like so:

nyc-2gb-1cpu-ubuntu-17-04:
  location: 1
  provider: my-vultr-config
  image: 223
  size: 13
  startup_script_id: 493234

salt.cloud.clouds.vultrpy.avail_images(conn=None)
  Return available images

salt.cloud.clouds.vultrpy.avail_locations(conn=None)
  return available datacenter locations

salt.cloud.clouds.vultrpy.avail_scripts(conn=None)
  return available startup scripts

salt.cloud.clouds.vultrpy.avail_sizes(conn=None)
  Return available sizes ("plans" in VultrSpeak)

salt.cloud.clouds.vultrpy.create(vm_)
  Create a single VM from a data dict

salt.cloud.clouds.vultrpy.destroy(name)
  Remove a node from Vultr

salt.cloud.clouds.vultrpy.get_configured_provider()
  Return the first configured instance

salt.cloud.clouds.vultrpy.list_nodes(**kwargs)
  Return basic data on nodes

salt.cloud.clouds.vultrpy.list_nodes_full(**kwargs)
  Return all data on nodes

salt.cloud.clouds.vultrpy.list_nodes_select(conn=None, call=None)
  Return a list of the VMs that are on the provider, with select fields
salt.cloud.clouds.vultrpy.list_scripts(conn=None, call=None)
    return list of Startup Scripts
	salt.cloud.clouds.vultrpy.show_instance(name, call=None)
    Show the details from the provider concerning an instance
	salt.cloud.clouds.vultrpy.start(*args, **kwargs)
    Execute a "start" action on a VM
	salt.cloud.clouds.vultrpy.stop(*args, **kwargs)
    Execute a "stop" action on a VM

21.4.33 salt.cloud.clouds.xen

XenServer Cloud Driver

The XenServer driver is designed to work with a Citrix XenServer.

Requires XenServer SDK (can be downloaded from https://www.citrix.com/downloads/xenserver/product-software/)

Place a copy of the XenAPI.py in the Python site-packages folder.

   depends XenAPI

Example provider configuration:

```
# /etc/salt/cloud.providers.d/myxen.conf
myxen:
    driver: xen
    url: http://10.0.0.120
    user: root
    password: p@ssw0rd
```

Example profile configuration:

```
# /etc/salt/cloud.profiles.d/myxen.conf
suse:
    provider: myxen
    user: root
    password: p@ssw0rd
    image: opensuseleap42_2-template
    storage_repo: 'Local storage'
    resource_pool: default_pool
    clone: True
    minion: master: 10.0.0.18
sles:
    provider: myxen
    user: root
    clone: False
    image: sles12sp2-template
    deploy: False
w2k12:
    provider: myxen
    image: w2k12svr-template
    clone: True
    userdata_file: /srv/salt/win/files/windows-firewall.ps1
```

(continues on next page)
Salt Documentation, Release 3001.1

```
win_installer: /srv/salt/win/files/Salt-Minion-2016.11.3-AMD64-Setup.exe
win_username: Administrator
win_password: p@ssw0rd
use_winrm: False
ipv4_cidr: 10.0.0.215/24
ipv4_gw: 10.0.0.1
```

salt.cloud.clouds.xen.avail_images(call=None)
Get a list of images from Xen

If called with the --list-images then it returns images with all details.

```
salt-cloud --list-images myxen
```

salt.cloud.clouds.xen.avail_locations(session=None, call=None)
Return available Xen locations (not implemented)

```
salt-cloud --list-locations myxen
```

salt.cloud.clouds.xen.avail_sizes(session=None, call=None)
Return a list of Xen template definitions

```
salt-cloud --list-sizes myxen
```

salt.cloud.clouds.xen.create(vm_)
Create a VM in Xen

The configuration for this function is read from the profile settings.

```
salt-cloud -p some_profile xenvm01
```

salt.cloud.clouds.xen.destroy(name=None, call=None)
Destroy Xen VM or template instance

```
salt-cloud -d xenvm01
```

salt.cloud.clouds.xen.destroy_template(name=None, call=None, kwargs=None)
Destroy Xen VM or template instance

```
salt-cloud -f destroy_template myxen name=testvm2
```

salt.cloud.clouds.xen.destroy_vm_vdis(name=None, session=None, call=None)
Get virtual block devices on VM

```
salt-cloud -a destroy_vm_vdis xenvm01
```

salt.cloud.clouds.xen.get_configured_provider()
Return the first configured instance.

salt.cloud.clouds.xen.get_pv_args(name, session=None, call=None)
Get PV arguments for a VM

```
salt-cloud -a get_pv_args xenvm01
```

salt.cloud.clouds.xen.get_vm_ip(name=None, session=None, call=None)
Get the IP address of the VM

```
salt-cloud --list-sizes myxen
```
salt-cloud -a get_vm_ip xenvm01

**Note:** Requires xen guest tools to be installed in VM

```
salt.cloud.clouds.xen.host_list(call=None)
Get a list of Xen Servers
salt-cloud -f host_list myxen
```

```
salt.cloud.clouds.xen.list_nodes()
List virtual machines
salt-cloud -Q
```

```
salt.cloud.clouds.xen.list_nodes_full(session=None)
List full virtual machines
salt-cloud -F
```

```
salt.cloud.clouds.xen.list_nodes_select(call=None)
Perform a select query on Xen VM instances
salt-cloud -S
```

```
salt.cloud.clouds.xen.pause(name, call=None, session=None)
Pause a vm
salt-cloud -a pause xenvm01
```

```
salt.cloud.clouds.xen.pif_list(call=None)
Get a list of Resource Pools
salt-cloud -f pool_list myxen
```

```
salt.cloud.clouds.xen.pool_list(call=None)
Get a list of Resource Pools
salt-cloud -f pool_list myxen
```

```
salt.cloud.clouds.xen.reboot(name, call=None, session=None)
Reboot a vm
salt-cloud -a reboot xenvm01
```

```
salt.cloud.clouds.xen.resume(name, call=None, session=None)
Resume a vm from disk
salt-cloud -a resume xenvm01
```

```
salt.cloud.clouds.xen.set_pv_args(name, kwargs=None, session=None, call=None)
Set PV arguments for a VM
salt-cloud -a set_pv_args xenvm01 pv_args="utf-8 graphical"
```
salt.cloud.clouds.xen.set_vm_ip(name=None, ipv4_cidr=None, ipv4_gw=None, session=None, call=None)
Set the IP address on a virtual interface (vif)
salt.cloud.clouds.xen.show_instance(name, session=None, call=None)
Show information about a specific VM or template
```
salt-cloud -a show_instance xenvm01
```
Note: memory is memory_dynamic_max
salt.cloud.clouds.xen.shutdown(name, call=None, session=None)
Shutdown a vm
```
salt-cloud -a shutdown xenvm01
```
salt.cloud.clouds.xen.sr_list(call=None)
Get a list of storage repositories
```
salt-cloud -f sr_list myxen
```
salt.cloud.clouds.xen.start(name, call=None, session=None)
Start a vm
```
salt-cloud -a start xenvm01
```
salt.cloud.clouds.xen.stop(name, call=None, session=None)
Stop a vm
```
salt-cloud -a stop xenvm01
```
salt.cloud.clouds.xen.suspend(name, call=None, session=None)
Suspend a vm to disk
```
salt-cloud -a suspend xenvm01
```
salt.cloud.clouds.xen.template_list(call=None)
Return available Xen template information.
This returns the details of each template to show number cores, memory sizes, etc..
```
salt-cloud -f template_list myxen
```
salt.cloud.clouds.xen.unpause(name, call=None, session=None)
UnPause a vm
```
salt-cloud -a unpause xenvm01
```
salt.cloud.clouds.xen.vbd_list(name=None, call=None)
Get a list of VBDs on a VM
requires: the name of the vm with the vbd definition
```
salt-cloud -a vbd_list xenvm01
```
salt.cloud.clouds.xen.vdi_list(call=None, kwargs=None)
Return available Xen VDI images
If this function is called with the `-f` or `--function` then it can return a list with minimal details using the `terse=True` keyword argument.

```bash
salt-cloud -f vdi_list myxen terse=True
```

`salt.cloud.clouds.xen.vif_list(name, call=None, kwargs=None)`
Get a list of virtual network interfaces on a VM

**requires**: the name of the vm with the vbd definition

```bash
salt-cloud -a vif_list xenvm01
```

### 21.5 engine modules

<table>
<thead>
<tr>
<th>Engine Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>

</tbody>
</table>
21.5.1 salt.engines.docker_events module

Send events from Docker events :Depends: Docker API >= 1.22

```python
salt.engines.docker_events.start(docker_url='unix://var/run/docker.sock',
tag='salt/engines/docker_events', filters=None, timeout=60)
```

Scan for Docker events and fire events

Example Config

```yaml
engines:
  - docker_events:
      docker_url: unix://var/run/docker.sock
      filters:
        event:
          - start
          - stop
          - die
          - oom
```

The config above sets up engines to listen for events from the Docker daemon and publish them to the Salt event bus.

For filter reference, see https://docs.docker.com/engine/reference/commandline/events/

21.5.2 salt.engines.fluent

An engine that reads messages from the salt event bus and pushes them onto a fluent endpoint.

New in version 3000.

Configuration

All arguments are optional

Example configuration of default settings

```yaml
engines:
  - fluent:
     host: localhost
     port: 24224
     app: engine
```

Example fluentd configuration

```xml
<source>
  @type forward
  port 24224
</source>

<match saltstack.**>
  @type file
  path /var/log/td-agent/saltstack
</match>
```

depends fluent-logger

```python
salt.engines.fluent.start(host='localhost', port=24224, app='engine')
```

Listen to salt events and forward them to fluent
Parameters

- **host**(str) -- Host running fluentd agent. Default is localhost
- **port**(int) -- Port of fluentd agent. Default is 24224
- **app**(str) -- Text sent as fluentd tag. Default is "engine". This text is appended to "salt-stack." to form a fluentd tag, ex: "saltstack.engine"

### 21.5.3 salt.engines.http_logstash

HTTP Logstash engine

An engine that reads messages from the salt event bus and pushes them onto a logstash endpoint via HTTP requests. Changed in version 2018.3.0.

**Note:** By default, this engine take everything from the Salt bus and exports into Logstash. For a better selection of the events that you want to publish, you can use the `tags` and `funs` options.

**configuration**  Example configuration

```yaml
engines:
  - http_logstash:
      url: http://blabla.com/salt-stuff
      tags:
        - salt/job/*/new
        - salt/job/*/ret/*
      funs:
        - probes.results
        - bgp.config

salt.engines.http_logstash.start(url=None, funs=None, tags=None)
Listen to salt events and forward them to logstash.
```

- **url** The Logstash endpoint.

- **funs:** *None* A list of functions to be compared against, looking into the `fun` field from the event data. This option helps to select the events generated by one or more functions. If an event does not have the `fun` field in the data section, it will be published. For a better selection, consider using the `tags` option. By default, this option accepts any event to be submitted to Logstash.

- **tags:** *None* A list of pattern to compare the event tag against. By default, this option accepts any event to be submitted to Logstash.

### 21.5.4 salt.engines.ircbot

IRC Bot engine

New in version 2017.7.0.

Example Configuration

```yaml
engines:
  - ircbot:
      nick: <nick>

(continues on next page)
username: <username>
password: <password>
host: chat.freenode.net
port: 7000
channels:
  - salt-test
  - '#something'
use_ssl: True
use_sasl: True
disable_query: True
allow_hosts:
  - salt/engineer/.*
allow_nicks:
  - gtmanfred

Available commands on irc are:

ping  return pong

echo <stuff>  return <stuff> targeted at the user who sent the commands

event <tag> [<extra>, <data>]  fire event on the master or minion event stream with the tag salt/engines/ircbot/<tag>

and a data object with a list of everything else sent in the message

Example of usage

<table>
<thead>
<tr>
<th>Time</th>
<th>User</th>
<th>Command</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>08:33:57</td>
<td>@gtmanfred</td>
<td>!ping</td>
<td>gtmanfred: pong</td>
</tr>
<tr>
<td>08:34:02</td>
<td>@gtmanfred</td>
<td>!echo ping</td>
<td>ping</td>
</tr>
<tr>
<td>08:34:17</td>
<td>@gtmanfred</td>
<td>!event</td>
<td>TaDa!</td>
</tr>
<tr>
<td>08:34:17</td>
<td>gtmanbot</td>
<td></td>
<td>irc is useful</td>
</tr>
</tbody>
</table>

[DEBUG ] Sending event: tag = salt/engines/ircbot/test/tag/ircbot; data = {'_stamp': '2016-11-28T14:34:16.633623', 'data': ['irc', 'is', 'useful']}

```
class salt.engines.ircbot.Event(source, code, line)

    property code
        Alias for field number 1

    property line
        Alias for field number 2

    property source
        Alias for field number 0

class salt.engines.ircbot.IRCClient(nick, host, port=6667, username=None, password=None, channels=None, use_ssl=False, use_sasl=False, char='!', allow_hosts=False, allow_nicks=False, disable_query=True)

    join_channel(channel)

    on_closed()

    on_connect()

    read_messages()

    send_message(line)
```
class salt.engines.ircbot.PrivEvent(source, nick, user, host, code, channel, command, line)

- **property channel**
  Alias for field number 5

- **property code**
  Alias for field number 4

- **property command**
  Alias for field number 6

- **property host**
  Alias for field number 3

- **property line**
  Alias for field number 7

- **property nick**
  Alias for field number 1

- **property source**
  Alias for field number 0

- **property user**
  Alias for field number 2

salt.engines.ircbot.start(nick, host, port=6667, username=None, password=None, channels=None, use_ssl=False, use_sasl=False, char='!', allow_hosts=False, allow_nicks=False, disable_query=True)

IRC Bot for interacting with salt.

- **nick** Nickname of the connected Bot.
- **host** irc server (example - chat.freenode.net).
- **port** irc port. Default: 6667
- **password** password for authenticating. If not provided, user will not authenticate on the irc server.
- **channels** channels to join.
- **use_ssl** connect to server using ssl. Default: False
- **use_sasl** authenticate using sasl, instead of messaging NickServ. Default: False

---

Note: This will allow the bot user to be fully authenticated before joining any channels

- **char** command character to look for. Default: !
- **allow_hosts** hostmasks allowed to use commands on the bot. Default: False True to allow all False to allow none List of regexes to allow matching
- **allow_nicks** Nicks that are allowed to use commands on the bot. Default: False True to allow all False to allow none List of regexes to allow matching
- **disable_query** Disable commands from being sent through private queries. Require they be sent to a channel, so that all communication can be controlled by access to the channel. Default: True
Warning: Unauthenticated Access to event stream

This engine sends events calls to the event stream without authenticating them in salt. Authentication will need to be configured and enforced on the irc server or enforced in the irc channel. The engine only accepts commands from channels, so non authenticated users could be banned or quieted in the channel.

/mode +q $~a # quiet all users who are not authenticated /mode +r # do not allow unauthenticated users into the channel

It would also be possible to add a password to the irc channel, or only allow invited users to join.

21.5.5 salt.engines.junos_syslog module

Junos Syslog Engine

New in version 2017.7.0.

depends pyparsing, twisted

An engine that listens to syslog message from Junos devices, extract event information and generate message on SaltStack bus.

The event topic sent to salt is dynamically generated according to the topic title specified by the user. The incoming event data (from the junos device) consists of the following fields:

1. hostname
2. hostip
3. daemon
4. event
5. severity
6. priority
7. timestamp
8. message
9. pid
10. raw (the raw event data forwarded from the device)

The topic title can consist of any of the combination of above fields, but the topic has to start with 'jnpr/syslog'. So, we can have different combinations:

- jnpr/syslog/hostip/daemon/event
- jnpr/syslog/daemon/severity

The corresponding dynamic topic sent on salt event bus would look something like:

- jnpr/syslog/1.1.1.1/mgd/UI_COMMIT_COMPLETED
- jnpr/syslog/sshd/7

The default topic title is 'jnpr/syslog/hostname/event'.

The user can choose the type of data they wants of the event bus. Like, if one wants only events pertaining to a particular daemon, they can specify that in the configuration file:
One can even have a list of daemons like:

```
daemon:
  - mgd
  - sshd
```

Example configuration (to be written in master config file)

```
engines:
  - junos_syslog:
    port: 9999
    topic: jnpr/syslog/hostip/daemon/event
daemon:
  - mgd
  - sshd
```

For junos_syslog engine to receive events, syslog must be set on the junos device. This can be done via following configuration:

```
set system syslog host <ip-of-the-salt-device> port 516 any any
```

Below is a sample syslog event which is received from the junos device:

```
'\<30>May 29 05:18:12 bng-ui-vm-9 mspd\[1492\]: No chassis configuration found'
```

The source for parsing the syslog messages is taken from: [https://gist.github.com/leandrosilva/3651640#file-xlog-py](https://gist.github.com/leandrosilva/3651640#file-xlog-py)

```
salt.engines.junos_syslog.start(port=516,**kwargs)
```

### 21.5.6 salt.engines.libvirt_events module

An engine that listens for libvirt events and resends them to the salt event bus.

The minimal configuration is the following and will listen to all events on the local hypervisor and send them with a tag starting with `salt/engines/libvirt_events`:

```
engines:
  - libvirt_events
```

Note that the automatically-picked libvirt connection will depend on the value of `uri_default` in `/etc/libvirt/libvirt.conf`. To force using another connection like the local LXC libvirt driver, set the `uri` property as in the following example configuration.

```
engines:
  - libvirt_events:
    uri: lxc:///n
    tag_prefix: libvirt
    filters:
      - domain/lifecycle
      - domain/reboot
      - pool
```

Filters is a list of event types to relay to the event bus. Items in this list can be either one of the main types (domain, network, pool, nodedev, secret), all or a more precise filter. These can be done with values
like `<main_type>/<subtype>`. The possible values are in the `CALLBACK_DEFS` constant. If the filters list contains `all`, all events will be relayed.

Be aware that the list of events increases with libvirt versions, for example network events have been added in libvirt 1.2.1.

**Running the engine on non-root**

Running this engine as non-root requires a special attention, which is surely the case for the master running as user `salt`. The engine is likely to fail to connect to libvirt with an error like this one:

```
[ERROR ] authentication unavailable: no polkit agent available to authenticate action 'org.libvirt.unix.monitor'
```

To fix this, the user running the engine, for example the salt-master, needs to have the rights to connect to libvirt in the machine polkit config. A polkit rule like the following one will allow `salt` user to connect to libvirt:

```javascript
polkit.addRule(function(action, subject) {
    if (action.id.indexOf("org.libvirt") == 0 && subject.user == "salt") {
        return polkit.Result.YES;
    }
});
```

New in version 2019.2.0.

**salt.engines.libvirt_events.start**

Listen to libvirt events and forward them to salt.

**Parameters**

- `uri` -- libvirt URI to listen on. Defaults to None to pick the first available local hypervisor
- `tag_prefix` -- the beginning of the salt event tag to use. Defaults to `salt/engines/libvirt_events`
- `filters` -- the list of event of listen on. Defaults to 'all'

**21.5.7 salt.engines.logentries**

An engine that sends events to the Logentries logging service.

**maintainer** Jimmy Tang (jimmy_tang@rapid7.com)

**maturity** New

**depends** ssl, certifi

**platform** all

To enable this engine the master and/or minion will need the following python libraries

- ssl certifi

If you are running a new enough version of python then the ssl library will be present already.

You will also need the following values configured in the minion or master config.

**configuration** Example configuration
The 'token' can be obtained from the Logentries service.

To test this engine

```
salt '*' test.ping cmd.run uptime
```

```python
class salt.engines.logentries.PlainTextSocketAppender(
    verbose=True,
    LE_API='data.logentries.com',
    LE_PORT=80,
    LE_TLS_PORT=443)
```

```
close_connection()
open_connection()
put(data)
reopen_connection()
```

```python
class salt.engines.logentries.SocketAppender
    alias of salt.engines.logentries.TLSSocketAppender
class salt.engines.logentries.TLSSocketAppender(
    verbose=True,
    LE_API='data.logentries.com',
    LE_PORT=80, LE_TLS_PORT=443)
```

```
open_connection()
```

```python
salt.engines.logentries.event_bus_context(opts)
salt.engines.logentries.start(endpoint='data.logentries.com', port=10000, token=None, tag='salt/engines/logentries')
```

Listen to salt events and forward them to Logentries

### 21.5.8 salt.engines.logstash_engine

An engine that reads messages from the salt event bus and pushes them onto a logstash endpoint.

```python
class salt.engines.logstash_engine.event_bus_context(opts)
salt.engines.logstash_engine.start(host, port=5959, tag='salt/engine/logstash', proto='udp')
```

Listen to salt events and forward them to logstash
21.5.9 salt.engines.napalm_syslog

NAPALM syslog engine

New in version 2017.7.0.

An engine that takes syslog messages structured in OpenConfig or IETF format and fires Salt events.

As there can be many messages pushed into the event bus, the user is able to filter based on the object structure.

Requirements

- napalm-logs

This engine transfers objects from the napalm-logs library into the event bus. The top dictionary has the following keys:

  - ip
  - host
  - timestamp
  - os: the network OS identified
  - model_name: the OpenConfig or IETF model name
  - error: the error name (consult the documentation)
  - message_details: details extracted from the syslog message
  - open_config: the OpenConfig model

The napalm-logs transfers the messages via widely used transport mechanisms such as: ZeroMQ (default), Kafka, etc.

The user can select the right transport using the transport option in the configuration.

configuration Example configuration

```yaml
engines:
  - napalm_syslog:
      transport: zmq
      address: 1.2.3.4
      port: 49018
```

configuration Configuration example, excluding messages from IOS-XR devices:

```yaml
engines:
  - napalm_syslog:
      transport: kafka
      address: 1.2.3.4
      port: 49018
      os_blacklist:
        - iosxr
```

Event example:
To consume the events and eventually react and deploy a configuration changes on the device(s) firing the event, one is able to identify the minion ID, using one of the following alternatives, but not limited to:

- **Host grains** to match the event tag
- **Host DNS grain** to match the IP address in the event data
- **Hostname grains** to match the event tag
- **Define static grains**
- **Write a grains module**
- **Targeting minions using pillar data** - The user can configure certain information in the Pillar data and then use it to identify minions

Master configuration example, to match the event and react:

```yaml
reactor:
  - 'napalm/syslog/*/BGP_PREFIX_THRESH_EXCEEDED/*/':
    - salt://increase_prefix_limit_on_threash_exceeded.sls
```

Which matches the events having the error code BGP_PREFIX_THRESH_EXCEEDED from any network operating system, from any host and reacts, executing the increase_prefix_limit_on_threash_exceeded.sls reactor, found under one of the `file_roots` paths.

Reactor example:

```yaml
increase_prefix_limit_on_threash_exceeded:
  local.net.load_template:
    - tgt: "hostname:{{ data['host'] }}"
    - tgt_type: grain
    - kwarg:
      template_name: salt://increase_prefix_limit.jinja
      openconfig_structure: {{ data['open_config'] }}
```

The reactor in the example increases the BGP prefix limit when triggered by an event as above. The minion is matched using the `host` field from the `data` (which is the body of the event), compared to the `hostname grain` field. When the event occurs, the reactor will execute the `net.load_template` function, sending as arguments the template `salt://increase_prefix_limit.jinja` defined by the user in their environment and the complete OpenConfig object under the variable name `openconfig_structure`. Inside the Jinja template, the user can process the object from `openconfig_structure` and define the business logic as required.

salt.engines.napalm_syslog.start(transport='zmq',
    address='0.0.0.0', port=49017,
    auth_address='0.0.0.0', auth_port=49018,
    disable_security=False, certificate=None,
    os_whitelist=None, os_blacklist=None,
    error_whitelist=None, error_blacklist=None,
    host_whitelist=None, host_blacklist=None)

Listen to napalm-logs and publish events into the Salt event bus.

**transport:** `zmq` Choose the desired transport.

---

**Note:** Currently `zmq` is the only valid option.
**os_whitelist**: None  List of operating systems allowed. By default everything is allowed.

**os_blacklist**: None  List of operating system to be ignored. Nothing ignored by default.

**error_whitelist**: None  List of errors allowed.

**error_blacklist**: None  List of errors ignored.

**host_whitelist**: None  List of hosts or IPs to be allowed.

**host_blacklist**: None  List of hosts or IPs to be ignored.

### 21.5.10 salt.engines.reactor module

Setup Reactor

Example Config in Master or Minion config

```yaml
engines:
  - reactor:
      refresh_interval: 60
      worker_threads: 10
      worker_hwm: 10000

reactor:
  - 'salt/cloud/*/destroyed':
    - /srv/reactor/destroy/*.sls
```

salt.engines.reactor.start(refresh_interval=None, worker_threads=None, worker_hwm=None)

### 21.5.11 salt.engines.redis_sentinel module

An engine that reads messages from the redis sentinel pubsub and sends reactor events based on the channels they are subscribed to.

**configuration**  Example configuration

```yaml
engines:
  - redis_sentinel:
      hosts:
        matching: 'board*'
        port: 26379
        interface: eth2
        channels:
          - '+switch-master'
          - '+odown'
          - '-odown'

depends redis

class salt.engines.redis_sentinel.Listener(host=None, port=None, channels=None, tag=None)

run()

work(item)

salt.engines.redis_sentinel.start(hosts, channels, tag=None)
```
21.5.12 salt.engines.script module

Send events based on a script's stdout

Example Config

```
engines:
  - script:
      cmd: /some/script.py -a 1 -b 2
      output: json
      interval: 5
```

Script engine configs:

- **cmd**: Script or command to execute
- **output**: Any available saltstack deserializer
- **interval**: How often in seconds to execute the command

```python
salt.engines.script.start(cmd, output='json', interval=1)
```

Parse stdout of a command and generate an event

The script engine will scrap stdout of the given script and generate an event based on the presence of the 'tag' key and its value.

If there is a data obj available, that will also be fired along with the tag.

**Example**

Given the following json output from a script:

```
{
  "tag": "lots/of/tacos",
  "data": { "toppings": "cilantro" }
}
```

This will fire the event 'lots/of/tacos' on the event bus with the data obj as is.

**Parameters**

- **cmd** -- The command to execute
- **output** -- How to deserialize stdout of the script
- **interval** -- How often to execute the script

21.5.13 salt.engines.slack module

An engine that reads messages from Slack and can act on them

```
depends slackclient Python module
```

**Important**: This engine requires a bot user. To create a bot user, first go to the Custom Integrations page in your Slack Workspace. Copy and paste the following URL, and replace myworkspace with the proper value for your workspace:

https://myworkspace.slack.com/apps/manage/custom-integrations

Next, click on the Bots integration and request installation. Once approved by an admin, you will be able to proceed with adding the bot user. Once the bot user has been added, you can configure it by adding an avatar, setting the display name, etc. You will also at this time have access to your API token, which will be needed to configure this engine.
Finally, add this bot user to a channel by switching to the channel and using `/invite @mybotuser`. Keep in mind that this engine will process messages from each channel in which the bot is a member, so it is recommended to narrowly define the commands which can be executed, and the Slack users which are allowed to run commands.

This engine has two boolean configuration parameters that toggle specific features (both default to `False`):

1. `control` - If set to `True`, then any message which starts with the trigger string (which defaults to `!` and can be overridden by setting the `trigger` option in the engine configuration) will be interpreted as a Salt CLI command and the engine will attempt to run it. The permissions defined in the various `groups` will determine if the Slack user is allowed to run the command. The `targets` and `default_target` options can be used to set targets for a given command, but the engine can also read the following two keyword arguments:

   - `target` - The target expression to use for the command
   - `tgt_type` - The match type, can be one of `glob`, `list`, `pcre`, `grain`, `grain_pcre`, `pillar`, `nodegroup`, `range`, `ipcidr`, or `compound`. The default value is `glob`.

Here are a few examples:

```sh
!test.ping target=*  
!state.apply foo target=os:CentOS tgt_type=grain  
!pkg.version mypkg target=role:database tgt_type=pillar
```

2. `fire_all` - If set to `True`, all messages which are not prefixed with the trigger string will fired as events onto Salt's ref:`event bus <event-system>`. The tag for these events will be prefixed with the string specified by the `tag` config option (default: `salt/engines/slack`).

The `groups_pillar_name` config option can be used to pull group configuration from the specified pillar key.

**Note:** In order to use `groups_pillar_name`, the engine must be running as a minion running on the master, so that the `Caller` client can be used to retrieve that minions pillar data, because the master process does not have pillar data.

**Configuration Examples**

Changed in version 2017.7.0: Access control group support added

This example uses a single group called `default`. In addition, other groups are being loaded from pillar data. The group names do not have any significance, it is the users and commands defined within them that are used to determine whether the Slack user has permission to run the desired command.

```yaml
engines:
  - slack:
      token: 'xoxb-xxxxxxxxxx-xxxxxxxxxxxxxxxxxxxxxxxxxxxxxx'
      control: True
      fire_all: False
      groups_pillar_name: 'slack_engine:groups_pillar'
    groups:
      default:
        users:
          - '*'
        commands:
          - test.ping
          - cmd.run
          - list_jobs
```

(continues on next page)
This example shows multiple groups applying to different users, with all users having access to run test.ping. Keep in mind that when using *, the value must be quoted, or else PyYAML will fail to load the configuration.

```
- list_commands
aliases:
  list_jobs:
    cmd: jobs.list_jobs
  list_commands:
    cmd: 'pillar.get salt:engines:slack:valid_commands target=saltmaster', tgt_type=list'

default_target:
  target: saltmaster
tgt_type: glob
targets:
  test.ping:
    target: '*'
tgt_type: glob
cmd.run:
  target: saltmaster
tgt_type: list
```

This example shows multiple groups applying to different users, with all users having access to run test.ping. Keep in mind that when using *, the value must be quoted, or else PyYAML will fail to load the configuration.

```
engines:
  - slack:
      groups_pillar: slack_engine_pillar
token: 'xoxb-xxxxxxxxxx-xxxxxxxxxxxxxxxxxxxxxxxxx'
control: True
fire_all: True
tag: salt/engines/slack
groups_pillar_name: 'slack_engine:groups_pillar'
groups:
  default:
    users:
      - '*'
cmds:
  - test.ping
 aliases:
  list_jobs:
    cmd: jobs.list_jobs
  list_commands:
    cmd: 'pillar.get salt:engines:slack:valid_commands target=saltmaster'

class salt.engines.slack.SlackClient(token)

can_user_run(user, command, groups)
Break out the permissions into the following:

Check whether a user is in any group, including whether a group has the '*' membership

Parameters

- user (str) -- The username being checked against
- **command** *(str)* -- The command that is being invoked (e.g. test.ping)
- **groups** *(dict)* -- the dictionary with groups permissions structure.

Return type  *tuple*

Returns

On a successful permitting match, returns 2-element tuple that contains the name of the group that successfully matched, and a dictionary containing the configuration of the group so it can be referenced.

On failure it returns an empty tuple

**commandline_to_list** *(cmdline_str, trigger_string)*

*cmdline_str* is the string of the command line *trigger_string* is the trigger string, to be removed

**control_message_target** *(slack_user_name, text, loaded_groups, trigger_string)*

Returns a tuple of (target, cmdline,) for the response

Raises IndexError if a user can’t be looked up from all_slack_users

Returns (False, False) if the user doesn’t have permission

These are returned together because the commandline and the targeting interact with the group config (specifically aliases and targeting configuration) so taking care of them together works out.

The cmdline that is returned is the actual list that should be processed by salt, and not the alias.

**fire** *(tag, msg)*

This replaces a function in main called ‘fire’

It fires an event into the salt bus.

**format_return_text** *(data, function, **kwargs)*

Print out YAML using the block mode

**generate_triggered_messages** *(token, trigger_string, groups, groups_pillar_name)*

slack_token = string trigger_string = string input_valid_users = set input_valid_commands = set

When the trigger_string prefixes the message text, yields a dictionary of:

```python
{
    'message_data': m_data,
    'cmdline': cmdline_list, # this is a list
    'channel': channel,
    'user': m_data['user'],
    'slack_client': sc
}
```

else yields {'message_data': m_data} and the caller can handle that

When encountering an error (e.g. invalid message), yields {}, the caller can proceed to the next message

When the websocket being read from has given up all its messages, yields {'done': True} to indicate that the caller has read all of the relevant data for now, and should continue its own processing and check back for more data later.

This relies on the caller sleeping between checks, otherwise this could flood

**get_config_groups** *(groups_conf, groups_pillar_name)*

get info from groups in config, and from the named pillar

todo: add specification for the minion to use to recover pillar
get_jobs_from_runner(outstanding_jids)
Given a list of job_ids, return a dictionary of those job_ids that have completed and their results.
Query the salt event bus via the jobs runner. jobs.list_job will show a job in progress, jobs.lookup_jid will return a job that has completed.
returns a dictionary of job id: result

get_slack_channels(token)
Get all channel names from Slack

get_slack_users(token)
Get all users from Slack

g = {'aliases': {}, 'commands': {'cmd.run', 'pillar.get'},
     'default_target': {'target': '*', 'tgt_type': 'glob'},
     'targets': {'pillar.get': {'target': 'you_momma', 'tgt_type': 'list'}},
     'users': {'dmangot', 'jmickle', 'pcn'}}

get_target(permitted_group, cmdline, alias_cmdline)
When we are permitted to run a command on a target, look to see what the default targeting is for that group, and for that specific command (if provided).
It's possible for None or False to be the result of either, which means that it's expected that the caller provide a specific target.
If no configured target is provided, the command line will be parsed for target=foo and tgt_type=bar
Test for this:

message_text(m_data)
Raises ValueError if a value doesn't work out, and TypeError if this isn't a message type

parse_args_and_kwargs(cmdline)
cmdline: list
returns tuple of: args (list), kwargs (dict)

run_command_async(msg)
Parameters
  - message_generator (generator of dict) -- Generates messages from slack that should be run
  - fire_all (bool) -- Whether to also fire messages to the event bus
  - tag (str) -- The tag to send to use to send to the event bus
  - interval (int) -- time to wait between ending a loop and beginning the next

run_commands_from_slack_async(message_generator, fire_all, tag, control, interval=1)
Pull any pending messages from the message_generator, sending each one to either the event bus, the command_async or both, depending on the values of fire_all and command
salt.engines.slack.start(token, control=False, trigger=!, groups=None, groups_pillar_name=None, fire_all=False, tag='salt/engines/slack')

Listen to slack events and forward them to salt, new version

21.5.14 salt.engines.sqs_events

An engine that continuously reads messages from SQS and fires them as events.

Note that long polling is utilized to avoid excessive CPU usage.

New in version 2015.8.0.

depends boto

Configuration

This engine can be run on the master or on a minion.

Example Config:

```text
sqs.keyid: GKTADJGHEIQSXMKKRBJ08H
sqs.key: askdjghsdfjkgHwupUjasdfklkflgljsdfljdkjghs
sqs.message_format: json
```

Explicit sqs credentials are accepted but this engine can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not (or for boto version < 2.5.1) used you need to specify them either in a pillar or in the config file of the master or minion, as appropriate:

To deserialize the message from json:

```text
sqs.message_format: json
```

It's also possible to specify key, keyid and region via a profile:

```text
sqs.keyid: GKTADJGHEIQSXMKKRBJ08H
sqs.key: askdjghsdfjkgHwupUjasdfklkflgljsdfljdkjghs
```

A region may also be specified in the configuration:

```text
sqs.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile:

```text
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkgHwupUjasdfklkflgljsdfljdkjghs
  region: us-east-1
```

Additionally you can define cross account sqs:
21.5.15  salt.engines.stalekey module

An engine that uses presence detection to keep track of which minions have been recently connected and remove their keys if they have not been connected for a certain period of time.

Requires that the minion_data_cache option be enabled.

configuration Example configuration:

```python
engines:
  - stalekey:
    interval: 3600
    expire: 86400
```

salt.engines.stalekey.start(interval=3600, expire=604800)

21.5.16  salt.engines.test

A simple test engine, not intended for real use but as an example

salt.engines.test.event_bus_context(opts)
salt.engines.test.start()

Listen to events and write them to a log file

21.5.17  salt.engines.thorium module

Manage the Thorium complex event reaction system

salt.engines.thorium.start(grains=False, grain_keys=None, pillar=False, pillar_keys=None)

Execute the Thorium runtime

21.5.18  salt.engines.webhook

Send events from webhook api

salt.engines.webhook.start(address=None, port=5000, ssl_crt=None, ssl_key=None)

Api to listen for webhooks to send to the reactor.

Implement the webhook behavior in an engine. rest_cherrypy Webhook docs

Unlike the rest_cherrypy Webhook, this is only an unauthenticated webhook endpoint. If an authenticated webhook endpoint is needed, use the salt-api webhook which runs on the master and authenticates through eauth.

```python
engines:
  - sqs_events:
    queue: prod
    owner_acct_id: 11111111111
```

salt.engines.sqs_events.start(queue, profile=None, tag='salt/engine/sqs', owner_acct_id=None)

Listen to sqs and fire message on event bus
Warning: Unauthenticated endpoint

This engine sends webhook calls to the event stream. If the engine is running on a minion with file_client: local the event is sent to the minion event stream. Otherwise it is sent to the master event stream.

Example Config

```
engines:
  - webhook: {}
```

```
engines:
  - webhook:
    port: 8000
    address: 10.128.1.145
    ssl_crt: /etc/pki/tls/certs/localhost.crt
    ssl_key: /etc/pki/tls/certs/localhost.key
```

## 21.6 executors modules

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>direct_call</td>
<td>Direct call executor module</td>
</tr>
<tr>
<td>docker</td>
<td>Docker executor module</td>
</tr>
<tr>
<td>splay</td>
<td>Splay function calls across targeted minions</td>
</tr>
<tr>
<td>sudo</td>
<td>Sudo executor module</td>
</tr>
</tbody>
</table>

### 21.6.1 salt.executors.direct_call module

Direct call executor module

```python
salt.executors.direct_call.execute(opts, data, func, args, kwargs)
```

Directly calls the given function with arguments

### 21.6.2 salt.executors.docker module

Docker executor module

Used with the docker proxy minion.

```python
salt.executors.docker.allow_missing_func(function)
```

Allow all calls to be passed through to docker container.

The docker call will use direct_call, which will return back if the module was unable to be run.

```python
salt.executors.docker.execute(opts, data, func, args, kwargs)
```

Directly calls the given function with arguments
21.6.3 salt.executors.splay module

Splay function calls across targeted minions

**salt.executors.splay.execute**(opts, data, func, args, kwargs)

Splay a salt function call execution time across minions over a number of seconds (default: 300)

---

**Note:** You *probably* want to use `--async` here and look up the job results later. If you're dead set on getting the output from the CLI command, then make sure to set the timeout (with the `-t` flag) to something greater than the splaytime (max splaytime + time to execute job). Otherwise, it's very likely that the cli will time out before the job returns.

---

CLI Example:

```
# With default splaytime
salt --async --module-executors=['[splay, direct_call]'] '*' pkg.install cowsay version=3.03-8.el6

# With specified splaytime (5 minutes) and timeout with 10 second buffer
salt -t 310 --module-executors=['[splay, direct_call]'] --executor-opts='{splaytime: 300}' '*' pkg.version cowsay
```

21.6.4 salt.executors.sudo module

Sudo executor module

**salt.executors.sudo.execute**(opts, data, func, args, kwargs)

Allow for the calling of execution modules via sudo.

This module is invoked by the minion if the `sudo_user` minion config is present.

Example minion config:

```
sudo_user: saltdev
```

Once this setting is made, any execution module call done by the minion will be run under `sudo -u <sudo_user> salt-call`. For example, with the above minion config,

```
salt sudo_minion cmd.run 'cat /etc/sudoers'
```

is equivalent to

```
sudo -u saltdev salt-call cmd.run 'cat /etc/sudoers'
```

being run on `sudo_minion`.

</tbody>
</table>

21.7.1 salt.fileservice.azurefs

The backend for serving files from the Azure blob storage service.
New in version 2015.8.0.
To enable, add `azurefs` to the `fileservice_backend` option in the Master config file.

```
fileservice_backend:
  - azurefs
```

Starting in Salt 2018.3.0, this fileservice requires the standalone Azure Storage SDK for Python. Theoretically any version >= v0.20.0 should work, but it was developed against the v0.33.0 version.

Each storage container will be mapped to an environment. By default, containers will be mapped to the `base` environment. You can override this behavior with the `saltenv` configuration option. You can have an unlimited number of storage containers, and can have a storage container serve multiple environments, or have multiple storage containers mapped to the same environment. Normal first-found rules apply, and storage containers are searched in the order they are defined.

You must have either an `account_key` or a `sas_token` defined for each container, if it is private. If you use a `sas_token`, it must have READ and LIST permissions.

```
azurefs:
  - account_name: my_storage
    account_key: 'fNH9cRpR+qVIVYZ+5rnZAhlHc9ycOUcJnhzpofoW0sxtL2KVlume1xFdlwmdfe+dJInZaEdWvCPHD4d/
    oqeA='
    container_name: my_container
  - account_name: my_storage
    account_key: 'fNH9cRpR+qVIVYZ+5rnZAhlHc9ycOUcJnhzpofoW0sxtL2KVlume1xFdlwmdfe+dJInZaEdWvCPHD4d/
    oqeA='
    container_name: my_dev_container
    saltenv: dev
  - account_name: my_storage
    container_name: my_public_container
```

Note: Do not include the leading ? for `sas_token` if generated from the web.
21.7.2 salt.fileserver.gitfs

Git Fileserver Backend

With this backend, branches and tags in a remote git repository are exposed to salt as different environments.

To enable, add `gitfs` to the `fileserver_backend` option in the Master config file.

```
fileserver_backend:
  - gitfs
```

**Note:** `git` also works here. Prior to the 2018.3.0 release, *only* `git` would work.

The Git fileserver backend supports both `pygit2` and `GitPython`, to provide the Python interface to `git`. If both are present, the order of preference for which one will be chosen is the same as the order in which they were listed: `pygit2`, then `GitPython`.

An optional master config parameter (`gitfs_provider`) can be used to specify which provider should be used, in the event that compatible versions of both `pygit2` and `GitPython` are installed.

More detailed information on how to use GitFS can be found in the [GitFS Walkthrough](#).

**Note:** Minimum requirements

To use `pygit2` for GitFS requires a minimum `pygit2` version of 0.20.3. `pygit2` 0.20.3 requires `libgit2` 0.20.0. `pygit2` and `libgit2` are developed alongside one another, so it is recommended to keep them both at the same major release to avoid unexpected behavior. For example, `pygit2` 0.21.x requires `libgit2` 0.21.x, `pygit2` 0.22.x will require `libgit2` 0.22.x, etc.

To use `GitPython` for GitFS requires a minimum `GitPython` version of 0.3.0, as well as the `git` CLI utility. Instructions for installing `GitPython` can be found [here](#).

To clear stale refs the `git` CLI utility must also be installed.

21.7.3 salt.fileserver.hgfs

Mercurial Fileserver Backend

To enable, add `hgfs` to the `fileserver_backend` option in the Master config file.

```
fileserver_backend:
  - hgfs
```

**Note:** `hg` also works here. Prior to the 2018.3.0 release, *only* `hg` would work.

After enabling this backend, branches, bookmarks, and tags in a remote mercurial repository are exposed to salt as different environments. This feature is managed by the `fileserver_backend` option in the salt master config file.

This fileserver has an additional option `hgfs_branch_method` that will set the desired branch method. Possible values are: `branches`, `bookmarks`, or `mixed`. If using `branches` or `mixed`, the default branch will be mapped to `base`. 
Changed in version 2014.1.0: The `hgfs_base` master config parameter was added, allowing for a branch other than default to be used for the base environment, and allowing for a base environment to be specified when using an `hgfs_branch_method` of bookmarks.

---

depends

- mercurial
- python bindings for mercurial (python-hglib)

21.7.4 salt.fileserver.minionfs

Fileserver backend which serves files pushed to the Master

The `cp.push` function allows Minions to push files up to the Master. Using this backend, these pushed files are exposed to other Minions via the Salt fileserver.

To enable minionfs, `file_recv` needs to be set to `True` in the master config file (otherwise `cp.push` will not be allowed to push files to the Master), and `minionfs` must be added to the `fileserver_backends` list.

```yaml
fileserver_backend:
  - minionfs
```

Note: `minion` also works here. Prior to the 2018.3.0 release, only `minion` would work.

Other `minionfs` settings include: `minionfs_whitelist`, `minionfs_blacklist`, `minionfs_mountpoint`, and `minionfs_env`.

See also:

MinionFS Backend Walkthrough

21.7.5 salt.fileserver.roots

The default file server backend

This fileserver backend serves files from the Master’s local filesystem. If `fileserver_backend` is not defined in the Master config file, then this backend is enabled by default. If it is defined then `roots` must be in the `fileserver_backend` list to enable this backend.

```yaml
fileserver_backend:
  - roots
```

Fileserver environments are defined using the `file_roots` configuration option.

21.7.6 salt.fileserver.s3fs

Amazon S3 Fileserver Backend

New in version 0.16.0.

This backend exposes directories in S3 buckets as Salt environments. To enable this backend, add `s3fs` to the `fileserver_backend` option in the Master config file.

```yaml
fileserver_backend:
  - s3fs
```
S3 credentials must also be set in the master config file:

```
| s3.keyid: | GKTADJGHEIQXSXMKRRB308H |
| s3.key:   | askdjghsdfjkghWupUjasdfklkgjsdfjajkghs |
```

Alternatively, if on EC2 these credentials can be automatically loaded from instance metadata.

This fileserver supports two modes of operation for the buckets:

1. **A single bucket per environment**

   ```
   s3.buckets:
   production:
   - bucket1
   - bucket2
   staging:
   - bucket3
   - bucket4
   ```

2. **Multiple environments per bucket**

   ```
   s3.buckets:
   - bucket1
   - bucket2
   - bucket3
   - bucket4
   ```

Note that bucket names must be all lowercase both in the AWS console and in Salt, otherwise you may encounter `SignatureDoesNotMatch` errors.

A multiple-environment bucket must adhere to the following root directory structure:

```
/s3://<bucket name>/<environment>/<files>
```

**Note:** This fileserver back-end requires the use of the MD5 hashing algorithm. MD5 may not be compliant with all security policies.

**Note:** This fileserver back-end is only compatible with MD5 ETag hashes in the S3 metadata. This means that you must use SSE-S3 or plaintext for bucket encryption, and that you must not use multipart upload when uploading to your bucket. More information here: https://docs.aws.amazon.com/AmazonS3/latest/API/RESTCommonResponseHeaders.html

Objects without an MD5 ETag will be fetched on every fileserver update.

If you deal with objects greater than 8MB, then you should use the following AWS CLI config to avoid multipart upload:

```
s3 =
multipart_threshold = 1024MB
```

More info here: https://docs.aws.amazon.com/cli/latest/topic/s3-config.html
21.7.7 salt.fileserver.svnfs

Subversion Fileserver Backend

After enabling this backend, branches and tags in a remote subversion repository are exposed to salt as different environments. To enable this backend, add `svnfs` to the `fileserver_backend` option in the Master config file.

```
fileserver_backend:
  - svnfs
```

**Note:** `svn` also works here. Prior to the 2018.3.0 release, only `svn` would work.

This backend assumes a standard svn layout with directories for branches, tags, and trunk, at the repository root.

```
depends
  - subversion
  - pysvn
```

Changed in version 2014.7.0: The paths to the trunk, branches, and tags have been made configurable, via the config options `svnfs_trunk`, `svnfs_branches`, and `svnfs_tags`, `svnfs_mountpoint` was also added. Finally, support for per-remote configuration parameters was added. See the documentation for more information.

21.8 grains modules

#### 21.8.1 salt.grains.chronos

Generate chronos proxy minion grains.

New in version 2015.8.2.

salt.grains.chronos.kernel()
salt.grains.chronos.os()
salt.grains.chronos.os_data()
salt.grains.chronos.os_family()

#### 21.8.2 salt.grains.cimc

Generate baseline proxy minion grains for cimc hosts.

salt.grains.cimc.cimc(proxy=None)

#### 21.8.3 salt.grains.core

The static grains, these are the core, or built in grains.

When grains are loaded they are not loaded in the same way that modules are loaded, grain functions are detected and executed, the functions MUST return a dict which will be applied to the main grains dict. This module will always be executed first, so that any grains loaded here in the core module can be overwritten just by returning dict keys with the same value as those returned here.

salt.grains.core.append_domain()
  Return append_domain if set

salt.grains.core.cwd()
  Current working directory

salt.grains.core.default_gateway()
  Populates grains which describe whether a server has a default gateway configured or not. Uses `ip -4 route show` and `ip -6 route show` and greps for a `default` at the beginning of any line. Assuming the standard `default` via `<ip>` format for default gateways, it will also parse out the ip address of the default gateway, and put it in `ip4_gw` or `ip6_gw`.

  If the `ip` command is unavailable, no grains will be populated.

  Currently does not support multiple default gateways. The grains will be set to the first default gateway found.

List of grains:
ip4_gw: True # ip/True/False if default ipv4 gateway
ip6_gw: True # ip/True/False if default ipv6 gateway
ip_gw: True # True if either of the above is True, False otherwise

salt.grains.core.dns()
Parse the resolver configuration file

New in version 2016.3.0.

salt.grains.core.fqdns()
Return all known FQDNs for the system by enumerating all interfaces and then trying to reverse resolve them (excluding 'lo' interface). To disable the fqdns grain, set enable_fqdns_grains: False in the minion configuration file.

salt.grains.core.get_machine_id()
Provide the machine-id for machine/virtualization combination

salt.grains.core.get_master()
Provides the minion with the name of its master. This is useful in states to target other services running on the master.

salt.grains.core.get_server_id()
Provides an integer based on the FQDN of a machine. Useful as server-id in MySQL replication or anywhere else you’ll need an ID like this.

salt.grains.core.hostname()
Return fqdn, hostname, domainname

Note: On Windows the domain grain may refer to the dns entry for the host instead of the Windows domain to which the host is joined. It may also be empty if not a part of any domain. Refer to the windowsdomain grain instead

salt.grains.core.hwaddr_interfaces()
Provide a dict of the connected interfaces and their hw addresses (Mac Address)

salt.grains.core.id_()
Return the id

salt.grains.core.ip4_interfaces()
Provide a dict of the connected interfaces and their ip4 addresses The addresses will be passed as a list for each interface

salt.grains.core.ip6_interfaces()
Provide a dict of the connected interfaces and their ip6 addresses The addresses will be passed as a list for each interface

salt.grains.core.ip_fqdn()
Return ip address and FQDN grains

salt.grains.core.ip_interfaces()
Provide a dict of the connected interfaces and their ip addresses The addresses will be passed as a list for each interface

salt.grains.core.kernelparams()
Return the kernel boot parameters

salt.grains.core.locale_info()
Provides defaultlanguage defaultencoding

salt.grains.core.os_data()
Return grains pertaining to the operating system
**salt.grains.core.**
- **path()**
  Return the path
- **pythonexecutable()**
  Return the python executable in use
- **pythonpath()**
  Return the Python path
- **pythonversion()**
  Return the Python version
- **saltpath()**
  Return the path of the salt module
- **saltversion()**
  Return the version of salt
- **saltversioninfo()**
  Return the version_info of salt
  New in version 0.17.0.
- **zmqversion()**
  Return the zeromq version

**21.8.4 salt.grains.disks**

Detect disks

**salt.grains.disks.**
- **disks()**
  Return list of disk devices

**21.8.5 salt.grains.esxi**

Generate baseline proxy minion grains for ESXi hosts.

New in version 2015.8.4.

**salt.grains.esxi.**
- **esxi()**
- **kernel()**
- **os()**
- **os_family()**

**21.8.6 salt.grains.extra**

**salt.grains.extra.**
- **config()**
  Return the grains set in the grains file
- **shell()**
  Return the default shell to use on this system
21.8.7 salt.grains.fibre_channel

Grains for Fibre Channel WWN's. On Windows this runs a PowerShell command that queries WMI to get the Fibre Channel WWN's available.

New in version 2018.3.0.

To enable these grains set `fibre_channel_grains: True`.

```
fibre_channel_grains: True
```

```
salt.grains.fibre_channel.fibre_channel_wwns()
    Return list of fiber channel HBA WWNs
```

21.8.8 salt.grains.fx2

Generate baseline proxy minion grains for Dell FX2 chassis. The challenge is that most of Salt isn't bootstrapped yet, so we need to repeat a bunch of things that would normally happen in proxy/fx2.py--just enough to get data from the chassis to include in grains.

```
salt.grains.fx2.fx2()
salt.grains.fx2.kernel()
salt.grains.fx2.location()
salt.grains.fx2.os_data()
salt.grains.fx2.os_family()
```

21.8.9 salt.grains.iscsi

Grains for iSCSI Qualified Names (IQN).

New in version 2018.3.0.

To enable these grains set `iscsi_grains: True`.

```
iscsi_grains: True
```

```
salt.grains.iscsi.iscsi_iqn()
    Return iSCSI IQN
```

21.8.10 salt.grains.junos

Grains for junos. NOTE this is a little complicated--junos can only be accessed via salt-proxy-minion. Thus, some grains make sense to get them from the minion (PYTHONPATH), but others don't (ip_interfaces)

```
salt.grains.junos.defaults()
salt.grains.junos.facts(proxy=none)
salt.grains.junos.os_family()
```
21.8.11 salt.grains.marathon

Generate marathon proxy minion grains.
New in version 2015.8.2.
salt.grains.marathon.kernel()
salt.grains.marathon.marathon()
salt.grains.marathon.os()
salt.grains.marathon.os_data()
salt.grains.marathon.os_family()

21.8.12 salt.grains.mdadm

Detect MDADM RAIDs

salt.grains.mdadm.mdadm()
  Return list of mdadm devices

21.8.13 salt.grains.mdata

SmartOS Metadata grain provider

  maintainer  Jorge Schrauwen <sjorge@blackdot.be>
  maturity   new
  depends    salt.utils, salt.module.cmdmod
  platform   SmartOS

New in version nitrogen.
salt.grains.mdata.mdata()
  Provide grains from the SmartOS metadata

21.8.14 salt.grains.metadata

Grains from cloud metadata servers at 169.254.169.254
New in version 2017.7.0.

  depends  requests

To enable these grains that pull from the http://169.254.169.254/latest metadata server set metadata_server_grains: True.

metadata_server_grains: True

salt.grains.metadata.metadata()
21.8.15 salt.grains.minion_process

Set grains describing the minion process.

```python
salt.grains.minion_process.grains()
```
Return the grains dictionary

21.8.16 salt.grains.napalm

NAPALM Grains

- **codeauthor** Mircea Ulinic <ping@mirceaulinic.net>
- **maturity** new
- **depends** napalm
- **platform** unix

Dependencies

- NAPALM proxy module

New in version 2016.11.0.

```python
salt.grains.napalm.getos(proxy=None)
```
Returns the Operating System name running on the network device.

Example: junos, iosxr, eos, ios etc.

CLI Example - select all network devices running JunOS:

```bash
salt -G 'os:junos' test.ping
```

```python
salt.grains.napalm.host(proxy=None)
```
This grain is set by the NAPALM grain module only when running in a proxy minion. When Salt is installed directly on the network device, thus running a regular minion, the host grain provides the physical hostname of the network device, as it would be on an ordinary minion server. When running in a proxy minion, host points to the value configured in the pillar: NAPALM proxy module.

**Note:** The difference between host and hostname is that host provides the physical location - either domain name or IP address, while hostname provides the hostname as configured on the device. They are not necessarily the same.

New in version 2017.7.0.

CLI Example:

```bash
salt 'device*'* grains.get host
```

Output:

```
device1:
  ip-172-31-13-136.us-east-2.compute.internal
device2:
  ip-172-31-11-193.us-east-2.compute.internal
```

(continues on next page)
salt.grains.napalm.host_dns(proxy=None)

Return the DNS information of the host. This grain is a dictionary having two keys:

- A
- AAAA

Note: This grain is disabled by default, as the proxy startup may be slower when the lookup fails. The user can enable it using the napalm_host_dns_grain option (in the pillar or proxy configuration file):

```
napalm_host_dns_grain: true
```

New in version 2017.7.0.

CLI Example:

```
salt 'device*' grains.get host_dns
```

Output:

```
device1:
    A: 172.31.9.153
    AAAA: fd52:188c:c068::1

device2:
    A: 172.31.46.249
    AAAA: fdca:3b17:31ab::17

device3:
    A: 172.31.8.167
    AAAA: fd0f:9fd6:5fab::1
```

salt.grains.napalm.hostname(proxy=None)

Return the hostname as configured on the network device.

CLI Example:

```
salt 'device*' grains.get hostname
```

Output:

```
device1:
    edge01.yyz01

device2:
    edge01.bjm01

device3:
    edge01.flw01
```

salt.grains.napalm.interfaces(proxy=None)

Returns the complete interfaces list of the network device.
Example: ['lc-0/0/0', 'pfe-0/0/0', 'xe-1/3/0', 'lo0', 'irb', 'demux0', 'fxp0']

CLI Example - select all devices that have a certain interface, e.g.: xe-1/1/1:

```bash
salt -G 'interfaces:xe-1/1/1' test.ping
```

Output:

```
edge01.yyz01:
  True
edge01.maa01:
  True
edge01.syd01:
  True
edge01.del01:
  True
edge01.dus01:
  True
edge01.kix01:
  True
```

```
salt.grains.napalm.model(proxy=None)
Returns the network device chassis model.

Example: MX480, ASR-9904-AC etc.

CLI Example - select all Juniper MX480 routers and execute traceroute to 8.8.8.8:

```bash
salt -G 'model:MX480' net.traceroute 8.8.8.8
```

```
salt.grains.napalm.optional_args(proxy=None)
Return the connection optional args.

Note: Sensible data will not be returned.
```

New in version 2017.7.0.

CLI Example - select all devices connecting via port 1234:

```bash
salt -G 'optional_args:port:1234' test.ping
```

Output:

```
device1:
  True
device2:
  True
```

```
salt.grains.napalm.serial(proxy=None)
Returns the chassis serial number.

Example: FOX1234W00F

CLI Example - select all devices whose serial number begins with FOX and display the serial number value:

```bash
salt -G 'serial:FOX*' grains.get serial
```

Output:
salt.grains.napalm.uptime(proxy=None)
Returns the uptime in seconds.

CLI Example - select all devices started/restarted within the last hour:
```
salt -G 'uptime<3600' test.ping
```

salt.grains.napalm.username(proxy=None)
Return the username.

New in version 2017.7.0.

CLI Example - select all devices using foobar as username for connection:
```
salt -G 'username:foobar' test.ping
```

Output:

salt.grains.napalm.vendor(proxy=None)
Returns the network device vendor.

Example: juniper, cisco, arista etc.

CLI Example - select all devices produced by Cisco and shutdown:
```
salt -G 'vendor:cisco' net.cli "shut"
```

salt.grains.napalm.version(proxy=None)
Returns the OS version.

Example: 13.3R6.5, 6.0.2 etc.

CLI Example - select all network devices running JunOS 13.3R6.5 and return the model:
```
salt -G 'os:junos and version:13.3R6.5' grains.get model
```

Output:
21.8.17 salt.grains.nvme
Grains for NVMe Qualified Names (NQN).
New in version 3000.
To enable these grains set `nvme_grains: True`.
```
   nvme_grains: True
```
salt.grains.nvme.nvme_nqn()
Return NVMe NQN

21.8.18 salt.grains.nxos
Grains for Cisco NX-OS minions
For documentation on setting up the nxos proxy minion look in the documentation for `salt.proxy.nxos`.
salt.grains.nxos.system_information(proxy=None)

21.8.19 salt.grains.opts
Simple grain to merge the opts into the grains directly if the grain_opts configuration value is set
```
salt.grains.opts.opts()
```
Return the minion configuration settings

21.8.20 salt.grains.panos
Generate baseline proxy minion grains for panos hosts.
salt.grains.panos.panos(proxy=None)

21.8.21 salt.grains.pending_reboot
Grain that indicates the system is pending a reboot See functions in salt.utils.win_system to see what conditions would indicate a reboot is pending
```
salt.grains.pending_reboot.pending_reboot()
```
A grain that indicates that the system is pending a reboot.

21.8.22 salt.grains.philips_hue
Static grains for the Philips HUE lamps
New in version 2015.8.3.
salt.grains.philips_hue.kernel()
salt.grains.philips_hue.os()
salt.grains.philips_hue.os_family()
salt.grains.philips_hue.product()
salt.grains.philips_hue.**vendor**()

### 21.8.23 salt.grains.rest_sample

Generate baseline proxy minion grains

salt.grains.rest_sample.**kernel**()
salt.grains.rest_sample.**location**()
salt.grains.rest_sample.**os**()
salt.grains.rest_sample.**os_data**()
salt.grains.rest_sample.**os_family**()
salt.grains.rest_sample.**proxy_functions** *(proxy)*

The loader will execute functions with one argument and pass a reference to the proxymodules LazyLoader object. However, grains sometimes get called before the LazyLoader object is setup so `proxy` might be `None`.

### 21.8.24 salt.grains.smartos

SmartOS grain provider

**maintainer** Jorge Schrauwen <sjorge@blackdot.be>

**maturity** new

**depends** salt.utils, salt.ext.six, salt.module.cmdmod

**platform** SmartOS

New in version nitrogen.

salt.grains.smartos.**smartos**()

Provide grains for SmartOS

### 21.8.25 salt.grains.ssh_sample

Generate baseline proxy minion grains

salt.grains.ssh_sample.**kernel**()
salt.grains.ssh_sample.**location**()
salt.grains.ssh_sample.**os_data**()
salt.grains.ssh_sample.**proxy_functions** *(proxy)*

The loader will execute functions with one argument and pass a reference to the proxymodules LazyLoader object. However, grains sometimes get called before the LazyLoader object is setup so `proxy` might be `None`.
21.8.26  salt.grains.zfs

ZFS grain provider

maintainer  Jorge Schrauwen <sjorge@blackdot.be>
maturity  new
depends  salt.module.cmdmod
platform  illumos,freebsd,linux

New in version 2018.3.0.
salt.grains.zfs.zfs()
  Provide grains for zfs/zpool

21.9  execution modules

Virtual modules

21.9.1  salt.modules.group

group is a virtual module that is fulfilled by one of the following modules:

<table>
<thead>
<tr>
<th>Execution Module</th>
<th>Used for</th>
</tr>
</thead>
<tbody>
<tr>
<td>groupadd</td>
<td>Linux, NetBSD, and OpenBSD systems using groupadd(8), groupdel(8), and groupmod(8)</td>
</tr>
<tr>
<td>pw_group</td>
<td>FreeBSD-based OSes using pw(8)</td>
</tr>
<tr>
<td>solaris_group</td>
<td>Solaris-based OSes using groupadd(1M), groupdel(1M), and groupmod(1M)</td>
</tr>
<tr>
<td>win_groupadd</td>
<td>Windows</td>
</tr>
</tbody>
</table>

21.9.2  salt.modules.kernelpkg

kernelpkg is a virtual module that is fulfilled by one of the following modules:

<table>
<thead>
<tr>
<th>Execution Module</th>
<th>Used for</th>
</tr>
</thead>
<tbody>
<tr>
<td>kernelpkg_linux_apt</td>
<td>Debian/Ubuntu-based distros which use apt-get for package management</td>
</tr>
<tr>
<td>kernelpkg_linux_yum</td>
<td>RedHat-based distros and derivatives using yum or dnf</td>
</tr>
</tbody>
</table>

21.9.3  salt.modules.pkg

pkg is a virtual module that is fulfilled by one of the following modules:
## salt.modules.service

`salt.modules.service` is a virtual module that is fulfilled by one of the following modules:

<table>
<thead>
<tr>
<th>Execution Module</th>
<th>Used for</th>
</tr>
</thead>
<tbody>
<tr>
<td>debian_service</td>
<td>Debian Wheezy and earlier</td>
</tr>
<tr>
<td>freebsd_service</td>
<td>FreeBSD-based OSes using <code>service(8)</code></td>
</tr>
<tr>
<td>gentoo_service</td>
<td>Gentoo Linux using <code>sysvinit</code> and <code>rc-update(8)</code></td>
</tr>
<tr>
<td>mac_service</td>
<td>Mac OS hosts using <code>launchctl(1)</code></td>
</tr>
<tr>
<td>netbsd_service</td>
<td>FreeBSD-based OSes</td>
</tr>
<tr>
<td>openbsd_service</td>
<td>OpenBSD-based OSes</td>
</tr>
<tr>
<td>rh_service</td>
<td>RedHat-based distros and derivatives using <code>service(8)</code> and <code>chkconfig(8)</code>. Supports both pure <code>sysvinit</code> and mixed <code>sysvinit/upstart</code> systems.</td>
</tr>
<tr>
<td>service</td>
<td>Fallback which simply wraps <code>sysvinit</code> scripts</td>
</tr>
<tr>
<td>systemd_service</td>
<td>Linux distros which use systemd</td>
</tr>
<tr>
<td>upstart_service</td>
<td>Ubuntu-based distros using <code>upstart</code></td>
</tr>
<tr>
<td>win_service</td>
<td>Windows</td>
</tr>
</tbody>
</table>

## salt.modules.shadow

`salt.modules.shadow` is a virtual module that is fulfilled by one of the following modules:

<table>
<thead>
<tr>
<th>Execution Module</th>
<th>Used for</th>
</tr>
</thead>
<tbody>
<tr>
<td>aix_shadow</td>
<td>AIX</td>
</tr>
<tr>
<td>linux_shadow</td>
<td>Linux</td>
</tr>
<tr>
<td>bsd_shadow</td>
<td>FreeBSD, OpenBSD, NetBSD</td>
</tr>
<tr>
<td>solaris_shadow</td>
<td>Solaris-based OSes</td>
</tr>
<tr>
<td>win_shadow</td>
<td>Windows</td>
</tr>
</tbody>
</table>
21.9.6 salt.modules.sysctl

`systctl` is a virtual module that is fulfilled by one of the following modules:

<table>
<thead>
<tr>
<th>Execution Module</th>
<th>Used for</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>freebsd_sysctl</code></td>
<td>FreeBSD</td>
</tr>
<tr>
<td><code>linux_sysctl</code></td>
<td>Linux</td>
</tr>
<tr>
<td><code>mac_sysctl</code></td>
<td>macOS</td>
</tr>
<tr>
<td><code>netbsd_sysctl</code></td>
<td>NetBSD</td>
</tr>
<tr>
<td><code>openbsd_sysctl</code></td>
<td>OpenBSD</td>
</tr>
</tbody>
</table>

21.9.7 salt.modules.user

`user` is a virtual module that is fulfilled by one of the following modules:

<table>
<thead>
<tr>
<th>Execution Module</th>
<th>Used for</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>useradd</code></td>
<td>Linux, NetBSD, and OpenBSD systems using <code>useradd(8)</code>, <code>userdel(8)</code>, and <code>usermod(8)</code></td>
</tr>
<tr>
<td><code>pw_user</code></td>
<td>FreeBSD-based OSes using <code>pw(8)</code></td>
</tr>
<tr>
<td><code>solaris_user</code></td>
<td>Solaris-based OSes using <code>useradd(1M)</code>, <code>userdel(1M)</code>, and <code>usermod(1M)</code></td>
</tr>
<tr>
<td><code>mac_user</code></td>
<td>MacOS</td>
</tr>
<tr>
<td><code>win_useradd</code></td>
<td>Windows</td>
</tr>
</tbody>
</table>

```
acme                                             ACME / Let’s Encrypt module
aix_group                                        Manage groups on Solaris
aix_shadow                                       Manage account locks on AIX systems
aixpkg                                           Package support for AIX
aliases                                          Manage the information in the aliases file
alternatives                                     Support for Alternatives system
ansiblelegate                                    Ansible Support
apache                                           Support for Apache
apcups                                           Module for apcupsd
apf                                               Support for Advanced Policy Firewall (APF)
apkpkg                                           Support for apk
aptly                                             Apty Debian repository manager.
aptpkg                                           Support for APT (Advanced Packaging Tool)
archive                                          A module to wrap (non-Windows) archive calls
arista_pyeapi                                    Arista pyleapi
artifactory                                      Module for fetching artifacts from Artifactory
at                                                Wrapper module for at(1)
at_solaris                                       Wrapper for at(1) on Solaris-like systems
augeas_cfg                                       Manages configuration files via augeas
aws_sqs                                          Support for the Amazon Simple Queue Service.
azurearm_compute                                 Azure (ARM) Compute Execution Module
azurearm_dns                                      Azure (ARM) DNS Execution Module
azurearm_network                                 Azure (ARM) Network Execution Module
azurearm_resource                                Azure (ARM) Resource Execution Module
```

21.9.8 salt.modules.acme module

ACME / Let's Encrypt module

This module currently looks for certbot script in the $PATH as - certbot, - lestsencrypt, - certbot-auto, - letsencrypt-auto eventually falls back to /opt/letsencrypt/letsencrypt-auto

Note: Installation & configuration of the Let's Encrypt client can for example be done using https://github.com/saltstack-formulas/letsencrypt-formula

Warning: Be sure to set at least accept-tos = True in cli.ini!

Most parameters will fall back to cli.ini defaults if None is given.

DNS plugins

This module currently supports the CloudFlare certbot DNS plugin. The DNS plugin credentials file needs to be passed in using the dns_plugin_credentials argument.

Make sure the appropriate certbot plugin for the wanted DNS provider is installed before using this module.

salt.modules.acme.cert(name, aliases=None, email=None, webroot=None, test_cert=False, renew=None, keysize=None, server=None, owner='root', group='root', mode='0640', certname=None, preferred_challenges=None, tls_sni_01_port=None, tls_sni_01_address=None, http_01_port=None, http_01_address=None, dns_plugin=None, dns_plugin_credentials=None)

Obtain/renew a certificate from an ACME CA, probably Let's Encrypt.

Parameters

- name -- Common Name of the certificate (DNS name of certificate)
- aliases -- subjectAltNames (Additional DNS names on certificate)
- email -- e-mail address for interaction with ACME provider
- webroot -- True or a full path to use to use webroot. Otherwise use standalone mode
- test_cert -- Request a certificate from the Happy Hacker Fake CA (mutually exclusive with 'server')
- renew -- True/force to force a renewal, or a window of renewal before expiry in days
- keysize -- RSA key bits
- server -- API endpoint to talk to
- owner -- owner of the private key file
- group -- group of the private key file
- mode -- mode of the private key file
- certname -- Name of the certificate to save
- preferred_challenges -- A sorted, comma delimited list of the preferred challenge to use during authorization with the most preferred challenge listed first.
- **tls_sni_01_port** -- Port used during tls-sni-01 challenge. This only affects the port Certbot listens on. A conforming ACME server will still attempt to connect on port 443.
- **tls_sni_01_address** -- The address the server listens to during tls-sni-01 challenge.
- **http_01_port** -- Port used in the http-01 challenge. This only affects the port Certbot listens on. A conforming ACME server will still attempt to connect on port 80.
- **https_01_address** -- The address the server listens to during http-01 challenge.
- **dns_plugin** -- Name of a DNS plugin to use (currently only 'cloudflare' or 'digitalocean')
- **dns_plugin_credentials** -- Path to the credentials file if required by the specified DNS plugin
- **dns_plugin_propagate_seconds** -- Number of seconds to wait for DNS propogations before asking ACME servers to verify the DNS record. (default 10)

Return type: **dict**

Returns: Dictionary with 'result' True/False/None, 'comment' and certificate's expiry date ('not_after')

CLI example:

```bash
salt 'gitlab.example.com' acme.cert dev.example.com "[gitlab.example.com]" test_
--cert=True renew=14 webroot=/opt/gitlab/embedded/service/gitlab-rails/
--public
```

**salt.modules.acme.certs()**

Return a list of active certificates

CLI example:

```bash
salt 'vhost.example.com' acme.certs
```

**salt.modules.acme.expires(name)**

The expiry date of a certificate in ISO format

Parameters: **name** (str) -- Name of certificate

Return type: **str**

Returns: Expiry date in ISO format.

CLI example:

```bash
salt 'gitlab.example.com' acme.expires dev.example.com
```

**salt.modules.acme.has(name)**

Test if a certificate is in the Let's Encrypt Live directory

Parameters: **name** (str) -- Name of certificate

Return type: **bool**

Code example:

```python
if __salt__['acme.has']('dev.example.com'):
    log.info('That is one nice certificate you have there!')
```

**salt.modules.acme.info(name)**

Return information about a certificate
Parameters **name (str)** -- Name of certificate

Return type **dict**

Returns Dictionary with information about the certificate. If neither the tls nor the x509 module can be used to determine the certificate information, the information will be retrieved as one big text block under the key text using the openssl cli.

CLI example:
```
salt 'gitlab.example.com' acme.info dev.example.com
```

salt.modules.acme.needs_renewal(*name*, *window=None*)
Check if a certificate needs renewal

Parameters
- **name (str)** -- Name of certificate
- **window (bool/str/int)** -- Window in days to renew earlier or True/force to just return True

Return type **bool**

Returns Whether or not the certificate needs to be renewed.

Code example:
```
if __salt__['acme.needs_renewal']('dev.example.com'):
    __salt__['acme.cert']('dev.example.com', **kwargs)
else:
    log.info('Your certificate is still good')
```

salt.modules.acme.renew_by(*name*, *window=None*)
Date in ISO format when a certificate should first be renewed

Parameters
- **name (str)** -- Name of certificate
- **window (int)** -- number of days before expiry when renewal should take place

Return type **str**

Returns Date of certificate renewal in ISO format.

### 21.9.9 salt.modules.aix_group module
Manage groups on Solaris

**Important**: If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to 'group.info' is not available), see [here](#).

salt.modules.aix_group.add(*name*, *gid=None*, *system=False*, *root=None*)
Add the specified group

CLI Example:
```
salt '*' group.add foo 3456
```

21.9. execution modules
salt.modules.aix_group.adduser(name, username, root=None)
Add a user in the group.

CLI Example:
```
salt '*' group.adduser foo bar
```

Verifies if a valid username 'bar' as a member of an existing group 'foo', if not then adds it.

salt.modules.aix_group.chomp(name, gid)
Change the gid for a named group

CLI Example:
```
salt '*' group.chomp foo 4376
```

salt.modules.aix_group.delete(name)
Remove the named group

CLI Example:
```
salt '*' group.delete foo
```

salt.modules.aix_group.deluser(name, username, root=None)
Remove a user from the group.

CLI Example:
```
salt '*' group.deluser foo bar
```

Removes a member user 'bar' from a group 'foo'. If group is not present then returns True.

salt.modules.aix_group.getent(refresh=False)
Return info on all groups

CLI Example:
```
salt '*' group.getent
```

salt.modules.aix_group.info(name)
Return information about a group

CLI Example:
```
salt '*' group.info foo
```

salt.modules.aix_group.members(name, members_list, root=None)
Replaces members of the group with a provided list.

CLI Example:
```
salt '*' group.members foo 'user1,user2,user3,....'
```

Replaces a membership list for a local group 'foo'. foo:x:1234:user1,user2,user3,...
21.9.10 salt.modules.aix_shadow module

Manage account locks on AIX systems
New in version 2018.3.0.

depends  none

salt.modules.aix_shadow.locked(user)
Query for all accounts which are flagged as locked.

CLI Example:

```
salt <minion_id> shadow.locked ALL
```

salt.modules.aix_shadow.login_failures(user)
Query for all accounts which have 3 or more login failures.

CLI Example:

```
salt <minion_id> shadow.login_failures ALL
```

salt.modules.aix_shadow.unlock(user)
Unlock user for locked account

CLI Example:

```
salt <minion_id> shadow.unlock user
```

21.9.11 salt.modules.aixpkg

Package support for AIX

**Important:** If you feel that Salt should be using this module to manage filesets or rpm packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

salt.modules.aixpkg.available_version(*names, **kwargs)
This function is an alias of latest_version.

Return the latest version of the named fileset/rpm package available for upgrade or installation. If more than one fileset/rpm package name is specified, a dict of name/version pairs is returned.

If the latest version of a given fileset/rpm package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

NOTE: Repositories are not presently supported for AIX. This function will always return an empty string for a given fileset/rpm package.

salt.modules.aixpkg.install(name=None, refresh=False, pkgs=None, version=None, test=False, **kwargs)
Install the named fileset(s)/rpm package(s).

name  The name of the fileset or rpm package to be installed.
refresh Whether or not to update the yum database before executing.

Multiple Package Installation Options:

pkgs A list of filesets and/or rpm packages to install. Must be passed as a python list. The name parameter will be ignored if this option is passed.

version Install a specific version of a fileset/rpm package. (Unused at present).

test Verify that command functions correctly:

Returns a dict containing the new fileset(s)/rpm package(s) names and versions:

```
{<package>: {'old': '<old-version>', 'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install /stage/middleware/AIX/bash-4.2-3.aix6.1.ppc.rpm
salt '*' pkg.install /stage/middleware/AIX/bash-4.2-3.aix6.1.ppc.rpm refresh=True
salt '*' pkg.install /stage/middleware/AIX/VIOS2111_update/tpc_4.1.1.85.bff
salt '*' pkg.install /stage/middleware/AIX/Xlc/usr/sys/inst.images/xlc.rte
salt '*' pkg.install /stage/middleware/AIX/Firefox/ppc-AIX53/Firefox.base
salt '*' pkg.install pkgs='["foo", "bar"]'
```

salt.modules.aixpkg.latest_version('names, **kwargs')

Return the latest version of the named fileset/rpm package available for upgrade or installation. If more than one fileset/rpm package name is specified, a dict of name/version pairs is returned.

If the latest version of a given fileset/rpm package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

NOTE: Repositories are not presently supported for AIX. This function will always return an empty string for a given fileset/rpm package.

salt.modules.aixpkg.list_pkgs(versions_as_list=False, **kwargs)

List the filesets/rpm packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

salt.modules.aixpkg.remove(name=None, pkgs=None, **kwargs)

Remove specified fileset(s)/rpm package(s).

name The name of the fileset or rpm package to be deleted.

Multiple Package Options:

pkgs A list of filesets and/or rpm packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a list containing the removed packages.

CLI Example:
salt '*' pkg.remove <fileset/rpm package name>
salt '*' pkg.remove tcsh
salt '*' pkg.remove xlc.rte
salt '*' pkg.remove Firefox.base.adt
salt '*' pkg.remove pkgs='["foo", "bar"]'

salt.modules.aixpkg.upgrade_available(name, **kwargs)
Check whether or not an upgrade is available for a given package

CLI Example:
salt '*' pkg.upgrade_available <package name>

salt.modules.aixpkg.version(names, **kwargs)
Common interface for obtaining the version of installed fileset/rpm package.

CLI Example:
salt '*' pkg.version vim
salt '*' pkg.version foo bar baz

21.9.12 salt.modules.aliases

Manage the information in the aliases file

salt.modules.aliases.get_target(alias)
Return the target associated with an alias

CLI Example:
salt '*' aliases.get_target alias

salt.modules.aliases.has_target(alias, target)
Return true if the alias/target is set

CLI Example:
salt '*' aliases.has_target alias target

salt.modules.aliases.list_aliases()
Return the aliases found in the aliases file in this format:

{ 'alias': 'target' }

CLI Example:
salt '*' aliases.list_aliases

salt.modules.aliases.rm_alias(alias)
Remove an entry from the aliases file

CLI Example:
salt '*' aliases.rm_alias alias

salt.modules.aliases.set_target(alias, target)
Set the entry in the aliases file for the given alias, this will overwrite any previous entry for the given alias or create a new one if it does not exist.
CLI Example:
```
salt '*' aliases.set_target alias target
```

## 21.9.13 `salt.modules.alternatives`

Support for Alternatives system

**codeauthor**  
Radek Rada <radek.rada@gmail.com>

### `salt.modules.alternatives.auto(name)`
Trigger alternatives to set the path for `<name>` as specified by priority.

CLI Example:
```
salt '*' alternatives.auto name
```

### `salt.modules.alternatives.check_exists(name, path)`
Check if the given path is an alternative for a name.

New in version 2015.8.4.

CLI Example:
```
salt '*' alternatives.check_exists name path
```

### `salt.modules.alternatives.check_installed(name, path)`
Check if the current highest-priority match for a given alternatives link is set to the desired path

CLI Example:
```
salt '*' alternatives.check_installed name path
```

### `salt.modules.alternatives.display(name)`
Display alternatives settings for defined command name

CLI Example:
```
salt '*' alternatives.display editor
```

### `salt.modules.alternatives.install(name, link, path, priority)`
Install symbolic links determining default commands

CLI Example:
```
salt '*' alternatives.install editor /usr/bin/editor /usr/bin/emacs23 50
```

### `salt.modules.alternatives.remove(name, path)`
Remove symbolic links determining the default commands.

CLI Example:
```
salt '*' alternatives.remove name path
```

### `salt.modules.alternatives.set_(name, path)`
Manually set the alternative `<path>` for `<name>`.

CLI Example:
salt '*' alternatives.set name path

```
salt.modules.alternatives.show_current(name)
    Display the current highest-priority alternative for a given alternatives link
    CLI Example:
    salt '*' alternatives.show_current editor
```

```
salt.modules.alternatives.show_link(name)
    Display master link for the alternative
    New in version 2015.8.13,2016.3.4,2016.11.0.
    CLI Example:
    salt '*' alternatives.show_link editor
```

21.9.14 salt.modules.ansiblegate

Ansible Support

This module can have an optional minion-level configuration in /etc/salt/minion.d/ as follows:

```
ansible_timeout: 1200
```

The timeout is how many seconds Salt should wait for any Ansible module to respond.

```
class salt.modules.ansiblegate.AnsibleModuleCaller(resolver)
```

```
DEFAULT_TIMEOUT = 1200

OPT_TIMEOUT_KEY = 'ansible_timeout'

call(module, *args, **kwargs)
    Call an Ansible module by invoking it. :param module: the name of the module. :param args: Arguments to the module :param kwargs: keywords to the module :return:
```

```
class salt.modules.ansiblegate.AnsibleModuleResolver(opts)
    This class is to resolve all available modules in Ansible.

    get_modules_list(pattern=None)
        Return module map references. :return:

    install()

    load_module(module)
        Introspect Ansible module.
            Parameters module --
            Returns

    resolve()

    salt.modules.ansiblegate.help(module=None, *args)
        Display help on Ansible standard module.
            Parameters module --
            Returns
```

21.9. execution modules
salt.modules.ansiblegate.list_(pattern=None)
Lists available modules. :return:

salt.modules.ansiblegate.playbooks(playbook, rundir=None, check=False, diff=False, extra_vars=None, flush_cache=False, forks=5, inventory=None, limit=None, list_hosts=False, list_tags=False, list_tasks=False, module_path=None, skip_tags=None, start_at_task=None, syntax_check=False, tags=None, playbook_kwargs=None)

Run Ansible Playbooks

Parameters

- **playbook** -- Which playbook to run.
- **rundir** -- Directory to run `ansible-playbook` in. (Default: None)
- **check** -- don’t make any changes; instead, try to predict some of the changes that may occur (Default: False)
- **diff** -- when changing (small) files and templates, show the differences in those files; works great with --check (default: False)
- **extra_vars** -- set additional variables as key=value or YAML/JSON, if filename prepend with @, (default: None)
- **flush_cache** -- clear the fact cache for every host in inventory (default: False)
- **forks** -- specify number of parallel processes to use (Default: 5)
- **inventory** -- specify inventory host path or comma separated host list. (Default: None)
  (Ansible’s default is /etc/ansible/hosts)
- **limit** -- further limit selected hosts to an additional pattern (Default: None)
- **list_hosts** -- outputs a list of matching hosts; does not execute anything else (Default: False)
- **list_tags** -- list all available tags (Default: False)
- **list_tasks** -- list all tasks that would be executed (Default: False)
- **module_path** -- prepend colon-separated path(s) to module library. (Default: None)
- **skip_tags** -- only run plays and tasks whose tags do not match these values (Default: False)
- **start_at_task** -- start the playbook at the task matching this name (Default: None)
- **tags** -- only run plays and tasks tagged with these values (Default: None)

Param **syntax_check**: perform a syntax check on the playbook, but do not execute it (Default: False)

Returns Playbook return

CLI Example:

```
salt 'ansiblehost' ansible.playbook playbook=/srv/playbooks/play.yml
```
21.9.15 salt.modules.apache

Support for Apache

Note: The functions in here are generic functions designed to work with all implementations of Apache. Debian-specific functions have been moved into deb_apache.py, but will still load under the apache namespace when a Debian-based system is detected.

salt.modules.apache.config(name, config, edit=True)
Create VirtualHost configuration files

name File for the virtual host
config VirtualHost configurations

Note: This function is not meant to be used from the command line. Config is meant to be an ordered dict of all of the apache configs.

CLI Example:

```
salt '*' apache.config /etc/httpd/conf.d/ports.conf config="[{'Listen': '22'}]"
```

salt.modules.apache.directives()
Return list of directives together with expected arguments and places where the directive is valid (apachectl -L)

CLI Example:

```
salt '*' apache.directives
```

salt.modules.apache.fullversion()
Return server version (apachectl -V)

CLI Example:

```
salt '*' apache.fullversion
```

salt.modules.apache.modules()
Return list of static and shared modules (apachectl -M)

CLI Example:

```
salt '*' apache.modules
```

salt.modules.apache.server_status(profile='default')
Get Information from the Apache server-status handler

Note: The server-status handler is disabled by default. In order for this function to work it needs to be enabled. See http://httpd.apache.org/docs/2.2/mod/mod_status.html

The following configuration needs to exists in pillar/grains. Each entry nested in apache.server-status is a profile of a vhost/server. This would give support for multiple apache servers/vhosts.
apache.server-status:
  default:
    url: http://localhost/server-status
    user: someuser
    pass: password
    realm: 'authentication realm for digest passwords'
    timeout: 5

CLI Examples:

    salt '*' apache.server_status
    salt '*' apache.server_status other-profile

salt.modules.apache.servermods()
  Return list of modules compiled into the server (apachectl -l)
  
  CLI Example:

    salt '*' apache.servermods

salt.modules.apache.signal(signal=None)
  Signals httpd to start, restart, or stop.
  
  CLI Example:

    salt '*' apache.signal restart

salt.modules.apache.useradd(pwfile, user, password, opts='')
  Add HTTP user using the htpasswd command. If the htpasswd file does not exist, it will be created. Valid options that can be passed are:

  n  Don't update file; display results on stdout.
  m  Force MD5 hashing of the password (default).
  d  Force CRYPT(3) hashing of the password.
  p  Do not hash the password (plaintext).
  s  Force SHA1 hashing of the password.

  CLI Examples:

    salt '*' apache.useradd /etc/httpd/htpasswd larry badpassword
    salt '*' apache.useradd /etc/httpd/htpasswd larry badpass opts=ns

salt.modules.apache.userdel(pwfile, user)
  Delete HTTP user from the specified htpasswd file.
  
  CLI Example:

    salt '*' apache.userdel /etc/httpd/htpasswd larry

salt.modules.apache.version()
  Return server version (apachectl -v)
  
  CLI Example:

    salt '*' apache.version

salt.modules.apache.vhosts()
  Show the settings as parsed from the config file (currently only shows the virtualhost settings) (apachectl
Because each additional virtual host adds to the execution time, this command may require a long timeout
be specified by using -t 10.

CLI Example:
```
salt -t 10 '*' apache.vhosts
```

21.9.16 salt.modules.apcups

Module for apcupsd

**salt.modules.apcups.status()**
Return apcaccess output

CLI Example:
```
salt '*' apcups.status
```

**salt.modules.apcups.status_battery()**
Return true if running on battery power

CLI Example:
```
salt '*' apcups.status_battery
```

**salt.modules.apcups.status_charge()**
Return battery charge

CLI Example:
```
salt '*' apcups.status_charge
```

**salt.modules.apcups.status_load()**
Return load

CLI Example:
```
salt '*' apcups.status_load
```

21.9.17 salt.modules.apf

Support for Advanced Policy Firewall (APF)

**maintainer** Mostafa Hussein <mostafa.hussein91@gmail.com>

**maturity** new

**depends** python-iptables

**platform** Linux

**salt.modules.apf.allow(ip, port=None)**
Add host (IP/FQDN) to allow_hosts.rules and immediately load new rule into firewall CLI Example:
```
salt '*' apf.allow 127.0.0.1
```

**salt.modules.apf.deny(ip)**
Add host (IP/FQDN) to deny_hosts.rules and immediately load new rule into firewall CLI Example:
salt '*' apf.deny 1.2.3.4

salt.modules.apf.disable()
Stop (flush) all firewall rules CLI Example:

    salt '*' apf.disable

salt.modules.apf.enable()
Load all firewall rules CLI Example:

    salt '*' apf.enable

salt.modules.apf.refresh()
Refresh & resolve dns names in trust rules CLI Example:

    salt '*' apf.refresh

salt.modules.apf.reload()
Stop (flush) & reload firewall rules CLI Example:

    salt '*' apf.reload

salt.modules.apf.remove(ip)
Remove host from [glob]_*_hosts.rules and immediately remove rule from firewall CLI Example:

    salt '*' apf.remove 1.2.3.4

salt.modules.apf.running()
Check apf status CLI Example:

    salt '*' apf.running

21.9.18 salt.modules.apkpkg

Support for apk

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see [here](#).

salt.modules.apkpkg.file_dict(*packages, **kwargs)
List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

    salt '*' pkg.file_list httpd
    salt '*' pkg.file_list httpd postfix
    salt '*' pkg.file_list

salt.modules.apkpkg.file_list(*packages, **kwargs)
List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:
salt.modules.apkpkg.install

Install the passed package, add refresh=True to update the apk database.

name The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option.

CLI Example:
salt '*' pkg.install <package name>

refresh Whether or not to refresh the package database before installing.

Multiple Package Installation Options:

pkgs A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:
salt '*' pkg.install pkgs=['"foo", "bar"]'

sources A list of IPK packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package. Dependencies are automatically resolved and marked as auto-installed.

CLI Example:
salt '*' pkg.install sources=[{"foo": "salt://foo.deb"},{"bar": "salt://bar.deb"}]

install_recommends Whether to install the packages marked as recommended. Default is True.

Returns a dict containing the new package names and versions:

```
{"<package>": {'old': '<old-version>',
              'new': '<new-version>'}}
```

salt.modules.apkpkg.latest_version

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...

salt.modules.apkpkg.list_pkgs

List the packages currently installed in a dict:

```
["<package_name>": "<version>"]
```

CLI Example:
salt.modules.apkpkg.list_upgrades(refresh=True, **kwargs)

List all available package upgrades.

CLI Example:
```
salt '*' pkg.list_upgrades
```

salt.modules.apkpkg.owner(*paths, **kwargs)

Return the name of the package that owns the file. Multiple file paths can be passed. Like pkg.version
<salt.modules.apk.version, if a single path is passed, a string will be returned, and if multiple paths
are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned
for that path.

CLI Example:
```
salt '*' pkg.owns /usr/bin/apachectl salt '*' pkg.owns /usr/bin/apachectl /usr/bin/basename
```

salt.modules.apkpkg.purge(name=None, pkgs=None, **kwargs)

Alias to remove

salt.modules.apkpkg.refresh_db(**kwargs)

Updates the package list

- True: Database updated successfully
- False: Problem updating database

CLI Example:
```
salt '*' pkg.refresh_db
```

salt.modules.apkpkg.remove(name=None, pkgs=None, purge=False, **kwargs)

Remove packages using apk del.

name  The name of the package to be deleted.

Multiple Package Options:

pkgs  A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this
option is passed.

Returns a dict containing the changes.

CLI Example:
```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.apkpkg.upgrade(name=None, pkgs=None, refresh=True, **kwargs)

Upgrades all packages via apk upgrade or a specific package if name or pkgs is specified. Name is ignored
if pkgs is specified

Returns a dict containing the changes.

```
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

CLI Example:
salt '*' pkg.upgrade

salt.modules.apkpkg.version(*names, **kwargs)
   Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

   CLI Example:

   salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...

21.9.19 salt.modules.aptly module

Aptly Debian repository manager.

New in version 2018.3.0.

salt.modules.aptly.cleanup_db(config_path='/etc/aptly.conf', dry_run=False)
   Remove data regarding unreferenced packages and delete files in the package pool that are no longer being used by packages.

   Parameters  dry_run (bool) -- Report potential changes without making any changes.
   Returns  A dictionary of the package keys and files that were removed.
   Return type  dict

   CLI Example:

   salt '*' aptly.cleanup_db

salt.modules.aptly.delete_repo(name, config_path='/etc/aptly.conf', force=False)
   Remove the repository.

   Parameters
   - name (str) -- The name of the repository.
   - config_path (str) -- The path to the configuration file for the aptly instance.
   - force (bool) -- Whether to remove the repository even if it is used as the source of an existing snapshot.

   Returns  A boolean representing whether all changes succeeded.
   Return type  bool

   CLI Example:

   salt '*' aptly.delete_repo name="test-repo"

salt.modules.aptly.get_config(config_path='/etc/aptly.conf')
   Get the configuration data.

   Parameters  config_path (str) -- The path to the configuration file for the aptly instance.
   Returns  A dictionary containing the configuration data.
   Return type  dict
CLI Example:

```
salt '*' aptly.get_config
```

```
salt.modules.aptly.get_repo(name, config_path='/etc/aptly.conf', with_packages=False)
```
Get the details of the repository.

**Parameters**

- `name` (**str**) -- The name of the repository.
- `config_path` (**str**) -- The path to the configuration file for the aptly instance.
- `with_packages` (**bool**) -- Return a list of packages in the repo.

**Returns**
A dictionary containing information about the repository.

**Return type**
dict

CLI Example:

```
salt '*' aptly.get_repo name="test-repo"
```

```
salt.modules.aptly.list_mirrors(config_path='/etc/aptly.conf')
```
Get a list of all the mirrors.

**Parameters**

- `config_path` (**str**) -- The path to the configuration file for the aptly instance.

**Returns**
A list of the mirror names.

**Return type**
list

CLI Example:

```
salt '*' aptly.list_mirrors
```

```
salt.modules.aptly.list_published(config_path='/etc/aptly.conf')
```
Get a list of all the published repositories.

**Parameters**

- `config_path` (**str**) -- The path to the configuration file for the aptly instance.

**Returns**
A list of the published repository names.

**Return type**
list

CLI Example:

```
salt '*' aptly.list_published
```

```
salt.modules.aptly.list_repos(config_path='/etc/aptly.conf', with_packages=False)
```
List all of the repos.

**Parameters**

- `config_path` (**str**) -- The path to the configuration file for the aptly instance.
- `with_packages` (**bool**) -- Return a list of packages in the repo.

**Returns**
A dictionary of the repositories.

**Return type**
dict

CLI Example:

```
salt '*' aptly.list_repos
```
salt.modules.aptly.list_snapshots(config_path='/etc/aptly.conf', sort_by_time=False)

Get a list of all the snapshots.

Parameters

- **config_path (str)** -- The path to the configuration file for the aptly instance.
- **sort_by_time (bool)** -- Whether to sort by creation time instead of by name.

Returns

A list of the snapshot names.

Return type: list

CLI Example:

```
salt '*' aptly.list_snapshots
```

salt.modules.aptly.new_repo(name, config_path='/etc/aptly.conf', comment=None, component=None, distribution=None, uploaders_file=None, from_snapshot=None, saltenv='base')

Create the new repository.

Parameters

- **name (str)** -- The name of the repository.
- **config_path (str)** -- The path to the configuration file for the aptly instance.
- **comment (str)** -- The description of the repository.
- **component (str)** -- The default component to use when publishing.
- **distribution (str)** -- The default distribution to use when publishing.
- **uploaders_file (str)** -- The repository upload restrictions config.
- **from_snapshot (str)** -- The snapshot to initialize the repository contents from.
- **saltenv (str)** -- The environment the file resides in.

Returns

A boolean representing whether all changes succeeded.

Return type: bool

CLI Example:

```
salt '*' aptly.new_repo name="test-repo" comment="Test main repo" component="main", distribution="trusty"
```

salt.modules.aptly.set_repo(name, config_path='/etc/aptly.conf', comment=None, component=None, distribution=None, uploaders_file=None, from_snapshot=None, saltenv='base')

Configure the repository settings.

Parameters

- **name (str)** -- The name of the repository.
- **config_path (str)** -- The path to the configuration file for the aptly instance.
- **comment (str)** -- The description of the repository.
- **component (str)** -- The default component to use when publishing.
- **distribution (str)** -- The default distribution to use when publishing.
- **uploaders_file (str)** -- The repository upload restrictions config.
- **from_snapshot (str)** -- The snapshot to initialize the repository contents from.
- **saltenv**(str) -- The environment the file resides in.

Returns A boolean representing whether all changes succeeded.

Return type *bool*

**CLI Example:**

```python
salt '*' aptly.set_repo name="test-repo" comment="Test universe repo" component="universe" distribution="xenial"
```

## 21.9.20 salt.modules.aptpkg

Support for APT (Advanced Packaging Tool)

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see [here](#).

For repository management, the `python-apt` package must be installed.

salt.modules.aptpkg.add_repo_key(path=None, text=None, keyserver=None, keyid=None, saltenv='base')

New in version 2017.7.0.

Add a repo key using `apt-key add`.

Parameters

- **path**(str) -- The path of the key file to import.
- **text**(str) -- The key data to import, in string form.
- **keyserver**(str) -- The server to download the repo key specified by the keyid.
- **keyid**(str) -- The key id of the repo key to add.
- **saltenv**(str) -- The environment the key file resides in.

Returns A boolean representing whether the repo key was added.

Return type *bool*

**CLI Examples:**

```bash
salt '*' pkg.add_repo_key 'salt://apt/sources/test.key'
salt '*' pkg.add_repo_key text="$KEY1"
salt '*' pkg.add_repo_key keyserver='keyserver.example' keyid='0000AAAA'
```

salt.modules.aptpkg.autoremove(list_only=False, purge=False)

New in version 2015.5.0.

Remove packages not required by another package using `apt-get autoremove`.

- **list_only** [False] Only retrieve the list of packages to be auto-removed, do not actually perform the auto-removal.
- **purge** [False] Also remove package config data when autoremoving packages.

New in version 2015.8.0.
CLI Example:

```
salt '*' pkg.autoremove
salt '*' pkg.autoremove list_only=True
salt '*' pkg.autoremove purge=True
```

`salt.modules.aptpkg.del_repo(repos, **kwargs)`
Delete a repo from the sources.list / sources.list.d

If the .list file is in the sources.list.d directory and the file that the repo exists in does not contain any other
repo configuration, the file itself will be deleted.

The repo passed in must be a fully formed repository definition string.

CLI Examples:

```
salt '*' pkg.del_repo "myrepo definition"
```

`salt.modules.aptpkg.del_repo_key(name=None, **kwargs)`
New in version 2015.8.0.

Remove a repo key using `apt-key del`

- **name**: Repo from which to remove the key. Unnecessary if `keyid` is passed.
- **keyid**: The KeyID of the GPG key to remove
- **keyid_ppa**: [False] If set to `True`, the repo's GPG key ID will be looked up from ppa.launchpad.net and re-

Note: Setting this option to `True` requires that the `name` param also be passed.

CLI Examples:

```
salt '*' pkg.del_repo_key keyid=0123ABCD
salt '*' pkg.del_repo_key name='ppa:foo/bar' keyid_ppa=True
```

`salt.modules.aptpkg.expand_repo_def(**kwargs)`
Take a repository definition and expand it to the full pkg repository dict that can be used for comparison. This
is a helper function to make the Debian/Ubuntu apt sources sane for comparison in the pkgrepo states.

This is designed to be called from pkgrepo states and will have little use being called on the CLI.

`salt.modules.aptpkg.file_dict(*packages, **kwargs)`
List the files that belong to a package, grouped by package. Not specifying any packages will return a list of
_every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_dict httpd
salt '*' pkg.file_dict httpd postfix
salt '*' pkg.file_dict
```

`salt.modules.aptpkg.file_list(*packages, **kwargs)`
List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the
system's package database (not generally recommended).

CLI Examples:
**salt.modules.aptpkg.get_repo***(repo, **kwargs)***

Display a repo from the sources.list / sources.list.d

The repo passed in needs to be a complete repo entry.

**CLI Examples:**

```
salt '*' pkg.get_repo "myrepo definition"
```

**salt.modules.aptpkg.get_repo_keys()**

New in version 2017.7.0.

List known repo key details.

**Returns**  A dictionary containing the repo keys.

**Return type**  dict

**CLI Examples:**

```
salt '*' pkg.get_repo_keys
```

**salt.modules.aptpkg.get_selections**(pattern=None, state=None)

View package state from the dpkg database.

Returns a dict of dicts containing the state, and package names:

```python
{'<host>':
    {'<state>': ['pkg1',
                ...
                ],
       },
   ...
}
```

**CLI Example:**

```
salt '*' pkg.get_selections
salt '*' pkg.get_selections 'python-*'
salt '*' pkg.get_selections state=hold
salt '*' pkg.get_selections 'openssh*' state=hold
```

**salt.modules.aptpkg.hold**(name=None, pkgs=None, sources=None, **kwargs)***

New in version 2014.7.0.

Set package in 'hold' state, meaning it will not be upgraded.

**name**  The name of the package, e.g., 'tmux'

**CLI Example:**

```
salt '*' pkg.hold <package name>
```

**pkgs**  A list of packages to hold. Must be passed as a python list.

**CLI Example:**
salt 'x' pkg.hold pkgs='["foo", "bar"]'

salt.modules.aptpkg.info_installed(*names, **kwargs)
Return the information of the named package(s) installed on the system.

names The names of the packages for which to return information.
failhard Whether to throw an exception if none of the packages are installed. Defaults to True.
New in version 2016.11.3.

CLI example:
salt 'x' pkg.info_installed <package1>
salt 'x' pkg.info_installed <package1> <package2> <package3> ...
salt 'x' pkg.info_installed <package1> failhard=false

salt.modules.aptpkg.install(name=None, refresh=False, fromrepo=None, skip_verify=False, debconf=None, pkgs=None, sources=None, reinstall=False, download-only=False, ignore_epoch=False, **kwargs)
Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any apt-get/dpkg commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).
Install the passed package, add refresh=True to update the dpkg database.

name The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option.

32-bit packages can be installed on 64-bit systems by appending the architecture designation (:i386, etc.) to the end of the package name.

CLI Example:
salt 'x' pkg.install <package name>

refresh Whether or not to refresh the package database before installing.
cache_valid_time
New in version 2016.11.0.
Skip refreshing the package database if refresh has already occurred within <value> seconds

fromrepo Specify a package repository to install from (e.g., apt-get -t unstable install somepackage)
skip_verify Skip the GPG verification check (e.g., --allow-unauthenticated, or --force-bad-verify for install from package file).

debconf Provide the path to a debconf answers file, processed before installation.

version Install a specific version of the package, e.g. 1.2.3-0ubuntu0. Ignored if "pkgs" or "sources" is passed.
Changed in version 2018.3.0: version can now contain comparison operators (e.g. >1.2.3, <=2.0, etc.)
**reinstall** [False] Specifying reinstall=True will use `apt-get install --reinstall` rather than simply `apt-get install` for requested packages that are already installed.

If a version is specified with the requested package, then `apt-get install --reinstall` will only be used if the installed version matches the requested version.

New in version 2015.8.0.

**ignore_epoch** [False] Only used when the version of a package is specified using a comparison operator (e.g. >4.1). If set to True, then the epoch will be ignored when comparing the currently-installed version to the desired version.

New in version 2018.3.0.

**pkgs** A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3-0ubuntu0"}]'
```

**sources** A list of DEB packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package. Dependencies are automatically resolved and marked as auto-installed.

32-bit packages can be installed on 64-bit systems by appending the architecture designation (:i386, etc.) to the end of the package name.

Changed in version 2014.7.0.

CLI Example:

```
salt '*' pkg.install sources=[{"foo": salt://foo.deb},{"bar": salt://bar.deb}]'
```

**force_yes** Passes --force-yes to the apt-get command. Don’t use this unless you know what you’re doing.

New in version 0.17.4.

**install_recommends** Whether to install the packages marked as recommended. Default is True.

New in version 2015.5.0.

**only_upgrade** Only upgrade the packages, if they are already installed. Default is False.

New in version 2015.5.0.

**force_conf_new** Always install the new version of any configuration files.

New in version 2015.8.0.

Returns a dict containing the new package names and versions:

```
{"<package>": {"old": '<old-version>', 'new': '<new-version>'}}
```

salt.modules.aptpkg.latest_version("names", **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

A specific repo can be requested using the fromrepo keyword argument.
cache_valid_time

New in version 2016.11.0.

Skip refreshing the package database if refresh has already occurred within <value> seconds

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> fromrepo=unstable
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.aptpkg.list_downloaded(root=None, **kwargs)

New in version 3000.?

List prefetched packages downloaded by apt in the local disk.

- **root**: operate on a different root directory.

CLI example:

```
salt '*' pkg.list_downloaded
```

salt.modules.aptpkg.list_pkgs(versions_as_list=False, removed=False, purge_desired=False, **kwargs)

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

- **removed**: If True, then only packages which have been removed (but not purged) will be returned.
- **purge_desired**: If True, then only packages which have been marked to be purged, but can't be purged due to their status as dependencies for other installed packages, will be returned. Note that these packages will appear in installed.

Changed in version 2014.1.1: Packages in this state now correctly show up in the output of this function.

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

salt.modules.aptpkg.list_repo_pkgs(*args, **kwargs)

New in version 2017.7.0.

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names.

This function can be helpful in discovering the version or repo to specify in a pkg.installed state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. For example:

```
{
    'bash': ['4.3-14ubuntu1.1',
             '4.3-14ubuntu1'],
    'nginx': ['1.18.0-0ubuntu0.16.04.4',
              '1.9.15-0ubuntu1']
}
```

CLI Examples:
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz

salt.modules.aptpkg.list_repos(**kwargs)
Lists all repos in the sources.list (and sources.lists.d) files

CLI Example:
salt '*' pkg.list_repos
salt '*' pkg.list_repos disabled=True

salt.modules.aptpkg.list_upgrades(refresh=True, dist_upgrade=True, **kwargs)
List all available package upgrades.

refresh  Whether to refresh the package database before listing upgrades. Default: True.
cache_valid_time
New in version 2016.11.0.
Skip refreshing the package database if refresh has already occurred within <value> seconds
dist_upgrade  Whether to list the upgrades using dist-upgrade vs upgrade. Default is to use dist-upgrade.

CLI Example:
salt '*' pkg.list_upgrades

salt.modules.aptpkg.mod_repo(repo, saltenv='base', **kwargs)
Modify one or more values for a repo. If the repo does not exist, it will be created, so long as the definition is well formed. For Ubuntu the ppa:<project>/repo format is acceptable. ppa: format can only be used to create a new repository.

The following options are available to modify a repo definition:

architectures  A comma-separated list of supported architectures, e.g. amd64 If this option is not set, all architectures (configured in the system) will be used.
comps  A comma separated list of components for the repo, e.g. main
file  A file name to be used
keyserver  Keyserver to get gpg key from
keyid  Key ID or a list of key IDs to load with the keyserver argument
key_url  URL to a GPG key to add to the APT GPG keyring
key_text  GPG key in string form to add to the APT GPG keyring
New in version 2018.3.0.
consolidate  [False] If True, will attempt to de-duplicate and consolidate sources
comments  Sometimes you want to supply additional information, but not as enabled configuration. All comments provided here will be joined into a single string and appended to the repo configuration with a comment marker (#) before it.
New in version 2015.8.9.
refresh  [True] Enable or disable (True or False) refreshing of the apt package database. The previous refresh_db argument was deprecated in favor of refresh`. The refresh_db argument will still continue to work to ensure backwards compatibility, but please change to using the preferred refresh.
Note: Due to the way keys are stored for APT, there is a known issue where the key won’t be updated unless another change is made at the same time. Keys should be properly added on initial configuration.

CLI Examples:

```bash
salt '*' pkg.mod_repo 'myrepo definition' uri=http://new/uri
salt '*' pkg.mod_repo 'myrepo definition' comps=main,universe
```

salt.modules.aptpkg.normalize_name(name)

Strips the architecture from the specified package name, if necessary.

CLI Example:

```bash
salt '*' pkg.normalize_name zsh:amd64
```

salt.modules.aptpkg.owner(paths, **kwargs)

New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like pkg.version, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

```bash
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /usr/bin/basename
```

salt.modules.aptpkg.parse_arch(name)

Parse name and architecture from the specified package name.

CLI Example:

```bash
salt '*' pkg.parse_arch zsh:amd64
```

salt.modules.aptpkg.purge(name=None, pkgs=None, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon’s control group. This is done to keep systemd from killing any apt-get/dpkg commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Remove packages via apt-get purge along with all configuration files.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:
salt ' '*' pkg.purge <package name>
salt ' '*' pkg.purge <package1>,<package2>,<package3>
salt ' '*' pkg.purge pkgs='["foo", "bar"]'

salt.modules.aptpkg.refresh_db(cache_valid_time=0, failhard=False, **kwargs)

Updates the APT database to latest packages based upon repositories

Returns a dict, with the keys being package databases and the values being the result of the update attempt. Values can be one of the following:

- True: Database updated successfully
- False: Problem updating database
- None: Database already up-to-date

cache_valid_time
New in version 2016.11.0.

Skip refreshing the package database if refresh has already occurred within <value> seconds

failhard
If False, return results of Err lines as False for the package database that encountered the error.
If True, raise an error with a list of the package databases that encountered errors.

CLI Example:
salt ' '*' pkg.refresh_db

salt.modules.aptpkg.remove(name=None, pkgs=None, **kwargs)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any apt-get/dpkg commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Remove packages using apt-get remove.

name  The name of the package to be deleted.

Multiple Package Options:

pkgs  A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:
salt ' '*' pkg.remove <package name>
salt ' '*' pkg.remove <package1>,<package2>,<package3>
salt ' '*' pkg.remove pkgs='["foo", "bar"]'

salt.modules.aptpkg.set_selections(path=None, selection=None, clear=False, saltenv='base')

Change package state in the dpkg database.

The state can be any one of, documented in dpkg(1):

- install
Salt Documentation, Release 3001.1

• hold
• deinstall
• purge
This command is commonly used to mark specific packages to be held from being upgraded, that is, to be
kept at a certain version. When a state is changed to anything but being held, then it is typically followed by
apt-get -u dselect-upgrade.
Note: Be careful with the clear argument, since it will start with setting all packages to deinstall state.
Returns a dict of dicts containing the package names, and the new and old versions:
{'<host>':
{'<package>': {'new': '<new-state>',
'old': '<old-state>'}
},
...
}

CLI Example:
salt '*'
salt '*'
,→"]}'
salt '*'
salt '*'

pkg.set_selections selection='{"install": ["netcat"]}'
pkg.set_selections selection='{"hold": ["openssh-server", "openssh-client
pkg.set_selections salt://path/to/file
pkg.set_selections salt://path/to/file clear=True

salt.modules.aptpkg.show(*names, **kwargs)
New in version 2019.2.0.
Runs an apt-cache show on the passed package names, and returns the results in a nested dictionary. The
top level of the return data will be the package name, with each package name mapping to a dictionary of
version numbers to any additional information returned by apt-cache show.
filter An optional comma-separated list (or quoted Python list) of case-insensitive keys on which to filter. This
allows one to restrict the information returned for each package to a smaller selection of pertinent items.
refresh [False] If True, the apt cache will be refreshed first. By default, no refresh is performed.
CLI Examples:
salt myminion pkg.show gawk
salt myminion pkg.show 'nginx-*'
salt myminion pkg.show 'nginx-*' filter=description,provides

salt.modules.aptpkg.unhold(name=None, pkgs=None, sources=None, **kwargs)
New in version 2014.7.0.
Set package current in 'hold' state to install state, meaning it will be upgraded.
name The name of the package, e.g., 'tmux'
CLI Example:
salt '*' pkg.unhold <package name>

pkgs A list of packages to unhold. Must be passed as a python list.
CLI Example:

21.9. execution modules

1301


salt ' '*' pkg.unhold pkgs='["foo", "bar"]'

```
salt.modules.aptpkg.upgrade(refresh=True, dist_upgrade=False, **kwargs)
```

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any apt-get/dpkg commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a `config option` called `systemd.scope`, with a value of `False` (no quotes).

Upgrades all packages via `apt-get upgrade` or `apt-get dist-upgrade` if `dist_upgrade` is `True`. Returns a dictionary containing the changes:

```
{ '<package>': { 'old': '<old-version>', 'new': '<new-version>' }}
```

`dist_upgrade` Whether to perform the upgrade using dist-upgrade vs upgrade. Default is to use upgrade.

New in version 2014.7.0.

`cache_valid_time`

New in version 2016.11.0.

Skip refreshing the package database if refresh has already occurred within `<value>` seconds

`download_only (or downloadonly)` Only download the packages, don't unpack or install them. Use `downloadonly` to be in line with yum and zypper module.

New in version 2018.3.0.

`force_conf_new` Always install the new version of any configuration files.

New in version 2015.8.0.

CLI Example:

```
salt ' '*' pkg.upgrade
```

```
salt.modules.aptpkg.upgrade_available(name, **kwargs)
```

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt ' '*' pkg.upgrade_available <package name>
```

```
salt.modules.aptpkg.version(*names, **kwargs)
```

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt ' '*' pkg.version <package name>
salt ' '*' pkg.version <package1> <package2> <package3> ...
```

```
salt.modules.aptpkg.version_cmp(pkg1, pkg2, ignore_epoch=False, **kwargs)
```

Do a cmp-style comparison on two packages. Return -1 if `pkg1 < pkg2`, 0 if `pkg1 == pkg2`, and 1 if `pkg1 > pkg2`. Return None if there was a problem making the comparison.
ignore_epoch  [False] Set to True to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:

```bash
salt '*' pkg.version_cmp '0.2.4@ubuntu1' '0.2.4.1@ubuntu1'
```

### 21.9.21 salt.modules.archive

A module to wrap (non-Windows) archive calls

New in version 2014.1.0.

```python
salt.modules.archive.cmd_unzip(zip_file, dest, excludes=None, options=None, template=None, runas=None, trim_output=False, password=None)
```

New in version 2015.5.0: In versions 2014.7.x and earlier, this function was known as `archive.unzip`.

Uses the `unzip` command to unpack zip files. This command is part of the `Info-ZIP` suite of tools, and is typically packaged as simply `unzip`.

**zip_file**  Path of zip file to be unpacked

**dest**  The destination directory into which the file should be unpacked

**excludes**  [None] Comma-separated list of files not to unpack. Can also be passed in a Python list.

**template**  [None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```bash
salt '*' archive.cmd_unzip template=jinja /tmp/zipfile.zip /tmp/{{grains.id}} excludes=file_1,file_2
```

**options**  Optional when using `zip` archives, ignored when using other archives files. This is mostly used to overwrite existing files with o. This options are only used when `unzip` binary is used.

New in version 2016.3.1.

**runas**  [None] Unpack the zip file as the specified user. Defaults to the user under which the minion is running.

New in version 2015.5.0.

**trim_output**  [False] The number of files we should output on success before the rest are trimmed, if this is set to True then it will default to 100

**password**  Password to use with password protected zip files

**Note:** This is not considered secure. It is recommended to instead use `archive.unzip` for password-protected ZIP files. If a password is used here, then the `unzip` command run to extract the ZIP file will not show up in the minion log like most shell commands Salt runs do. However, the password will still be present in the events logged to the minion log at the `debug` log level. If the minion is logging at `debug` (or more verbose), then be advised that the password will appear in the log.

New in version 2016.11.0.

CLI Example:

```bash
salt '*' archive.cmd_unzip /tmp/zipfile.zip /home/strongbad/ excludes=file_1,file_2
```

### 21.9. execution modules
salt.modules.archive.cmd_zip(zip_file, sources, template=None, cwd=None, runas=None)

New in version 2015.5.0: In versions 2014.7.x and earlier, this function was known as archive.zip.

Uses the zip command to create zip files. This command is part of the Info-ZIP suite of tools, and is typically packaged as simply zip.

zip_file  Path of zip file to be created

sources  Comma-separated list of sources to include in the zip file. Sources can also be passed in a Python list.

Changed in version 2017.7.0: Globbing is now supported for this argument

template  [None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.cmd_zip template=jinja /tmp/zipfile.zip /tmp/sourcefile1,/ --tmp/[[grains.id]].txt
```

cwd  [None] Use this argument along with relative paths in sources to create zip files which do not contain the leading directories. If not specified, the zip file will be created as if the cwd was /, and creating a zip file of /foo/bar/baz.txt will contain the parent directories foo and bar. To create a zip file containing just baz.txt, the following command would be used:

```
salt '*' archive.cmd_zip /tmp/baz.zip baz.txt cwd=/foo/bar
```

New in version 2014.7.1.

runas  [None] Create the zip file as the specified user. Defaults to the user under which the minion is running.

New in version 2015.5.0.

CLI Example:

```
salt '*' archive.cmd_zip /tmp/zipfile.zip /tmp/sourcefile1,/tmp/sourcefile2
# Globbing for sources (2017.7.0 and later)
salt '*' archive.cmd_zip /tmp/zipfile.zip '/*sourcefile*'  
```

salt.modules.archive.gunzip(gzipfile, template=None, runas=None, options=None)

Uses the gunzip command to unpack gzip files

template  [None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.gunzip template=jinja /tmp/{{grains.id}}.txt.gz
```

runas  [None] The user with which to run the gzip command line

options  [None] Pass any additional arguments to gzip

New in version 2016.3.4.

CLI Example:

```
# Create /tmp/sourcefile.txt
salt '*' archive.gunzip /tmp/sourcefile.txt.gz
salt '*' archive.gunzip /tmp/sourcefile.txt options='--verbose'
```

salt.modules.archive.gzip(sourcefile, template=None, runas=None, options=None)

Uses the gzip command to create gzip files

template  [None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:
Salt Documentation, Release 3001.1

salt 'x' archive.gzip template=jinja /tmp/{{grains.id}}.txt

runas [None] The user with which to run the gzip command line

options [None] Pass any additional arguments to gzip

New in version 2016.3.4.

CLI Example:

```bash
# Create /tmp/sourcefile.txt.gz
salt 'x' archive.gzip /tmp/sourcefile.txt
salt 'x' archive.gzip /tmp/sourcefile.txt options='-9 --verbose'
```

salt.modules.archive.is_encrypted(name, clean=False, saltenv='base', source_hash=None)

New in version 2016.11.0.

Returns True if the zip archive is password-protected, False if not. If the specified file is not a ZIP archive, an error will be raised.

name The path / URL of the archive to check.

clean [False] Set this value to True to delete the path referred to by name once the contents have been listed. This option should be used with care.

**Note:** If there is an error listing the archive's contents, the cached file will not be removed, to allow for troubleshooting.

saltenv [base] Specifies the fileserver environment from which to retrieve archive. This is only applicable when archive is a file from the salt:// fileserver.

source_hash If name is an http(s)/ftp URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the archive if the cached copy matches the specified hash.

New in version 2018.3.0.

CLI Examples:

```bash
salt 'x' archive.is_encrypted /path/to/myfile.zip
salt 'x' archive.is_encrypted salt://foo.zip
salt 'x' archive.is_encrypted salt://foo.zip saltenv=dev
salt 'x' archive.is_encrypted https://domain.tld/myfile.zip clean=True
salt 'x' archive.is_encrypted https://domain.tld/myfile.zip source_hash=f1d2d2f924e98ac86f7f7b36c94bcdf32beec15
salt 'x' archive.is_encrypted ftp://10.1.2.3/foo.zip
```

salt.modules.archive.list_(name, archive_format=None, options=None, strip_components=None, clean=False, verbose=False, saltenv='base', source_hash=None)

New in version 2016.11.0.

Changed in version 2016.11.2: The rarfile Python module is now supported for listing the contents of rar archives. This is necessary on minions with older releases of the rar CLI tool, which do not support listing the contents in a parsable format.

List the files and directories in an tar, zip, or rar archive.

**Note:** This function will only provide results for XZ-compressed archives if the xz CLI command is available, as Python does not at this time natively support XZ compression in its tarfile module. Keep in mind however
that most Linux distros ship with **xz** already installed.

To check if a given minion has **xz**, the following Salt command can be run:

```bash
salt minion_id cmd.which xz
```

If **None** is returned, then **xz** is not present and must be installed. It is widely available and should be packaged as either **xz** or **xz-utils**.

---

**name**  Path/URL of archive

**archive_format**  Specify the format of the archive (**tar**, **zip**, or **rar**). If this argument is omitted, the archive format will be guessed based on the value of the **name** parameter.

**options**  For tar archives only. This function will, by default, try to use the **tarfile** module from the Python standard library to get a list of files/directories. If this method fails, then it will fall back to using the shell to decompress the archive to stdout and pipe the results to `tar -tf -` to produce a list of filenames. XZ-compressed archives are already supported automatically, but in the event that the tar archive uses a different sort of compression not supported natively by **tarfile**, this option can be used to specify a command that will decompress the archive to stdout. For example:

```bash
salt minion_id archive.list /path/to/foo.tar.gz options='gzip --decompress -- ->stdout'
```

**Note:** It is not necessary to manually specify options for gzip’ed archives, as gzip compression is natively supported by **tarfile**.

---

**strip_components**  This argument specifies a number of top-level directories to strip from the results. This is similar to the paths that would be extracted if **--strip-components** (or **--strip**) were used when extracting tar archives.

New in version 2016.11.2.

**clean**  [**False**]  Set this value to **True** to delete the path referred to by **name** once the contents have been listed. This option should be used with care.

**Note:** If there is an error listing the archive’s contents, the cached file will not be removed, to allow for troubleshooting.

**verbose**  [**False**]  If **False**, this function will return a list of files/dirs in the archive. If **True**, it will return a dictionary categorizing the paths into separate keys containing the directory names, file names, and also directories/files present in the top level of the archive.

Changed in version 2016.11.2: This option now includes symlinks in their own list. Before, they were included with files.

**saltenv**  [**base**]  Specifies the fileserver environment from which to retrieve **archive**. This is only applicable when **archive** is a file from the **salt://** fileserver.

---

**source_hash**  If **name** is an http(s)/ftp URL and the file exists in the minion’s file cache, this option can be passed to keep the minion from re-downloading the archive if the cached copy matches the specified hash.

New in version 2018.3.0.

CLI Examples:
salt.modules.archive.rar(rarfile, sources=None, template=None, cwd=None, runas=None)

Uses rar for Linux to create rar files

rarfile Path of rar file to be created

sources Comma-separated list of sources to include in the rar file. Sources can also be passed in a Python list.

Changed in version 2017.7.0: Globbing is now supported for this argument

cwd [None] Run the rar command from the specified directory. Use this argument along with relative file paths to create rar files which do not contain the leading directories. If not specified, this will default to the home directory of the user under which the salt minion process is running.

New in version 2014.7.1.

template [None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

salt '*' archive.rar template=jinja /tmp/rarfile.rar '/tmp/sourcefile1,/tmp/{\{grains.id\}}.txt'

CLI Example:

salt '*' archive.rar /tmp/rarfile.rar /tmp/sourcefile1,/tmp/sourcefile2
# Globbing for sources (2017.7.0 and later)
salt '*' archive.rar /tmp/rarfile.rar '/tmp/sourcefile*'

salt.modules.archive.tar(options, tarfile, sources=None, dest=None, cwd=None, template=None, runas=None)

Note: This function has changed for version 0.17.0. In prior versions, the cwd and template arguments must be specified, with the source directories/files coming as a space-separated list at the end of the command. Beginning with 0.17.0, sources must be a comma-separated list, and the cwd and template arguments are optional.

Uses the tar command to pack, unpack, etc. tar files

options Options to pass to the tar command

Changed in version 2015.8.0: The mandatory -prefixing has been removed. An options string beginning with a --long-option, would have uncharacteristically needed its first - removed under the former scheme.

Also, tar will parse its options differently if short options are used with or without a preceding -, so it is better to not confuse the user into thinking they’re using the non-- format, when really they are using the with-- format.

tarfile The filename of the tar archive to pack/unpack

sources Comma delimited list of files to pack into the tarfile. Can also be passed as a Python list.

Changed in version 2017.7.0: Globbing is now supported for this argument
**Salt Documentation, Release 3001.1**

**dest** The destination directory into which to unpack the tarfile.

**cwd** [None] The directory in which the tar command should be executed. If not specified, will default to the home directory of the user under which the salt minion process is running.

**template** [None] Can be set to ‘jinja’ or another supported template engine to render the command arguments before execution:

```bash
salt '*' archive.tar cjvf /tmp/salt.tar.bz2 {{grains.saltpath}} template=jinja
```

**CLI Examples:**

- # Create a tarfile
  - `salt '*' archive.tar cjvf /tmp/tarfile.tar.b2z2 /tmp/file_1,/tmp/file_2`
- # Create a tarfile using globbing (2017.7.0 and later)
  - `salt '*' archive.tar cjvf /tmp/tarfile.tar.b2z2 '/tmp/file_*'`
- # Unpack a tarfile
  - `salt '*' archive.tar xf foo.tar dest=/target/directory`

**salt.modules.archive.unrar**

- `rarfile` Name of rar file to be unpacked
- `dest` The destination directory into which to unpack the rar file
- **template** [None] Can be set to ‘jinja’ or another supported template engine to render the command arguments before execution:

```bash
salt '*' archive.unrar template=jinja /tmp/rarfile.rar /tmp/{{grains.id}}/™
```

- **excludes** [None] Can be in a comma-separated list or a Python list.

**trim_output** [False] The number of files we should output on success before the rest are trimmed, if this is set to True then it will default to 100

**CLI Example:**

```bash
salt '*' archive.unrar /tmp/rarfile.rar /home/strongbad/ excludes=file_1,file_2
```

**salt.modules.archive.unzip**

- `zip_file` Path of zip file to be unpacked
- `dest` The destination directory into which the file should be unpacked
- **excludes** [None] Comma-separated list of files not to unpack. Can also be passed in a Python list.
- **options** This options are only used when unzip binary is used. In this function is ignored.

  - New in version 2016.3.1.
- **template** [None] Can be set to ‘jinja’ or another supported template engine to render the command arguments before execution:

  ```bash
  salt '*' archive.unzip /tmp/rarfile.rar /home/strongbad/ excludes=file_1,file_2
  ```

**Changed in version 2015.5.0:** This function was rewritten to use Python’s native zip file support. The old functionality has been preserved in the new function `archive.cmd_unzip`. For versions 2014.7.x and earlier, see the `archive.cmd_zip` documentation.
<table>
<thead>
<tr>
<th>Variable</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>runas</td>
<td>[None]</td>
<td>Unpack the zip file as the specified user. Defaults to the user under which the minion is running.</td>
</tr>
<tr>
<td>trim_output</td>
<td>[False]</td>
<td>The number of files we should output on success before the rest are trimmed, if this is set to True then it will default to 100</td>
</tr>
<tr>
<td>password</td>
<td></td>
<td>Password to use with password protected zip files</td>
</tr>
</tbody>
</table>

**Note:** The password will be present in the events logged to the minion log file at the debug log level. If the minion is logging at debug (or more verbose), then be advised that the password will appear in the log.

New in version 2016.3.0.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>extract_perms</td>
<td>[True]</td>
<td>The Python zipfile module does not extract file/directory attributes by default. When this argument is set to True, Salt will attempt to apply the file permission attributes to the extracted files/folders. On Windows, only the read-only flag will be extracted as set within the zip file, other attributes (i.e. user/group permissions) are ignored. Set this argument to False to disable this behavior.</td>
</tr>
</tbody>
</table>

New in version 2016.11.0.

**Example:**
```
salt '*' archive.unzip /tmp/zipfile.zip /home/strongbad/ excludes=file_1,file_2
```
21.9.22 salt.modules.arista_pyeapi

Arista pyeapi

New in version 2019.2.0.

Execution module to interface the connection with Arista switches, connecting to the remote network device using the pyeapi library. It is flexible enough to execute the commands both when running under an Arista Proxy Minion, as well as running under a Regular Minion by specifying the connection arguments, i.e., device_type, host, username, password etc.

- codeauthor Mircea Ulinic <ping@mirceaulinic.net>
- maturity new
- depends pyeapi
- platform unix

Note: To understand how to correctly enable the eAPI on your switch, please check https://eos.arista.com/arista-eapi-101/.

Dependencies

The pyeapi Execution module requires the Python Client for eAPI (pyeapi) to be installed: pip install pyeapi.

Usage

This module can equally be used via the pyeapi Proxy module or directly from an arbitrary (Proxy) Minion that is running on a machine having access to the network device API, and the pyeapi library is installed.

When running outside of the pyeapi Proxy (i.e., from another Proxy Minion type, or regular Minion), the pyeapi connection arguments can be either specified from the CLI when executing the command, or in a configuration block under the pyeapi key in the configuration opts (i.e., (Proxy) Minion configuration file), or Pillar. The module supports these simultaneously. These fields are the exact same supported by the pyeapi Proxy Module:
transport: **https** Specifies the type of connection transport to use. Valid values for the connection are **socket**, **http_local**, **http**, and **https**.

**host:** **localhost** The IP address or DNS host name of the connection device.

**username:** **admin** The username to pass to the device to authenticate the eAPI connection.

**password** The password to pass to the device to authenticate the eAPI connection.

**port** The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for **http**, or 443 for **https**).

**enablepwd** The enable mode password if required by the destination node.

Example (when not running in a **pyeapi** Proxy Minion):

```python
pyeapi:
    username: test
    password: test
```

In case the **username** and **password** are the same on any device you are targeting, the block above (besides other parameters specific to your environment you might need) should suffice to be able to execute commands from outside a **pyeapi** Proxy, e.g.:

```bash
salt '* pyeapi.run_commands show version show interfaces
salt '* pyeapi.config ntp server 1.2.3.4
```

**Note:** Remember that the above applies only when not running in a **pyeapi** Proxy Minion. If you want to use the **pyeapi** Proxy, please follow the documentation notes for a proper setup.

```python
salt.modules.arista_pyeapi.call(method, *args, **kwargs)
```

Invoke an arbitrary pyeapi method.

- **method** The name of the pyeapi method to invoke.
- **args** A list of arguments to send to the method invoked.
- **kwars** Key-value dictionary to send to the method invoked.

**transport:** **https** Specifies the type of connection transport to use. Valid values for the connection are **socket**, **http_local**, **http**, and **https**.

**Note:** This argument does not need to be specified when running in a **pyeapi** Proxy Minion.

**host:** **localhost** The IP address or DNS host name of the connection device.

**username:** **admin** The username to pass to the device to authenticate the eAPI connection.

**password** The password to pass to the device to authenticate the eAPI connection.
Salt Documentation, Release 3001.1

**port** The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

**enablepwd** The enable mode password if required by the destination node.

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

CLI Example:

```bash
salt '*' pyeapi.call run_commands "[\'show version\']"
```

```python
salt.modules.arista_pyeapi.config(commands=None, config_file=None, template_engine='jinja', context=None, defaults=None, saltenv='base', **kwargs)
```

Configures the node with the specified commands.

This method is used to send configuration commands to the node. It will take either a string or a list and prepend the necessary commands to put the session into config mode.

Returns the diff after the configuration commands are loaded.

**config_file** The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice.

This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

**commands** The commands to send to the node in config mode. If the commands argument is a string it will be cast to a list. The list of commands will also be prepended with the necessary commands to put the session in config mode.

**Note:** This argument is ignored when `config_file` is specified.

**template_engine:** `jinja` The template engine to use when rendering the source file. Default: `jinja`. To simply fetch the file without attempting to render, set this argument to `None`.

**context** Variables to add to the template context.

**defaults** Default values of the `context` dict.

**transport:** `https` Specifies the type of connection transport to use. Valid values for the connection are `socket`, `http_local`, `http`, and `https`. 
Note: This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

**host:** `localhost` The IP address or DNS host name of the connection device.

Note: This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

**username:** `admin` The username to pass to the device to authenticate the eAPI connection.

Note: This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

**password** The password to pass to the device to authenticate the eAPI connection.

Note: This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

**port** The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).

Note: This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

**enablepwd** The enable mode password if required by the destination node.

Note: This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

### CLI Example:
```
salt '*' pyeapi.config commands="['ntp server 1.2.3.4', 'ntp server 5.6.7.8']"
salt '*' pyeapi.config config_file=salt://config.txt
salt '*' pyeapi.config config_file=https://bit.ly/2LGLcDy context="{'servers': ["'1.2.3.4'"], \\
                   'proxy_minion': 'localhost', \\
                   'username': 'admin', \\
                   'password': 'password', \\
                   'transport': 'https', \\
                   'failure_timeout': 5, \\
                   'connection_timeout': 3, \\
                   'socket_timeout': 2}"
```

`salt.modules.arista_pyeapi.get_config(config='running-config', 
params=None, 
as_string=False, **kwargs)`

Retrieves the config from the device.

This method will retrieve the config from the node as either a string or a list object. The config to retrieve can be specified as either the startup-config or the running-config.

**config:** `running-config` Specifies to return either the nodes startup-config or running-config. The default value is the running-config.

**params** A string of keywords to append to the command for retrieving the config.

**as_string:** `False` Flag that determines the response. If `True`, then the configuration is returned as a raw string. If `False`, then the configuration is returned as a list. The default value is `False`.

**transport:** `https` Specifies the type of connection transport to use. Valid values for the connection are `socket`, `http_local`, `http`, and `https`.

Note: This argument does not need to be specified when running in a *pyeapi* Proxy Minion.
host: **localhost** The IP address or DNS host name of the connection device.

**Note:** This argument does not need to be specified when running in a pyeapi Proxy Minion.

username: **admin** The username to pass to the device to authenticate the eAPI connection.

**Note:** This argument does not need to be specified when running in a pyeapi Proxy Minion.

password The password to pass to the device to authenticate the eAPI connection.

**Note:** This argument does not need to be specified when running in a pyeapi Proxy Minion.

port  The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).

**Note:** This argument does not need to be specified when running in a pyeapi Proxy Minion.

enablepwd The enable mode password if required by the destination node.

**Note:** This argument does not need to be specified when running in a pyeapi Proxy Minion.

**CLI Example:**
salt '*' pyeapi.get_config
salt '*' pyeapi.get_config params='section snmp-server'
salt '*' pyeapi.get_config config='startup-config'

class arista_pyeapi:
    def get_connection(self, **kwargs):
        return self.conn

    def run_commands(self, commands, **kwargs):
        return self.run_commands(commands, **kwargs)

**Usage Example:**

```python
conn = salt.modules.arista_pyeapi.get_connection(host='router1.example.com',
                                                username='example',
                                                password='example')
show_ver = conn.run_commands(['show version', 'show interfaces'])
```

**Warning:** This function returns an unserializable object, hence it is not meant to be used on the CLI. This should mainly be used when invoked from other modules for the low level connection with the network device.

**kwargs** Key-value dictionary with the authentication details.

**Usage Example:**

```python
conn = salt.modules.arista_pyeapi.get_connection(**kwargs)
show_ver = conn.run_commands(['show version', 'show interfaces'])
```

**Warning:** This function sends the commands to the device using the nodes transport. This is a lower layer function that shouldn't normally need to be used, preferring instead to use config() or enable().
transport: **https** Specifies the type of connection transport to use. Valid values for the connection are socket, **http_local**, **http**, and **https**.

Note: This argument does not need to be specified when running in a **pyeapi** Proxy Minion.

**host**: **localhost** The IP address or DNS host name of the connection device.

Note: This argument does not need to be specified when running in a **pyeapi** Proxy Minion.

**username**: **admin** The username to pass to the device to authenticate the eAPI connection.

Note: This argument does not need to be specified when running in a **pyeapi** Proxy Minion.

**password** The password to pass to the device to authenticate the eAPI connection.

Note: This argument does not need to be specified when running in a **pyeapi** Proxy Minion.

**port** The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for **http**, or 443 for **https**).

Note: This argument does not need to be specified when running in a **pyeapi** Proxy Minion.

**enablepwd** The enable mode password if required by the destination node.

Note: This argument does not need to be specified when running in a **pyeapi** Proxy Minion.

CLI Example:

```bash
salt '*' pyeapi.run_commands 'show version'
salt '*' pyeapi.run_commands 'show version' encoding=text
salt '*' pyeapi.run_commands 'show version' encoding=text host=cr1.thn.lon8
   --username=example password=weak
```

Output example:

```
veos1:
 |
 ---
 architecture: i386
 bootupTimestamp: 1527541728.53
 hardwareRevision: internalBuildId:
   63d2e89a-220d-4b8a-a9b3-0524fa8f9c5f
 internalVersion:
   4.18.1F-4591672.4181F
 isIntlVersion: False
```

(continues on next page)
salt.modules.arista_pyeapi.section

Return a section of the config.

regex  A valid regular expression used to select sections of configuration to return.

config: running-config  The configuration to return. Valid values for config are running-config or startup-config. The default value is running-config.

transport: https  Specifies the type of connection transport to use. Valid values for the connection are socket, http_local, http, and https.

Note:  This argument does not need to be specified when running in a pyeapi Proxy Minion.

host:  localhost  The IP address or DNS host name of the connection device.

Note:  This argument does not need to be specified when running in a pyeapi Proxy Minion.

username:  admin  The username to pass to the device to authenticate the eAPI connection.

Note:  This argument does not need to be specified when running in a pyeapi Proxy Minion.

password  The password to pass to the device to authenticate the eAPI connection.

Note:  This argument does not need to be specified when running in a pyeapi Proxy Minion.

port  The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).

Note:  This argument does not need to be specified when running in a pyeapi Proxy Minion.

enablepwd  The enable mode password if required by the destination node.

Note:  This argument does not need to be specified when running in a pyeapi Proxy Minion.

CLI Example:
21.9.23  salt.modules.artifactory

Module for fetching artifacts from Artifactory

**exception** salt.modules.artifactory.ArtifactoryError(value)

salt.modules.artifactory.get_latest_release(artifactory_url, repository, group_id, artifact_id, packaging, target_dir='/tmp', target_file=None, classifier=None, username=None, password=None, use_literal_group_id=False)

Gets the latest release of the artifact

*artifactory_url*  URL of artifactory instance

*repository*  Release repository in artifactory to retrieve artifact from, for example: libs-releases

*group_id*  Group Id of the artifact

*artifact_id*  Artifact Id of the artifact

*packaging*  Packaging type (jar,war,ear,etc)

*target_dir*  Target directory to download artifact to (default: /tmp)

*target_file*  Target file to download artifact to (by default it is target_dir/artifact_id-version.packaging)

*classifier*  Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.

*username*  Artifactory username. Optional parameter.

*password*  Artifactory password. Optional parameter.

salt.modules.artifactory.get_latest_snapshot(artifactory_url, repository, group_id, artifact_id, packaging, target_dir='/tmp', target_file=None, classifier=None, username=None, password=None, use_literal_group_id=False)

Gets latest snapshot of the given artifact

*artifactory_url*  URL of artifactory instance

*repository*  Snapshot repository in artifactory to retrieve artifact from, for example: libs-snapshots

*group_id*  Group Id of the artifact

*artifact_id*  Artifact Id of the artifact

*packaging*  Packaging type (jar,war,ear,etc)

*target_dir*  Target directory to download artifact to (default: /tmp)

*target_file*  Target file to download artifact to (by default it is target_dir/artifact_id-snapshot_version.packaging)

*classifier*  Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.

*username*  Artifactory username. Optional parameter.

*password*  Artifactory password. Optional parameter.
```
salt.modules.artifactory.get_release(artifactory_url, repository, group_id, artifact_id, packaging, version, target_dir="/tmp", target_file=None, classifier=None, username=None, password=None, use_literal_group_id=False)
```

Gets the specified release of the artifact

- **artifactory_url**: URL of artifactory instance
- **repository**: Release repository in artifactory to retrieve artifact from, for example: libs-releases
- **group_id**: Group Id of the artifact
- **artifact_id**: Artifact Id of the artifact
- **packaging**: Packaging type (jar,war,ear,etc)
- **version**: Version of the artifact
- **target_dir**: Target directory to download artifact to (default: /tmp)
- **target_file**: Target file to download artifact to (by default it is target_dir/artifact_id-version.packaging)
- **classifier**: Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.
- **username**: Artifactory username. Optional parameter.
- **password**: Artifactory password. Optional parameter.

```
salt.modules.artifactory.get_snapshot(artifactory_url, repository, group_id, artifact_id, packaging, version, snapshot_version=None, target_dir="/tmp", target_file=None, classifier=None, username=None, password=None, use_literal_group_id=False)
```

Gets snapshot of the desired version of the artifact

- **artifactory_url**: URL of artifactory instance
- **repository**: Snapshot repository in artifactory to retrieve artifact from, for example: libs-snapshots
- **group_id**: Group Id of the artifact
- **artifact_id**: Artifact Id of the artifact
- **packaging**: Packaging type (jar,war,ear,etc)
- **version**: Version of the artifact
- **target_dir**: Target directory to download artifact to (default: /tmp)
- **target_file**: Target file to download artifact to (by default it is target_dir/artifact_id-snapshot_version.packaging)
- **classifier**: Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.
- **username**: Artifactory username. Optional parameter.
- **password**: Artifactory password. Optional parameter.
21.9.24 salt.modules.at

Wrapper module for at(1)

Also, a ‘tag’ feature has been added to more easily tag jobs.

**platform** linux, openbsd, freebsd

Changed in version 2017.7.0.

```python
salt.modules.at.at(*args, **kwargs)
```

Add a job to the queue.

The ‘timespec’ follows the format documented in the at(1) manpage.

CLI Example:

```
salt '*' at.at <timespec> <cmd> [tag=<tag>] [runas=<user>]
salt '*' at.at 12:05am '/sbin/reboot' tag=reboot
tsalt '*' at.at '3:05am +3 days' 'bin/myscript' tag=nightly runas=jim
```

```python
salt.modules.at.atc(jobid)
```

Print the at(1) script that will run for the passed job id. This is mostly for debugging so the output will just be text.

CLI Example:

```
salt '*' at.atc <jobid>
```

```python
salt.modules.at.atq(tag=None)
```

List all queued and running jobs or only those with an optional ‘tag’.

CLI Example:

```
salt '*' at.atq
salt '*' at.atq [tag]
salt '*' at.atq [job number]
```

```python
salt.modules.at.atrm(*args)
```

Remove jobs from the queue.

CLI Example:

```
salt '*' at.atrm <jobid> <jobid> .. <jobid>
salt '*' at.atrm all
salt '*' at.atrm all [tag]
```

```python
salt.modules.at.jobcheck(**kwargs)
```

Check the job from queue. The kwargs dict include 'hour minute day month year tag runas' Other parameters will be ignored.

CLI Example:

```
salt '*' at.jobcheck runas=jam day=13
salt '*' at.jobcheck day=13 month=12 year=13 tag=rose
```
21.9.25 salt.modules.at_solaris

Wrapper for at(1) on Solaris-like systems

Note: we try to mirror the generic at module where possible

maintainer jorge schrauwen <sjorge@blackdot.be>
maturity new
platform solaris,illumos,smartso

New in version 2017.7.0.

salt.modules.at_solaris.at(*args, **kwargs)
Add a job to the queue.
The 'timespec' follows the format documented in the at(1) manpage.

CLI Example:

salt '*' at.at <timespec> <cmd> [tag=<tag>] [runas=<user>]
salt '*' at.at 12:05am '/sbin/reboot' tag=reboot
salt '*' at.at '3:05am +3 days' 'bin/myscript' tag=nightly runas=jim

salt.modules.at_solaris.atc(jobid)
Print the at(1) script that will run for the passed job id. This is mostly for debugging so the output will just be text.

CLI Example:

salt '*' at.atc <jobid>

salt.modules.at_solaris.atq(tag=None)
List all queued and running jobs or only those with an optional 'tag'.

CLI Example:

salt '*' at.atq
salt '*' at.atq [tag]
salt '*' at.atq [job number]

salt.modules.at_solaris.atrm(*args)
Remove jobs from the queue.

CLI Example:

salt '*' at.atrm <jobid> <jobid> .. <jobid>
salt '*' at.atrm all
salt '*' at.atrm all [tag]

salt.modules.at_solaris.jobcheck(**kwargs)
Check the job from queue. The kwargs dict include 'hour minute day month year tag runas' Other parameters will be ignored.

CLI Example:

salt '*' at.jobcheck runas=jam day=13
salt '*' at.jobcheck day=13 month=12 year=13 tag=rose
21.9.26 salt.modules.augeas_cfg

Manages configuration files via augeas
This module requires the augeas Python module.

Warning: Minimal installations of Debian and Ubuntu have been seen to have packaging bugs with python-augeas, causing the augeas module to fail to import. If the minion has the augeas module installed, but the functions in this execution module fail to run due to being unavailable, first restart the salt-minion service. If the problem persists past that, the following command can be run from the master to determine what is causing the import to fail:

```
salt minion-id cmd.run 'python -c "from augeas import Augeas"'
```

For affected Debian/Ubuntu hosts, installing libpython2.7 has been known to resolve the issue.

salt.modules.augeas_cfg.execute(context=None, lens=None, commands=None, load_path=None)

Execute Augeas commands

New in version 2014.7.0.

CLI Example:

```
salt '*' augeas.execute /files/etc/redis/redis.conf \commands='["set bind 0.0.0.0", "set maxmemory 1G"]'
```

context The Augeas context

lens The Augeas lens to use

commands The Augeas commands to execute

New in version 2016.3.0.

load_path A colon-spearated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LENS_LIB.

salt.modules.augeas_cfg.get(path, value='', load_path=None)

Get a value for a specific augeas path

CLI Example:

```
salt '*' augeas.get /files/etc/hosts/1/ ipaddr
```

path The path to get the value of

value The optional value to get

New in version 2016.3.0.

load_path A colon-spearated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LENS_LIB.

salt.modules.augeas_cfg.ls(path, load_path=None)

List the direct children of a node

CLI Example:
salt '*/' augeas.ls /files/etc/passwd

**salt.modules.augeas_cfg.match**(path, value='', load_path=None)
Get matches for path expression

CLI Example:
salt '*/' augeas.match /files/etc/services/service-name ssh

**path** The path to list

New in version 2016.3.0.

**load_path** A colon-spearated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LENS_LIB.

**salt.modules.augeas_cfg.remove**(path, load_path=None)
Get matches for path expression

CLI Example:
salt '*/' augeas.remove /files/etc/sysctl.conf/net.ipv4.conf.all.log_martians

**path** The path to remove

New in version 2016.3.0.

**load_path** A colon-spearated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LENS_LIB.

**salt.modules.augeas_cfg.setvalue**(args)
Set a value for a specific augeas path

CLI Example:
salt '*/' augeas.setvalue /files/etc/hosts/1/canonical localhost

This will set the first entry in /etc/hosts to localhost

CLI Example:
salt '*/' augeas.setvalue /files/etc/hosts/01/ipaddr 192.168.1.1 /files/etc/hosts/01/canonical test

Adds a new host to /etc/hosts the ip address 192.168.1.1 and hostname test

CLI Example:
Ensures that the following line is present in /etc/sudoers:

```
%wheel ALL = PASSWD : ALL , NOPASSWD : /usr/bin/apt-get , /usr/bin/aptitude
```

```python
salt '*' augeas.setvalue prefix=/files/etc/sudoers/ \
    "spec[user = '%wheel']/user" "%wheel" \ 
    "spec[user = '%wheel']/host_group/host" 'ALL' \ 
    "spec[user = '%wheel']/host_group/command[1]" 'ALL' \ 
    "spec[user = '%wheel']/host_group/command[1]/tag" 'PASSWD' \ 
    "spec[user = '%wheel']/host_group/command[2]" '/usr/bin/apt-get' \ 
    "spec[user = '%wheel']/host_group/command[2]/tag" NOPASSWD
```

salt.modules.augeas_cfg.tree(path, load_path=None)

Returns recursively the complete tree of a node

CLI Example:

```bash
salt '*' augeas.tree /files/etc/
```

**path**  The base of the recursive listing

New in version 2016.3.0.

**load_path**  A colon-spearated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LENS_LIB.

### 21.9.27 salt.modules.aws_sqs

Support for the Amazon Simple Queue Service.

salt.modules.aws_sqs.create_queue(name, region, opts=None, user=None)

Creates a queue with the correct name.

**name**  Name of the SQS queue to create

**region**  Region to create the SQS queue in

**opts**  [None] Any additional options to add to the command line

**user**  [None] Run hg as a user other than what the minion runs as

CLI Example:

```bash
salt '*' aws_sqs.create_queue <sqs queue> <region>
```

salt.modules.aws_sqs.delete_message(queue, region, receipthandle, opts=None, user=None)

Delete one or more messages from a queue in a region

**queue**  The name of the queue to delete messages from

**region**  Region where SQS queues exists

**receipthandle**  The ReceiptHandle of the message to delete. The ReceiptHandle is obtained in the return from receive_message

**opts**  [None] Any additional options to add to the command line

**user**  [None] Run as a user other than what the minion runs as

CLI Example:
New in version 2014.7.0.

salt.modules.aws_sqs.delete_queue(name, region, opts=None, user=None)
Deletes a queue in the region.

name Name of the SQS queue to deletes
region Name of the region to delete the queue from
opts [None] Any additional options to add to the command line
user [None] Run hg as a user other than what the minion runs as

CLI Example:
salt '*' aws_sqs.delete_queue <sqs queue> <region>

salt.modules.aws_sqs.list_queues(region, opts=None, user=None)
List the queues in the selected region.

region Region to list SQS queues for
opts [None] Any additional options to add to the command line
user [None] Run hg as a user other than what the minion runs as

CLI Example:
salt '*' aws_sqs.list_queues <region>

salt.modules.aws_sqs.queue_exists(name, region, opts=None, user=None)
Returns True or False on whether the queue exists in the region

name Name of the SQS queue to search for
region Name of the region to search for the queue in
opts [None] Any additional options to add to the command line
user [None] Run hg as a user other than what the minion runs as

CLI Example:
salt '*' aws_sqs.queue_exists <sqs queue> <region>

salt.modules.aws_sqs.receive_message(queue, region, num=1, opts=None, user=None)
Receive one or more messages from a queue in a region

queue The name of the queue to receive messages from
region Region where SQS queues exists
num [1] The max number of messages to receive
opts [None] Any additional options to add to the command line
user [None] Run as a user other than what the minion runs as

CLI Example:
salt '*' aws_sqs.receive_message <sqs queue> <region>
salt '*' aws_sqs.receive_message <sqs queue> <region> num=10

New in version 2014.7.0.
21.9.28 salt.modules.azurearm_compute

Azure (ARM) Compute Execution Module
New in version 2019.2.0.

maintainer  <devops@decisionlab.io>
maturity  new
depends

• azure  >= 2.0.0
• azure-common  >= 1.1.8
• azure-mgmt  >= 1.0.0
• azure-mgmt-compute  >= 1.0.0
• azure-mgmt-network  >= 1.7.1
• azure-mgmt-resource  >= 1.1.0
• azure-mgmt-storage  >= 1.0.0
• azure-mgmt-web  >= 0.32.0
• azure-storage  >= 0.34.3
• msrestazure  >= 0.4.21

platform  linux

configuration  This module requires Azure Resource Manager credentials to be passed as keyword arguments to every function in order to work properly.

Required provider parameters:
if using username and password:

• subscription_id
• username
• password

if using a service principal:

• subscription_id
• tenant
• client_id
• secret

Optional provider parameters:

cloud_environment:Used to point the cloud driver to different API endpoints, such as Azure GovCloud.

Possible values:

• AZURE_PUBLIC_CLOUD (default)
• AZURE_CHINA_CLOUD
• AZURE_US_GOV_CLOUD
• AZURE_GERMAN_CLOUD
salt.modules.azurearm_compute.availability_set_create_or_update(name, resource_group, **kwargs)

New in version 2019.2.0.
Create or update an availability set.

Parameters
- name -- The availability set to create.
- resource_group -- The resource group name assigned to the availability set.

CLI Example:
salt-call azurearm_compute.availability_set_create_or_update testset testgroup

salt.modules.azurearm_compute.availability_set_delete(name, resource_group, **kwargs)

New in version 2019.2.0.
Delete an availability set.

Parameters
- name -- The availability set to delete.
- resource_group -- The resource group name assigned to the availability set.

CLI Example:
salt-call azurearm_compute.availability_set_delete testset testgroup

salt.modules.azurearm_compute.availability_set_get(name, resource_group, **kwargs)

New in version 2019.2.0.
Get a dictionary representing an availability set's properties.

Parameters
- name -- The availability set to get.
- resource_group -- The resource group name assigned to the availability set.

CLI Example:
salt-call azurearm_compute.availability_set_get testset testgroup

salt.modules.azurearm_compute.availability_sets_list(resource_group, **kwargs)

New in version 2019.2.0.
List all availability sets within a resource group.

Parameters resource_group -- The resource group name to list availability sets within.

CLI Example:
salt-call azurearm_compute.availability_sets_list testgroup

salt.modules.azurearm_compute.availability_sets_list_available_sizes(name, resource_group, **kwargs)

New in version 2019.2.0.
List all available virtual machine sizes that can be used to create a new virtual machine in an existing availability set.

**Parameters**

- **name** -- The availability set name to list available virtual machine sizes within.
- **resource_group** -- The resource group name to list available availability set sizes within.

**CLI Example:**
```
salt-call azurearm_compute.availability_sets_list_available_sizes testset
```

```python
salt.modules.azurearm_compute.virtual_machine_capture(name, destination_name, resource_group, prefix='capture-', overwrite=False, **kwargs)
```

New in version 2019.2.0.

Captures the VM by copying virtual hard disks of the VM and outputs a template that can be used to create similar VMs.

**Parameters**

- **name** -- The name of the virtual machine.
- **destination_name** -- The destination container name.
- **resource_group** -- The resource group name assigned to the virtual machine.
- **prefix** -- (Default: 'capture-') The captured virtual hard disk's name prefix.
- **overwrite** -- (Default: False) Overwrite the destination disk in case of conflict.

**CLI Example:**
```
salt-call azurearm_compute.virtual_machine_capture testvm testcontainer testgroup
```

```python
salt.modules.azurearm_compute.virtual_machine_convert_to_managed_disks(name, resource_group, **kwargs)
```

New in version 2019.2.0.

Converts virtual machine disks from blob-based to managed disks. Virtual machine must be stop-deallocated before invoking this operation.

**Parameters**

- **name** -- The name of the virtual machine to convert.
- **resource_group** -- The resource group name assigned to the virtual machine.

**CLI Example:**
```
salt-call azurearm_compute.virtual_machine_convert_to_managed_disks testvm
```

```python
salt.modules.azurearm_compute.virtual_machine_deallocate(name, resource_group, **kwargs)
```

New in version 2019.2.0.

Power off a virtual machine and deallocate compute resources.
Parameters

- **name** -- The name of the virtual machine to deallocate.
- **resource_group** -- The resource group name assigned to the virtual machine.

CLI Example:
```
salt-call azurearm_compute.virtual_machine_deallocate testvm testgroup
```

salt.modules.azurearm_compute.virtual_machine_generalize(name, resource_group, **kwargs)

New in version 2019.2.0.
Set the state of a virtual machine to 'generalized'.

Parameters

- **name** -- The name of the virtual machine.
- **resource_group** -- The resource group name assigned to the virtual machine.

CLI Example:
```
salt-call azurearm_compute.virtual_machine_generalize testvm testgroup
```

salt.modules.azurearm_compute.virtual_machine_get(name, resource_group, **kwargs)

New in version 2019.2.0.
Retrieves information about the model view or the instance view of a virtual machine.

Parameters

- **name** -- The name of the virtual machine.
- **resource_group** -- The resource group name assigned to the virtual machine.

CLI Example:
```
salt-call azurearm_compute.virtual_machine_get testvm testgroup
```

salt.modules.azurearm_compute.virtual_machine_power_off(name, resource_group, **kwargs)

New in version 2019.2.0.
Power off (stop) a virtual machine.

Parameters

- **name** -- The name of the virtual machine to stop.
- **resource_group** -- The resource group name assigned to the virtual machine.

CLI Example:
```
salt-call azurearm_compute.virtual_machine_power_off testvm testgroup
```

salt.modules.azurearm_compute.virtual_machine_redeploy(name, resource_group, **kwargs)

New in version 2019.2.0.
Redeploy a virtual machine.

Parameters

- **name** -- The name of the virtual machine to redeploy.
• **resource_group** -- The resource group name assigned to the virtual machine.

CLI Example:

```bash
salt-call azurearm_compute.virtual_machine_redeploy testvm testgroup
```

```python
salt.modules.azurearm_compute.virtual_machine_restart(name, resource_group, **kwargs)
```

New in version 2019.2.0.

Restart a virtual machine.

**Parameters**

- **name** -- The name of the virtual machine to restart.
- **resource_group** -- The resource group name assigned to the virtual machine.

CLI Example:

```bash
salt-call azurearm_compute.virtual_machine_restart testvm testgroup
```

```python
salt.modules.azurearm_compute.virtual_machine_start(name, resource_group, **kwargs)
```

New in version 2019.2.0.

Power on (start) a virtual machine.

**Parameters**

- **name** -- The name of the virtual machine to start.
- **resource_group** -- The resource group name assigned to the virtual machine.

CLI Example:

```bash
salt-call azurearm_compute.virtual_machine_start testvm testgroup
```

```python
salt.modules.azurearm_compute.virtual_machines_list(resource_group, **kwargs)
```

New in version 2019.2.0.

List all virtual machines within a resource group.

**Parameters**

- **resource_group** -- The resource group name to list virtual machines within.

CLI Example:

```bash
salt-call azurearm_compute.virtual_machines_list testgroup
```

```python
salt.modules.azurearm_compute.virtual_machines_list_all(**kwargs)
```

New in version 2019.2.0.

List all virtual machines within a subscription.

CLI Example:

```bash
salt-call azurearm_compute.virtual_machines_list_all
```

```python
salt.modules.azurearm_compute.virtual_machines_list_available_sizes(name, resource_group, **kwargs)
```

New in version 2019.2.0.

Lists all available virtual machine sizes to which the specified virtual machine can be resized.
Parameters

- **name** -- The name of the virtual machine.
- **resource_group** -- The resource group name assigned to the virtual machine.

CLI Example:
```
salt-call azurearm_compute.virtual_machines_list_available_sizes testvm testgroup
```

### 21.9.29 salt.modules.azurearm_dns module

Azure (ARM) DNS Execution Module

New in version 3000.

- **maintainer** `<devops@eitr.tech>`
- **maturity** new

- **depends**
  - `azure >= 2.0.0`
  - `azure-common >= 1.1.8`
  - `azure-mgmt >= 1.0.0`
  - `azure-mgmt-compute >= 1.0.0`
  - `azure-mgmt-dns >= 2.0.0rc1`
  - `azure-mgmt-network >= 1.7.1`
  - `azure-mgmt-resource >= 1.1.0`
  - `azure-mgmt-storage >= 1.0.0`
  - `azure-mgmt-web >= 0.32.0`
  - `azure-storage >= 0.34.3`
  - `msrestazure >= 0.4.21`

- **platform** linux

- **configuration** This module requires Azure Resource Manager credentials to be passed as keyword arguments to every function in order to work properly.

Required provider parameters:

- if using username and password:
  - `subscription_id`
  - `username`
  - `password`

- if using a service principal:
  - `subscription_id`
  - `tenant`
  - `client_id`
  - `secret`
Optional provider parameters:

**cloud_environment**: Used to point the cloud driver to different API endpoints, such as Azure GovCloud.

Possible values:
- `AZURE_PUBLIC_CLOUD` (default)
- `AZURE_CHINA_CLOUD`
- `AZURE_US_GOV_CLOUD`
- `AZURE_GERMAN_CLOUD`

```python
salt.modules.azurearm_dns.record_set_create_or_update(name, zone_name, resource_group, record_type, **kwargs)
```

New in version 3000.

Creates or updates a record set within a DNS zone.

**Parameters**

- `name` -- The name of the record set, relative to the name of the zone.
- `zone_name` -- The name of the DNS zone (without a terminating dot).
- `resource_group` -- The name of the resource group.
- `record_type` -- The type of DNS record in this record set. Record sets of type SOA can be updated but not created (they are created when the DNS zone is created). Possible values include: 'A', 'AAAA', 'CAA', 'CNAME', 'MX', 'NS', 'PTR', 'SOA', 'SRV', 'TXT'  

CLI Example:

```
salt-call azurearm_dns.record_set_create_or_update myhost myzone testgroup A arecords='[{ipv4_address: 10.0.0.1}]' ttl=300
```

```python
salt.modules.azurearm_dns.record_set_delete(name, zone_name, resource_group, record_type, **kwargs)
```

New in version 3000.

Deletes a record set from a DNS zone. This operation cannot be undone.

**Parameters**

- `name` -- The name of the record set, relative to the name of the zone.
- `zone_name` -- The name of the DNS zone (without a terminating dot).
- `resource_group` -- The name of the resource group.
- `record_type` -- The type of DNS record in this record set. Record sets of type SOA cannot be deleted (they are deleted when the DNS zone is deleted). Possible values include: 'A', 'AAAA', 'CAA', 'CNAME', 'MX', 'NS', 'PTR', 'SOA', 'SRV', 'TXT'

CLI Example:

```
salt-call azurearm_dns.record_set_delete myhost myzone testgroup A
```

```python
salt.modules.azurearm_dns.record_set_get(name, zone_name, resource_group, record_type, **kwargs)
```

New in version 3000.

Get a dictionary representing a record set's properties.

**Parameters**
- **name** -- The name of the record set, relative to the name of the zone.
- **zone_name** -- The name of the DNS zone (without a terminating dot).
- **resource_group** -- The name of the resource group.
- **record_type** -- The type of DNS record in this record set. Possible values include: 'A', 'AAAA', 'CAA', 'CNAME', 'MX', 'NS', 'PTR', 'SOA', 'SRV', 'TXT'

**CLI Example:**
```
salt-call azurearm_dns.record_set_get '@' myzone testgroup SOA
```

- **salt.modules.azurearm_dns.record_sets_list_by_dns_zone**
  
  New in version 3000.

  Lists all record sets in a DNS zone.

  **Parameters**
  
  - **zone_name** -- The name of the DNS zone (without a terminating dot).
  - **resource_group** -- The name of the resource group.
  - **top** -- The maximum number of record sets to return. If not specified, returns up to 100 record sets.
  - **recordsetnamesuffix** -- The suffix label of the record set name that has to be used to filter the record set enumerations.

  **CLI Example:**
  ``
salt-call azurearm_dns.record_sets_list_by_dns_zone myzone testgroup
  ``

- **salt.modules.azurearm_dns.record_sets_list_by_type**
  
  New in version 3000.

  Lists the record sets of a specified type in a DNS zone.

  **Parameters**
  
  - **zone_name** -- The name of the DNS zone (without a terminating dot).
  - **resource_group** -- The name of the resource group.
  - **record_type** -- The type of record sets to enumerate. Possible values include: 'A', 'AAAA', 'CAA', 'CNAME', 'MX', 'NS', 'PTR', 'SOA', 'SRV', 'TXT'
  - **top** -- The maximum number of record sets to return. If not specified, returns up to 100 record sets.
  - **recordsetnamesuffix** -- The suffix label of the record set name that has to be used to filter the record set enumerations.

  **CLI Example:**
  ``
salt-call azurearm_dns.record_sets_list_by_type myzone testgroup SOA
  ``

- **salt.modules.azurearm_dns.zone_create_or_update**
  
  New in version 3000.
Creates or updates a DNS zone. Does not modify DNS records within the zone.

Parameters

- **name** -- The name of the DNS zone to create (without a terminating dot).
- **resource_group** -- The name of the resource group.

CLI Example:

```bash
salt-call azurearm_dns.zone_create_or_update myzone testgroup
```

salt.modules.azurearm_dns.zone_delete(name, resource_group, **kwargs)

New in version 3000.

Delete a DNS zone within a resource group.

Parameters

- **name** -- The name of the DNS zone to delete.
- **resource_group** -- The name of the resource group.

CLI Example:

```bash
salt-call azurearm_dns.zone_delete myzone testgroup
```

salt.modules.azurearm_dns.zone_get(name, resource_group, **kwargs)

New in version 3000.

Get a dictionary representing a DNS zone's properties, but not the record sets within the zone.

Parameters

- **name** -- The DNS zone to get.
- **resource_group** -- The name of the resource group.

CLI Example:

```bash
salt-call azurearm_dns.zone_get myzone testgroup
```

salt.modules.azurearm_dns.zones_list(top=None, **kwargs)

New in version 3000.

Lists the DNS zones in all resource groups in a subscription.

Parameters **top** -- The maximum number of DNS zones to return. If not specified, returns up to 100 zones.

CLI Example:

```bash
salt-call azurearm_dns.zones_list
```

salt.modules.azurearm_dns.zones_list_by_resource_group(resource_group, top=None, **kwargs)

New in version 3000.

Lists the DNS zones in a resource group.

Parameters

- **resource_group** -- The name of the resource group.
- **top** -- The maximum number of DNS zones to return. If not specified, returns up to 100 zones.
21.9.30  salt.modules.azurearm_network

Azure (ARM) Network Execution Module

New in version 2019.2.0.

maintainer  <devops@decisionlab.io>
maturity  new
depends
  - azure >= 2.0.0
  - azure-common >= 1.1.8
  - azure-mgmt >= 1.0.0
  - azure-mgmt-compute >= 1.0.0
  - azure-mgmt-network >= 1.7.1
  - azure-mgmt-resource >= 1.1.0
  - azure-mgmt-storage >= 1.0.0
  - azure-mgmt-web >= 0.32.0
  - azure-storage >= 0.34.3
  - msrestazure >= 0.4.21

platform  linux

configuration  This module requires Azure Resource Manager credentials to be passed as keyword arguments to every function in order to work properly.

Required provider parameters:

if using username and password:
  - subscription_id
  - username
  - password

if using a service principal:
  - subscription_id
  - tenant
  - client_id
  - secret

Optional provider parameters:

cloud_environment: Used to point the cloud driver to different API endpoints, such as Azure GovCloud.

Possible values:
  - AZURE_PUBLIC_CLOUD (default)
• AZURE_CHINA_CLOUD
• AZURE_US_GOV_CLOUD
• AZURE_GERMAN_CLOUD

salt.modules.azurearm_network.check_dns_name_availability(name, region, **kwargs)

New in version 2019.2.0.

Check whether a domain name in the current zone is available for use.

Parameters

- name -- The DNS name to query.
- region -- The region to query for the DNS name in question.

CLI Example:
```
salt-call azurearm_network.check_dns_name_availability testdnsname westus
```

salt.modules.azurearm_network.check_ip_address_availability(ip_address, virtual_network, resource_group, **kwargs)

New in version 2019.2.0.

Check that a private ip address is available within the specified virtual network.

Parameters

- ip_address -- The ip_address to query.
- virtual_network -- The virtual network to query for the IP address in question.
- resource_group -- The resource group name assigned to the virtual network.

CLI Example:
```
salt-call azurearm_network.check_ip_address_availability 10.0.0.4 testnet testgroup
```

salt.modules.azurearm_network.default_security_rule_get(name, security_group, resource_group, **kwargs)

New in version 2019.2.0.

Get details about a default security rule within a security group.

Parameters

- name -- The name of the security rule to query.
- security_group -- The network security group containing the security rule.
- resource_group -- The resource group name assigned to the network security group.

CLI Example:
```
salt-call azurearm_network.default_security_rule_get DenyAllOutBound testnsg testgroup
```

salt.modules.azurearm_network.default_security_rules_list(security_group, resource_group, **kwargs)

New in version 2019.2.0.
List default security rules within a security group.

Parameters

- **security_group** -- The network security group to query.
- **resource_group** -- The resource group name assigned to the network security group.

CLI Example:

```
salt-call azurearm_network.default_security_rules_list testnsg testgroup
```

salt.modules.azurearm_network.get_virtual_machine_scale_set_network_interface(name, scale_set, vm_index, resource_group, **kwargs)

New in version 2019.2.0.

Get information about a specific network interface within a scale set.

Parameters

- **name** -- The name of the network interface to query.
- **scale_set** -- The name of the scale set containing the interface.
- **vm_index** -- The virtual machine index.
- **resource_group** -- The resource group name assigned to the scale set.

CLI Example:

```
salt-call azurearm_network.get_virtual_machine_scale_set_network_interface testiface0 testset testvm testgroup
```

salt.modules.azurearm_network.list_virtual_machine_scale_set_network_interfaces(scale_set, resource_group, **kwargs)

New in version 2019.2.0.

Get information about all network interfaces within a scale set.

Parameters

- **scale_set** -- The name of the scale set to query.
- **resource_group** -- The resource group name assigned to the scale set.

CLI Example:

```
salt-call azurearm_network.list_virtual_machine_scale_set_vm_network_interfaces testset testgroup
```

salt.modules.azurearm_network.list_virtual_machine_scale_set_vm_network_interfaces(scale_set, vm_index, resource_group, **kwargs)

New in version 2019.2.0.

Get information about all network interfaces in a specific virtual machine within a scale set.
Parameters

- **scale_set** -- The name of the scale set to query.
- **vm_index** -- The virtual machine index.
- **resource_group** -- The resource group name assigned to the scale set.

CLI Example:

```bash
salt-call azurearm_network.list_virtual_machine_scale_set_vm_network_interfaces --testset testvm testgroup
```

**salt.modules.azurearm_network.load_balancer_create_or_update**

Create or update a load balancer within a specified resource group.

Parameters

- **name** -- The name of the load balancer to create.
- **resource_group** -- The resource group name assigned to the load balancer.

CLI Example:

```bash
salt-call azurearm_network.load_balancer_create_or_update testlb testgroup
```

**salt.modules.azurearm_network.load_balancer_delete**

Delete a load balancer.

Parameters

- **name** -- The name of the load balancer to delete.
- **resource_group** -- The resource group name assigned to the load balancer.

CLI Example:

```bash
salt-call azurearm_network.load_balancer_delete testlb testgroup
```

**salt.modules.azurearm_network.load_balancer_get**

Get details about a specific load balancer.

Parameters

- **name** -- The name of the load balancer to query.
- **resource_group** -- The resource group name assigned to the load balancer.

CLI Example:

```bash
salt-call azurearm_network.load_balancer_get testlb testgroup
```

**salt.modules.azurearm_network.load_balancers_list**

List all load balancers within a resource group.

Parameters **resource_group** -- The resource group name to list load balancers within.
CLI Example:

```bash
salt-call azurearm_network.load_balancers_list testgroup
```

salt.modules.azurearm_network.load_balancers_list_all(**kwargs)

New in version 2019.2.0.

List all load balancers within a subscription.

CLI Example:

```bash
salt-call azurearm_network.load_balancers_list_all
```

salt.modules.azurearm_network.network_interface_create_or_update(name, ip_configurations, subnet, virtual_network, resource_group, **kwargs)

New in version 2019.2.0.

Create or update a network interface within a specified resource group.

Parameters

- **name** -- The name of the network interface to create.
- **ip_configurations** -- A list of dictionaries representing valid NetworkInterfaceIP-Configuration objects. The 'name' key is required at minimum. At least one IP Configuration must be present.
- **subnet** -- The name of the subnet assigned to the network interface.
- **virtual_network** -- The name of the virtual network assigned to the subnet.
- **resource_group** -- The resource group name assigned to the virtual network.

CLI Example:

```bash
salt-call azurearm_network.network_interface_create_or_update test-iface0 [{'name': 'testipconfig1'}] testsubnet testnet testgroup
```

salt.modules.azurearm_network.network_interface_delete(name, resource_group, **kwargs)

New in version 2019.2.0.

Delete a network interface.

Parameters

- **name** -- The name of the network interface to delete.
- **resource_group** -- The resource group name assigned to the network interface.

CLI Example:

```bash
salt-call azurearm_network.network_interface_delete test-iface0 testgroup
```

salt.modules.azurearm_network.network_interface_get(name, resource_group, **kwargs)

New in version 2019.2.0.

Get details about a specific network interface.
Parameters

- **name** -- The name of the network interface to query.
- **resource_group** -- The resource group name assigned to the network interface.

CLI Example:

```bash
salt-call azurearm_network.network_interface_get test-iface0 testgroup
```

salt.modules.azurearm_network.network_interface_get_effective_route_table(name, resource_group, **kwargs)

New in version 2019.2.0.

Get all route tables for a specific network interface.

Parameters

- **name** -- The name of the network interface to query.
- **resource_group** -- The resource group name assigned to the network interface.

CLI Example:

```bash
salt-call azurearm_network.network_interface_get_effective_route_table test-iface0 testgroup
```

salt.modules.azurearm_network.network_interface_list_effective_network_security_groups(name, resource_group, **kwargs)

New in version 2019.2.0.

Get all network security groups applied to a specific network interface.

Parameters

- **name** -- The name of the network interface to query.
- **resource_group** -- The resource group name assigned to the network interface.

CLI Example:

```bash
salt-call azurearm_network.network_interface_list_effective_network_security_groups test-iface0 testgroup
```

salt.modules.azurearm_network.network_interfaces_list(resource_group, **kwargs)

New in version 2019.2.0.

List all network interfaces within a resource group.

Parameters

- **resource_group** -- The resource group name to list network interfaces within.

CLI Example:

```bash
salt-call azurearm_network.network_interfaces_list testgroup
```

salt.modules.azurearm_network.network_interfaces_list_all(**kwargs)

New in version 2019.2.0.

List all network interfaces within a subscription.

CLI Example:
salt-call azurearm_network.network_interfaces_list_all

salt.modules.azurearm_network.network_security_group_create_or_update(name, resource_group, **kwargs)

New in version 2019.2.0.
Create or update a network security group.

Parameters

- name -- The name of the network security group to create.
- resource_group -- The resource group name assigned to the network security group.

CLI Example:
salt-call azurearm_network.network_security_group_create_or_update testnsg testgroup

salt.modules.azurearm_network.network_security_group_delete(name, resource_group, **kwargs)

New in version 2019.2.0.
Delete a network security group within a resource group.

Parameters

- name -- The name of the network security group to delete.
- resource_group -- The resource group name assigned to the network security group.

CLI Example:
salt-call azurearm_network.network_security_group_delete testnsg testgroup

salt.modules.azurearm_network.network_security_group_get(name, resource_group, **kwargs)

New in version 2019.2.0.
Get details about a network security group within a resource group.

Parameters

- name -- The name of the network security group to query.
- resource_group -- The resource group name assigned to the network security group.

CLI Example:
salt-call azurearm_network.network_security_group_get testnsg testgroup

salt.modules.azurearm_network.network_security_groups_list(resource_group, **kwargs)

New in version 2019.2.0.
List all network security groups within a resource group.

Parameters resource_group -- The resource group name to list network security groups within.

CLI Example:
salt-call azurearm_network.network_security_groups_list testgroup

salt.modules.azurearm_network.network_security_groups_list_all(**kwargs)
New in version 2019.2.0.
List all network security groups within a subscription.
CLI Example:
salt-call azurearm_network.network_security_groups_list_all

salt.modules.azurearm_network.public_ip_address_create_or_update(name, resource_group, **kwargs)
New in version 2019.2.0.
Create or update a public IP address within a specified resource group.
Parameters
• name -- The name of the public IP address to create.
• resource_group -- The resource group name assigned to the public IP address.
CLI Example:
salt-call azurearm_network.public_ip_address_create_or_update test-ip-0 testgroup

salt.modules.azurearm_network.public_ip_address_delete(name, resource_group, **kwargs)
New in version 2019.2.0.
Delete a public IP address.
Parameters
• name -- The name of the public IP address to delete.
• resource_group -- The resource group name assigned to the public IP address.
CLI Example:
salt-call azurearm_network.public_ip_address_delete test-pub-ip testgroup

salt.modules.azurearm_network.public_ip_address_get(name, resource_group, **kwargs)
New in version 2019.2.0.
Get details about a specific public IP address.
Parameters
• name -- The name of the public IP address to query.
• resource_group -- The resource group name assigned to the public IP address.
CLI Example:
salt-call azurearm_network.public_ip_address_get test-pub-ip testgroup

salt.modules.azurearm_network.public_ip_addresses_list(resource_group, **kwargs)
New in version 2019.2.0.
List all public IP addresses within a resource group.
Parameters `resource_group` -- The resource group name to list public IP addresses within.

CLI Example:

```
salt-call azurearm_network.public_ip_addresses_list testgroup
```

salt.modules.azurearm_network.public_ip_addresses_list_all(**kwargs)
New in version 2019.2.0.
List all public IP addresses within a subscription.

CLI Example:

```
salt-call azurearm_network.public_ip_addresses_list_all
```

salt.modules.azurearm_network.route_create_or_update(name, address_prefix, next_hop_type, route_table, resource_group, next_hop_ip_address=None, **kwargs)
New in version 2019.2.0.
Create or update a route within a specified route table.

Parameters

- `name` -- The name of the route to create.
- `address_prefix` -- The destination CIDR to which the route applies.
- `next_hop_type` -- The type of Azure hop the packet should be sent to. Possible values are: 'VirtualNetworkGateway', 'VnetLocal', 'Internet', 'VirtualAppliance', and 'None'.
- `next_hop_ip_address` -- Optional IP address to which packets should be forwarded. Next hop values are only allowed in routes where the next_hop_type is 'VirtualAppliance'.
- `route_table` -- The name of the route table containing the route.
- `resource_group` -- The resource group name assigned to the route table.

CLI Example:

```
salt-call azurearm_network.route_create_or_update test-rt '10.0.0.0/8' test-rt-table testgroup
```

salt.modules.azurearm_network.route_delete(name, route_table, resource_group, **kwargs)
New in version 2019.2.0.
Delete a route from a route table.

Parameters

- `name` -- The route to delete.
- `route_table` -- The route table containing the route.
- `resource_group` -- The resource group name assigned to the route table.

CLI Example:

```
salt-call azurearm_network.route_delete test-rt test-rt-table testgroup
```
salt.modules.azurearm_network.route_filter_create_or_update(name, resource_group, **kwargs)

New in version 2019.2.0.

Create or update a route filter within a specified resource group.

Parameters

- **name** -- The name of the route filter to create.
- **resource_group** -- The resource group name assigned to the route filter.

CLI Example:

```
salt-call azurearm_network.route_filter_create_or_update test-filter testgroup
```

salt.modules.azurearm_network.route_filter_delete(name, resource_group, **kwargs)

New in version 2019.2.0.

Delete a route filter.

Parameters

- **name** -- The name of the route filter to delete.
- **resource_group** -- The resource group name assigned to the route filter.

CLI Example:

```
salt-call azurearm_network.route_filter_delete test-filter testgroup
```

salt.modules.azurearm_network.route_filter_get(name, resource_group, **kwargs)

New in version 2019.2.0.

Get details about a specific route filter.

Parameters

- **name** -- The name of the route table to query.
- **resource_group** -- The resource group name assigned to the route filter.

CLI Example:

```
salt-call azurearm_network.route_filter_get test-filter testgroup
```

salt.modules.azurearm_network.route_filter_rule_create_or_update(name, access, communities, route_filter, resource_group, **kwargs)

New in version 2019.2.0.

Create or update a rule within a specified route filter.

Parameters

- **name** -- The name of the rule to create.
- **access** -- The access type of the rule. Valid values are 'Allow' and 'Deny'.
- **communities** -- A list of BGP communities to filter on.
- **route_filter** -- The name of the route filter containing the rule.
• **resource_group** -- The resource group name assigned to the route filter.

CLI Example:

```
salt-call azurearm_network.route_filter_rule_create_or_update
  --test-rule allow "["12076:51006"]" test-filter testgroup
```

```
salt.modules.azurearm_network.route_filter_rule_delete(name, route_filter, resource_group, **kwargs)
```

New in version 2019.2.0.

Delete a route filter rule.

Parameters

- **name** -- The route filter rule to delete.
- **route_filter** -- The route filter containing the rule.
- **resource_group** -- The resource group name assigned to the route filter.

CLI Example:

```
salt-call azurearm_network.route_filter_rule_delete test-rule test-filter testgroup
```

```
salt.modules.azurearm_network.route_filter_rule_get(name, route_filter, resource_group, **kwargs)
```

New in version 2019.2.0.

Get details about a specific route filter rule.

Parameters

- **name** -- The route filter rule to query.
- **route_filter** -- The route filter containing the rule.
- **resource_group** -- The resource group name assigned to the route filter.

CLI Example:

```
salt-call azurearm_network.route_filter_rule_get test-rule test-filter testgroup test-filter
```

```
salt.modules.azurearm_network.route_filter_rules_list(route_filter, resource_group, **kwargs)
```

New in version 2019.2.0.

List all routes within a route filter.

Parameters

- **route_filter** -- The route filter to query.
- **resource_group** -- The resource group name assigned to the route filter.

CLI Example:

```
salt-call azurearm_network.route_filter_rules_list test-filter test-filter testgroup
```

```
salt.modules.azurearm_network.route_filters_list(resource_group, **kwargs)
```

New in version 2019.2.0.

List all route filters within a resource group.

Parameters **resource_group** -- The resource group name to list route filters within.
CLI Example:

```
salt-call azurearm_network.route_filters_list testgroup
```

```
salt.modules.azurearm_network.route_filters_list_all(**kwargs)
```

New in version 2019.2.0.

List all route filters within a subscription.

CLI Example:

```
salt-call azurearm_network.route_filters_list_all
```

```
salt.modules.azurearm_network.route_get(name, route_table, resource_group, **kwargs)
```

New in version 2019.2.0.

Get details about a specific route.

Parameters

- **name** -- The route to query.
- **route_table** -- The route table containing the route.
- **resource_group** -- The resource group name assigned to the route table.

CLI Example:

```
salt-call azurearm_network.route_get test-rt test-rt-table testgroup
```

```
salt.modules.azurearm_network.route_table_create_or_update(name, resource_group, **kwargs)
```

New in version 2019.2.0.

Create or update a route table within a specified resource group.

Parameters

- **name** -- The name of the route table to create.
- **resource_group** -- The resource group name assigned to the route table.

CLI Example:

```
salt-call azurearm_network.route_table_create_or_update test-rt-table testgroup
```

```
salt.modules.azurearm_network.route_table_delete(name, resource_group, **kwargs)
```

New in version 2019.2.0.

Delete a route table.

Parameters

- **name** -- The name of the route table to delete.
- **resource_group** -- The resource group name assigned to the route table.

CLI Example:

```
salt-call azurearm_network.route_table_delete test-rt-table testgroup
```

```
salt.modules.azurearm_network.route_table_get(name, resource_group, **kwargs)
```

New in version 2019.2.0.

Get details about a specific route table.
Parameters

- **name** -- The name of the route table to query.
- **resource_group** -- The resource group name assigned to the route table.

CLI Example:

```
salt-call azurearm_network.route_table_get test-rt-table testgroup
```

salt.modules.azurearm_network.route_tables_list

New in version 2019.2.0.

List all route tables within a resource group.

Parameters **resource_group** -- The resource group name to list route tables within.

CLI Example:

```
salt-call azurearm_network.route_tables_list testgroup
```

salt.modules.azurearm_network.route_tables_list_all

New in version 2019.2.0.

List all route tables within a subscription.

CLI Example:

```
salt-call azurearm_network.route_tables_list_all
```

salt.modules.azurearm_network.routes_list

New in version 2019.2.0.

List all routes within a route table.

Parameters

- **route_table** -- The route table to query.
- **resource_group** -- The resource group name assigned to the route table.

CLI Example:

```
salt-call azurearm_network.routes_list test-rt-table testgroup
```
New in version 2019.2.0.

Create or update a security rule within a specified network security group.

Parameters

- **name** -- The name of the security rule to create.
- **access** -- 'allow' or 'deny'
- **direction** -- 'inbound' or 'outbound'
- **priority** -- Integer between 100 and 4096 used for ordering rule application.
- **protocol** -- 'tcp', 'udp', or '*' (asterix)
- **destination_address_prefix** -- The CIDR or destination IP range. Asterix '*' can also be used to match all destination IPs. Default tags such as 'VirtualNetwork', 'AzureLoadBalancer' and 'Internet' can also be used. If this is an ingress rule, specifies where network traffic originates from.
- **destination_port_range** -- The destination port or range. Integer or range between 0 and 65535. Asterix '*' can also be used to match all ports.
- **source_address_prefix** -- The CIDR or source IP range. Asterix '*' can also be used to match all source IPs. Default tags such as 'VirtualNetwork', 'AzureLoadBalancer' and 'Internet' can also be used. If this is an ingress rule, specifies where network traffic originates from.
- **source_port_range** -- The source port or range. Integer or range between 0 and 65535. Asterix '*' can also be used to match all ports.
- **destination_address_prefixes** -- A list of destination_address_prefix values. This parameter overrides destination_address_prefix and will cause any value entered there to be ignored.
- **destination_port_ranges** -- A list of destination_port_range values. This parameter overrides destination_port_range and will cause any value entered there to be ignored.
- **source_address_prefixes** -- A list of source_address_prefix values. This parameter overrides source_address_prefix and will cause any value entered there to be ignored.
- **source_port_ranges** -- A list of source_port_range values. This parameter overrides source_port_range and will cause any value entered there to be ignored.

```python
salt.modules.azurearm_network.security_rule_create_or_update(name, access, direction, priority, protocol, security_group, resource_group, source_address_prefix=None, destination_address_prefix=None, source_port_range=None, destination_port_range=None, source_address_prefixes=None, destination_address_prefixes=None, source_port_ranges=None, destination_port_ranges=None, **kwargs)
```
• **security_group** -- The network security group containing the security rule.
• **resource_group** -- The resource group name assigned to the network security group.

CLI Example:

```bash
salt-call azurearm_network.security_rule_create_or_update testrule1 allow
→ outbound 101 tcp testnsg testgroup
→ source_address_prefix='*
→ destination_address_prefix=internet source_port_range='*
→ destination_port_range='1-1024'
```

```python
salt.modules.azurearm_network.security_rule_delete(security_rule, security_group, resource_group, **kwargs)
```

New in version 2019.2.0.

Delete a security rule within a specified security group.

Parameters

• **name** -- The name of the security rule to delete.
• **security_group** -- The network security group containing the security rule.
• **resource_group** -- The resource group name assigned to the network security group.

CLI Example:

```bash
salt-call azurearm_network.security_rule_delete testrule1 testnsg testgroup
```

```python
salt.modules.azurearm_network.security_rule_get(security_rule, security_group, resource_group, **kwargs)
```

New in version 2019.2.0.

Get a security rule within a specified network security group.

Parameters

• **name** -- The name of the security rule to query.
• **security_group** -- The network security group containing the security rule.
• **resource_group** -- The resource group name assigned to the network security group.

CLI Example:

```bash
salt-call azurearm_network.security_rule_get testrule1 testnsg testgroup
```

```python
salt.modules.azurearm_network.security_rules_list(security_group, resource_group, **kwargs)
```

New in version 2019.2.0.

List security rules within a network security group.

Parameters

• **security_group** -- The network security group to query.
• **resource_group** -- The resource group name assigned to the network security group.

CLI Example:

```bash
salt-call azurearm_network.security_rules_list testnsg testgroup
```
salt.modules.azurearm_network.subnet_create_or_update(name, address_prefix, virtual_network, resource_group, **kwargs)

New in version 2019.2.0.
Create or update a subnet.

**Parameters**
- **name** -- The name assigned to the subnet being created or updated.
- **address_prefix** -- A valid CIDR block within the virtual network.
- **virtual_network** -- The virtual network name containing the subnet.
- **resource_group** -- The resource group name assigned to the virtual network.

CLI Example:
```
salt-call azurearm_network.subnet_create_or_update testsubnet, '10.0.0.0/24' testnet testgroup
```

salt.modules.azurearm_network.subnet_delete(name, virtual_network, resource_group, **kwargs)

New in version 2019.2.0.
Delete a subnet.

**Parameters**
- **name** -- The name of the subnet to delete.
- **virtual_network** -- The virtual network name containing the subnet.
- **resource_group** -- The resource group name assigned to the virtual network.

CLI Example:
```
salt-call azurearm_network.subnet_delete testsubnet testnet testgroup
```

salt.modules.azurearm_network.subnet_get(name, virtual_network, resource_group, **kwargs)

New in version 2019.2.0.
Get details about a specific subnet.

**Parameters**
- **name** -- The name of the subnet to query.
- **virtual_network** -- The virtual network name containing the subnet.
- **resource_group** -- The resource group name assigned to the virtual network.

CLI Example:
```
salt-call azurearm_network.subnet_get testsubnet testnet testgroup
```

salt.modules.azurearm_network.subnets_list(virtual_network, resource_group, **kwargs)

New in version 2019.2.0.
List all subnets within a virtual network.

**Parameters**
- **virtual_network** -- The virtual network name to list subnets within.
• **resource_group** -- The resource group name assigned to the virtual network.

  CLI Example:

  ```
salt-call azurearm_network.subnets_list testnet testgroup
  ```

  `salt.modules.azurearm_network.usages_list(location, **kwargs)`

  New in version 2019.2.0.

  List subscription network usage for a location.

  Parameters **location** -- The Azure location to query for network usage.

  CLI Example:

  ```
salt-call azurearm_network.usages_list westus
  ```

  `salt.modules.azurearm_network.virtual_network_create_or_update(name, address_prefixes, resource_group, **kwargs)`

  New in version 2019.2.0.

  Create or update a virtual network.

  Parameters

  • **name** -- The name assigned to the virtual network being created or updated.

  • **address_prefixes** -- A list of CIDR blocks which can be used by subnets within the virtual network.

  • **resource_group** -- The resource group name assigned to the virtual network.

  CLI Example:

  ```
salt-call azurearm_network.virtual_network_create_or_update testnet ['10.0.0.0/16'] testgroup
  ```

  `salt.modules.azurearm_network.virtual_network_delete(name, resource_group, **kwargs)`

  New in version 2019.2.0.

  Delete a virtual network.

  Parameters

  • **name** -- The name of the virtual network to delete.

  • **resource_group** -- The resource group name assigned to the virtual network.

  CLI Example:

  ```
salt-call azurearm_network.virtual_network_delete testnet testgroup
  ```

  `salt.modules.azurearm_network.virtual_network_get(name, resource_group, **kwargs)`

  New in version 2019.2.0.

  Get details about a specific virtual network.

  Parameters

  • **name** -- The name of the virtual network to query.

  • **resource_group** -- The resource group name assigned to the virtual network.
CLI Example:

```
salt-call azurearm_network.virtual_network_get testnet testgroup
```

```
salt.modules.azurearm_network.virtual_networks_list(resource_group, **kwargs)
```

New in version 2019.2.0.

List all virtual networks within a resource group.

**Parameters**

- **resource_group** -- The resource group name to list virtual networks within.

CLI Example:

```
salt-call azurearm_network.virtual_networks_list testgroup
```

```
salt.modules.azurearm_network.virtual_networks_list_all(**kwargs)
```

New in version 2019.2.0.

List all virtual networks within a subscription.

CLI Example:

```
salt-call azurearm_network.virtual_networks_list_all
```

## 21.9.31 salt.modules.azurearm_resource

Azure (ARM) Resource Execution Module

New in version 2019.2.0.

**maintainer**

<devops@decisionlab.io>

**maturity**

new

**depends**

- azure >= 2.0.0
- azure-common >= 1.1.8
- azure-mgmt >= 1.0.0
- azure-mgmt-compute >= 1.0.0
- azure-mgmt-network >= 1.7.1
- azure-mgmt-resource >= 1.1.0
- azure-mgmt-storage >= 1.0.0
- azure-mgmt-web >= 0.32.0
- azure-storage >= 0.34.3
- msrestazure >= 0.4.21

**platform**

linux

**configuration**

This module requires Azure Resource Manager credentials to be passed as keyword arguments to every function in order to work properly.

Required provider parameters:

- if using username and password:
• subscription_id
• username
• password

if using a service principal:
• subscription_id
• tenant
• client_id
• secret

Optional provider parameters:

cloud_environment: Used to point the cloud driver to different API endpoints, such as Azure GovCloud.

Possible values:
• AZURE_PUBLIC_CLOUD (default)
• AZURE_CHINA_CLOUD
• AZURE_US_GOV_CLOUD
• AZURE_GERMAN_CLOUD

salt.modules.azurearm_resource.deployment_cancel(name, resource_group, **kwargs)
New in version 2019.2.0.
Cancel a deployment if in 'Accepted' or 'Running' state.

Parameters
• name -- The name of the deployment to cancel.
• resource_group -- The resource group name assigned to the deployment.

CLI Example:
salt-call azurearm_resource.deployment_cancel testdeploy testgroup

salt.modules.azurearm_resource.deployment_check_existence(name, resource_group, **kwargs)
New in version 2019.2.0.
Check the existence of a deployment.

Parameters
• name -- The name of the deployment to query.
• resource_group -- The resource group name assigned to the deployment.

CLI Example:
salt-call azurearm_resource.deployment_check_existence testdeploy testgroup
New in version 2019.2.0.

Deploys resources to a resource group.

Parameters

- **name** -- The name of the deployment to create or update.
- **resource_group** -- The resource group name assigned to the deployment.
- **deploy_mode** -- The mode that is used to deploy resources. This value can be either 'incremental' or 'complete'. In Incremental mode, resources are deployed without deleting existing resources that are not included in the template. In Complete mode, resources are deployed and existing resources in the resource group that are not included in the template are deleted. Be careful when using Complete mode as you may unintentionally delete resources.
- **debug_setting** -- The debug setting of the deployment. The permitted values are 'none', 'requestContent', 'responseContent', or 'requestContent,responseContent'. By logging information about the request or response, you could potentially expose sensitive data that is retrieved through the deployment operations.
- **deploy_params** -- JSON string containing name and value pairs that define the deployment parameters for the template. You use this element when you want to provide the parameter values directly in the request rather than link to an existing parameter file. Use either the parameters_link property or the deploy_params property, but not both.
- **parameters_link** -- The URI of a parameters file. You use this element to link to an existing parameters file. Use either the parameters_link property or the deploy_params property, but not both.
- **deploy_template** -- JSON string of template content. You use this element when you want to pass the template syntax directly in the request rather than link to an existing template. Use either the template_link property or the deploy_template property, but not both.
- **template_link** -- The URI of the template. Use either the template_link property or the deploy_template property, but not both.

CLI Example:

```
salt-call azurearm_resource.deployment_create_or_update testdeploy testgroup
```

salt.modules.azurerarm_resource.deployment_delete(name, resource_group, **kwargs)

New in version 2019.2.0.

Delete a deployment.

Parameters

- **name** -- The name of the deployment to delete.
• **resource_group** -- The resource group name assigned to the deployment.

CLI Example:

```
salt-call azurearm_resource.deployment_delete testdeploy testgroup
```

salt.modules.azurearm_resource.deployment_export_template(name, resource_group, **kwargs)

New in version 2019.2.0.

Exports the template used for the specified deployment.

Parameters

• **name** -- The name of the deployment to query.

• **resource_group** -- The resource group name assigned to the deployment.

CLI Example:

```
salt-call azurearm_resource.deployment_export_template testdeploy testgroup
```

salt.modules.azurearm_resource.deployment_get(name, resource_group, **kwargs)

New in version 2019.2.0.

Get details about a specific deployment.

Parameters

• **name** -- The name of the deployment to query.

• **resource_group** -- The resource group name assigned to the deployment.

CLI Example:

```
salt-call azurearm_resource.deployment_get testdeploy testgroup
```

salt.modules.azurearm_resource.deployment_operation_get(operation, deployment, resource_group, **kwargs)

New in version 2019.2.0.

Get a deployment operation within a deployment.

Parameters

• **operation** -- The operation ID of the operation within the deployment.

• **deployment** -- The name of the deployment containing the operation.

• **resource_group** -- The resource group name assigned to the deployment.

CLI Example:

```
salt-call azurearm_resource.deployment_operation_get XXXXX testdeploy testgroup
```

salt.modules.azurearm_resource.deployment_operations_list(name, resource_group, result_limit=10, **kwargs)

New in version 2019.2.0.

List all deployment operations within a deployment.

Parameters

• **name** -- The name of the deployment to query.
• **resource_group** -- The resource group name assigned to the deployment.

• **result_limit** -- (Default: 10) The limit on the list of deployment operations.

CLI Example:

```
salt-call azurearm_resource.deployment_operations_list testdeploy testgroup
```

```python
salt.modules.azurearm_resource.deployment_validate(name, resource_group, deploy_mode=None, debug_setting=None, deploy_params=None, parameters_link=None, deploy_template=None, template_link=None, **kwargs)
```

New in version 2019.2.0.

Validates whether the specified template is syntactically correct and will be accepted by Azure Resource Manager.

Parameters

• **name** -- The name of the deployment to validate.

• **resource_group** -- The resource group name assigned to the deployment.

• **deploy_mode** -- The mode that is used to deploy resources. This value can be either 'incremental' or 'complete'. In Incremental mode, resources are deployed without deleting existing resources that are not included in the template. In Complete mode, resources are deployed and existing resources in the resource group that are not included in the template are deleted. Be careful when using Complete mode as you may unintentionally delete resources.

• **debug_setting** -- The debug setting of the deployment. The permitted values are 'none', 'requestContent', 'responseContent', or 'requestContent,responseContent'. By logging information about the request or response, you could potentially expose sensitive data that is retrieved through the deployment operations.

• **deploy_params** -- JSON string containing name and value pairs that define the deployment parameters for the template. You use this element when you want to provide the parameter values directly in the request rather than link to an existing parameter file. Use either the parameters_link property or the deploy_params property, but not both.

• **parameters_link** -- The URI of a parameters file. You use this element to link to an existing parameters file. Use either the parameters_link property or the deploy_params property, but not both.

• **deploy_template** -- JSON string of template content. You use this element when you want to pass the template syntax directly in the request rather than link to an existing template. Use either the template_link property or the deploy_template property, but not both.

• **template_link** -- The URI of the template. Use either the template_link property or the deploy_template property, but not both.

CLI Example:

```
salt-call azurearm_resource.deployment_validate testdeploy testgroup
```

```python
salt.modules.azurearm_resource.deployments_list(resource_group, **kwargs)
```

New in version 2019.2.0.
List all deployments within a resource group.

CLI Example:

```text
salt-call azurearm_resource.deployments_list testgroup
```

**salt.modules.azurearm_resource**.policy_assignment_create(name, scope, definition_name, **kwargs)

New in version 2019.2.0.

Create a policy assignment.

**Parameters**

- **name** -- The name of the policy assignment to create.
- **scope** -- The scope of the policy assignment.
- **definition_name** -- The name of the policy definition to assign.

CLI Example:

```text
salt-call azurearm_resource.policy_assignment_create testassign /subscriptions/bc75htn-a0fhsi-349b-56gh-4fghti-f84852 testpolicy
```

**salt.modules.azurearm_resource**.policy_assignment_delete(name, scope, **kwargs)

New in version 2019.2.0.

Delete a policy assignment.

**Parameters**

- **name** -- The name of the policy assignment to delete.
- **scope** -- The scope of the policy assignment.

CLI Example:

```text
salt-call azurearm_resource.policy_assignment_delete testassign /subscriptions/bc75htn-a0fhsi-349b-56gh-4fghti-f84852
```

**salt.modules.azurearm_resource**.policy_assignment_get(name, scope, **kwargs)

New in version 2019.2.0.

Get details about a specific policy assignment.

**Parameters**

- **name** -- The name of the policy assignment to query.
- **scope** -- The scope of the policy assignment.

CLI Example:

```text
salt-call azurearm_resource.policy_assignment_get testassign /subscriptions/bc75htn-a0fhsi-349b-56gh-4fghti-f84852
```

**salt.modules.azurearm_resource**.policy_assignments_list(**kwargs)

New in version 2019.2.0.

List all policy assignments for a subscription.

CLI Example:
salt-call azurearm_resource.policy_assignments_list

salt.modules.azurearm_resource.policy_assignments_list_for_resource_group(resource_group, **kwargs)

New in version 2019.2.0.
List all policy assignments for a resource group.

Parameters
resource_group -- The resource group name to list policy assignments within.

CLI Example:
salt-call azurearm_resource.policy_assignments_list_for_resource_group testgroup

salt.modules.azurearm_resource.policy_definition_create_or_update(name, policy_rule, **kwargs)

New in version 2019.2.0.
Create or update a policy definition.

Parameters
• name -- The name of the policy definition to create or update.
• policy_rule -- A dictionary defining the policy rule.

CLI Example:
salt-call azurearm_resource.policy_definition_create_or_update testpolicy '{...}
...rule definition..}'

salt.modules.azurearm_resource.policy_definition_delete(name, **kwargs)

New in version 2019.2.0.
Delete a policy definition.

Parameters
name -- The name of the policy definition to delete.

CLI Example:
salt-call azurearm_resource.policy_definition_delete testpolicy

salt.modules.azurearm_resource.policy_definition_get(name, **kwargs)

New in version 2019.2.0.
Get details about a specific policy definition.

Parameters
name -- The name of the policy definition to query.

CLI Example:
salt-call azurearm_resource.policy_definition_get testpolicy

salt.modules.azurearm_resource.policy_definitions_list(hide_builtin=False, **kwargs)

New in version 2019.2.0.
List all policy definitions for a subscription.

Parameters
hide_builtin -- Boolean which will filter out BuiltIn policy definitions from the result.

CLI Example:
salt-call azurearm_resource.policy_definitions_list

salt.modules.azurearm_resource.resource_group_check_existence(name, **kwargs)
New in version 2019.2.0.
Check for the existence of a named resource group in the current subscription.

Parameters name -- The resource group name to check.

CLI Example:
salt-call azurearm_resource.resource_group_check_existence testgroup

salt.modules.azurearm_resource.resource_group_create_or_update(name, location, **kwargs)
New in version 2019.2.0.
Create or update a resource group in a given location.

Parameters
- name -- The name of the resource group to create or update.
- location -- The location of the resource group. This value is not able to be updated once the resource group is created.

CLI Example:
salt-call azurearm_resource.resource_group_create_or_update testgroup westus

salt.modules.azurearm_resource.resource_group_delete(name, **kwargs)
New in version 2019.2.0.
Delete a resource group from the subscription.

Parameters name -- The resource group name to delete.

CLI Example:
salt-call azurearm_resource.resource_group_delete testgroup

salt.modules.azurearm_resource.resource_group_get(name, **kwargs)
New in version 2019.2.0.
Get a dictionary representing a resource group’s properties.

Parameters name -- The resource group name to get.

CLI Example:
salt-call azurearm_resource.resource_group_get testgroup

salt.modules.azurearm_resource.resource_groups_list(**kwargs)
New in version 2019.2.0.
List all resource groups within a subscription.

CLI Example:
salt-call azurearm_resource.resource_groups_list
salt.modules.azurearm_resource.subscription_get(subscription_id=None, **kwargs)
New in version 2019.2.0.
Get details about a subscription.

Parameters subscription_id -- The ID of the subscription to query.

CLI Example:

```shell
salt-call azurearm_resource.subscription_get XXXXXXXX
```

salt.modules.azurearm_resource.subscriptions_list(**kwargs)
New in version 2019.2.0.
List all subscriptions for a tenant.

CLI Example:

```shell
salt-call azurearm_resource.subscriptions_list
```

salt.modules.azurearm_resource.subscriptions_list_locations(subscription_id=None, **kwargs)
New in version 2019.2.0.
List all locations for a subscription.

Parameters subscription_id -- The ID of the subscription to query.

CLI Example:

```shell
salt-call azurearm_resource.subscriptions_list_locations XXXXXXXX
```

salt.modules.azurearm_resource.tenants_list(**kwargs)
New in version 2019.2.0.
List all tenants for your account.

CLI Example:

```shell
salt-call azurearm_resource.tenants_list
```

21.9.32 salt.modules.bamboohr

Support for BambooHR
New in version 2015.8.0.
Requires a subdomain and an apikey in /etc/salt/minion:

```
bamboohr:
  apikey: 012345678901234567890
  subdomain: mycompany
```

salt.modules.bamboohr.list_employees(order_by='id')
Show all employees for this company.

CLI Example:

```shell
salt myminion bamboohr.list_employees
```
By default, the return data will be keyed by ID. However, it can be ordered by any other field. Keep in mind that if the field that is chosen contains duplicate values (i.e., location is used, for a company which only has one location), then each duplicate value will be overwritten by the previous. Therefore, it is advisable to only sort by fields that are guaranteed to be unique.

CLI Examples:

```bash
salt myminion bamboohr.list_employees order_by=id
salt myminion bamboohr.list_employees order_by=dName
salt myminion bamboohr.list_employees order_by=workEmail
```

salt.modules.bamboohr.list_meta_fields()
Show all meta data fields for this company.

CLI Example:

```bash
salt myminion bamboohr.list_meta_fields
```

salt.modules.bamboohr.list_users(order_by='id')
Show all users for this company.

CLI Example:

```bash
salt myminion bamboohr.list_users
```

By default, the return data will be keyed by ID. However, it can be ordered by any other field. Keep in mind that if the field that is chosen contains duplicate values (i.e., location is used, for a company which only has one location), then each duplicate value will be overwritten by the previous. Therefore, it is advisable to only sort by fields that are guaranteed to be unique.

CLI Examples:

```bash
salt myminion bamboohr.list_users order_by=id
salt myminion bamboohr.list_users order_by.email
```

salt.modules.bamboohr.show_employee(emp_id, fields=None)
Show all employees for this company.

CLI Example:

```bash
salt myminion bamboohr.show_employee 1138
```

By default, the fields normally returned from bamboohr.list_employees are returned. These fields are:

- canUploadPhoto
- department
- displayName
- firstName
- id
- jobTitle
- lastName
- location
- mobilePhone
- nickname
- photoUploaded
- photoUrl
- workEmail
Salt Documentation, Release 3001.1

• workPhone
• workPhoneExtension
If needed, a different set of fields may be specified, separated by commas:
CLI Example:
salt myminion bamboohr.show_employee 1138 displayName,dateOfBirth
A list of available fields can be found at http://www.bamboohr.com/api/documentation/employees.php
salt.modules.bamboohr.update_employee(emp_id, key=None, value=None, items=None)
Update one or more items for this employee. Specifying an empty value will clear it for that employee.
CLI Examples:
salt myminion bamboohr.update_employee 1138 nickname Curly salt myminion bamboohr.update_employee 1138 nickname '' salt myminion bamboohr.update_employee 1138
items='{”nickname”: ”Curly”} salt myminion bamboohr.update_employee 1138 items='{”nickname”:
””}

21.9.33 salt.modules.baredoc module
Baredoc walks the installed module and state directories and generates dictionaries and lists of the function names
and their arguments.
New in version 3001.
salt.modules.baredoc.list_modules(name=False, names_only=False)
Walk the Salt install tree for execution modules and return a dictionary or a list of their functions as well as
their arguments.
Parameters
• name -- specify a specific module to list. If not specified, all modules will be listed.
• names_only -- Return only a list of the callable functions instead of a dictionary with
arguments
CLI Example: (example truncated for brevity)
salt myminion baredoc.modules_and_args
myminion:
---------[...]
at:
- atq:
tag: null
- atrm:
args: args
- at:
args: args
kwargs: kwargs
- atc:
jobid: null
- jobcheck:
kwargs: kwargs
[...]

21.9. execution modules

1361


salt.modules.baredoc.list_states(name=False, names_only=False)

Walk the Salt install tree for state modules and return a dictionary or a list of their functions as well as their arguments.

Parameters

- **name** -- specify a specific module to list. If not specified, all modules will be listed.
- **names_only** -- Return only a list of the callable functions instead of a dictionary with arguments

CLI Example: (example truncated for brevity)

```
salt myminion baredoc.modules_and_args
```

```
myminion:
  ----------
  ...
  at:
  - present:
    name: null
    timespec: null
    tag: null
    user: null
    job: null
    unique_tag: false
  - absent:
    name: null
    jobid: null
    kwargs: kwargs
  - watch:
    name: null
    timespec: null
    tag: null
    user: null
    job: null
    unique_tag: false
  - mod_watch:
    name: null
    kwargs: kwargs
  ...
```

salt.modules.baredoc.module_docs(names)

Return the docstrings for all modules. Optionally, specify a module or a function to narrow the selection.

Parameters **name** -- specify a specific module to list.

salt.modules.baredoc.state_docs(names)

Return the docstrings for all state modules. Optionally, specify a state module or a function to narrow the selection.

Parameters **name** -- specify a specific module to list.
21.9.34 salt.modules.bcache module

Module for managing BCache sets

BCache is a block-level caching mechanism similar to ZFS L2ARC/ZIL, dm-cache and fscache. It works by formatting one block device as a cache set, then adding backend devices (which need to be formatted as such) to the set and activating them.

It’s available in Linux mainline kernel since 3.10

https://www.kernel.org/doc/Documentation/bcache.txt

This module needs the bcache userspace tools to function.

salt.modules.bcache.attach_(dev=None)

Attach a backing devices to a cache set If no dev is given, all backing devices will be attached.

CLI example:
```
salt '*' bcache.attach sdc
salt '*' bcache.attach /dev/bcache1
```

Returns  bool or None if nuttin’ happened

salt.modules.bcache.back_make(dev, cache_mode='writeback', force=False, attach=True, bucket_size=None)

Create a backing device for attachment to a set. Because the block size must be the same, a cache set already needs to exist.

CLI example:
```
salt '*' bcache.back_make sdc cache_mode=writeback attach=True
```

Parameters
- **cache_mode** -- writethrough, writeback, writearound or none.
- **force** -- Overwrite existing bcaches
- **attach** -- Immediately attach the backing device to the set
- **bucket_size** -- Size of a bucket (see kernel doc)

salt.modules.bcache.cache_make(dev, reserved=None, force=False, block_size=None, bucket_size=None, attach=True)

Create BCache cache on a block device. If blkdiscard is available the entire device will be properly cleared in advance.

CLI example:
```
salt '*' bcache.cache_make sdb reserved=10% block_size=4096
```

Parameters
- **reserved** -- if dev is a full device, create a partition table with this size empty.

Note: this increases the amount of reserved space available to SSD garbage collectors, potentially (vastly) increasing performance
- **block_size** -- Block size of the cache; defaults to devices' logical block size
- **force** -- Overwrite existing BCache sets
- **attach** -- Attach all existing backend devices immediately

salt.modules.bcache.config

Show or update config of a bcache device.

If no device is given, operate on the cache set itself.

CLI example:

```
salt '*' bcache.config
salt '*' bcache.config bcache1
salt '*' bcache.config errors=panic journal_delay_ms=150
cache_mode=writeback writeback_percent=15
```

**Returns** config or True/False

salt.modules.bcache.detach

Detach a backing device(s) from a cache set If no dev is given, all backing devices will be attached.

Detaching a backing device will flush its write cache. This should leave the underlying device in a consistent state, but might take a while.

CLI example:

```
salt '*' bcache.detach sdc
salt '*' bcache.detach bcache1
```

salt.modules.bcache.device

Check the state of a single bcache device

CLI example:

```
salt '*' bcache.device bcache0
salt '*' bcache.device /dev/sdc stats=True
```

**Parameters**

- **stats** -- include statistics
- **settings** -- include all settings
- **internals** -- include all internals
- **superblock** -- include superblock info

salt.modules.bcache.start

Trigger a start of the full bcache system through udev.

CLI example:

```
salt '*' bcache.start
```

salt.modules.bcache.status

Show the full status of the BCache system and optionally all its involved devices

CLI example:
salt '*' bcache.status
salt '*' bcache.status stats=True
salt '*' bcache.status internals=True alldevs=True

Parameters

- **stats** -- include statistics
- **config** -- include settings
- **internals** -- include internals
- **superblock** -- include superblock

salt.modules.bcache.stop(

Stop a bcache device. If no device is given, all backing devices will be detached from the cache, which will subsequently be stopped.

**Warning:** 'Stop' on an individual backing device means hard-stop; no attempt at flushing will be done and the bcache device will seemingly 'disappear' from the device lists

CLI example:

```
salt '*' bcache.stop
```

salt.modules.bcache.super_(dev)

Read out BCache SuperBlock

CLI example:

```
salt '*' bcache.device bcache0
salt '*' bcache.device /dev/sdc
```

salt.modules.bcache.uuid(

Return the bcache UUID of a block device. If no device is given, the Cache UUID is returned.

CLI example:

```
salt '*' bcache.uuid
salt '*' bcache.uuid /dev/sda
salt '*' bcache.uuid bcache0
```

21.9.35 salt.modules.beacons

Module for managing the Salt beacons on a minion

New in version 2015.8.0.

salt.modules.beacons.add(name, beacon_data, **kwargs)

Add a beacon on the minion

Parameters

- **name** -- Name of the beacon to configure
- **beacon_data** -- Dictionary or list containing configuration for beacon.
Returns  Boolean and status message on success or failure of add.

CLI Example:

```bash
salt '*' beacons.add ps "[{'processes': {'salt-master': 'stopped', 'apache2': 'stopped'}}]
```

salt.modules.beacons.delete(name, **kwargs)
Delete a beacon item

Parameters  name -- Name of the beacon to delete

Returns  Boolean and status message on success or failure of delete.

CLI Example:

```bash
salt '*' beacons.delete ps
salt '*' beacons.delete load
```

salt.modules.beacons.disable(**kwargs)
Disable all beacons jobs on the minion

Returns  Boolean and status message on success or failure of disable.

CLI Example:

```bash
salt '*' beacons.disable
```

salt.modules.beacons.disable_beacon(name, **kwargs)
Disable a beacon on the minion

Parameters  Name -- Name of the beacon to disable.

Returns  Boolean and status message on success or failure of disable.

CLI Example:

```bash
salt '*' beacons.disable_beacon ps
```

salt.modules.beacons.enable(**kwargs)
Enable all beacons on the minion

Returns  Boolean and status message on success or failure of enable.

Return type  bool

CLI Example:

```bash
salt '*' beacons.enable
```

salt.modules.beacons.enable_beacon(name, **kwargs)
Enable beacon on the minion

Parameters  Name -- Name of the beacon to enable.

Returns  Boolean and status message on success or failure of enable.

CLI Example:

```bash
salt '*' beacons.enable_beacon ps
```

salt.modules.beacons.list_(return_yaml=True, include_pillar=True, include_opts=True, **kwargs)
List the beacons currently configured on the minion
Parameters

- **return_yaml** -- Whether to return YAML formatted output, default True
- **include_pillar** -- Whether to include beacons that are configured in pillar, default is True.
- **include_opts** -- Whether to include beacons that are configured in opts, default is True.

**Returns** List of currently configured Beacons.

CLI Example:

```
salt '*' beacons.list
```

```python
salt.modules.beacons.list_available(return_yaml=True, **kwargs)
```

List the beacons currently available on the minion

**Parameters**

- **return_yaml** -- Whether to return YAML formatted output, default True

**Returns** List of currently configured Beacons.

CLI Example:

```
salt '*' beacons.list_available
```

```python
salt.modules.beacons.modify(name, beacon_data, **kwargs)
```

Modify an existing beacon

**Parameters**

- **name** -- Name of the beacon to configure
- **beacon_data** -- Dictionary or list containing updated configuration for beacon.

**Returns** Boolean and status message on success or failure of modify.

CLI Example:

```
salt '*' beacons.modify ps "[{'salt-master': 'stopped'}, {'apache2': 'stopped'}]"
```

```python
salt.modules.beacons.reset(**kwargs)
```

Reset beacon configuration on the minion

CLI Example:

```
salt '*' beacons.reset
```

```python
salt.modules.beacons.save(**kwargs)
```

Save all configured beacons to the minion config

**Returns** Boolean and status message on success or failure of save.

CLI Example:

```
salt '*' beacons.save
```
21.9.36 salt.modules.bigip

An execution module which can manipulate an f5 bigip via iControl REST

    maturity develop
    platform f5_bigip_11.6

salt.modules.bigip.add_pool_member(hostname, username, password, name, member)
A function to connect to a bigip device and add a new member to an existing pool.

    hostname The host/address of the bigip device
    username The iControl REST username
    password The iControl REST password
    name The name of the pool to modify
    member The name of the member to add i.e. 10.1.1.80

CLI Example:

```
salt '*' bigip.add_pool_members bigip admin admin my-pool 10.2.2.1:80
```

salt.modules.bigip.commit_transaction(hostname, username, password, label)
A function to connect to a bigip device and commit an existing transaction.

    hostname The host/address of the bigip device
    username The iControl REST username
    password The iControl REST password
    label the label of this transaction stored within the grain: bigip_f5_trans:<label>

CLI Example:

```
salt '*' bigip.commit_transaction bigip admin admin my_transaction
```

salt.modules.bigip.create_monitor(hostname, username, password, monitor_type, name, **kwargs)
A function to connect to a bigip device and create a monitor.

    hostname The host/address of the bigip device
    username The iControl REST username
    password The iControl REST password
    monitor_type The type of monitor to create
    name The name of the monitor to create
    kwargs Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names
          are used.

CLI Example:

```
salt '*' bigip.create_monitor bigip admin admin http my-http-monitor timeout=10 interval=5
```

salt.modules.bigip.create_node(hostname, username, password, name, address, trans_label=None)
A function to connect to a bigip device and create a node.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the node
address The address of the node
trans_label The label of the node

The label of the transaction stored within the grain: bigip_f5_trans:<label>

CLI Example:
```bash
salt '*' bigip.create_node bigip admin admin 10.1.1.2
```

```python
salt.modules.bigip.create_pool(hostname, username, password, name, members=None, allow_nat=None, allow_snat=None, description=None, gateway_failsafe_device=None, ignore_persisted_weight=None, ip_tos_to_client=None, ip_tos_to_server=None, link_qos_to_client=None, link_qos_to_server=None, load_balancing_mode=None, min_active_members=None, min_up_members=None, min_up_members_action=None, min_up_members_checking=None, monitor=None, profiles=None, queue_depth_limit=None, queue_on_connection_limit=None, queue_time_limit=None, reselect_tries=None, service_down_action=None, slow_ramp_time=None)
```

A function to connect to a bigip device and create a pool.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to create.
members List of comma delimited pool members to add to the pool. i.e. 10.1.1.1:80,10.1.1.2:80,10.1.1.3:80
allow_nat [yes | no]
allow_snat [yes | no]
description [string]
gateway_failsafe_device [string]
ignore_persisted_weight [enabled | disabled]
ip_tos_to_client [pass-through | [integer]]
ip_tos_to_server [pass-through | [integer]]
link_qos_to_client [pass-through | [integer]]
link_qos_to_server [pass-through | [integer]]
load_balancing_mode [dynamic-ratio-member | dynamic-ratio-node | fastest-app-response | fastest-node | least-connections-members | least-connections-node | least-sessions | observed-member | observed-node | predictive-member | predictive-node | ratio-least-connections-member | ratio-least-connections-node | ratio-member | ratio-node | ratio-session | round-robin | weighted-least-connections-member | weighted-least-connections-node]
min_active_members [integer]
min_up_members [integer]
min_up_members_action [failover | reboot | restart-all]
min_up_members_checking [enabled | disabled]
monitor [name]
profiles [none | profile_name]
queue_depth_limit [integer]
queue_on_connection_limit [enabled | disabled]
queue_time_limit [integer]
reselect_tries [integer]
service_down_action [drop | none | reselect | reset]
slow_ramp_time [integer]

CLI Example:
salt '*' bigip.create_pool bigip admin admin my-pool 10.1.1.1:80,10.1.1.2:80,10.1.
       ->1.3:80 monitor=http

salt.modules.bigip.create_profile(hostname, username, password, profile_type, name,
                      **kwargs)
A function to connect to a bigip device and create a profile.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
profile_type The type of profile to create
name The name of the profile to create
kwargs [ arg=val ] ... [arg=key1:val1,key2:val2] ...  

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are
used.

Creating Complex Args Profiles can get pretty complicated in terms of the amount of possible config op-
tions. Use the following shorthand to create complex arguments such as lists, dictionaries, and lists of
dictionaries. An option is also provided to pass raw json as well.
lists [i,i,i]: param='item1,item2,item3'
Dictionary [k:v,k:v,k:v]: param='key-1:val-1,key-2:val2,key-3:va-3'
List of Dictionaries [k:v,k:v|k:v,k:v]: param='key-1:val-1,
       key-2:val-2|key-1:val-1,key-2:val-2|key-1:val-1,key-2:val-2'
JSON: '{ ... }j': cert-key-chain='j{ "default": { "cert": "default.crt", "chain": "default.crt", "key": "default.key" } }j'

Escaping Delimiters: Use \, or \: or \| to escape characters which shouldn't be treated as delimiters
i.e. ciphers='DEFAULT\:!SSLv3'

CLI Examples:
salt '*' bigip.create_profile bigip admin admin http my-http-profile defaultsFrom=/Common/http
salt '*' bigip.create_profile bigip admin admin http my-http-profile defaultsFrom=/Common/http
    → /Common/http
    enforcement=maxHeaderCount:3200,maxRequests:10

salt.modules.bigip.create_virtual(hostname, username, password, name, destination, pool=None, address_status=None, auto_lasthop=None, bwc_policy=None, cmp_enabled=None, connection_limit=None, dhcp_relay=None, description=None, fallback_persistence=None, flow_eviction_policy=None, gtm_score=None, ip_forward=None, ip_protocol=None, internal=None, twelve_forward=None, last_hop_pool=None, mask=None, mirror=None, nat64=None, persist=None, profiles=None, rate_class=None, rate_limit=None, rate_limit_mode=None, rate_limit_dst=None, rate_limit_src=None, rules=None, related_rules=None, reject=None, source=None, source_address_translation=None, source_port=None, state=None, traffic_classes=None, translate_address=None, translate_port=None, vlans=None)

A function to connect to a bigip device and create a virtual server.

hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
name  The name of the virtual to create
destination  [[virtual_address_name:port] | [ipv4:port] | [ipv6:port] ]
pool  [[pool_name] | none]
address_status  [yes | no]
auto_lasthop  [default | enabled | disabled ]
bwc_policy  [none] | string]
cmp_enabled  [yes | no]
dhcp_relay  [yes | no]
connection_limit  [integer]
description  [string]
state  [disabled | enabled]
fallback_persistence  [none | [profile name] ]
flow_eviction_policy  [none | [eviction policy name] ]
gtm_score  [integer]
ip_forward  [yes | no]
ip_protocol  [any | protocol]
internal  [yes | no]
twelve_forward  (12-forward) [yes | no]
last_hop_pool  [[pool_name] | none]
mask  { [ipv4] | [ipv6] }
mirror  { [disabled | enabled | none] }
nat64  [enabled | disabled]
persist  [none | profile1,profile2,profile3 ... ]
profiles  [none | default | profile1,profile2,profile3 ... ]
policies  [none | default | policy1,policy2,policy3 ... ]
rate_class  [name]
rate_limit  [integer]
rate_limit_mode  [destination | object | object-destination | object-source | object-source-destination | source | source-destination]
rate_limit_dst  [integer]
rate_limitSrc  [integer]
rules  [none | [rule_one,rule_two ... ] ]
related_rules  [none | [rule_one,rule_two ... ] ]
reject  [yes | no]
source  { [ipv4[/prefixlen]] | [ipv6[/prefixlen]] }
source_address_translation  [none | snat:pool_name | lsn | automap ]
source_port  [change | preserve | preserve-strict]
state  [enabled | disabled]
traffic_classes  [none | default | class_one,class_two ... ]
translate_address  [enabled | disabled]
translate_port  [enabled | disabled]
vlans  [none | default | [enabled|disabled]:vlan1,vlan2,vlan3 ... ]

CLI Examples:

```
salt '*' bigip.create_virtual bigip admin admin my-virtual-3 26.2.2.5:80 \
pool=my-http-pool-http profiles=http,tcp
```
```
salt '*' bigip.create_virtual bigip admin admin my-virtual-3 43.2.2.5:80 \
pool=test-http-pool-http profiles=http,websecurity persist=cookie,hash \
policies=asm_auto_l7_policy__http-virtual \
related_rules=_sys_APM_ExchangeSupport_helper,_sys_https_redirect \
source_address_translation=snat:my-snat-pool \
translate_address=enabled translate_port=enabled \
traffic_classes=my-class,other-class \
vlans=enabled:external,internal
```

salt.modules.bigip.delete_monitor( hostname, username, password, monitor_type, name )

A function to connect to a bigip device and delete an existing monitor.

hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
monitor_type The type of monitor to delete
name The name of the monitor to delete

CLI Example:
```
salt '*' bigip.delete_monitor bigip admin admin http my-http-monitor
```

salt.modules.bigip.delete_node(hostname, username, password, name, trans_label=None)
A function to connect to a bigip device and delete a specific node.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the node which will be deleted.
trans_label The label of the transaction stored within the grain: bigip_f5_trans:<label>

CLI Example:
```
salt '*' bigip.delete_node bigip admin admin my-node
```

salt.modules.bigip.delete_pool(hostname, username, password, name)
A function to connect to a bigip device and delete a specific pool.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool which will be deleted

CLI Example:
```
salt '*' bigip.delete_pool bigip admin admin my-pool
```

salt.modules.bigip.delete_pool_member(hostname, username, password, name, member)
A function to connect to a bigip device and delete a specific pool.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to modify
member The name of the pool member to delete

CLI Example:
```
salt '*' bigip.delete_pool_member bigip admin admin my-pool 10.2.2.2:80
```

salt.modules.bigip.delete_profile(hostname, username, password, profile_type, name)
A function to connect to a bigip device and delete an existing profile.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
profile_type The type of profile to delete

21.9. execution modules
name  The name of the profile to delete

    CLI Example:

    salt '*' bigip.delete_profile bigip admin admin http my-http-profile

salt.modules.bigip.delete_transaction( hostname, username, password, label )
A function to connect to a bigip device and delete an existing transaction.

    hostname  The host/address of the bigip device
    username  The iControl REST username
    password  The iControl REST password
    label     The label of this transaction stored within the grain: bigip_f5_trans:<label>

    CLI Example:

    salt '*' bigip.delete_transaction bigip admin admin my_transaction

salt.modules.bigip.delete_virtual( hostname, username, password, name )
A function to connect to a bigip device and delete a specific virtual.

    hostname  The host/address of the bigip device
    username  The iControl REST username
    password  The iControl REST password
    name      The name of the virtual to delete

    CLI Example:

    salt '*' bigip.delete_virtual bigip admin admin my-virtual

salt.modules.bigip.list_monitor( hostname, username, password, monitor_type, name=None )
A function to connect to a bigip device and list an existing monitor. If no name is provided than all monitors
of the specified type will be listed.

    hostname  The host/address of the bigip device
    username  The iControl REST username
    password  The iControl REST password
    monitor_type  The type of monitor(s) to list
    name      The name of the monitor to list

    CLI Example:

    salt '*' bigip.list_monitor bigip admin admin http my-http-monitor

salt.modules.bigip.list_node( hostname, username, password, name=None, trans_label=None )
A function to connect to a bigip device and list all nodes or a specific node.

    hostname  The host/address of the bigip device
    username  The iControl REST username
    password  The iControl REST password
    name      The name of the node to list. If no name is specified than all nodes will be listed.
    trans_label  The label of the transaction stored within the grain: bigip_f5_trans:<label>
CLI Example:

```plaintext
salt '*' bigip.list_node bigip admin admin my-node
```

salt.modules.bigip.list_pool (hostname, username, password, name=None)
A function to connect to a bigip device and list all pools or a specific pool.

- **hostname** The host/address of the bigip device
- **username** The iControl REST username
- **password** The iControl REST password
- **name** The name of the pool to list. If no name is specified then all pools will be listed.

CLI Example:

```plaintext
salt '*' bigip.list_pool bigip admin admin my-pool
```

salt.modules.bigip.list_profile (hostname, username, password, profile_type, name=None)
A function to connect to a bigip device and list an existing profile. If no name is provided than all profiles of the specified type will be listed.

- **hostname** The host/address of the bigip device
- **username** The iControl REST username
- **password** The iControl REST password
- **profile_type** The type of profile(s) to list
- **name** The name of the profile to list

CLI Example:

```plaintext
salt '*' bigip.list_profile bigip admin admin http my-http-profile
```

salt.modules.bigip.list_transaction (hostname, username, password, label)
A function to connect to a bigip device and list an existing transaction.

- **hostname** The host/address of the bigip device
- **username** The iControl REST username
- **password** The iControl REST password
- **label** The label of this transaction stored within the grain: bigip_f5_trans:<label>

CLI Example:

```plaintext
salt '*' bigip.list_transaction bigip admin admin my_transaction
```

salt.modules.bigip.list_virtual (hostname, username, password, name=None)
A function to connect to a bigip device and list all virtuals or a specific virtual.

- **hostname** The host/address of the bigip device
- **username** The iControl REST username
- **password** The iControl REST password
- **name** The name of the virtual to list. If no name is specified than all virtuals will be listed.

CLI Example:
salt 'bigip.list_virtual bigip admin admin my-virtual

```python
salt.modules.bigip.modify_monitor( hostname, username, password, monitor_type, name, **kwargs)
``` A function to connect to a bigip device and modify an existing monitor.

- **hostname** The host/address of the bigip device
- **username** The iControl REST username
- **password** The iControl REST password
- **monitor_type** The type of monitor to modify
- **name** The name of the monitor to modify
- **kwargs** Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

CLI Example:

```
salt '*' bigip.modify_monitor bigip admin admin http my-http-monitor timeout=16 interval=6
```

```python
salt.modules.bigip.modify_node( hostname, username, password, name, connection_limit=None, description=None, dynamic_ratio=None, logging=None, monitor=None, rate_limit=None, ratio=None, session=None, state=None, trans_label=None)
``` A function to connect to a bigip device and modify an existing node.

- **hostname** The host/address of the bigip device
- **username** The iControl REST username
- **password** The iControl REST password
- **name** The name of the node to modify
- **connection_limit** [integer]
- **description** [string]
- **dynamic_ratio** [integer]
- **logging** [enabled | disabled]
- **monitor** [[name] | none | default]
- **rate_limit** [integer]
- **ratio** [integer]
- **session** [user-enabled | user-disabled]
- **state** [user-down | user-up]
- **trans_label** The label of the transaction stored within the grain: bigip_f5_trans:<label>

CLI Example:

```
salt '*' bigip.modify_node bigip admin admin 10.1.1.2 ratio=2 logging=enabled
```
salt.modules.bigip.modify_pool(hostname, username, password, name, allow_nat=None, allow_snat=None, description=None, gateway_failsafe_device=None, ignore_persisted_weight=None, ip_tos_to_client=None, ip_tos_to_server=None, link_qos_to_client=None, link_qos_to_server=None, load_balancing_mode=None, min_active_members=None, min_up_members=None, min_up_members_action=None, min_up_members_checking=None, monitor=None, profiles=None, queue_depth_limit=None, queue_on_connection_limit=None, queue_time_limit=None, reselect_tries=None, service_down_action=None, slow_ramp_time=None)

A function to connect to a bigip device and modify an existing pool.

hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
name  The name of the pool to modify.
allow_nat  [yes | no]
allow_snat  [yes | no]
description  [string]
gateway_failsafe_device  [string]
ignore_persisted_weight  [yes | no]
ip_tos_to_client  [pass-through | [integer]]
ip_tos_to_server  [pass-through | [integer]]
link_qos_to_client  [pass-through | [integer]]
link_qos_to_server  [pass-through | [integer]]
load_balancing_mode  [dynamic-ratio-member | dynamic-ratio-node | fastest-app-response | fastest-node | least-connections-members | least-connections-node | least-sessions | observed-member | observed-node | predictive-member | predictive-node | ratio-least-connections-member | ratio-least-connections-node | ratio-member | ratio-node | ratio-session | round-robin | weighted-least-connections-member | weighted-least-connections-node]
min_active_members  [integer]
min_up_members  [integer]
min_up_members_action  [failover | reboot | restart-all]
min_up_members_checking  [enabled | disabled]
monitor  [name]
profiles  [none | profile_name]
queue_on_connection_limit  [enabled | disabled]
queue_depth_limit  [integer]
queue_time_limit  [integer]
reselect_tries  [integer]
service_down_action  [drop | none | reselect | reset]
slow_ramp_time [integer]

CLI Example:

```bash
salt '*' bigip.modify_pool bigip admin admin my-pool 10.1.1.1:80,10.1.1.2:80,10.1.1.3:80 min_active_members=1
```

salt.modules.bigip.modify_pool_member

A function to connect to a bigip device and modify an existing member of a pool.

```
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to modify
member The name of the member to modify i.e. 10.1.1.2:80
connection_limit [integer]
description [string]
dynamic_ratio [integer]
inherit_profile [enabled | disabled]
logging [enabled | disabled]
monitor [name]
priority_group [integer]
profiles [none | profile_name]
rate_limit [integer]
ratio [integer]
session [user-enabled | user-disabled]
state [ user-up | user-down ]
```

CLI Example:

```bash
salt '*' bigip.modify_pool_member bigip admin admin my-pool 10.2.2.1:80 state=user-down session=user-disabled
```

salt.modules.bigip.modify_profile

A function to connect to a bigip device and create a profile.

```
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
profile_type The type of profile to create
```

**kwargs

A function to connect to a bigip device and create a profile.
name  The name of the profile to create

kwargs  [ arg=val ] ... [arg=key1=val1,key2=val2] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

Creating Complex Args

Profiles can get pretty complicated in terms of the amount of possible config options. Use the
following shorthand to create complex arguments such as lists, dictionaries, and lists of dictionaries.
An option is also provided to pass raw json as well.

lists  [i,i,i]: param='item1,item2,item3'

Dictionary  [k:v,k:v]: param='key-1:val-1,key-2:val2,key-3:va-3'

List of Dictionaries  [k:v,k:v,k:v]: param='key-1:val-1,key-2:val2,key-1:val-1,key-2:val-2'

JSON:  'j{...}j': cert-key-chain='j{ "default": { "cert": "default.crt", "chain": "default.crt", "key": "default.key" } }j'

Escaping Delimiters: Use \, or \: or | to escape characters which shouldn't be treated as de-limiters i.e. ciphers='DEFAULT:\!:SSLv3'

CLI Examples:

```bash
salt '*' bigip.modify_profile bigip admin admin http my-http-profile defaultsFrom=/Common/http
salt '*' bigip.modify_profile bigip admin admin http my-http-profile defaultsFrom=/Common/http
  enforcement=maxHeaderCount:3200,maxRequests:10
salt '*' bigip.modify_profile bigip admin admin client-ssl my-client-ssl-1
  retainCertificate=false
  ciphers='DEFAULT:\!:SSLv3'
  cert_key_chain='j{ "default": { "cert": "default.crt", "chain": "default.crt", "key": "default.key" } }j'
```

salt.modules.bigip.modify_virtual(hostname, username, password, name, destination=None, pool=None, address_status=None, auto_lasthop=None, bwc_policy=None, cmp_enabled=None, connection_limit=None, dhcp_relay=None, description=None, fallback_persistence=None, flow_eviction_policy=None, gtm_score=None, ip_forward=None, ip_protocol=None, internal=None, twelve_forward=None, last_hop_pool=None, mask=None, mirror=None, nat64=None, persist=None, profiles=None, policies=None, rate_class=None, rate_limit=None, rate_limit_mode=None, rate_limit_dst=None, rate_limit_src=None, rules=None, related_rules=None, reject=None, source=None, source_address_translation=None, source_port=None, state=None, traffic_classes=None, translate_address=None, translate_port=None, vlans=None)

A function to connect to a bigip device and modify an existing virtual server.

hostname  The host/address of the bigip device

username  The iControl REST username

password  The iControl REST password
name  The name of the virtual to modify

destination  [ [virtual_address_name:port] | [ipv4:port] | [ipv6:port] ]

pool  [ [pool_name] | none]

address_status  [yes | no]

auto_lasthop  [default | enabled | disabled ]

bwc_policy  [none] | string]

cmp_enabled  [yes | no]

dhcp_relay  [yes | no]

connection_limit  [integer]

description  [string]

state  [disabled | enabled]

fallback_persistence  [none ] | [profile name] ]

flow_eviction_policy  [none ] | [eviction policy name] ]

gtm_score  [integer]

ip_forward  [yes | no]

ip_protocol  [any | protocol]

internal  [yes | no]

twelve_forward  (12-forward) [yes | no]

last_hop-pool  [ [pool_name] | none]

mask  { [ipv4] | [ipv6] }

mirror  { [disabled | enabled | none] }

nat64  [enabled | disabled]

persist  [none | profile1,profile2,profile3 ... ]

profiles  [none | default | profile1,profile2,profile3 ... ]

policies  [none | default | policy1,policy2,policy3 ... ]

rate_class  [name]

rate_limit  [integer]

rate_limit_mode  [destination | object | object-destination | object-source | object-source-destination | source | source-destination]

traffic_classes [none | default | class_one, class_two ...]
translate_address [enabled | disabled]
translate_port [enabled | disabled]
vlan [none | default | [enabled | disabled]: vlan1, vlan2, vlan3 ...]

CLI Example:
```
salt '*' bigip.modify_virtual bigip admin admin my-virtual source_address_translation=none
salt '*' bigip.modify_virtual bigip admin admin my-virtual rules=my-rule, my-other=rule
```

salt.modules.bigip.replace_pool_members( hostname, username, password, name, members)
A function to connect to a bigip device and replace members of an existing pool with new members.

- **hostname** The host/address of the bigip device
- **username** The iControl REST username
- **password** The iControl REST password
- **name** The name of the pool to modify
- **members** List of comma delimited pool members to replace existing members with. i.e. 10.1.1.1:80,10.1.1.2:80,10.1.1.3:80

CLI Example:
```
salt '*' bigip.replace_pool_members bigip admin admin my-pool 10.2.2.1:80,10.2.2.2:80,10.2.2.3:80
```

salt.modules.bigip.start_transaction( hostname, username, password, label)
A function to connect to a bigip device and start a new transaction.

- **hostname** The host/address of the bigip device
- **username** The iControl REST username
- **password** The iControl REST password
- **label** The name / alias for this transaction. The actual transaction id will be stored within a grain called bigip_f5_trans:<label>

CLI Example:
```
salt '*' bigip.start_transaction bigip admin admin my_transaction
```
21.9.37 salt.modules.bluez_bluetooth

Support for Bluetooth (using BlueZ in Linux).

The following packages are required packages for this module:

- bluez >= 5.7
- bluez-libs >= 5.7
- bluez-utils >= 5.7
- pybluez >= 0.18

**salt.modules.bluez_bluetooth.address()**

Get the many addresses of the Bluetooth adapter

CLI Example:

```
salt '*' bluetooth.address
```

**salt.modules.bluez_bluetooth.block(bdaddr)**

Block a specific bluetooth device by BD Address

CLI Example:

```
```

**salt.modules.bluez_bluetooth.discoverable(dev)**

Enable this bluetooth device to be discoverable.

CLI Example:

```
salt '*' bluetooth.discoverable hci0
```

**salt.modules.bluez_bluetooth.noscan(dev)**

Turn off scanning modes on this device.

CLI Example:

```
salt '*' bluetooth.noscan hci0
```

**salt.modules.bluez_bluetooth.pair(address, key)**

Pair the bluetooth adapter with a device

CLI Example:

```
salt '*' bluetooth.pair DE:AD:BE:EF:CA:FE 1234
```

Where DE:AD:BE:EF:CA:FE is the address of the device to pair with, and 1234 is the passphrase.

TODO: This function is currently broken, as the bluez-simple-agent program no longer ships with BlueZ >= 5.0. It needs to be refactored.

**salt.modules.bluez_bluetooth.power(dev, mode)**

Power a bluetooth device on or off

CLI Examples:

```
salt '*' bluetooth.power hci0 on
salt '*' bluetooth.power hci0 off
```

**salt.modules.bluez_bluetooth.scan()**

Scan for bluetooth devices in the area

CLI Example:
salt '*' bluetooth.scan

```
salt.modules.bluez_bluez_bluetooth.start()
    Start the bluetooth service.
    CLI Example:
    salt '*' bluetooth.start
```

```
salt.modules.bluez_bluez_bluetooth.stop()
    Stop the bluetooth service.
    CLI Example:
    salt '*' bluetooth.stop
```

```
salt.modules.bluez_bluez_bluetooth.unblock(bdaddr)
    Unblock a specific bluetooth device by BD Address
    CLI Example:
```

```
salt.modules.bluez_bluez_bluetooth.unpair(address)
    Unpair the bluetooth adapter from a device
    CLI Example:
```

Where DE:AD:BE:EF:CA:FE is the address of the device to unpair.

**TODO:** This function is currently broken, as the bluez-simple-agent program no longer ships with BlueZ >= 5.0. It needs to be refactored.

```
salt.modules.bluez_bluez_bluetooth.version()
    Return Bluez version from bluetoothd -v
    CLI Example:
    salt '*' bluetoothd.version
```

### 21.9.38 salt.modules.boto3_elasticache module

**Execution module for Amazon ElastiCache using boto3**

New in version 2017.7.0.

**configuration** This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available at:

```
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:
A region may also be specified in the configuration:

```
elasticache.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

depends boto3

```
salt.modules.boto3_elasticache.add_tags_to_resource(name, region=None, key=None, keyid=None, profile=None, **args)
```

Add tags to an Elasticache resource.

Note that this function is essentially useless as it requires a full AWS ARN for the resource being operated on, but there is no provided API or programmatic way to find the ARN for a given object from its name or ID alone. It requires specific knowledge about the account number, AWS partition, and other magic details to generate.

If you happen to have those at hand though, feel free to utilize this function...

Example:

```
→ Tags='[{'Key': 'TeamOwner', 'Value': 'infrastructure'}]'
```

```
salt.modules.boto3_elasticache.authorize_cache_security_group_ingress(name, region=None, key=None, keyid=None, profile=None, **args)
```

Authorize network ingress from an ec2 security group to a cache security group.

Example:

```
salt myminion boto3_elasticache.authorize_cache_security_group_ingress name=mycachesecgrp
→ EC2SecurityGroupName=someEC2sg
→ EC2SecurityGroupOwnerId=SOMEOWNERID
```

```
salt.modules.boto3_elasticache.cache_cluster_exists(name, conn=None, region=None, key=None, keyid=None, profile=None)
```

Check to see if a cache cluster exists.
Example:

```
salt myminion boto3_elasticache.cache_cluster_exists myelasticsearch
```

```
salt.modules.boto3_elasticache.cache_security_group_exists(name,  
region=None,  
key=None,  
keyid=None,  
profile=None)
```

Check to see if an ElastiCache security group exists.

Example:

```
salt myminion boto3_elasticache.cache_security_group_exists mysecuritygroup
```

```
salt.modules.boto3_elasticache.cache_subnet_group_exists(name,  
region=None,  
key=None,  
keyid=None,  
profile=None)
```

Check to see if an ElastiCache subnet group exists.

Example:

```
salt myminion boto3_elasticache.cache_subnet_group_exists my-subnet-group
```

```
salt.modules.boto3_elasticache.copy_snapshot(name,  
region=None,  
key=None,  
keyid=None,  
profile=None,  **args)
```

Make a copy of an existing snapshot.

Example:

```
salt myminion boto3_elasticache.copy_snapshot name=mySnapshot  
          TargetSnapshotName=copyOfMySnapshot
```

```
salt.modules.boto3_elasticache.create_cache_cluster(name,  
wait=600,  
security_groups=None,  
region=None,  
key=None,  
keyid=None,  
profile=None,  **args)
```

Create a cache cluster.

Example:

```
salt myminion boto3_elasticache.create_cache_cluster name=myCacheCluster  
          Engine=redis  
          CacheNodeType=cache.t2.micro  
          NumCacheNodes=1  
          SecurityGroupIds='[sg-
                         →11223344]'  
          CacheSubnetGroupName=myCacheSubnetGroup
```

```
salt.modules.boto3_elasticache.create_cache_parameter_group(name,  
region=None,  
key=None,  
keyid=None,  
profile=None,  **args)
```

Create a cache parameter group.

Example:

```
salt myminion boto3_elasticache.create_cache_parameter_group  
          name=myParamGroup  
          CacheParameterGroupFamily=redis2.8  
          Description="My Parameter Group"
```
salt.modules.boto3_elasticache.create_cache_security_group(name, region=None, key=None, keyid=None, profile=None, **args)

Create a cache security group.
Example:

```python
salt myminion boto3_elasticache.create_cache_security_group mycachesecgrp
# Description='My Cache Security Group'
```

salt.modules.boto3_elasticache.create_cache_subnet_group(name, subnets=None, region=None, key=None, keyid=None, profile=None, **args)

Create an ElastiCache subnet group
Example:

```python
salt myminion boto3_elasticache.create_cache_subnet_group name=my-subnet-group
# CacheSubnetGroupDescription='description'
subnets=['[myVPCSubnet1,myVPCSubnet2]'
```

salt.modules.boto3_elasticache.create_replication_group(name, wait=600, security_groups=None, region=None, key=None, keyid=None, profile=None, **args)

Example:

```python
salt myminion boto3_elasticache.create_replication_group
# name=myelasticache
ReplicationGroupDescription='description'
```

salt.modules.boto3_elasticache.delete_cache_cluster(name, wait=600, region=None, key=None, keyid=None, profile=None, **args)

Delete a cache cluster.
Example:

```python
salt myminion boto3_elasticache.delete myelasticache
```

salt.modules.boto3_elasticache.delete_cache_parameter_group(name, region=None, key=None, keyid=None, profile=None, **args)

Delete a cache parameter group.
Example:

```python
salt myminion boto3_elasticache.delete_cache_parameter_group myParamGroup
```
salt.modules.boto3_elasticache.delete_cache_security_group

Delete a cache security group.

Example:

```
salt myminion boto3_elasticache.delete_cache_security_group myelasticachesg
```

salt.modules.boto3_elasticache.delete_cache_subnet_group

Delete an ElastiCache subnet group.

Example:

```
salt myminion boto3_elasticache.delete_subnet_group my-subnet-group region=us-east-1
```

salt.modules.boto3_elasticache.delete_replication_group

Delete an ElastiCache replication group, optionally taking a snapshot first.

Example:

```
salt myminion boto3_elasticache.delete_replication_group my-replication-group
```

salt.modules.boto3_elasticache.describe_cache_clusters

Return details about all (or just one) Elasticache cache clusters.

Example:

```
salt myminion boto3_elasticache.describe_cache_clusters
salt myminion boto3_elasticache.describe_cache_clusters myelasticache
```

salt.modules.boto3_elasticache.describe_cache_parameter_groups

Return details about all (or just one) Elasticache cache clusters.

Example:

```
salt myminion boto3_elasticache.describe_cache_parameter_groups
salt myminion boto3_elasticache.describe_cache_parameter_groups myParameterGroup
```
salt.modules.boto3_elasticache.describe_cache_security_groups(name=None, conn=None, region=None, key=None, keyid=None, profile=None)

Return details about all (or just one) Elasticache cache clusters.

Example:
```
salt myminion boto3_elasticache.describe_cache_security_groups
salt myminion boto3_elasticache.describe_cache_security_groups mycachesecgrp
```

salt.modules.boto3_elasticache.describe_cache_subnet_groups(name=None, conn=None, region=None, key=None, keyid=None, profile=None)

Return details about all (or just one) Elasticache replication groups.

Example:
```
salt myminion boto3_elasticache.describe_cache_subnet_groups region=us-east-1
```

salt.modules.boto3_elasticache.describe_replication_groups(name=None, conn=None, region=None, key=None, keyid=None, profile=None)

Return details about all (or just one) Elasticache replication groups.

Example:
```
salt myminion boto3_elasticache.describe_replication_groups
salt myminion boto3_elasticache.describe_replication_groups myelasticache
```

salt.modules.boto3_elasticache.list_cache_subnet_groups(region=None, key=None, keyid=None, profile=None)

Return a list of all cache subnet group names

Example:
```
salt myminion boto3_elasticache.list_cache_subnet_groups region=us-east-1
```

salt.modules.boto3_elasticache.list_tags_for_resource(name, region=None, key=None, keyid=None, profile=None, **args)

List tags on an Elasticache resource.

Note that this function is essentially useless as it requires a full AWS ARN for the resource being operated on, but there is no provided API or programmatic way to find the ARN for a given object from its name or ID alone. It requires specific knowledge about the account number, AWS partition, and other magic details to generate.

If you happen to have those handy, feel free to utilize this however...

Example:
salt.modules.boto3_elasticache.modify_cache_cluster(name, wait=600, security_groups=None, region=None, key=None, keyid=None, profile=None, **args)

Update a cache cluster in place.

Notes: `ApplyImmediately: False` is pretty danged silly in the context of salt. You can pass it, but for fairly obvious reasons the results over multiple runs will be undefined and probably contrary to your desired state. Reducing the number of nodes requires an EXPLICIT CacheNodeIdsToRemove be passed, which until a reasonable heuristic for programmatically deciding which nodes to remove has been established, MUST be decided and populated intentionally before a state call, and removed again before the next. In practice this is not particularly useful and should probably be avoided.

Example:

```
salt myminion boto3_elasticache.create_cache_cluster name=myCacheCluster ⬠
   ⬠ NotificationTopicStatus=inactive
```

salt.modules.boto3_elasticache.modify_cache_subnet_group(name, subnets=None, region=None, key=None, keyid=None, profile=None, **args)

Modify an ElastiCache subnet group

Example:

```
salt myminion boto3_elasticache.modify_cache_subnet_group name=my-subnet-group ⬠
   ⬠ subnets='[myVPCSubnet3]'
```

salt.modules.boto3_elasticache.modify_replication_group(name, wait=600, security_groups=None, region=None, key=None, keyid=None, profile=None, **args)

Modify a replication group.

Example:

```
salt myminion boto3_elasticache.modify_replication_group name=myelasticsearch ⬠
   ⬠ ReplicationGroupDescription=newDescription
```

salt.modules.boto3_elasticache.remove_tags_from_resource(name, region=None, key=None, keyid=None, profile=None, **args)

Remove tags from an Elasticache resource.

Note that this function is essentially useless as it requires a full AWS ARN for the resource being operated on, but there is no provided API or programmatic way to find the ARN for a given object from its name or ID alone. It requires specific knowledge about the account number, AWS partition, and other magic details to generate.

If you happen to have those at hand though, feel free to utilize this function...
Example:

```
salt myminion boto3_elasticache.remove_tags_from_resource name  
  → TagKeys='["TeamOwner"]'
```

`salt.modules.boto3_elasticache.replication_group_exists(name, region=None, key=None, keyid=None, profile=None)`

Check to see if a replication group exists.

Example:

```
salt myminion boto3_elasticache.replication_group_exists myelasticache
```

`salt.modules.boto3_elasticache.revoke_cache_security_group_ingress(name, region=None, key=None, keyid=None, profile=None, **args)`

Revoke network ingress from an ec2 security group to a cache security group.

Example:

```
salt myminion boto3_elasticache.revoke_cache_security_group_ingress  
  → mycachesecgrp  
  → EC2SecurityGroupName=someEC2sg  
  → EC2SecurityGroupOwnerId=SOMEOWNERID
```

### 21.9.39 `salt.modules.boto3_elasticsearch` module

Connection module for Amazon Elasticsearch Service

New in version Natrium.

**configuration** This module accepts explicit IAM credentials but can also utilize IAM roles assigned to the instance trough Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
es.keyid: GKTADJGHEIQSXMKKRBJ08H
es.key: askdjghsdfjkgdWupUjasdflkdfklgjhsdjakghs
```

A region may also be specified in the configuration:

```
es.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:
Salt Documentation, Release 3001.1

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfdklgjfdsfjajkghs
  region: us-east-1
```

All methods return a dict with: 'result' key containing a boolean indicating success or failure, 'error' key containing the error message returned by boto on error, 'response' key containing the data of the response returned by boto on success.

**codeauthor** Herbert Buurman <herbert.buurman@ogd.nl>

**depends** boto3

`salt.modules.boto3_elasticsearch.add_tags` *(domain_name=None, arn=None, tags=None, region=None, key=None, keyid=None, profile=None)*

Attaches tags to an existing Elasticsearch domain. Tags are a set of case-sensitive key value pairs. An Elasticsearch domain may have up to 10 tags.

**Parameters**

- `domain_name (str)` -- The name of the Elasticsearch domain you want to add tags to.
- `arn (str)` -- The ARN of the Elasticsearch domain you want to add tags to. Specifying this overrides `domain_name`.
- `tags (dict)` -- The dict of tags to add to the Elasticsearch domain.

**Return type** dict

**Returns** Dictionary with key 'result' and as value a boolean denoting success or failure. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

**CLI Example:**

```
salt myminion boto3_elasticsearch.add_tags domain_name=mydomain tags='{"foo": "bar", "baz": "qux"}"
```

`salt.modules.boto3_elasticsearch.cancel_elasticsearch_service_software_update` *(domain_name, region=None, keyid=None, key=None, profile=None)*

Cancels a scheduled service software update for an Amazon ES domain. You can only perform this operation before the AutomatedUpdateDate and when the UpdateStatus is in the PENDING_UPDATE state.

**Parameters** `domain_name (str)` -- The name of the domain that you want to stop the latest service software update on.

**Return type** dict

**Returns** Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with the current service software options. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.
salt.modules.boto3_elasticsearch.check_upgrade_eligibility(
    domain_name, elasticsearch_version,
    region=None,
    keyid=None,
    key=None,
    profile=None,
)

Helper function to determine in one call if an Elasticsearch domain can be upgraded to the specified Elasticsearch version.

This assumes that the Elasticsearch domain is at rest at the moment this function is called. I.e. The domain is not in the process of:

- being created.
- being updated.
- another upgrade running, or a check thereof.
- being deleted.

Behind the scenes, this does 3 things:

- Check if `elasticsearch_version` is among the compatible elasticsearch versions.
- Perform a check if the Elasticsearch domain is eligible for the upgrade.
- Check the result of the check and return the result as a boolean.

Parameters

- `name (str)` -- The Elasticsearch domain name to check.
- `elasticsearch_version (str)` -- The Elasticsearch version to upgrade to.

Return type `dict`

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with boolean result of the check. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

CLI Example:

```bash
salt myminion boto3_elasticsearch.check_upgrade_eligibility mydomain '6.7'
```
salt.modules.boto3_elasticsearch.create_elasticsearch_domain(domain_name,
elasticsearch_version=None,
elasticsearch_cluster_config=None,
ebs_options=None,
access_policies=None,
nsnapshot_options=None,
vpc_options=None,
cognito_options=None,
encryption_at_rest_options=None,
node_to_node_encryption_options=None,
advanced_options=None,
log_publishing_options=None,
blocking=False,
region=None,
key=None,
keyid=None,
profile=None)

Given a valid config, create a domain.

Parameters

- **domain_name**(str) -- The name of the Elasticsearch domain that you are creating. Domain names are unique across the domains owned by an account within an AWS region. Domain names must start with a letter or number and can contain the following characters: a-z (lowercase), 0-9, and - (hyphen).

- **elasticsearch_version**(str) -- String of format X.Y to specify version for the Elasticsearch domain eg. "1.5" or "2.3".

- **elasticsearch_cluster_config**(dict) -- Dictionary specifying the configuration options for an Elasticsearch domain. Keys (case sensitive) in here are:
  - InstanceType (str): The instance type for an Elasticsearch cluster.
  - InstanceCount (int): The instance type for an Elasticsearch cluster.
  - DedicatedMasterEnabled (bool): Indicate whether a dedicated master node is enabled.
  - ZoneAwarenessEnabled (bool): Indicate whether zone awareness is enabled. If this is not enabled, the Elasticsearch domain will only be in one availability zone.
  - ZoneAwarenessConfig (dict): Specifies the zone awareness configuration for a domain when zone awareness is enabled. Keys (case sensitive) in here are:
    - AvailabilityZoneCount (int): An integer value to indicate the number of availability zones for a domain when zone awareness is enabled. This should be equal to number of subnets if VPC endpoints is enabled. Allowed values: 2, 3
    - DedicatedMasterType (str): The instance type for a dedicated master node.
    - DedicatedMasterCount (int): Total number of dedicated master nodes, active and on standby, for the cluster.
• **ebs_options** *(dict)* -- Dict specifying the options to enable or disable and specifying the type and size of EBS storage volumes. Keys (case sensitive) in here are:
  - EBSEnabled (bool): Specifies whether EBS-based storage is enabled.
  - VolumeType (str): Specifies the volume type for EBS-based storage.
  - VolumeSize (int): Integer to specify the size of an EBS volume.
  - Iops (int): Specifies the IOPD for a Provisioned IOPS EBS volume (SSD).

• **access_policies** *(str or dict)* -- Dict or JSON string with the IAM access policy.

• **snapshot_options** *(dict)* -- Dict specifying the snapshot options. Keys (case sensitive) in here are:
  - AutomatedSnapshotStartHour (int): Specifies the time, in UTC format, when the service takes a daily automated snapshot of the specified Elasticsearch domain. Default value is 0 hours.

• **vpc_options** *(dict)* -- Dict with the options to specify the subnets and security groups for the VPC endpoint. Keys (case sensitive) in here are:
  - SubnetIds (list): The list of subnets for the VPC endpoint.
  - SecurityGroupIds (list): The list of security groups for the VPC endpoint.

• **cognito_options** *(dict)* -- Dict with options to specify the cognito user and identity pools for Kibana authentication. Keys (case sensitive) in here are:
  - Enabled (bool): Specifies the option to enable Cognito for Kibana authentication.
  - UserPoolId (str): Specifies the Cognito user pool ID for Kibana authentication.
  - IdentityPoolId (str): Specifies the Cognito identity pool ID for Kibana authentication.
  - RoleArn (str): Specifies the role ARN that provides Elasticsearch permissions for accessing Cognito resources.

• **encryption_at_rest_options** *(dict)* -- Dict specifying the encryption at rest options. Keys (case sensitive) in here are:
  - Enabled (bool): Specifies the option to enable Encryption At Rest.
  - KmsKeyId (str): Specifies the KMS Key ID for Encryption At Rest options.

• **node_to_node_encryption_options** *(dict)* -- Dict specifying the node to node encryption options. Keys (case sensitive) in here are:
  - Enabled (bool): Specify True to enable node-to-node encryption.

• **advanced_options** *(dict)* -- Dict with option to allow references to indices in an HTTP request body. Must be False when configuring access to individual sub-resources. By default, the value is True. See [http://docs.aws.amazon.com/elasticsearch-service/latest/developerguide/es-createupdatedomains.html#es-createdomain-configure-advanced-options](http://docs.aws.amazon.com/elasticsearch-service/latest/developerguide/es-createupdatedomains.html#es-createdomain-configure-advanced-options) for more information.

• **log_publishing_options** *(dict)* -- Dict with options for various type of logs. The keys denote the type of log file and can be one of the following:
  - INDEX_SLOW_LOGS
  - SEARCH_SLOW_LOGS
  - ES_APPLICATION_LOGS

The value assigned to each key is a dict with the following case sensitive keys:
CloudWatchLogsLogGroupArn (str): The ARN of the Cloudwatch log group to which the log needs to be published.

Enabled (bool): Specifies whether given log publishing option is enabled or not.

- **blocking (bool)** -- Whether or not to wait (block) until the Elasticsearch domain has been created.

Note: Not all instance types allow enabling encryption at rest. See https://docs.aws.amazon.com/elasticsearch-service/latest/developerguide/aes-supported-instance-types.html

**Return type** dict

**Returns** Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with the domain status configuration. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

**CLI Example:**

```bash
salt myminion boto3_elasticsearch.create_elasticsearch_domain mydomain

elasticsearch_cluster_config='{
    "InstanceType": "t2.micro.elasticsearch",
    "InstanceCount": 1,
    "DedicatedMasterEnabled": False,
    "ZoneAwarenessEnabled": False
}

ebs_options='{
    "EBSEnabled": True,
    "VolumeType": "gp2",
    "VolumeSize": 10,
    "Iops": 0
}

access_policies='{
    "Version": "2012-10-17",
    "Statement": [

```

**salt.modules.boto3_elasticsearch.delete_elasticsearch_domain**

Permanently deletes the specified Elasticsearch domain and all of its data. Once a domain is deleted, it cannot be recovered.

**Parameters**

- **domain_name (str)** -- The name of the domain to delete.
- **blocking (bool)** -- Whether or not to wait (block) until the Elasticsearch domain has been deleted.

**Return type** dict
Returns Dictionary with key ‘result’ and as value a boolean denoting success or failure. Upon failure, also contains a key ‘error’ with the error message as value.

New in version Natrium.

call.modules.boto3_elasticsearch.delete_elasticsearch_service_role(region=None, keyid=None, key=None, profile=None)

Deletes the service-linked role that Elasticsearch Service uses to manage and maintain VPC domains. Role deletion will fail if any existing VPC domains use the role. You must delete any such Elasticsearch domains before deleting the role.

Return type dict

Returns Dictionary with key ‘result’ and as value a boolean denoting success or failure. Upon failure, also contains a key ‘error’ with the error message as value.

New in version Natrium.

call.modules.boto3_elasticsearch.describe_elasticsearch_domain(domain_name, region=None, keyid=None, key=None, profile=None)

Given a domain name gets its status description.

Parameters domain_name (str) -- The name of the domain to get the status of.

Return type dict

Returns Dictionary with key ‘result’ and as value a boolean denoting success or failure. Upon success, also contains a key ‘response’ with the domain status information. Upon failure, also contains a key ‘error’ with the error message as value.

New in version Natrium.

call.modules.boto3_elasticsearch.describe_elasticsearch_domain_config(domain_name, region=None, keyid=None, key=None, profile=None)

Provides cluster configuration information about the specified Elasticsearch domain, such as the state, creation date, update version, and update date for cluster options.

Parameters domain_name (str) -- The name of the domain to describe.

Return type dict

Returns Dictionary with key ‘result’ and as value a boolean denoting success or failure. Upon success, also contains a key ‘response’ with the current configuration information. Upon failure, also contains a key ‘error’ with the error message as value.

New in version Natrium.
salt.modules.boto3_elasticsearch.describe_elasticsearch_domains

Returns domain configuration information about the specified Elasticsearch domains, including the domain ID, domain endpoint, and domain ARN.

Parameters
domain_names (list) -- List of domain names to get information for.

Returns
Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with the list of domain status information. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

CLI Example:
salt myminion boto3_elasticsearch.describe_elasticsearch_domains ['"domain_a",
"domain_b"]'

salt.modules.boto3_elasticsearch.describe_elasticsearch_instance_type_limits

Describe Elasticsearch Limits for a given InstanceType and ElasticsearchVersion. When modifying existing Domain, specify the DomainName to know what Limits are supported for modifying.

Parameters

- instance_type (str) -- The instance type for an Elasticsearch cluster for which Elasticsearch Limits are needed.
- elasticsearch_version (str) -- Version of Elasticsearch for which Limits are needed.
- domain_name (str) -- Represents the name of the Domain that we are trying to modify. This should be present only if we are querying for Elasticsearch Limits for existing domain.

Returns
Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with the limits information. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

CLI Example:
salt.myminion.boto3_elasticsearch.describe_elasticsearch_instance_type_limits
  instance_type=r3.8xlarge.elasticsearch
  elasticsearch_version='6.2'

salt.modules.boto3_elasticsearch.describe_reserved_elasticsearch_instance_offering(reserved_elasticsearch_instance_offering_id=None, region=None, keyid=None, key=None, profile=None)

Lists available reserved Elasticsearch instance offerings.

Parameters
  reserved_elasticsearch_instance_offering_id (str) -- The offering identifier filter value. Use this parameter to show only the available offering that matches the specified reservation identifier.

Return type
  dict

Returns
  Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with the list of offerings information. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

salt.modules.boto3_elasticsearch.describe_reserved_elasticsearch_instances(reserved_elasticsearch_instance_id=None, region=None, keyid=None, key=None, profile=None)

Returns information about reserved Elasticsearch instances for this account.

Parameters
  reserved_elasticsearch_instance_id (str) -- The reserved instance identifier filter value. Use this parameter to show only the reservation that matches the specified reserved Elasticsearch instance ID.

Return type
  dict

Returns
  Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with a list of information on reserved instances. Upon failure, also contains a key 'error' with the error message as value.

Note
  Version 1.9.174 of boto3 has a bug in that reserved_elasticsearch_instance_id is considered a required argument, even though the documentation says otherwise.

New in version Natrium.

salt.modules.boto3_elasticsearch.exists(domain_name, region=None, key=None, keyid=None, profile=None)

Given a domain name, check to see if the given domain exists.

Parameters
  domain_name (str) -- The name of the domain to check.

Return type
  dict

Returns
  Dictionary with key 'result' and as value a boolean denoting success or failure. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.
salt.modules.boto3_elasticsearch.get_compatible_elasticsearch_versions(domain_name=None, region=None, keyid=None, key=None, profile=None)

Returns a list of upgrade compatible Elasticsearch versions. You can optionally pass a `domain_name` to get all upgrade compatible Elasticsearch versions for that specific domain.

**Parameters**
- **domain_name** (`str`) -- The name of an Elasticsearch domain.

**Return type** `dict`

**Returns** Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with a list of compatible versions. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

salt.modules.boto3_elasticsearch.get_upgrade_history(domain_name, region=None, keyid=None, key=None, profile=None)

Retrieves the complete history of the last 10 upgrades that were performed on the domain.

**Parameters**
- **domain_name** (`str`) -- The name of an Elasticsearch domain. Domain names are unique across the domains owned by an account within an AWS region. Domain names start with a letter or number and can contain the following characters: a-z (lowercase), 0-9, and -(hyphen).

**Return type** `dict`

**Returns** Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with a list of upgrade histories. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

salt.modules.boto3_elasticsearch.get_upgrade_status(domain_name, region=None, keyid=None, key=None, profile=None)

Retrieves the latest status of the last upgrade or upgrade eligibility check that was performed on the domain.

**Parameters**
- **domain_name** (`str`) -- The name of an Elasticsearch domain. Domain names are unique across the domains owned by an account within an AWS region. Domain names start with a letter or number and can contain the following characters: a-z (lowercase), 0-9, and -(hyphen).

**Return type** `dict`

**Returns** Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with upgrade status information. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

salt.modules.boto3_elasticsearch.list_domain_names(region=None, keyid=None, key=None, profile=None)

Returns the name of all Elasticsearch domains owned by the current user’s account.

**Return type** `dict`
Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with a list of domain names. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

```
salt.modules.boto3_elasticsearch.list_elasticsearch_instance_types(elasticsearch_version, domain_name=None, region=None, keyid=None, key=None, profile=None)
```

List all Elasticsearch instance types that are supported for given ElasticsearchVersion.

Parameters

- **elasticsearch_version (str)** -- Version of Elasticsearch for which list of supported Elasticsearch instance types are needed.
- **domain_name (str)** -- DomainName represents the name of the Domain that we are trying to modify. This should be present only if we are querying for list of available Elasticsearch instance types when modifying existing domain.

Return type dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with a list of Elasticsearch instance types. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

```
salt.modules.boto3_elasticsearch.list_elasticsearch_versions(region=None, keyid=None, key=None, profile=None)
```

List all supported Elasticsearch versions.

Return type dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with a list of Elasticsearch versions. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

```
salt.modules.boto3_elasticsearch.list_tags(domain_name=None, arn=None, region=None, key=None, keyid=None, profile=None)
```

Returns all tags for the given Elasticsearch domain.

Return type dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with a dict of tags. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.
salt.modules.boto3_elasticsearch.purchase_reserved_elasticsearch_instance_offering(reserved_elasticsearch_instance_offering_id, reservation_name, instance_count=None, region=None, keyid=None, key=None, profile=None)

Allows you to purchase reserved Elasticsearch instances.

Parameters

- **reserved_elasticsearch_instance_offering_id** *(str)* -- The ID of the reserved Elasticsearch instance offering to purchase.
- **reservation_name** *(str)* -- A customer-specified identifier to track this reservation.
- **instance_count** *(int)* -- The number of Elasticsearch instances to reserve.

Return type **dict**

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with purchase information. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

salt.modules.boto3_elasticsearch.remove_tags(tag_keys, domain_name=None, arn=None, region=None, key=None, keyid=None, profile=None)

Removes the specified set of tags from the specified Elasticsearch domain.

Parameters

- **tag_keys** *(list)* -- List with tag keys you want to remove from the Elasticsearch domain.
- **domain_name** *(str)* -- The name of the Elasticsearch domain you want to remove tags from.
- **arn** *(str)* -- The ARN of the Elasticsearch domain you want to remove tags from. Specifying this overrides domain_name.

Return type **dict**

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

CLI Example:

```
salt myminion boto3_elasticsearch.remove_tags \['"foo", "bar"\'] domain_name=my_domain
```
s alt.modules.boto3_elasticsearch.\texttt{\textbf{start}}\texttt{\_elasticsearch\_service\_software\_update}(\textit{domain\_name}, \\
region=\textit{None}, \\
keyid=\textit{None}, \\
key=\textit{None}, \\
profile=\textit{None})

Schedules a service software update for an Amazon ES domain.

- **Parameters** \texttt{domain\_name (str)} -- The name of the domain that you want to update to the latest service software.

- **Return type** \texttt{dict}

- **Returns** Dictionary with key ‘result’ and as value a boolean denoting success or failure. Upon success, also contains a key ‘response’ with service software information. Upon failure, also contains a key ‘error’ with the error message as value.

New in version Natrium.

s alt.modules.boto3_elasticsearch.\texttt{\textbf{update}}\texttt{\_elasticsearch\_domain\_config}(\textit{domain\_name}, \\
elasticsearch\_cluster\_config=\textit{None}, \\
ebs\_options=\textit{None}, \\
vpc\_options=\textit{None}, \\
access\_policies=\textit{None}, \\
snapshot\_options=\textit{None}, \\
cognito\_options=\textit{None}, \\
advanced\_options=\textit{None}, \\
log\_publishing\_options=\textit{None}, \\
blocking=\textit{False}, \\
region=\textit{None}, \\
key=\textit{None}, \\
keyid=\textit{None}, \\
profile=\textit{None})

Modifies the cluster configuration of the specified Elasticsearch domain, for example setting the instance type and the number of instances.

- **Parameters**
  - \texttt{domain\_name (str)} -- The name of the Elasticsearch domain that you are creating. Domain names are unique across the domains owned by an account within an AWS region. Domain names must start with a letter or number and can contain the following characters: a-z (lowercase), 0-9, and - (hyphen).
  - \texttt{elasticsearch\_cluster\_config (dict)} -- Dictionary specifying the configuration options for an Elasticsearch domain. Keys (case sensitive) in here are:
    - InstanceType (str): The instance type for an Elasticsearch cluster.
    - InstanceCount (int): The instance type for an Elasticsearch cluster.
    - DedicatedMasterEnabled (bool): Indicate whether a dedicated master node is enabled.
- ZoneAwarenessEnabled (bool): Indicate whether zone awareness is enabled.
- ZoneAwarenessConfig (dict): Specifies the zone awareness configuration for a domain when zone awareness is enabled. Keys (case sensitive) in here are:
  - AvailabilityZoneCount (int): An integer value to indicate the number of availability zones for a domain when zone awareness is enabled. This should be equal to number of subnets if VPC endpoints is enabled.
- DedicatedMasterType (str): The instance type for a dedicated master node.
- DedicatedMasterCount (int): Total number of dedicated master nodes, active and on standby, for the cluster.
- ebs_options (dict) -- Dict specifying the options to enable or disable and specifying the type and size of EBS storage volumes. Keys (case sensitive) in here are:
  - EBSEnabled (bool): Specifies whether EBS-based storage is enabled.
  - VolumeType (str): Specifies the volume type for EBS-based storage.
  - VolumeSize (int): Integer to specify the size of an EBS volume.
  - Iops (int): Specifies the IOPD for a Provisioned IOPS EBS volume (SSD).
- snapshot_options (dict) -- Dict specifying the snapshot options. Keys (case sensitive) in here are:
  - AutomatedSnapshotStartHour (int): Specifies the time, in UTC format, when the service takes a daily automated snapshot of the specified Elasticsearch domain. Default value is 0 hours.
- vpc_options (dict) -- Dict with the options to specify the subnets and security groups for the VPC endpoint. Keys (case sensitive) in here are:
  - SubnetIds (list): The list of subnets for the VPC endpoint.
  - SecurityGroupIds (list): The list of security groups for the VPC endpoint.
- cognito_options (dict) -- Dict with options to specify the cognito user and identity pools for Kibana authentication. Keys (case sensitive) in here are:
  - Enabled (bool): Specifies the option to enable Cognito for Kibana authentication.
  - UserPoolId (str): Specifies the Cognito user pool ID for Kibana authentication.
  - IdentityPoolId (str): Specifies the Cognito identity pool ID for Kibana authentication.
  - RoleArn (str): Specifies the role ARN that provides Elasticsearch permissions for accessing Cognito resources.
- advanced_options (dict) -- Dict with option to allow references to indices in an HTTP request body. Must be False when configuring access to individual sub-resources. By default, the value is True. See http://docs.aws.amazon.com/elasticsearch-service/latest/developerguide/es-createupdatedomains.html#es-createdomain-configure-advanced-options for more information.
- access_policies (str/dict) -- Dict or JSON string with the IAM access policy.
- log_publishing_options (dict) -- Dict with options for various type of logs. The keys denote the type of log file and can be one of the following:

  INDEX_SLOW_LOGS, SEARCH_SLOW_LOGS, ES_APPLICATION_LOGS.

The value assigned to each key is a dict with the following case sensitive keys:
- CloudWatchLogsLogGroupArn (str): The ARN of the Cloudwatch log group to which the log needs to be published.
- Enabled (bool): Specifies whether given log publishing option is enabled or not.

- **blocking (bool)** -- Whether or not to wait (block) until the Elasticsearch domain has been updated.

**Return type**  
dict

**Returns** Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with the domain configuration. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

CLI Example:

```python
salt myminion boto3_elasticsearch.update_elasticsearch_domain_config mydomain 
  elasticsearch_cluster_config='{"InstanceType": "t2.micro.elasticsearch", 
  "InstanceCount": 1, 
  "DedicatedMasterEnabled": false,
  "ZoneAwarenessEnabled": false}' 
  ebs_options='{"EBSEnabled": true, 
  "VolumeType": "gp2", 
  "VolumeSize": 10, 
  "Iops": 0}'} 
  access_policies='{"Version": "2012-10-17", "Statement": [{
  "Effect": "Allow", "Principal": {"AWS": "*"}, "Action": "es:*", 
  "Condition": {"IpAddress": {"aws:SourceIp": ["127.0.0.1"]}}}]}' 
  snapshot_options='{"AutomatedSnapshotStartHour": 0}'} 
  advanced_options='{"rest.action.multi.allow_explicit_index": "true"}'}
```

**salt.modules.boto3_elasticsearch.upgrade_elasticsearch_domain(domain_name, target_version, perform_check_only=None, blocking=False, region=None, keyid=None, key=None, profile=None)**

Allows you to either upgrade your domain or perform an Upgrade eligibility check to a compatible Elasticsearch version.

**Parameters**

- **domain_name (str)** -- The name of an Elasticsearch domain. Domain names are unique across the domains owned by an account within an AWS region. Domain names start with a letter or number and can contain the following characters: a-z (lowercase), 0-9, and -(hyphen).

- **target_version (str)** -- The version of Elasticsearch that you intend to upgrade the domain to.

- **perform_check_only (bool)** -- This flag, when set to True, indicates that an Upgrade Eligibility Check needs to be performed. This will not actually perform the Upgrade.
• **blocking** *(bool)* -- Whether or not to wait (block) until the Elasticsearch domain has been upgraded.

**Return type** *dict*

**Returns** Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with the domain configuration. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

CLI Example:

```
salt myminion boto3_elasticsearch.upgrade_elasticsearch_domain mydomain
  target_version='6.7'
  perform_check_only=True
```

salt.modules.boto3_elasticsearch.wait_for_upgrade *(domain_name, region=None, keyid=None, key=None, profile=None)*

Block until an upgrade-in-progress for domain name is finished.

**Parameters**

- **name** *(str)* -- The name of the domain to wait for.

**Return type** *dict*

**Returns** Dictionary with key 'result' and as value a boolean denoting success or failure. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

### 21.9.40 salt.modules.boto3_route53 module

Execution module for Amazon Route53 written against Boto 3

New in version 2017.7.0.

**configuration** This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
route53.keyid: GKTADJGHEIQXSXMKKRBJ08H
route53.key: askdjghsdfjkghWupUjasdflkdlgjsdfjajkghs
```

A region may also be specified in the configuration:

```
route53.region: us-east-1
```

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQXSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdlgjsdfjajkghs
  region: us-east-1
```
Note that Route53 essentially ignores all (valid) settings for 'region', since there is only one End-point (in us-east-1 if you care) and any (valid) region setting will just send you there. It is entirely safe to set it to None as well.

depends boto3

salt.modules.boto3_route53.associate_vpc_with_hosted_zone(HostedZoneId=None,
Name=None, VPC-
CId=None, VPC-
Name=None, VPCRe-
gion=None, Com-
ment=None, re-
gion=None, key=None,
keyid=None, pro-
file=None)

Associates an Amazon VPC with a private hosted zone.

To perform the association, the VPC and the private hosted zone must already exist. You can't convert a public hosted zone into a private hosted zone. If you want to associate a VPC from one AWS account with a zone from another, the AWS account owning the hosted zone must first submit a CreateVPCAssociationAuthorization (using create_vpc_association_authorization() or by other means, such as the AWS console). With that done, the account owning the VPC can then call associate_vpc_with_hosted_zone() to create the association.

Add that if both sides happen to be within the same account, associate_vpc_with_hosted_zone() is enough on its own, and there is no need for the CreateVPCAssociationAuthorization step.

Also note that looking up hosted zones by name (e.g. using the Name parameter) only works within a single account - if you're associating a VPC to a zone in a different account, as outlined above, you unfortunately MUST use the HostedZoneId parameter exclusively.

**HostedZoneId** The unique Zone Identifier for the Hosted Zone.

**Name** The domain name associated with the Hosted Zone(s).

**VPCId** When working with a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCName.

**VPCName** When working with a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCId.

**VPCRegion** When working with a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from VPCId or VPCName, if possible. If this fails, you'll need to provide an explicit value for VPCRegion.

**Comment** Any comments you want to include about the change being made.

CLI Example:

```bash
salt myminion boto3_route53.associate_vpc_with_hosted_zone
--- Name=example.org, VPCName=myVPC VPCRegion=us-east-1 Comment="Whoo-hoo! I added another VPC."
```

salt.modules.boto3_route53.aws_encode(x)

An implementation of the encoding required to support AWS's domain name rules defined here:

While AWS's documentation specifies individual ASCII characters which need to be encoded, we instead just try to force the string to one of escaped unicode or idna depending on whether there are non-ASCII characters present.

This means that we support things like `åöäö` as a domain name string.

More information about IDNA encoding in python is found here:
salt.modules.boto3_route53.change_resource_record_sets(HostedZoneId=None,
Name=None, PrivateZone=None, ChangeBatch=None, region=None,
key=None, keyid=None, profile=None)

See the AWS Route53 API docs as well as the Boto3 documentation for all the details...

The syntax for a ChangeBatch parameter is as follows, but note that the permutations of allowed parameters and combinations thereof are quite varied, so perusal of the above linked docs is highly recommended for any non-trival configurations.

```json
{
  "Comment": "string",
  "Changes": [
    {
      "Action": "CREATE"|"DELETE"|"UPSERT",
      "ResourceRecordSet": {
        "Name": "string",
        "Type": "SOA"|"A"|"TXT"|"NS"|"CNAME"|"MX"|"NAPTR"|"PTR"|"SRV"|"SPF"|"AAAA",
        "SetIdentifier": "string",
        "Weight": 123,
        "Region": "us-east-1"|"us-east-2"|"us-west-1"|"us-west-2"|"ca-central-1"|"eu-west-1"|"eu-west-2"|"eu-central-1"|"ap-southeast-1"|"ap-southeast-2"|"ap-northeast-1"|"ap-northeast-2"|"sa-east-1"|"cn-north-1"|"ap-south-1",
        "GeoLocation": {
          "ContinentCode": "string",
          "CountryCode": "string",
          "SubdivisionCode": "string"
        },
        "Failover": "PRIMARY"|"SECONDARY",
        "TTL": 123,
        "ResourceRecords": [
          {
            "Value": "string"
          },
        ],
        "AliasTarget": {
          "HostedZoneId": "string",
          "DNSName": "string",
          "EvaluateTargetHealth": True|False
        },
        "HealthCheckId": "string",
        "TrafficPolicyInstanceId": "string"
      }
    }
  ]
}
```

CLI Example:

```json
foo={
  "Name": "my-cname.example.org.",
  "TTL": 600,
  "Type": "CNAME",
  "ResourceRecords": [
```

(continues on next page)
```
{
  "Value": "my-host.example.org"
}
```

```bash
foo=`echo $foo`  # Remove newlines
salt myminion boto3_route53.change_resource_record_sets DomainName=example.org,
  keyid=A1234567890ABCDEF123 key=xblahblahblah
  ChangeBatch="[{'Changes': [{'Action': 'UPSERT', 'ResourceRecordSet': $foo}]}]"
```

salt.modules.boto3_route53.create_hosted_zone(Name, VPCId=None, VPCName=None, VPCRegion=None, CallerReference=None, Comment='', PrivateZone=False, DelegationSetId=None, region=None, key=None, keyid=None, profile=None)

Create a new Route53 Hosted Zone. Returns a Python data structure with information about the newly created Hosted Zone.

**Name**  The name of the domain. This should be a fully-specified domain, and should terminate with a period. This is the name you have registered with your DNS registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request.

**VPCId**  When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCName. Ignored if passed for a non-private zone.

**VPCName**  When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCId. Ignored if passed for a non-private zone.

**VPCRegion**  When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from VPCId or VPCName, if possible. If this fails, you'll need to provide an explicit value for this option. Ignored if passed for a non-private zone.

**CallerReference**  A unique string that identifies the request and that allows create_hosted_zone() calls to be retried without the risk of executing the operation twice. This is a required parameter when creating new Hosted Zones. Maximum length of 128.

**Comment**  Any comments you want to include about the hosted zone.

**PrivateZone**  Boolean - Set to True if creating a private hosted zone.

**DelegationSetId**  If you want to associate a reusable delegation set with this hosted zone, the ID that Amazon Route 53 assigned to the reusable delegation set when you created it. Note that XXX TODO create_delegation_set() is not yet implemented, so you'd need to manually create any delegation sets before utilizing this.

**region**  Region endpoint to connect to.

**key**  AWS key to bind with.

**keyid**  AWS keyid to bind with.

**profile**  Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

**CLI Example:**

```
salt myminion boto3_route53.create_hosted_zone example.org.
```

salt.modules.boto3_route53.delete_hosted_zone(Id, region=None, key=None, keyid=None, profile=None)

Delete a Route53 hosted zone.
CLI Example:

```python
salt myminion boto3_route53.delete_hosted_zone Z1234567890
```

**salt.modules.boto3_route53.delete_hosted_zone_by_domain**

Delete a Route53 hosted zone by domain name, and PrivateZone status if provided.

CLI Example:

```python
salt myminion boto3_route53.delete_hosted_zone_by_domain example.org
```

Disassociates an Amazon VPC from a private hosted zone.

You can't disassociate the last VPC from a private hosted zone. You also can't convert a private hosted zone into a public hosted zone.

Note that looking up hosted zones by name (e.g. using the Name parameter) only works with a single AWS account - if you're disassociating a VPC in one account from a hosted zone in a different account you unfortunately MUST use the HostedZoneId parameter exclusively. XXX FIXME DOCU

**HostedZoneId** The unique Zone Identifier for the Hosted Zone.

**Name** The domain name associated with the Hosted Zone(s).

**VPCId** When working with a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCName.

**VPCName** When working with a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCId.

**VPCRegion** When working with a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from VPCId or VPCName, if possible. If this fails, you'll need to provide an explicit value for VPCRegion.

**Comment** Any comments you want to include about the change being made.

CLI Example:

```python
salt myminion boto3_route53.disassociate_vpc_from_hosted_zone
  Name=example.org, VPCName=myVPC, VPCRegion=us-east-1 Comment=
  "Whoops! Don't wanna talk to this-here zone no more."
```

**salt.modules.boto3_route53.find_hosted_zone**

Find a hosted zone with the given characteristics.

**Id** The unique Zone Identifier for the Hosted Zone. Exclusive with Name.
Name  The domain name associated with the Hosted Zone. Exclusive with Id. Note this has the potential to match more then one hosted zone (e.g. a public and a private if both exist) which will raise an error unless PrivateZone has also been passed in order split the different.

PrivateZone  Boolean - Set to True if searching for a private hosted zone.

region  Region to connect to.

dict  Secret key to be used.

keyid  Access key to be used.

profile  Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:

```
salt myminion boto3_route53.find_hosted_zone Name=salt.org. →profile='{"region": "us-east-1", "keyid": "A12345678AB", "key": "xblahblahblah"}"
```

salt.modules.boto3_route53.get_hosted_zone(Id, region=None, key=None, keyid=None, profile=None)

Return detailed info about the given zone.

Id  The unique Zone Identifier for the Hosted Zone.

region  Region to connect to.

dict  Secret key to be used.

keyid  Access key to be used.

profile  Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:

```
salt myminion boto3_route53.get_hosted_zone Z1234567690 →profile='{"region": "us-east-1", "keyid": "A12345678AB", "key": "xblahblahblah"}"
```

salt.modules.boto3_route53.get_hosted_zones_by_domain(Name, region=None, key=None, keyid=None, profile=None)

Find any zones with the given domain name and return detailed info about them. Note that this can return multiple Route53 zones, since a domain name can be used in both public and private zones.

Name  The domain name associated with the Hosted Zone(s).

region  Region to connect to.

dict  Secret key to be used.

keyid  Access key to be used.

profile  Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:

```
salt myminion boto3_route53.get_hosted_zones_by_domain salt.org. →profile='{"region": "us-east-1", "keyid": "A12345678AB", "key": "xblahblahblah"}"
```

1410 Chapter 21. Salt Module Reference
salt.modules.boto3_route53.get_resource_records(HostedZoneId=None, Name=None, StartRecordName=None, StartRecordType=None, PrivateZone=None, region=None, key=None, keyid=None, profile=None)

Get all resource records from a given zone matching the provided StartRecordName (if given) or all records in the zone (if not), optionally filtered by a specific StartRecordType. This will return any and all RRs matching, regardless of their special AWS flavors (weighted, geolocation, alias, etc.) so your code should be prepared for potentially large numbers of records back from this function - for example, if you’ve created a complex geolocation mapping with lots of entries all over the world providing the same server name to many different regional clients.

If you want EXACTLY ONE record to operate on, you’ll need to implement any logic required to pick the specific RR you care about from those returned.

Note that if you pass in Name without providing a value for PrivateZone (either True or False), CommandExecutionError can be raised in the case of both public and private zones matching the domain. XXX FIXME DOCU

CLI example:

```
salt myminion boto3_route53.get_records test.example.org example.org A
```

salt.modules.boto3_route53.list_hosted_zones(DelegationSetId=None, region=None, key=None, keyid=None, profile=None)

Return detailed info about all zones in the bound account.

DelegationSetId If you’re using reusable delegation sets and you want to list all of the hosted zones that are associated with a reusable delegation set, specify the ID of that delegation set.

region Region to connect to.

deploy key Secret key to be used.

deploy keyid Access key to be used.

profile Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:

```
salt myminion boto3_route53.describe_hosted_zones profile='{
  "region": "us-east-1", "keyid": "A12345678AB", "key": "xblahblahblah"'}
```

salt.modules.boto3_route53.update_hosted_zone_comment(Id=None, Name=None, Comment=None, PrivateZone=None, region=None, key=None, keyid=None, profile=None)

Update the comment on an existing Route 53 hosted zone.

Id The unique Zone Identifier for the Hosted Zone.

Name The domain name associated with the Hosted Zone(s).

Comment Any comments you want to include about the hosted zone.

PrivateZone Boolean - Set to True if changing a private hosted zone.

CLI Example:

```
salt myminion boto3_route53.update_hosted_zone_comment Name=example.org.
  Comment="This is an example comment for an example zone"
```
21.9.41 salt.modules.boto3_sns module

Connection module for Amazon SNS

**configuration**

This module accepts explicit sns credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
sns.keyid: GKTADJGHEIQSXMKKRBJ08H
sns.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
sns.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

depends boto3

salt.modules.boto3_sns.create_topic(Name, region=None, key=None, keyid=None, profile=None)

Create an SNS topic.

CLI example:

```
salt myminion boto3_sns.create_topic mytopic region=us-east-1
```

salt.modules.boto3_sns.delete_topic(TopicArn, region=None, key=None, keyid=None, profile=None)

Delete an SNS topic.

CLI example:

```
salt myminion boto3_sns.delete_topic mytopic region=us-east-1
```

salt.modules.boto3_sns.describe_topic(name, region=None, key=None, keyid=None, profile=None)

Returns details about a specific SNS topic, specified by name or ARN.

CLI example:

```
salt my_favorite_client boto3_sns.describe_topic a_sns_topic_of_my_choice
```

salt.modules.boto3_sns.get_subscription_attributes(SubscriptionArn, region=None, key=None, keyid=None, profile=None)

Returns all of the properties of a subscription.
CLI example:
```
salt myminion boto3_sns.get_subscription_attributes somesubscription region=us-west-1
```

```
salt.modules.boto3_sns.get_topic_attributes(TopicArn, region=None, key=None, keyid=None, profile=None)
```

Returns all of the properties of a topic. Topic properties returned might differ based on the authorization of the user.

CLI example:
```
salt myminion boto3_sns.get_topic_attributes someTopic region=us-west-1
```

```
salt.modules.boto3_sns.list_subscriptions(region=None, key=None, keyid=None, profile=None)
```

Returns a list of the requester's topics

CLI example:
```
salt myminion boto3_sns.list_subscriptions region=us-east-1
```

```
salt.modules.boto3_sns.list_subscriptions_by_topic(TopicArn, region=None, key=None, keyid=None, profile=None)
```

Returns a list of the subscriptions to a specific topic

CLI example:
```
salt myminion boto3_sns.list_subscriptions_by_topic mytopic region=us-east-1
```

```
salt.modules.boto3_sns.list_topics(region=None, key=None, keyid=None, profile=None)
```

Returns a list of the requester's topics

CLI example:
```
salt myminion boto3_sns.list_topics
```

```
salt.modules.boto3_sns.set_subscription_attributes(SubscriptionArn, AttributeName, AttributeValue, region=None, key=None, keyid=None, profile=None)
```

Set an attribute of a subscription to a new value.

CLI example:
```
salt myminion boto3_sns.set_subscription_attributes someSubscription RawMessageDelivery jsonStringValue
```

```
salt.modules.boto3_sns.set_topic_attributes(TopicArn, AttributeName, AttributeValue, region=None, key=None, keyid=None, profile=None)
```

Set an attribute of a topic to a new value.

CLI example:
```
salt myminion boto3_sns.set_topic_attributes someTopic DisplayName myDisplayNameValue
```

21.9. execution modules
salt.modules.boto3_sns.subscribe(TopicArn, Protocol, Endpoint, region=None, key=None, keyid=None, profile=None)

Subscribe to a Topic.

CLI example:
```
salt myminion boto3_sns.subscribe mytopic https https://www.example.com/sns-endpoint
```

salt.modules.boto3_sns.topic_exists(name, region=None, key=None, keyid=None, profile=None)

Check to see if an SNS topic exists.

CLI example:
```
salt myminion boto3_sns.topic_exists mytopic region=us-east-1
```

salt.modules.boto3_sns.unsubscribe(SubscriptionArn, region=None, key=None, keyid=None, profile=None)

Unsubscribe a specific SubscriptionArn of a topic.

CLI Example:
```
salt myminion boto3_sns.unsubscribe my_subscription_arn region=us-east-1
```

21.9.42 salt.modules.boto_apigateway module

Connection module for Amazon APIGateway

New in version 2016.11.0.

depends

- boto >= 2.8.0
- boto3 >= 1.2.1
- botocore >= 1.4.49

configuration This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance trough Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
apigateway.keyid: GKTADJGHEIQSXMKKRBJ08H
apigateway.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
apigateway.region: us-west-2
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-west-2

Changed in version 2015.8.0: All methods now return a dictionary. Create and delete methods return:

```yaml
created: true
```

or

```yaml
created: false
eroerror:
  message: error message
```

Request methods (e.g. describe_apigateway) return:

```yaml
apigateway:
  - {...}
  - {...}
```

or

```yaml
error:
  message: error message
```

`salt.modules.boto_apigateway.activate_api_deployment`:

```python
salt.modules.boto_apigateway.activate_api_deployment(restApiId, stageName, deploymentId, region=None, key=None, keyid=None, profile=None)
```

Activates previously deployed deployment for a given stage

CLI Example:

```bash
salt myminion boto_apigateway.activate_api_deployment restApiId stagename=deploymentId
```

`salt.modules.boto_apigateway.api_exists`:

```python
salt.modules.boto_apigateway.api_exists(name, description=None, region=None, key=None, keyid=None, profile=None)
```

Check to see if the given Rest API Name and optionally description exists.

CLI Example:

```bash
salt myminion boto_apigateway.exists myapi_name
```

`salt.modules.boto_apigateway.api_model_exists`:

```python
salt.modules.boto_apigateway.api_model_exists(restApiId, modelName, region=None, key=None, keyid=None, profile=None)
```

Check to see if the given modelName exists in the given restApiId

CLI Example:

```bash
salt myminion boto_apigateway.api_model_exists restApiId modelName
```

`salt.modules.boto_apigateway.associate_api_key_stagekeys`:

```python
salt.modules.boto_apigateway.associate_api_key_stagekeys(apiKey, stagekeyslist, region=None, key=None, keyid=None, profile=None)
```

associate the given stagekeyslist to the given apiKey.
CLI Example:
```
salt myminion boto_apigateway.associate_stagekeys_api_key
  api_key '"["restapi id/stage name", ...]'
```

salt.modules.boto_apigateway.attach_usage_plan_to_apis(plan_id, apis, region=None, key=None, keyid=None, profile=None)

Attaches given usage plan to each of the apis provided in a list of apid and stage values

New in version 2017.7.0.

apis  a list of dictionaries, where each dictionary contains the following:
  apid  a string, which is the id of the created API in AWS ApiGateway
  stage  a string, which is the stage that the created API is deployed to.

CLI Example:
```
salt myminion boto_apigateway.attach_usage_plan_to_apis plan_id='usage plan id'
  apis='[{"apid": "some id 1", "stage": "some stage 1"}]'
```

salt.modules.boto_apigateway.create_api(name, description, cloneFrom=None, region=None, key=None, keyid=None, profile=None)

Create a new REST API Service with the given name

Returns {created: True} if the rest api was created and returns {created: False} if the rest api was not created.

CLI Example:
```
salt myminion boto_apigateway.create_api myapi_name api_description
```

salt.modules.boto_apigateway.create_api_deployment(restApiId, stageName, stageDescription='', description='', cacheClusterEnabled=False, cacheClusterSize='0.5', variables=None, region=None, key=None, keyid=None, profile=None)

Creates a new API deployment.

CLI Example:
```
salt myminion boto_apigateway.create_api_deployent restApiId stagename
  stageDescription='' \ description='' cacheClusterEnabled=True|False cacheClusterSize=0.5 variables='{"name": "value"}'
```

salt.modules.boto_apigateway.create_api_integration(restApiId, resourcePath, httpMethod, integrationType, integrationHttpMethod, uri, credentials, requestParameters=None, requestTemplates=None, region=None, key=None, keyid=None, profile=None)

Creates an integration for a given method in a given API. If integrationType is MOCK, uri and credential parameters will be ignored.
uri is in the form of (substitute APIGATEWAY_REGION and LAMBDA_FUNC_ARN)

credentials is in the form of an iam role name or role arn.

CLI Example:

```
salt myminion boto_apigateway.create_api_integration restApiId resourcePath
  httpMethod
  integrationType integrationHttpMethod uri credentials ['{}']
```

```
salt.modules.boto_apigateway.create_api_integration_response
  (restApiId, resourcePath, httpMethod, statusCode, selectionPattern, responseParameters=None, responseTemplates=None, region=None, key=None, keyid=None, profile=None)
```

Creates an integration response for a given method in a given API

CLI Example:

```
salt myminion boto_apigateway.create_api_integration_response
  restApiId resourcePath httpMethod
  statusCode selectionPattern ['{}'] ['{}']
```

```
salt.modules.boto_apigateway.create_api_key
  (name, description, enabled=True, stageKeys=None, region=None, key=None, keyid=None, profile=None)
```

Create an API key given name and description.

An optional enabled argument can be provided. If provided, the valid values are True|False. This argument
defaults to True.

An optional stageKeys argument can be provided in the form of list of dictionary with 'restApiId' and 'stage-
Name' as keys.

CLI Example:

```
salt myminion boto_apigateway.create_api_key
  name description
salt myminion boto_apigateway.create_api_key
  name description enabled=False
salt myminion boto_apigateway.create_api_key
  name description stageKeys='[["restApiId": "id", "stageName": "stagename"]]
```

```
salt.modules.boto_apigateway.create_api_method
  (restApiId, resourcePath, httpMethod, authorizationType, apiKeyRequired=False, requestParameters=None, requestModels=None, region=None, key=None, keyid=None, profile=None)
```

Creates API method for a resource in the given API

CLI Example:
salt.myminion boto_apigateway.create_api_method restApiId resourcePath,\n  httpMethod, authorizationType, \n  apiKeyRequired=False, requestParameters='{"name", "value"}', requestModels='{"content-type", "value"}'

salt.modules.boto_apigateway.create_api_method_response(restApiId, resourcePath, httpMethod, statusCode, responseParameters=None, responseModels=None, region=None, key=None, keyid=None, profile=None)

Create API method response for a method on a given resource in the given API

CLI Example:

salt myminion boto_apigateway.create_api_method_response restApiId resourcePath \n  httpMethod statusCode \n  \n  apiKeyRequired=False, requestParameters='{"name", "value"}', requestModels='{"content-type", "value"}'

salt.modules.boto_apigateway.create_api_model(restApiId, modelName, modelDescription, schema, contentType='application/json', region=None, key=None, keyid=None, profile=None)

Create a new model in a given API with a given schema, currently only contentType supported is 'application/json'

CLI Example:

salt myminion boto_apigateway.create_api_model restApiId modelName \n  modelDescription '<schema>' 'content-type'

salt.modules.boto_apigateway.create_api_resources(restApiId, path, region=None, key=None, keyid=None, profile=None)

Given rest api id, and an absolute resource path, create all the resources and return all resources in the resourcepath, returns False on failure.

CLI Example:

salt myminion boto_apigateway.create_api_resources myapi_id resource_path

salt.modules.boto_apigateway.create_api_stage(restApiId, stageName, deploymentId, description='', cacheClusterEnabled=False, cacheClusterSize='0.5', variables=None, region=None, key=None, keyid=None, profile=None)

Creates a new API stage for a given restApild and deploymentId.

CLI Example:

salt myminion boto_apigateway.create_api_stage restApiId stagename deploymentId \n  description='' cacheClusterEnabled=True|False cacheClusterSize='0.5' \n  variables='{"name": "value"}'

salt.modules.boto_apigateway.create_usage_plan(name, description=None, throttle=None, quota=None, region=None, key=None, keyid=None, profile=None)
Creates a new usage plan with throttling and quotas optionally applied

New in version 2017.7.0.

**name**  Name of the usage plan

**throttle**  A dictionary consisting of the following keys:

- **rateLimit**  requests per second at steady rate, float
- **burstLimit**  maximum number of requests per second, integer

**quota**  A dictionary consisting of the following keys:

- **limit**  number of allowed requests per specified quota period [required if quota parameter is present]
- **offset**  number of requests to be subtracted from limit at the beginning of the period [optional]
- **period**  quota period, must be one of DAY, WEEK, or MONTH. [required if quota parameter is present]

CLI Example:

```text
salt myminion boto_apigateway.create_usage_plan name='usage plan name' throttle='{
  "rateLimit": 10.0, "burstLimit": 10}'
```

```python
salt.modules.boto_apigateway.delete_api(name, description=None, region=None, key=None, keyid=None, profile=None)
```

Delete all REST API Service with the given name and an optional API description

Returns {deleted: True, count: deleted_count} if apis were deleted, and returns {deleted: False} if error or not found.

CLI Example:

```text
salt myminion boto_apigateway.delete_api myapi_name
salt myminion boto_apigateway.delete_api myapi_name description='api description'
```

```python
salt.modules.boto_apigateway.delete_api_deployment(restApiId, deploymentId, region=None, key=None, keyid=None, profile=None)
```

Deletes API deployment for a given restApiId and deploymentID

CLI Example:

```text
salt myminion boto_apigateway.delete_api_deployent restApiId deploymentId
```

```python
salt.modules.boto_apigateway.delete_api_integration(restApiId, resourcePath, httpMethod, region=None, key=None, keyid=None, profile=None)
```

Deletes an integration for a given method in a given API

CLI Example:

```text
salt myminion boto_apigateway.delete_api_integration restApiId resourcePath
  --httpMethod
```
salt.modules.boto_apigateway.delete_api_integration_response(restApiId, resourcePath, httpMethod, statusCode, region=None, key=None, keyid=None, profile=None)

Deletes an integration response for a given method in a given API

CLI Example:
salt myminion boto_apigateway.delete_api_integration_response restApiId resourcePath httpMethod statusCode

salt.modules.boto_apigateway.delete_api_key(apiKey, region=None, key=None, keyid=None, profile=None)

Deletes a given apiKey

CLI Example:
salt myminion boto_apigateway.delete_api_key apiKeystring

salt.modules.boto_apigateway.delete_api_method(restApiId, resourcePath, httpMethod, region=None, key=None, keyid=None, profile=None)

Delete API method for a resource in the given API

CLI Example:
salt myminion boto_apigateway.delete_api_method restApiId resourcePath httpMethod

salt.modules.boto_apigateway.delete_api_method_response(restApiId, resourcePath, httpMethod, statusCode, region=None, key=None, keyid=None, profile=None)

Delete API method response for a resource in the given API

CLI Example:
salt myminion boto_apigateway.delete_api_method_response restApiId resourcePath httpMethod statusCode

salt.modules.boto_apigateway.delete_api_model(restApiId, modelName, region=None, key=None, keyid=None, profile=None)

Delete a model identified by name in a given API

CLI Example:
salt myminion boto_apigateway.delete_api_model restApiId modelName

salt.modules.boto_apigateway.delete_api_resources(restApiId, path, region=None, key=None, keyid=None, profile=None)

Given restApiId and an absolute resource path, delete the resources starting from the absolute resource path. If resourcepath is the root resource '/', the function will return False. Returns False on failure.

CLI Example:
salt myminion boto_apigateway.delete_api_resources myapi_id, resource_path

salt.modules.boto_apigateway.delete_api_stage(restApiId, stageName, region=None, key=None, keyid=None, profile=None)

Deletes stage identified by stageName from API identified by restApiId

CLI Example:
salt myminion boto_apigateway.delete_api_stage restApiId stageName

salt.modules.boto_apigateway.delete_usage_plan(plan_id, region=None, key=None, keyid=None, profile=None)

Deletes usage plan identified by plan_id

New in version 2017.7.0.

CLI Example:
salt myminion boto_apigateway.delete_usage_plan plan_id='usage plan id'

salt.modules.boto_apigateway.describe_api_deployment(restApiId, deploymentId, region=None, key=None, keyid=None, profile=None)

Get API deployment for a given restApiId and deploymentId.

CLI Example:
salt myminion boto_apigateway.describe_api_deployment restApiId deploymentId

salt.modules.boto_apigateway.describe_api_deployments(restApiId, region=None, key=None, keyid=None, profile=None)

Gets information about the defined API Deployments. Return list of api deployments.

CLI Example:
salt myminion boto_apigateway.describe_api_deployments restApiId

salt.modules.boto_apigateway.describe_api_integration(restApiId, resourcePath, httpMethod, region=None, key=None, keyid=None, profile=None)

Get an integration for a given method in a given API

CLI Example:
salt myminion boto_apigateway.describe_api_integration restApiId resourcePath=resourcePath httpMethod

salt.modules.boto_apigateway.describe_api_integration_response(restApiId, resourcePath, httpMethod, statusCode, region=None, key=None, keyid=None, profile=None)

Get an integration response for a given method in a given API
CLI Example:

```bash
salt myminion boto_apigateway.describe_api_integration_response restApiId resourcePath httpMethod statusCode
```

salt.modules.boto_apigateway.describe_api_key(apiKey, region=None, key=None, keyid=None, profile=None)

Gets info about the given api key

CLI Example:

```bash
salt myminion boto_apigateway.describe_api_key apigw_api_key
```

salt.modules.boto_apigateway.describe_api_keys(region=None, key=None, keyid=None, profile=None)

Gets information about the defined API Keys. Return list of apiKeys.

CLI Example:

```bash
salt myminion boto_apigateway.describe_api_keys
```

salt.modules.boto_apigateway.describe_api_method(restApiId, resourcePath, httpMethod, region=None, key=None, keyid=None, profile=None)

Get API method for a resource in the given API

CLI Example:

```bash
salt myminion boto_apigateway.describe_api_method restApiId resourcePath httpMethod
```

salt.modules.boto_apigateway.describe_api_method_response(restApiId, resourcePath, httpMethod, status-Code, region=None, key=None, keyid=None, profile=None)

Get API method response for a resource in the given API

CLI Example:

```bash
salt myminion boto_apigateway.describe_api_method_response restApiId resourcePath httpMethod statusCode
```

salt.modules.boto_apigateway.describe_api_model(restApiId, modelName, flatten=True, region=None, key=None, keyid=None, profile=None)

Get a model by name for a given API

CLI Example:

```bash
salt myminion boto_apigateway.describe_api_model restApiId modelName [True]
```

salt.modules.boto_apigateway.describe_api_models(restApiId, region=None, key=None, keyid=None, profile=None)

Get all models for a given API

CLI Example:

```bash
salt myminion boto_apigateway.describe_api_models restApiId
```
salt.modules.boto_apigateway.describe_api_resource

Given rest api id, and an absolute resource path, returns the resource id for the given path.

CLI Example:
```
salt myminion boto_apigateway.describe_api_resource myapi_id resource_path
```

salt.modules.boto_apigateway.describe_api_resource_method

Given rest api id, resource path, and http method (must be one of DELETE, GET, HEAD, OPTIONS, PATCH, POST, PUT), return the method for the api/resource path if defined. Return False if method is not defined.

CLI Example:
```
salt myminion boto_apigateway.describe_api_resource_method myapi_id resource_path httpmethod
```

salt.modules.boto_apigateway.describe_api_resources

Given rest api id, return all resources for this api.

CLI Example:
```
salt myminion boto_apigateway.describe_api_resources myapi_id
```

salt.modules.boto_apigateway.describe_api_stage

Get API stage for a given apiID and stage name

CLI Example:
```
salt myminion boto_apigateway.describe_api_stage restApiId stageName
```

salt.modules.boto_apigateway.describe_api_stages

Get all API stages for a given apiID and deploymentID

CLI Example:
```
salt myminion boto_apigateway.describe_api_stages restApiId deploymentId
```

salt.modules.boto_apigateway.describe_apis

Returns all rest apis in the defined region. If optional parameter name is included, returns all rest apis matching the name in the defined region.

CLI Example:
```
salt myminion boto_apigateway.describe_apis
salt myminion boto_apigateway.describe_apis name='api name'
salt myminion boto_apigateway.describe_apis name='api name' description='desc str'
```
salt.modules.boto_apigateway.describe_usage_plans(name=None, plan_id=None, region=None, key=None, keyid=None, profile=None)

Returns a list of existing usage plans, optionally filtered to match a given plan name

New in version 2017.7.0.

CLI Example:
```
salt myminion boto_apigateway.describe_usage_plans
salt myminion boto_apigateway.describe_usage_plans name='usage plan name'
salt myminion boto_apigateway.describe_usage_plans plan_id='usage plan id'
```

salt.modules.boto_apigateway.detach_usage_plan_from_apis(plan_id, apis, region=None, key=None, keyid=None, profile=None)

Detaches given usage plan from each of the apis provided in a list of apiId and stage value

New in version 2017.7.0.

apis  a list of dictionaries, where each dictionary contains the following:
   apiId  a string, which is the id of the created API in AWS ApiGateway
   stage  a string, which is the stage that the created API is deployed to.

CLI Example:
```
salt myminion boto_apigateway.detach_usage_plan_to_apis plan_id='usage plan id'
→apis=['{"apiId": "some id 1", "stage": "some stage 1"}']
```

salt.modules.boto_apigateway.disable_api_key(apiKey, region=None, key=None, keyid=None, profile=None)

disable the given apiKey.

CLI Example:
```
salt myminion boto_apigateway.enable_api_key apiKey
```

salt.modules.boto_apigateway.disassociate_api_key_stagekeys(apiKey, stagekeyslist, region=None, key=None, keyid=None, profile=None)

disassociate the given stagekeyslist to the given apiKey.

CLI Example:
```
salt myminion boto_apigateway.disassociate_api_key_stagekeys apiKey ['"restapi id/stage name", ...']
```

salt.modules.boto_apigateway.enable_api_key(apiKey, region=None, key=None, keyid=None, profile=None)

enable the given apiKey.

CLI Example:
```
salt myminion boto_apigateway.enable_api_key apiKey
```
salt.modules.boto_apigateway.flush_api_stage_cache(restApiId, stageName, region=None, key=None, keyid=None, profile=None)

Flushes cache for the stage identified by stageName from API identified by restApiId

CLI Example:
```
salt myminion boto_apigateway.flush_api_stage_cache restApiId stageName
```

salt.modules.boto_apigateway.overwrite_api_stage_variables(restApiId, stageName, variables, region=None, key=None, keyid=None, profile=None)

Overwrite the stage variables for the given restApiId and stage name with the given variables, variables must be in the form of a dictionary. Overwrite will always remove all the existing stage variables associated with the given restApiId and stage name, follow by the adding of all the variables specified in the variables dictionary

CLI Example:
```
salt myminion boto_apigateway.overwrite_api_stage_variables restApiId stageName variables='{"name": "value"}"
```

salt.modules.boto_apigateway.update_api_key_description(apiKey, description, region=None, key=None, keyid=None, profile=None)

update the given apiKey with the given description.

CLI Example:
```
salt myminion boto_apigateway.update_api_key_description api_key description
```

salt.modules.boto_apigateway.update_api_model_schema(restApiId, modelName, schema, region=None, key=None, keyid=None, profile=None)

update the schema (in python dictionary format) for the given model in the given restApiId

CLI Example:
```
salt myminion boto_apigateway.update_api_model_schema restApiId modelName schema
```

salt.modules.boto_apigateway.update_usage_plan(plan_id, throttle=None, quota=None, region=None, key=None, keyid=None, profile=None)

Updates an existing usage plan with throttling and quotas

New in version 2017.7.0.

**plan_id** Id of the created usage plan

**throttle** A dictionary consisting of the following keys:

- **rateLimit** requests per second at steady rate, float
- **burstLimit** maximum number of requests per second, integer

**quota** A dictionary consisting of the following keys:

- **limit** number of allowed requests per specified quota period [required if quota parameter is present]
- **offset** number of requests to be subtracted from limit at the beginning of the period [optional]
period quota period, must be one of DAY, WEEK, or MONTH. [required if quota parameter is present

CLI Example:

```shell
salt myminion boto_apigateway.update_usage_plan plan_id='usage plan id' throttle=
  
  "rateLimit": 10.0, "burstLimit": 10"
```

## 21.9.43 `salt.modules.boto_asg`

Connection module for Amazon Autoscale Groups

New in version 2014.7.0.

**configuration** This module accepts explicit autoscale credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```yaml
asg.keyid: GKTADJGHEIQSXMKKRBJ08H
asg.key: asdjgjhsdfjkgHwupUjadsdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```yaml
asg.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: asdjgjhsdfjkgHwupUjadsdflkdfklgjsdfjajkghs
  region: us-east-1
```

**depends** boto

**depends** boto3

`salt.modules.boto_asg.create` *(name, launch_config_name, availability_zones, min_size, max_size, desired_capacity=0, load_balancers=0, default_cooldown=0, health_check_type=0, health_check_period=0, placement_group=0, vpc_zone_identifier=0, tags=0, termination_policies=0, suspended_processes=0, scaling_policies=0, scheduled_actions=0, region=0, notification_arn=0, notification_types=0, key=0, keyid=0, profile=0)*

Create an autoscale group.

CLI example:

```shell
salt myminion boto_asg.create myasg mylc "["us-east-1a", "us-east-1e"]" 1 10 load_
  balancers=["myelb", "myelb2"] tags=[{"key": "Name", value="myasg", 
  "propagate_at_launch": True}]"
```
salt.modules.boto_asg.create_launch_configuration(name, image_id, key_name=None, vpc_id=None, vpc_name=None, security_groups=None, user_data=None, instance_type='m1.small', kernel_id=None, ramdisk_id=None, block_device_mappings=None, instance_monitoring=False, spot_price=None, instance_profile_name=None, ebs_optimized=False, associate_public_ip_address=None, volume_type=None, delete_on_termination=True, iops=None, use_block_device_types=False, region=None, key=None, keyid=None, profile=None)

Create a launch configuration.

CLI example:
```
salt myminion boto_asg.create_launch_configuration mylc image_id=ami-0b9c9f62 key_...name='mykey' security_groups='["mygroup"]' instance_type='c3.2xlarge'
```

salt.modules.boto_asg.delete(name, force=False, region=None, key=None, keyid=None, profile=None)

Delete an autoscale group.

CLI example:
```
salt myminion boto_asg.delete myasg region=us-east-1
```

salt.modules.boto_asg.delete_launch_configuration(name, region=None, key=None, keyid=None, profile=None)

Delete a launch configuration.

CLI example:
```
salt myminion boto_asg.delete_launch_configuration mylc
```

salt.modules.boto_asg.describe_launch_configuration(name, region=None, key=None, keyid=None, profile=None)

Dump details of a given launch configuration.

CLI example:
```
salt myminion boto_asg.describe_launch_configuration mylc
```

salt.modules.boto_asg.enter_standby(name, instance_ids, should_decrement_desired_capacity=False, region=None, key=None, keyid=None, profile=None)

Switch desired instances to StandBy mode

New in version 2016.11.0.

CLI example:
```
salt-call boto_asg.enter_standby my_autoscale_group_name '"[i-xxxxxx"]'
```
salt.modules.boto_asg.exists(\textcode{\textit{name}, region=None, key=None, keyid=None, profile=None})
Check to see if an autoscale group exists.

CLI example:
\texttt{salt myminion boto_asg.exists myasg region=us-east-1}\n
salt.modules.boto_asg.exit_standby(\textcode{\textit{name}, instance_ids, should_decrement_desired_capacity=False, region=None, key=None, keyid=None, profile=None})
Exit desired instances from StandBy mode
New in version 2016.11.0.

CLI example:
\texttt{salt-call boto_asg.exit_standby my_autoscale_group_name 'i-xxxxxx'}\n
salt.modules.boto_asg.get_all_groups(\textcode{region=None, key=None, keyid=None, profile=None})
Return all AutoScale Groups visible in the account (as a list of boto.ec2.autoscale.group.AutoScalingGroup).
New in version 2016.11.0.

CLI example:
\texttt{salt-call boto_asg.get_all_groups region=us-east-1 --output yaml}\n
salt.modules.boto_asg.get_all_launch_configurations(\textcode{region=None, key=None, keyid=None, profile=None})
Fetch and return all Launch Configuration with details.

CLI example:
\texttt{salt myminion boto_asg.get_all_launch_configurations}\n
salt.modules.boto_asg.get_cloud_init_mime(\textcode{\textit{cloud_init}})
Get a mime multipart encoded string from a cloud-init dict. Currently supports boothooks, scripts and cloud-config.

CLI Example:
\texttt{salt myminion boto.get_cloud_init_mime <cloud init>}\n
salt.modules.boto_asg.get_config(\textcode{\textit{name}, region=None, key=None, keyid=None, profile=None})
Get the configuration for an autoscale group.

CLI example:
\texttt{salt myminion boto_asg.get_config myasg region=us-east-1}\n
salt.modules.boto_asg.get_instances(\textcode{\textit{name}, lifecycle_state='InService', health_status='Healthy', attribute='private_ip_address', attributes=None, region=None, key=None, keyid=None, profile=None})
return attribute of all instances in the named autoscale group.

CLI example:
\texttt{salt-call boto_asg.get_instances my_autoscale_group_name}
salt.modules.boto_asg.get_scaling_policy_arn(as_group, scaling_policy_name, region=None, key=None, keyid=None, profile=None)

Return the arn for a scaling policy in a specific autoscale group or None if not found. Mainly used as a helper method for boto_cloudwatch_alarm, for linking alarms to scaling policies.

CLI Example:
```
salt '*' boto_asg.get_scaling_policy_arn mygroup mypolicy
```

salt.modules.boto_asg.launch_configuration_exists(name, region=None, key=None, keyid=None, profile=None)

Check for a launch configuration's existence.

CLI example:
```
salt myminion boto_asg.launch_configuration_exists mylc
```

salt.modules.boto_asg.list_groups(region=None, key=None, keyid=None, profile=None)

Return all AutoScale Groups visible in the account (as a list of names).

New in version 2016.11.0.

CLI example:
```
salt-call boto_asg.list_groups region=us-east-1
```

salt.modules.boto_asg.list_launch_configurations(region=None, key=None, keyid=None, profile=None)

List all Launch Configurations.

CLI example:
```
salt myminion boto_asg.list_launch_configurations
```

salt.modules.boto_asg.update(name, launch_config_name, availability_zones, min_size, max_size, desired_capacity=None, load_balancers=None, default_cooldown=None, health_check_type=None, health_check_period=None, placement_group=None, vpc_zone_identifier=None, tags=None, termination_policies=None, scaling_policies=None, scheduled_actions=None, notification_arn=None, notification_types=None, region=None, key=None, keyid=None, profile=None)

Update an autoscale group.

CLI example:
```
salt myminion boto_asg.update myasg mylc ["us-east-1a", "us-east-1e"] 1 10 load_balancers=['"myelb", "myelb2"] tags=['{"key": "Name", value="myasg", "propagate_at_launch": True}]'
```
21.9.44 salt.modules.boto_cfn

Connection module for Amazon Cloud Formation

New in version 2015.5.0.

**configuration** This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cfn.keyid: GKTADJGHEIQSXMKKRBJ08H
fcm.key: askdjghsdfjkgWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
cfn.region: us-east-1
```

**depends** boto

salt.modules.boto_cfn.create(name, template_body=None, template_url=None, parameters=None, notification_arns=None, disable_rollback=None, timeout_in_minutes=None, capabilities=None, tags=None, on_failure=None, stack_policy_body=None, stack_policy_url=None, region=None, key=None, keyid=None, profile=None)

Create a CFN stack.

CLI Example:

```
salt myminion boto_cfn.create mystack template_url='https://s3.amazonaws.com/bucket/template.cft' region=us-east-1
```

salt.modules.boto_cfn.delete(name, region=None, key=None, keyid=None, profile=None)

Delete a CFN stack.

CLI Example:

```
salt myminion boto_cfn.delete mystack region=us-east-1
```

salt.modules.boto_cfn.describe(name, region=None, key=None, keyid=None, profile=None)

Describe a stack.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_cfn.describe mystack region=us-east-1
```

salt.modules.boto_cfn.exists(name, region=None, key=None, keyid=None, profile=None)

Check to see if a stack exists.

CLI Example:

```
salt myminion boto_cfn.exists mystack region=us-east-1
```
salt.modules.boto_cfn.get_template(name, region=None, key=None, keyid=None, profile=None)

Check to see if attributes are set on a CFN stack.

CLI Example:

```
salt myminion boto_cfn.get_template mystack
```

salt.modules.boto_cfn.update_stack(name, template_body=None, template_url=None, parameters=None, notification_arns=None, disable_rollback=False, timeout_in_minutes=None, capabilities=None, tags=None, use_previous_template=None, stack_policy_during_update_body=None, stack_policy_during_update_url=None, stack_policy_body=None, stack_policy_url=None, region=None, key=None, keyid=None, profile=None)

Update a CFN stack.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_cfn.update_stack mystack template_url='https://s3.amazonaws.com/bucket/template.cft' region=us-east-1
```

salt.modules.boto_cfn.validate_template(template_body=None, template_url=None, region=None, key=None, keyid=None, profile=None)

Validate cloudformation template

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_cfn.validate_template mystack-template
```

21.9.45 salt.modules.boto_cloudfront

Connection module for Amazon CloudFront

New in version 2018.3.0.

depends boto3

configuration This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles or it can read them from the ~/.aws/credentials file or from these environment variables: AWS_ACCESS_KEY_ID, AWS_SECRET_ACCESS_KEY. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cloudfront.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudfront.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```
A region may also be specified in the configuration:

```
cloudfront.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkgWupUjasdfkldfklgjsdfjajkghs
  region: us-east-1
```

```
salt.modules.boto_cloudfront.create_distribution(name, config, tags=None, region=None, key=None, keyid=None, profile=None)
```

Create a CloudFront distribution with the given name, config, and (optionally) tags.

```
name Name for the CloudFront distribution
config Configuration for the distribution
tags Tags to associate with the distribution
region Region to connect to
documentation/1432/keys/key
key Secret key to use
keyid Access key to use
profile A dict with region, key, and keyid, or a pillar key (string) that contains such a dict.
```

CLI Example:

```
salt myminion boto_cloudfront.create_distribution name=mydistribution

```

```
salt.modules.boto_cloudfront.export_distributions(region=None, key=None, keyid=None, profile=None)
```

Get details of all CloudFront distributions. Produces results that can be used to create an SLS file.

CLI Example:

```
salt-call boto_cloudfront.export_distributions --out=txt | sed "s/

```

```
salt.modules.boto_cloudfront.get_distribution(name, region=None, key=None, keyid=None, profile=None)
```

Get information about a CloudFront distribution (configuration, tags) with a given name.

```
name Name of the CloudFront distribution
region Region to connect to
documentation/1432/keys/key
key Secret key to use
keyid Access key to use
profile A dict with region, key, and keyid, or a pillar key (string) that contains such a dict.
```

CLI Example:
salt myminion boto_cloudfront.get_distribution name=mydistribution &
    profile=awsprofile

salt.modules.boto_cloudfront.update_distribution(name, config, tags=None, region=None, key=None, keyid=None, profile=None)

Update the config (and optionally tags) for the CloudFront distribution with the given name.

name  Name of the CloudFront distribution
config  Configuration for the distribution
tags  Tags to associate with the distribution
region  Region to connect to
key  Secret key to use
keyid  Access key to use
profile  A dict with region, key, and keyid, or a pillar key (string) that contains such a dict.

CLI Example:
salt myminion boto_cloudfront.update_distribution name=mydistribution &
    profile=awsprofile
    config='{"Comment":"partial configuration",
    "Enabled":true}"

21.9.46 salt.modules.boto_cloudtrail module

Connection module for Amazon CloudTrail
New in version 2016.3.0.

depends
    • boto
    • boto3

The dependencies listed above can be installed via package or pip.

configuration  This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

cloudtrail.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudtrail.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

A region may also be specified in the configuration:

cloudtrail.region: us-east-1

If a region is not specified, the default is us-east-1.
It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```python
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfajkghs
    region: us-east-1
```

```python
salt.modules.boto_cloudtrail.add_tags(Name, region=None, key=None, keyid=None, profile=None, **kwargs)
```

Add tags to a trail

Returns {tagged: true} if the trail was tagged and returns {tagged: False} if the trail was not tagged.

CLI Example:

```bash
salt myminion boto_cloudtrail.add_tags my_trail tag_a=tag_value tag_b=tag_value
```

```python
salt.modules.boto_cloudtrail.create(Name, S3BucketName, S3KeyPrefix=None, SnsTopicName=None, IncludeGlobalServiceEvents=None, IsMultiRegionTrail=None, EnableLogFileValidation=None, CloudWatchLogsLogGroupArn=None, CloudWatchLogsRoleArn=None, KmsKeyId=None, region=None, key=None, keyid=None, profile=None)
```

Given a valid config, create a trail.

Returns {created: true} if the trail was created and returns {created: False} if the trail was not created.

CLI Example:

```bash
salt myminion boto_cloudtrail.create my_trail my_bucket
```

```python
salt.modules.boto_cloudtrail.delete(Name, region=None, key=None, keyid=None, profile=None)
```

Given a trail name, delete it.

Returns {deleted: true} if the trail was deleted and returns {deleted: false} if the trail was not deleted.

CLI Example:

```bash
salt myminion boto_cloudtrail.delete mytrail
```

```python
salt.modules.boto_cloudtrail.describe(Name, region=None, key=None, keyid=None, profile=None)
```

Given a trail name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```bash
salt myminion boto_cloudtrail.describe mytrail
```

```python
salt.modules.boto_cloudtrail.exists(Name, region=None, key=None, keyid=None, profile=None)
```

Given a trail name, check to see if the given trail exists.

Returns True if the given trail exists and returns False if the given trail does not exist.

CLI Example:
```python
salt myminion boto_cloudtrail.exists mytrail

salt.modules.boto_cloudtrail.list(region=None, key=None, keyid=None, profile=None)
List all trails
Returns list of trails
CLI Example:

.. code-block::

   policies:
   - {...}
   - {...}

salt.modules.boto_cloudtrail.list_tags(Name, region=None, key=None, keyid=None, profile=None)
List tags of a trail

Returns

* {...}
* {...}

Return type  tags

CLI Example:

```
salt myminion boto_cloudtrail.list_tags my_trail
```

salt.modules.boto_cloudtrail.remove_tags(Name, region=None, key=None, keyid=None, profile=None, **kwargs)
Remove tags from a trail

Returns {tagged: true} if the trail was tagged and returns {tagged: False} if the trail was not tagged.

CLI Example:

```
salt myminion boto_cloudtrail.remove_tags my_trail tag_a=tag_value tag_b=tag_value
```

salt.modules.boto_cloudtrail.start_logging(Name, region=None, key=None, keyid=None, profile=None)
Start logging for a trail

Returns {started: true} if the trail was started and returns {started: False} if the trail was not started.

CLI Example:

```
salt myminion boto_cloudtrail.start_logging my_trail
```

salt.modules.boto_cloudtrail.status(Name, region=None, key=None, keyid=None, profile=None)
Given a trail name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_cloudtrail.describe mytrail
```

salt.modules.boto_cloudtrail.stop_logging(Name, region=None, key=None, keyid=None, profile=None)
Stop logging for a trail

21.9. execution modules 1435
Returns \{stopped: true\} if the trail was stopped and returns \{stopped: False\} if the trail was not stopped.

CLI Example:

```
salt myminion boto_cloudtrail.stop_logging my_trail
```

salt.modules.boto_cloudtrail.update\((Name, S3BucketName, S3KeyPrefix=None, SnsTopicName=None, IncludeGlobalServiceEvents=None, IsMultiRegionTrail=None, EnableLogFileValidation=None, CloudWatchLogsLogGroupArn=None, CloudWatchLogsRoleArn=None, KmsKeyId=None, region=None, key=None, keyid=None, profile=None)\)

Given a valid config, update a trail.

Returns \{created: true\} if the trail was created and returns \{created: False\} if the trail was not created.

CLI Example:

```
salt myminion boto_cloudtrail.update my_trail my_bucket
```

21.9.47 salt.modules.boto_cloudwatch

Connection module for Amazon CloudWatch

New in version 2014.7.0.

configuration This module accepts explicit credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cloudwatch.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
cloudwatch.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:  
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

depends boto

salt.modules.boto_cloudwatch.convert_to_arn\((arns, region=None, key=None, keyid=None, profile=None)\)

Convert a list of strings into actual arns. Converts convenience names such as 'scaling_policy:...'

CLI Example:
**salt**

```python
salt '*' convert_to_arn 'scaling_policy:'
```

salt.modules.boto_cloudwatch.create_or_update_alarm(connection=None, name=None, metric=None, namespace=None, statistic=None, comparison=None, threshold=None, period=None, evaluation_periods=None, unit=None, description='', dimensions=None, alarm_actions=None, insufficient_data_actions=None, ok_actions=None, region=None, key=None, keyid=None, profile=None)

Create or update a cloudwatch alarm.

**Params are the same as:** https://boto.readthedocs.io/en/latest/ref/cloudwatch.html#boto.ec2.cloudwatch.Alarm

Dimensions must be a dict. If the value of Dimensions is a string, it will be json decoded to produce a dict. alarm_actions, insufficient_data_actions, and ok_actions must be lists of string. If the passed-in value is a string, it will be split on "", to produce a list. The strings themselves for alarm_actions, insufficient_data_actions, and ok_actions must be Amazon resource names (ARN's); however, this method also supports an arn lookup notation, as follows:

```
arn:aws:.... ARN as per http://docs.aws.amazon.com/general/latest/gr/aws-arns-and-namespaces.html scaling_policy:<as_name>:<scaling_policy_name> The named autoscale group scaling policy, for the named group (e.g. scaling_policy:my-asg:ScaleDown)
```

This is convenient for setting up autoscaling as follows. First specify a boto_asg.present state for an ASG with scaling_policies, and then set up boto_cloudwatch_alarm.present states which have alarm_actions that reference the scaling_policy.

**CLI example:**

```
salt myminion boto_cloudwatch.create_alarm name=myalarm ... region=us-east-1
```

salt.modules.boto_cloudwatch.delete_alarm(name, region=None, key=None, keyid=None, profile=None)

Delete a cloudwatch alarm

**CLI example to delete a queue:**

```
salt myminion boto_cloudwatch.delete_alarm myalarm region=us-east-1
```

salt.modules.boto_cloudwatch.get_alarm(name, region=None, key=None, keyid=None, profile=None)

Get alarm details. Also can be used to check to see if an alarm exists.

**CLI example:**

```
salt myminion boto_cloudwatch.get_alarm myalarm region=us-east-1
```

salt.modules.boto_cloudwatch.get_all_alarms(region=None, prefix=None, key=None, keyid=None, profile=None)

Get all alarm details. Produces results that can be used to create an sls file.

If prefix parameter is given, alarm names in the output will be prepended with the prefix; alarms that have the prefix will be skipped. This can be used to convert existing alarms to be managed by salt, as follows:
1. Make a "backup" of all existing alarms
   $ salt-call boto_cloudwatch.get_all_alarms --out=txt | sed "s/local: //" > legacy_alarms.sls

2. Get all alarms with new prefixed names
   $ salt-call boto_cloudwatch.get_all_alarms "prefix="MANAGED BY SALT"" --out=txt | sed "s/local: //" > managed_alarms.sls

3. Insert the managed alarms into cloudwatch
   $ salt-call state.template managed_alarms.sls

4. Manually verify that the new alarms look right

5. Delete the original alarms
   $ sed s/present/absent/ legacy_alarms.sls > remove_legacy_alarms.sls
   $ salt-call state.template remove_legacy_alarms.sls

6. Get all alarms again, verify no changes
   $ salt-call boto_cloudwatch.get_all_alarms --out=txt | sed "s/local: //" > final_alarms.sls
   $ diff final_alarms.sls managed_alarms.sls

CLI example:

```
salt myminion boto_cloudwatch.get_all_alarms region=us-east-1 --out=txt
```

---

### 21.9.48 `salt.modules.boto_cloudwatch_event` module

Connection module for Amazon CloudWatch Events

New in version 2016.11.0.

**configuration** This module accepts explicit credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cloudwatch_event.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch_event.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
cloudwatch_event.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

**depends** boto3

```
salt.modules.boto_cloudwatch_event.create_or_update(Name, ScheduleExpression=None, EventPattern=None, Description=None, RoleArn=None, State=None, region=None, key=None, keyid=None, profile=None)
```
Given a valid config, create an event rule.
Returns {created: true} if the rule was created and returns {created: False} if the rule was not created.

CLI Example:
salt myminion boto_cloudwatch_event.create_or_update my_rule

```
salt.modules.boto_cloudwatch_event.delete(Name, region=None, key=None, keyid=None, profile=None)
```

Given a rule name, delete it.
Returns {deleted: true} if the rule was deleted and returns {deleted: false} if the rule was not deleted.

CLI Example:
salt myminion boto_cloudwatch_event.delete myrule

```
salt.modules.boto_cloudwatch_event.describe(Name, region=None, key=None, keyid=None, profile=None)
```

Given a rule name describe its properties.
Returns a dictionary of interesting properties.

CLI Example:
salt myminion boto_cloudwatch_event.describe myrule

```
salt.modules.boto_cloudwatch_event.exists(Name, region=None, key=None, keyid=None, profile=None)
```

Given a rule name, check to see if the given rule exists.
Returns True if the given rule exists and returns False if the given rule does not exist.

CLI example:
salt myminion boto_cloudwatch_event.exists myevent region=us-east-1

```
salt.modules.boto_cloudwatch_event.list_rules(region=None, key=None, keyid=None, profile=None)
```

List, with details, all Cloudwatch Event rules visible in the current scope.

CLI example:
salt myminion boto_cloudwatch_event.list_rules region=us-east-1

```
salt.modules.boto_cloudwatch_event.list_targets(Rule, region=None, key=None, keyid=None, profile=None)
```

Given a rule name list the targets of that rule.
Returns a dictionary of interesting properties.

CLI Example:
salt myminion boto_cloudwatch_event.list_targets myrule

```
salt.modules.boto_cloudwatch_event.put_targets(Rule, Targets, region=None, key=None, keyid=None, profile=None)
```

Add the given targets to the given rule
Returns a dictionary describing any failures.

CLI Example:
salt.modules.boto_cloudwatch_event.remove_targets(Rule, Ids, region=None, key=None, keyid=None, profile=None)

Given a rule name remove the named targets from the target list

Returns a dictionary describing any failures.

CLI Example:

salt myminion boto_cloudwatch_event.remove_targets myrule ['Target1']

21.9.49 salt.modules.boto_cognitoidentity module

Connection module for Amazon CognitoIdentity

New in version 2016.11.0.

configuration This module accepts explicit CognitoIdentity credentials but can also utilize IAM roles assigned to the instance trough Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

cognitoidentity.keyid: GKTADJGHEIQSXMKKRBJ08H

cognitoidentity.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

A region may also be specified in the configuration:

cognitoidentity.region: us-east-1

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1

Changed in version 2015.8.0: All methods now return a dictionary. Create, delete, set, and update methods return:

created: true

or

created: false

error:
  message: error message

Request methods (e.g., describe_identity_pools) return:
identity_pools:
- {...}
- {...}

or

error:
  message: error message

depends boto3

salt.modules.boto_cognitoidentity.create_identity_pool(IdentityPoolName, AllowUnauthenticatedIdentities=False, SupportedLoginProviders=None, DeveloperProviderName=None, OpenIdConnectProviderARNs=None, region=None, key=None, keyid=None, profile=None)

Creates a new identity pool. All parameters except for IdentityPoolName is optional. SupportedLoginProviders should be a dictionary mapping provider names to provider app IDs. OpenIdConnectProviderARNs should be a list of OpenID Connect provider ARNs.

Returns the created identity pool if successful

CLI Example:

```
salt myminion boto_cognitoidentity.create_identity_pool my_id_pool_name
  → DeveloperProviderName=custom_developer_provider
```

salt.modules.boto_cognitoidentity.delete_identity_pools(IdentityPoolName, IdentityPoolId=None, region=None, key=None, keyid=None, profile=None)

Given an identity pool name, (optionally if an identity pool id is given, the given name will be ignored)

Deletes all identity pools matching the given name, or the specific identity pool with the given identity pool id.

CLI Example:

```
salt myminion boto_cognitoidentity.delete_identity_pools my_id_pool_name
salt myminion boto_cognitoidentity.delete_identity_pools '' IdentityPoolId=my_id_ pool_id
```

salt.modules.boto_cognitoidentity.describe_identity_pools(IdentityPoolName, IdentityPoolId=None, region=None, key=None, keyid=None, profile=None)

Given an identity pool name, (optionally if an identity pool id is given, the given name will be ignored)

Returns a list of matched identity pool name's pool properties

CLI Example:
```python
salt myminion boto_cognitoidentity.describe_identity_pools my_id_pool_name
salt myminion boto_cognitoidentity.describe_identity_pools '' IdentityPoolId=my_
→ id_pool_id
```

```python
salt.modules.boto_cognitoidentity.get_identity_pool_roles(IdentityPoolName, 
IdentityPoolId=None, 
region=None, key=None, 
keyid=None, profile=None)
```

Given an identity pool name, (optionally if an identity pool id if given, the given name will be ignored)

Returns a list of matched identity pool name's associated roles

CLI Example:

```python
salt myminion boto_cognitoidentity.get_identity_pool_roles my_id_pool_name
salt myminion boto_cognitoidentity.get_identity_pool_roles '' IdentityPoolId=my_
→ id_pool_id
```

```python
salt.modules.boto_cognitoidentity.set_identity_pool_roles(IdentityPoolId, 
AuthenticatedRole=None, 
UnauthenticatedRole=None, 
region=None, key=None, 
keyid=None, profile=None)
```

Given an identity pool id, set the given AuthenticatedRole and UnauthenticatedRole (the Role can be an iam arm, or a role name) If AuthenticatedRole or UnauthenticatedRole is not given, the authenticated and/or the unauthenticated role associated previously with the pool will be cleared.

Returns set True if successful, set False if unsuccessful with the associated errors.

CLI Example:

```python
salt myminion boto_cognitoidentity.set_identity_pool_roles my_id_pool_id 
# this clears the roles
salt myminion boto_cognitoidentity.set_identity_pool_roles my_id_pool_id 
→ AuthenticatedRole=my_auth_role UnauthenticatedRole=my_unauth_role 
# this will set the auth role and clear the unauth role
salt myminion boto_cognitoidentity.set_identity_pool_roles my_id_pool_id 
→ AuthenticatedRole=my_auth_role 
# this will set the auth role and clear the unauth role
salt myminion boto_cognitoidentity.set_identity_pool_roles my_id_pool_id 
→ UnauthenticatedRole=my_unauth_role 
# this will set the unauth role and clear the auth role
```

```python
salt.modules.boto_cognitoidentity.update_identity_pool(IdentityPoolId, 
IdentityPoolName=None, AllowUnauthenticatedIdentities=False, 
SupportedLoginProviders=None, DeveloperProviderName=None, 
OpenIdConnectProviderARNS=None, region=None, key=None, 
keyid=None, profile=None)
```

Updates the given IdentityPoolId's properties. All parameters except for IdentityPoolId, is optional. Sup-
portedLoginProviders should be a dictionary mapping provider names to provider app IDs. OpenIdConnectProviderARNs should be a list of OpenID Connect provider ARNs.

To clear SupportedLoginProviders pass '[]'
To clear OpenIdConnectProviderARNs pass '[]'
boto3 api prevents DeveloperProviderName to be updated after it has been set for the first time.

Returns the updated identity pool if successful

CLI Example:

```bash
salt myminion boto_cognitoidentity.update_identity_pool my_id_pool_id my_id_pool_name DeveloperProviderName=custom_developer_provider
```

## 21.9.50 salt.modules.boto_datapipeline module

Connection module for Amazon Data Pipeline

New in version 2016.3.0.

```python
depends boto3
```

salt.modules.boto_datapipeline.activate_pipeline(pipeline_id, region=None, key=None, keyid=None, profile=None)

Start processing pipeline tasks. This function is idempotent.

CLI example:

```bash
salt myminion boto_datapipeline.activate_pipeline my_pipeline_id
```

salt.modules.boto_datapipeline.create_pipeline(name, unique_id, description='', region=None, key=None, keyid=None, profile=None)

Create a new, empty pipeline. This function is idempotent.

CLI example:

```bash
salt myminion boto_datapipeline.create_pipeline my_name my_unique_id
```

salt.modules.boto_datapipeline.delete_pipeline(pipeline_id, region=None, key=None, keyid=None, profile=None)

Delete a pipeline, its pipeline definition, and its run history. This function is idempotent.

CLI example:

```bash
salt myminion boto_datapipeline.delete_pipeline my_pipeline_id
```

salt.modules.boto_datapipeline.describe_pipelines(pipeline_ids, region=None, key=None, keyid=None, profile=None)

Retrieve metadata about one or more pipelines.

CLI example:

```bash
salt myminion boto_datapipeline.describe_pipelines ['my_pipeline_id']
```
salt.modules.boto_datapipeline.get_pipeline_definition(pipeline_id, version='latest', region=None, key=None, keyid=None, profile=None)

Get the definition of the specified pipeline.

CLI example:
salt myminion boto_datapipeline.get_pipeline_definition my_pipeline_id

salt.modules.boto_datapipeline.list_pipelines(region=None, key=None, keyid=None, profile=None)

Get a list of pipeline ids and names for all pipelines.

CLI Example:
salt myminion boto_datapipeline.list_pipelines profile=myprofile

salt.modules.boto_datapipeline.pipeline_id_from_name(name, region=None, key=None, keyid=None, profile=None)

Get the pipeline id, if it exists, for the given name.

CLI example:
salt myminion boto_datapipeline.pipeline_id_from_name my_pipeline_name

salt.modules.boto_datapipeline.put_pipeline_definition(pipeline_id, pipeline_objects, parameter_objects=None, parameter_values=None, region=None, key=None, keyid=None, profile=None)

Add tasks, schedules, and preconditions to the specified pipeline. This function is idempotent and will replace an existing definition.

CLI example:
salt myminion boto_datapipeline.put_pipeline_definition my_pipeline_id my_pipeline_objects

21.9.51 salt.modules.boto_dynamodb

Connection module for Amazon DynamoDB

New in version 2015.5.0.

configuration This module accepts explicit DynamoDB credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

A region may also be specified in the configuration:
If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfkjgHwupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

depends boto

```python
salt.modules.boto_dynamodb.create_global_secondary_index(
    table_name,
    global_index,
    region=None,
    key=None,
    keyid=None,
    profile=None)
```

Creates a single global secondary index on a DynamoDB table.

CLI Example: .. code-block:: bash

```
salt myminion boto_dynamodb.create_global_secondary_index table_name / index_name
```

```python
salt.modules.boto_dynamodb.create_table(
    table_name,
    region=None,
    key=None,
    keyid=None,
    profile=None,
    read_capacity_units=None,
    write_capacity_units=None,
    hash_key=None,
    hash_key_data_type=None,
    range_key=None,
    range_key_data_type=None,
    local_indexes=None,
    global_indexes=None)
```

Creates a DynamoDB table.

CLI Example:

```bash
salt myminion boto_dynamodb.create_table table_name /
region=us-east-1 /
hash_key=id /
hash_key_data_type=N /
range_key=created_at /
range_key_data_type=N /
read_capacity_units=1 /
write_capacity_units=1
```

```python
salt.modules.boto_dynamodb.delete(
    table_name,
    region=None,
    key=None,
    keyid=None,
    profile=None)
```

Delete a DynamoDB table.

CLI Example:

```bash
salt myminion boto_dynamodb.delete table_name region=us-east-1
```

```python
salt.modules.boto_dynamodb.describe(
    table_name,
    region=None,
    key=None,
    keyid=None,
    profile=None)
```

Describe a DynamoDB table.

CLI example:

```bash
salt myminion boto_dynamodb.describe table_name region=us-east-1
```
salt.modules.boto_dynamodb.exists(table_name, region=None, key=None, keyid=None, profile=None)

Check to see if a table exists.

CLI Example:

```
salt myminion boto_dynamodb.exists table_name region=us-east-1
```

salt.modules.boto_dynamodb.extract_index(index_data, global_index=False)

Instantiates and returns an AllIndex object given a valid index configuration

CLI Example: salt myminion boto_dynamodb.extract_index index

salt.modules.boto_dynamodb.update(table_name, throughput=None, global_indexes=None, region=None, key=None, keyid=None, profile=None)

Update a DynamoDB table.

CLI example:

```
salt myminion boto_dynamodb.update table_name region=us-east-1
```

salt.modules.boto_dynamodb.update_global_secondary_index(table_name, global_indexes, region=None, key=None, keyid=None, profile=None)

Updates the throughput of the given global secondary indexes.

CLI Example: .. code-block:: bash

```
salt myminion boto_dynamodb.update_global_secondary_index table_name / indexes
```

21.9.52 salt.modules.boto_ec2

Connection module for Amazon EC2

New in version 2015.8.0.

configuration This module accepts explicit EC2 credentials but can also utilize IAM roles assigned to
the instance through Instance Profiles. Dynamic credentials are then automatically obtained from
AWS API and no further configuration is necessary. More Information available here.

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

```
ec2.keyid: GKTADJGHEIQSXMKKRBJ08H
ec2.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
ec2.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid, and region via a profile, either as a passed in dict, or as a string to pull from
pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```
depends boto

salt.modules.boto_ec2.allocate_eip_address(domain=None, region=None, key=None, keyid=None, profile=None)

Allocate a new Elastic IP address and associate it with your account.

domain (string) Optional param - if set to exactly 'vpc', the address will be allocated to the VPC. The default simply maps the EIP to your account container.

returns (dict) dict of 'interesting' information about the newly allocated EIP, with probably the most interesting keys being 'public_ip'; and 'allocation_id' iff 'domain=vpc' was passed.

CLI Example:
salt-call boto_ec2.allocate_eip_address domain=vpc

New in version 2016.3.0.

salt.modules.boto_ec2.assign_private_ip_addresses(network_interface_id=None, network_interface_name=None, private_ip_addresses=None, secondary_private_ip_address_count=None, allow_reassociation=False, region=None, key=None, keyid=None, profile=None)

Assigns one or more secondary private IP addresses to a network interface.

network_interface_id (string) - ID of the network interface to associate the IP with (exclusive with 'network_interface_name')

network_interface_name (string) - Name of the network interface to associate the IP with (exclusive with 'network_interface_id')

private_ip_addresses (list) - Assigns the specified IP addresses as secondary IP addresses to the network interface (exclusive with 'secondary_private_ip_address_count')

secondary_private_ip_address_count (int) - The number of secondary IP addresses to assign to the network interface. (exclusive with 'private_ip_addresses')

allow_reassociation (bool) – Allow a currently associated EIP to be re-associated with the new instance or interface.

returns (bool) - True on success, False on failure.

CLI Example:
salt myminion boto_ec2.assign_private_ip_addresses network_interface_name=my_eni
   private_ip_addresses=private_ip
salt myminion boto_ec2.assign_private_ip_addresses network_interface_name=my_eni
   secondary_private_ip_address_count=2

New in version 2017.7.0.

salt.modules.boto_ec2.associate_eip_address(instance_id=None, instance_name=None, public_ip=None, allocation_id=None, network_interface_id=None, network_interface_name=None, private_ip_address=None, allow_reassociation=False, region=None, key=None, keyid=None, profile=None)

Associate an Elastic IP address with a currently running instance or a network interface. This requires exactly
one of either 'public_ip' or 'allocation_id', depending on whether you’re associating a VPC address or a plain EC2 address.

**instance_id** (string) – ID of the instance to associate with (exclusive with 'instance_name')

**instance_name** (string) – Name tag of the instance to associate with (exclusive with 'instance_id')

**public_ip** (string) – Public IP address, for standard EC2 based allocations.

**allocation_id** (string) – Allocation ID for a VPC-based EIP.

**network_interface_id** (string) - ID of the network interface to associate the EIP with

**network_interface_name** (string) - Name of the network interface to associate the EIP with

**private_ip_address** (string) – The primary or secondary private IP address to associate with the Elastic IP address.

**allow_reassociation** (bool) – Allow a currently associated EIP to be re-associated with the new instance or interface.

**returns** (bool) - True on success, False on failure.

CLI Example:

```bash
salt myminion boto_ec2.associate_eip_address instance_name=bubba.ho.tep allocation_id=eipalloc-ef382c8a
```

New in version 2016.3.0.

salt.modules.boto_ec2.**attach_network_interface**(device_index, name=None, network_interface_id=None, instance_name=None, instance_id=None, region=None, key=None, keyid=None, profile=None)

Attach an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:

```bash
salt myminion boto_ec2.attach_network_interface my_eni instance_name=salt-master device_index=0
```

salt.modules.boto_ec2.**attach_volume**(volume_id, instance_id, device, region=None, key=None, keyid=None, profile=None)

Attach an EBS volume to an EC2 instance.

**volume_id** (string) – The ID of the EBS volume to be attached.

**instance_id** (string) – The ID of the EC2 instance to attach the volume to.

**device** (string) – The device on the instance through which the volume is exposed (e.g. /dev/sdh)

**returns** (bool) - True on success, False on failure.

CLI Example:

```bash
salt-call boto_ec2.attach_volume vol-12345678 i-87654321 /dev/sdh
```
salt.modules.boto_ec2.create_image(ami_name, instance_id=None, instance_name=None, tags=None, region=None, key=None, keyid=None, profile=None, description=None, no_reboot=False, dry_run=False, filters=None)

Given instance properties that define exactly one instance, create AMI and return AMI-id.

**CLI Examples:**

```
salt myminion boto_ec2.create_image ami_name= myinstance
salt myminion boto_ec2.create_image another_ami_name tags='{"mytag": "value"}' → description='this is my ami'
```

salt.modules.boto_ec2.create_key(key_name, save_path, region=None, key=None, keyid=None, profile=None)

Creates a key and saves it to a given path. Returns the private key.

**CLI Example:**

```
salt myminion boto_ec2.create_key mykey /root/
```

salt.modules.boto_ec2.create_network_interface(name, subnet_id=None, subnet_name=None, private_ip_address=None, description=None, groups=None, region=None, key=None, keyid=None, profile=None)

Create an Elastic Network Interface.

New in version 2016.3.0.

**CLI Example:**

```
salt myminion boto_ec2.create_network_interface my_eni subnet-12345678 → description=my_eni groups=['my_group']
```

salt.modules.boto_ec2.create_tags(resource_ids, tags, region=None, key=None, keyid=None, profile=None)

Create new metadata tags for the specified resource ids.

New in version 2016.11.0.

- **resource_ids** (string) or (list) – List of resource IDs. A plain string will be converted to a list of one element.
- **tags** (dict) – Dictionary of name/value pairs. To create only a tag name, pass “” as the value.

**returns** (bool) - True on success, False on failure.

**CLI Example:**

```
salt-call boto_ec2.create_tags vol-12345678 '{"Name": "myVolume01"}'
```

salt.modules.boto_ec2.create_volume(zone_name, size=None, snapshot_id=None, volume_type=None, iops=None, encrypted=False, kms_key_id=None, wait_for_creation=False, region=None, key=None, keyid=None, profile=None)

Create an EBS volume to an availability zone.

- **zone_name** (string) – The Availability zone name of the EBS volume to be created.
- **size** (int) – The size of the new volume, in GiB. If you're creating the volume from a snapshot and don't specify a volume size, the default is the snapshot size.
snapshot_id  (string) – The snapshot ID from which the new volume will be created.

volume_type  (string) - The type of the volume. Valid volume types for AWS can be found here: http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EBSVolumeTypes.html

iops  (int) - The provisioned IOPS you want to associate with this volume.

encrypted  (bool) - Specifies whether the volume should be encrypted.

kms_key_id  (string) - If encrypted is True, this KMS Key ID may be specified to encrypt volume with this key e.g.: arn:aws:kms:us-east-1:012345678910:key/abcd1234-a123-456a-a12b-a123b4cd56ef

wait_for_creation  (bool) - Whether or not to wait for volume creation to complete.

returns  (string) - created volume id on success, error message on failure.

CLI Example:

```
salt-call boto_ec2.create_volume us-east-1a
size=10
snapshot_id=snap-0123abcd
```

salt.modules.boto.ec2.delete_key(key_name, region=None, key=None, keyid=None, profile=None)

Deletes a key. Always returns True

CLI Example:

```
salt myminion boto_ec2.delete_key mykey
```

salt.modules.boto_ec2.delete_network_interface(name=None, network_interface_id=None, region=None, key=None, keyid=None, profile=None)

Create an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_ec2.create_network_interface my_eni subnet=12345
→description=my_eni groups=['my_group']
```

salt.modules.boto_ec2.delete_tags(resource_ids, tags, region=None, key=None, keyid=None, profile=None)

Delete metadata tags for the specified resource ids.

New in version 2016.11.0.

resource_ids  (string) or (list) – List of resource IDs. A plain string will be converted to a list of one element.

tags  

   (dict) or (list) – Either a dictionary containing name/value pairs or a list containing just tag names.
      If you pass in a dictionary, the values must match the actual tag values or the tag will not be deleted.
      If you pass in a value of None for the tag value, all tags with that name will be deleted.

returns  (bool) - True on success, False on failure.

CLI Example:
salt-call boto_ec2.delete_tags vol-12345678 "{"Name": "myVolume01"}"
salt-call boto_ec2.delete_tags vol-12345678 "["Name","MountPoint"]"

salt.modules.boto_ec2.delete_volume(volume_id, instance_id=None, device=None, force=False, region=None, key=None, keyid=None, profile=None)

Detach an EBS volume from an EC2 instance.
New in version 2016.11.0.

volume_id (string) – The ID of the EBS volume to be deleted.
force (bool) – Forces deletion even if the device has not yet been detached from its instance.
returns (bool) - True on success, False on failure.

CLI Example:
salt-call boto_ec2.delete_volume vol-12345678

salt.modules.boto_ec2.detach_network_interface(name=None, network_interface_id=None, attachment_id=None, force=False, region=None, key=None, keyid=None, profile=None)

Detach an Elastic Network Interface.
New in version 2016.3.0.

CLI Example:
salt myminion boto_ec2.detach_network_interface my_eni

salt.modules.boto_ec2.detach_volume(volume_id, instance_id=None, device=None, force=False, wait_for_detachement=False, region=None, key=None, keyid=None, profile=None)

Detach an EBS volume from an EC2 instance.
New in version 2016.11.0.

volume_id (string) – The ID of the EBS volume to be detached.
instance_id (string) – The ID of the EC2 instance from which it will be detached.
device (string) – The device on the instance through which the volume is exposed (e.g. /dev/sdh)
force (bool) – Forces detachment if the previous detachment attempt did not occur cleanly. This option can lead to data loss or a corrupted file system. Use this option only as a last resort to detach a volume from a failed instance. The instance will not have an opportunity to flush file system caches nor file system meta data. If you use this option, you must perform file system check and repair procedures.
wait_for_detachement (bool) - Whether or not to wait for volume detachement to complete.
returns (bool) - True on success, False on failure.

CLI Example:
salt-call boto_ec2.detach_volume vol-12345678 i-87654321
**salt.modules.boto_ec2.disassociate_eip_address**

Disassociate an Elastic IP address from a currently running instance. This requires exactly one of either `association_id` or `public_ip`, depending on whether you’re dealing with a VPC or EC2 Classic address.

- **public_ip** (string) – Public IP address, for EC2 Classic allocations.
- **association_id** (string) – Association ID for a VPC-bound EIP.
- **returns** (bool) - True on success, False on failure.

CLI Example:
```
salt myminion boto_ec2.disassociate_eip_address association_id=eipassoc-e3ba2d16
```

New in version 2016.3.0.

**salt.modules.boto_ec2.exists**

Given an instance id, check to see if the given instance id exists.

- **returns** True if the given instance with the given id, name, or tags exists; otherwise, False is returned.

CLI Example:
```
salt myminion boto_ec2.exists myinstance
```

**salt.modules.boto_ec2.find_images**

Given image properties, find and return matching AMI ids

CLI Examples:
```
salt myminion boto_ec2.find_images tags='{"mytag": "value"}'
```

**salt.modules.boto_ec2.find_instances**

Given instance properties, find and return matching instance ids

CLI Examples:
```
salt myminion boto_ec2.find_instances # Lists all instances
salt myminion boto_ec2.find_instances name=myinstance
salt myminion boto_ec2.find_instances tags='{"mytag": "value"}'
salt myminion boto_ec2.find_instances filters='{"vpc-id": "vpc-12345678"}"
```

**salt.modules.boto_ec2.get_all_eip_addresses**

Get public addresses of some, or all EIPs associated with the current account.

- **addresses** (list) - Optional list of addresses. If provided, only the addresses associated with those in the list will be returned.
- **allocation_ids** (list) - Optional list of allocation IDs. If provided, only the addresses associated with the given allocation IDs will be returned.
- **returns** (list) - A list of the requested EIP addresses

CLI Example:
salt-call boto_ec2.get_all_eip_addresses

New in version 2016.3.0.

salt.modules.boto_ec2.get_all_tags(filters=None, region=None, key=None, keyid=None, profile=None)

Describe all tags matching the filter criteria, or all tags in the account otherwise.

New in version 2018.3.0.

filters (dict) - Additional constraints on which volumes to return. Note that valid filters vary extensively depending on the resource type. When in doubt, search first without a filter and then use the returned data to help fine-tune your search. You can generally garner the resource type from its ID (e.g. vol-XXXXX is a volume, i-XXXXX is an instance, etc.

CLI Example:

```
salt-call boto_ec2.get_all_tags '{"tag:Name": myInstanceNameTag, resource-type:instance}"
```

salt.modules.boto_ec2.get_all_volumes(volume_ids=None, filters=None, return_objs=False, region=None, key=None, keyid=None, profile=None)

Get a list of all EBS volumes, optionally filtered by provided 'filters' param.

New in version 2016.11.0.

volume_ids (list) - Optional list of volume_ids. If provided, only the volumes associated with those in the list will be returned.

filters (dict) - Additional constraints on which volumes to return. Valid filters are:

- attachment.attach-time - The time stamp when the attachment initiated.
- attachment.delete-on-termination - Whether the volume is deleted on instance termination.
- attachment.device - The device name that is exposed to the instance (for example, /dev/sda1).
- attachment.instance-id - The ID of the instance the volume is attached to.
- attachment.status - The attachment state (attaching | attached | detaching | detached).
- availability-zone - The Availability Zone in which the volume was created.
- create-time - The time stamp when the volume was created.
- encrypted - The encryption status of the volume.
- size - The size of the volume, in GiB.
- snapshot-id - The snapshot from which the volume was created.
- status - The status of the volume (creating | available | in-use | deleting | deleted | error).
- tag: key=value - The key/value combination of a tag assigned to the resource.
- volume-id - The volume ID.
- volume-type - The Amazon EBS volume type. This can be gp2 for General Purpose SSD, io1 for Provisioned IOPS SSD, st1 for Throughput Optimized HDD, sc1 for Cold HDD, or standard for Magnetic volumes.

return_objs (bool) - Changes the return type from list of volume IDs to list of boto.ec2.volume.Volume objects.

returns (list) - A list of the requested values: Either the volume IDs or, if return_objs is True, boto.ec2.volume.Volume objects.
Salt Documentation, Release 3001.1

CLI Example:
salt-call boto_ec2.get_all_volumes filters='{"tag:Name": "myVolume01"}'

salt.modules.boto_ec2.get_attribute(attribute, instance_name=None, instance_id=None, region=None, key=None, keyid=None, profile=None, filters=None)
Get an EC2 instance attribute.
CLI Example:
salt myminion boto_ec2.get_attribute sourceDestCheck instance_name=my_instance

Available attributes:
• instanceType
• kernel
• ramdisk
• userData
• disableApiTermination
• instanceInitiatedShutdownBehavior
• rootDeviceName
• blockDeviceMapping
• productCodes
• sourceDestCheck
• groupSet
• ebsOptimized
• sriovNetSupport
salt.modules.boto_ec2.get_eip_address_info(addresses=None, allocation_ids=None, region=None, key=None, keyid=None, profile=None)
Get 'interesting' info about some, or all EIPs associated with the current account.
addresses (list) - Optional list of addresses. If provided, only the addresses associated with those in the list
will be returned.
allocation_ids (list) - Optional list of allocation IDs. If provided, only the addresses associated with the given
allocation IDs will be returned.
returns (list of dicts) - A list of dicts, each containing the info for one of the requested EIPs.
CLI Example:
salt-call boto_ec2.get_eip_address_info addresses=52.4.2.15

New in version 2016.3.0.
salt.modules.boto_ec2.get_id(name=None, tags=None, region=None, key=None, keyid=None, profile=None, in_states=None, filters=None)
Given instance properties, return the instance id if it exists.
CLI Example:
1454

Chapter 21. Salt Module Reference


salt myminion boto_ec2.get_id myinstance

salt.modules.boto_ec2.get_key(key_name, region=None, key=None, keyid=None, profile=None)
Check to see if a key exists. Returns fingerprint and name if it does and False if it doesn't CLI Example:
salt myminion boto_ec2.get_key mykey

salt.modules.boto_ec2.get_keys(keynames=None, filters=None, region=None, key=None, keyid=None, profile=None)
Gets all keys or filters them by name and returns a list. keynames (list):: A list of the names of keypairs to retrieve. If not provided, all key pairs will be returned. filters (dict) :: Optional filters that can be used to limit the results returned. Filters are provided in the form of a dictionary consisting of filter names as the key and filter values as the value. The set of allowable filter names/values is dependent on the request being performed. Check the EC2 API guide for details. CLI Example:
salt myminion boto_ec2.get_keys

salt.modules.boto_ec2.get_network_interface(name=None, network_interface_id=None, region=None, key=None, keyid=None, profile=None)
Get an Elastic Network Interface. New in version 2016.3.0. CLI Example:
salt myminion boto_ec2.get_network_interface name=my_eni

salt.modules.boto_ec2.get_network_interface_id(name, region=None, key=None, keyid=None, profile=None)
Get an Elastic Network Interface id from its name tag. New in version 2016.3.0. CLI Example:
salt myminion boto_ec2.get_network_interface_id name=my_eni

salt.modules.boto_ec2.get_tags(instance_id=None, keyid=None, key=None, profile=None, region=None)
Given an instance_id, return a list of tags associated with that instance. returns (list) - list of tags as key/value pairs CLI Example:
salt myminion boto_ec2.get_tags instance_id

salt.modules.boto_ec2.get_unassociated_eip_address(domain='standard', region=None, key=None, keyid=None, profile=None)
Return the first unassociated EIP domain Indicates whether the address is an EC2 address or a VPC address (standard|vpc). CLI Example:
salt-call boto_ec2.get_unassociated_eip_address

New in version 2016.3.0.

salt.modules.boto_ec2.get_zones(region=None, key=None, keyid=None, profile=None)
Get a list of AZs for the configured region.

CLI Example:

```
salt myminion boto_ec2.get_zones
```

salt.modules.boto_ec2.import_key(key_name, public_key_material, region=None, key=None, keyid=None, profile=None)
Imports the public key from an RSA key pair that you created with a third-party tool. Supported formats: - OpenSSH public key format (e.g., the format in ~/.ssh/authorized_keys) - Base64 encoded DER format - SSH public key file format as specified in RFC4716 - DSA keys are not supported. Make sure your key generator is set up to create RSA keys. Supported lengths: 1024, 2048, and 4096.

CLI Example:

```
salt myminion boto_ec2.import mykey publickey
```

salt.modules.boto_ec2.modify_network_interface_attribute(name=None, network_interface_id=None, attr=None, value=None, region=None, key=None, keyid=None, profile=None)
Modify an attribute of an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_ec2.modify_network_interface_attribute my_eni attr=description\n→value='example description'
```

salt.modules.boto_ec2.release_eip_address(public_ip=None, allocation_id=None, region=None, key=None, keyid=None, profile=None)
Free an Elastic IP address. Pass either a public IP address to release an EC2 Classic EIP, or an AllocationId to release a VPC EIP.

public_ip (string) - The public IP address - for EC2 elastic IPs.
allocation_id (string) - The Allocation ID - for VPC elastic IPs.
returns (bool) - True on success, False on failure

CLI Example:

```
salt myminion boto_ec2.release_eip_address allocation_id=eipalloc-ef382c8a
```

New in version 2016.3.0.
salt.modules.boto_ec2.run(image_id, name=None, tags=None, key_name=None, security_groups=None, user_data=None, instance_type='m1.small', placement=None, kernel_id=None, ramdisk_id=None, monitoring_enabled=None, vpc_id=None, vpc_name=None, subnet_id=None, subnet_name=None, private_ip_address=None, block_device_map=None, disable_api_termination=None, instance_initiated_shutdown_behavior=None, placement_group=None, client_token=None, security_group_ids=None, security_group_names=None, additional_info=None, tenancy=None, instance_profile_arn=None, instance_profile_name=None, ebs_optimized=None, network_interface_id=None, network_interface_name=None, region=None, key=None, keyid=None, profile=None, network_interfaces=None)

Create and start an EC2 instance.

Returns True if the instance was created; otherwise False.

CLI Example:

```
salt myminion boto_ec2.run ami-b80c2b87 name=myinstance
```

- **image_id** (string) – The ID of the image to run.
- **name** (string) - The name of the instance.
- **tags** (dict of key: value pairs) - tags to apply to the instance.
- **key_name** (string) – The name of the key pair with which to launch instances.
- **security_groups** (list of strings) – The names of the EC2 classic security groups with which to associate instances
- **user_data** (string) – The Base64-encoded MIME user data to be made available to the instance(s) in this reservation.
- **instance_type** (string) – The type of instance to run. Note that some image types (e.g. hvm) only run on some instance types.
- **placement** (string) – The Availability Zone to launch the instance into.
- **kernel_id** (string) – The ID of the kernel with which to launch the instances.
- **ramdisk_id** (string) – The ID of the RAM disk with which to launch the instances.
- **monitoring_enabled** (bool) – Enable detailed CloudWatch monitoring on the instance.
- **vpc_id** (string) - ID of a VPC to bind the instance to. Exclusive with vpc_name.
- **vpc_name** (string) - Name of a VPC to bind the instance to. Exclusive with vpc_id.
- **subnet_id** (string) – The subnet ID within which to launch the instances for VPC.
- **subnet_name** (string) – The name of a subnet within which to launch the instances for VPC.
- **private_ip_address** (string) – If you’re using VPC, you can optionally use this parameter to assign the instance a specific available IP address from the subnet (e.g. 10.0.0.25).
- **block_device_map** (boto.ec2.blockdevicemapping.BlockDeviceMapping) – A BlockDeviceMapping data structure describing the EBS volumes associated with the image.

**YAML example:**
disable_api_termination (bool) – If True, the instances will be locked and will not be able to be terminated via the API.

instance_initiated_shutdown_behavior (string) – Specifies whether the instance stops or terminates on instance-initiated shutdown. Valid values are: stop, terminate

placement_group (string) – If specified, this is the name of the placement group in which the instance(s) will be launched.

client_token (string) – Unique, case-sensitive identifier you provide to ensure idempotency of the request. Maximum 64 ASCII characters.

security_group_ids (list of strings) – The ID(s) of the VPC security groups with which to associate instances.

security_group_names (list of strings) – The name(s) of the VPC security groups with which to associate instances.

additional_info (string) – Specifies additional information to make available to the instance(s).

tenancy (string) – The tenancy of the instance you want to launch. An instance with a tenancy of ‘dedicated’ runs on single-tenant hardware and can only be launched into a VPC. Valid values are: “default” or “dedicated”. NOTE: To use dedicated tenancy you MUST specify a VPC subnet-ID as well.

instance_profile_arn (string) – The Amazon resource name (ARN) of the IAM Instance Profile (IIP) to associate with the instances.

instance_profile_name (string) – The name of the IAM Instance Profile (IIP) to associate with the instances.

ebs_optimized (bool) – Whether the instance is optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal EBS I/O performance. This optimization isn’t available with all instance types.

network_interfaces (boto.ec2.networkinterface.NetworkInterfaceCollection) – A NetworkInterfaceCollection data structure containing the ENI specifications for the instance.

network_interface_id (string) - ID of the network interface to attach to the instance

network_interface_name (string) - Name of the network interface to attach to the instance

salt.modules.boto_ec2.set_attribute(attribute, attribute_value, instance_name=None, instance_id=None, region=None, key=None, keyid=None, profile=None, filters=None)

Set an EC2 instance attribute. Returns whether the operation succeeded or not.

CLI Example:
salt myminion boto_ec2.set_attribute sourceDestCheck False instance_name=my_instance
Available attributes:

- instanceType
- kernel
- ramdisk
- userData
- disableApiTermination
- instanceInitiatedShutdownBehavior
- rootDeviceName
- blockDeviceMapping
- productCodes
- sourceDestCheck
- groupSet
- ebsOptimized
- sriovNetSupport

`salt.modules.boto_ec2.set_volumes_tags(tag_maps, authoritative=False, dry_run=False, region=None, key=None, keyid=None, profile=None)`

New in version 2016.11.0.

**tag_maps (list)** List of dicts of filters and tags, where 'filters' is a dict suitable for passing to the 'filters' argument of get_all_volumes() above, and 'tags' is a dict of tags to be set on volumes (via create_tags/delete_tags) as matched by the given filters. The filter syntax is extended to permit passing either a list of volume_ids or an instance_name (with instance_name being the Name tag of the instance to which the desired volumes are mapped). Each mapping in the list is applied separately, so multiple sets of volumes can be all tagged differently with one call to this function. If filtering by instance Name, You may additionally limit the instances matched by passing in a list of desired instance states. The default set of states is ('pending', 'rebooting', 'running', 'stopping', 'stopped').

YAML example fragment:

```yaml
- filters:
  attachment.instance_id: i-abcdef12
  tags:
    Name: dev-int-abcdef12.aws-foo.com
- filters:
  attachment.device: /dev/sdf
  tags:
    ManagedSnapshots: true
    BillingGroup: bubba.hotep@aws-foo.com
  in_states:
    - stopped
    - terminated
- filters:
  instance_name: prd-foo-01.aws-foo.com
  tags:
    Name: prd-foo-01.aws-foo.com
    BillingGroup: infra-team@aws-foo.com
  filters:
    volume_ids: [ vol-12345689, vol-abcdef12 ]
```
**tags:**

`BillingGroup`: infra-team@aws-foo.com

**authoritative (bool)** If true, any existing tags on the matched volumes, and not explicitly requested here, will be removed.

**dry_run (bool)** If true, don’t change anything, just return a dictionary describing any changes which would have been applied.

**returns (dict)** A dict describing status and any changes.

```python
classify

salt.modules.boto_ec2.terminate(``instance_id=None, name=None, region=None, key=None, keyid=None, profile=None, filters=None)``

Terminate the instance described by instance_id or name.

CLI Example:

```bash
salt myminion boto_ec2.terminate name=myinstance
salt myminion boto_ec2.terminate instance_id=i-a46b9f
```

salt.modules.boto_ec2.unassign_private_ip_addresses(``network_interface_name=None, network_interface_id=None, private_ip_addresses=None, region=None, key=None, keyid=None, profile=None)``

Unassigns one or more secondary private IP addresses from a network interface

**network_interface_id** (string) - ID of the network interface to associate the IP with (exclusive with 'network_interface_name')

**network_interface_name** (string) - Name of the network interface to associate the IP with (exclusive with 'network_interface_id')

**private_ip_addresses** (list) - Assigns the specified IP addresses as secondary IP addresses to the network interface.

**returns** (bool) - True on success, False on failure.

CLI Example:

```bash
salt myminion boto_ec2.unassign_private_ip_addresses network_interface_name=my_eni private_ip_addresses=private_ip
```

New in version 2017.7.0.

## 21.9.53 salt.modules.boto_efs module

Connection module for Amazon EFS

New in version 2017.7.0.

**configuration** This module accepts explicit EFS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles or it can read them from the ~/.aws/credentials file or from these environment variables: AWS_ACCESS_KEY_ID, AWS_SECRET_ACCESS_KEY. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available at:
If IAM roles are not used you need to specify them either in a pillar or in the minion's config file

```yaml
  efs.keyid: GKTADJGHEIQSXMKKRBJ08H
  efs.key: askd+ghsdfjkghWupU/asdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration

```yaml
  efs.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid, and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```yaml
  myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askd+ghsdfjkghWupU/asdflkdfklgjsdfjajkghs
    region: us-east-1
```

**depends** boto3

**salt.modules.boto_efs.create_file_system**

```python
name (string) - The name for the new file system
performance_mode (string) - The PerformanceMode of the file system. Can be either generalPurpose or maxIO
creation_token (string) - A unique name to be used as reference when creating an EFS. This will ensure idempotency. Set to name if not specified otherwise

returns (dict) - A dict of the data for the elastic file system
```

**CLI Example:**

```
salt 'my-minion' boto_efs.create_file_system efs-name generalPurpose
```

**salt.modules.boto_efs.create_mount_target**

```python
filesystemid (string) - ID of the file system for which to create the mount target.
subnetid (string) - ID of the subnet to add the mount target in.
```

**Returns**

- A dict of the data for the elastic file system

**CLI Example:**

```
salt 'my-minion' boto_efs.create_mount_target filesystemid subnetid
```

---

21.9. execution modules
ipaddress

(string) - Valid IPv4 address within the address range of the specified subnet.

securitygroups

(list[string]) - Up to five VPC security group IDs, of the form sg-xxxxxxxx. These must be for the same
VPC as subnet specified.

returns (dict) - A dict of the response data

CLI Example:

```
salt 'my-minion' boto_efs.create_mount_target filesystemid subnetid
```

salt.modules.boto_efs.create_tags(filesystemid, tags, keyid=None, key=None, profile=None, region=None, **kwargs)

Creates or overwrites tags associated with a file system. Each tag is a key-value pair. If a tag key specified in
the request already exists on the file system, this operation overwrites its value with the value provided in the
request.

filesystemid (string) - ID of the file system for whose tags will be modified.

tags (dict) - The tags to add to the file system

CLI Example:

```
salt 'my-minion' boto_efs.create_tags
```

salt.modules.boto_efs.delete_file_system(filesystemid, keyid=None, key=None, profile=None, region=None, **kwargs)

Deletes a file system, permanently severing access to its contents. Upon return, the file system no longer exists
and you can’t access any contents of the deleted file system. You can’t delete a file system that is in use. That
is, if the file system has any mount targets, you must first delete them.

filesystemid (string) - ID of the file system to delete.

CLI Example:

```
salt 'my-minion' boto_efs.delete_file_system filesystemid
```

salt.modules.boto_efs.delete_mount_target(mounttargetid, keyid=None, key=None, profile=None, region=None, **kwargs)

Deletes the specified mount target.

This operation forcibly breaks any mounts of the file system via the mount target that is being deleted, which
might disrupt instances or applications using those mounts. To avoid applications getting cut off abruptly, you
might consider unmounting any mounts of the mount target, if feasible. The operation also deletes the associ-
ated network interface. Uncommitted writes may be lost, but breaking a mount target using this operation
does not corrupt the file system itself. The file system you created remains. You can mount an EC2 instance
in your VPC via another mount target.

mounttargetid (string) - ID of the mount target to delete

CLI Example:

```
salt 'my-minion' boto_efs.delete_mount_target mounttargetid
```

salt.modules.boto_efs.delete_tags(filesystemid, tags, keyid=None, key=None, profile=None, region=None, **kwargs)

Deletes the specified tags from a file system.

filesystemid (string) - ID of the file system for whose tags will be removed.
tags (list[string]) - The tag keys to delete to the file system

CLI Example:
```
salt 'my-minion' boto_efs.delete_tags
```

```
salt.modules.boto_efs.delete_tags
```

```
salt.modules.boto_efs.get_file_systems(filesystemid=None, keyid=None, key=None, profile=None, region=None, creation_token=None, **kwargs)
```

Get all EFS properties or a specific instance property if filesystemid is specified

**filesystemid** (string) - ID of the file system to retrieve properties

**creation_token** (string) - A unique token that identifies an EFS. If filesystem created via create_file_system this would either be explicitly passed in or set to name. You can limit your search with this.

**returns** (list[dict]) - list of all elastic file system properties

CLI Example:
```
salt 'my-minion' boto_efs.get_file_systems efs-id
```

```
salt.modules.boto_efs.get_file_systems
```

```
salt.modules.boto_efs.get_mount_targets(filesystemid=None, mounttargetid=None, keyid=None, key=None, profile=None, region=None, **kwargs)
```

Get all the EFS mount point properties for a specific filesystemid or the properties for a specific mounttargetid. One or the other must be specified

**filesystemid** (string) - ID of the file system whose mount targets to list Must be specified if mounttargetid is not

**mounttargetid** (string) - ID of the mount target to have its properties returned Must be specified if filesystemid is not

**returns** (list[dict]) - list of all mount point properties

CLI Example:
```
salt 'my-minion' boto_efs.get_mount_targets
```

```
salt.modules.boto_efs.get_mount_targets
```

```
salt.modules.boto_efs.get_tags(filesystemid, keyid=None, key=None, profile=None, region=None, **kwargs)
```

Return the tags associated with an EFS instance.

**filesystemid** (string) - ID of the file system whose tags to list

**returns** (list) - list of tags as key/value pairs

CLI Example:
```
salt 'my-minion' boto_efs.get_tags efs-id
```

```
salt.modules.boto_efs.get_tags
```

```
salt.modules.boto_efs.set_security_groups(mounttargetid, securitygroup, keyid=None, key=None, profile=None, region=None, **kwargs)
```

Modifies the set of security groups in effect for a mount target

**mounttargetid** (string) - ID of the mount target whose security groups will be modified

**securitygroups** (list[string]) - list of no more than 5 VPC security group IDs.

CLI Example:
21.9.54 salt.modules.boto_elasticache

Connection module for Amazon Elasticache

New in version 2014.7.0.

**configuration** This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
elasticache.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticache.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
elasticache.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

depends boto

salt.modules.boto_elasticache.**authorize_cache_security_group_ingress**

Authorize network ingress from an ec2 security group to a cache security group.

CLI example:

```
salt myminion boto_elasticache.authorize_cache_security_group_ingress
   -myelasticachesg myec2sg 879879
```
salt.modules.boto_elasticache.create(name, num_cache_nodes=None, engine=None, cache_node_type=None, replication_group_id=None, cache_parameter_group_name=None, cache_subnet_group_name=None, cache_security_group_names=None, security_group_ids=None, snapshot_arns=None, preferred_availability_zone=None, preferred_maintenance_window=None, port=None, notification_topic_arn=None, auto_minor_version_upgrade=None, wait=None, region=None, key=None, keyid=None, profile=None)

Create a cache cluster.

CLI example:
```
salt myminion boto_elasticache.create myelasticache redis cache.t1.micro cache_security_group_names=['"myelastichcachesg"']
```

salt.modules.boto_elasticache.create_cache_security_group(name, description, region=None, key=None, keyid=None, profile=None)

Create a cache security group.

CLI example:
```
salt myminion boto_elasticache.create_cache_security_group myelasticachesg 'My Cache Security Group'
```

salt.modules.boto_elasticache.create_replication_group(name, primary_cluster_id, replication_group_description, wait=None, region=None, key=None, keyid=None, profile=None)

Create replication group.

CLI example:
```
salt myminion boto_elasticache.create_replication_group myelasticache myprimarycluster description
```

salt.modules.boto_elasticache.create_subnet_group(name, description, subnet_ids=None, subnet_names=None, tags=None, region=None, key=None, keyid=None, profile=None)

Create an ElastiCache subnet group

CLI example to create an ElastiCache subnet group:
```
salt myminion boto_elasticache.create_subnet_group my-subnet-group "group description" subnet_ids=['[subnet-12345678, subnet-87654321]'] region=us-east-1
```

salt.modules.boto_elasticache.delete(name, wait=False, region=None, key=None, keyid=None, profile=None)

Delete a cache cluster.
CLI example:

```python
salt myminion boto_elasticache.delete myelasticache
```

```
salt.modules.boto_elasticache.delete_cache_security_group(name, region=None, key=None, keyid=None, profile=None)
```

Delete a cache security group.

CLI example:

```python
salt myminion boto_elasticache.delete_cache_security_group myelasticachesg
```

```
salt.modules.boto_elasticache.delete_replication_group(name, region=None, key=None, keyid=None, profile=None)
```

Delete an ElastiCache replication group.

CLI example:

```python
salt myminion boto_elasticache.delete_replication_group my-replication-group
```

```
salt.modules.boto_elasticache.delete_subnet_group(name, region=None, key=None, keyid=None, profile=None)
```

Delete an ElastiCache subnet group.

CLI example:

```python
salt myminion boto_elasticache.delete_subnet_group my-subnet-group
```

```
salt.modules.boto_elasticache.describe_replication_group(name, region=None, key=None, keyid=None, profile=None, parameter=None)
```

Get replication group information.

CLI example:

```python
salt myminion boto_elasticache.describe_replication_group mygroup
```

```
salt.modules.boto_elasticache.exists(name, region=None, key=None, keyid=None, profile=None)
```

Check to see if a cache cluster exists.

CLI example:

```python
salt myminion boto_elasticache.exists myelasticache
```

```
salt.modules.boto_elasticache.get_all_cache_subnet_groups(name=None, region=None, key=None, keyid=None, profile=None)
```

Return a list of all cache subnet groups with details.

CLI example:
```
salt myminion boto_elasticache.get_all_subnet_groups region=us-east-1
```

```
salt.modules.boto_elasticache.get_cache_subnet_group(name, region=None, key=None, keyid=None, profile=None)
```

Get information about a cache subnet group.

CLI example:
```
salt myminion boto_elasticache.get_cache_subnet_group mycache_subnet_group
```

```
salt.modules.boto_elasticache.get_config(name, region=None, key=None, keyid=None, profile=None)
```

Get the configuration for a cache cluster.

CLI example:
```
salt myminion boto_elasticache.get_config myelasticache
```

```
salt.modules.boto_elasticache.get_group_host(name, region=None, key=None, keyid=None, profile=None)
```

Get hostname from replication cache group

CLI example:
```
salt myminion boto_elasticache.get_group_host myelasticachegroup
```

```
salt.modules.boto_elasticache.get_node_host(name, region=None, key=None, keyid=None, profile=None)
```

Get hostname from cache node

CLI example:
```
salt myminion boto_elasticache.get_node_host myelasticache
```

```
salt.modules.boto_elasticache.group_exists(name, region=None, key=None, keyid=None, profile=None)
```

Check to see if a replication group exists.

CLI example:
```
salt myminion boto_elasticache.group_exists myelasticache
```

```
salt.modules.boto_elasticache.list_cache_subnet_groups(name=None, region=None, key=None, keyid=None, profile=None)
```

Return a list of all cache subnet group names

CLI example:
```
salt myminion boto_elasticache.list_subnet_groups region=us-east-1
```

```
salt.modules.boto_elasticache.revoke_cache_security_group_ingress(name, ec2_security_group_name, ec2_security_group_owner_id, region=None, key=None, keyid=None, profile=None)
```

21.9. execution modules
Revoke network ingress from an ec2 security group to a cache security group.

CLI example:

```bash
salt myminion boto_elasticache.revoke_cache_security_group_ingress
    --myelasticachesg myec2sg 879879
```

```python
salt.modules.boto_elasticache.subnet_group_exists(name, tags=None, region=None, key=None, keyid=None, profile=None)
```

Check to see if an ElastiCache subnet group exists.

CLI example:

```bash
salt myminion boto_elasticache.subnet_group_exists my-param-group
    --region=us-east-1
```

### 21.9.55 salt.modules.boto_elasticsearch_domain module

Connection module for Amazon Elasticsearch Service  
New in version 2016.11.0.

**configuration**  
This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```yaml
lambda.keyid: GKTADJGHEIQSXMKKRBJ08H
lambda.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```yaml
lambda.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

Create and delete methods return:

```yaml
created: true
```

or

```yaml
created: false
error:
    message: error message
```
Request methods (e.g., describe_function) return:

```yaml
domain:
- {...}
- {...}
```

or

```yaml
error:
message: error message
```

depends boto3

```python
salt.modules.boto_elasticsearch_domain.add_tags(DomainName=None, ARN=None, region=None, key=None, keyid=None, profile=None, **kwargs)
```

Add tags to a domain

Returns {tagged: true} if the domain was tagged and returns {tagged: False} if the domain was not tagged.

CLI Example:

```bash
salt myminion boto_elasticsearch_domain.add_tags mydomain tag_a=tag_value tag_b=tag_value
```

```python
salt.modules.boto_elasticsearch_domain.create(DomainName, ElasticsearchClusterConfig=None, EBSOptions=None, AccessPolicies=None, SnapshotOptions=None, AdvancedOptions=None, region=None, key=None, keyid=None, profile=None, ElasticsearchVersion=None)
```

Given a valid config, create a domain.

Returns {created: true} if the domain was created and returns {created: False} if the domain was not created.

CLI Example:

```bash
salt myminion boto_elasticsearch_domain.create mydomain

{"InstanceType": "t2.micro.elasticsearch", "InstanceCount": 1, "DedicatedMasterEnabled": false, "ZoneAwarenessEnabled": false} 

{"EBSEnabled": true, "VolumeType": "gp2", "VolumeSize": 10, "Iops": 0} 

{"AutomatedSnapshotStartHour": 0} 

{"rest.action.multi.allow_explicit_index": "true"}
```

```python
salt.modules.boto_elasticsearch_domain.delete(DomainName, region=None, key=None, keyid=None, profile=None)
```

Given a domain name, delete it.

Returns {deleted: true} if the domain was deleted and returns {deleted: false} if the domain was not deleted.

CLI Example:

```bash
salt myminion boto_elasticsearch_domain.delete mydomain
```
salt.modules.boto_elasticsearch_domain.describe

Given a domain name describe its properties.
Returns a dictionary of interesting properties.
CLI Example:
```
salt myminion boto_elasticsearch_domain.describe mydomain
```

salt.modules.boto_elasticsearch_domain.exists

Given a domain name, check to see if the given domain exists.
Returns True if the given domain exists and returns False if the given function does not exist.
CLI Example:
```
salt myminion boto_elasticsearch_domain.exists mydomain
```

salt.modules.boto_elasticsearch_domain.list_tags

List tags of a trail

Returns

• {...}
• {...}

Return type tags

CLI Example:
```
salt myminion boto_cloudtrail.list_tags my_trail
```

salt.modules.boto_elasticsearch_domain.remove_tags

Remove tags from a trail
Returns {tagged: true} if the trail was tagged and returns {tagged: False} if the trail was not tagged.
CLI Example:
```
salt myminion boto_cloudtrail.remove_tags my_trail tag_a=tag_value tag_b=tag_value
```

salt.modules.boto_elasticsearch_domain.status

Given a domain name describe its status.
Returns a dictionary of interesting properties.
CLI Example:
```
salt myminion boto_elasticsearch_domain.status mydomain
```
salt.modules.boto_elasticsearch_domain.update(DomainName, ElasticsearchClusterConfig=None, EBSOptions=None, AccessPolicies=None, SnapshotOptions=None, AdvancedOptions=None, region=None, key=None, keyid=None, profile=None)

Update the named domain to the configuration.

Returns {updated: true} if the domain was updated and returns {updated: False} if the domain was not updated.

CLI Example:

```bash
salt myminion boto_elasticsearch_domain.update mydomain
{
    "InstanceType": "t2.micro.elasticsearch",
    "InstanceCount": 1,
    "DedicatedMasterEnabled": false,
    "ZoneAwarenessEnabled": true,
    "EBSEnabled": true,
    "VolumeType": "gp2",
    "VolumeSize": 10,
    "Iops": 0,
    "Version": "2012-10-17",
}
```

21.9.56 salt.modules.boto_elb

Connection module for Amazon ELB

New in version 2014.7.0.

**configuration** This module accepts explicit elb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
elb.keyid: GKTADJGHEIQSXMKKRBJ08H
elb.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
elb.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

**depends** boto >= 2.33.0
salt.modules.boto_elb.apply_security_groups(name, security_groups, region=None, key=None, keyid=None, profile=None)

Apply security groups to ELB.

CLI example:

```bash
salt myminion boto_elb.apply_security_groups myelb ['mysecgroup1']
```

salt.modules.boto_elb.attach_subnets(name, subnets, region=None, key=None, keyid=None, profile=None)

Attach ELB to subnets.

CLI example:

```bash
cat myminion boto_elb.attach_subnets myelb ['mysubnet']
```

salt.modules.boto_elb.create(name, availability_zones, listeners, subnets=None, security_groups=None, scheme='internet-facing', region=None, key=None, keyid=None, profile=None)

Create an ELB

CLI example to create an ELB:

```bash
cat myminion boto_elb.create myelb ["us-east-1a", "us-east-1e"] [elb_port:443, "elb_protocol": "HTTPS", ...] region=us-east-1
```

salt.modules.boto_elb.create_listeners(name, listeners, region=None, key=None, keyid=None, profile=None)

Create listeners on an ELB.

CLI example:

```bash
cat myminion boto_elb.create_listeners myelb ["HTTPS", "HTTP", 443, 80, [arn:aws:iam::111111111111:server-certificate/mycert"]
```

salt.modules.boto_elb.create_policy(name, policy_name, policy_type, policy, region=None, key=None, keyid=None, profile=None)

Create an ELB policy.

New in version 2016.3.0.

CLI example:

```bash
cat myminion boto_elb.create_policy myelb mypolicy LBCookieStickinessPolicyType ["CookieExpirationPeriod": 3600]
```

salt.modules.boto_elb.delete(name, region=None, key=None, keyid=None, profile=None)

Delete an ELB.

CLI example to delete an ELB:

```bash
cat myminion boto_elb.delete myelb region=us-east-1
```

salt.modules.boto_elb.delete_listeners(name, ports, region=None, key=None, keyid=None, profile=None)

Delete listeners on an ELB.

CLI example:

```bash
cat myminion boto_elb.delete_listeners myelb [80,443]
```
salt.modules.boto_elb.delete_policy(name, policy_name, region=None, key=None, keyid=None, profile=None)

Delete an ELB policy.
New in version 2016.3.0.
CLI example:

```bash
salt myminion boto_elb.delete_policy myelb mypolicy
```

salt.modules.boto_elb.delete_tags(name, tags, region=None, key=None, keyid=None, profile=None)

Add the tags on an ELB
name  name of the ELB
tags list of tags to remove
CLI Example:

```bash
salt myminion boto_elb.delete_tags my-elb-name ['TagToRemove1', 'TagToRemove2']
```

salt.modules.boto_elb.deregister_instances(name, instances, region=None, key=None, keyid=None, profile=None)

Deregister instances with an ELB. Instances is either a string instance id or a list of string instance id's.
Returns:
• True: instance(s) deregistered successfully
• False: instance(s) failed to be deregistered
• None: instance(s) not valid or not registered, no action taken
CLI example:

```bash
salt myminion boto_elb.deregister_instances myelb instance_id
salt myminion boto_elb.deregister_instances myelb "[instance_id, instance_id]"
```

salt.modules.boto_elb.detach_subnets(name, subnets, region=None, key=None, keyid=None, profile=None)

Detach ELB from subnets.
CLI example:

```bash
salt myminion boto_elb.detach_subnets myelb '"[mysubnet]"'
```

salt.modules.boto_elb.disable_availability_zones(name, availability_zones, region=None, key=None, keyid=None, profile=None)

Disable availability zones for ELB.
CLI example:

```bash
salt myminion boto_elb.disable_availability_zones myelb '"[us-east-1a]"'
```

salt.modules.boto_elb.enable_availability_zones(name, availability_zones, region=None, key=None, keyid=None, profile=None)

Enable availability zones for ELB.
CLI example:
salt.myminion.boto_elb.enable_availability_zones(myelb='["us-east-1a"]')

salt.modules.boto_elb.exists(name, region=None, key=None, keyid=None, profile=None)
Check to see if an ELB exists.
CLI example:
salt myminion boto_elb.exists myelb region=us-east-1

salt.modules.boto_elb.get_all_elbs(region=None, key=None, keyid=None, profile=None)
Return all load balancers associated with an account
CLI example:
salt myminion boto_elb.get_all_elbs region=us-east-1

salt.modules.boto_elb.get_attributes(name, region=None, key=None, keyid=None, profile=None)
Check to see if attributes are set on an ELB.
CLI example:
salt myminion boto_elb.get_attributes myelb

salt.modules.boto_elb.get_elb_config(name, region=None, key=None, keyid=None, profile=None)
Get an ELB configuration.
CLI example:
salt myminion boto_elb.exists myelb region=us-east-1

salt.modules.boto_elb.get_health_check(name, region=None, key=None, keyid=None, profile=None)
Get the health check configured for this ELB.
CLI example:
salt myminion boto_elb.get_health_check myelb

salt.modules.boto_elb.get_instance_health(name, region=None, key=None, keyid=None, profile=None, instances=None)
Get a list of instances and their health state
CLI example:
salt myminion boto_elb.get_instance_health myelb
salt myminion boto_elb.get_instance_health myelb region=us-east-1 instances="[instance_id,instance_id]"

salt.modules.boto_elb.list_elbs(region=None, key=None, keyid=None, profile=None)
Return names of all load balancers associated with an account
CLI example:
salt myminion boto_elb.list_elbs region=us-east-1

salt.modules.boto_elb.listener_dict_to_tuple(listener)
Convert an ELB listener dict into a listener tuple used by certain parts of the AWS ELB API.
salt.modules.boto_elb.register_instances(name, instances, region=None, key=None, keyid=None, profile=None)

Register instances with an ELB. Instances is either a string instance id or a list of string instance id's.

Returns:
- True: instance(s) registered successfully
- False: instance(s) failed to be registered

CLI example:
```
salt myminion boto_elb.register_instances myelb instance_id
salt myminion boto_elb.register_instances myelb "[instance_id,instance_id]"
```

salt.modules.boto_elb.set_attributes(name, attributes, region=None, key=None, keyid=None, profile=None)

Set attributes on an ELB.

name (string) Name of the ELB instance to set attributes for

attributes A dict of attributes to set.

Valid attributes are:
- access_log (dict)
  - enabled (bool) Enable storage of access logs.
  - s3_bucket_name (string) The name of the S3 bucket to place logs.
  - s3_bucket_prefix (string) Prefix for the log file name.
  - emit_interval (int) Interval for storing logs in S3 in minutes. Valid values are 5 and 60.
- connection_draining (dict)
  - enabled (bool) Enable connection draining.
  - timeout (int) Maximum allowed time in seconds for sending existing connections to an instance that is deregistering or unhealthy. Default is 300.
- cross_zone_load_balancing (dict)
  - enabled (bool) Enable cross-zone load balancing.

CLI example to set attributes on an ELB:
```
salt myminion boto_elb.set_attributes myelb '{"access_log": {"enabled": "true", "s3_bucket_name": "mybucket", "s3_bucket_prefix": "mylogs/", "emit_interval": "5"}, "region": "us-east-1"
```

salt.modules.boto_elb.set_backend_policy(name, port, policies=None, region=None, key=None, keyid=None, profile=None)

Set the policies of an ELB backend server.

CLI example:
```
salt myminion boto_elb.set_backend_policy myelb 443 "[policy1,policy2]"
```
salt.modules.boto_elb.set_health_check(name, health_check, region=None, key=None, keyid=None, profile=None)

Set attributes on an ELB.

CLI example to set attributes on an ELB:
```
salt myminion boto_elb.set_health_check myelb '{"target": "HTTP:80/"}'
```

salt.modules.boto_elb.set_instances(name, instances, test=False, region=None, key=None, keyid=None, profile=None)

Set the instances assigned to an ELB to exactly the list given.

CLI example:
```
salt myminion boto_elb.set_instances myelb region=us-east-1 instances=
"[instance_id,instance_id]"
```

salt.modules.boto_elb.set_listener_policy(name, port, policies=None, region=None, key=None, keyid=None, profile=None)

Set the policies of an ELB listener.

New in version 2016.3.0.

CLI example:
```
salt myminion boto_elb.set_listener_policy myelb 443 "[policy1,policy2]"
```

salt.modules.boto_elb.set_tags(name, tags, region=None, key=None, keyid=None, profile=None)

Add the tags on an ELB.

New in version 2016.3.0.

**name** name of the ELB

**tags** dict of name/value pair tags

CLI Example:
```
salt myminion boto_elb.set_tags my-elb-name 
"{'Tag1': 'Value', 'Tag2': 'Another Value'}"
```

21.9.57 salt.modules.boto_elbv2 module

Connection module for Amazon ALB.

New in version 2017.7.0.

**configuration** This module accepts explicit elb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
elbv2.keyid: GKTADJGHEIQSXMKKRBJ08H
elbv2.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
elbv2.region: us-west-2
```

1476 Chapter 21. Salt Module Reference
If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfnjkgWupUjasdfklgjklkgsfjajkghs
  region: us-east-1
```

```
salt.modules.boto_elbv2.create_target_group(name, protocol, port, vpc_id, region=None, key=None, keyid=None, profile=None, health_check_protocol='HTTP', health_check_port='traffic-port', health_check_path='/', health_check_interval_seconds=30, health_check_timeout_seconds=5, healthy_threshold_count=5, unhealthy_threshold_count=2)
```

Create target group if not present.

**name** (string) - The name of the target group.

**protocol** (string) - The protocol to use for routing traffic to the targets

**port** (int) - The port on which the targets receive traffic. This port is used unless you specify a port override when registering the traffic.

**vpc_id** (string) - The identifier of the virtual private cloud (VPC).

**health_check_protocol** (string) - The protocol the load balancer uses when performing health check on targets. The default is the HTTP protocol.

**health_check_port** (string) - The port the load balancer uses when performing health checks on targets. The default is 'traffic-port', which indicates the port on which each target receives traffic from the load balancer.

**health_check_path** (string) - The ping path that is the destination on the targets for health checks. The default is '/.

**health_check_interval_seconds** (integer) - The approximate amount of time, in seconds, between health checks of an individual target. The default is 30 seconds.

**health_check_timeout_seconds** (integer) - The amount of time, in seconds, during which no response from a target means a failed health check. The default is 5 seconds.

**healthy_threshold_count** (integer) - The number of consecutive health checks successes required before considering an unhealthy target healthy. The default is 5.

**unhealthy_threshold_count** (integer) - The number of consecutive health check failures required before considering a target unhealthy. The default is 2.

**returns** (bool) - True on success, False on failure.

CLI example: .. code-block:: bash

```
salt myminion boto_elbv2.create_target_group learn1give1 protocol=HTTP port=54006 vpc_id=vpc-deadbeef
```
salt.modules.boto_elbv2.delete_target_group(name, region=None, key=None, keyid=None, profile=None)
    Delete target group.
    name (string) - Target Group Name or Amazon Resource Name (ARN).
    returns (bool) - True on success, False on failure.
    CLI example:
    ```
salt myminion boto_elbv2.delete_target_group arn:aws:elasticloadbalancing:us-west-2:644138682826:targetgroup/learn1give1-api/414788a16b5cf163
    ```

salt.modules.boto_elbv2.deregister_targets(name, targets, region=None, key=None, keyid=None, profile=None)
    Deregister targets to a target group of an ALB. targets is either a instance id string or a list of instance id's.
    Returns:
    • True: instance(s) deregistered successfully
    • False: instance(s) failed to be deregistered
    CLI example:
    ```
salt myminion boto_elbv2.deregister_targets myelb instance_id
salt myminion boto_elbv2.deregister_targets myelb "[instance_id,instance_id]"
    ```

salt.modules.boto_elbv2.describe_target_health(name, targets=None, region=None, key=None, keyid=None, profile=None)
    Get the current health check status for targets in a target group.
    CLI example:
    ```
salt myminion boto_elbv2.describe_target_health arn:aws:elasticloadbalancing:us-west-2:644138682826:targetgroup/learn1give1-api/414788a16b5cf163 targets=\"i-isdf23ifj]\"n
    ```

salt.modules.boto_elbv2.register_targets(name, targets, region=None, key=None, keyid=None, profile=None)
    Register targets to a target group of an ALB. targets is either a instance id string or a list of instance id's.
    Returns:
    • True: instance(s) registered successfully
    • False: instance(s) failed to be registered
    CLI example:
    ```
salt myminion boto_elbv2.register_targets myelb instance_id
salt myminion boto_elbv2.register_targets myelb "[instance_id,instance_id]"
    ```

salt.modules.boto_elbv2.target_group_exists(name, region=None, key=None, keyid=None, profile=None)
    Check to see if an target group exists.
    CLI example:
    ```
salt myminion boto_elbv2.target_group_exists arn:aws:elasticloadbalancing:us-west-2:644138682826:targetgroup/learn1give1-api/414788a16b5cf163
    ```
21.9.58  salt.modules.boto_iam

Connection module for Amazon IAM

New in version 2014.7.0.

**configuration**  This module accepts explicit iam credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
iam.keyid: GKTADJGHEIQSXMKKRBJ08H
iam.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
iam.region: us-east-1
```

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

**depends**  boto

salt.modules.boto_iam.add_user_to_group(user_name, group_name, region=None, key=None, keyid=None, profile=None)

Add user to group.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.add_user_to_group myuser mygroup
```

salt.modules.boto_iam.associate_profile_to_role(profile_name, role_name, region=None, key=None, keyid=None, profile=None)

Associate an instance profile with an IAM role.

CLI Example:

```
salt myminion boto_iam.associate_profile_to_role myiprofile myirole
```

salt.modules.boto_iam.attach_group_policy(policy_name, group_name, region=None, key=None, keyid=None, profile=None)

Attach a managed policy to a group.

CLI Example:

```
salt myminion boto_iam.attach_group_policy mypolicy mygroup
```

salt.modules.boto_iam.attach_role_policy(policy_name, role_name, region=None, key=None, keyid=None, profile=None)

Attach a managed policy to a role.

CLI Example:
salt myminion boto_iam.attach_role_policy mypolicy myrole

salt.modules.boto_iam.attach_user_policy(policy_name, user_name, region=None, key=None,
keyid=None, profile=None)

Attach a managed policy to a user.

CLI Example:
salt myminion boto_iam.attach_user_policy mypolicy myuser

salt.modules.boto_iam.build_policy(region=None, key=None, keyid=None, profile=None)

Build a default assume role policy.

New in version 2015.8.0.

CLI Example:
salt myminion boto_iam.build_policy

salt.modules.boto_iam.create_access_key(user_name, region=None, key=None, keyid=None,
profile=None)

Create access key id for a user.

New in version 2015.8.0.

CLI Example:
salt myminion boto_iam.create_access_key myuser

salt.modules.boto_iam.create_group(group_name, path=None, region=None, key=None,
keyid=None, profile=None)

Create a group.

New in version 2015.8.0.

CLI Example:
salt myminion boto_iam.create_group group

salt.modules.boto_iam.create_instance_profile(name, region=None, key=None,
keyid=None, profile=None)

Create an instance profile.

New in version 2015.8.0.

CLI Example:
salt myminion boto_iam.create_instance_profile myiprofile

salt.modules.boto_iam.create_login_profile(user_name, password, region=None, key=None,
keyid=None, profile=None)

Creates a login profile for the specified user, give the user the ability to access AWS services and the AWS Management Console.

New in version 2015.8.0.

CLI Example:
salt myminion boto_iam.create_login_profile user_name password
salt.modules.boto_iam.create_policy(policy_name, policy_document, path=None, description=None, region=None, key=None, keyid=None, profile=None)

Create a policy.

CLI Example:
```
salt myminios boto_iam.create_policy mypolicy '{"Version": "2012-10-17",
```

salt.modules.boto_iam.create_policy_version(policy_name, policy_document, set_as_default=None, region=None, key=None, keyid=None, profile=None)

Create a policy version.

CLI Example:
```
salt myminios boto_iam.create_policy_version mypolicy '{"Version": "2012-10-17",
```

salt.modules.boto_iam.create_role(name, policy_document=None, path=None, region=None, key=None, keyid=None, profile=None)

Create an instance role.

CLI Example:
```
salt myminion boto_iam.create_role myrole
```

salt.modules.boto_iam.create_role_policy(role_name, policy_name, policy, region=None, key=None, keyid=None, profile=None)

Create or modify a role policy.

CLI Example:
```
salt myminion boto_iam.create_role_policy myirole mypolicy '{"MyPolicy":
   "{Action": ["sqs:*"], "Effect": "Allow", "Resource": [
   "arn:aws:sqs:*:*:*"], "Sid": "MyPolicySqs1"}]'}
```

salt.modules.boto_iam.create_saml_provider(name, saml_metadata_document, region=None, key=None, keyid=None, profile=None)

Create SAML provider

CLI Example:
```
salt myminion boto_iam.create_saml_provider my_saml_provider_name saml_metadata_document
```

salt.modules.boto_iam.create_user(user_name, path=None, region=None, key=None, keyid=None, profile=None)

Create a user.

New in version 2015.8.0.

CLI Example:
```
salt myminion boto_iam.create_user myuser
```
salt.modules.boto_iam.deactivate_mfa_device(user_name, serial, region=None, key=None, keyid=None, profile=None)

Deactivates the specified MFA device and removes it from association with the user.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_iam.deactivate_mfa_device user_name serial_num
```

salt.modules.boto_iam.delete_access_key(access_key_id, user_name=None, region=None, key=None, keyid=None, profile=None)

Delete access key id from a user.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.delete_access_key myuser
```

salt.modules.boto_iam.delete_group(group_name, region=None, key=None, keyid=None, profile=None)

Delete a group policy.

CLI Example:

```
```

salt.modules.boto_iam.delete_group_policy(group_name, policy_name, region=None, key=None, keyid=None, profile=None)

Delete a group policy.

CLI Example:

```
```

salt.modules.boto_iam.delete_instance_profile(name, region=None, key=None, keyid=None, profile=None)

Delete an instance profile.

CLI Example:

```
salt myminion boto_iam.delete_instance_profile myiprofile
```

salt.modules.boto_iam.delete_login_profile(user_name, region=None, key=None, keyid=None, profile=None)

Deletes a login profile for the specified user.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_iam.delete_login_profile user_name
```
salt.modules.boto_iam.delete_policy(policy_name, region=None, key=None, keyid=None, profile=None)

Delete a policy.
CLI Example:

```
salt myminion boto_iam.delete_policy mypolicy
```

salt.modules.boto_iam.delete_policy_version(policy_name, version_id, region=None, key=None, keyid=None, profile=None)

Delete a policy version.
CLI Example:

```
salt myminion boto_iam.delete_policy_version mypolicy v1
```

salt.modules.boto_iam.delete_role(name, region=None, key=None, keyid=None, profile=None)

Delete an IAM role.
CLI Example:

```
salt myminion boto_iam.delete_role myirole
```

salt.modules.boto_iam.delete_role_policy(role_name, policy_name, region=None, key=None, keyid=None, profile=None)

Delete a role policy.
CLI Example:

```
salt myminion boto_iam.delete_role_policy myirole mypolicy
```

salt.modules.boto_iam.delete_saml_provider(name, region=None, key=None, keyid=None, profile=None)

Delete SAML provider
CLI Example:

```
salt myminion boto_iam.delete_saml_provider my_saml_provider_name
```

salt.modules.boto_iam.delete_server_cert(cert_name, region=None, key=None, keyid=None, profile=None)

Deletes a certificate from Amazon.
New in version 2015.8.0.
CLI Example:

```
salt myminion boto_iam.delete_server_cert mycert_name
```

salt.modules.boto_iam.delete_user(user_name, region=None, key=None, keyid=None, profile=None)

Delete a user.
New in version 2015.8.0.
CLI Example:

```
salt myminion boto_iam.delete_user myuser
```

salt.modules.boto_iam.delete_user_policy(user_name, policy_name, region=None, key=None, keyid=None, profile=None)

Delete a user policy.
CLI Example:

```bash
salt myminion boto_iam.delete_user_policy myuser mypolicy
```

**salt.modules.boto_iam.delete_virtual_mfa_device**(serial, region=None, key=None, keyid=None, profile=None)

Deletes the specified virtual MFA device.

CLI Example:

```bash
salt myminion boto_iam.delete_virtual_mfa_device serial_num
```

**salt.modules.boto_iam.describe_role**(name, region=None, key=None, keyid=None, profile=None)

Get information for a role.

CLI Example:

```bash
salt myminion boto_iam.describe_role myirole
```

**salt.modules.boto_iam.detach_group_policy**(policy_name, group_name, region=None, key=None, keyid=None, profile=None)

Detach a managed policy to a group.

CLI Example:

```bash
salt myminion boto_iam.detach_group_policy mypolicy mygroup
```

**salt.modules.boto_iam.detach_role_policy**(policy_name, role_name, region=None, key=None, keyid=None, profile=None)

Detach a managed policy to a role.

CLI Example:

```bash
salt myminion boto_iam.detach_role_policy mypolicy myrole
```

**salt.modules.boto_iam.detach_user_policy**(policy_name, user_name, region=None, key=None, keyid=None, profile=None)

Detach a managed policy to a user.

CLI Example:

```bash
salt myminion boto_iam.detach_user_policy mypolicy myuser
```

**salt.modules.boto_iam.disassociate_profile_from_role**(profile_name, role_name, region=None, key=None, keyid=None, profile=None)

Disassociate an instance profile from an IAM role.

CLI Example:

```bash
salt myminion boto_iam.disassociate_profile_from_role myirole myiprofile
```

**salt.modules.boto_iam.export_roles**(path_prefix="/", region=None, key=None, keyid=None, profile=None)

Get all IAM role details. Produces results that can be used to create an sls file.

CLI Example:

```bash
salt-call boto_iam.export_roles --out=txt | sed "s/local: //" > iam_roles.sls
```
salt.modules.boto_iam.export_users `path_prefix='/', region=None, key=None, keyid=None, profile=None`

Get all IAM user details. Produces results that can be used to create an sls file.

New in version 2016.3.0.

CLI Example:

```
salt-call boto_iam.export_users --out=txt | sed "s/local: //" > iam_users.sls
```

salt.modules.boto_iam.get_account_id `region=None, key=None, keyid=None, profile=None`

Get a the AWS account id associated with the used credentials.

CLI Example:

```
salt myminion boto_iam.get_account_id
```

salt.modules.boto_iam.get_account_policy `region=None, key=None, keyid=None, profile=None`

Get account policy for the AWS account.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.get_account_policy
```

salt.modules.boto_iam.get_all_access_keys `user_name`, `marker=None`, `max_items=None`, `region=None`, `key=None`, `keyid=None`, `profile=None`

Get all access keys from a user.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.get_all_access_keys myuser
```

salt.modules.boto_iam.get_all_group_policies `group_name`, `region=None`, `key=None`, `keyid=None`, `profile=None`

Get a list of policy names from a group.

CLI Example:

```
salt myminion boto_iam.get_all_group_policies mygroup
```

salt.modules.boto_iam.get_all_groups `path_prefix='/', region=None`, `key=None`, `keyid=None`, `profile=None`

Get and return all IAM group details, starting at the optional path.

New in version 2016.3.0.

CLI Example:

```
salt-call boto_iam.get_all_groups
```

salt.modules.boto_iam.get_all_instance_profiles `path_prefix='/', region=None`, `key=None`, `keyid=None`, `profile=None`

Get and return all IAM instance profiles, starting at the optional path.

New in version 2016.11.0.

CLI Example:
Get all MFA devices associated with an IAM user.
New in version 2016.3.0.
CLI Example:
```
salt myminion boto_iam.get_all_mfa_devices user_name
```

Get and return all IAM role details, starting at the optional path.
New in version 2016.3.0.
CLI Example:
```
salt-call boto_iam.get_all_roles
```

Get all user policies.
New in version 2015.8.0.
CLI Example:
```
salt myminion boto_iam.get_all_user_policies myuser
```

Get and return all IAM user details, starting at the optional path.
New in version 2016.3.0.
CLI Example:
```
salt-call boto_iam.get_all_users
```

Get group information.
New in version 2015.8.0.
CLI Example:
```
salt myminion boto_iam.get_group mygroup
```

Get group information.
New in version 2016.3.0.
CLI Example:
```
salt myminion boto_iam.get_group mygroup
```
salt.modules.boto_iam.get_group_policy(group_name, policy_name, region=None, key=None, keyid=None, profile=None)

Retrieves the specified policy document for the specified group.

New in version 2015.8.0.

CLI Example:
```
salt myminion boto_iam.get_group_policy mygroup policymname
```

salt.modules.boto_iam.get_policy(policy_name, region=None, key=None, keyid=None, profile=None)

Check to see if policy exists.

CLI Example:
```
salt myminion boto_iam.instance_profile_exists myiprolfle
```

salt.modules.boto_iam.get_policy_version(policy_name, version_id, region=None, key=None, keyid=None, profile=None)

Check to see if policy exists.

CLI Example:
```
salt myminion boto_iam.instance_profile_exists myiprolfle
```

salt.modules.boto_iam.get_role_policy(role_name, policy_name, region=None, key=None, keyid=None, profile=None)

Get a role policy.

CLI Example:
```
salt myminion boto_iam.get_role_policy myirole mypolicy
```

salt.modules.boto_iam.get_saml_provider(name, region=None, key=None, keyid=None, profile=None)

Get SAML provider document.

CLI Example:
```
salt myminion boto_iam.get_saml_provider arn
```

salt.modules.boto_iam.get_saml_provider_arn(name, region=None, key=None, keyid=None, profile=None)

Get SAML provider

CLI Example:
```
salt myminion boto_iam.get_saml_provider_arn my_saml_provider_name
```

salt.modules.boto_iam.get_server_certificate(cert_name, region=None, key=None, keyid=None, profile=None)

Returns certificate information from Amazon

New in version 2015.8.0.

CLI Example:
```
salt myminion boto_iam.get_server_certificate mycert_name
```
salt.modules.boto_iam.get_user(user_name=None, region=None, key=None, keyid=None, profile=None)

Get user information.
New in version 2015.8.0.
CLI Example:

```
salt myminion boto_iam.get_user myuser
```

salt.modules.boto_iam.get_user_policy(user_name, policy_name, region=None, key=None, keyid=None, profile=None)

Retrieves the specified policy document for the specified user.
New in version 2015.8.0.
CLI Example:

```
salt myminion boto_iam.get_user_policy myuser mypolicyname
```

salt.modules.boto_iam.instance_profile_exists(name, region=None, key=None, keyid=None, profile=None)

Check to see if an instance profile exists.
CLI Example:

```
salt myminion boto_iam.instance_profile_exists myiprofile
```

salt.modules.boto_iam.list_attached_group_policies(group_name, path_prefix=None, entity_filter=None, region=None, key=None, keyid=None, profile=None)

List entities attached to the given group.
CLI Example:

```
salt myminion boto_iam.list_entities_for_policy mypolicy
```

salt.modules.boto_iam.list_attached_role_policies(role_name, path_prefix=None, entity_filter=None, region=None, key=None, keyid=None, profile=None)

List entities attached to the given role.
CLI Example:

```
salt myminion boto_iam.list_entities_for_policy mypolicy
```

salt.modules.boto_iam.list_attached_user_policies(user_name, path_prefix=None, entity_filter=None, region=None, key=None, keyid=None, profile=None)

List entities attached to the given user.
CLI Example:

```
salt myminion boto_iam.list_entities_for_policy mypolicy
```
salt.modules.boto_iam.list_entities_for_policy(policy_name, path_prefix=None, entity_filter=None, region=None, key=None, keyid=None, profile=None)

List entities that a policy is attached to.

CLI Example:

```bash
salt myminion boto_iam.list_entities_for_policy mypolicy
```

salt.modules.boto_iam.list_instance_profiles(path_prefix='/', region=None, key=None, keyid=None, profile=None)

List all IAM instance profiles, starting at the optional path.

New in version 2016.11.0.

CLI Example:

```bash
salt-call boto_iam.list_instance_profiles
```

salt.modules.boto_iam.list_policies(region=None, key=None, keyid=None, profile=None)

List policies.

CLI Example:

```bash
salt myminion boto_iam.list_policies
```

salt.modules.boto_iam.list_policy_versions(policy_name, region=None, key=None, keyid=None, profile=None)

List versions of a policy.

CLI Example:

```bash
salt myminion boto_iam.list_policy_versions mypolicy
```

salt.modules.boto_iam.list_role_policies(role_name, region=None, key=None, keyid=None, profile=None)

Get a list of policy names from a role.

CLI Example:

```bash
salt myminion boto_iam.list_role_policies myirole
```

salt.modules.boto_iam.list_saml_providers(region=None, key=None, keyid=None, profile=None)

List SAML providers.

CLI Example:

```bash
salt myminion boto_iam.list_saml_providers
```

salt.modules.boto_iam.policy_exists(policy_name, region=None, key=None, keyid=None, profile=None)

Check to see if policy exists.

CLI Example:

```bash
salt myminion boto_iam.instance_profile_exists myiprofile
```

salt.modules.boto_iam.policy_version_exists(policy_name, version_id, region=None, key=None, keyid=None, profile=None)

Check to see if policy exists.
CLI Example:

```
salt myminion boto_iam.instance_profile_exists myiprofile
```

```
salt.modules.boto_iam.profile_associated( role_name, profile_name, region, key, keyid, profile)
```

Check to see if an instance profile is associated with an IAM role.

CLI Example:

```
salt myminion boto_iam.profile_associated myirole myiprofile
```

```
salt.modules.boto_iam.put_group_policy( group_name, policy_name, policy_json, region=None, key=None, keyid=None, profile=None)
```

Adds or updates the specified policy document for the specified group.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.put_group_policy mygroup policymanypolicyrules
```

```
salt.modules.boto_iam.put_user_policy( user_name, policy_name, policy_json, region=None, key=None, keyid=None, profile=None)
```

Adds or updates the specified policy document for the specified user.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.put_user_policy myuser policymanypolicyrules
```

```
salt.modules.boto_iam.remove_user_from_group( group_name, user_name, region=None, key=None, keyid=None, profile=None)
```

Remove user from group.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.remove_user_from_group mygroup myuser
```

```
salt.modules.boto_iam.role_exists( name, region=None, key=None, keyid=None, profile=None)
```

Check to see if an IAM role exists.

CLI Example:

```
salt myminion boto_iam.role_exists myirole
```

```
salt.modules.boto_iam.set_default_policy_version( policy_name, version_id, region=None, key=None, keyid=None, profile=None)
```

Set the default version of a policy.

CLI Example:

```
salt myminion boto_iam.set_default_policy_version mypolicy v1
```
salt.modules.boto_iam.update_account_password_policy(allow_users_to_change_password=None, hard_expiry=None, max_password_age=None, minimum_password_length=None, passwordReusePrevention=None, require_lowercase_characters=None, require_numbers=None, require_symbols=None, require_uppercase_characters=None, region=None, key=None, keyid=None, profile=None)

Update the password policy for the AWS account.
New in version 2015.8.0.

CLI Example:
```
salt myminion boto_iam.update_account_password_policy True
```

salt.modules.boto_iam.update_assume_role_policy(role_name, policy_document, region=None, key=None, keyid=None, profile=None)

Update an assume role policy for a role.
New in version 2015.8.0.

CLI Example:
```
salt myminion boto_iam.update_assume_role_policy myrole '{"Statement":"..."}''
```

salt.modules.boto_iam.update_saml_provider(name, saml_metadata_document, region=None, key=None, keyid=None, profile=None)

Update SAML provider.

CLI Example:
```
salt myminion boto_iam.update_saml_provider my_saml_provider_name saml_metadata_document
```

salt.modules.boto_iam.upload_server_cert(cert_name, cert_body, private_key, cert_chain=None, path=None, region=None, key=None, keyid=None, profile=None)

Upload a certificate to Amazon.
New in version 2015.8.0.

CLI Example:
```
salt myminion boto_iam.upload_server_cert mycert_name.crt priv_key
```

Parameters
- **cert_name** -- The name for the server certificate. Do not include the path in this value.
- **cert_body** -- The contents of the public key certificate in PEM-encoded format.
- **private_key** -- The contents of the private key in PEM-encoded format.
Salt Documentation, Release 3001.1

- **cert_chain** -- The contents of the certificate chain. This is typically a concatenation of the PEM-encoded public key certificates of the chain.
- **path** -- The path for the server certificate.
- **region** -- The name of the region to connect to.
- **key** -- The key to be used in order to connect
- **keyid** -- The keyid to be used in order to connect
- **profile** -- The profile that contains a dict of region, key, keyid

Returns: True / False

salt.modules.boto_iam.user_exists_in_group(*user_name*, *group_name*, *region=None, key=None, keyid=None, profile=None*)

Check if user exists in group.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.user_exists_in_group myuser mygroup
```

21.9.59 salt.modules.boto_iot module

Connection module for Amazon IoT

New in version 2016.3.0.

depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

**configuration** This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
iot.keyid: GKTADJGHEIQSXMKKRBJ08H
iot.key: askdjghsdfjkgshWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
iot.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkgHUpUjasdflkdfklgjsdfjajkghs
  region: us-east-1

salt.modules.boto_iot.attach_principal_policy(policyName, principal, region=None, key=None, keyid=None, profile=None)

Attach the specified policy to the specified principal (certificate or other credential.)
Returns {attached: true} if the policy was attached {attached: False} if the policy was not attached.
CLI Example:
salt myminion boto_iot.attach_principal_policy mypolicy mycognitoID

salt.modules.boto_iot.create_policy(policyName, policyDocument, region=None, key=None, keyid=None, profile=None)

Given a valid config, create a policy.
Returns {created: true} if the policy was created and returns {created: False} if the policy was not created.
CLI Example:
salt myminion boto_iot.create_policy my_policy

  
  \{"Version":"2015-12-12",
  "Statement":[
    {"Effect":"Allow",
      "Action":["iot:Publish"],
      "Resource":["arn:::topic/foo/bar"]}
  ]
\}

salt.modules.boto_iot.create_policy_version(policyName, policyDocument, setAsDefault=False, region=None, key=None, keyid=None, profile=None)

Given a valid config, create a new version of a policy.
Returns {created: true} if the policy version was created and returns {created: False} if the policy version was not created.
CLI Example:
salt myminion boto_iot.create_policy_version my_policy

  
  \{"Statement":[
    {"Effect":"Allow","Action":["iot:Publish"],"Resource":["arn:::topic/foo/bar"]}
  ]
\}

salt.modules.boto_iot.create_thing_type(thingTypeName, thingTypeDescription, searchableAttributesList, region=None, key=None, keyid=None, profile=None)

Given a valid config, create a thing type.
Returns {created: true} if the thing type was created and returns {created: False} if the thing type was not created.
New in version 2016.11.0.
CLI Example:
salt myminion boto_iot.create_thing_type mythingtype

  thingtype_description_string: 
    "["searchable_attr_1", "searchable_attr_2"]"
salt.modules.boto_iot.create_topic_rule(`ruleName`, `sql`, `actions`, `description`, `ruleDisabled=False`, `region=None`, `key=None`, `keyid=None`, `profile=None`)

Given a valid config, create a topic rule.
Returns {created: true} if the rule was created and returns {created: False} if the rule was not created.

CLI Example:
```
salt myminion boto_iot.create_topic_rule my_rule "SELECT * FROM 'some/thing'" \\
    ["lambda":{"FunctionArn":"arn:::::something"},"sns":{
    "TargetArn":"arn:::::something","RoleArn":"arn:::::something"}]
```

salt.modules.boto_iot.delete_policy(`policyName`, `region=None`, `key=None`, `keyid=None`, `profile=None`)

Given a policy name, delete it.
Returns {deleted: true} if the policy was deleted and returns {deleted: false} if the policy was not deleted.

CLI Example:
```
salt myminion boto_iot.delete_policy mypolicy
```

salt.modules.boto_iot.delete_policy_version(`policyName`, `policyVersionId`, `region=None`, `key=None`, `keyid=None`, `profile=None`)

Given a policy name and version, delete it.
Returns {deleted: true} if the policy version was deleted and returns {deleted: false} if the policy version was not deleted.

CLI Example:
```
salt myminion boto_iot.delete_policy_version mypolicy_version
```

salt.modules.boto_iot.delete_thing_type(`thingTypeName`, `region=None`, `key=None`, `keyid=None`, `profile=None`)

Given a thing type name, delete it.
Returns {deleted: true} if the thing type was deleted and returns {deleted: false} if the thing type was not deleted.

New in version 2016.11.0.

CLI Example:
```
salt myminion boto_iot.delete_thing_type mythingtype
```

salt.modules.boto_iot.delete_topic_rule(`ruleName`, `region=None`, `key=None`, `keyid=None`, `profile=None`)

Given a rule name, delete it.
Returns {deleted: true} if the rule was deleted and returns {deleted: False} if the rule was not deleted.

CLI Example:
```
salt myminion boto_iot.delete_rule myrule
```

salt.modules.boto_iot.deprecate_thing_type(`thingTypeName`, `undoDeprecate=False`, `region=None`, `key=None`, `keyid=None`, `profile=None`)

Given a thing type name, deprecate it when undoDeprecate is False and undeprecate it when undoDeprecate is True.
Returns {deprecated: true} if the thing type was deprecated and returns {deprecated: false} if the thing type was not deprecated.

New in version 2016.11.0.

CLI Example:

```bash
salt myminion boto_iot.deprecate_thing_type mythingtype
```

`salt.modules.boto_iot.describe_policy(policyName, region=None, key=None, keyid=None, profile=None)`

Given a policy name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```bash
salt myminion boto_iot.describe_policy mypolicy
```

`salt.modules.boto_iot.describe_policy_version(policyName, policyVersionId, region=None, key=None, keyid=None, profile=None)`

Given a policy name and version describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```bash
salt myminion boto_iot.describe_policy_version mypolicy version
```

`salt.modules.boto_iot.describe_thing_type(thingTypeName, region=None, key=None, keyid=None, profile=None)`

Given a thing type name describe its properties.

Returns a dictionary of interesting properties.

New in version 2016.11.0.

CLI Example:

```bash
salt myminion boto_iot.describe_thing_type mythingtype
```

`salt.modules.boto_iot.describe_topic_rule(ruleName, region=None, key=None, keyid=None, profile=None)`

Given a topic rule name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```bash
salt myminion boto_iot.describe_topic_rule myrule
```

`salt.modules.boto_iot.detach_principal_policy(policyName, principal, region=None, key=None, keyid=None, profile=None)`

Detach the specified policy from the specified principal (certificate or other credential.)

Returns {detached: true} if the policy was detached {detached: False} if the policy was not detached.

CLI Example:

```bash
salt myminion boto_iot.detach_principal_policy mypolicy mycognitoID
```
salt.modules.boto_iot.list_policies(region=None, key=None, keyid=None, profile=None)
List all policies
Returns list of policies
CLI Example:
salt myminion boto_iot.list_policies
Example Return:

```
policies:
  - {...}
  - {...}
```

salt.modules.boto_iot.list_policy_versions(policyName, region=None, key=None, keyid=None, profile=None)
List the versions available for the given policy.
CLI Example:
salt myminion boto_iot.list_policy_versions mypolicy
Example Return:

```
policyVersions:
  - {...}
  - {...}
```

salt.modules.boto_iot.list_principal_policies(principal, region=None, key=None, keyid=None, profile=None)
List the policies attached to the given principal.
CLI Example:
salt myminion boto_iot.list_principal_policies myprincipal
Example Return:

```
policies:
  - {...}
  - {...}
```

salt.modules.boto_iot.list_topic_rules(topic=None, ruleDisabled=None, region=None, key=None, keyid=None, profile=None)
List all rules (for a given topic, if specified)
Returns list of rules
CLI Example:
salt myminion boto_iot.list_topic_rules
Example Return:

```
rules:
  - {...}
  - {...}
```
salt.modules.boto_iot.policy_exists(policyName, region=None, key=None, keyid=None, profile=None)

Given a policy name, check to see if the given policy exists.
Returns True if the given policy exists and returns False if the given policy does not exist.

CLI Example:
salt myminion boto_iot.policy_exists mypolicy

salt.modules.boto_iot.policy_version_exists(policyName, policyVersionId, region=None, key=None, keyid=None, profile=None)

Given a policy name and version ID, check to see if the given policy version exists.
Returns True if the given policy version exists and returns False if the given policy version does not exist.

CLI Example:
salt myminion boto_iot.policy_version_exists mypolicy versionid

salt.modules.boto_iot.replace_topic_rule(ruleName, sql, actions, description, ruleDisabled=False, region=None, key=None, keyid=None, profile=None)

Given a valid config, replace a topic rule with the new values.
Returns [created: true] if the rule was created and returns [created: False] if the rule was not created.

CLI Example:
salt myminion boto_iot.replace_topic_rule my_rule 'SELECT * FROM some.thing' \
'[{"lambda":{"functionArn":"arn:::::something"},"sns":{"targetArn":"arn:::::something","roleArn":"arn:::::something"}}]

salt.modules.boto_iot.set_default_policy_version(policyName, policyVersionId, region=None, key=None, keyid=None, profile=None)

Sets the specified version of the specified policy as the policy's default (operative) version. This action affects all certificates that the policy is attached to.
Returns [changed: true] if the policy version was set [changed: False] if the policy version was not set.

CLI Example:
salt myminion boto_iot.set_default_policy_version mypolicy versionid

salt.modules.boto_iot.thing_type_exists(thingTypeName, region=None, key=None, keyid=None, profile=None)

Given a thing type name, check to see if the given thing type exists.
Returns True if the given thing type exists and returns False if the given thing type does not exist.
New in version 2016.11.0.

CLI Example:
salt myminion boto_iot.thing_type_exists mythingtype

salt.modules.boto_iot.topic_rule_exists(ruleName, region=None, key=None, keyid=None, profile=None)

Given a rule name, check to see if the given rule exists.
Returns True if the given rule exists and returns False if the given rule does not exist.
CLI Example:

```
salt myminion boto_iot.topic_rule_exists myrule
```

21.9.60 salt.modules.boto_kinesis module

Connection module for Amazon Kinesis

New in version 2017.7.0.

**configuration** This module accepts explicit Kinesis credentials but can also utilize IAM roles assigned to the instance trough Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
**kinesis.keyid**: GKTADJGHEIQSXMKKRBJ08H
**kinesis.key**: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
**kinesis.region**: us-east-1
```

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
**myprofile**:
  **keyid**: GKTADJGHEIQSXMKKRBJ08H
  **key**: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  **region**: us-east-1
```

**depends** boto3

salt.modules.boto_kinesis.**create_stream**(stream_name, num_shards, region=None, key=None, keyid=None, profile=None)

Create a stream with name stream_name and initial number of shards num_shards.

CLI example:

```
salt myminion boto_kinesis.create_stream my_stream N region=us-east-1
```

salt.modules.boto_kinesis.**decrease_stream_retention_period**(stream_name, retention_hours, region=None, key=None, keyid=None, profile=None)

Decrease stream retention period to retention_hours

CLI example:

```
salt myminion boto_kinesis.decrease_stream_retention_period my_stream N region=us-east-1
```
**salt.modules.boto_kinesis.delete_stream**

Delete the stream with name stream_name. This cannot be undone! All data will be lost!!

CLI example:

```bash
salt myminion boto_kinesis.delete_stream my_stream region=us-east-1
```

**salt.modules.boto_kinesis.disable_enhanced_monitoring**

Disable enhanced monitoring for the specified shard-level metrics on stream stream_name

CLI example:

```bash
salt myminion boto_kinesis.disable_enhanced_monitoring my_stream ["metrics", "to", "disable"] region=us-east-1
```

**salt.modules.boto_kinesis.enable_enhanced_monitoring**

Enable enhanced monitoring for the specified shard-level metrics on stream stream_name

CLI example:

```bash
salt myminion boto_kinesis.enable_enhanced_monitoring my_stream ["metrics", "to", "enable"] region=us-east-1
```

**salt.modules.boto_kinesis.exists**

Check if the stream exists. Returns False and the error if it does not.

CLI example:

```bash
salt myminion boto_kinesis.exists my_stream region=us-east-1
```

**salt.modules.boto_kinesis.get_info_for_reshard**

Collect some data: number of open shards, key range, etc. Modifies stream_details to add a sorted list of OpenShards. Returns (min_hash_key, max_hash_key, stream_details)

CLI example:

```bash
salt myminion boto_kinesis.get_info_for_reshard existing_stream_details
```

**salt.modules.boto_kinesis.get_stream_when_active**

Get complete stream info from AWS, returning only when the stream is in the ACTIVE state. Continues to retry when stream is updating or creating. If the stream is deleted during retries, the loop will catch the error and break.

CLI example:

```bash
salt myminion boto_kinesis.get_stream_when_active my_stream region=us-east-1
```

**salt.modules.boto_kinesis.increase_stream_retention_period**

21.9. execution modules
Increase stream retention period to retention_hours

CLI example:

```
salt myminion boto_kinesis.increase_stream_retention_period my_stream N region=us-east-1
```

salt.modules.boto_kinesis.list_streams(region=None, key=None, keyid=None, profile=None)

Return a list of all streams visible to the current account

CLI example:

```
salt myminion boto_kinesis.list_streams
```

salt.modules.boto_kinesis.long_int(hash_key)

The hash key is a 128-bit int, sent as a string. It’s necessary to convert to int/long for comparison operations. This helper method handles python 2/3 incompatibility

CLI example:

```
salt myminion boto_kinesis.long_int some_MD5_hash_as_string
```

Returns long object if python 2.X, int object if python 3.X

salt.modules.boto_kinesis.reshard(stream_name, desired_size, force=False, region=None, key=None, keyid=None, profile=None)

Reshard a kinesis stream. Each call to this function will wait until the stream is ACTIVE, then make a single split or merge operation. This function decides where to split or merge with the assumption that the ultimate goal is a balanced partition space.

For safety, user must past in force=True; otherwise, the function will dry run.

CLI example:

```
salt myminion boto_kinesis.reshard my_stream N True region=us-east-1
```

Returns True if a split or merge was found/performed, False if nothing is needed

21.9.61 salt.modules.boto_kms

Connection module for Amazon KMS

New in version 2015.8.0.

configuration This module accepts explicit kms credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
kms.keyid: GKTADJGHEIQSXMKKRBJ08H
kms.key: askdjghsdfjkgwupUjasdflkdfklgjsdfajkghs
```

A region may also be specified in the configuration:
If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

    myprofile: keyid: GKTADJGHEIQSXMKKRBJ08H key: askdjghsdfjghWupUjasdfldjflgjsdfjajkghs region: us-east-1

    depends boto

salt.modules.boto_kms.create_alias(alias_name, target_key_id, region=None, key=None, keyid=None, profile=None)

Create a display name for a key.

    CLI example:

        salt myminion boto_kms.create_alias 'alias/mykey' key_id

salt.modules.boto_kms.create_grant(key_id, grantee_principal, retiring_principal=None, operations=None, constraints=None, grant_tokens=None, region=None, key=None, keyid=None, profile=None)

Add a grant to a key to specify who can access the key and under what conditions.

    CLI example:

        salt myminion boto_kms.create_grant 'alias/mykey' 'arn:aws:iam::11111111111111111111:role/myrole' operations=['"Encrypt","Decrypt"]'

salt.modules.boto_kms.create_key(policy=None, description=None, key_usage=None, region=None, key=None, keyid=None, profile=None)

Creates a master key.

    CLI example:

        salt myminion boto_kms.create_key '{"Statement":...}' "My master key"

salt.modules.boto_kms.decrypt(ciphertext_blob, encryption_context=None, grant_tokens=None, region=None, key=None, keyid=None, profile=None)

Decrypt ciphertext.

    CLI example:

        salt myminion boto_kms.decrypt encrypted_ciphertext

salt.modules.boto_kms.describe_key(key_id, region=None, key=None, keyid=None, profile=None)

Get detailed information about a key.

    CLI example:

        salt myminion boto_kms.describe_key 'alias/mykey'

salt.modules.boto_kms.disable_key(key_id, region=None, key=None, keyid=None, profile=None)

Mark key as disabled.

    CLI example:

        salt myminion boto_kms.disable_key 'alias/mykey'
salt.modules.boto_kms.disable_key_rotation(key_id, region=None, key=None, keyid=None, profile=None)

Disable key rotation for specified key.

CLI example:

```bash
salt myminion boto_kms.disable_key_rotation 'alias/mykey'
```

salt.modules.boto_kms.enable_key(key_id, region=None, key=None, keyid=None, profile=None)

Mark key as enabled.

CLI example:

```bash
salt myminion boto_kms.enable_key 'alias/mykey'
```

salt.modules.boto_kms.enable_key_rotation(key_id, region=None, key=None, keyid=None, profile=None)

Disable key rotation for specified key.

CLI example:

```bash
salt myminion boto_kms.enable_key_rotation 'alias/mykey'
```

salt.modules.boto_kms.encrypt(key_id, plaintext, encryption_context=None, grant_tokens=None, region=None, key=None, keyid=None, profile=None)

Encrypt plaintext into cipher text using specified key.

CLI example:

```bash
salt myminion boto_kms.encrypt 'alias/mykey' 'myplaindata' '{"aws:username": "myuser"}'
```

salt.modules.boto_kms.generate_data_key(key_id, encryption_context=None, number_of_bytes=None, key_spec=None, grant_tokens=None, region=None, key=None, keyid=None, profile=None)

Generate a secure data key.

CLI example:

```bash
salt myminion boto_kms.generate_data_key 'alias/mykey' number_of_bytes=1024 key_spec=AES_128
```

salt.modules.boto_kms.generate_data_key_without_plaintext(key_id, encryption_context=None, number_of_bytes=None, key_spec=None, grant_tokens=None, region=None, key=None, keyid=None, profile=None)

Generate a secure data key without a plaintext copy of the key.

CLI example:

```bash
salt myminion boto_kms.generate_data_key_without_plaintext 'alias/mykey' number_of_bytes=1024 key_spec=AES_128
```
salt.modules.boto_kms.generate_random(number_of_bytes=None, region=None, key=None, keyid=None, profile=None)

Generate a random string.

CLI example:
```
salt myminion boto_kms.generate_random number_of_bytes=1024
```

salt.modules.boto_kms.get_key_policy(key_id, policy_name, region=None, key=None, keyid=None, profile=None)

Get the policy for the specified key.

CLI example:
```
salt myminion boto_kms.get_key_policy 'alias/mykey' mypolicy
```

salt.modules.boto_kms.get_key_rotation_status(key_id, region=None, key=None, keyid=None, profile=None)

Get status of whether or not key rotation is enabled for a key.

CLI example:
```
salt myminion boto_kms.get_key_rotation_status 'alias/mykey'
```

salt.modules.boto_kms.key_exists(key_id, region=None, key=None, keyid=None, profile=None)

Check for the existence of a key.

CLI example:
```
salt myminion boto_kms.key_exists 'alias/mykey'
```

salt.modules.boto_kms.list_grants(key_id, limit=None, marker=None, region=None, key=None, keyid=None, profile=None)

List grants for the specified key.

CLI example:
```
salt myminion boto_kms.list_grants 'alias/mykey'
```

salt.modules.boto_kms.list_key_policies(key_id, limit=None, marker=None, region=None, key=None, keyid=None, profile=None)

List key policies for the specified key.

CLI example:
```
salt myminion boto_kms.list_key_policies 'alias/mykey'
```

salt.modules.boto_kms.put_key_policy(key_id, policy_name, policy, region=None, key=None, keyid=None, profile=None)

Attach a key policy to the specified key.

CLI example:
```
salt myminion boto_kms.put_key_policy 'alias/mykey' default '{"Statement":...}'
```

salt.modules.boto_kms.re_encrypt(ciphertext_blob, destination_key_id, source_encryption_context=None, destination_encryption_context=None, grant_tokens=None, region=None, key=None, keyid=None, profile=None)

Reencrypt encrypted data with a new master key.
CLI example:

```bash
salt myminion boto_kms.re_encrypt 'encrypted_data' 'alias/mynewkey' default '{ "Statement":...}'
```

```python
salt.modules.boto_kms.revoke_grant(key_id, grant_id, region=None, key=None, keyid=None, profile=None)
```

Revoke a grant from a key.

CLI example:

```bash
salt myminion boto_kms.revoke_grant 'alias/mykey' 8u89hf-j09j...
```

```python
salt.modules.boto_kms.update_key_description(key_id, description, region=None, key=None, keyid=None, profile=None)
```

Update a key’s description.

CLI example:

```bash
salt myminion boto_kms.update_key_description 'alias/mykey' 'My key'
```

## 21.9.62 salt.modules.boto_lambda module

Connection module for Amazon Lambda

New in version 2016.3.0.

```
depends
- boto
- boto3
```

The dependencies listed above can be installed via package or pip.

```
configuration
This module accepts explicit Lambda credentials but can also utilize IAM roles assigned
to the instance through Instance Profiles. Dynamic credentials are then automatically obtained
from AWS API and no further configuration is necessary. More Information available here.
```

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

```
lambda.keyid: GKTADJGHEIQSXMKKRBJ08H
lambda.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
lambda.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from
pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

Changed in version 2015.8.0: All methods now return a dictionary. Create and delete methods return:
Request methods (e.g., `describe_function`) return:

```python
function:
- {...}
- {...}
```

or

```python
error:
- message: error message
```

```python
salt.modules.boto_lambda.add_permission(FunctionName, StatementId, Action, Principal, SourceArn=None, SourceAccount=None, Qualifier=None, region=None, key=None, keyid=None, profile=None)
```

Add a permission to a lambda function.

Returns `{added: true}` if the permission was added and returns `{added: False}` if the permission was not added.

CLI Example:

```bash
salt myminion boto_lamba.add_permission my_function my_id "lambda:*" \
s3.amazonaws.com aws:arn:::bucket-name \
aws-account-id
```

```python
salt.modules.boto_lambda.alias_exists(FunctionName, Name, region=None, key=None, keyid=None, profile=None)
```

Given a function name and alias name, check to see if the given alias exists.

Returns True if the given alias exists and returns False if the given alias does not exist.

CLI Example:

```bash
salt myminion boto_lamba.alias_exists myfunction myalias
```

```python
salt.modules.boto_lambda.create_alias(FunctionName, Name, FunctionVersion, Description='', region=None, key=None, keyid=None, profile=None)
```

Given a valid config, create an alias to a function.

Returns `{created: true}` if the alias was created and returns `{created: False}` if the alias was not created.

CLI Example:

```bash
salt myminion boto_lamba.create_alias my_function my_alias $LATEST "An alias"
```

```python
salt.modules.boto_lambda.create_event_source_mapping(EventSourceArn, FunctionName, StartingPosition, Enabled=True, BatchSize=100, region=None, key=None, keyid=None, profile=None)
```

Identifies a stream as an event source for a Lambda function. It can be either an Amazon Kinesis stream or
an Amazon DynamoDB stream. AWS Lambda invokes the specified function when records are posted to the stream.

Returns {created: true} if the event source mapping was created and returns {created: False} if the event source mapping was not created.

CLI Example:

```
salt myminion boto_lamba.create_event_source_mapping arn:::eventsource
    →myfunction LATEST
```

salt.modules.boto_lambda.create_function(FunctionName, Runtime, Role, Handler, ZipFile=None, S3Bucket=None, S3Key=None, S3ObjectVersion=None, Description='', Timeout=3, MemorySize=128, Publish=False, WaitForRole=False, RoleRetries=5, region=None, key=None, keyid=None, profile=None, VpcConfig=None, Environment=None)

New in version 2017.7.0.

Given a valid config, create a function.

Environment The parent object that contains your environment’s configuration settings. This is a dictionary of the form:

```
{
    'Variables': {
        'VariableName': 'VariableValue'
    }
}
```

Returns {'created': True} if the function was created and {created: False} if the function was not created.

CLI Example:

```
salt myminion boto_lamba.create_function my_function python2.7 my_role my_file.my_
    →function my_function.zip
```

salt.modules.boto_lambda.delete_alias(FunctionName, Name, region=None, key=None, keyid=None, profile=None)

Given a function name and alias name, delete the alias.

Returns {deleted: true} if the alias was deleted and returns {deleted: false} if the alias was not deleted.

CLI Example:

```
salt myminion boto_lamba.delete_alias myfunction myalias
```

salt.modules.boto_lambda.delete_event_source_mapping(UUID=None, EventSourceArn=None, FunctionName=None, region=None, key=None, keyid=None, profile=None)

Given an event source mapping ID or an event source ARN and FunctionName, delete the event source mapping.

Returns {deleted: true} if the mapping was deleted and returns {deleted: false} if the mapping was not deleted.
**CLI Example:**

```bash
salt myminion boto_lambda.delete_event_source_mapping 260c423d-e8b5-4443-8d6a-~5e91b9ecd0fa
```

```python
salt.modules.boto_lambda.delete_function(FunctionName, Qualifier=None, region=None, key=None, keyid=None, profile=None)
```

Given a function name and optional version qualifier, delete it.

Returns {deleted: true} if the function was deleted and returns {deleted: false} if the function was not deleted.

**CLI Example:**

```bash
salt myminion boto_lambda.delete_function myfunction
```

```python
salt.modules.boto_lambda.describe_alias(FunctionName, Name, region=None, key=None, keyid=None, profile=None)
```

Given a function name and alias name describe the properties of the alias.

Returns a dictionary of interesting properties.

**CLI Example:**

```bash
salt myminion boto_lambda.describe_alias myalias
```

```python
salt.modules.boto_lambda.describe_event_source_mapping(UUID=None, EventSourceArn=None, FunctionName=None, region=None, key=None, keyid=None, profile=None)
```

Given an event source mapping ID or an event source ARN and FunctionName, obtain the current settings of that mapping.

Returns a dictionary of interesting properties.

**CLI Example:**

```bash
salt myminion boto_lambda.describe_event_source_mapping uuid
```

```python
salt.modules.boto_lambda.describe_function(FunctionName, region=None, key=None, keyid=None, profile=None)
```

Given a function name describe its properties.

Returns a dictionary of interesting properties.

**CLI Example:**

```bash
salt myminion boto_lambda.describe_function myfunction
```

```python
salt.modules.boto_lambda.event_source_mapping_exists(UUID=None, EventSourceArn=None, FunctionName=None, region=None, key=None, keyid=None, profile=None)
```

Given an event source mapping ID or an event source ARN and FunctionName, check whether the mapping exists.

Returns True if the given alias exists and returns False if the given alias does not exist.

**CLI Example:**
salt myminion boto_lambda.alias_exists myfunction myalias

```
salt.modules.boto_lambda.function_exists(FunctionName, region=None, key=None, keyid=None, profile=None)
```

Given a function name, check to see if the given function name exists.

Returns True if the given function exists and returns False if the given function does not exist.

CLI Example:
```
salt myminion boto_lambda.function_exists myfunction
```

```
salt.modules.boto_lambda.get_event_source_mapping_ids(EventSourceArn, FunctionName, region=None, key=None, keyid=None, profile=None)
```

Given an event source and function name, return a list of mapping IDs

CLI Example:
```
salt myminion boto_lambda.get_event_source_mapping_ids arn:::: myfunction
```

```
salt.modules.boto_lambda.get_permissions(FunctionName, Qualifier=None, region=None, key=None, keyid=None, profile=None)
```

Get resource permissions for the given lambda function

Returns dictionary of permissions, by statement ID

CLI Example:
```
salt myminion boto_lambda.get_permissions my_function
```

```
salt.modules.boto_lambda.permissions: {...}
```

```
salt.modules.boto_lambda.list_function_versions(FunctionName, region=None, key=None, keyid=None, profile=None)
```

List the versions available for the given function.

Returns list of function versions

CLI Example:
```
v ersions: {-
  {...}
  ...
```

```
salt.modules.boto_lambda.list_functions(region=None, key=None, keyid=None, profile=None)
```

List all Lambda functions visible in the current scope.

CLI Example:
```
salt myminion boto_lambda.list_functions
```

```
salt.modules.boto_lambda.remove_permission(FunctionName, StatementId, Qualifier=None, region=None, key=None, keyid=None, profile=None)
```

Remove a permission from a lambda function.

Returns {removed: true} if the permission was removed and returns {removed: False} if the permission was not removed.
CLI Example:
```
salt myminion boto_lambda.remove_permission my_function my_id
```

```python
salt.modules.boto_lambda.update_alias(FunctionName, Name, FunctionVersion=None, Description=None, region=None, key=None, keyid=None, profile=None)
```

Update the named alias to the configuration.

Returns {updated: true} if the alias was updated and returns {updated: False} if the alias was not updated.

CLI Example:
```
salt myminion boto_lambda.update_alias my_lambda my_alias $LATEST
```

```python
salt.modules.boto_lambda.update_event_source_mapping(UUID, FunctionName=None, Enabled=None, BatchSize=None, region=None, key=None, keyid=None, profile=None)
```

Update the event source mapping identified by the UUID.

Returns {updated: true} if the alias was updated and returns {updated: False} if the alias was not updated.

CLI Example:
```
salt myminion boto_lambda.update_event_source_mapping uuid FunctionName=new_function
```

```python
salt.modules.boto_lambda.update_function_code(FunctionName, ZipFile=None, S3Bucket=None, S3Key=None, S3ObjectVersion=None, Publish=False, region=None, key=None, keyid=None, profile=None)
```

Upload the given code to the named lambda function.

Returns {updated: true} if the function was updated and returns {updated: False} if the function was not updated.

CLI Example:
```
salt myminion boto_lambda.update_function_code my_function ZipFile=function.zip
```

```python
salt.modules.boto_lambda.update_function_config(FunctionName, Role=None, Handler=None, Description=None, Timeout=None, MemorySize=None, region=None, key=None, keyid=None, profile=None, VpcConfig=None, WaitForRole=False, RoleRetries=5, Environment=None)
```

New in version 2017.7.0.

Update the named lambda function to the configuration.

**Environment**  The parent object that contains your environment’s configuration settings. This is a dictionary of the form:

```python
{
    'Variables': {
```

(continues on next page)
Returns {'updated': True} if the function was updated, and {'updated': False} if the function was not updated.

CLI Example:

```
salt myminion boto_lamba.update_function_config my_function my_role my_file.my_{function} "my lambda function"
```

## 21.9.63 salt.modules.boto_rds

Connection module for Amazon RDS

New in version 2015.8.0.

**configuration** This module accepts explicit rds credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
 rds.keyid: GKTADJGHEIQSXMKKRBJ08H
 rds.key: askdjghsdfjkgWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
 rds.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQXSXMKRBBJJK8H
  key: askdjghsdfjkgWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

**depends** boto3
salt.modules.boto_rds.create(name, allocated_storage, db_instance_class, engine, master_username, master_user_password, db_name=None, db_security_groups=None, vpc_security_group_ids=None, vpc_security_groups=None, availability_zone=None, db_subnet_group_name=None, preferred_maintenance_window=None, db_parameter_group_name=None, backup_retention_period=None, preferred_backup_window=None, port=None, multi_az=None, engine=None, engine_version=None, auto_minor_version_upgrade=None, license_model=None, iops=None, option_group_name=None, character_set_name=None, tde_enabled=None, tde_credential_arn=None, tde_credential_password=None, storage_encrypted=None, kms_key_id=None, domain=None, copy_tags_to_snapshot=None, monitoring_interval=None, monitoring_role_arn=None, domain_iam_role_name=None, region=None, promotion_tier=None, key=None, keyid=None, profile=None, \n\nCreate an RDS Instance

CLI example to create an RDS Instance:

```
salt myminion boto_rds.create myrds t2.micro MySQL sqlusr sqlpassw
```

salt.modules.boto_rds.create_option_group(name, engine_name, major_engine_version, option_group_description, tags=None, region=None, key=None, keyid=None, profile=None)

Create an RDS option group

CLI example to create an RDS option group:

```
salt myminion boto_rds.create_option_group my-opt-group mysql 5.6 → "group description"
```

salt.modules.boto_rds.create_parameter_group(name, db_parameter_group_family, description, tags=None, region=None, key=None, keyid=None, profile=None)

Create an RDS parameter group

CLI example to create an RDS parameter group:

```
salt myminion boto_rds.create_parameter_group my-param-group mysql5.6 → "group description"
```

salt.modules.boto_rds.create_read_replica(name, source_name, db_instance_class=None, availability_zone=None, port=None, auto_minor_version_upgrade=None, iops=None, option_group_name=None, publicly_accessible=None, tags=None, db_subnet_group_name=None, storage_type=None, copy_tags_to_snapshot=None, monitoring_interval=None, monitoring_role_arn=None, region=None, key=None, keyid=None, profile=None)

Create an RDS read replica

CLI example to create an RDS read replica:
```
salt myminion boto_rds.create_read_replica replicaname source_name
```

```
salt.modules.boto_rds.create_subnet_group(name, description, subnet_ids, tags=None,
                                          region=None, key=None, keyid=None, profile=None)

Create an RDS subnet group
```

CLI example to create an RDS subnet group:

```
salt myminion boto_rds.create_subnet_group my-subnet-group
   description '[subnet-12345678, subnet-87654321]' region=us-east-1
```

```
salt.modules.boto_rds.delete(name, skip_final_snapshot=None, final_db_snapshot_identifier=None,
                              region=None, key=None, keyid=None, profile=None, tags=None, wait_for_deletion=True,
                              timeout=180)

Delete an RDS instance.
```

CLI example:

```
salt myminion boto_rds.delete myrds skip_final_snapshot=True
   region=us-east-1
```

```
salt.modules.boto_rds.delete_option_group(name, region=None, key=None, keyid=None, profile=None)

Delete an RDS option group.
```

CLI example:

```
salt myminion boto_rds.delete_option_group my-opt-group region=us-east-1
```

```
salt.modules.boto_rds.delete_parameter_group(name, region=None, key=None, keyid=None, profile=None)

Delete an RDS parameter group.
```

CLI example:

```
salt myminion boto_rds.delete_parameter_group my-param-group
   region=us-east-1
```

```
salt.modules.boto_rds.delete_subnet_group(name, region=None, key=None, keyid=None, profile=None)

Delete an RDS subnet group.
```

CLI example:

```
salt myminion boto_rds.delete_subnet_group my-subnet-group
   region=us-east-1
```

```
salt.modules.boto_rds.describe(name, tags=None, region=None, key=None, keyid=None, profile=None)

Return RDS instance details.
```

CLI example:

```
salt myminion boto_rds.describe myrds
```
salt.modules.boto_rds.describe_db_instances(name=None, filters=None, jmespath='DBInstances', region=None, key=None, keyid=None, profile=None)

Return a detailed listing of some, or all, DB Instances visible in the current scope. Arbitrary subelements or subsections of the returned dataset can be selected by passing in a valid JMSEPath filter as well.

CLI example:
salt myminion boto_rds.describe_db_instances jmespath='DBInstances[*].DBInstanceIdentifier'

salt.modules.boto_rds.describe_db_subnet_groups(name=None, filters=None, jmespath='DBSubnetGroups', region=None, key=None, keyid=None, profile=None)

Return a detailed listing of some, or all, DB Subnet Groups visible in the current scope. Arbitrary subelements or subsections of the returned dataset can be selected by passing in a valid JMSEPath filter as well.

CLI example:
salt myminion boto_rds.describe_db_subnet_groups

salt.modules.boto_rds.describe_parameter_group(name, Filters=None, MaxRecords=None, Marker=None, region=None, key=None, keyid=None, profile=None)

Returns a list of DBParameterGroup descriptions. CLI example to description of parameter group:
salt myminion boto_rds.describe_parameter_group parametergroupname region=us-east-1

salt.modules.boto_rds.describe_parameters(name, Source=None, MaxRecords=None, Marker=None, region=None, key=None, keyid=None, profile=None)

Returns a list of DBParameterGroup parameters. CLI example to description of parameters

salt myminion boto_rds.describe_parameters parametergroupname region=us-east-1

salt.modules.boto_rds.exists(name, tags=None, region=None, key=None, keyid=None, profile=None)

Check to see if an RDS exists.

CLI example:
salt myminion boto_rds.exists myrds region=us-east-1

salt.modules.boto_rds.get_endpoint(name, tags=None, region=None, key=None, keyid=None, profile=None)

Return the endpoint of an RDS instance.

CLI example:
salt myminion boto_rds.get_endpoint myrds
salt.modules.boto_rds.modify_db_instance(name, allocated_storage=None, allow_major_version_upgrade=None, apply_immediately=None, auto_minor_version_upgrade=None, backup_retention_period=None, ca_certificate_identifier=None, character_set_name=None, copy_tags_to_snapshot=None, db_cluster_identifier=None, db_instance_class=None, db_name=None, db_parameter_group_name=None, db_port_number=None, db_security_groups=None, db_subnet_group_name=None, domain=None, domain_iam_role_name=None, engine_version=None, iops=None, kms_key_id=None, license_model=None, master_user_password=None, monitoring_interval=None, monitoring_role_arn=None, multi_az=None, new_db_instance_identifier=None, option_group_name=None, preferred_backup_window=None, preferred_maintenance_window=None, promotion_tier=None, publicly_accessible=None, storage_encrypted=None, storage_type=None, tde_credential_arn=None, tde_credential_password=None, vpc_security_group_ids=None, region=None, key=None, keyid=None, profile=None)

Modify settings for a DB instance. CLI example to description of parameters

```
salt myminion boto_rds.modify_db_instance db_instance_identifier region=us-east-1
```

salt.modules.boto_rds.option_group_exists(name, tags=None, region=None, key=None, keyid=None, profile=None)

Check to see if an RDS option group exists.

CLI example:

```
salt myminion boto_rds.option_group_exists myoptiongr region=us-east-1
```

salt.modules.boto_rds.parameter_group_exists(name, tags=None, region=None, key=None, keyid=None, profile=None)

Check to see if an RDS parameter group exists.

CLI example:

```
salt myminion boto_rds.parameter_group_exists myparametergroup region=us-east-1
```

salt.modules.boto_rds.subnet_group_exists(name, tags=None, region=None, key=None, keyid=None, profile=None)

Check to see if an RDS subnet group exists.

CLI example:
salt myminion boto_rds.subnet_group_exists my-param-group
    → region=us-east-1

salt.modules.boto_rds.update_parameter_group(name, parameters, apply_method='pending-reboot', tags=None, region=None, key=None, keyid=None, profile=None)

Update an RDS parameter group.

CLI example:
salt myminion boto_rds.update_parameter_group my-param-group
    → parameters='{"back_log":1, "binlog_cache_size":4096}'
    → region=us-

21.9.64 salt.modules.boto_route53

Connection module for Amazon Route53

New in version 2014.7.0.

configuration This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
    → ec2.html

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

route53.keyid: GKTADJGHEIQSXMKKRBJ08H
route53.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

A region may also be specified in the configuration:

route53.region: us-east-1

If a region is not specified, the default is 'universal', which is what the boto_route53 library expects, rather than None.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1

depends boto

salt.modules.boto_route53.add_record(name, value, zone, record_type, identifier=None, ttl=None, region=None, key=None, keyid=None, profile=None, wait_for_sync=True, split_dns=False, private_zone=False, retry_on_rate_limit=False, rate_limit_retries=None, retry_on_errors=True, error_retries=5)

Add a record to a zone.
CLI example:

```bash
salt myminion boto_route53.add_record test.example.org 1.1.1.1 example.
```

### retry_on_errors

Continue to query if the zone exists after an error is raised. The previously used argument `retry_on_rate_limit` was deprecated for this argument. Users can still use `retry_on_rate_limit` to ensure backwards compatibility, but please migrate to using the favored `retry_on_errors` argument instead.

### error_retries

Number of times to attempt to query if the zone exists. The previously used argument `rate_limit_retries` was deprecated for this argument. Users can still use `rate_limit_retries` to ensure backwards compatibility, but please migrate to using the favored `error_retries` argument instead.

```python
salt.modules.boto_route53.create_healthcheck(ip_addr=None, fqdn=None, region=None, key=None, keyid=None, profile=None, port=53, hc_type='TCP', resource_path='', string_match=None, request_interval=30, failure_threshold=3, retry_on_errors=True, error_retries=5)
```

Create a Route53 healthcheck

New in version 2018.3.0.

- **ip_addr**
  
  IP address to check. `ip_addr` or `fqdn` is required.

- **fqdn**
  
  Domain name of the endpoint to check. `ip_addr` or `fqdn` is required.

- **port**
  
  Port to check.

- **hc_type**
  
  Healthcheck type. HTTP | HTTPS | HTTP_STR_MATCH | HTTPS_STR_MATCH | TCP

- **resource_path**
  
  Path to check.

- **string_match**
  
  If `hc_type` is HTTP_STR_MATCH or HTTPS_STR_MATCH, the string to search for in the response body from the specified resource.

- **request_interval**
  
  The number of seconds between the time that Amazon Route 53 gets a response from your endpoint and the time that it sends the next health-check request.

- **failure_threshold**
  
  The number of consecutive health checks that an endpoint must pass or fail for Amazon Route 53 to change the current status of the endpoint from unhealthy to healthy or vice versa.

- **region**
  
  Region endpoint to connect to
key
  AWS key
keyid
  AWS keyid
profile
  AWS pillar profile

CLI Example:

```bash
salt myminion boto_route53.create_healthcheck 192.168.0.1
salt myminion boto_route53.create_healthcheck 192.168.0.1 port=443 hc_type=HTTPS resource_path=/ fqdn=blog
```

```python
salt.modules.boto_route53.create_hosted_zone(
    domain_name, caller_ref=None, comment='',
    private_zone=False, vpc_id=None, vpc_name=None, vpc_region=None, region=None, key=None, keyid=None, profile=None)
```

Create a new Route53 Hosted Zone. Returns a Python data structure with information about the newly created Hosted Zone.

**domain_name** The name of the domain. This must be fully-qualified, terminating with a period. This is the name you have registered with your domain registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request.

**caller_ref** A unique string that identifies the request and that allows create_hosted_zone() calls to be retried without the risk of executing the operation twice. It can take several minutes for the change to replicate globally, and change from PENDING to INSYNC status. Thus it's best to provide some value for this where possible, since duplicate calls while the first is in PENDING status will be accepted and can lead to multiple copies of the zone being created. On the other hand, if a zone is created with a given caller_ref, then deleted, a second attempt to create a zone with the same caller_ref will fail until that caller_ref is flushed from the Route53 system, which can take upwards of 24 hours.

**comment** Any comments you want to include about the hosted zone.

**private_zone** Set True if creating a private hosted zone.

**vpc_id** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpe_name. Ignored when creating a non-private zone.

**vpc_name** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpe_id. Ignored when creating a non-private zone.

**vpc_region** When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from vpc_id or vpc_name, where possible. If this fails, you'll need to provide an explicit value for this option. Ignored when creating a non-private zone.

**region** Region endpoint to connect to.

**key** AWS key to bind with.

**keyid** AWS keyid to bind with.

**profile** Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:
salt.myminion boto_route53.create_hosted_zone example.org

salt.modules.boto_route53.create_zone(zone, private=False, vpc_id=None, vpc_region=None, region=None, key=None, keyid=None, profile=None)

Create a Route53 hosted zone.
New in version 2015.8.0.
zone DNS zone to create
private True/False if the zone will be a private zone
vpc_id VPC ID to associate the zone to (required if private is True)
vpc_region VPC Region (required if private is True)
region region endpoint to connect to
key AWS key
keyid AWS keyid
profile AWS pillar profile
CLI Example:

salt.myminion boto_route53.create_zone example.org

salt.modules.boto_route53.delete_record(name, zone, record_type, identifier=None, all_records=False, region=None, key=None, keyid=None, profile=None, wait_for_sync=True, split_dns=False, private_zone=False, retry_on_rate_limit=None, rate_limit_retries=None, retry_on_errors=True, error_retries=5)

Modify a record in a zone.
CLI example:

salt.myminion boto_route53.delete_record test.example.org example.org A

retry_on_errors
Continue to query if the zone exists after an error is raised. The previously used argument retry_on_rate_limit was deprecated for this argument. Users can still use retry_on_rate_limit to ensure backwards compatibility, but please migrate to using the favored retry_on_errors argument instead.

error_retries Number of times to attempt to query if the zone exists. The previously used argument rate_limit_retries was deprecated for this arguments. Users can still use rate_limit_retries to ensure backwards compatibility, but please migrate to using the favored error_retries argument instead.

salt.modules.boto_route53.delete_zone(zone, region=None, key=None, keyid=None, profile=None)

Delete a Route53 hosted zone.
New in version 2015.8.0.
CLI Example:

salt.myminion boto_route53.delete_zone example.org
salt.modules.boto_route53.describe_hosted_zones(
    zone_id=None,  
domain_name=None,  
region=None,  
key=None,  
keyid=None,  
profile=None
)

Return detailed info about one, or all, zones in the bound account. If neither zone_id nor domain_name is provided, return all zones. Note that the return format is slightly different between the 'all' and 'single' description types.

- **zone_id** The unique identifier for the Hosted Zone
- **domain_name** The FQDN of the Hosted Zone (including final period)
- **region** Region to connect to.
- **key** Secret key to be used.
- **keyid** Access key to be used.
- **profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:

```
salt myminion boto_route53.describe_hosted_zones domain_name=foo.bar.com.  
  profile='{"region": "us-east-1", "keyid": "A12345678AB", "key": 
  "xblahblahblah"}
```

salt.modules.boto_route53.get_record(
    name,  
zone,  
record_type,  
fetch_all=False,  
region=None,  
key=None,  
keyid=None,  
profile=None,  
split_dns=False,  
private_zone=False,  
identifier=None,  
retry_on_rate_limit=None,  
rate_limit_retries=None,  
retry_on_errors=True,  
error_retries=5
)

Get a record from a zone.

CLI example:

```
salt myminion boto_route53.get_record test.example.org example.org A
```

**retry_on_errors**

Continue to query if the zone exists after an error is raised. The previously used argument `retry_on_rate_limit` was deprecated for this argument. Users can still use `retry_on_rate_limit` to ensure backwards compatibility, but please migrate to using the favored `retry_on_errors` argument instead.

**error_retries** Number of times to attempt to query if the zone exists. The previously used argument `rate_limit_retries` was deprecated for this arguments. Users can still use `rate_limit_retries` to ensure backwards compatibility, but please migrate to using the favored `error_retries` argument instead.

salt.modules.boto_route53.list_all_zones_by_id(
    region=None,  
key=None,  
keyid=None,  
profile=None
)

List, by their IDs, all hosted zones in the bound account.

- **region** Region to connect to.
- **key** Secret key to be used.
- **keyid** Access key to be used.
- **profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
Salt Documentation, Release 3001.1

CLI Example:

```
salt myminion boto_route53.list_all_zones_by_id
```

```
salt.modules.boto_route53.list_all_zones_by_name(region=None, key=None, keyid=None, profile=None)
```

List, by their FQDNs, all hosted zones in the bound account.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:

```
salt myminion boto_route53.list_all_zones_by_name
```

```
salt.modules.boto_route53.update_record(name, value, zone, record_type, identifier=None, ttl=None, region=None, key=None, keyid=None, profile=None, wait_for_sync=True, split_dns=False, private_zone=False, retry_on_rate_limit=None, rate_limit_retries=None, retry_on_errors=True, error_retries=5)
```

Modify a record in a zone.

CLI example:

```
salt myminion boto_route53.modify_record test.example.org 1.1.1.1 example.org A
```

**retry_on_errors**

Continue to query if the zone exists after an error is raised. The previously used argument `retry_on_rate_limit` was deprecated for this argument. Users can still use `retry_on_rate_limit` to ensure backwards compatibility, but please migrate to using the favored `retry_on_errors` argument instead.

**error_retries** Number of times to attempt to query if the zone exists. The previously used argument `rate_limit_retries` was deprecated for this arguments. Users can still use `rate_limit_retries` to ensure backwards compatibility, but please migrate to using the favored `error_retries` argument instead.

```
salt.modules.boto_route53.zone_exists(zone, region=None, key=None, keyid=None, profile=None, rate_limit_retries=None, retry_on_rate_limit=None, retry_on_errors=True, error_retries=5)
```

Check for the existence of a Route53 hosted zone.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_route53.zone_exists example.org
```

**retry_on_errors**
Continue to query if the zone exists after an error is raised. The previously used argument \texttt{retry\_on\_rate\_limit} was deprecated for this argument. Users can still use \texttt{retry\_on\_rate\_limit} to ensure backwards compatibility, but please migrate to using the favored \texttt{retry\_on\_errors} argument instead.

\textbf{error\_retries} Number of times to attempt to query if the zone exists. The previously used argument \texttt{rate\_limit\_retries} was deprecated for this arguments. Users can still use \texttt{rate\_limit\_retries} to ensure backwards compatibility, but please migrate to using the favored \texttt{error\_retries} argument instead.

21.9.65 salt.modules.boto_s3 module

Connection module for Amazon S3 using boto3

New in version 2018.3.0.

\textbf{configuration} This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles or it can read them from the \texttt{~/.aws/credentials} file or from these environment variables: \texttt{AWS\_ACCESS\_KEY\_ID, AWS\_SECRET\_ACCESS\_KEY}. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available at:

\begin{verbatim}
  iam-roles-for-amazon-ec2.html
  configuration.html#guide-configuration
\end{verbatim}

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

\begin{verbatim}
s3.keyid: GKTADJGHEIQXSMMCRRB08H
s3.key: askdjghsdfjkghWupUjasdflkdfkljgsdfjajkghs
\end{verbatim}

A region may also be specified in the configuration:

\begin{verbatim}
s3.region: us-east-1
\end{verbatim}

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

\begin{verbatim}
myprofile:
  keyid: GKTADJGHEIQXSMMCRRB08H
  key: askdjghsdfjkghWupUjasdflkdfkljgsdfjajkghs
  region: us-east-1
\end{verbatim}

\textbf{depends} boto3

\textbf{salt.modules.boto_s3.get_object_metadata} (\texttt{name}, \texttt{extra_args=None}, \texttt{region=None}, \texttt{key=None}, \texttt{keyid=None}, \texttt{profile=None})

Get metadata about an S3 object. Returns None if the object does not exist.

You can pass AWS SSE-C related args and/or RequestPayer in extra_args.

CLI Example:
salt myminion boto_s3.get_object_metadata \\
  my_bucket/path/to/object \\
  region=us-east-1 \\
  key=key \\
  keyid=keyid \\
  profile=profile \\

salt.modules.boto_s3.upload_file(source, name, extra_args=None, region=None, key=None, keyid=None, profile=None)

Upload a local file as an S3 object.

CLI Example:
	salt myminion boto_s3.upload_file \\
    /path/to/local/file \\
    my_bucket/path/to/object \\
    region=us-east-1 \\
    key=key \\
    keyid=keyid \\
    profile=profile \\

21.9.66 salt.modules.boto_s3_bucket module

Connection module for Amazon S3 Buckets

New in version 2016.3.0.

**depends**

- boto
- boto3

The dependencies listed above can be installed via package or pip.

**configuration** This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

**s3.keyid**: GKTADJGHEIQSXMKKRBJ08H
**s3.key**: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

A region may also be specified in the configuration:

**s3.region**: us-east-1

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
region: us-east-1

salt.modules.boto_s3_bucket.create

Given a valid config, create an S3 Bucket.

Returns {created: true} if the bucket was created and returns {created: False} if the bucket was not created.

CLI Example:

```bash
salt myminion boto_s3_bucket.create my_bucket
    GrantFullControl='emailaddress@example@example.com'
    GrantRead='uri="http://acs.amazonaws.com/groups/global/AllUsers"
    GrantReadACP='emailaddress="exampl@example.com",id="2345678909876432"'
    LocationConstraint=us-west-1
```

salt.modules.boto_s3_bucket.delete

Given a bucket name, delete it, optionally emptying it first.

Returns {deleted: true} if the bucket was deleted and returns {deleted: false} if the bucket was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete mybucket
```

salt.modules.boto_s3_bucket.delete_cors

Delete the CORS configuration for the given bucket

Returns {deleted: true} if CORS was deleted and returns {deleted: False} if CORS was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete_cors my_bucket
```

salt.modules.boto_s3_bucket.delete_lifecycle_configuration

Delete the lifecycle configuration for the given bucket

Returns {deleted: true} if Lifecycle was deleted and returns {deleted: False} if Lifecycle was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete_lifecycle_configuration my_bucket
```

salt.modules.boto_s3_bucket.delete_objects

Delete objects in a given S3 bucket.

Returns {deleted: true} if all objects were deleted and {deleted: false, failed: [key, ...]} otherwise
CLI Example:
```
salt myminion boto_s3_bucket.delete_objects mybucket '{Objects: [Key: myobject]}'
```

```
salt.modules.boto_s3_bucket.delete_policy(Bucket, region=None, key=None, keyid=None, profile=None)
```

Delete the policy from the given bucket

Returns {deleted: true} if policy was deleted and returns {deleted: False} if policy was not deleted.

CLI Example:
```
salt myminion boto_s3_bucket.delete_policy my_bucket
```

```
salt.modules.boto_s3_bucket.delete_replication(Bucket, region=None, key=None, keyid=None, profile=None)
```

Delete the replication config from the given bucket

Returns {deleted: true} if replication configuration was deleted and returns {deleted: False} if replication configuration was not deleted.

CLI Example:
```
salt myminion boto_s3_bucket.delete_replication my_bucket
```

```
salt.modules.boto_s3_bucket.delete_tagging(Bucket, region=None, key=None, keyid=None, profile=None)
```

Delete the tags from the given bucket

Returns {deleted: true} if tags were deleted and returns {deleted: False} if tags were not deleted.

CLI Example:
```
salt myminion boto_s3_bucket.delete_tagging my_bucket
```

```
salt.modules.boto_s3_bucket.delete_website(Bucket, region=None, key=None, keyid=None, profile=None)
```

Remove the website configuration from the given bucket

Returns {deleted: true} if website configuration was deleted and returns {deleted: False} if website configuration was not deleted.

CLI Example:
```
salt myminion boto_s3_bucket.delete_website my_bucket
```

```
salt.modules.boto_s3_bucket.describe(Bucket, region=None, key=None, keyid=None, profile=None)
```

Given a bucket name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:
```
salt myminion boto_s3_bucket.describe mybucket
```

```
salt.modules.boto_s3_bucket.empty(Bucket, MFA=None, RequestPayer=None, region=None, key=None, keyid=None, profile=None)
```

Delete all objects in a given S3 bucket.

Returns {deleted: true} if all objects were deleted and {deleted: false, failed: [key, ...]} otherwise

CLI Example:
salt myminion boto_s3_bucket.empty mybucket

```
salt.modules.boto_s3_bucket.exists(Bucket, region=None, key=None, keyid=None, profile=None)
```

Given a bucket name, check to see if the given bucket exists.

Returns True if the given bucket exists and returns False if the given bucket does not exist.

CLI Example:

```
salt myminion boto_s3_bucket.exists mybucket
```

```
salt.modules.boto_s3_bucket.list(region=None, key=None, keyid=None, profile=None)
```

List all buckets owned by the authenticated sender of the request.

Returns list of buckets

CLI Example:

```
Owner: {...}
Buckets:
- {...}
- {...}
```

```
salt.modules.boto_s3_bucket.list_object_versions(Bucket, Delimiter=None, EncodingType=None, Prefix=None, region=None, key=None, keyid=None, profile=None)
```

List objects in a given S3 bucket.

Returns a list of objects.

CLI Example:

```
salt myminion boto_s3_bucket.list_object_versions mybucket
```

```
salt.modules.boto_s3_bucket.list_objects(Bucket, Delimiter=None, EncodingType=None, Prefix=None, FetchOwner=False, StartAfter=None, region=None, key=None, keyid=None, profile=None)
```

List objects in a given S3 bucket.

Returns a list of objects.

CLI Example:

```
salt myminion boto_s3_bucket.list_objects mybucket
```

```
salt.modules.boto_s3_bucket.put_acl(Bucket, ACL=None, AccessControlPolicy=None, GrantFullControl=None, GrantRead=None, GrantReadACP=None, GrantWrite=None, GrantWriteACP=None, region=None, key=None, keyid=None, profile=None)
```

Given a valid config, update the ACL for a bucket.

Returns {updated: true} if the ACL was updated and returns {updated: False} if the ACL was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_acl my_bucket 'public' \
GrantFullControl='emailaddress@example@example.com'
```

(continues on next page)
salt.modules.boto_s3_bucket.put_cors(Bucket, CORSRules, region=None, key=None, keyid=None, profile=None)

Given a valid config, update the CORS rules for a bucket.

Returns {updated: true} if CORS was updated and returns {updated: False} if CORS was not updated.

CLI Example:

```bash
salt myminion boto_s3_bucket.put_cors my_bucket '{"AllowedHeaders": [], "AllowedMethods": ["GET"], "AllowedOrigins": ["*"], "ExposeHeaders": [], "MaxAgeSeconds": 123}'
```

salt.modules.boto_s3_bucket.put_lifecycle_configuration(Bucket, Rules, region=None, key=None, keyid=None, profile=None)

Given a valid config, update the Lifecycle rules for a bucket.

Returns {updated: true} if Lifecycle was updated and returns {updated: False} if Lifecycle was not updated.

CLI Example:

```bash
salt myminion boto_s3_bucket.put_lifecycle_configuration my_bucket '{"Expiration": {...}, "ID": "idstring", "Prefix": "prefixstring", "Status": "enabled", "Transitions": [{...}], "NoncurrentVersionTransitions": [{...}], "NoncurrentVersionExpiration": {...}}'
```

salt.modules.boto_s3_bucket.put_logging(Bucket, TargetBucket=None, TargetPrefix=None, TargetGrants=None, region=None, key=None, keyid=None, profile=None)

Given a valid config, update the logging parameters for a bucket.

Returns {updated: true} if parameters were updated and returns {updated: False} if parameters were not updated.

CLI Example:

```bash
salt myminion boto_s3_bucket.put_logging my_bucket log_bucket '{...}' /prefix
```
salt.modules.boto_s3_bucket.put_notification_configuration(Bucket, TopicConfigurations=None, QueueConfigurations=None, LambdaFunctionConfigurations=None, region=None, key=None, keyid=None, profile=None)

Given a valid config, update the notification parameters for a bucket.
Returns {updated: true} if parameters were updated and returns {updated: False} if parameters were not updated.

CLI Example:
```
salt myminion boto_s3_bucket.put_notification_configuration my_bucket
```

salt.modules.boto_s3_bucket.put_policy(Bucket, Policy, region=None, key=None, keyid=None, profile=None)

Given a valid config, update the policy for a bucket.
Returns {updated: true} if policy was updated and returns {updated: False} if policy was not updated.

CLI Example:
```
salt myminion boto_s3_bucket.put_policy my_bucket {...}
```

salt.modules.boto_s3_bucket.put_replication(Bucket, Role, Rules, region=None, key=None, keyid=None, profile=None)

Given a valid config, update the replication configuration for a bucket.
Returns {updated: true} if replication configuration was updated and returns {updated: False} if replication configuration was not updated.

CLI Example:
```
salt myminion boto_s3_bucket.put_replication my_bucket my_role [...]
```

salt.modules.boto_s3_bucket.put_request_payment(Bucket, Payer, region=None, key=None, keyid=None, profile=None)

Given a valid config, update the request payment configuration for a bucket.
Returns {updated: true} if request payment configuration was updated and returns {updated: False} if request payment configuration was not updated.

CLI Example:
```
salt myminion boto_s3_bucket.put_request_payment my_bucket Requester
```

salt.modules.boto_s3_bucket.put_tagging(Bucket, region=None, key=None, keyid=None, profile=None, **kwargs)

Given a valid config, update the tags for a bucket.
Returns {updated: true} if tags were updated and returns {updated: False} if tags were not updated.

CLI Example:
salt myminion boto_s3_bucket.put_tagging my_bucket my_role [...] 

salt.modules.boto_s3_bucket.put_versioning(Bucket, Status, MFADelete=None, MFA=None, region=None, key=None, keyid=None, profile=None)

Given a valid config, update the versioning configuration for a bucket.

Returns {updated: true} if versioning configuration was updated and returns {updated: False} if versioning configuration was not updated.

CLI Example:
salt myminion boto_s3_bucket.put_versioning my_bucket Enabled

salt.modules.boto_s3_bucket.put_website(Bucket, ErrorDocument=None, IndexDocument=None, RedirectAllRequestsTo=None, RoutingRules=None, region=None, key=None, keyid=None, profile=None)

Given a valid config, update the website configuration for a bucket.

Returns {updated: true} if website configuration was updated and returns {updated: False} if website configuration was not updated.

CLI Example:
salt myminion boto_s3_bucket.put_website my_bucket IndexDocument='{"Suffix": ➔"index.html"}'

21.9.67 salt.modules.boto_secgroup

Connection module for Amazon Security Groups

New in version 2014.7.0.

configuration This module accepts explicit ec2 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

secgroup.keyid: GKTADJGHEIQSXMKKRBJ08H
secgroup.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

A region may also be specified in the configuration:

secgroup.region: us-east-1

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfljkghWupUjasdfklgjsdfjajkghs
  region: us-east-1

depends boto

salt.modules.boto_secgroup.authorize(name=None, source_group_name=None, source_group_owner_id=None, ip_protocol=None, from_port=None, to_port=None, cidr_ip=None, group_id=None, source_group_group_id=None, region=None, key=None, keyid=None, profile=None, vpc_id=None, vpc_name=None, egress=False)

Add a new rule to an existing security group.

CLI example:
salt myminion boto_secgroup.authorize mysecgroup ip_protocol=tcp from_port=80 to_port=80 cidr_ip=['10.0.0.0/8', '192.168.0.0/24']

salt.modules.boto_secgroup.convert_to_group_ids(groups, vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)

Given a list of security groups and a vpc_id, convert_to_group_ids will convert all list items in the given list to security group ids.

CLI example:
salt myminion boto_secgroup.convert_to_group_ids mysecgroup vpc=89yhh7h

salt.modules.boto_secgroup.create(name, description, vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)

Create a security group.

CLI example:
salt myminion boto_secgroup.create mysecgroup 'My Security Group'

salt.modules.boto_secgroup.delete(name=None, group_id=None, region=None, key=None, keyid=None, profile=None, vpc_id=None, vpc_name=None)

Delete a security group.

CLI example:
salt myminion boto_secgroup.delete mysecgroup

salt.modules.boto_secgroup.delete_tags(tags, name=None, group_id=None, vpc_name=None, vpc_id=None, region=None, key=None, keyid=None, profile=None)

Deletes tags from a security group.

New in version 2016.3.0.

tags a list of tags to remove
name the name of the security group

group_id the group id of the security group (in lie of a name/vpc combo)
vpc_name the name of the vpc to search the named group for
vpc_id  the id of the vpc, in lieu of the vpc_name
region  the amazon region
key    amazon key
keyid  amazon keyid
profile amazon profile

CLI example:

```bash
salt myminion boto_secgroup.delete_tags ["TAG_TO_DELETE1","TAG_TO_DELETE2"]
security_group_name vpc_id=vpc-13435 profile=my_aws_profile
```

```
salt.modules.boto_secgroup.exists(name=None, region=None, key=None, keyid=None, profile=None, vpc_id=None, vpc_name=None, group_id=None)
```
Check to see if a security group exists.

CLI example:

```
salt myminion boto_secgroup.exists mysecgroup
```

```
salt.modules.boto_secgroup.get_all_security_groups(groupnames=None, group_ids=None, filters=None, region=None, key=None, keyid=None, profile=None)
```
Return a list of all Security Groups matching the given criteria and filters.

Note that the `groupnames` argument only functions correctly for EC2 Classic and default VPC Security Groups. To find groups by name in other VPCs you'll want to use the `group-name` filter instead.

The valid keys for the `filters` argument can be found in AWS's API documentation.

CLI example:

```
salt myminion boto_secgroup.get_all_security_groups filters='{"group-name": mygroup}"
```

```
salt.modules.boto_secgroup.get_config(name=None, group_id=None, region=None, key=None, keyid=None, profile=None, vpc_id=None, vpc_name=None)
```
Get the configuration for a security group.

CLI example:

```
salt myminion boto_secgroup.get_config mysecgroup
```

```
salt.modules.boto_secgroup.get_group_id(name, vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)
```
Get a Group ID given a Group Name or Group Name and VPC ID

CLI example:

```
salt myminion boto_secgroup.get_group_id mysecgroup
```

```
salt.modules.boto_secgroup.revoke(name=None, source_group_name=None, source_group_owner_id=None, ip_protocol=None, from_port=None, to_port=None, cidr_ip=None, group_id=None, source_group_group_id=None, region=None, key=None, keyid=None, profile=None, vpc_id=None, vpc_name=None, egress=False)
```

Remove a rule from an existing security group.

CLI example:

```
salt myminion boto_secgroup.revoke mysecgroup ip_protocol=tcp from_port=80 to_port=80 cidr_ip='10.0.0.0/8'
```

```
salt.modules.boto_secgroup.set_tags(tags, name=None, group_id=None, vpc_name=None, vpc_id=None, region=None, key=None, keyid=None, profile=None)
```

Sets tags on a security group.

New in version 2016.3.0.

- **tags**: a dict of key:value pair of tags to set on the security group
- **name**: the name of the security group
- **group_id**: the group id of the security group (in lieu of a name/vpc combo)
- **vpc_name**: the name of the vpc to search the named group for
- **vpc_id**: the id of the vpc, in lieu of the vpc_name
- **region**: the amazon region
- **key**: amazon key
- **keyid**: amazon keyid
- **profile**: amazon profile

CLI example:

```
salt myminion boto_secgroup.set_tags "{'TAG1': 'Value1', 'TAG2': 'Value2'}" security_group_name vpc_id=vpc-13435 profile=my_aws_profile
```

### 21.9.68 salt.modules.boto_sns

Connection module for Amazon SNS

- **configuration**
  
  This module accepts explicit sns credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
sns.keyid: GKTADJGHEIQXSXMCKKRBJ08H
sns.key: askdjghsdfjkgHwupUjasdfsdlkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
sns.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkgHwupUjasdfklgdlfmjsdfjajkghs
  region: us-east-1

depends boto

salt.modules.boto_sns.create(name, region=None, key=None, keyid=None, profile=None)
  Create an SNS topic.

CLI example to create a topic:

```bash
salt myminion boto_sns.create mytopic region=us-east-1
```

salt.modules.boto_sns.delete(name, region=None, key=None, keyid=None, profile=None)
  Delete an SNS topic.

CLI example to delete a topic:

```bash
salt myminion boto_sns.delete mytopic region=us-east-1
```

salt.modules.boto_sns.exists(name, region=None, key=None, keyid=None, profile=None)
  Check to see if an SNS topic exists.

CLI example:

```bash
salt myminion boto_sns.exists mytopic region=us-east-1
```

salt.modules.boto_sns.get_all_subscriptions_by_topic(name, region=None, key=None, keyid=None, profile=None)
  Get list of all subscriptions to a specific topic.

CLI example to delete a topic:

```bash
salt myminion boto_sns.get_all_subscriptions_by_topic mytopic region=us-east-1
```

salt.modules.boto_sns.get_all_topics(region=None, key=None, keyid=None, profile=None)
  Returns a list of the all topics.

CLI example:

```bash
salt myminion boto_sns.get_all_topics
```

salt.modules.boto_sns.get_arn(name, region=None, key=None, keyid=None, profile=None)
  Returns the full ARN for a given topic name.

CLI example:

```bash
salt myminion boto_sns.get_arn mytopic
```

salt.modules.boto_sns.subscribe(topic, protocol, endpoint, region=None, key=None, keyid=None, profile=None)
  Subscribe to a Topic.

CLI example to delete a topic:

```bash
salt myminion boto_sns.subscribe mytopic https https://www.example.com/sns-endpoint region=us-east-1
```
salt.modules.boto_sns.unsubscribe(topic, subscription_arn, region=None, key=None, keyid=None, profile=None)

Unsubscribe a specific SubscriptionArn of a topic.

CLI Example:

```
salt myminion boto_sns.unsubscribe my_topic my_subscription_arn region=us-east-1
```

New in version 2016.11.0.

## 21.9.69 salt.modules.boto_sqs

Connection module for Amazon SQS

New in version 2014.7.0.

**configuration**

This module accepts explicit sqs credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available at:

```
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
sqs.keyid: GKTADJGHEIQSXMKKRBJ08H
sqs.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
sqs.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

**depends** boto3

salt.modules.boto_sqs.create(name, attributes=None, region=None, key=None, keyid=None, profile=None)

Create an SQS queue.

CLI Example:

```
salt myminion boto_sqs.create myqueue region=us-east-1
```

salt.modules.boto_sqs.delete(name, region=None, key=None, keyid=None, profile=None)

Delete an SQS queue.

CLI Example:

```
salt myminion boto_sqs.delete myqueue region=us-east-1
```
salt.modules.boto_sqs.exists(name, region=None, key=None, keyid=None, profile=None)

Check to see if a queue exists.

CLI Example:
```
salt myminion boto_sqs.exists myqueue region=us-east-1
```

salt.modules.boto_sqs.get_attributes(name, region=None, key=None, keyid=None, profile=None)

Return attributes currently set on an SQS queue.

CLI Example:
```
salt myminion boto_sqs.get_attributes myqueue
```

salt.modules.boto_sqs.list_(prefix='', region=None, key=None, keyid=None, profile=None)

Return a list of the names of all visible queues.

New in version 2016.11.0.

CLI Example:
```
salt myminion boto_sqs.list region=us-east-1
```

salt.modules.boto_sqs.set_attributes(name, attributes, region=None, key=None, keyid=None, profile=None)

Set attributes on an SQS queue.

CLI Example:
```
salt myminion boto_sqs.set_attributes myqueue '{ReceiveMessageWaitTimeSeconds: 20}' region=us-east-1
```

21.9.70 salt.modules.boto_ssm module

Connection module for Amazon SSM

configuration This module uses IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

depends boto3

salt.modules.boto_ssm.delete_parameter(Name, region=None, key=None, keyid=None, profile=None)

Removes a parameter from the SSM parameter store

New in version 3000.

```
salt-call boto_ssm.delete_parameter test-param
```

salt.modules.boto_ssm.get_parameter(name, withdecryption=False, resp_json=False, region=None, key=None, keyid=None, profile=None)

Retrieves a parameter from SSM Parameter Store

New in version 3000.
salt-call boto_ssm.get_parameter test-param withdescription=True

```python
salt.modules.boto_ssm.put_parameter(Name, Value, Description=None, Type='String', KeyId=None, Overwrite=False, AllowedPattern=None, region=None, key=None, keyid=None, profile=None)
```

Sets a parameter in the SSM parameter store
New in version 3000.

```
salt-call boto_ssm.put_parameter test-param test_value Type=SecureString&KeyId=alias/aws/ssm Description='test encrypted key'
```

### 21.9.71 salt.modules.boto_vpc

Connection module for Amazon VPC
New in version 2014.7.0.

**depends**
- boto >= 2.8.0
- boto3 >= 1.2.6

**configuration**
This module accepts explicit VPC credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```yaml
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```yaml
vpc.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

Changed in version 2015.8.0: All methods now return a dictionary. Create and delete methods return:

```yaml
created: true
```

or

```yaml
created: false
error:
  message: error message
```

Request methods (e.g., `describe_vpc`) return:
New in version 2016.11.0.

Functions to request, accept, delete and describe VPC peering connections. Named VPC peering connections can be requested using these modules. VPC owner accounts can accept VPC peering connections (named or otherwise).

Examples showing creation of VPC peering connection

```
# Create a named VPC peering connection
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
  → name=my_vpc_connection
# Without a name
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
# Specify a region
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
  → region=us-west-2
```

Check to see if VPC peering connection is pending

```
salt myminion boto_vpc.is_peering_connection_pending name=salt-vpc
# Specify a region
salt myminion boto_vpc.is_peering_connection_pending name=salt-vpc region=us-west-2
# specify an id
salt myminion boto_vpc.is_peering_connection_pending conn_id=pcx-8a8939e3
```

Accept VPC peering connection

```
salt myminion boto_vpc.accept_vpc_peering_connection name=salt-vpc
# Specify a region
salt myminion boto_vpc.accept_vpc_peering_connection name=salt-vpc region=us-west-2
# specify an id
salt myminion boto_vpc.accept_vpc_peering_connection conn_id=pcx-8a8939e3
```

Deleting VPC peering connection via this module

```
# Delete a named VPC peering connection
salt myminion boto_vpc.delete_vpc_peering_connection name=salt-vpc
# Specify a region
salt myminion boto_vpc.delete_vpc_peering_connection name=salt-vpc region=us-west-2
# specify an id
salt myminion boto_vpc.delete_vpc_peering_connection conn_id=pcx-8a8939e3
```

```
salt.modules.boto_vpc.accept_vpc_peering_connection(conn_id='', name='', region=None,
  key=None, keyid=None, profile=None, dry_run=False)
```

Request a VPC peering connection between two VPCs.

New in version 2016.11.0.

Parameters

- **conn_id** -- The ID to use. String type.
- **name** -- The name of this VPC peering connection. String type.
- **region** -- The AWS region to use. Type string.
- **key** -- The key to use for this connection. Type string.
- **keyid** -- The key id to use.
- **profile** -- The profile to use.
- **dry_run** -- The dry_run flag to set.

**Returns** dict

Warning: Please specify either the vpc_peering_connection_id or name but not both. Specifying both will result in an error!

CLI Example:

```bash
salt myminion boto_vpc.accept_vpc_peering_connection name=salt-vpc
# Specify a region
salt myminion boto_vpc.accept_vpc_peering_connection name=salt-vpc region=us-west-2
# specify an id
salt myminion boto_vpc.accept_vpc_peering_connection conn_id=pcx-8a839e3
```

salt.modules.boto_vpc.associate_dhcp_options_to_vpc(dhcp_options_id, vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)

Given valid DHCP options id and a valid VPC id, associate the DHCP options record with the VPC.

Returns True if the DHCP options record were associated and returns False if the DHCP options record was not associated.

CLI Example:

```bash
salt myminion boto_vpc.associate_dhcp_options_to_vpc 'dhcp-a0bl34pp' 'vpc-6b1fe402'
```

salt.modules.boto_vpc.associate_network_acl_to_subnet(network_acl_id=None, subnet_id=None, network_acl_name=None, subnet_name=None, region=None, key=None, keyid=None, profile=None)

Given a network acl and subnet ids or names, associate a network acl to a subnet.

CLI Example:

```bash
salt myminion boto_vpc.associate_network_acl_to_subnet network_acl_id='acl-5fb85d36' subnet_id='subnet-6a1fe403'
salt myminion boto_vpc.associate_network_acl_to_subnet network_acl_id='myacl' subnet_id='mysubnet'
```

salt.modules.boto_vpc.associate_route_table(route_table_id=None, subnet_id=None, route_table_name=None, subnet_name=None, region=None, key=None, keyid=None, profile=None)

Given a route table and subnet name or id, associates the route table with the subnet.

21.9. execution modules
CLI Example:

```bash
salt myminion boto_vpc.associate_route_table 'rtb-1f382e7d' 'subnet-6a1fe403'
```

```bash
salt myminion boto_vpc.associate_route_table route_table_name='myrtb' subnet_name='mysubnet'
```

```bash
salt.modules.boto_vpc.check_vpc(vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)
```

Check whether a VPC with the given name or id exists. Returns the vpc_id or None. Raises SaltInvocationError if both vpc_id and vpc_name are None. Optionally raise a CommandExecutionError if the VPC does not exist. New in version 2016.3.0.

CLI Example:

```bash
salt myminion boto_vpc.check_vpc vpc_name=myvpc profile=awsprofile
```

```bash
salt.modules.boto_vpc.create(cidr_block, instance_tenancy=None, vpc_name=None, enable_dns_support=None, enable_dns_hostnames=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Given a valid CIDR block, create a VPC.

An optional instance_tenancy argument can be provided. If provided, the valid values are 'default' or 'dedicated'. An optional vpc_name argument can be provided.

Returns {created: true} if the VPC was created and returns {created: False} if the VPC was not created.

CLI Example:

```bash
salt myminion boto_vpc.create '10.0.0.0/24'
```

```bash
salt.modules.boto_vpc.create_customer_gateway(vpn_connection_type, ip_address, bgp_asn, customer_gateway_name=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Given a valid VPN connection type, a static IP address and a customer gateway’s Border Gateway Protocol (BGP) Autonomous System Number, create a customer gateway.

Returns the customer gateway id if the customer gateway was created and returns False if the customer gateway was not created.

CLI Example:

```bash
salt myminion boto_vpc.create_customer_gateway 'ipsec.1', '12.1.2.3', 65534
```

```bash
salt.modules.boto_vpc.create_dhcp_options(domain_name=None, domain_name_servers=None, ntp_servers=None, netbios_name_servers=None, netbios_node_type=None, dhcp_options_name=None, tags=None, vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)
```

Given valid DHCP options, create a DHCP options record, optionally associating it with an existing VPC.

Returns True if the DHCP options record was created and returns False if the DHCP options record was not deleted.

Changed in version 2015.8.0: Added vpc_name and vpc_id arguments
CLI Example:
```
salt myminion boto_vpc.create_dhcp_options domain_name='example.com' \ 
domain_name_servers='[1.2.3.4]' ntp_servers='[5.6.7.8]' \ 
netbios_name_servers='[10.0.0.1]' netbios_node_type=1 \ 
vpc_name='myvpc'
```

```
salt.modules.boto_vpc.create_internet_gateway(internet_gateway_name=None, \ 
vpc_id=None, vpc_name=None, \ 
tags=None, region=None, key=None, \ 
keyid=None, profile=None)
```

Create an Internet Gateway, optionally attaching it to an existing VPC.

Returns the internet gateway id if the internet gateway was created and returns False if the internet gateways was not created.

New in version 2015.8.0.

CLI Example:
```
salt myminion boto_vpc.create_internet_gateway \ 
internet_gateway_name=myigw vpc_name=myvpc
```

```
salt.modules.boto_vpc.create_nat_gateway(subnet_id=None, subnet_name=None, allocation_id=None, region=None, key=None, \ 
keyid=None, profile=None)
```

Create a NAT Gateway within an existing subnet. If allocation_id is specified, the elastic IP address it references is associated with the gateway. Otherwise, a new allocation_id is created and used.

This function requires boto3 to be installed.

Returns the nat gateway id if the nat gateway was created and returns False if the nat gateway was not created.

New in version 2016.11.0.

CLI Example:
```
salt myminion boto_vpc.create_nat_gateway subnet_name=mysubnet
```

```
salt.modules.boto_vpc.create_network_acl(vpc_id=None, vpc_name=None, network_acl_name=None, subnet_id=None, subnet_name=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Given a vpc_id, creates a network acl.

Returns the network acl id if successful, otherwise returns False.

Changed in version 2015.8.0: Added vpc_name, subnet_id, and subnet_name arguments

CLI Example:
```
salt myminion boto_vpc.create_network_acl 'vpc-6b1fe402'
```

```
salt.modules.boto_vpc.create_network_acl_entry(network_acl_id=None, \ 
rule_number=None, protocol=None, \ 
rule_action=None, cidr_block=None, egress=None, network_acl_name=None, \ 
icmp_code=None, icmp_type=None, \ 
port_range_from=None, port_range_to=None, region=None, \ 
key=None, keyid=None, profile=None)
```

Creates a network acl entry.

CLI Example:

```
salt myminion boto_vpc.create_network_acl_entry 'acl-5fb85d36' '32767' 'all' 'deny' '0.0.0.0/0' egress=true
```

```
salt.modules.boto_vpc.create_route_table(vpc_id=None, vpc_name=None, route_table_name=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Creates a route.

If a nat gateway is specified, boto3 must be installed

CLI Example:

```
salt myminion boto_vpc.create_route 'rtb-1f382e7d' '10.0.0.0/16' gateway_id='vgw-alb2c3'
```

```
salt.modules.boto_vpc.create_subnet(vpc_id=None, cidr_block=None, vpc_name=None, availability_zone=None, subnet_name=None, tags=None, region=None, key=None, keyid=None, profile=None, auto_assign_public_ipv4=False)
```

Given a valid VPC ID or Name and a CIDR block, create a subnet for the VPC.

An optional availability zone argument can be provided.

Returns True if the VPC subnet was created and returns False if the VPC subnet was not created.

Changed in version 2015.8.0: Added vpc_name argument

CLI Examples:

```
salt myminion boto_vpc.create_subnet vpc_id='vpc-6b1fe402' \ subnet_name='mysubnet' cidr_block='10.0.0.0/25'
salt myminion boto_vpc.create_subnet vpc_name='myvpc' \ subnet_name='mysubnet', cidr_block='10.0.0.0/25'
```
Given a customer gateway ID, check if the customer gateway ID exists.
Returns True if the customer gateway ID exists; Returns False otherwise.
CLI Example:
```
salt myminion boto_vpc.customer_gateway_exists cgw-b6a247df
salt myminion boto_vpc.customer_gateway_exists customer_gateway_name=mycgw
```

```
salt.modules.boto_vpc.delete(vpc_id=None, name=None, vpc_name=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Given a VPC ID or VPC name, delete the VPC.
Returns {deleted: true} if the VPC was deleted and returns {deleted: false} if the VPC was not deleted.
CLI Example:
```
salt myminion boto_vpc.delete vpc_id='vpc-6b1fe402'
salt myminion boto_vpc.delete name='myvpc'
```

```
salt.modules.boto_vpc.delete_customer_gateway(customer_gateway_id=None, customer_gateway_name=None, region=None, key=None, keyid=None, profile=None)
```

Given a customer gateway ID or name, delete the customer gateway.
Returns True if the customer gateway was deleted and returns False if the customer gateway was not deleted.
Changed in version 2015.8.0: Added customer_gateway_name argument
CLI Example:
```
salt myminion boto_vpc.delete_customer_gateway 'cgw-b6a247df'
```

```
salt.modules.boto_vpc.delete_dhcp_options(dhcp_options_id=None, dhcp_options_name=None, region=None, key=None, keyid=None, profile=None)
```

Delete dhcp options by id or name.
New in version 2015.8.0.
CLI Example:
```
salt myminion boto_vpc.delete_dhcp_options 'dopt-b6a247df'
```

```
salt.modules.boto_vpc.delete_internet_gateway(internet_gateway_id=None, internet_gateway_name=None, detach=False, region=None, key=None, keyid=None, profile=None)
```

Delete an internet gateway (by name or id).
Returns True if the internet gateway was deleted and otherwise False.
New in version 2015.8.0.
CLI Examples:
```
salt myminion boto_vpc.delete_internet_gateway internet_gateway_id=igw-1a2b3c
salt myminion boto_vpc.delete_internet_gateway internet_gateway_name=myigw
```
salt.modules.boto_vpc.delete_nat_gateway(nat_gateway_id, release_eips=False, region=None, key=None, keyid=None, profile=None, wait_for_delete=False, wait_for_delete_retries=5)

Delete a nat gateway (by id).
Returns True if the internet gateway was deleted and otherwise False.
This function requires boto3 to be installed.
New in version 2016.11.0.
nat_gateway_id  Id of the NAT Gateway
release_eips  whether to release the elastic IPs associated with the given NAT Gateway Id
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
wait_for_delete  whether to wait for delete of the NAT gateway to be in failed or deleted state after issuing the delete call.
wait_for_delete_retries  NAT gateway may take some time to be go into deleted or failed state. During the deletion process, subsequent release of elastic IPs may fail; this state will automatically retry this number of times to ensure the NAT gateway is in deleted or failed state before proceeding.

CLI Examples:
salt myminion boto_vpc.delete_nat_gateway nat_gateway_id=igw-1a2b3c

salt.modules.boto_vpc.delete_network_acl(network_acl_id=None, network_acl_name=None, disassociate=False, region=None, key=None, keyid=None, profile=None)

Delete a network acl based on the network_acl_id or network_acl_name provided.

CLI Examples:
salt myminion boto_vpc.delete_network_acl network_acl_id='acl-5fb85d36' \ disassociate=false
salt myminion boto_vpc.delete_network_acl network_acl_name='myacl' \ disassociate=true

salt.modules.boto_vpc.delete_network_acl_entry(network_acl_id=None, rule_number=None, egress=None, network_acl_name=None, region=None, key=None, keyid=None, profile=None)

Deletes a network acl entry.

CLI Example:
salt myminion boto_vpc.delete_network_acl_entry 'acl-5fb85d36' '32767'

salt.modules.boto_vpc.delete_route(route_table_id=None, destination_cidr_block=None, route_table_name=None, region=None, key=None, keyid=None, profile=None)

Deletes a route.
CLI Example:
```
salt myminion boto_vpc.delete_route 'rtb-1f382e7d' '10.0.0.0/16'
```

`salt.modules.boto_vpc.delete_route_table`:
```
(route_table_id=None, route_table_name=None, region=None, key=None, keyid=None, profile=None)
```
Deletes a route table.
CLI Examples:
```
salt myminion boto_vpc.delete_route_table route_table_id='rtb-1f382e7d'
salt myminion boto_vpc.delete_route_table route_table_name='myroutetable'
```

`salt.modules.boto_vpc.delete_subnet`:
```
(subnet_id=None, subnet_name=None, region=None, key=None, keyid=None, profile=None)
```
Given a subnet ID or name, delete the subnet.
Returns True if the subnet was deleted and returns False if the subnet was not deleted.
Changed in version 2015.8.0: Added subnet_name argument
CLI Example:
```
salt myminion boto_vpc.delete_subnet 'subnet-6a1fe403'
```

`salt.modules.boto_vpc.delete_vpc_peering_connection`:
```
(conn_id=None, conn_name=None, region=None, key=None, keyid=None, profile=None, dry_run=False)
```
Delete a VPC peering connection.
New in version 2016.11.0.

- **conn_id**: The connection ID to check. Exclusive with conn_name.
- **conn_name**: The connection name to check. Exclusive with conn_id.
- **region**: Region to connect to.
- **key**: Secret key to be used.
- **keyid**: Access key to be used.
- **profile**: A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
- **dry_run**: If True, skip application and simply return projected status.

CLI Example:
```
# Create a named VPC peering connection
salt myminion boto_vpc.delete_vpc_peering_connection conn_name=salt-vpc
# Specify a region
salt myminion boto_vpc.delete_vpc_peering_connection conn_name=salt-vpc region=us-west-2
# specify an id
salt myminion boto_vpc.delete_vpc_peering_connection conn_id=pcx-8a8939e3
```

`salt.modules.boto_vpc.describe`:
```
(vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)
```
Given a VPC ID describe its properties.
Returns a dictionary of interesting properties.
Changed in version 2015.8.0: Added vpc_name argument

CLI Example:

```bash
salt myminion boto_vpc.describe vpc_id=vpc-123456
salt myminion boto_vpc.describe vpc_name=myvpc
```

```
salt.modules.boto_vpc.describe_nat_gateways(nat_gateway_id=None, subnet_id=None, subnet_name=None, vpc_id=None, vpc_name=None, states='pending', 'available', region=None, key=None, keyid=None, profile=None)
```

Return a description of nat gateways matching the selection criteria.

This function requires boto3 to be installed.

CLI Example:

```bash
salt myminion boto_vpc.describe_nat_gateways nat_gateway_id='nat-03b02643b43216fe7',
salt myminion boto_vpc.describe_nat_gateways subnet_id='subnet-5b05942d'
```

```
salt.modules.boto_vpc.describe_route_table(route_table_id=None, route_table_name=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Given route table properties, return route table details if matching table(s) exist.

New in version 2015.8.0.

CLI Example:

```bash
salt myminion boto_vpc.describe_route_table route_table_id='rtb-1f382e7d'
```

```
salt.modules.boto_vpc.describe_route_tables(route_table_id=None, route_table_name=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Given route table properties, return details of all matching route tables.

This function requires boto3 to be installed.

New in version 2016.11.0.

CLI Example:

```bash
salt myminion boto_vpc.describe_route_tables vpc_id='vpc-a6a9efc3'
```

```
salt.modules.boto_vpc.describe_subnet(subnet_id=None, subnet_name=None, region=None, key=None, keyid=None, profile=None)
```

Given a subnet id or name, describe its properties.

Returns a dictionary of interesting properties.

New in version 2015.8.0.

CLI Examples:

```bash
salt myminion boto_vpc.describe_subnet subnet_id=subnet-123456
salt myminion boto_vpc.describe_subnet subnet_name=mysubnet
```
salt.modules.boto_vpc.describe_subnets(subnet_ids=None, subnet_names=None, vpc_id=None, cidr=None, region=None, key=None, keyid=None, profile=None)

Given a VPC ID or subnet CIDR, returns a list of associated subnets and their details. Return all subnets if VPC ID or CIDR are not provided. If a subnet id or CIDR is provided, only its associated subnet details will be returned.

New in version 2015.8.0.

CLI Examples:

```
salt myminion boto_vpc.describe_subnets
salt myminion boto_vpc.describe_subnets subnet_ids=['subnet-ba1987ab', 'subnet-ba1987cd']
salt myminion boto_vpc.describe_subnets vpc_id=vpc-123456
salt myminion boto_vpc.describe_subnets cidr=10.0.0.0/21
```

salt.modules.boto_vpc.describe_vpc_peering_connection(name, region=None, key=None, keyid=None, profile=None)

Returns any VPC peering connection id(s) for the given VPC peering connection name.

VPC peering connection ids are only returned for connections that are in the active, pending-acceptance or provisioning state.

New in version 2016.11.0.

Parameters

- **name** -- The string name for this VPC peering connection
- **region** -- The aws region to use
- **key** -- Your aws key
- **keyid** -- The key id associated with this aws account
- **profile** -- The profile to use

Returns dict

CLI Example:

```
salt myminion boto_vpc.describe_vpc_peering_connection salt-vpc
salt myminion boto_vpc.describe_vpc_peering_connection salt-vpc region=us-west-2
```

salt.modules.boto_vpc.describe_vpcs(vpc_id=None, name=None, cidr=None, tags=None, region=None, key=None, keyid=None, profile=None)

Describe all VPCs, matching the filter criteria if provided.

Returns a list of dictionaries with interesting properties.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_vpc.describe_vpcs
```
salt.modules.boto_vpc.dhcp_options_exists(dhcp_options_id=None, name=None, dhcp_options_name=None, tags=None, region=None, key=None, keyid=None, profile=None)

Check if a dhcp option exists.
Returns True if the dhcp option exists; Returns False otherwise.

CLI Example:
```
salt myminion boto_vpc.dhcp_options_exists dhcp_options_id='dhcp-a0bl34pp'
```

code

salt.modules.boto_vpc.disassociate_network_acl(subnet_id=None, vpc_id=None, subnet_name=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)

Given a subnet ID, disassociates a network acl.

CLI Example:
```
salt myminion boto_vpc.disassociate_network_acl 'subnet-6a1fe403'
```

code

salt.modules.boto_vpc.disassociate_route_table(association_id, region=None, key=None, keyid=None, profile=None)

Disassociates a route table.

association_id The Route Table Association ID to disassociate

CLI Example:
```
salt myminion boto_vpc.disassociate_route_table 'rtbassoc-d8ccddba'
```

code

salt.modules.boto_vpc.exists(vpc_id=None, name=None, cidr=None, tags=None, region=None, key=None, keyid=None, profile=None)

Given a VPC ID, check to see if the given VPC ID exists.
Returns True if the given VPC ID exists and returns False if the given VPC ID does not exist.

CLI Example:
```
salt myminion boto_vpc.exists myvpc
```

code

salt.modules.boto_vpc.get_dhcp_options(dhcp_options_name=None, dhcp_options_id=None, region=None, key=None, keyid=None, profile=None)

Return a dict with the current values of the requested DHCP options set

CLI Example:
```
salt myminion boto_vpc.get_dhcp_options 'myfunnydhcpoptionsname'
```

New in version 2016.3.0.

code

salt.modules.boto_vpc.get_id(name=None, cidr=None, tags=None, region=None, key=None, keyid=None, profile=None)

Given VPC properties, return the VPC id if a match is found.

CLI Example:
```
salt myminion boto_vpc.get_id myvpc
```

code
salt.modules.boto_vpc.get_resource_id(resource, name=None, resource_id=None, region=None, key=None, keyid=None, profile=None)

Get an AWS id for a VPC resource by type and name.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_vpc.get_resource_id internet_gateway myigw
```

salt.modules.boto_vpc.get_subnet_association(subnets, region=None, key=None, keyid=None, profile=None)

Given a subnet (aka: a vpc zone identifier) or list of subnets, returns vpc association.

Returns a VPC ID if the given subnets are associated with the same VPC ID. Returns False on an error or if the given subnets are associated with different VPC IDs.

CLI Examples:

```
salt myminion boto_vpc.get_subnet_association subnet-61b47516
salt myminion boto_vpc.get_subnet_association [ 'subnet-61b47516', 'subnet-2cb9785b' ] ...
```

salt.modules.boto_vpc.is_peering_connection_pending(conn_id=None, conn_name=None, region=None, key=None, keyid=None, profile=None)

Check if a VPC peering connection is in the pending state.

New in version 2016.11.0.

- **conn_id** The connection ID to check. Exclusive with conn_name.
- **conn_name** The connection name to check. Exclusive with conn_id.
- **region** Region to connect to.
- **key** Secret key to be used.
- **keyid** Access key to be used.
- **profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:

```
salt myminion boto_vpc.is_peering_connection_pending conn_name=salt-vpc
salt myminion boto_vpc.is_peering_connection_pending conn_name=salt-vpc region=us-west-2
salt myminion boto_vpc.is_peering_connection_pending conn_id=pcx-8a8939e3
```

salt.modules.boto_vpc.nat_gateway_exists(nat_gateway_id=None, subnet_id=None, subnet_name=None, vpc_id=None, vpc_name=None, states=['pending', 'available'], region=None, key=None, keyid=None, profile=None)

Checks if a nat gateway exists.

This function requires boto3 to be installed.

New in version 2016.11.0.
CLI Example:

```bash
salt myminion boto_vpc.nat_gateway_exists nat_gateway_id='nat-03b02643b43216fe7'
salt myminion boto_vpc.nat_gateway_exists subnet_id='subnet-5b05942d'
```

salt.modules.boto_vpc.network_acl_exists(network_acl_id=None, name=None, network_acl_name=None, tags=None, region=None, key=None, keyid=None, profile=None)

Checks if a network acl exists.

Returns True if the network acl exists or returns False if it doesn't exist.

CLI Example:

```bash
salt myminion boto_vpc.network_acl_exists network_acl_id='acl-5fb85d36'
```

salt.modules.boto_vpc.peering_connection_pending_from_vpc(conn_id=None, conn_name=None, vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)

Check if a VPC peering connection is in the pending state, and requested from the given VPC.

New in version 2016.11.0.

- **conn_id** The connection ID to check. Exclusive with conn_name.
- **conn_name** The connection name to check. Exclusive with conn_id.
- **vpc_id** Is this the ID of the requesting VPC for this peering connection. Exclusive with vpc_name.
- **vpc_name** Is this the Name of the requesting VPC for this peering connection. Exclusive with vpc_id.
- **region** Region to connect to.
- **key** Secret key to be used.
- **keyid** Access key to be used.
- **profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:

```bash
salt myminion boto_vpc.is_peering_connection_pending name=salt-vpc
```

salt.modules.boto_vpc.replace_network_acl_entry(network_acl_id=None, rule_number=None, protocol=None, rule_action=None, cidr_block=None, egress=None, network_acl_name=None, icmp_code=None, icmp_type=None, port_range_from=None, port_range_to=None, region=None, key=None, keyid=None, profile=None)

Replaces a network acl entry.

CLI Example:

```bash
salt myminion boto_vpc.replace_network_acl_entry 'acl-5fb85d36' '32767' 'all' 'deny' '0.0.0.0/0' egress=true
```
salt.modules.boto_vpc.replace_route

```
route_table_id=None, destination_cidr_block=None,
route_table_name=None, gateway_id=None,
instance_id=None, interface_id=None,
region=None, key=None, keyid=None, profile=None,
vpc_peering_connection_id=None)
```

Replaces a route.

CLI Example:

```bash
salt myminion boto_vpc.replace_route 'rtb-1f382e7d' '10.0.0.0/16' gateway_id='vgw-a1b2c3'
```

salt.modules.boto_vpc.replace_route_table_association

```
association_id, route_table_id,
region=None, key=None,
keyid=None, profile=None)
```

Replaces a route table association.

CLI Example:

```bash
salt myminion boto_vpc.replace_route_table_association 'rtbassoc-d8ccddba' 'rtb-1f382e7d'
```

salt.modules.boto_vpc.request_vpc_peering_connection

```
requester_vpc_id=None, requester_vpc_name=None,
peer_vpc_id=None, peer_vpc_name=None,
name=None, peer_owner_id=None,
region=None, key=None,
keyid=None, profile=None,
dry_run=False)
```

Request a VPC peering connection between two VPCs.

New in version 2016.11.0.

**requester_vpc_id** ID of the requesting VPC. Exclusive with requester_vpc_name.

**requester_vpc_name** Name tag of the requesting VPC. Exclusive with requester_vpc_id.

**peer_vpc_id** ID of the VPC to create VPC peering connection with. This can be a VPC in another account. Exclusive with peer_vpc_name.

**peer_vpc_name** Name tag of the VPC to create VPC peering connection with. This can only be a VPC in the same account, else resolving it into a vpc ID will almost certainly fail. Exclusive with peer_vpc_id.

**name** The name to use for this VPC peering connection.

**peer_owner_id** ID of the owner of the peer VPC. Defaults to your account ID, so a value is required if peering with a VPC in a different account.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**dry_run** If True, skip application and return status.

CLI Example:
# Create a named VPC peering connection
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
  → name=my_vpc_connection

# Without a name
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da

# Specify a region
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
  → region=us-west-2

salt.modules.boto_vpc.resource_exists(resource, name=None, resource_id=None, tags=None, region=None, key=None, keyid=None, profile=None)

Given a resource type and name, return {exists: true} if it exists, {exists: false} if it does not exist, or {error: {message: error text}} on error.

New in version 2015.8.0.

CLI Example:
salt myminion boto_vpc.resource_exists internet_gateway myigw

salt.modules.boto_vpc.route_exists(destination_cidr_block, route_table_name=None, route_table_id=None, gateway_id=None, instance_id=None, interface_id=None, tags=None, region=None, key=None, keyid=None, profile=None, vpc_peering_connection_id=None)

Checks if a route exists.

New in version 2015.8.0.

CLI Example:
salt myminion boto_vpc.route_exists destination_cidr_block='10.0.0.0/20' gateway_id='local' route_table_name='test'

salt.modules.boto_vpc.route_table_exists(route_table_id=None, name=None, route_table_name=None, tags=None, region=None, key=None, keyid=None, profile=None)

Checks if a route table exists.

CLI Example:
salt myminion boto_vpc.route_table_exists route_table_id='rtb-1f382e7d'

salt.modules.boto_vpc.subnet_exists(subnet_id=None, name=None, subnet_name=None, cidr=None, tags=None, zones=None, region=None, key=None, keyid=None, profile=None)

Check if a subnet exists.

Returns True if the subnet exists, otherwise returns False.

Changed in version 2015.8.0: Added subnet_name argument

Deprecated name argument

CLI Example:
salt myminion boto_vpc.subnet_exists subnet_id='subnet-6a1fe403'
21.9.72 salt.modules.bower

Manage and query Bower packages

This module manages the installed packages using Bower. Note that npm, git and bower must be installed for this module to be available.

salt.modules.bower.\texttt{install}(pkg, dir, pkgs=None, runas=None, env=None)

Install a Bower package.

If no package is specified, the dependencies (from bower.json) of the package in the given directory will be installed.

\begin{itemize}
  \item \texttt{pkg} A package name in any format accepted by Bower, including a version identifier
  \item \texttt{dir} The target directory in which to install the package
  \item \texttt{pkgs} A list of package names in the same format as the \texttt{pkg} parameter
  \item \texttt{runas} The user to run Bower with
  \item \texttt{env} Environment variables to set when invoking Bower. Uses the same \texttt{env} format as the \texttt{cmd.run} execution function.
\end{itemize}

\textbf{CLI Example:}

\begin{verbatim}
salt '*' bower.install underscore /path/to/project
salt '*' bower.install jquery#2.0 /path/to/project
\end{verbatim}

salt.modules.bower.\texttt{list}_(dir, runas=None, env=None)

List installed Bower packages.

\begin{itemize}
  \item \texttt{dir} The directory whose packages will be listed
  \item \texttt{runas} The user to run Bower with
  \item \texttt{env} Environment variables to set when invoking Bower. Uses the same \texttt{env} format as the \texttt{cmd.run} execution function.
\end{itemize}

\textbf{CLI Example:}

\begin{verbatim}
salt '*' bower.list /path/to/project
\end{verbatim}

salt.modules.bower.\texttt{prune}(dir, runas=None, env=None)

New in version 2017.7.0.

Remove extraneous local Bower packages, i.e. those not referenced in bower.json

\begin{itemize}
  \item \texttt{dir} The directory whose packages will be pruned
  \item \texttt{runas} The user to run Bower with
  \item \texttt{env} Environment variables to set when invoking Bower. Uses the same \texttt{env} format as the \texttt{cmd.run} execution function.
\end{itemize}

\textbf{CLI Example:}

\begin{verbatim}
salt '*' bower.prune /path/to/project
\end{verbatim}

salt.modules.bower.\texttt{uninstall}(pkg, dir, runas=None, env=None)

Uninstall a Bower package.

\begin{itemize}
  \item \texttt{pkg} A package name in any format accepted by Bower
\end{itemize}
The target directory from which to uninstall the package

runas  The user to run Bower with

eenv  Environment variables to set when invoking Bower. Uses the same env format as the cmd.run execution function.

CLI Example:

```
salt '*' bower.uninstall underscore /path/to/project
```

### 21.9.73 salt.modules.bridge

Module for gathering and managing bridging information

**salt.modules.bridge.add**(br=None)

Creates a bridge

CLI Example:

```
salt '*' bridge.add br0
```

**salt.modules.bridge.addif**(br=None, iface=None)

Adds an interface to a bridge

CLI Example:

```
salt '*' bridge.addif br0 eth0
```

**salt.modules.bridge.delete**(br=None)

 Deletes a bridge

CLI Example:

```
salt '*' bridge.delete br0
```

**salt.modules.bridge.delif**(br=None, iface=None)

Removes an interface from a bridge

CLI Example:

```
salt '*' bridge.delif br0 eth0
```

**salt.modules.bridge.find_interaces**(args)

Returns the bridge to which the interfaces are bond to

CLI Example:

```
salt '*' bridge.find_interfaces eth0 [eth1...]`
```

**salt.modules.bridge.interfaces**(br=None)

Returns interfaces attached to a bridge

CLI Example:

```
salt '*' bridge.interfaces br0
```

**salt.modules.bridge.list_**( )

Returns the machine's bridges list
salt modules.bridge.show(br=None)

Returns bridges interfaces along with enslaved physical interfaces. If no interface is given, all bridges are shown, else only the specified bridge values are returned.

CLI Example:

```
salt '*' bridge.show
salt '*' bridge.show br0
```

salt modules.bridge.stp(br=None, state='disable', iface=None)

Sets Spanning Tree Protocol state for a bridge

CLI Example:

```
salt '*' bridge.stp br0 enable
salt '*' bridge.stp br0 disable
```

For BSD-like operating systems, it is required to add the interface on which to enable the STP.

CLI Example:

```
salt '*' bridge.stp bridge0 enable fxp0
salt '*' bridge.stp bridge0 disable fxp0
```

21.9.74 salt modules.bsd_shadow

Manage the password database on BSD systems

**Important:** If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to 'shadow.info' is not available), see here.

salt modules.bsd_shadow.default_hash()

Returns the default hash used for unset passwords

CLI Example:

```
salt '*' shadow.default_hash
```

salt modules.bsd_shadow.del_password(name)

New in version 2015.8.2.

Delete the password from name user

CLI Example:

```
salt '*' shadow.del_password username
```

salt modules.bsd_shadow.info(name)

Return information for the specified user

CLI Example:
salt '...' shadow.info someuser

salt.modules.bsd_shadow.set_change(name, change)
    Sets the time at which the password expires (in seconds since the UNIX epoch). See man 8 usermod on NetBSD and OpenBSD or man 8 pw on FreeBSD.
    A value of 0 sets the password to never expire.
    CLI Example:
    ```
salt '...' shadow.set_change username 1419980400
    ```

salt.modules.bsd_shadow.set_expire(name, expire)
    Sets the time at which the account expires (in seconds since the UNIX epoch). See man 8 usermod on NetBSD and OpenBSD or man 8 pw on FreeBSD.
    A value of 0 sets the account to never expire.
    CLI Example:
    ```
salt '...' shadow.set_expire username 1419980400
    ```

salt.modules.bsd_shadow.set_password(name, password)
    Set the password for a named user. The password must be a properly defined hash. The password hash can be generated with this command:
    ```python
    python -c "import crypt; print crypt.crypt('password', ciphersalt)"
    ```
    **Note:** When constructing the ciphersalt string, you must escape any dollar signs, to avoid them being interpolated by the shell.
    
    'password' is, of course, the password for which you want to generate a hash.
    
    ciphersalt is a combination of a cipher identifier, an optional number of rounds, and the cryptographic salt. The arrangement and format of these fields depends on the cipher and which flavor of BSD you are using. For more information on this, see the manpage for crypt(3). On NetBSD, additional information is available in passwd.conf(5).
    
    It is important to make sure that a supported cipher is used.
    
    CLI Example:
    ```
salt '...' shadow.set_password someuser '$1$UYCIxa628.9qXjpQCjM4a..' 
    ```

21.9.75 salt.modules.btrfs

Module for managing BTRFS file systems.

salt.modules.btrfs.add(mountpoint, *devices, **kwargs)
    Add a devices to a BTRFS filesystem.
    General options:
    - **nodiscard**: Do not perform whole device TRIM
    - **force**: Force overwrite existing filesystem on the disk
    
    CLI Example:
salt.modules.btrfs.add /mountpoint /dev/sda1 /dev/sda2

salt.modules.btrfs.convert(device, permanent=False, keeplf=False)
Convert ext2/3/4 to BTRFS. Device should be mounted.

Filesystem can be converted temporarily so the further processing and rollback is possible, or permanently,
where previous extended filesystem image gets deleted. Please note, permanent conversion takes a while as
BTRFS filesystem needs to be properly rebalanced afterwards.

General options:

- **permanent**: Specify if the migration should be permanent (false by default)
- **keeplf**: Keep **lost+found** of the partition (removed by default, but still in the image, if not perma-
  nent migration)

CLI Example:

```
salt '*' btrfs.convert /dev/sda1
salt '*' btrfs.convert /dev/sda1 permanent=True
```

salt.modules.btrfs.defragment(path)
Defragment mounted BTRFS filesystem. In order to defragment a filesystem, device should be properly
mounted and writable.

If passed a device name, then defragmented whole filesystem, mounted on in. If passed a mountpoint of the
filesystem, then only this mount point is defragmented.

CLI Example:

```
salt '*' btrfs.defragment /dev/sda1
salt '*' btrfs.defragment /path/on/filesystem
```

salt.modules.btrfs.delete(mountpoint, *devices, **kwargs)
Remove devices from a BTRFS filesystem.

CLI Example:

```
salt '*' btrfs.delete /mountpoint /dev/sda1 /dev/sda2
```

salt.modules.btrfs.devices()
Get known BTRFS formatted devices on the system.

CLI Example:

```
salt '*' btrfs.devices
```

salt.modules.btrfs.features()
List currently available BTRFS features.

CLI Example:

```
salt '*' btrfs.mkfs_features
```

salt.modules.btrfs.info(device)
Get BTRFS filesystem information.

CLI Example:

```
salt '*' btrfs.info /dev/sda1
```
salt.modules.btrfs.mkfs("devices, **kwargs")
Create a file system on the specified device. By default wipes out with force.

General options:
- `allocsize`: Specify the BTRFS offset from the start of the device.
- `bytecount`: Specify the size of the resultant filesystem.
- `nodesize`: Node size.
- `leafsize`: Specify the nodesize, the tree block size in which btrfs stores data.
- `noforce`: Prevent force overwrite when an existing filesystem is detected on the device.
- `sectorsize`: Specify the sectorsize, the minimum data block allocation unit.
- `nodiscard`: Do not perform whole device TRIM operation by default.
- `uuid`: Pass UUID or pass True to generate one.

Options:
- `dto`: (raid0|raid1|raid5|raid6|raid10|single|dup) Specify how the data must be spanned across the devices specified.
- `mto`: (raid0|raid1|raid5|raid6|raid10|single|dup) Specify how metadata must be spanned across the devices specified.
- `fts`: Features (call salt <host> btrfs.features for full list of available features)

See the mkfs.btrfs(8) manpage for a more complete description of corresponding options description.

CLI Example:
```
salt '*' btrfs.mkfs /dev/sda1
salt '*' btrfs.mkfs /dev/sda1 noforce=True
```

salt.modules.btrfs.properties(obj, type=None, set=None)
List properties for given btrfs object. The object can be path of BTRFS device, mount point, or any directories/files inside the BTRFS filesystem.

General options:
- `type`: Possible types are s[subvol], f[ilesystem], i[node] and d[evice].
- `force`: Force overwrite existing filesystem on the disk
- `set`: <key=value,key1=value1...> Options for a filesystem properties.

CLI Example:
```
salt '*' btrfs.properties /mountpoint
salt '*' btrfs.properties /dev/sda1 type=subvol set='ro=false,label="My Storage"'
```

salt.modules.btrfs.resize(mountpoint, size)
Resize filesystem.

General options:
- `mountpoint`: Specify the BTRFS mountpoint to resize.
- `size`: ([+-]<newsize>[kKmMgGtTpPeE]max) Specify the new size of the target.

CLI Example:
```
salt '*' btrfs.resize /mountpoint size=+1g
salt '*' btrfs.resize /dev/sda1 size=max
```

**salt.modules.btrfs.subvolume_create** *(name, dest=None, qgroupids=None)*

Create subvolume `name` in `dest`.

- **Return**: True if the subvolume is created, False is the subvolume is already there.

  - **name**: Name of the new subvolume
  - **dest**: If not given, the subvolume will be created in the current directory, if given will be in /dest/name
  - **qgroupids**: Add the newly created subvolume to a qgroup. This parameter is a list

**CLI Example:**

```
salt '*' btrfs.subvolume_create var
salt '*' btrfs.subvolume_create var dest=/mnt
salt '*' btrfs.subvolume_create var qgroupids='[200]'
```

**salt.modules.btrfs.subvolume_delete** *(name=None, names=None, commit=None)*

Delete the subvolume(s) from the filesystem

- **Return**: True if the subvolume is deleted, False is the subvolume was already missing.

  - **name**: Name of the subvolume to remove
  - **names**: List of names of subvolumes to remove
  - **commit**: `after`: Wait for transaction commit at the end
  - `each`: Wait for transaction commit after each delete

**CLI Example:**

```
salt '*' btrfs.subvolume_delete /var/volumes/tmp
salt '*' btrfs.subvolume_delete /var/volumes/tmp commit=after
```

**salt.modules.btrfs.subvolume_exists** *(path)*

Check if a subvolume is present in the filesystem.

- **path**: Mount point for the subvolume (full path)

**CLI Example:**

```
salt '*' btrfs.subvolume_exists /mnt/var
```

**salt.modules.btrfs.subvolume_find_new** *(name, last_gen)*

List the recently modified files in a subvolume

- **name**: Name of the subvolume
- **last_gen**: Last transid marker from where to compare

**CLI Example:**

```
```
salt '*' btrfs.subvolume_find_new /var/volumes/tmp 1024

salt.modules.btrfs.subvolume_get_default(path)
Get the default subvolume of the filesystem path
path Mount point for the subvolume

CLI Example:
salt '*' btrfs.subvolume_get_default /var/volumes/tmp

salt.modules.btrfs.subvolume_list(path, parent_id=False, absolute=False, ogeneration=False, generation=False, subvolumes=False, uuid=False, parent_uuid=False, sent_subvolume_uuid=False, snapshots=False, readonly=False, deleted=False, generation_cmp=None, ogeneration_cmp=None, sort=None)
List the subvolumes present in the filesystem.
path Mount point for the subvolume
parent_id Print parent ID
absolute Print all the subvolumes in the filesystem and distinguish between absolute and relative path with respect to the given <path>
ogeneration Print the ogeneration of the subvolume
generation Print the generation of the subvolume
subvolumes Print only subvolumes below specified <path>
uuid Print the UUID of the subvolume
parent_uuid Print the parent uuid of subvolumes (and snapshots)
sent_subvolume_uuid Print the UUID of the sent subvolume, where the subvolume is the result of a receive operation
snapshots Only snapshot subvolumes in the filesystem will be listed
readonly Only readonly subvolumes in the filesystem will be listed
deleted Only deleted subvolumns that are ye not cleaned
generation_cmp List subvolumes in the filesystem that its generation is >=, <= or = value. ‘+’ means >= value, ‘-’ means <= value, If there is neither ‘+’ nor ‘-’, it means = value
ogeneration_cmp List subvolumes in the filesystem that its ogeneration is >=, <= or = value
sort List subvolumes in order by specified items. Possible values: * rootid * gen * ogen * path You can add ‘+’ or ‘-’ in front of each items, ‘+’ means ascending, ‘-’ means descending. The default is ascending. You can combine it in a list.

CLI Example:
salt '*' btrfs.subvolume_list /var/volumes/tmp
salt '*' btrfs.subvolume_list /var/volumes/tmp path=True
salt '*' btrfs.subvolume_list /var/volumes/tmp sort='[-rootid]'

salt.modules.btrfs.subvolume_set_default(subvolid, path)
Set the subvolume as default
subvolid ID of the new default subvolume
**salt**

### btrfs.subvolume_set_default

**path** Mount point for the filesystem

CLI Example:

```
salt '*' btrfs.subvolume_set_default 257 /var/volumes/tmp
```

### btrfs.subvolume_show

**path** Mount point for the filesystem

CLI Example:

```
salt '*' btrfs.subvolume_show /var/volumes/tmp
```

### btrfs.subvolume_snapshot

**source** Source subvolume from where to create the snapshot

**dest** If only dest is given, the subvolume will be named as the basename of the source

**name** Name of the snapshot

**read_only** Create a read only snapshot

CLI Example:

```
salt '*' btrfs.subvolume_snapshot /var/volumes/tmp dest=./snapshots
salt '*' btrfs.subvolume_snapshot /var/volumes/tmp name=backup
```

### btrfs.subvolume_sync

**path** Mount point for the filesystem

**subvolids** List of IDs of subvolumes to wait for

**sleep** Sleep N seconds between checks (default: 1)

CLI Example:

```
salt '*' btrfs.subvolume_sync /var/volumes/tmp
salt '*' btrfs.subvolume_sync /var/volumes/tmp subvolids='[257]'
```

### btrfs.usage

**path** Show in which disk the chunks are allocated.

CLI Example:

```
salt '*' btrfs.usage /your/mountpoint
```

### btrfs.version

Return BTRFS version.

CLI Example:

```
salt '*' btrfs.version
```
21.9.76 salt.modules.cabal

Manage and query Cabal packages

New in version 2015.8.0.

salt.modules.cabal.install(pkg=None, pkgs=None, user=None, install_global=False, env=None)
Install a cabal package.

pkg A package name in format accepted by cabal-install. See: https://wiki.haskell.org/Cabal-Install
pkgs A list of packages names in same format as pkg
user The user to run cabal install with
install_global Install package globally instead of locally
env Environment variables to set when invoking cabal. Uses the same env format as the cmd.run execution function

CLI Example:

```
salt '*' cabal.install shellcheck
salt '*' cabal.install shellcheck-0.3.5
```

salt.modules.cabal.list_(pkg=None, user=None, installed=False, env=None)
List packages matching a search string.

pkg Search string for matching package names
user The user to run cabal list with
installed If True, only return installed packages.
env Environment variables to set when invoking cabal. Uses the same env format as the cmd.run execution function

CLI example:

```
salt '*' cabal.list
salt '*' cabal.list ShellCheck
```

salt.modules.cabal.uninstall(pkg, user=None, env=None)
Uninstall a cabal package.

pkg The package to uninstall
user The user to run ghc-pkg unregister with
env Environment variables to set when invoking cabal. Uses the same env format as the cmd.run execution function

CLI Example:

```
salt '*' cabal.uninstall ShellCheck
```

salt.modules.cabal.update(user=None, env=None)
Updates list of known packages.

user The user to run cabal update with
env Environment variables to set when invoking cabal. Uses the same env format as the cmd.run execution function.
CLI Example:

```
salt '*' cabal.update
```

### 21.9.77 salt.modules.capirca_acl module

**Capirca ACL**

Generate ACL (firewall) configuration for network devices.

New in version 2017.7.0.

- **codeauthor** Mircea Ulinic <ping@mirceaulinic.net> & Robert Ankeny <robankeny@google.com>
- **maturity** new
- **depends** capirca
- **platform** unix

#### Dependencies

The firewall configuration is generated by [Capirca](https://www.capirca.org).

To install Capirca, execute: `pip install capirca`.

```python
salt.modules.capirca_acl.get_filter_config(platform, filter_name, filter_options=None, terms=None, prepend=True, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=True, only_lower_merge=False, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d')
```

Return the configuration of a policy filter.

- **platform** The name of the Capirca platform.
- **filter_name** The name of the policy filter.
- **filter_options** Additional filter options. These options are platform-specific. See the complete list of options.
- **terms** List of terms for this policy filter. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.
- **prepend**: **True** When `merge_pillar` is set as `True`, the final list of terms generated by merging the terms from `terms` with those defined in the pillar (if any): new terms are prepended at the beginning, while existing ones will preserve the position. To add the new terms at the end of the list, set this argument to `False`.
- **pillar_key**: **acl** The key in the pillar containing the default attributes values. Default: `acl`.
- **pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
- **saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.
- **merge_pillar**: **True** Merge the CLI variables with the pillar. Default: `True`.
- **only_lower_merge**: **False** Specify if it should merge only the terms fields. Otherwise it will try to merge also filters fields. Default: `False`.

---

21.9. execution modules 1561
revision_id  Add a comment in the filter config having the description for the changes applied.
revision_no  The revision count.
revision_date: True  Boolean flag: display the date when the filter configuration was generated. Default: True.
revision_date_format: %Y/%m/%d  The date format to be used when generating the perforce data. Default: %Y/%m/%d (<year>/<month>/<day>).

CLI Example:

```bash
salt '*' capirca.get_filter_config ciscoxr my-filter pillar_key=netacl
```

Output Example:

```
! $Id: $
! $Date: $
! $Revision: $
no ipv4 access-list my-filter
ipv4 access-list my-filter
remark $Id: $
remark my-term
deny ipv4 any eq 1234 any
deny ipv4 any eq 1235 any
remark my-other-term
permit tcp any range 5678 5680 any
exit
```

The filter configuration has been loaded from the pillar, having the following structure:

```
netacl:
  - my-filter:
    terms:
      - my-term:
        source_port: [1234, 1235]
        action: reject
      - my-other-term:
        source_port: [5678, 5680]
        protocol: tcp
        action: accept
```

salt.modules.capirca_acl.get_filter_pillar(filter_name, pillar_key='acl', pillarenv=None, saltenv=None)

Helper that can be used inside a state SLS, in order to get the filter configuration given its name.

filter_name  The name of the filter.
pillar_key  The root key of the whole policy config.
pillarenv  Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
saltenv  Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.
Return the configuration of the whole policy.

**platform**  The name of the Capirca platform.

**filters**  List of filters for this policy. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

**prepend**  When `merge_pillar` is set as `True`, the final list of filters generated by merging the filters from `filters` with those defined in the pillar (if any): new filters are prepended at the beginning, while existing ones will preserve the position. To add the new filters at the end of the list, set this argument to `False`.

**pillar_key**  `acl`  The key in the pillar containing the default attributes values. Default: `acl`.

**pillarenv**  Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv**  Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

**merge_pillar**  `True`  Merge the CLI variables with the pillar. Default: `True`.

**only_lower_merge**  `False`  Specify if it should merge only the filters and terms fields. Otherwise it will try to merge everything at the policy level. Default: `False`.

**revision_id**  Add a comment in the policy config having the description for the changes applied.

**revision_no**  The revision count.

**revision_date**  `True`  Boolean flag: display the date when the policy configuration was generated. Default: `True`.

**revision_date_format**  `%Y/%m/%d`  The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (**year*/**month*/**day**).

CLI Example:

```
salt '*' capirca.get_policy_config juniper pillar_key=netacl
```

Output Example:

```
firewall {
    family inet {
        replace:
        /*
        ** $Id:$
        ** $Date:$
        ** $Revision:$
        **
        */
        filter my-filter {
            term my-term {
                from {
                    source-port [ 1234 1235 ];
                }
                then {
                    reject;
                }
            }
        }
        term my-other-term {
            from {
                protocol tcp;
                source-port 5678-5680;
            }
        }
    }
}
```

(continues on next page)
The policy configuration has been loaded from the pillar, having the following structure:

```
netacl:
  - my-filter:
    options:
    - not-interface-specific
    terms:
      - my-term:
        source_port: [1234, 1235]
        action: reject
      - my-other-term:
        source_port:
        - [5678, 5680]
        protocol: tcp
        action: accept
    - my-other-filter:
      terms:
      - dummy-term:
        protocol:
        - tcp
        - udp
        action: reject
```

The policy configuration has been loaded from the pillar, having the following structure:
Return the configuration of a single policy term.

**platform**  The name of the Capirca platform.

**filter_name**  The name of the policy filter.

**term_name**  The name of the term.

**filter_options**  Additional filter options. These options are platform-specific. E.g.: `inet6`, `bridge`, `object-group`.

**pillar_key**: `acl`  The key in the pillar containing the default attributes values. Default: `acl`. If the pillar contains the following structure:

```
firewall:
  - my-filter:
    terms:
      - my-term:
        source_port: 1234
        source_address:
          - 1.2.3.4/32
          - 5.6.7.8/32
```

The `pillar_key` field would be specified as `firewall`.

**pillarenv**  Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv**  Included only for compatibility with ` pillarenv_from_saltenv `, and is otherwise ignored.

**merge_pillar**: `True`  Merge the CLI variables with the pillar. Default: `True`.

**revision_id**  Add a comment in the term config having the description for the changes applied.

**revision_no**  The revision count.

**revision_date**: `True`  Boolean flag: display the date when the term configuration was generated. Default: `True`.

**revision_date_format**: `%Y/%m/%d`  The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (<year>/<month>/<day>.

**source_service**  A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a `source_port` and protocol.

As this module is available on Unix platforms only, it reads the IANA port assignment from `/etc/services`.

If the user requires additional shortcuts to be referenced, they can add entries under `/etc/services`, which can be managed using the `file state`.

**destination_service**  A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a `destination_port` and protocol. Allows the same options as `source_service`.
**term_fields**  Term attributes. To see what fields are supported, please consult the list of supported **keywords**. Some platforms have few other **optional** keywords.

**Note:** The following fields are accepted:

- action
- address
- address_exclude
- comment
- counter
- expiration
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix
- forwarding_class
- forwarding_class_except
- logging
- log_name
- loss_priority
- option
- policer
- port
- precedence
- principals
- protocol
- protocol_except
- qos
- pan_application
- routing_instance
- source_address
- source_address_exclude
- source_port
- source_prefix
- verbatim
- packet_length
- fragment_offset
- hop_limit
- icmp_type
- ether_type
- traffic_class_count
- traffic_type
- translated
- dscp_set
- dscp_match
- dscp_except
- next_ip
- flexible_match_range
- source_prefix_except
- destination_prefix_except
- vpn
- source_tag
- destination_tag
- source_interface
- destination_interface
- flattened
- flattened_addr
- flattened_saddr
- flattened_daddr
- priority

**Note:** The following fields can be also a single value and a list of values:

- action
- address
- address_exclude
- comment
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix
- forwarding_class
- forwarding_class_except
- logging
- option
• port
• precedence
• principals
• protocol
• protocol_except
• pan_application
• source_address
• source_address_exclude
• source_port
• source_prefix
• verbatim
• icmp_type
• ether_type
• traffic_type
• dscp_match
• dscp_except
• flexible_match_range
• source_prefix_except
• destination_prefix_except
• source_tag
• destination_tag
• source_service
• destination_service

Example: destination_address can be either defined as:

```
destination_address: 172.17.17.1/24
```

or as a list of destination IP addresses:

```
destination_address:
  - 172.17.17.1/24
  - 172.17.19.1/24
```

or a list of services to be matched:

```
source_service:
  - ntp
  - snmp
  - ldap
  - bgpd
```
Note: The port fields source_port and destination_port can be used as above to select either a single value, either a list of values, but also they can select port ranges. Example:

```yaml
source_port:
  - [1000, 2000]
  - [3000, 4000]
```

With the configuration above, the user is able to select the 1000-2000 and 3000-4000 source port ranges.

CLI Example:

```bash
salt '*' capirca.get_term_config arista filter-name term-name source_address=1.2.3.4 destination_address=5.6.7.8 action=accept
```

Output Example:

```bash
! $Date: 2017/03/22 $
no ip access-list filter-name
ip access-list filter-name
  remark term-name
  permit ip host 1.2.3.4 host 5.6.7.8
exit
```

```python
salt.modules.capirca_acl.get_term_pillar(filter_name, term_name, pillar_key='acl', pillarenv=None, saltenv=None)
```

Helper that can be used inside a state SLS, in order to get the term configuration given its name, under a certain filter uniquely identified by its name.

- `filter_name` The name of the filter.
- `term_name` The name of the term.
- `pillar_key` The root key of the whole policy config. Default: acl.
- `pillarenv` Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
- `saltenv` Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

## 21.9.78 salt.modules.cassandra_cql

Cassandra Database Module

New in version 2015.5.0.

This module works with Cassandra v2 and v3 and hence generates queries based on the internal schema of said version.

- `depends` DataStax Python Driver for Apache Cassandra [https://github.com/datastax/python-driver](https://github.com/datastax/python-driver)
  pip install cassandra-driver

- `referenced by` Salt's cassandra_cql returner

- `configuration` The Cassandra cluster members and connection port can either be specified in the master or minion config, the minion's pillar or be passed to the module.

  Example configuration in the config for a single node:
Example configuration in the config for a cluster:

```yaml
cassandra:
    cluster: 192.168.50.10
    port: 9000
    username: cas_admin
```

Changed in version 2016.11.0.

Added support for `ssl_options` and `protocol_version`.

Example configuration with `ssl_options`:

If `ssl_options` are present in cassandra config the cassandra_cql returner will use SSL. SSL isn't used if `ssl_options` isn't specified.

```yaml
cassandra:
    cluster: 192.168.50.10
    port: 9000
    username: cas_admin

    ssl_options:
        ca_certs: /etc/ssl/certs/ca-bundle.trust.crt

        # SSL version should be one from the ssl module
        # This is an optional parameter
        ssl_version: PROTOCOL_TLSv1
```

Additionally you can also specify the `protocol_version` to use.

```yaml
cassandra:
    cluster: 192.168.50.10
    port: 9000
    username: cas_admin

    # defaults to 4, if not set
    protocol_version: 3
```

`salt.modules.cassandra_cql.cql_query` *(query, contact_points=None, port=None, cql_user=None, cql_pass=None)*

Run a query on a Cassandra cluster and return a dictionary.

Parameters

- `query (str)` -- The query to execute.
- `contact_points (str | list[str])` -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- `cql_user (str)` -- The Cassandra user if authentication is turned on.
- `cql_pass (str)` -- The Cassandra user password if authentication is turned on.
- `port (int)` -- The Cassandra cluster port, defaults to None.
- `params (str)` -- The parameters for the query, optional.

Returns: A dictionary from the return values of the query

Return type: list[dict]

CLI Example:
```
salt 'cassandra-server' cassandra_cql.cql_query "SELECT * FROM users_by_name WHERE first_name = 'jane'"
```

salt.modules.cassandra_cql.cql_query_with_prepare(query, statement_name, statement_arguments, asynchronous=False, callback_errors=None, contact_points=None, port=None, cql_user=None, cql_pass=None, **kwargs)

Run a query on a Cassandra cluster and return a dictionary.

This function should not be used asynchronously for SELECTs -- it will not return anything and we don't currently have a mechanism for handling a future that will return results.

Parameters

- `query (str)` -- The query to execute.
- `statement_name (str)` -- Name to assign the prepared statement in the __context__ dictionary
- `statement_arguments (list[str])` -- Bind parameters for the SQL statement
- `asynchronous (bool)` -- Run this query in asynchronous mode
- `async (bool)` -- Run this query in asynchronous mode (an alias to 'asynchronous')
- `callback_errors (Function callable)` -- Function to call after query runs if there is an error
- `contact_points (str | list[str])` -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- `cql_user (str)` -- The Cassandra user if authentication is turned on.
- `cql_pass (str)` -- The Cassandra user password if authentication is turned on.
- `port (int)` -- The Cassandra cluster port, defaults to None.
- `params (str)` -- The parameters for the query, optional.

Returns: A dictionary from the return values of the query

Return type: list[dict]

CLI Example:
# Insert data asynchronously
salt this-node cassandra_cql.cql_query_with_prepare "name_insert" "INSERT INTO USERS (first_name, last_name) VALUES (?, ?)" → 'John', 'Doe', asynchronous=True

# Select data, should not be asynchronous because there is not currently a facility to return data from a future
salt this-node cassandra_cql.cql_query_with_prepare "name_select" "SELECT * FROM USERS WHERE first_name=?" → 'John'

salt.modules.cassandra_cql.create_keyspace(keyspace, replication_strategy='SimpleStrategy', replication_factor=1, replication_datacenters=None, contact_points=None, port=None, cql_user=None, cql_pass=None)

Create a new keyspace in Cassandra.

Parameters

- **keyspace (str)** -- The keyspace name
- **replication_strategy (str)** -- either SimpleStrategy or NetworkTopologyStrategy
- **replication_factor (int)** -- number of replicas of data on multiple nodes. not used if using NetworkTopologyStrategy
- **replication_datacenters (str | dict[str, int])** -- string or dict of data-center names to replication factors, required if using NetworkTopologyStrategy (will be a dict if coming from state file).
- **contact_points (str | list[str])** -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user (str)** -- The Cassandra user if authentication is turned on.
- **cql_pass (str)** -- The Cassandra user password if authentication is turned on.
- **port (int)** -- The Cassandra cluster port, defaults to None.

Returns The info for the keyspace or False if it does not exist.

Return type dict

CLI Example:

```
# CLI Example:
salt 'minion1' cassandra_cql.create_keyspace keyspace=newkeyspace

salt 'minion1' cassandra_cql.create_keyspace keyspace=newkeyspace replication_strategy=NetworkTopologyStrategy replication_datacenters='{"datacenter_1": 3, "datacenter_2": 2}''
```

salt.modules.cassandra_cql.create_user(username, password, superuser=False, contact_points=None, port=None, cql_user=None, cql_pass=None)

Create a new cassandra user with credentials and superuser status.

Parameters

- **username (str)** -- The name of the new user.
- **password (str)** -- The password of the new user.
• **superuser** *(bool)* -- Is the new user going to be a superuser? default: False

• **contact_points** *(str | list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.

• **cql_user** *(str)* -- The Cassandra user if authentication is turned on.

• **cql_pass** *(str)* -- The Cassandra user password if authentication is turned on.

• **port** *(int)* -- The Cassandra cluster port, defaults to None.

**Returns**

**Return type**

**CLI Example:**

```bash
salt 'minion1' cassandra_cql.create_user username=joe password=secret
salt 'minion1' cassandra_cql.create_user username=joe password=secret
   -> superuser=True
salt 'minion1' cassandra_cql.create_user username=joe password=secret
   -> superuser=True contact_points=minion1
```

**salt.modules.cassandra_cql.drop_keyspace** *(keyspace, contact_points=None, port=None, cql_user=None, cql_pass=None)*

Drop a keyspace if it exists in a Cassandra cluster.

**Parameters**

• **keyspace** *(str)* -- The keyspace to drop.

• **contact_points** *(str | list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.

• **cql_user** *(str)* -- The Cassandra user if authentication is turned on.

• **cql_pass** *(str)* -- The Cassandra user password if authentication is turned on.

• **port** *(int)* -- The Cassandra cluster port, defaults to None.

**Returns** The info for the keyspace or False if it does not exist.

**Return type** **dict**

**CLI Example:**

```bash
salt 'minion1' cassandra_cql.drop_keyspace keyspace=test
salt 'minion1' cassandra_cql.drop_keyspace keyspace=test contact_points=minion1
```

**salt.modules.cassandra_cql.grant_permission** *(username, resource=None, resource_type='keyspace', permission=None, contact_points=None, port=None, cql_user=None, cql_pass=None)*

Grant permissions to a user.

**Parameters**

• **username** *(str)* -- The name of the user to grant permissions to.

• **resource** *(str)* -- The resource (keyspace or table), if None, permissions for all resources are granted.
- **resource_type** *(str)* -- The resource_type (keyspace or table), defaults to 'keyspace'.

- **permission** *(str)* -- A permission name (e.g. select), if None, all permissions are granted.

- **contact_points** *(str | list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.

- **cql_user** *(str)* -- The Cassandra user if authentication is turned on.

- **cql_pass** *(str)* -- The Cassandra user password if authentication is turned on.

- **port** *(int)* -- The Cassandra cluster port, defaults to None.

**Returns**

**Return type**

CLI Example:

```python
salt 'minion1' cassandra_cql.grant_permission
salt 'minion1' cassandra_cql.grant_permission username=joe resource=test_keyspace permission=select
salt 'minion1' cassandra_cql.grant_permission username=joe resource=test_table resource_type=table permission=select contact_points=minion1
```

salt.modules.cassandra_cql.info(contact_points=None, port=None, cql_user=None, cql_pass=None)

Show the Cassandra information for this cluster.

**Parameters**

- **contact_points** *(str | list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.

- **cql_user** *(str)* -- The Cassandra user if authentication is turned on.

- **cql_pass** *(str)* -- The Cassandra user password if authentication is turned on.

- **port** *(int)* -- The Cassandra cluster port, defaults to None.

**Returns**

The information for this Cassandra cluster.

**Return type**

**dict**

CLI Example:

```python
salt 'minion1' cassandra_cql.info
salt 'minion1' cassandra_cql.info contact_points=minion1
```

salt.modules.cassandra_cql.keyspace_exists(keyspace, contact_points=None, port=None, cql_user=None, cql_pass=None)

Check if a keyspace exists in a Cassandra cluster.

:param keyspace The keyspace name to check for. :type keyspace: str :param contact_points: The Cassandra cluster addresses, can either be a string or a list of IPs. :type contact_points: str | list[str] :param cql_user: The Cassandra user if authentication is turned on. :type cql_user: str :param cql_pass: The Cassandra user password if authentication is turned on. :type cql_pass: str :param port: The Cassandra cluster port, defaults to None. :type port: int :return: The info for the keyspace or False if it does not exist. :rtype: dict

CLI Example:
salt 'minion1' cassandra_cql.keyspace_exists keyspace=system

salt.modules.cassandra_cql.list_column_families(keyspace=None, contact_points=None, port=None, cql_user=None, cql_pass=None)

List column families in a Cassandra cluster for all keyspaces or just the provided one.

Parameters

- **keyspace** *(str)* -- The keyspace to provide the column families for, optional.
- **contact_points** *(str | list[str])* -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** *(str)* -- The Cassandra user if authentication is turned on.
- **cql_pass** *(str)* -- The Cassandra user password if authentication is turned on.
- **port** *(int)* -- The Cassandra cluster port, defaults to None.

Returns The column families in this Cassandra cluster.

Return type `list[dict]`

CLI Example:
salt 'minion1' cassandra_cql.list_column_families
salt 'minion1' cassandra_cql.list_column_families contact_points=minion1
salt 'minion1' cassandra_cql.list_column_families keyspace=system

salt.modules.cassandra_cql.list_keyspaces(contact_points=None, port=None, cql_user=None, cql_pass=None)

List keyspaces in a Cassandra cluster.

Parameters

- **contact_points** *(str | list[str])* -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** *(str)* -- The Cassandra user if authentication is turned on.
- **cql_pass** *(str)* -- The Cassandra user password if authentication is turned on.
- **port** *(int)* -- The Cassandra cluster port, defaults to None.

Returns The keyspaces in this Cassandra cluster.

Return type `list[dict]`

CLI Example:
salt 'minion1' cassandra_cql.list_keyspaces
salt 'minion1' cassandra_cql.list_keyspaces contact_points=minion1 port=9000

salt.modules.cassandra_cql.list_permissions(username=None, resource=None, resource_type='keyspace', permission=None, contact_points=None, port=None, cql_user=None, cql_pass=None)

List permissions.

Parameters
- **username** (*str*) -- The name of the user to list permissions for.
- **resource** (*str*) -- The resource (keyspace or table), if None, permissions for all resources are listed.
- **resource_type** (*str*) -- The resource_type (keyspace or table), defaults to 'keyspace'.
- **permission** (*str*) -- A permission name (e.g. select), if None, all permissions are listed.
- **contact_points** (*str* | *list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql_pass** (*str*) -- The Cassandra user password if authentication is turned on.

Returns Dictionary of permissions.

Return type *dict*

CLI Example:

```python
salt 'minion1' cassandra_cql.list_permissions
salt 'minion1' cassandra_cql.list_permissions username=joe resource=test_keyspace permission=select
salt 'minion1' cassandra_cql.list_permissions username=joe resource=test_table resource_type=table permission=select contact_points=minion1
```

salt.modules.cassandra_cql.list_users(*contact_points=None, port=None, cql_user=None, cql_pass=None)*

List existing users in this Cassandra cluster.

Parameters

- **contact_points** (*str* | *list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.
- **cql_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql_pass** (*str*) -- The Cassandra user password if authentication is turned on.

Returns The list of existing users.

Return type *dict*

CLI Example:

```python
salt 'minion1' cassandra_cql.list_users
salt 'minion1' cassandra_cql.list_users contact_points=minion1
```

salt.modules.cassandra_cql.version(*contact_points=None, port=None, cql_user=None, cql_pass=None)*

Show the Cassandra version.

Parameters

- **contact_points** (*str* | *list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
• **cql_user** *(str)* -- The Cassandra user if authentication is turned on.

• **cql_pass** *(str)* -- The Cassandra user password if authentication is turned on.

• **port** *(int)* -- The Cassandra cluster port, defaults to None.

**Returns**  The version for this Cassandra cluster.

**Return type**  *str*

**CLI Example:**

```
salt 'minion1' cassandra_cql.version
salt 'minion1' cassandra_cql.version contact_points=minion1
```

## 21.9.79 salt.modules.cassandra_mod

Cassandra NoSQL Database Module

**depends**

• pycassa Cassandra Python adapter

**configuration**  The location of the ‘nodetool’ command, host, and thrift port needs to be specified via pillar:

```
cassandra.nodetool: /usr/local/bin/nodetool
cassandra.host: localhost
cassandra.thrift_port: 9160
```

**salt.modules.cassandra_mod.column_families**(keyspace=None)

Return existing column families for all keyspaces or just the provided one.

**CLI Example:**

```
salt '*' cassandra.column_families
salt '*' cassandra.column_families <keyspace>
```

**salt.modules.cassandra_mod.column_family_definition**(keyspace, column_family)

Return a dictionary of column family definitions for the given keyspace/column_family

**CLI Example:**

```
salt '*' cassandra.column_family_definition <keyspace> <column_family>
```

**salt.modules.cassandra_mod.compactionstats()**

Return compactionstats info

**CLI Example:**

```
salt '*' cassandra.compactionstats
```

**salt.modules.cassandra_mod.info()**

Return cassandra node info

**CLI Example:**

```
salt '*' cassandra.info
```
salt.modules.cassandra_mod.keyspaces()
Return existing keyspaces

CLI Example:
```
salt '*' cassandra.keyspaces
```

salt.modules.cassandra_mod.netstats()
Return netstats info

CLI Example:
```
salt '*' cassandra.netstats
```

salt.modules.cassandra_mod.ring()
Return cassandra ring info

CLI Example:
```
salt '*' cassandra.ring
```

salt.modules.cassandra_mod.tpstats()
Return tpstats info

CLI Example:
```
salt '*' cassandra.tpstats
```

salt.modules.cassandra_mod.version()
Return the cassandra version

CLI Example:
```
salt '*' cassandra.version
```

21.9.80 salt.modules.celery module

Support for scheduling celery tasks. The worker is independent of salt and thus can run in a different virtualenv or on a different python version, as long as broker, backend and serializer configurations match. Also note that celery and packages required by the celery broker, e.g. redis must be installed to load the salt celery execution module.

**Note:** A new app (and thus new connections) is created for each task execution

salt.modules.celery.run_task(task_name, args=None, kwargs=None, broker=None, backend=None, wait_for_result=False, timeout=None, propagate=True, interval=0.5, no_ack=True, raise_timeout=True, config=None)

Execute celery tasks. For celery specific parameters see celery documentation.

CLI Example:
```
salt '*' celery.run_task tasks.sleep args=[4] broker=redis://localhost \ backend=redis://localhost wait_for_result=true
```

**task_name** The task name, e.g. tasks.sleep

**args** Task arguments as a list
**kwargs  Task keyword arguments

**broker**  Broker for celeryapp, see celery documentation

**backend**  Result backend for celeryapp, see celery documentation

**wait_for_result**  Wait until task result is read from result backend and return result, Default: False

**timeout**  Timeout waiting for result from celery, see celery AsyncResult.get documentation

**propagate**  Propagate exceptions from celery task, see celery AsyncResult.get documentation, Default: True

**interval**  Interval to check for task result, see celery AsyncResult.get documentation, Default: 0.5

**no_ack**  see celery AsyncResult.get documentation. Default: True

**raise_timeout**  Raise timeout exception if waiting for task result times out. Default: False

**config**  Config dict for celery app, See celery documentation

### 21.9.81 salt.modules.ceph module

Module to provide ceph control with salt.

**depends**

- ceph_cfg Python module

New in version 2016.11.0.

**salt.modules.ceph.ceph_version()**
Get the version of ceph installed

CLI Example:

```
salt '*' ceph.ceph_version
```

**salt.modules.ceph.cluster_quorum(**kwargs)**
Get the cluster's quorum status

CLI Example:

```
salt '*' ceph.cluster_quorum  
    'cluster_name'='ceph'  
    'cluster_uuid'='cluster_uuid'
```

**cluster_uuid**  The cluster UUID. Defaults to value found in ceph config file.

**cluster_name**  The cluster name. Defaults to ceph.

**salt.modules.ceph.cluster_status(**kwargs)**
Get the cluster status, including health if in quorum

CLI Example:

```
salt '*' ceph.cluster_status  
    'cluster_name'='ceph'  
    'cluster_uuid'='cluster_uuid'
```

**cluster_uuid**  The cluster UUID. Defaults to value found in ceph config file.

**cluster_name**  The cluster name. Defaults to ceph.
salt.modules.ceph.keyring_auth_add(**kwargs)
Add keyring to authorized list

CLI Example:
```
salt '*' ceph.keyring_auth_add \
  'keyring_type'='admin' \
  'cluster_name'='ceph' \
  'cluster_uuid'='cluster_uuid'
```

keyring_type (required) One of admin, mon, osd, rgw, mds
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.

salt.modules.ceph.keyring_auth_del(**kwargs)
Remove keyring from authorised list

CLI Example:
```
salt '*' ceph.keyring_osd_auth_del \
  'keyring_type'='admin' \
  'cluster_name'='ceph' \
  'cluster_uuid'='cluster_uuid'
```

keyring_type (required) One of admin, mon, osd, rgw, mds
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.

salt.modules.ceph.keyring_auth_list(**kwargs)
List all cephx authorization keys

CLI Example:
```
salt '*' ceph.keyring_auth_list \
  'cluster_name'='ceph' \
  'cluster_uuid'='cluster_uuid'
```

cluster_name The cluster name. Defaults to ceph.
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

salt.modules.ceph.keyring_create(**kwargs)
Create keyring for cluster

CLI Example:
```
salt '*' ceph.keyring_create \
  'keyring_type'='admin' \
  'cluster_name'='ceph' \
  'cluster_uuid'='cluster_uuid'
```

keyring_type (required) One of admin, mon, osd, rgw, mds
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
**cluster_name**  The cluster name. Defaults to ceph.

salt.modules.ceph.**keyring_present**( **kwargs**)  
Returns True if the keyring is present on disk, otherwise False  

CLI Example:

```python
salt '*' ceph.keyring_present
  'keyring_type'='admin'
  'cluster_name'='ceph'
  'cluster_uuid'='cluster_uuid'
```

**keyring_type** (required)  One of admin, mon, osd, rgw, mds  

**cluster_uuid**  The cluster UUID. Defaults to value found in ceph config file.  

**cluster_name**  The cluster name. Defaults to ceph.

salt.modules.ceph.**keyring_purge**( **kwargs**)  
Delete keyring for cluster  

CLI Example:

```python
salt '*' ceph.keyring_purge
  'keyring_type'='admin'
  'cluster_name'='ceph'
  'cluster_uuid'='cluster_uuid'
```

**keyring_type** (required)  One of admin, mon, osd, rgw, mds  

**cluster_uuid**  The cluster UUID. Defaults to value found in ceph config file.  

**cluster_name**  The cluster name. Defaults to ceph.  

If no ceph config file is found, this command will fail.

salt.modules.ceph.**keyring_save**( **kwargs**)  
Create save keyring locally  

CLI Example:

```python
salt '*' ceph.keyring_save
  'keyring_type'='admin'
  'cluster_name'='ceph'
  'cluster_uuid'='cluster_uuid'
```

**keyring_type** (required)  One of admin, mon, osd, rgw, mds  

**cluster_uuid**  The cluster UUID. Defaults to value found in ceph config file.  

**cluster_name**  The cluster name. Defaults to ceph.

salt.modules.ceph.**mds_create**( **kwargs**)  
Create a mds  

CLI Example:
name (required) The MDS name (must start with mds.)

port (required) Port to which the MDS will listen

addr (required) Address or IP address for the MDS to listen

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

cluster_name The cluster name. Defaults to ceph.

salt.modules.ceph.mds_create(**kwargs)
Remove a mds

CLI Example:

```
salt '*' ceph.mds_create \
    'name' = 'mds.name' \
    'port' = 1000, \
    'addr' = 'fqdn.example.org' \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

name (required) The MDS name (must start with mds.)

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

cluster_name The cluster name. Defaults to ceph.

salt.modules.ceph.mds_destroy(**kwargs)
Remove a mds

CLI Example:

```
salt '*' ceph.mds_destroy \
    'name' = 'mds.name' \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

name (required) The MDS name (must start with mds.)

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

cluster_name The cluster name. Defaults to ceph.

salt.modules.ceph.mon_active(**kwargs)
Returns True if the mon daemon is running, otherwise False

CLI Example:

```
salt '*' ceph.mon_active \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

cluster_name The cluster name. Defaults to ceph.

salt.modules.ceph.mon_create(**kwargs)
Create a mon node

CLI Example:

```
salt '*' ceph.mon_create \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

cluster_name The cluster name. Defaults to ceph.
salt.modules.ceph.mon_is(**kwargs)
Returns True if the target is a mon node, otherwise False

CLI Example:

```python
salt '*' ceph.mon_is
  'cluster_name'='ceph'
  'cluster_uuid'='cluster_uuid'
```

cluster_name The cluster name. Defaults to ceph.
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

salt.modules.ceph.mon_quorum(**kwargs)
Returns True if the mon daemon is in the quorum, otherwise False

CLI Example:

```python
salt '*' ceph.mon_quorum
  'cluster_name'='ceph'
  'cluster_uuid'='cluster_uuid'
```

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.

salt.modules.ceph.mon_status(**kwargs)
Get status from mon daemon

CLI Example:

```python
salt '*' ceph.mon_status
  'cluster_name'='ceph'
  'cluster_uuid'='cluster_uuid'
```

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.

salt.modules.ceph.osd_activate(**kwargs)
Activate an OSD

CLI Example:

```python
salt '*' ceph.osd_activate 'osd_dev'='/dev/vdc'
```

salt.modules.ceph.osd_discover()
List all OSD by cluster

CLI Example:

```python
salt '*' ceph.osd_discover
```

salt.modules.ceph.osd_prepare(**kwargs)
Prepare an OSD

CLI Example:
salt 'osd' ceph.osd_prepare 'osd_dev'='/dev/vdc' \ 'journal_dev'='device' \ 'cluster_name'='ceph' \ 'cluster_uuid'='cluster_uuid' \ 'osd_fs_type'='xfs' \ 'osd_uuid'='2a143b73-6d85-4389-a9e9-b8a78d9e1e07' \ 'journal_uuid'='4562a5db-ff6f-4268-811d-12fd4a9ae98'

cluster_uuid  The device to store the osd data on.

journal_dev  The journal device. defaults to osd_dev.

cluster_name  The cluster name. Defaults to ceph.

cluster_uuid  The cluster date will be added too. Defaults to the value found in local config.

osd_fs_type  set the file system to store OSD data with. Defaults to "xfs".

osd_uuid  set the OSD data UUID. If set will return if OSD with data UUID already exists.

journal_uuid  set the OSD journal UUID. If set will return if OSD with journal UUID already exists.

salt.modules.ceph.partition_is(dev)
Check whether a given device path is a partition or a full disk.

CLI Example:

salt '*' ceph.partition_is /dev/sdc

salt.modules.ceph.partition_list()
List partitions by disk

CLI Example:

salt '*' ceph.partition_list

salt.modules.ceph.partition_list_journal()
List all OSD journal partitions by partition

CLI Example:

salt '*' ceph.partition_list_journal

salt.modules.ceph.partition_list_osd()
List all OSD data partitions by partition

CLI Example:

salt '*' ceph.partition_list_osd

salt.modules.ceph.pool_add(pool_name, **kwargs)
Create a pool

CLI Example:

salt '*' ceph.pool_add pool_name \ 'cluster_name'='ceph' \ 'cluster_uuid'='cluster_uuid'

cluster_name  The cluster name. Defaults to ceph.
cluster_uuid  The cluster UUID. Defaults to value found in ceph config file.

pg_num  Default to 8

pgp_num  Default to pg_num

pool_type  can take values "replicated" or "erasure"

erasure_code_profile  The "erasure_code_profile"

crush_ruleset  The crush map rule set

salt.modules.ceph.pool_del(pool_name,**kwargs)
Delete a pool

CLI Example:

```
salt '*' ceph.pool_del pool_name \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

cluster_name  The cluster name. Defaults to ceph.

cluster_uuid  The cluster UUID. Defaults to value found in ceph config file.

salt.modules.ceph.pool_list(**kwargs)
List all pools

CLI Example:

```
salt '*' ceph.pool_list \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

cluster_name  The cluster name. Defaults to ceph.

cluster_uuid  The cluster UUID. Defaults to value found in ceph config file.

salt.modules.ceph.purge(**kwargs)
purge ceph configuration on the node

CLI Example:

```
salt '*' ceph.purge \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

cluster_name  The cluster name. Defaults to ceph.

cluster_uuid  The cluster UUID. Defaults to value found in ceph config file.

salt.modules.ceph.rgw_create(**kwargs)
Create a rgw

CLI Example:

```
salt '*' ceph.rgw_create \
    'name' = 'rgw.name' \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```
name (required)  The RGW client name. Must start with \texttt{rgw}.

\texttt{cluster\_uuid}  The cluster UUID. Defaults to value found in \texttt{ceph} config file.

\texttt{cluster\_name}  The cluster name. Defaults to \texttt{ceph}.

\texttt{salt.modules.ceph.rgw\_destroy(**kwargs)}

Remove a rgw

CLI Example:

```
salt '*' ceph.rgw_destroy \n   'name' = 'rgw.name' \n   'cluster\_name'='ceph' \n   'cluster\_uuid'='cluster\_uuid'
```

name (required)  The RGW client name (must start with \texttt{rgw}.)

\texttt{cluster\_uuid}  The cluster UUID. Defaults to value found in \texttt{ceph} config file.

\texttt{cluster\_name}  The cluster name. Defaults to \texttt{ceph}.

\texttt{salt.modules.ceph.rgw\_pools\_create(**kwargs)}

Create pools for rgw

CLI Example:

```
salt '*' ceph.rgw_pools_create
```

\texttt{cluster\_uuid}  The cluster UUID. Defaults to value found in \texttt{ceph} config file.

\texttt{cluster\_name}  The cluster name. Defaults to \texttt{ceph}.

\texttt{salt.modules.ceph.rgw\_pools\_missing(**kwargs)}

Show pools missing for rgw

CLI Example:

```
salt '*' ceph.rgw_pools_missing
```

\texttt{cluster\_uuid}  The cluster UUID. Defaults to value found in \texttt{ceph} config file.

\texttt{cluster\_name}  The cluster name. Defaults to \texttt{ceph}.

\texttt{salt.modules.ceph.zap(target=None,**kwargs)}

Destroy the partition table and content of a given disk.

```
salt '*' ceph.osd_prepare 'dev'='\texttt{/dev/vdc}' \n   'cluster\_name'='ceph' \n   'cluster\_uuid'='cluster\_uuid'
```

\texttt{dev}  The block device to format.

\texttt{cluster\_name}  The cluster name. Defaults to \texttt{ceph}.

\texttt{cluster\_uuid}  The cluster UUID. Defaults to value found in \texttt{ceph} config file.
21.9.82 salt.modules.chassis

Glue execution module to link to the fx2 proxymodule.
Depends: iDRAC Remote execution module (salt.modules.dracr)

For documentation on commands that you can direct to a Dell chassis via proxy, look in the documentation for salt.modules.dracr.

This execution module calls through to a function in the fx2 proxy module called chconfig. That function looks up the function passed in the cmd parameter in salt.modules.dracr and calls it.

New in version 2015.8.2.
salt.modules.chassis.chassis_credentials()
salt.modules.chassis.cmd(cmd, *args, **kwargs)

21.9.83 salt.modules.chef

Execute chef in server or solo mode

salt.modules.chef.client(whyrun=False, localmode=False, logfile=None, **kwargs)

Execute a chef client run and return a dict with the stderr, stdout, return code, and pid.

CLI Example:
salt '*' chef.client server=https://localhost

server  The chef server URL
client_key  Set the client key file location
config  The configuration file to use
config-file-jail Directory under which config files are allowed to be loaded (no client.rb or knife.rb outside this path will be loaded).
environment  Set the Chef Environment on the node
group  Group to set privilege to
json-attributes  Load attributes from a JSON file or URL
localmode  Point chef-client at local repository if True
log_level  Set the log level (debug, info, warn, error, fatal)
logfile  Set the log file location
node-name  The node name for this client
override-runlist  Replace current run list with specified items for a single run
pid  Set the PID file location, defaults to /tmp/chef-client.pid
run-lock-timeout  Set maximum duration to wait for another client run to finish, default is indefinitely.
runitlist  Permanently replace current run list with specified items
user  User to set privilege to
validation_key  Set the validation key file location, used for registering new clients
whyrun  Enable whyrun mode when set to True
salt.modules.chef.solo(whyrun=False, logfile=None, **kwargs)

Execute a chef solo run and return a dict with the stderr, stdout, return code, and pid.

CLI Example:
```
salt '*' chef.solo override-runlist=test
```

config  The configuration file to use
environment  Set the Chef Environment on the node
group  Group to set privilege to
json-attributes  Load attributes from a JSON file or URL
log_level  Set the log level (debug, info, warn, error, fatal)
logfile  Set the log file location
node-name  The node name for this client
override-runlist  Replace current run list with specified items for a single run
recipe-url  Pull down a remote gzipped tarball of recipes and untar it to the cookbook cache
run-lock-timeout  Set maximum duration to wait for another client run to finish, default is indefinitely.
user  User to set privilege to
whyrun  Enable whyrun mode when set to True

21.9.84  salt.modules.chocolatey

A dead simple module wrapping calls to the Chocolatey package manager (http://chocolatey.org)

New in version 2014.1.0.
salt.modules.chocolatey.add_source(name, source_location, username=None, password=None)

Instructs Chocolatey to add a source.

name  The name of the source to be added as a chocolatey repository.
source  Location of the source you want to work with.
username  Provide username for chocolatey sources that need authentication credentials.
password  Provide password for chocolatey sources that need authentication credentials.

CLI Example:
```
salt '*' chocolatey.add_source <source name> <source_location>
salt '*' chocolatey.add_source <source name> <source_location> user=<user> password=<password>
```
salt.modules.chocolatey.bootstrap(force=False, source=None)

Download and install the latest version of the Chocolatey package manager via the official bootstrap.

Chocolatey requires Windows PowerShell and the .NET v4.0 runtime. Depending on the host's version of Windows, chocolatey.bootstrap will attempt to ensure these prerequisites are met by downloading and executing the appropriate installers from Microsoft.

Note: If PowerShell is installed, you may have to restart the host machine for Chocolatey to work.
Note: If you're installing offline using the source parameter, the PowerShell and .NET requirements must already be met on the target. This shouldn't be a problem on Windows versions 2012/8 and later

Parameters

- **force**(bool) -- Run the bootstrap process even if Chocolatey is found in the path.
- **source**(str) -- The location of the .nupkg file or .ps1 file to run from an alternate location. This can be one of the following types of URLs:
  - salt://
  - http(s)://
  - ftp://
  - file:// - A local file on the system

New in version 3001.

Returns The stdout of the Chocolatey installation script

Return type **str**

CLI Example:

```
# To bootstrap Chocolatey
salt '*' chocolatey.bootstrap
salt '*' chocolatey.bootstrap force=True

# To bootstrap Chocolatey offline from a file on the salt master
salt '*' chocolatey.bootstrap source=salt://files/chocolatey.nupkg

# To bootstrap Chocolatey from a file on C:\Temp
salt '*' chocolatey.bootstrap source=C:\Temp\chocolatey.nupkg
```

salt.modules.chocolatey.chocolatey_version()

Returns the version of Chocolatey installed on the minion.

CLI Example:

```
salt '*' chocolatey.chocolatey_version
```

salt.modules.chocolatey.disable_source(name)

Instructs Chocolatey to disable a source.

name Name of the source repository to disable.

CLI Example:

```
salt '*' chocolatey.disable_source <name>
```

salt.modules.chocolatey.enable_source(name)

Instructs Chocolatey to enable a source.

name Name of the source repository to enable.

CLI Example:

```
salt '*' chocolatey.enable_source <name>
```
salt.modules.chocolatey.install(name, version=None, source=None, force=False, pre_versions=False, install_args=None, override_args=False, force_x86=False, package_args=None, allow_multiple=False, execution_timeout=None)

Instructs Chocolatey to install a package.

Parameters

- **name** *(str)* -- The name of the package to be installed. Only accepts a single argument. Required.

- **version** *(str)* -- Install a specific version of the package. Defaults to latest version. Default is None.

- **source** *(str)* -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed. Default is None. Alternate Sources:
  - cygwin
  - python
  - ruby
  - webpi
  - windowsfeatures

- **force** *(bool)* -- Reinstall the current version of an existing package. Do not use with allow_multiple. Default is False.

- **pre_versions** *(bool)* -- Include pre-release packages. Default is False.

- **install_args** *(str)* -- A list of install arguments you want to pass to the installation process i.e product key or feature list. Default is None.

- **override_args** *(bool)* -- Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments. Default is None.

- **force_x86** *(bool)* -- Force x86 (32bit) installation on 64 bit systems. Default is False.

- **package_args** *(str)* -- Arguments you want to pass to the package. Default is None.

- **allow_multiple** *(bool)* -- Allow multiple versions of the package to be installed. Do not use with force. Does not work with all packages. Default is False. New in version 2017.7.0.

- **execution_timeout** *(str)* --

  - execution timeout value you want to pass to the installation process. Default is None. *(Chocolatey)* -- New in version 2018.3.0.

Returns The output of the chocolatey command

Return type *str*

CLI Example:

```
salt '*' chocolatey.install <package name>
salt '*' chocolatey.install <package name> version=<package version>
salt '*' chocolatey.install <package name> install_args=<args> override_args=True
```
salt.modules.chocolatey.install_cygwin(name, install_args=None, override_args=False)
Instructs Chocolatey to install a package via Cygwin.

- **name**: The name of the package to be installed. Only accepts a single argument.
- **install_args**: A list of install arguments you want to pass to the installation process i.e product key or feature list.
- **override_args**: Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments.

CLI Example:

```bash
salt '*' chocolatey.install_cygwin <package name>
salt '*' chocolatey.install_cygwin <package name> install_args=<args> override_args=True
```

salt.modules.chocolatey.install_gem(name, version=None, install_args=None, override_args=False)
Instructs Chocolatey to install a package via Ruby’s Gems.

- **name**: The name of the package to be installed. Only accepts a single argument.
- **version**: Install a specific version of the package. Defaults to latest version available.
- **install_args**: A list of install arguments you want to pass to the installation process i.e product key or feature list.
- **override_args**: Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments.

CLI Example:

```bash
salt '*' chocolatey.install_gem <package name>
salt '*' chocolatey.install_gem <package name> version=<package version>
salt '*' chocolatey.install_gem <package name> install_args=<args> override_args=True
```

salt.modules.chocolatey.install_missing(name, version=None, source=None)
Instructs Chocolatey to install a package if it doesn't already exist.

Changed in version 2014.7.0: If the minion has Chocolatey >= 0.9.8.24 installed, this function calls chocolatey.install instead, as installmissing is deprecated as of that version and will be removed in Chocolatey 1.0.

- **name**: The name of the package to be installed. Only accepts a single argument.
- **version**: Install a specific version of the package. Defaults to latest version available.
- **source**: Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed.

CLI Example:

```bash
salt '*' chocolatey.install_missing <package name>
salt '*' chocolatey.install_missing <package name> version=<package version>
```

salt.modules.chocolatey.install_python(name, version=None, install_args=None, override_args=False)
Instructs Chocolatey to install a package via Python's easy_install.
name The name of the package to be installed. Only accepts a single argument.

version Install a specific version of the package. Defaults to latest version available.

install_args A list of install arguments you want to pass to the installation process i.e product key or feature list

override_args Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments

CLI Example:

```
salt '*' chocolatey.install_python <package name>
salt '*' chocolatey.install_python <package name> version=<package version>
salt '*' chocolatey.install_python <package name> install_args=<args> override_args=True
```

salt.modules.chocolatey.install_webpi(name, install_args=None, override_args=False)

Instructs Chocolatey to install a package via the Microsoft Web PI service.

name The name of the package to be installed. Only accepts a single argument.

install_args A list of install arguments you want to pass to the installation process i.e product key or feature list

override_args Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments

CLI Example:

```
salt '*' chocolatey.install_webpi <package name>
salt '*' chocolatey.install_webpi <package name> install_args=<args> override_args=True
```

salt.modules.chocolatey.install_windowsfeatures(name)

Instructs Chocolatey to install a Windows Feature via the Deployment Image Servicing and Management tool.

name The name of the feature to be installed. Only accepts a single argument.

CLI Example:

```
salt '*' chocolatey.install_windowsfeatures <package name>
```

salt.modules.chocolatey.list_(narrow=None, all_versions=False, pre_versions=False, source=None, local_only=False, exact=False)

Instructs Chocolatey to pull a vague package list from the repository.

Parameters

- **narrow (str)** -- Term used to narrow down results. Searches against name/description/tag. Default is None.
- **all_versions (bool)** -- Display all available package versions in results. Default is False.
- **pre_versions (bool)** -- Display pre-release packages in results. Default is False.
- **source (str)** -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed if None is passed. Default is None.
- **local_only (bool)** -- Display packages only installed locally. Default is False.
**exact** *(bool)* -- Display only packages that match `narrow` exactly. Default is False.

New in version 2017.7.0.

**Returns** A dictionary of results.

**Return type** *dict*

CLI Example:

```bash
salt '*' chocolatey.list <narrow>
salt '*' chocolatey.list <narrow> all_versions=True
```

**salt.modules.chocolatey.list_webpi()**

Instructs Chocolatey to pull a full package list from the Microsoft Web PI repository.

**Returns** List of webpi packages

**Return type** *str*

CLI Example:

```bash
salt '*' chocolatey.list_webpi
```

**salt.modules.chocolatey.list_windowsfeatures()**

Instructs Chocolatey to pull a full package list from the Windows Features list, via the Deployment Image Servicing and Management tool.

**Returns** List of Windows Features

**Return type** *str*

CLI Example:

```bash
salt '*' chocolatey.list_windowsfeatures
```

**salt.modules.chocolatey.unbootstrap()**

Uninstall chocolatey from the system by doing the following:

New in version 3001.

- Delete the Chocolatey Directory
- Remove Chocolatey from the path
- Remove Chocolatey environment variables

**Returns** A list of items that were removed, otherwise an empty list

**Return type** *list*

CLI Example:

```bash
salt * chocolatey.unbootstrap
```

**salt.modules.chocolatey.uninstall**(name, version=None, uninstall_args=None, override_args=False)

Instructs Chocolatey to uninstall a package.

**name** The name of the package to be uninstalled. Only accepts a single argument.

**version** Uninstalls a specific version of the package. Defaults to latest version installed.
uninstall_args  A list of uninstall arguments you want to pass to the uninstallation process i.e product key or
feature list

override_args  Set to true if you want to override the original uninstall arguments (for the native uninstaller)
in the package and use your own. When this is set to False uninstall_args will be appended to the end of
the default arguments

CLI Example:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>salt '*' chocolatey.uninstall &lt;package name&gt;</td>
<td>Uninstall all installed packages or specified</td>
</tr>
<tr>
<td>salt '*' chocolatey.uninstall &lt;package name&gt; version=&lt;package version&gt;</td>
<td>Version of the package being uninstalled</td>
</tr>
<tr>
<td>salt '*' chocolatey.uninstall &lt;package name&gt; override_args=True</td>
<td>Override uninstall arguments</td>
</tr>
</tbody>
</table>

salt.modules.chocolatey.update (name, source=None, pre_versions=False)
Instructs Chocolatey to update packages on the system.

name  The name of the package to update, or “all” to update everything installed on the system.

source  Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the
official Chocolatey feed.

pre_versions  Include pre-release packages in comparison. Defaults to False.

CLI Example:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>salt &quot;*&quot; chocolatey.update all</td>
<td>Update all installed packages</td>
</tr>
<tr>
<td>salt &quot;*&quot; chocolatey.update &lt;package name&gt; pre_versions=True</td>
<td>Pre-version enabled</td>
</tr>
</tbody>
</table>

salt.modules.chocolatey.upgrade (name, version=None, source=None, force=False,
pre_versions=False, install_args=None, override_args=False,
force_x86=False, package_args=None)

New in version 2016.3.4.

Instructs Chocolatey to upgrade packages on the system. (update is being deprecated). This command will
install the package if not installed.

Parameters

- name  (str) -- The name of the package to update, or "all" to update everything installed
  on the system.
- version (str) -- Install a specific version of the package. Defaults to latest version.
- source  (str) -- Chocolatey repository (directory, share or remote URL feed) the package
  comes from. Defaults to the official Chocolatey feed.
- force  (bool) -- Reinstall the same version already installed
- pre_versions (bool) -- Include pre-release packages in comparison. Defaults to False.
- install_args (str) -- A list of install arguments you want to pass to the installation
  process i.e product key or feature list
- override_args (str) -- Set to true if you want to override the original install arguments
  (for the native installer) in the package and use your own. When this is set to False
  install_args will be appended to the end of the default arguments
- force_x86  -- Force x86 (32bit) installation on 64 bit systems. Defaults to false.
- package_args -- A list of arguments you want to pass to the package

Returns  Results of the chocolatey command
Return type  str

CLI Example:

salt '*' chocolatey.upgrade all
salt '*' chocolatey.upgrade <package name> pre_versions=True

salt.modules.chocolatey.version(name, check_remote=False, source=None, pre_versions=False)

Instructs Chocolatey to check an installed package version, and optionally compare it to one available from a remote feed.

Parameters

• name (str) -- The name of the package to check. Required.
• check_remote (bool) -- Get the version number of the latest package from the remote feed. Default is False.
• source (str) -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed. Default is None.
• pre_versions (bool) -- Include pre-release packages in comparison. Default is False.

Returns  A dictionary of currently installed software and versions

Return type  dict

CLI Example:

salt '*' chocolatey.version <package name>
salt '*' chocolatey.version <package name> check_remote=True

21.9.85  salt.modules.chronos module

Module providing a simple management interface to a chronos cluster.
Currently this only works when run through a proxy minion.
New in version 2015.8.2.

salt.modules.chronos.has_job(name)

Return whether the given job is currently configured.

CLI Example:

salt chronos-minion-id chronos.has_job my-job

salt.modules.chronos.job(name)

Return the current server configuration for the specified job.

CLI Example:

salt chronos-minion-id chronos.job my-job

salt.modules.chronos.jobs()

Return a list of the currently installed job names.

CLI Example:

salt chronos-minion-id chronos.jobs
salt.modules.chronos.rm_job(name)
Remove the specified job from the server.

CLI Example:
```
salt chronos-minion-id chronos.rm_job my-job
```

salt.modules.chronos.update_job(name, config)
Update the specified job with the given configuration.

CLI Example:
```
salt chronos-minion-id chronos.update_job my-job '<config yaml>'
```

### 21.9.86 salt.modules.chroot module

- **maintainer**: Alberto Planas <aplanas@suse.com>
- **maturity**: new
- **depends**: None
- **platform**: Linux

salt.modules.chroot.apply_(root, mods=None, **kwargs)
Apply an state inside a chroot.

This function will call chroot.highstate or chroot.sls based on the arguments passed to this function. It exists as a more intuitive way of applying states.

- **root**: Path to the chroot environment
- **mod**: Path to the state

For a formal description of the possible parameters accepted in this function, check state.apply_ documentation.

CLI Example:
```
salt myminion chroot.apply /chroot
salt myminion chroot.apply /chroot stuff
salt myminion chroot.apply /chroot stuff pillar='{"foo": "bar"}'
```

salt.modules.chroot.call(root, function, *args, **kwargs)
Executes a Salt function inside a chroot environment.

The chroot does not need to have Salt installed, but Python is required.

- **root**: Path to the chroot environment
- **function**: Salt execution module function

CLI Example:
```
salt myminion chroot.call /chroot test.ping
salt myminion chroot.call /chroot ssh.set_auth_key user key=mykey
```

salt.modules.chroot.create(root)
Create a basic chroot environment.

Note that this environment is not functional. The caller needs to install the minimal required binaries, including Python if chroot.call is called.

- **root**: Path to the chroot environment
CLI Example:
```
salt myminion chroot.create /chroot
```

**salt.modules.chroot.exist** *(root)*
Return True if the chroot environment is present.

**salt.modules.chroot.highstate** *(root, **kwargs)*
Retrieve the state data from the salt master for this minion and execute it inside the chroot.

- **root** Path to the chroot environment

For a formal description of the possible parameters accepted in this function, check *state.highstate* documentation.

CLI Example:
```
salt myminion chroot.highstate /chroot
salt myminion chroot.highstate /chroot pillar={"foo": "bar"}
```

**salt.modules.chroot.sls** *(root, mods, saltenv='base', test=None, exclude=None, **kwargs)*
Execute the states in one or more SLS files inside the chroot.

- **root** Path to the chroot environment
- **saltenv** Specify a salt fileserver environment to be used when applying states
- **mods** List of states to execute
- **test** Run states in test-only (dry-run) mode
- **exclude** Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing sls or id keys. Glob-patterns may be used to match multiple states.

For a formal description of the possible parameters accepted in this function, check *state.sls* documentation.

CLI Example:
```
salt '*' chroot.sls /chroot stuff pillar={"foo": "bar"}
```

### 21.9.87 salt.modules.cimc module

Module to provide Cisco UCS compatibility to Salt

- **codeauthor** Spencer Ervin <spencer ervin@hotmail.com>
- **maturity** new
- **depends** none
- **platform** unix
Configuration

This module accepts connection configuration details either as parameters, or as configuration settings in pillar as a Salt proxy. Options passed into opts will be ignored if options are passed into pillar.

See also:
Cisco UCS Proxy Module

About

This execution module was designed to handle connections to a Cisco UCS server. This module adds support to send connections directly to the device through the rest API.

```
salt.modules.cimc.activate_backup_image(reset=False)
```
Activates the firmware backup image.

Parameters

- reset (bool) -- Reset the CIMC device on activate.

```
salt '*' cimc.activate_backup_image
salt '*' cimc.activate_backup_image reset=True
```

```
salt.modules.cimc.create_user(uid=None, username=None, password=None, priv=None)
```
Create a CIMC user with username and password.

Parameters

- uid (int) -- The user ID slot to create the user account in.
- username (str) -- The name of the user.
- password (str) -- The clear text password of the user.
- priv (str) -- The privilege level of the user.

```
salt '*' cimc.create_user 11 username=admin password=foobar priv=admin
```

```
salt.modules.cimc.get_bios_defaults()
```
Get the default values of BIOS tokens.

```
salt '*' cimc.get_bios_defaults
```

```
salt.modules.cimc.get_bios_settings()
```
Get the C240 server BIOS token values.

```
salt '*' cimc.get_bios_settings
```

```
salt.modules.cimc.get_boot_order()
```
Retrieves the configured boot order table.

```
salt '*' cimc.get_boot_order
```
salt.modules.cimc.get_cpu_details()
Get the CPU product ID details.

CLI Example:
```
salt '*' cimc.get_cpu_details
```

salt.modules.cimc.get_disks()
Get the HDD product ID details.

CLI Example:
```
salt '*' cimc.get_disks
```

salt.modules.cimc.get_ethernet_interfaces()
Get the adapter Ethernet interface details.

CLI Example:
```
salt '*' cimc.get_ethernet_interfaces
```

salt.modules.cimc.get_fibre_channel_interfaces()
Get the adapter fibre channel interface details.

CLI Example:
```
salt '*' cimc.get_fibre_channel_interfaces
```

salt.modules.cimc.get_firmware()
Retrieves the current running firmware versions of server components.

CLI Example:
```
salt '*' cimc.get_firmware
```

salt.modules.cimc.get_hostname()
Retrieves the hostname from the device.

New in version 2019.2.0.

CLI Example:
```
salt '*' cimc.get_hostname
```

salt.modules.cimc.get_ldap()
Retrieves LDAP server details.

CLI Example:
```
salt '*' cimc.get_ldap
```

salt.modules.cimc.get_management_interface()
Retrieve the management interface details.

CLI Example:
```
salt '*' cimc.get_management_interface
```

salt.modules.cimc.get_memory_token()
Get the memory RAS BIOS token.

CLI Example:
salt 'x' cimc.get_memory_token

salt.modules.cimc.get_memory_unit()
Get the IMM/Memory unit product ID details.

CLI Example:
salt 'x' cimc.get_memory_unit

salt.modules.cimc.get_network_adapters()
Get the list of network adapters and configuration details.

CLI Example:
salt 'x' cimc.get_network_adapters

salt.modules.cimc.get_ntp()
Retrieves the current running NTP configuration.

CLI Example:
salt 'x' cimc.get_ntp

salt.modules.cimc.get_pci_adapters()
Get the PCI adapter product ID details.

CLI Example:
salt 'x' cimc.get_pci_adapters

salt.modules.cimc.get_power_configuration()
Get the configuration of the power settings from the device. This is only available on some C-Series servers.

New in version 2019.2.0.

CLI Example:
salt 'x' cimc.get_power_configuration

salt.modules.cimc.get_power_supplies()
Retrieves the power supply unit details.

CLI Example:
salt 'x' cimc.get_power_supplies

salt.modules.cimc.get_snmp_config()
Get the snmp configuration details.

CLI Example:
salt 'x' cimc.get_snmp_config

salt.modules.cimc.get_syslog()
Get the Syslog client-server details.

CLI Example:
salt 'x' cimc.get_syslog
salt.modules.cimc.get_syslog_settings()
Get the Syslog configuration settings from the system.

New in version 2019.2.0.

CLI Example:
```
salt '*' cimc.get_syslog_settings
```

cimc.get_system_info()
Get the system information.

CLI Example:
```
salt '*' cimc.get_system_info
```

cimc.get_users()
Get the CIMC users.

CLI Example:
```
salt '*' cimc.get_users
```

cimc.get_vic_adapters()
Get the VIC adapter general profile details.

CLI Example:
```
salt '*' cimc.get_vic_adapters
```

cimc.get_vic_uplinks()
Get the VIC adapter uplink port details.

CLI Example:
```
salt '*' cimc.get_vic_uplinks
```

cimc.mount_share(name=None, remote_share=None, remote_file=None, mount_type='nfs', username=None, password=None)
Mounts a remote file through a remote share. Currently, this feature is supported in version 1.5 or greater. The remote share can be either NFS, CIFS, or WWW.

Some of the advantages of CIMC Mounted vMedia include: Communication between mounted media and target stays local (inside datacenter) Media mounts can be scripted/automated No vKVM requirements for media connection Multiple share types supported Connections supported through all CIMC interfaces

Note: CIMC Mounted vMedia is enabled through BIOS configuration.

**Parameters**

- `name (str)` -- The name of the volume on the CIMC device.
- `remote_share (str)` -- The file share link that will be used to mount the share. This can be NFS, CIFS, or WWW. This
- `remote_file (str)` -- The name of the remote file to mount. It must reside within remote_share.
- `mount_type (str)` -- The type of share to mount. Valid options are nfs, cifs, and www.
- **username** (*str*) -- An optional requirement to pass credentials to the remote share. If not provided, an
  *connection attempt will be made.* *(unauthenticated)*
- **password** (*str*) -- An optional requirement to pass a password to the remote share. If not provided, an
  *connection attempt will be made.*

CLI Example:

```
salt '*' cimc.mount_share name=WIN7 remote_share=10.xxx.27.xxx:/nfs remote_
  → file=sl1huu.iso

salt '*' cimc.mount_share name=WIN7 remote_share=10.xxx.27.xxx:/nfs remote_
  → file=sl1huu.iso username=bob password=badpassword
```

**salt.modules.cimc.reboot()**

Power cycling the server.

CLI Example:

```
salt '*' cimc.reboot
```

**salt.modules.cimc.set_hostname** (*hostname=None*)

Sets the hostname on the server.

New in version 2019.2.0.

Parameters

- **hostname** (*str*) -- The new hostname to set.

CLI Example:

```
salt '*' cimc.set_hostname foobar
```

**salt.modules.cimc.set_logging_levels** (*remote=None, local=None*)

Sets the logging levels of the CIMC devices. The logging levels must match the following options: emergency, alert, critical, error, warning, notice, informational, debug.

New in version 2019.2.0.

Parameters

- **remote** (*str*) -- The logging level for SYSLOG logs.
- **local** (*str*) -- The logging level for the local device.

CLI Example:

```
salt '*' cimc.set_logging_levels remote=error local=notice
```

**salt.modules.cimc.set_ntp_server** (*server1=", server2=", server3=", server4="*)

Sets the NTP servers configuration. This will also enable the client NTP service.

Parameters

- **server1** (*str*) -- The first IP address or FQDN of the NTP servers.
- **server2** (*str*) -- The second IP address or FQDN of the NTP servers.
- **server3** (*str*) -- The third IP address or FQDN of the NTP servers.
- **server4** (*str*) -- The fourth IP address or FQDN of the NTP servers.
CLI Example:

```bash
salt '*' cimc.set_ntp_server 10.10.10.1
salt '*' cimc.set_ntp_server 10.10.10.1 foo.bar.com
```

```
salt.modules.cimc.set_power_configuration(policy=None, delayType=None, delayValue=None)
```

Sets the power configuration on the device. This is only available for some C-Series servers.

New in version 2019.2.0.

Parameters

- **policy (str)** -- The action to be taken when chassis power is restored after
  unexpected power loss. This can be one of the following:
  - **reset** -- The server is allowed to boot up normally when power is restored. The server can restart immediately or, optionally, after a fixed or random delay.
  - **stay-off** -- The server remains off until it is manually restarted.
  - **last-state** -- The server restarts and the system attempts to restore any processes that were running before power was lost.

- **delayType (str)** -- If the selected policy is reset, the restart can be
  **with this option. This can be one of the following:**
  - **fixed** -- The server restarts after a fixed delay.
  - **random** -- The server restarts after a random delay.

- **delayValue (int)** -- If a fixed delay is selected, once chassis power is
  **and the Cisco IMC has finished rebooting, the system waits for**
  **specified number of seconds before restarting the server.**
  **Enter an (the)**
  - **between 0 and 240. (integer)**

CLI Example:

```bash
salt '*' cimc.set_power_configuration stay-off
salt '*' cimc.set_power_configuration reset fixed 0
```

```
salt.modules.cimc.set_syslog_server(server=None, type='primary')
```

Set the SYSLOG server on the host.

Parameters

- **server (str)** -- The hostname or IP address of the SYSLOG server.
- **type (str)** -- Specifies the type of SYSLOG server. This can either be primary (default) or secondary.

CLI Example:

```bash
salt '*' cimc.set_syslog_server foo.bar.com
salt '*' cimc.set_syslog_server foo.bar.com primary
```

(continues on next page)
salt '*

```salt
salt '*
cimc.set_syslog_server foo.bar.com secondary
```

```python
cimc.set_syslog_server

```cimc.set_syslog_server```

Sets a CIMC user with specified configurations.

New in version 2019.2.0.

Parameters

- **uid** (`int`) -- The user ID slot to create the user account in.
- **username** (`str`) -- The name of the user.
- **password** (`str`) -- The clear text password of the user.
- **priv** (`str`) -- The privilege level of the user.
- **status** (`str`) -- The account status of the user.

CLI Example:

```shell
salt '*
cimc.set_user uid=11 username=admin password=foobor priv=admin active
```

salt.modules.cimc.tftp_update_bios

Update the BIOS firmware through TFTP.

Parameters

- **server** (`str`) -- The IP address or hostname of the TFTP server.
- **path** (`str`) -- The TFTP path and filename for the BIOS image.

CLI Example:

```shell
salt '*
cimc.tftp_update_bios server=foo.bar.com path=HP-SL2.cap
```

salt.modules.cimc.tftp_update_cimc

Update the CIMC firmware through TFTP.

Parameters

- **server** (`str`) -- The IP address or hostname of the TFTP server.
- **path** (`str`) -- The TFTP path and filename for the CIMC image.

CLI Example:

```shell
salt '*
cimc.tftp_update_cimc server=foo.bar.com path=HP-SL2.bin
```

---

**21.9.88 salt.modules.ciscoconfparse_mod module**

Execution module for **ciscoconfparse**

New in version 2019.2.0.

This module can be used for basic configuration parsing, audit or validation for a variety of network platforms having Cisco IOS style configuration (one space indentation), including: Cisco IOS, Cisco Nexus, Cisco IOS-XR, Cisco IOS-XR, Cisco ASA, Arista EOS, Brocade, HP Switches, Dell PowerConnect Switches, or Extreme Networks devices. In newer versions, **ciscoconfparse** provides support for brace-delimited configuration style as well, for platforms such as: Juniper Junos, Palo Alto, or F5 Networks.
See [http://www.pennington.net/py/ciscoconfparse/index.html](http://www.pennington.net/py/ciscoconfparse/index.html) for further details.

**depends** ciscoconfparse

This module depends on the Python library with the same name, ciscoconfparse - to install execute: `pip install ciscoconfparse`

```python
salt.modules.ciscoconfparse_mod.filter_lines(
    config=None, config_path=None, parent_regex=None, child_regex=None, saltenv='base')
```

Return a list of detailed matches, for the configuration blocks (parent-child relationship) whose parent respects the regular expressions configured via the `parent_regex` argument, and the child matches the `child_regex` regular expression. The result is a list of dictionaries with the following keys:

- **match**: a boolean value that tells whether `child_regex` matched any children lines.
- **parent**: the parent line (as text).
- **child**: the child line (as text). If no child line matched, this field will be `None`.

Note that the return list contains the elements that matched the parent condition, the `parent_regex` regular expression. Therefore, the `parent` field will always have a valid value, while `match` and `child` may default to `False` and `None` respectively when there is not child match.

**CLI Example:**

```bash
salt '*' ciscoconfparse.filter_lines config_path=https://bit.ly/2mAdq7z parent_regex='Gigabit' child_regex='shutdown'
```

Example output (for the example above):

```json
[
    {
        'parent': 'interface GigabitEthernet1',
        'match': False,
        'child': None
    },
    {
        'parent': 'interface GigabitEthernet2',
        'match': True,
        'child': 'shutdown'
    },
    {
        'parent': 'interface GigabitEthernet3',
        'match': True,
        'child': 'shutdown'
    }
]
```

```python
salt.modules.ciscoconfparse_mod.find_lines(
    config=None, config_path=None, regex=None, saltenv='base')
```

Return all the lines (as text) that match the expression in the `regex` argument.

**config** The configuration sent as text.

**Note**: This argument is ignored when `config_path` is specified.

**config_path** The absolute or remote path to the file with the configuration to be parsed. This argument supports the usual Salt filesystem URIs, e.g., `salt://`, `https://`, `ftp://`, `s3://`, etc.
regex  The regular expression to match the lines against.

saltenv: base  Salt fileserver environment from which to retrieve the file. This argument is ignored when config_path is not a salt:// URL.

CLI Example:

```bash
salt '*' ciscoconfparse.find_lines config_path=https://bit.ly/2mAdq7z regex='ip address'
```

Output example:
```
cisco-ios-router:
  - ip address dhcp
  - ip address 172.20.0.1 255.255.255.0
  - no ip address
```

```
salt.modules.ciscoconfparse_mod.find_lines_w_child(config=None, config_path=None,
          parent_regex=None,
          child_regex=None, ignore_ws=False, saltenv='base')
```

Return a list of parent lines (as text) matching the regular expression parent_regex that have children lines matching child_regex.

config  The configuration sent as text.

Note: This argument is ignored when config_path is specified.

```
ciscoconfparse.find_lines_w_child(config=None, config_path=None,
          parent_regex='ge-(.*)',
          child_regex='unit \d+')
```

config  The absolute or remote path to the file with the configuration to be parsed. This argument supports the usual Salt filesystem URIs, e.g., salt://, https://, ftp://, s3://, etc.

parent_regex  The regular expression to match the parent lines against.

child_regex  The regular expression to match the child lines against.

ignore_ws: False  Whether to ignore the white spaces.

saltenv: base  Salt fileserver environment from which to retrieve the file. This argument is ignored when config_path is not a salt:// URL.

CLI Example:

```bash
salt '*' ciscoconfparse.find_lines_w_child config_path=https://bit.ly/2mAdq7z
  →parent_line='line con' child_line='stopbits'
salt '*' ciscoconfparse.find_lines_w_child config_path=https://bit.ly/2uIRxau
  →parent_regex='ge-(.*)' child_regex='unit \d+'  
```

```
salt.modules.ciscoconfparse_mod.find_lines_wo_child(config=None, config_path=None,
          parent_regex=None,
            child_regex=None, ignore_ws=False, saltenv='base')
```

Return a list of parent ciscoconfparse.IOSCfgLine lines as text, which matched the parent_regex and whose children did not match child_regex. Only the parent ciscoconfparse.IOSCfgLine text lines will be returned. For simplicity, this method only finds oldest ancestors without immediate children that match.

config  The configuration sent as text.
Note: This argument is ignored when config_path is specified.

config_path The absolute or remote path to the file with the configuration to be parsed. This argument supports the usual Salt filesystem URIs, e.g., salt://, https://, ftp://, s3://, etc.

parent_regex The regular expression to match the parent lines against.

child_regex The regular expression to match the child lines against.

ignore_ws: False Whether to ignore the white spaces.

saltenv: base Salt filesystem environment from which to retrieve the file. This argument is ignored when config_path is not a salt:// URL.

CLI Example:
```
salt '*' ciscoconfparse.find_lines_wo_child config_path=https://bit.ly/2mAdq7z0
→parent_line='line con' child_line='stopbits'
```

salt.modules.ciscoconfparse_mod.find_objects(config=None, config_path=None, regex=None, saltenv='base')

Return all the line objects that match the expression in the regex argument.

Warning: This function is mostly valuable when invoked from other Salt components (i.e., execution modules, states, templates etc.). For CLI usage, please consider using ciscoconfparse.find_lines

config The configuration sent as text.

Note: This argument is ignored when config_path is specified.

config_path The absolute or remote path to the file with the configuration to be parsed. This argument supports the usual Salt filesystem URIs, e.g., salt://, https://, ftp://, s3://, etc.

regex The regular expression to match the lines against.

saltenv: base Salt filesystem environment from which to retrieve the file. This argument is ignored when config_path is not a salt:// URL.

Usage example:
```
objects = __salt__['ciscoconfparse.find_objects'](config_path='salt://path/to/config.txt', regex='Gigabit')
for obj in objects:
    print(obj['text'])
```

salt.modules.ciscoconfparse_mod.find_objects_w_child(config=None, config_path=None, parent_regex=None, child_regex=None, ignore_ws=False, saltenv='base')

Parse through the children of all parent lines matching parent_regex, and return a list of child objects, which matched the child_regex.
Warning: This function is mostly valuable when invoked from other Salt components (i.e., execution modules, states, templates etc.). For CLI usage, please consider using ciscoconfparse.

find_lines_w_child

config The configuration sent as text.

Note: This argument is ignored when config_path is specified.

config_path The absolute or remote path to the file with the configuration to be parsed. This argument supports the usual Salt filesystem URIs, e.g., salt://, https://, ftp://, s3://, etc.

parent_regex The regular expression to match the parent lines against.

child_regex The regular expression to match the child lines against.

ignore_ws: False Whether to ignore the white spaces.

saltenv: base Salt fileserver environment from which to retrieve the file. This argument is ignored when config_path is not a salt:// URL.

Usage example:

```python
def find_objects_w_child(config_path='https://bit.ly/2mAdq7z', parent_regex='line con', child_regex='stopbits')
for obj in objects:
    print(obj.text)
```

Return a list of parent ciscoconfparse.IOSCfgLine objects, which matched the parent_regex and whose children did not match child_regex. Only the parent ciscoconfparse.IOSCfgLine objects will be returned. For simplicity, this method only finds oldest ancestors without immediate children that match.

Warning: This function is mostly valuable when invoked from other Salt components (i.e., execution modules, states, templates etc.). For CLI usage, please consider using ciscoconfparse.

find_lines_wo_child

config The configuration sent as text.

Note: This argument is ignored when config_path is specified.

config_path The absolute or remote path to the file with the configuration to be parsed. This argument supports the usual Salt filesystem URIs, e.g., salt://, https://, ftp://, s3://, etc.

parent_regex The regular expression to match the parent lines against.
child_regex  The regular expression to match the child lines against.

ignore_ws: **False**  Whether to ignore the white spaces.

saltenv: **base**  Salt fileserver environment from which to retrieve the file. This argument is ignored when
config_path is not a salt:// URL.

Usage example:

```python
objects = __salt__['ciscoconfparse.find_objects_wo_child'](config_path='https://
→bit.ly/2mAdq7z',
→parent_regex='line con
→',
→child_regex='stopbits')

for obj in objects:
    print(obj.text)
```

### 21.9.89 `salt.modules.cisconso`

Execution module for Cisco Network Services Orchestrator Proxy minions

For documentation on setting up the cisconso proxy minion look in the documentation for *salt.proxy.cisconso*.

`salt.modules.cisconso.apply_rollback(datastore, name)`

Apply a system rollback

**Parameters**

- `datastore` ([`DatastoreType`](https://docs.return42.com/salt/latest/ref/namespaces/salt/modules/cisconso.html#salt.modules.cisconso.DatastoreType) `str` `enum`): The datastore, e.g. running, operational. One of the NETCONF store IETF types
- `name` (`str`): an ID of the rollback to restore

```bash
salt cisco-nso cisconso.apply_rollback 52
```

`salt.modules.cisconso.get_data(datastore, path)`

Get the configuration of the device tree at the given path

**Parameters**

- `datastore` ([`DatastoreType`](https://docs.return42.com/salt/latest/ref/namespaces/salt/modules/cisconso.html#salt.modules.cisconso.DatastoreType) `str` `enum`): The datastore, e.g. running, operational. One of the NETCONF store IETF types
- `path` (`list` `str` OR `tuple`): The device path to set the value at, a list of element names in order, / separated

**Returns**  The network configuration at that tree

**Return type**  `dict`

```bash
salt cisco-nso cisconso.get_data running 'devices/ex0'
```

`salt.modules.cisconso.get_rollback(name)`

Get the backup of stored a configuration rollback

**Parameters**  `name` (`str`): Typically an ID of the backup

**Return type**  `str`

**Returns**  the contents of the rollback snapshot

21.9. execution modules 1609
salt cisco-nso cisconso.get rollback 52

salt.modules.cisconso.get_rollbacks()
Get a list of stored configuration rollbacks

salt cisco-nso cisconso.get_rollbacks

salt.modules.cisconso.info()
Return system information for grains of the NSO proxy minion

salt 'x' cisconso.info

salt.modules.cisconso.set_data_value(datastore, path, data)
Set a data entry in a datastore

Parameters

• **datastore** (DatastoreType(str enum)) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types

• **path** (list, str OR tuple) -- The device path to set the value at, a list of element names in order, / separated

• **data** (dict) -- The new value at the given path

Return type bool

Returns True if successful, otherwise error.

salt cisco-nso cisconso.set_data_value running 'devices/ex0/routes' 10.0.0.20/24

21.9.90 salt.modules.cloud

Salt-specific interface for calling Salt Cloud directly

salt.modules.cloud.action(fun=None, cloudmap=None, names=None, provider=None, instance=None, **kwargs)
Execute a single action on the given provider/instance

CLI Example:

salt minionname cloud.action start instance=myinstance
salt minionname cloud.action stop instance=myinstance
salt minionname cloud.action show_image provider=my-ec2-config image=ami-1624987f

salt.modules.cloud.create(provider, names, opts=None, **kwargs)
Create an instance using Salt Cloud

CLI Example:

salt minionname cloud.create my-ec2-config myinstance image=ami-1624987f size='t1.micro' ssh_username=ec2-user securitygroup=default delvol_on_destroy=True

salt.modules.cloud.destroy(names)
Destroy the named VM(s)

CLI Example:
```python
salt.minionname cloud.destroy myinstance
```

```python
salt.modules.cloud.full_query(query_type='list_nodes_full')
List all available cloud provider data
CLI Example:
```
salt.minionname cloud.full_query
```

```python
salt.modules.cloud.get_instance(name, provider=None)
Return details on an instance.
Similar to the cloud action show_instance but returns only the instance details.
CLI Example:
```
salt.minionname cloud.get_instance myinstance
```
SLS Example:
```
[{{ salt['cloud.get_instance']('myinstance')['mac_address'] }}]
```

```python
salt.modules.cloud.has_instance(name, provider=None)
Return true if the instance is found on a provider
CLI Example:
```
salt.minionname cloud.has_instance myinstance
```

```python
salt.modules.cloud.list_images(provider='all')
List cloud provider images for the given providers
CLI Example:
```
salt.minionname cloud.list_images my-gce-config
```

```python
salt.modules.cloud.list_locations(provider='all')
List cloud provider locations for the given providers
CLI Example:
```
salt.minionname cloud.list_locations my-gce-config
```

```python
salt.modules.cloud.list_sizes(provider='all')
List cloud provider sizes for the given providers
CLI Example:
```
salt.minionname cloud.list_sizes my-gce-config
```

```python
salt.modules.cloud.map_run(path=None, **kwargs)
Execute a salt cloud map file
Cloud Map data can be retrieved from several sources:
- a local file (provide the path to the file to the 'path' argument)
- a JSON-formatted map directly (provide the appropriately formatted to using the 'map_data' argument)
- the Salt Pillar (provide the map name of under 'pillar:cloud:maps' to the 'map_pillar' argument)
```
Note: Only one of these sources can be read at a time. The options are listed in their order of precedence.

CLI Examples:

```python
salt minionname cloud.map_run /path/to/cloud.map
salt minionname cloud.map_run path=/path/to/cloud.map
salt minionname cloud.map_run map_pillar='<map_pillar>'
  .. versionchanged:: 2018.3.1
salt minionname cloud.map_run map_data='<actual map data>'
```

```python
salt.modules.cloud.network_create(provider, names, **kwargs)
Create private network

CLI Example:

```
salt minionname cloud.network_create my-nova names=['salt'] cidr='192.168.100.0/24'
```

```python
salt.modules.cloud.network_list(provider)
List private networks

CLI Example:

```
salt minionname cloud.network_list my-nova
```

```python
salt.modules.cloud.profile_(profile, names, vm_overrides=None, opts=None, **kwargs)
Spin up an instance using Salt Cloud

CLI Example:

```
salt minionname cloud.profile my-gce-config myinstance
```

```python
salt.modules.cloud.query(query_type='list_nodes')
List cloud provider data for all providers

CLI Examples:

```
salt minionname cloud.query
salt minionname cloud.query list_nodes_full
salt minionname cloud.query list_nodes_select
```

```python
salt.modules.cloud.select_query(query_type='list_nodes_select')
List selected nodes

CLI Example:

```
salt minionname cloud.select_query
```

```python
salt.modules.cloud.virtual_interface_create(provider, names, **kwargs)
Attach private interfaces to a server

CLI Example:

```
salt minionname cloud.virtual_interface_create my-nova names=['salt-master'] net_name='salt'
```

```python
salt.modules.cloud.virtual_interface_list(provider, names, **kwargs)
List virtual interfaces on a server
```
CLI Example:

```bash
salt minionname cloud.virtual_interface_list my-nova names=['salt-master']
```

salt.modules.cloud.volume_attach(provider, names, **kwargs)
Attach volume to a server

CLI Example:

```bash
salt minionname cloud.volume_attach my-nova myblock server_name=myserver device='/dev/xvdf'
```

salt.modules.cloud.volume_create(provider, names, **kwargs)
Create volume

CLI Example:

```bash
salt minionname cloud.volume_create my-nova myblock size=100 voltype=SSD
```

salt.modules.cloud.volume_delete(provider, names, **kwargs)
Delete volume

CLI Example:

```bash
salt minionname cloud.volume_delete my-nova myblock
```

salt.modules.cloud.volume_detach(provider, names, **kwargs)
Detach volume from a server

CLI Example:

```bash
salt minionname cloud.volume_detach my-nova myblock server_name=myserver
```

salt.modules.cloud.volume_list(provider)
List block storage volumes

CLI Example:

```bash
salt minionname cloud.volume_list my-nova
```

**21.9.91 salt.modules.cmdmod**

A module for shelling out.

Keep in mind that this module is insecure, in that it can give whomever has access to the master root execution access to all salt minions.

salt.modules.cmdmod.exec_code(lang, code, cwd=None, args=None, **kwargs)
Pass in two strings, the first naming the executable language, aka - python2, python3, ruby, perl, lua, etc. the second string containing the code you wish to execute. The stdout will be returned.

All parameters from cmd.run_all except python_shell can be used.

CLI Example:

```bash
salt '*' cmd.exec_code ruby 'puts "cheese"'
salt '*' cmd.exec_code ruby 'puts "cheese"' args=['arg1', 'arg2'] env={"FOO": "bar"}
```
salt.modules.cmdmod.exec_code_all(lang, code, cwd=None, args=None, **kwargs)

Pass in two strings, the first naming the executable language, aka - python2, python3, ruby, perl, lua, etc. the second string containing the code you wish to execute. All cmd artifacts (stdout, stderr, retcode, pid) will be returned.

All parameters from cmd.run_all except python_shell can be used.

CLI Example:

```
salt '*' cmd.exec_code_all ruby 'puts "cheese"'
salt '*' cmd.exec_code_all ruby 'puts "cheese"' args=['"arg1", "arg2"] env={"FOO": "bar"} 
```

salt.modules.cmdmod.has_exec(cmd)

Returns true if the executable is available on the minion, false otherwise

CLI Example:

```
salt '*' cmd.has_exec cat
```

salt.modules.cmdmod.powershell(cmd, cwd=None, stdin=None, runas=None, shell='/bin/sh', env=None, clean_env=False, template=None, rstrip=True, umask=None, output_encoding=None, output_loglevel='debug', hide_output=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv='base', use_vt=False, password=None, depth=None, encode_cmd=False, success_retcodes=None, **kwargs)

Execute the passed PowerShell command and return the output as a dictionary.

Other cmd.* functions (besides cmd.powershell_all) return the raw text output of the command. This function appends | ConvertTo-JSON to the command and then parses the JSON into a Python dictionary. If you want the raw textual result of your PowerShell command you should use cmd.run with the shell=powershell option.

For example:

```
salt '*' cmd.run '$PSVersionTable.CLRVersion' shell=powershell
salt '*' cmd.run 'Get-NetTCPConnection' shell=powershell
```

New in version 2016.3.0.

**Warning:** This passes the cmd argument directly to PowerShell without any further processing! Be absolutely sure that you have properly sanitized the command passed to this function and do not use untrusted inputs.

In addition to the normal cmd.run parameters, this command offers the `depth` parameter to change the Windows default depth for the ConvertTo-JSON powershell command. The Windows default is 2. If you need more depth, set that here.

**Note:** For some commands, setting the depth to a value greater than 4 greatly increases the time it takes for the command to return and in many cases returns useless data.

**Parameters**

- `cmd (str)` -- The powershell command to run.
Salt Documentation, Release 3001.1

• cwd (str) -- The directory from which to execute the command. Defaults to the home
directory of the user specified by runas (or the user under which Salt is running if runas
is not specified).
• stdin (str) -- A string of standard input can be specified for the command to be run
using the stdin parameter. This can be useful in cases where sensitive information must
be read from standard input.
• runas (str) -- Specify an alternate user to run the command. The default behavior is to
run as the user under which Salt is running. If running on a Windows minion you must also
use the password argument, and the target user account must be in the Administrators
group.
• password (str) -- Windows only. Required when specifying runas. This parameter
will be ignored on non-Windows platforms.
New in version 2016.3.0.
• shell (str) -- Specify an alternate shell. Defaults to the system's default shell.
• python_shell (bool) -- If False, let python handle the positional arguments. Set to
True to use shell features, such as pipes or redirection.
• env (dict) -- Environment variables to be set prior to execution.
Note: When passing environment variables on the CLI, they should be passed as the string
representation of a dictionary.
salt myminion cmd.powershell 'some command' env='{"FOO": "bar"}'

• clean_env (bool) -- Attempt to clean out all other shell environment variables and set
only those provided in the 'env' argument to this function.
• template (str) -- If this setting is applied then the named templating engine will be
used to render the downloaded file. Currently jinja, mako, and wempy are supported.
• rstrip (bool) -- Strip all whitespace off the end of output before it is returned.
• umask (str) -- The umask (in octal) to use when running the command.
• output_encoding (str) -- Control the encoding used to decode the command's output.
Note: This should not need to be used in most cases. By default, Salt will try to use the
encoding detected from the system locale, and will fall back to UTF-8 if this fails. This
should only need to be used in cases where the output of the command is encoded in
something other than the system locale or UTF-8.
To see the encoding Salt has detected from the system locale, check the locale line in the
output of test.versions_report.
New in version 2018.3.0.
• output_loglevel (str) -- Control the loglevel at which the output from the command
is logged to the minion log.
Note: The command being run will still be logged at the debug loglevel regardless, unless
quiet is used for this value.

21.9. execution modules

1615


- **ignore_retcode** *(bool)* -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.

- **hide_output** *(bool)* -- If `True`, suppress stdout and stderr in the return data.

  Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

- **timeout** *(int)* -- A timeout in seconds for the executed process to return.

- **use_vt** *(bool)* -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

- **reset_system_locale** *(bool)* -- Resets the system locale

- **saltenv** *(str)* -- The salt environment to use. Default is 'base'

- **depth** *(int)* -- The number of levels of contained objects to be included. Default is 2. Values greater than 4 seem to greatly increase the time it takes for the command to complete for some commands. eg: `dir`

  New in version 2016.3.4.

- **encode_cmd** *(bool)* -- Encode the command before executing. Use in cases where characters may be dropped or incorrectly converted when executed. Default is `False`.

- **success_retcodes** *(list)* -- This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.

- **stdin_raw_newlines** *(bool)* -- False If `True`, Salt will not automatically convert the characters \n present in the stdin value to newlines.

  New in version 2019.2.0.

**Returns**

- `dict` A dictionary of data returned by the powershell command.

**CLI Example:**

```
salt '*' cmd.powershell "$PSVersionTable.CLRVersion"
```
salt.modules.cmdmod.powershell_all(cmd, cwd=None, stdin=None, runas=None, shell='/bin/sh',
                  env=None, clean_env=False, template=None,
                  rstrip=True, umask=None, output_encoding=None,
                  output_loglevel='debug', quiet=False, timeout=None,
                  reset_system_locale=True, ignore_retcode=False,
                  saltenv='base', use_vt=False, password=None, depth=None,
                  encode_cmd=False, force_list=False, success_retcodes=None,
                  **kwargs)

Execute the passed PowerShell command and return a dictionary with a result field representing the output
of the command, as well as other fields showing us what the PowerShell invocation wrote to stderr, the
process id, and the exit code of the invocation.

This function appends | ConvertTo-JSON to the command before actually invoking powershell.

An unquoted empty string is not valid JSON, but it's very normal for the Powershell output to be exactly that.
Therefore, we do not attempt to parse empty Powershell output (which would result in an exception). Instead
we treat this as a special case and one of two things will happen:

- If the value of the force_list parameter is True, then the result field of the return dictionary will
  be an empty list.
- If the value of the force_list parameter is False, then the return dictionary will not have a result
  key added to it. We aren't setting result to None in this case, because None is the Python represen-
  tation of "null" in JSON. (We likewise can't use False for the equivalent reason.)

If Powershell's output is not an empty string and Python cannot parse its content, then a
CommandExecutionError exception will be raised.

If Powershell's output is not an empty string, Python is able to parse its content, and the type of the resulting
Python object is other than list then one of two things will happen:

- If the value of the force_list parameter is True, then the result field will be a singleton list with
  the Python object as its sole member.
- If the value of the force_list parameter is False, then the value of result will be the unmodified
  Python object.

If Powershell's output is not an empty string, Python is able to parse its content, and the type of the resulting
Python object is list, then the value of result will be the unmodified Python object. The force_list
parameter has no effect in this case.

**Note:** An example of why the force_list parameter is useful is as follows: The Powershell command dir
x | ConvertTo-Json results in

- no output when x is an empty directory.
- a dictionary object when x contains just one item.
- a list of dictionary objects when x contains multiple items.

By setting force_list to True we will always end up with a list of dictionary items, representing files, no
matter how many files x contains. Conversely, if force_list is False, we will end up with no result
key in our return dictionary when x is an empty directory, and a dictionary object when x contains just one
file.

If you want a similar function but with a raw textual result instead of a Python dictionary, you should use
cmd.run_all in combination with shell=powershell.

The remaining fields in the return dictionary are described in more detail in the Returns section.

Example:
New in version 2018.3.0.

**Warning:** This passes the `cmd` argument directly to PowerShell without any further processing! Be absolutely sure that you have properly sanitized the command passed to this function and do not use untrusted inputs.

In addition to the normal `cmd.run` parameters, this command offers the `depth` parameter to change the Windows default depth for the `ConvertTo-JSON` powershell command. The Windows default is 2. If you need more depth, set that here.

**Note:** For some commands, setting the depth to a value greater than 4 greatly increases the time it takes for the command to return and in many cases returns useless data.

### Parameters

- **cmd** *(str)* -- The powershell command to run.
- **cwd** *(str)* -- The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **stdin** *(str)* -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** *(str)* -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.
- **password** *(str)* -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.
- **shell** *(str)* -- Specify an alternate shell. Defaults to the system's default shell.
- **python_shell** *(bool)* -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **env** *(dict)* -- Environment variables to be set prior to execution.

**Note:** When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

- **clean_env** *(bool)* -- Attempt to clean out all other shell environment variables and set only those provided in the `env` argument to this function.
- **template** *(str)* -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **rstrip**(bool) -- Strip all whitespace off the end of output before it is returned.
- **umask**(str) -- The umask (in octal) to use when running the command.
- **output_encoding**(str) -- Control the encoding used to decode the command’s output.

Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the `locale` line in the output of `test.versions_report`.

New in version 2018.3.0.

- **output_loglevel**(str) -- Control the loglevel at which the output from the command is logged to the minion log.

Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

- **ignore_retcode**(bool) -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.

- **timeout**(int) -- A timeout in seconds for the executed process to return.

- **use_vt**(bool) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

- **reset_system_locale**(bool) -- Resets the system locale

- **ignore_retcode** -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.

- **saltenv**(str) -- The salt environment to use. Default is 'base'

- **depth**(int) -- The number of levels of contained objects to be included. Default is 2. Values greater than 4 seem to greatly increase the time it takes for the command to complete for some commands. eg: `dir`

- **encode_cmd**(bool) -- Encode the command before executing. Use in cases where characters may be dropped or incorrectly converted when executed. Default is False.

- **force_list**(bool) -- The purpose of this parameter is described in the preamble of this function’s documentation. Default value is False.

- **success_retcodes**(list) --

  This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.
New in version 2019.2.0.

- **stdin_raw_newlines (bool)** --

  - **False** If True, Salt will not automatically convert the characters \n present in the stdin value to newlines.

New in version 2019.2.0.

**Returns**

A dictionary with the following entries:

- **result** For a complete description of this field, please refer to this function’s preamble. This key will not be added to the dictionary when force_list is False and Powershell’s output is the empty string.

- **stderr** What the PowerShell invocation wrote to stderr.

- **pid** The process id of the PowerShell invocation

- **retcode** This is the exit code of the invocation of PowerShell. If the final execution status (in PowerShell) of our command (with | ConvertTo-JSON appended) is False this should be non-0. Likewise if PowerShell exited with $LASTEXITCODE set to some non-0 value, then retcode will end up with this value.

**Return type** **dict**

**CLI Example:**

```bash
salt '*' cmd.powershell_all "$PSVersionTable.CLRVersion"
```

**CLI Example:**

```bash
salt '*\' cmd.powershell_all "dir mydirectory\" force_list=True
```

**salt.modules.cmdmod.recode (cmd, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh', python_shell=None, env=None, clean_env=False, template=None, umask=None, output_encoding=None, output_loglevel='debug', log_callback=None, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv='base', use_vt=False, password=None, success_retcodes=None, **kwargs)**

Execute a shell command and return the command’s return code.

**Parameters**

- **cmd (str)** -- The command to run. ex: ls -lart /home

- **cwd (str)** -- The directory from which to execute the command. Defaults to the home directory of the user specified by runas (or the user under which Salt is running if runas is not specified).

- **stdin (str)** -- A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input.

- **runas (str)** -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the password argument, and the target user account must be in the Administrators group.
Warning: For versions 2018.3.3 and above on macOS while using runas, to pass special characters to the command you need to escape the characters on the shell.

Example:
```
\$ cmd.retcode 'echo \"h=\"baz\"\" runas=macuser
```

- **password** *(str)* -- Windows only. Required when specifying runas. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

- **group** *(str)* -- Group to run command as. Not currently supported on Windows.

- **shell** *(str)* -- Specify an alternate shell. Defaults to the system’s default shell.

- **python_shell** *(bool)* -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.

- **env** *(dict)* -- Environment variables to be set prior to execution.

  **Note:** When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

  ```
salt myminion cmd.retcode 'some command' env='{"FOO": "bar"}"
```

- **clean_env** *(bool)* -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.

- **template** *(str)* -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.

- **rstrip** *(bool)* -- Strip all whitespace off the end of output before it is returned.

- **umask** *(str)* -- The umask (in octal) to use when running the command.

- **output_encoding** *(str)* -- Control the encoding used to decode the command’s output.

  **Note:** This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

  To see the encoding Salt has detected from the system locale, check the `locale` line in the output of `test.versions_report`.

  New in version 2018.3.0.

- **output_loglevel** *(str)* -- Control the loglevel at which the output from the command is logged to the minion log.

  **Note:** The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.
• **ignore_retcode** *(bool)* -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn’t necessarily mean failure. Pass this argument as True to skip logging the output if the command has a nonzero exit code.

• **timeout** *(int)* -- A timeout in seconds for the executed process to return.

• **use_vt** *(bool)* -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

• **success_retcodes** *(list)* --

  This parameter will allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.

• **stdin_raw_newlines** *(bool)* --

  False If True, Salt will not automatically convert the characters \n present in the stdin value to newlines.

  New in version 2019.2.0.

Return type **int**

Return type **None**

**Returns** Return Code as an int or None if there was an exception.

**CLI Example:**

```
salt '*' cmd.retcode "file /bin/bash"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.retcode template=jinja "file {{grains.pythonpath[0]}}/python"
```

A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input.

```
salt '*' cmd.retcode "grep f" stdin='one
two
three
four
five
'
```

**salt.modules.cmdmod.run**(cmd, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh', python_shell=None, env=None, clean_env=False, template=None, rstrip=True, umask=None, output_encoding=None, output_loglevel='debug', log_callback=None, hide_output=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv='base', use_vt=False, bg=False, password=None, encoded_cmd=False, raise_err=False, prepend_path=None, success_retcodes=None, **kwargs)

Execute the passed command and return the output as a string

**Parameters**

• **cmd**(str) -- The command to run. ex: ls -lart /home

• **cwd**(str) -- The directory from which to execute the command. Defaults to the home directory of the user specified by runas (or the user under which Salt is running if runas is not specified).
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

- **runas** (*str*) -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running.

  Warning: For versions 2018.3.3 and above on macosx while using runas, on linux while using run, to pass special characters to the command you need to escape the characters on the shell.

  Example:
  ```
  cmd.run('echo \\
  h="baz"\\n  ' runas=macuser
  ```

- **group** (*str*) -- Group to run command as. Not currently supported on Windows.

- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

- **shell** (*str*) -- Specify an alternate shell. Defaults to the system's default shell.

- **python_shell** (*bool*) -- If `False`, let python handle the positional arguments. Set to `True` to use shell features, such as pipes or redirection.

- **bg** (*bool*) -- If `True`, run command in background and do not await or deliver its results.

  New in version 2016.3.0.

- **env** (*dict*) -- Environment variables to be set prior to execution.

  Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

  ```
  salt myminion cmd.run 'some command'.env={!"FOO": "bar"}
  ```

- **clean_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.

- **prepend_path** (*str*) -- $PATH segment to prepend (trailing `:` not necessary) to $PATH.

  New in version 2018.3.0.

- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.

- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.

- **umask** (*str*) -- The umask (in octal) to use when running the command.

- **output_encoding** (*str*) -- Control the encoding used to decode the command’s output.

  Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.
To see the encoding Salt has detected from the system locale, check the `locale` line in the output of `test.versions_report`.

New in version 2018.3.0.

- **output_loglevel** (`str`) -- Control the log level at which the output from the command is logged to the minion log.
  
  **Note:** The command being run will still be logged at the `debug` log level regardless, unless `quiet` is used for this value.

- **ignore_retcode** (`bool`) -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.

- **hide_output** (`bool`) -- If `True`, suppress stdout and stderr in the return data.
  
  **Note:** This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

- **timeout** (`int`) -- A timeout in seconds for the executed process to return.

- **use_vt** (`bool`) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

- **encoded_cmd** (`bool`) -- Specify if the supplied command is encoded. Only applies to shell 'powershell'.

- **raise_err** (`bool`) -- If `True` and the command has a nonzero exit code, a CommandExecutionError exception will be raised.

**Warning:** This function does not process commands through a shell unless the python_shell flag is set to True. This means that any shell-specific functionality such as 'echo' or the use of pipes, redirection or &&, should either be migrated to cmd.shell or have the python_shell=True flag set here.

The use of python_shell=True means that the shell will accept _any_ input including potentially malicious commands such as 'good_command;rm -rf /'. Be absolutely certain that you have sanitized your input prior to using python_shell=True

**Parameters**

- **success_retcodes** (`list`) --
  
  This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

- **stdin_raw_newlines** (`bool`) --
If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

New in version 2019.2.0.

CLI Example:
```
salt '*' cmd.run "ls -l | awk '/foo/{print \$2}"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:
```
salt '*' cmd.run template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/{print \$2}"
```

Specify an alternate shell with the `shell` parameter:
```
salt '*' cmd.run "Get-ChildItem C:\ " shell='powershell'
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
```
salt '*' cmd.run "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

If an equal sign (`=`) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:
```
salt '*' cmd.run cmd='sed -e s/=/:/g'
```

salt.modules.cmdmod.run_all(cmd, cwd=None, stdin=None, runas=None, group=None, shell=None, python_shell=None, env=None, clean_env=False, template=None, rstrip=True, umask=None, output_encoding=None, output_loglevel='debug', log_callback=None, hide_output=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv='base', use_vt=False, redirect_stderr=False, password=None, encoded_cmd=False, prepend_path=None, success_retcodes=None, **kwargs)

Execute the passed command and return a dict of return data

Parameters

- **cmd** *(str)* -- The command to run. ex: `ls -lart /home`
- **cwd** *(str)* -- The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **stdin** *(str)* -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** *(str)* -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.
Warning: For versions 2018.3.3 and above on macOS while using runas, to pass special characters to the command you need to escape the characters on the shell.

Example:

```python
import cmd

runas = 'macuser'

runas = Runas(sys.argv[1], runas=runas)
```

- **password** *(str)* -- Windows only. Required when specifying runas. This parameter will be ignored on non-Windows platforms.
  
  New in version 2016.3.0.

- **group** *(str)* -- Group to run command as. Not currently supported on Windows.

- **shell** *(str)* -- Specify an alternate shell. Defaults to the system's default shell.

- **python_shell** *(bool)* -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.

- **env** *(dict)* -- Environment variables to be set prior to execution.

  Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```python
cmd.run_all('some command', env={'FOO': 'bar'})
```

- **clean_env** *(bool)* -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.

- **prepend_path** *(str)* -- $PATH segment to prepend (trailing ':' not necessary) to $PATH
  
  New in version 2018.3.0.

- **template** *(str)* -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.

- **rstrip** *(bool)* -- Strip all whitespace off the end of output before it is returned.

- **umask** *(str)* -- The umask (in octal) to use when running the command.

- **output_encoding** *(str)* -- Control the encoding used to decode the command's output.

  Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

  To see the encoding Salt has detected from the system locale, check the `locale` line in the output of `test.versions_report`.

  New in version 2018.3.0.

- **output_loglevel** *(str)* -- Control the loglevel at which the output from the command is logged to the minion log.
Note: The command being run will still be logged at the debug loglevel regardless, unless quiet is used for this value.

- **ignore_retcode** *(bool)* -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as True to skip logging the output if the command has a nonzero exit code.

- **hide_output** *(bool)* -- If True, suppress stdout and stderr in the return data.

Note: This is separate from output_loglevel, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

- **timeout** *(int)* -- A timeout in seconds for the executed process to return.

- **use_vt** *(bool)* -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

- **encoded_cmd** *(bool)* -- Specify if the supplied command is encoded. Only applies to shell ‘powershell’.

New in version 2018.3.0.

- **redirect_stderr** *(bool)* -- If set to True, then stderr will be redirected to stdout. This is helpful for cases where obtaining both the retcode and output is desired, but it is not desired to have the output separated into both stdout and stderr.

New in version 2015.8.2.

- **password** -- Windows only. Required when specifying runas. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.

- **bg** *(bool)* -- If True, run command in background and do not await or deliver its results

New in version 2016.3.6.

- **success_retcodes** *(list)* --

  This parameter will allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

- **stdin_raw_newlines** *(bool)* --

  False: If True, Salt will not automatically convert the characters \n present in the stdin value to newlines.

New in version 2019.2.0.

CLI Example:

```
salt '*' cmd.run_all "ls -l | awk '/foo/{print \$2}'"
```
The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```bash
salt '*' cmd.run_all template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/{print \ $2}"
```

A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input.

```bash
salt '*' cmd.run_all "grep f" stdin='one
two
three
four
five\n'
```

salt.modules.cmdmod.run_bg(cmd, cwd=None, runas=None, group=None, shell='/bin/sh',
python_shell=None, env=None, clean_env=False, template=None, umask=None, timeout=None, output_encoding=None, output_loglevel='debug', log_callback=None, reset_system_locale=True, ignore_retcode=False, saltenv='base', password=None, prepend_path=None, success_retcodes=None, **kwargs)

Execute the passed command in the background and return its PID.

**Note:** If the init system is systemd and the backgrounded task should run even if the salt-minion process is restarted, prepend `systemd-run --scope` to the command. This will reparent the process in its own scope separate from salt-minion, and will not be affected by restarting the minion service.

### Parameters

- **cmd** (str) -- The command to run. ex: `ls -lart /home`
- **cwd** (str) -- The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **group** (str) -- Group to run command as. Not currently supported on Windows.
- **shell** (str) -- Shell to execute under. Defaults to the system default shell.
- **output_encoding** (str) -- Control the encoding used to decode the command's output.

**Note:** This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the `locale` line in the output of `test.versions_report`.

New in version 2018.3.0.

- **output_loglevel** (str) -- Control the loglevel at which the output from the command is logged to the minion log.

**Note:** The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

- **ignore_retcode** (bool) -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log.
However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.

- **runas** *(str)* -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

  **Warning:** For versions 2018.3.3 and above on macOS while using `runas`, to pass special characters to the command you need to escape the characters on the shell.

  Example:

  ```python
  cmd.run_bg 'echo \'h="baz\'\!'\' runas=macuser
  ```

- **password** *(str)* -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

- **shell** -- Specify an alternate shell. Defaults to the system's default shell.

- **python_shell** *(bool)* -- If False, let python handle the positional arguments. Set to `True` to use shell features, such as pipes or redirection.

- **env** *(dict)* -- Environment variables to be set prior to execution.

  **Note:** When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

  ```python
  salt myminion cmd.run_bg 'some command' env=\'\"F00\": "bar\"\'
  ```

- **clean_env** *(bool)* -- Attempt to clean out all other shell environment variables and set only those provided in the `env` argument to this function.

- **prepend_path** *(str)* -- $PATH segment to prepend (trailing `:` not necessary) to $PATH

  New in version 2018.3.0.

- **template** *(str)* -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.

- **umask** *(str)* -- The umask (in octal) to use when running the command.

- **timeout** *(int)* -- A timeout in seconds for the executed process to return.

  **Warning:** This function does not process commands through a shell unless the `python_shell` argument is set to `True`. This means that any shell-specific functionality such as `echo` or the use of pipes, redirection or `&&`, should either be migrated to `cmd.shell` or have the `python_shell=True` flag set here.

  The use of `python_shell=True` means that the shell will accept _any_ input including potentially malicious commands such as `good_command;rm -rf /`. Be absolutely certain that you have sanitized your input prior to using `python_shell=True`.

**Parameters**

21.9. execution modules 1629
• **success_retcodes** *(list)* --

This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

• **stdin_raw_newlines** *(bool)* --

False If True, Salt will not automatically convert the characters `\n` present in the stdin value to newlines.

New in version 2019.2.0.

CLI Example:

```bash
salt '*' cmd.run_bg "fstrim-all"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```bash
salt '*' cmd.run_bg template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/{print \
\$2}'"
```

Specify an alternate shell with the shell parameter:

```bash
salt '*' cmd.run_bg "Get-ChildItem C:\ " shell='powershell'
```

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format key=val. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```bash
salt '*' cmd.run_bg cmd='ls -lR / | sed -e s/=/:/g > /tmp/dontwait'
```

salt.modules.cmdmod.run_chroot *(root, cmd, cwd=None, stdin=None, runas=None, group=None, shell="/bin/sh", python_shell=True, binds=None, env=None, clean_env=False, template=None, rstrip=True, umask=None, output_encoding=None, output_loglevel='quiet', log_callback=None, hide_output=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv='base', use_vt=False, bg=False, success_retcodes=None, **kwargs)*

New in version 2014.7.0.

This function runs `cmd.run_all` wrapped within a chroot, with dev and proc mounted in the chroot

Parameters

• **root** *(str)* -- Path to the root of the jail to use.

• **stdin** *(str)* -- A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input.

• **runas** *(str)* -- User to run script as.

• **group** *(str)* -- Group to run script as.

• **shell** *(str)* -- Shell to execute under. Defaults to the system default shell.

• **cmd** *(str)* -- The command to run. ex: `ls -lart /home`
Salt Documentation, Release 3001.1

• cwd (str) -- The directory from which to execute the command. Defaults to the home
directory of the user specified by runas (or the user under which Salt is running if runas
is not specified).
• runas -- Specify an alternate user to run the command. The default behavior is to run
as the user under which Salt is running. If running on a Windows minion you must also
use the password argument, and the target user account must be in the Administrators
group.
• shell -- Specify an alternate shell. Defaults to the system's default shell.
• python_shell (bool) -- If False, let python handle the positional arguments. Set to
True to use shell features, such as pipes or redirection.
• binds (list) -- List of directories that will be exported inside the chroot with the bind
option.
New in version 3000.
• env (dict) -- Environment variables to be set prior to execution.
Note: When passing environment variables on the CLI, they should be passed as the string
representation of a dictionary.
salt myminion cmd.run_chroot 'some command' env='{"FOO": "bar"}'

• clean_env (dict) -- Attempt to clean out all other shell environment variables and set
only those provided in the 'env' argument to this function.
• template (str) -- If this setting is applied then the named templating engine will be
used to render the downloaded file. Currently jinja, mako, and wempy are supported.
• rstrip (bool) -- Strip all whitespace off the end of output before it is returned.
• umask (str) -- The umask (in octal) to use when running the command.
• output_encoding (str) -- Control the encoding used to decode the command's output.
Note: This should not need to be used in most cases. By default, Salt will try to use the
encoding detected from the system locale, and will fall back to UTF-8 if this fails. This
should only need to be used in cases where the output of the command is encoded in
something other than the system locale or UTF-8.
To see the encoding Salt has detected from the system locale, check the locale line in the
output of test.versions_report.
New in version 2018.3.0.
• output_loglevel (str) -- Control the loglevel at which the output from the command
is logged to the minion log.
Note: The command being run will still be logged at the debug loglevel regardless, unless
quiet is used for this value.
• ignore_retcode (bool) -- If the exit code of the command is nonzero, this is treated
as an error condition, and the output from the command will be logged to the minion log.
However, there are some cases where programs use the return code for signaling and a
21.9. execution modules

1631


nonzero exit code doesn't necessarily mean failure. Pass this argument as True to skip 
logging the output if the command has a nonzero exit code.

- **hide_output (bool)** -- If True, suppress stdout and stderr in the return data.

---

**Note:** This is separate from output_loglevel, which only handles how Salt logs to 
the minion log.

New in version 2018.3.0.

- **timeout (int)** -- A timeout in seconds for the executed process to return.
- **use_vt (bool)** -- Use VT utils (saltstack) to stream the command output more interactively 
to the console and the logs. This is experimental.

**Parar stdin** A string of standard input can be specified for the command to be run using the 
stdin parameter. This can be useful in cases where sensitive information must be read from 
standard input.

**success_retcodes:** This parameter will be allow a list of 
non-zero return codes that should be considered a success. If the return code returned from the 
run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

CLI Example:

```
salt '*' cmd.run_chroot /var/lib/lxc/container_name/rootfs 'sh /tmp/bootstrap.sh'
```

salt.modules.cmdmod.run_stderr(cmd, cwd=None, stdin=None, runas=None, group=None, 
shell='/bin/sh', python_shell=None, env=None, clean_env=False, 
template=None, rstrip=True, umask=None, output_encoding=None, 
output_loglevel='debug', log_callback=None, 
hide_output=False, timeout=None, reset_system_locale=True, 
ignore_retcode=False, saltenv='base', use_vt=False, password=None, 
prepend_path=None, success_retcodes=None, **kwargs)

Execute a command and only return the standard error

**Parameters**

- **cmd (str)** -- The command to run. ex: ls -lart /home
- **cwd (str)** -- The directory from which to execute the command. Defaults to the home 
directory of the user specified by runas (or the user under which Salt is running if runas 
is not specified).
- **stdin (str)** -- A string of standard input can be specified for the command to be run 
using the stdin parameter. This can be useful in cases where sensitive information must 
be read from standard input.
- **runas (str)** -- Specify an alternate user to run the command. The default behavior is to 
run as the user under which Salt is running. If running on a Windows minion you must also 
use the password argument, and the target user account must be in the Administrators 
group.
Warning: For versions 2018.3.3 and above on macOS while using runas, to pass special characters to the command you need to escape the characters on the shell.

Example:
```
| cmd.run_stderr 'echo '\"h="baz\"'\" | runas=macuser |
```

- **password**(str) -- Windows only. Required when specifying runas. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

- **group**(str) -- Group to run command as. Not currently supported on Windows.

- **shell**(str) -- Specify an alternate shell. Defaults to the system's default shell.

- **python_shell**(bool) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.

- **env**(dict) -- Environment variables to be set prior to execution.

**Note:** When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.run_stderr 'some command' env='{"FOO": "bar"}'
```

- **clean_env**(bool) -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.

- **prepend_path**(str) -- $PATH segment to prepend (trailing ':' not necessary) to $PATH

  New in version 2018.3.0.

- **template**(str) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wenmpy are supported.

- **rstrip**(bool) -- Strip all whitespace off the end of output before it is returned.

- **umask**(str) -- The umask (in octal) to use when running the command.

- **output_encoding**(str) -- Control the encoding used to decode the command's output.

  **Note:** This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

  To see the encoding Salt has detected from the system locale, check the `locale` line in the output of `test.versions_report`.

  New in version 2018.3.0.

- **output_loglevel**(str) -- Control the loglevel at which the output from the command is logged to the minion log.
The command being run will still be logged at the debug log level regardless, unless quiet is used for this value.

- **ignore_retcode** *(bool)* -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as True to skip logging the output if the command has a nonzero exit code.

- **hide_output** *(bool)* -- If True, suppress stdout and stderr in the return data.

Note: This is separate from output_loglevel, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

- **timeout** *(int)* -- A timeout in seconds for the executed process to return.

- **use_vt** *(bool)* -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

- **success_retcodes** *(list)* -- This parameter will allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

- **stdin_raw_newlines** *(bool)* -- False If True, Salt will not automatically convert the characters \n present in the stdin value to newlines.

New in version 2019.2.0.

CLI Example:

```bash
salt '*' cmd.run_stderr "ls -l | awk '/foo/ {print $2}'"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```bash
salt '*' cmd.run_stderr template=jinja "ls -l /tmp/\{grains.id\} | awk '/foo/ \n\{print $2\}""
```

A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input.

```bash
salt '*' cmd.run_stderr "grep f stdin='one\ntwo\nthree\nfour\nfive\n'"
```
Execute a command, and only return the standard out

Parameters

- **cmd (str)** -- The command to run. ex: `ls -lart /home`
- **cwd (str)** -- The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **stdin (str)** -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas (str)** -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

```python
salt myminion cmd.run_stdout 'some command'
env={"FOO": "bar"}
```

- **password (str)** -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.

- **group (str)** -- Group to run command as. Not currently supported on Windows.
- **shell (str)** -- Specify an alternate shell. Defaults to the system's default shell.
- **python_shell (bool)** -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **env (dict)** -- Environment variables to be set prior to execution.

Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```python
salt myminion cmd.run_stdout 'some command' env={"FOO": "bar"}
```

- **clean_env (bool)** -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **prepend_path (str)** -- $PATH segment to prepend (trailing ':' not necessary) to $PATH

New in version 2018.3.0.

- **template (str)** -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **rstrip (bool)** -- Strip all whitespace off the end of output before it is returned.
- **umask (str)** -- The umask (in octal) to use when running the command.
• **output_encoding** *(str)* -- Control the encoding used to decode the command's output.

*Note:* This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the `locale` line in the output of `test.versions_report`.

New in version 2018.3.0.

• **output_loglevel** *(str)* -- Control the log level at which the output from the command is logged to the minion log.

*Note:* The command being run will still be logged at the `debug` log level regardless, unless `quiet` is used for this value.

• **ignore_retcode** *(bool)* -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.

• **hide_output** *(bool)* -- If `True`, suppress stdout and stderr in the return data.

*Note:* This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

• **timeout** *(int)* -- A timeout in seconds for the executed process to return.

• **use_vt** *(bool)* -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

• **success_retcodes** *(list)*

  This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

• **stdin_raw_newlines** *(bool)*

  False If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

New in version 2019.2.0.

CLI Example:

```
salt '*' cmd.run_stdout "ls -l | awk '/foo/{print \$2}'"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:
Salt Documentation, Release 3001.1

Salt Documentation, Release 3001.1

```
salt '*' cmd.run_stdout template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/ → (print \$2)'"
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

```
salt '*' cmd.run_stdout "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

salt.modules.cmdmod.script(source, args=None, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh', python_shell=None, env=None, template=None, umask=None, output_encoding=None, output_loglevel='debug', log_callback=None, hide_output=False, timeout=None, reset_system_locale=True, saltenv='base', use_vt=False, bg=False, password=None, success_retcodes=None, **kwargs)

Download a script from a remote location and execute the script locally. The script can be located on the salt master file server or on an HTTP/FTP server.

The script will be executed directly, so it can be written in any available programming language.

**Parameters**

- **source (str)** -- The location of the script to download. If the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs

- **args (str)** -- String of command line args to pass to the script. Only used if no args are specified as part of the `name` argument. To pass a string containing spaces in YAML, you will need to doubly-quote it:

  ```
salt myminion cmd.script salt://foo.sh "arg1 'arg two' arg3"
  ```

- **cwd (str)** -- The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).

- **stdin (str)** -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

- **runas (str)** -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

**Note:** For Window's users, specifically Server users, it may be necessary to specify your runas user using the User Logon Name instead of the legacy logon name. Traditionally, logons would be in the following format.

```
Domain/user
```

In the event this causes issues when executing scripts, use the UPN format which looks like the following.

```
user@domain.local
```

More information <https://github.com/saltstack/salt/issues/55080>

- **password (str)** -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

21.9. execution modules 1637
New in version 2016.3.0.

- **group** *(str)* -- Group to run script as. Not currently supported on Windows.
- **shell** *(str)* -- Specify an alternate shell. Defaults to the system's default shell.
- **python_shell** *(bool)* -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **bg** *(bool)* -- If True, run script in background and do not await or deliver its results
- **env** *(dict)* -- Environment variables to be set prior to execution.

**Note:** When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.script 'some command' env='{"FOO": "bar"}''
```

- **template** *(str)* -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **umask** *(str)* -- The umask (in octal) to use when running the command.
- **output_encoding** *(str)* -- Control the encoding used to decode the command’s output.

**Note:** This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the `locale` line in the output of `test.versions_report`.

New in version 2018.3.0.

- **output_loglevel** *(str)* -- Control the loglevel at which the output from the command is logged to the minion log.

**Note:** The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

- **ignore_retcode** *(bool)* -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.
- **hide_output** *(bool)* -- If True, suppress stdout and stderr in the return data.

**Note:** This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

New in version 2018.3.0.
• timeout (int) -- If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill

• use_vt (bool) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

• success_retcodes (list) --

  This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.

• stdin_raw_newlines (bool) --

  False If True, Salt will not automatically convert the characters \n present in the stdin value to newlines.

  New in version 2019.2.0.

CLI Example:

```
salt '*' cmd.script salt://scripts/runme.sh
salt '*' cmd.script salt://scripts/runme.sh 'arg1 arg2 "arg 3"'
salt '*' cmd.script salt://scripts/windows_task.ps1 args=' -Input c:\tmp\infile. →txt' shell='powershell'
salt '*' cmd.script salt://scripts/runme.sh stdin='one
two
three
four
five'
```

salt.modules.cmdmod.script_retcode(source, args=None, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh', python_shell=None, env=None, template='jinja', umask=None, timeout=None, reset_system_locale=True, saltenv='base', output_encoding=None, output_loglevel='debug', log_callback=None, use_vt=False, success_retcodes=None, **kwargs)

Download a script from a remote location and execute the script locally. The script can be located on the salt master file server or on an HTTP/FTP server.

The script will be executed directly, so it can be written in any available programming language.

The script can also be formatted as a template, the default is jinja.

Only evaluate the script return code and do not block for terminal output

Parameters

• source (str) -- The location of the script to download. If the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs

• args (str) -- String of command line args to pass to the script. Only used if no args are specified as part of the name argument. To pass a string containing spaces in YAML, you will need to doubly-quote it: "arg1 'arg two' arg3"

• cwd (str) -- The directory from which to execute the command. Defaults to the home directory of the user specified by runas (or the user under which Salt is running if runas is not specified).

• stdin (str) -- A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** *(str)* -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the **password** argument, and the target user account must be in the Administrators group.

- **password** *(str)* -- Windows only. Required when specifying **runas**. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

- **group** *(str)* -- Group to run script as. Not currently supported on Windows.

- **shell** *(str)* -- Specify an alternate shell. Defaults to the system's default shell.

- **python_shell** *(bool)* -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.

- **env** *(dict)* -- Environment variables to be set prior to execution.

  Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```python
salt myminion cmd.script_retcode 'some command' env={'"FOO": "bar"'}
```

- **template** *(str)* -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.

- **umask** *(str)* -- The umask (in octal) to use when running the command.

- **output_encoding** *(str)* -- Control the encoding used to decode the command's output.

  Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

  To see the encoding Salt has detected from the system locale, check the **locale** line in the output of `test.versions_report`.

  New in version 2018.3.0.

- **output_loglevel** *(str)* -- Control the loglevel at which the output from the command is logged to the minion log.

  Note: The command being run will still be logged at the **debug** loglevel regardless, unless **quiet** is used for this value.

- **ignore_retcode** *(bool)* -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as **True** to skip logging the output if the command has a nonzero exit code.

- **timeout** *(int)* -- If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill
• **use_vt** *(bool)* -- Use VT utils (saltstack) to stream the command output more interac-
vively to the console and the logs. This is experimental.

• **success_retcodes** *(list)* --

  This parameter will be allow a list of non-zero return codes that should be considered a
  success. If the return code returned from the run matches any in the provided list, the
  return code will be overridden with zero.

  New in version 2019.2.0.

• **stdin_raw_newlines** *(bool)* --

  False If True, Salt will not automatically convert the characters \n  present in the stdin
  value to newlines.

  New in version 2019.2.0.

CLI Example:

```
salt '*' cmd.script_retcode salt://scripts/runme.sh
salt '*' cmd.script_retcode salt://scripts/runme.sh 'arg1 arg2 "arg 3"'
```

A string of standard input can be specified for the command to be run using the stdin
parameter. This can be useful in cases where sensitive information must be read from standard input.

```
salt '*' cmd.script_retcode salt://scripts/runme.sh stdin='one
two
three
four

five'
```

salt.modules.cmdmod.shell *(cmd, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh',
  env=None, clean_env=False, template=None, rstrip=True, umask=None, output_encoding=None, output_loglevel='debug',
  log_callback=None, hide_output=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv='base',
  use_vt=False, bg=False, password=None, prepend_path=None, success_retcodes=None, **kwargs)*

Execute the passed command and return the output as a string.

New in version 2015.5.0.

Parameters

• **cmd** *(str)* -- The command to run. ex: ls -lart /home

• **cwd** *(str)* -- The directory from which to execute the command. Defaults to the home
directory of the user specified by runas (or the user under which Salt is running if runas
is not specified).

• **stdin** *(str)* -- A string of standard input can be specified for the command to be run
using the stdin parameter. This can be useful in cases where sensitive information must be
read from standard input.

• **runas** *(str)* -- Specify an alternate user to run the command. The default behavior is to
run as the user under which Salt is running. If running on a Windows minion you must also
use the password argument, and the target user account must be in the Administrators
group.

**Warning:** For versions 2018.3.3 and above on macosx while using runas, to pass special
characters to the command you need to escape the characters on the shell.
Example:
```
cmd.shell 'echo "h="baz""'
runas=macuser
```

- **group** (str) -- Group to run command as. Not currently supported on Windows.
- **password** (str) -- Windows only. Required when specifying runas. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.
- **shell** (int) -- Shell to execute under. Defaults to the system default shell.
- **bg** (bool) -- If True, run command in background and do not await or deliver its results
- **env** (dict) -- Environment variables to be set prior to execution.

  Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.shell 'some command' env={'"FOO": "bar"'}
```

- **clean_env** (bool) -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **prepend_path** (str) -- $PATH segment to prepend (trailing ':' not necessary) to $PATH

  New in version 2018.3.0.
- **template** (str) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **rstrip** (bool) -- Strip all whitespace off the end of output before it is returned.
- **umask** (str) -- The umask (in octal) to use when running the command.
- **output_encoding** (str) -- Control the encoding used to decode the command’s output.

  Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

  To see the encoding Salt has detected from the system locale, check the `locale` line in the output of `test.versions_report`.

  New in version 2018.3.0.
- **output_loglevel** (str) -- Control the loglevel at which the output from the command is logged to the minion log.

  Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

- **ignore_retcode** (bool) -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log.

  However, there are some cases where programs use the return code for signaling and a
nonzero exit code doesn't necessarily mean failure. Pass this argument as True to skip logging the output if the command has a nonzero exit code.

- **hide_output (bool)** -- If True, suppress stdout and stderr in the return data.

Note: This is separate from output_loglevel, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

- **timeout (int)** -- A timeout in seconds for the executed process to return.

- **use_vt (bool)** -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

**Warning:** This passes the cmd argument directly to the shell without any further processing! Be absolutely sure that you have properly sanitized the command passed to this function and do not use untrusted inputs.

Parameters

- **success_retcodes (list)** --

  This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.

- **stdin_raw_newlines (bool)** --

  False If True, Salt will not automatically convert the characters \n present in the stdin value to newlines.

  New in version 2019.2.0.

CLI Example:

```
salt '*' cmd.shell "ls -l | awk '/foo/{print \$2}''
```

The template arg can be set to ‘jinja’ or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.shell template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/{print \$2}''
```

Specify an alternate shell with the shell parameter:

```
salt '*' cmd.shell "Get-ChildItem C:\" shell='powershell'
```

A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input.

```
salt '*' cmd.shell "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format key=val. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:
salt modules.cmdmod.shell_info(shell, list_modules=False)

New in version 2016.11.0.

Provides information about a shell or script languages which often use #!. The values returned are dependent on the shell or scripting languages all return the installed, path, version, version_raw

Parameters

- shell(str) -- Name of the shell. Support shells/script languages include cmd, perl, php, powershell, python, ruby and zsh (bash,)
- list_modules(bool) -- True to list modules available to the shell.
- only lists powershell modules. (Currently)

Returns A dictionary of information about the shell

Return type dict

```
{
'version': '<2 or 3 numeric components dot-separated>',
'version_raw': '<full version string>',
'path': '<full path to binary>',
'installed': '<True, False or None>',
'<attribute>': '<attribute value>'
}
```

Note:

- installed is always returned, if None or False also returns error and may also return stdout for diagnostics.
- version is for use in determine if a shell/script language has a particular feature set, not for package management.
- The shell must be within the executable search path.

CLI Example:

```
salt '*' cmd.shell_info bash
salt '*' cmd.shell_info powershell
```

Codeauthor Damon Atkins <https://github.com/damon-atkins>

salt modules.cmdmod.shells()

Lists the valid shells on this system via the /etc/shells file

New in version 2015.5.0.

CLI Example:

```
salt '*' cmd.shells
```

salt modules.cmdmod.tty(device, echo="")

Echo a string to a specific tty

CLI Example:
salt.modules.cmdmod.which(cmd)
    Returns the path of an executable available on the minion, None otherwise
    CLI Example:
    ```
salt '*' cmd.which cat
    ```

salt.modules.cmdmod.which_bin(cmds)
    Returns the first command found in a list of commands
    CLI Example:
    ```
salt '*' cmd.which_bin '[pip2, pip, pip-python]'"'
    ```

21.9.92 salt.modules.composer

Use composer to install PHP dependencies for a directory

salt.modules.composer.did_composer_install(dir)
    Test to see if the vendor directory exists in this directory
    ```
dir Directory location of the composer.json file
    ```
    CLI Example:
    ```
salt '*' composer.did_composer_install /var/www/application
    ```

salt.modules.composer.install(directory, composer=None, php=None, runas=None, prefer_source=None, prefer_dist=None, no_scripts=None, no_plugins=None, optimize=None, no_dev=None, quiet=False, composer_home='/root', env=None)
    Install composer dependencies for a directory.
    If composer has not been installed globally making it available in the system PATH & making it executable, the composer and php parameters will need to be set to the location of the executables.
    ```
directory Directory location of the composer.json file.
composer Location of the composer.phar file. If not set composer will just execute "composer" as if it is installed globally. (i.e. /path/to/composer.phar)
php Location of the php executable to use with composer. (i.e. /usr/bin/php)
runas Which system user to run composer as.
prefer_source --prefer-source option of composer.
prefer_dist --prefer-dist option of composer.
no_scripts --no-scripts option of composer.
no_plugins --no-plugins option of composer.
optimize --optimize-autoloader option of composer. Recommended for production.
no_dev --no-dev option for composer. Recommended for production.
quiet --quiet option for composer. Whether or not to return output from composer.
**composer_home**  $COMPOSER_HOME environment variable

**env**  A list of environment variables to be set prior to execution.

CLI Example:

```bash
salt '*' composer.install /var/www/application
salt '*' composer.install /var/www/application
  --optimize=True
```

**salt.modules.composer.selfupdate** (composer=None, php=None, runas=None, quiet=False, composer_home='/root')

Update composer itself.

If composer has not been installed globally making it available in the system PATH & making it executable, the composer and php parameters will need to be set to the location of the executables.

**composer**  Location of the composer.phar file. If not set composer will just execute "composer" as if it is installed globally. (i.e. /path/to/composer.phar)

**php**  Location of the php executable to use with composer. (i.e. /usr/bin/php)

**runas**  Which system user to run composer as.

**quiet**  --quiet option for composer. Whether or not to return output from composer.

**composer_home**  $COMPOSER_HOME environment variable

CLI Example:

```bash
salt '*' composer.selfupdate
```

**salt.modules.composer.update** (directory, composer=None, php=None, runas=None, prefer_source=None, prefer_dist=None, no_scripts=None, no_plugins=None, optimize=None, no_dev=None, quiet=False, composer_home='/root', env=None)

Update composer dependencies for a directory.

If composer install has not yet been run, this runs composer install instead.

If composer has not been installed globally making it available in the system PATH & making it executable, the composer and php parameters will need to be set to the location of the executables.

**directory**  Directory location of the composer.json file.

**composer**  Location of the composer.phar file. If not set composer will just execute "composer" as if it is installed globally. (i.e. /path/to/composer.phar)

**php**  Location of the php executable to use with composer. (i.e. /usr/bin/php)

**runas**  Which system user to run composer as.

**prefer_source**  --prefer-source option of composer.

**prefer_dist**  --prefer-dist option of composer.

**no_scripts**  --no-scripts option of composer.

**no_plugins**  --no-plugins option of composer.

**optimize**  --optimize-autoloader option of composer. Recommended for production.

**no_dev**  --no-dev option for composer. Recommended for production.

**quiet**  --quiet option for composer. Whether or not to return output from composer.
**composer_home**  $COMPOSER_HOME environment variable

**env**  A list of environment variables to be set prior to execution.

CLI Example:

```bash
salt '*' composer.update /var/www/application
salt '*' composer.update /var/www/application
  no_dev=True
  optimize=True
```

### 21.9.93 salt.modules.config

Return config information

salt.modules.config.backup_mode(backup=")

Return the backup mode

CLI Example:

```bash
salt '*' config.backup_mode
```

salt.modules.config.dot_vals(value)

Pass in a configuration value that should be preceded by the module name and a dot, this will return a list of all read key/value pairs

CLI Example:

```bash
salt '*' config.dot_vals host
```

salt.modules.config.gather_bootstrap_script(bootstrap=None)

Download the salt-bootstrap script, and return its location

**bootstrap**  URL of alternate bootstrap script

CLI Example:

```bash
salt '*' config.gather_bootstrap_script
```

salt.modules.config.get(key, default="", delimiter=':', merge=None, omit_opts=False, omit_pillar=False, omit_master=False, omit_grains=False)

Attempt to retrieve the named value from the minion config file, pillar, grains or the master config. If the named value is not available, return the value specified by the `default` argument. If this argument is not specified, `default` falls back to an empty string.

Values can also be retrieved from nested dictionaries. Assume the below data structure:

```json
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the `apache` key, in the sub-dictionary corresponding to the `pkg` key, the following command can be used:

```bash
salt myminion config.get pkg:apache
```

The `:` (colon) is used to represent a nested dictionary level.

Changed in version 2015.5.0: The `delimiter` argument was added, to allow delimiters other than `:` to be used.

This function traverses these data stores in this order, returning the first match found:
Minion configuration
Minion’s grains
Minion’s pillar data

- Master configuration (requires pillar_opts to be set to True in Minion config file in order to work)

This means that if there is a value that is going to be the same for the majority of minions, it can be configured in the Master config file, and then overridden using the grains, pillar, or Minion config file.

Adding config options to the Master or Minion configuration file is easy:

```plaintext
my-config-option: value
cafe-menu:
  - egg and bacon
  - egg sausage and bacon
  - egg and spam
  - egg bacon and spam
  - egg bacon sausage and spam
  - spam bacon sausage and spam
  - spam egg spam spam bacon and spam
  - spam sausage spam spam bacon spam tomato and spam
```

**Note:** Minion configuration options built into Salt (like those defined [here](#)) will always be defined in the Minion configuration and thus cannot be overridden by grains or pillar data. However, additional (user-defined) configuration options (as in the above example) will not be in the Minion configuration by default and thus can be overridden using grains/pillar data by leaving the option out of the minion config file.

### Arguments

**delimiter** New in version 2015.5.0.

Override the delimiter used to separate nested levels of a data structure.

**merge** New in version 2015.5.0.

If passed, this parameter will change the behavior of the function so that, instead of traversing each data store above in order and returning the first match, the data stores are first merged together and then searched. The pillar data is merged into the master config data, then the grains are merged, followed by the Minion config data. The resulting data structure is then searched for a match. This allows for configurations to be more flexible.

**Note:** The merging described above does not mean that grain data will end up in the Minion’s pillar data, or pillar data will end up in the master config data, etc. The data is just combined for the purposes of searching an amalgam of the different data stores.

The supported merge strategies are as follows:

- **recurse** - If a key exists in both dictionaries, and the new value is not a dictionary, it is replaced. Otherwise, the sub-dictionaries are merged together into a single dictionary, recursively on down, following the same criteria. For example:

  ```python
  >>> dict1 = {'foo': {'bar': 1, 'qux': True},
             'hosts': ['a', 'b', 'c'],
             'only_x': None}
  >>> dict2 = {'foo': {'baz': 2, 'qux': False},
  (continues on next page)""
The dictionaries `dict1` and `dict2` are merged in the following example:

```python
>>> dict1 = {'foo': {'bar': 1, 'qux': True},
            'hosts': ['a', 'b', 'c'],
            'only_x': None}
>>> dict2 = {'foo': {'baz': 2, 'qux': False},
            'hosts': ['d', 'e', 'f'],
            'only_y': None}
>>> merged = {'foo': {'baz': 2, 'qux': False},
            'hosts': ['d', 'e', 'f'],
            'only_dict1': None,
            'only_dict2': None}
```

- **overwrite** - If a key exists in the top level of both dictionaries, the new value completely overwrites the old. For example:

```python
>>> dict1 = {'foo': {'bar': 1, 'qux': True},
            'hosts': ['a', 'b', 'c'],
            'only_x': None}
>>> dict2 = {'foo': {'baz': 2, 'qux': False},
            'hosts': ['d', 'e', 'f'],
            'only_y': None}
>>> merged = {'foo': {'baz': 2, 'qux': False},
            'hosts': ['d', 'e', 'f'],
            'only_dict1': None,
            'only_dict2': None}
```

**CLI Example:**
```
salt '*' config.get pkg:apache
salt '*' config.get lxc.container_profile:centos merge=recurse
```

**salt.modules.config.items()**

Return the complete config from the currently running minion process. This includes defaults for values not set in the config file.

**CLI Example:**
```
salt '*' config.items
```

**salt.modules.config.manage_mode(mode)**

Return a mode value, normalized to a string

**CLI Example:**
```
salt '*' config.manage_mode
```

**salt.modules.config.merge(value, default='', omit_opts=False, omit_master=False, omit_pillar=False)**

Retrieves an option based on key, merging all matches.

Same as `option()` except that it merges all matches, rather than taking the first match.

**CLI Example:**
```
salt '*' config.merge schedule
```

**salt.modules.config.option(value, default=None, omit_opts=False, omit_grains=False, omit_pillar=False, omit_master=False, omit_all=False, wildcard=False)**

Returns the setting for the specified config value. The priority for matches is the same as in `config.get`, only this function does not recurse into nested data structures. Another difference between this function and `config.get` is that it comes with a set of "sane defaults". To view these, you can run the following command:
**default**
The default value if no match is found. If not specified, then the fallback default will be an empty string, unless `wildcard=True`, in which case the return will be an empty dictionary.

**omit_opts** [False] Pass as `True` to exclude matches from the minion configuration file

**omit_grains** [False] Pass as `True` to exclude matches from the grains

**omit_pillar** [False] Pass as `True` to exclude matches from the pillar data

**omit_master** [False] Pass as `True` to exclude matches from the master configuration file

**omit_all** [True] Shorthand to omit all of the above and return matches only from the "sane defaults".

New in version 3000.

**wildcard** [False] If used, this will perform pattern matching on keys. Note that this will also significantly change the return data. Instead of only a value being returned, a dictionary mapping the matched keys to their values is returned. For example, using `wildcard=True` with a key of `foo.bar` could return a dictionary like so:

```
{'foo.bar': True, 'foo.baz': False}
```

New in version 3000.

**CLI Example:**

```bash
salt '*' config.option redis.host
```

**salt.modules.config.valid_fileproto(uri)**

Returns a boolean value based on whether or not the URI passed has a valid remote file protocol designation

**CLI Example:**

```bash
salt '*' config.valid_fileproto salt://path/to/file
```

### 21.9.94 salt.modules.consul

Interact with Consul

[https://www.consul.io](https://www.consul.io)

**salt.modules.consul.acl_clone(consul_url=None, token=None, **kwargs)**

Information about an ACL token.

**Parameters**

- `consul_url` -- The Consul server URL.
- `id` -- Unique identifier for the ACL to update.

**Returns** Boolean, message of success or failure, and new ID of cloned ACL.

**CLI Example:**

```bash
salt '*' consul.acl_info id='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'
```

**salt.modules.consul.acl_create(consul_url=None, token=None, **kwargs)**

Create a new ACL token.
Parameters

- **consul_url** -- The Consul server URL.
- **name** -- Meaningful indicator of the ACL’s purpose.
- **type** -- Type is either client or management. A management token is comparable to a root user and has the ability to perform any action including creating, modifying, and deleting ACLs.
- **rules** -- The Consul server URL.

Returns Boolean & message of success or failure.

CLI Example:
```
salt '*' consul.acl_create
```

`salt.modules.consul.acl_delete`(consul_url=None, token=None, **kwargs)
Delete an ACL token.

Parameters

- **consul_url** -- The Consul server URL.
- **id** -- Unique identifier for the ACL to update.

Returns Boolean & message of success or failure.

CLI Example:
```
salt '*' consul.acl_delete id='c1c4d223-91cb-3d1f-1ee8-f2af9e76716'
```

`salt.modules.consul.acl_info`(consul_url=None, **kwargs)
Information about an ACL token.

Parameters

- **consul_url** -- The Consul server URL.
- **id** -- Unique identifier for the ACL to update.

Returns Information about the ACL requested.

CLI Example:
```
salt '*' consul.acl_info id='c1c4d223-91cb-3d1f-1ee8-f2af9e76716'
```

`salt.modules.consul.acl_list`(consul_url=None, token=None, **kwargs)
List the ACL tokens.

Parameters **consul_url** -- The Consul server URL.

Returns List of ACLs

CLI Example:
```
salt '*' consul.acl_list
```

`salt.modules.consul.acl_update`(consul_url=None, token=None, **kwargs)
Update an ACL token.

Parameters

- **consul_url** -- The Consul server URL.
- **name** -- Meaningful indicator of the ACL's purpose.
- **id** -- Unique identifier for the ACL to update.
- **type** -- Type is either client or management. A management token is comparable to a root user and has the ability to perform any action including creating, modifying, and deleting ACLs.
- **rules** -- The Consul server URL.

**Returns**  Boolean & message of success or failure.

**CLI Example:**
```bash
salt '*' consul.acl_update
```

```python
salt.modules.consul.agent_check_deregister(consul_url=None, token=None, checkid=None)
```

The agent will take care of deregistering the check from the Catalog.

**Parameters**
- **consul_url** -- The Consul server URL.
- **checkid** -- The ID of the check to deregister from Consul.

**Returns**  Boolean and message indicating success or failure.

**CLI Example:**
```bash
salt '*' consul.agent_check_deregister checkid='Memory Utilization'
```

```python
salt.modules.consul.agent_check_fail(consul_url=None, token=None, checkid=None, **kwargs)
```

This endpoint is used with a check that is of the TTL type. When this is called, the status of the check is set to critical and the TTL clock is reset.

**Parameters**
- **consul_url** -- The Consul server URL.
- **checkid** -- The ID of the check to deregister from Consul.
- **note** -- A human-readable message with the status of the check.

**Returns**  Boolean and message indicating success or failure.

**CLI Example:**
```bash
salt '*' consul.agent_check_fail checkid='redis_check1' note='Forcing check into critical state.'
```

```python
salt.modules.consul.agent_check_pass(consul_url=None, token=None, checkid=None, **kwargs)
```

This endpoint is used with a check that is of the TTL type. When this is called, the status of the check is set to passing and the TTL clock is reset.

**Parameters**
- **consul_url** -- The Consul server URL.
- **checkid** -- The ID of the check to mark as passing.
- **note** -- A human-readable message with the status of the check.

**Returns**  Boolean and message indicating success or failure.
CLI Example:

```bash
salt '*' consul.agent_check_pass checkid='redis_check1' note='Forcing check into passing state.'
```

```python
salt.modules.consul.agent_check_register(consul_url=None, token=None, **kwargs)
```

The register endpoint is used to add a new check to the local agent.

**Parameters**

- `consul_url` -- The Consul server URL.
- `name` -- The description of what the check is for.
- `id` -- The unique name to use for the check, if not provided 'name' is used.
- `notes` -- Human readable description of the check.
- `script` -- If script is provided, the check type is a script, and Consul will evaluate that script based on the interval parameter.
- `http` -- Check will perform an HTTP GET request against the value of HTTP (expected to be a URL) based on the interval parameter.
- `ttl` -- If a TTL type is used, then the TTL update endpoint must be used periodically to update the state of the check.
- `interval` -- Interval at which the check should run.

**Returns** Boolean and message indicating success or failure.

CLI Example:

```bash
salt '*' consul.agent_check_register name='Memory Utilization' script='/usr/local/bin/check_mem.py' interval='15s'
```

```python
salt.modules.consul.agent_check_warn(consul_url=None, token=None, checkid=None, **kwargs)
```

This endpoint is used with a check that is of the TTL type. When this is called, the status of the check is set to warning and the TTL clock is reset.

**Parameters**

- `consul_url` -- The Consul server URL.
- `checkid` -- The ID of the check to deregister from Consul.
- `note` -- A human-readable message with the status of the check.

**Returns** Boolean and message indicating success or failure.

CLI Example:

```bash
salt '*' consul.agent_check_warn checkid='redis_check1' note='Forcing check into warning state.'
```

```python
salt.modules.consul.agent_checks(consul_url=None, token=None)
```

Returns the checks the local agent is managing

**Parameters**

- `consul_url` -- The Consul server URL.

**Returns** Returns the checks the local agent is managing

CLI Example:
The `salt.modules.consul.agent_join` function triggers the local agent to join a node.

**Parameters**

- `consul_url` -- The Consul server URL.
- `address` -- The address for the agent to connect to.
- `wan` -- Causes the agent to attempt to join using the WAN pool.

**Returns** Boolean and message indicating success or failure.

**CLI Example:**

```bash
salt '*' consul.agent_join address='192.168.1.1'
```

The `salt.modules.consul.agent_leave` function is used to instruct the agent to force a node into the left state.

**Parameters**

- `consul_url` -- The Consul server URL.
- `node` -- The node the agent will force into left state.

**Returns** Boolean and message indicating success or failure.

**CLI Example:**

```bash
salt '*' consul.agent_leave node='web1.example.com'
```

The `salt.modules.consul.agent_maintenance` function manages node maintenance mode.

**Parameters**

- `consul_url` -- The Consul server URL.
- `enable` -- The enable flag is required. Acceptable values are either true (to enter maintenance mode) or false (to resume normal operation).
- `reason` -- If provided, its value should be a text string explaining the reason for placing the node into maintenance mode.

**Returns** Boolean and message indicating success or failure.

**CLI Example:**

```bash
salt '*' consul.agent_maintenance enable='False' reason='Upgrade in progress'
```

The `salt.modules.consul.agent_members` function returns the members as seen by the local serf agent.

**Parameters**

- `consul_url` -- The Consul server URL.

**Returns** Returns the members as seen by the local serf agent.

**CLI Example:**

```bash
salt '*' consul.agent_members
```
salt.modules.consul.agent_self(consul_url=None, token=None)

Returns the local node configuration

Parameters consul_url -- The Consul server URL.

Returns Returns the local node configuration

CLI Example:

```
salt '*' consul.agent_self
```

salt.modules.consul.agent_service_deregister(consul_url=None, token=None, serviceid=None)

Used to remove a service.

Parameters

- consul_url -- The Consul server URL.
- serviceid -- A serviceid describing the service.

Returns Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_service_deregister serviceid='redis'
```

salt.modules.consul.agent_service_maintenance(consul_url=None, token=None, serviceid=None, **kwargs)

Used to place a service into maintenance mode.

Parameters

- consul_url -- The Consul server URL.
- serviceid -- A name of the service.
- enable -- Whether the service should be enabled or disabled.
- reason -- A human readable message of why the service was enabled or disabled.

Returns Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_service_maintenance serviceid='redis' enable='True' reason='Down for upgrade'
```

salt.modules.consul.agent_service_register(consul_url=None, token=None, **kwargs)

The used to add a new service, with an optional health check, to the local agent.

Parameters

- consul_url -- The Consul server URL.
- name -- A name describing the service.
- address -- The address used by the service, defaults to the address of the agent.
- port -- The port used by the service.
- id -- Unique ID to identify the service, if not provided the value of the name parameter is used.
- tags -- Identifying tags for service, string or list.
• **script** -- If script is provided, the check type is a script, and Consul will evaluate that script based on the interval parameter.

• **http** -- Check will perform an HTTP GET request against the value of HTTP (expected to be a URL) based on the interval parameter.

• **check_ttl** -- If a TTL type is used, then the TTL update endpoint must be used periodically to update the state of the check.

• **check_interval** -- Interval at which the check should run.

**Returns**  Boolean and message indicating success or failure.

CLI Example:

```yaml
salt '*' consul.agent_service_register name='redis' tags='["master", "v1"]' address='127.0.0.1' port='8080' check_script='/usr/local/bin/check_redis.py' interval='10s'
```

salt.modules.consul.agent_services(consul_url=None, token=None)

Returns the services the local agent is managing

**Parameters**

- **consul_url** -- The Consul server URL.

**Returns**  Returns the services the local agent is managing

CLI Example:

```yaml
salt '*' consul.agent_services
```

salt.modules.consul.catalog_datacenters(consul_url=None, token=None)

Return list of available datacenters from catalog.

**Parameters**

- **consul_url** -- The Consul server URL.

**Returns**  The list of available datacenters.

CLI Example:

```yaml
salt '*' consul.catalog_datacenters
```

salt.modules.consul.catalog_deregister(consul_url=None, token=None, **kwargs)

Deregisters a node, service, or check

**Parameters**

- **consul_url** -- The Consul server URL.

- **node** -- The node to deregister.

- **datacenter** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

- **checkid** -- The ID of the health check to deregister.

- **serviceid** -- The ID of the service to deregister.

**Returns**  Boolean & message of success or failure.

CLI Example:

```yaml
salt '*' consul.catalog_register node='node1' serviceid='redis_server1' checkid='redis_check1'
```
salt.modules.consul.catalog_node

Information about the registered node.

**Parameters**

- **consul_url** -- The Consul server URL.
- **node** -- The node to request information about.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

**Returns** Information about the requested node.

CLI Example:

```
salt '*' consul.catalog_service service='redis'
```

salt.modules.consul.catalog_nodes

Return list of available nodes from catalog.

**Parameters**

- **consul_url** -- The Consul server URL.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

**Returns** The list of available nodes.

CLI Example:

```
salt '*' consul.catalog_nodes
```

salt.modules.consul.catalog_register

Registers a new node, service, or check

**Parameters**

- **consul_url** -- The Consul server URL.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.
- **node** -- The node to register.
- **address** -- The address of the node.
- **service** -- The service that will be registered.
- **service_address** -- The address that the service listens on.
- **service_port** -- The port for the service.
- **service_id** -- A unique identifier for the service, if this is not provided "name" will be used.
- **service_tags** -- Any tags associated with the service.
- **check** -- The name of the health check to register
- **check_status** -- The initial status of the check, must be one of unknown, passing, warning, or critical.
- **check_service** -- The service that the check is performed against.
- **check_id** -- Unique identifier for the service.
check_notes -- An opaque field that is meant to hold human-readable text.

Returns Boolean & message of success or failure.

CLI Example:
```
salt '*' consul.catalog_register node='node1' address='192.168.1.1' service='redis' 
   service_address='127.0.0.1' service_port='8080' service_id='redis_server1'
```

```
salt.modules.consul.catalog_service(consul_url=None, token=None, service=None, **kwargs)
```

Information about the registered service.

Parameters

- consul_url -- The Consul server URL.
- dc -- By default, the datacenter of the agent is queried; however, the dc can be provided
  using the "dc" parameter.
- tag -- Filter returned services with tag parameter.

Returns Information about the requested service.

CLI Example:
```
salt '*' consul.catalog_service service='redis'
```

```
salt.modules.consul.catalog_services(consul_url=None, token=None, **kwargs)
```

Return list of available services rom catalog.

Parameters

- consul_url -- The Consul server URL.
- dc -- By default, the datacenter of the agent is queried; however, the dc can be provided
  using the "dc" parameter.

Returns The list of available services.

CLI Example:
```
salt '*' consul.catalog_services
```

```
salt.modules.consul.delete(consul_url=None, token=None, key=None, **kwargs)
```

Delete values from Consul

Parameters

- consul_url -- The Consul server URL.
- key -- The key to use as the starting point for the list.
- recurse -- Delete values recursively beginning at the value of key.
- cas -- This flag is used to turn the DELETE into a Check-And-Set operation.

Returns Boolean & message of success or failure.

CLI Example:
```
salt '*' consul.delete key='web'
salt '*' consul.delete key='web' recurse='True'
```

```
salt.modules.consul.event_fire(consul_url=None, token=None, name=None, **kwargs)
```

List the ACL tokens.
Parameters

- **consul_url** -- The Consul server URL.
- **name** -- The name of the event to fire.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.
- **node** -- Filter by node name.
- **service** -- Filter by service name.
- **tag** -- Filter by tag name.

Returns List of ACLs

CLI Example:

```
salt '*' consul.event_fire name='deploy'
```

salt.modules.consul.event_list

List the recent events.

Parameters

- **consul_url** -- The Consul server URL.
- **name** -- The name of the event to fire.

Returns List of ACLs

CLI Example:

```
salt '*' consul.event_list
```

salt.modules.consul.get

Get key from Consul

Parameters

- **consul_url** -- The Consul server URL.
- **key** -- The key to use as the starting point for the list.
- **recurse** -- Return values recursively beginning at the value of key.
- **decode** -- By default values are stored as Base64 encoded values, decode will return the whole key with the value decoded.
- **raw** -- Simply return the decoded value of the key.

Returns The keys in Consul.

CLI Example:

```
salt '*' consul.get key='web/key1'
salt '*' consul.get key='web' recurse=True
salt '*' consul.get key='web' recurse=True decode=True
```

By default values stored in Consul are base64 encoded, passing the decode option will show them as the decoded values.

```
salt '*' consul.get key='web' recurse=True decode=True raw=True
```
By default Consult will return other information about the key, the raw option will return only the raw value.

```python
salt.modules.consul.health_checks(consul_url=None, token=None, service=None, **kwargs)
```

Health information about the registered service.

**Parameters**

- **consul_url** -- The Consul server URL.
- **service** -- The service to request health information about.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

**Returns** Health information about the requested node.

**CLI Example:**

```
salt '*' consul.health_checks service='redis1'
```

```python
salt.modules.consul.health_node(consul_url=None, token=None, node=None, **kwargs)
```

Health information about the registered node.

**Parameters**

- **consul_url** -- The Consul server URL.
- **node** -- The node to request health information about.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

**Returns** Health information about the requested node.

**CLI Example:**

```
salt '*' consul.health_node node='node1'
```

```python
salt.modules.consul.health_service(consul_url=None, token=None, service=None, **kwargs)
```

Health information about the registered service.

**Parameters**

- **consul_url** -- The Consul server URL.
- **service** -- The service to request health information about.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.
- **tag** -- Filter returned services with tag parameter.
- **passing** -- Filter results to only nodes with all checks in the passing state.

**Returns** Health information about the requested node.

**CLI Example:**

```
salt '*' consul.health_service service='redis1'
salt '*' consul.health_service service='redis1' passing='True'
```

```python
salt.modules.consul.health_state(consul_url=None, token=None, state=None, **kwargs)
```

Returns the checks in the state provided on the path.

**Parameters**
Salt Documentation, Release 3001.1

- **consul_url** -- The Consul server URL.
- **state** -- The state to show checks for. The supported states are any, unknown, passing, warning, or critical. The any state is a wildcard that can be used to return all checks.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

**Returns** The checks in the provided state.

CLI Example:

```
salt '*' consul.health_state state='redis1'
salt '*' consul.health_state service='redis1' passing='True'
```

**salt.modules.consul.list_** (consul_url=None, token=None, key=None, **kwargs)
List keys in Consul

**Parameters**

- **consul_url** -- The Consul server URL.
- **key** -- The key to use as the starting point for the list.

**Returns** The list of keys.

CLI Example:

```
salt '*' consul.list
salt '*' consul.list key='web'
```

**salt.modules.consul.put** (consul_url=None, token=None, key=None, value=None, **kwargs)
Put values into Consul

**Parameters**

- **consul_url** -- The Consul server URL.
- **key** -- The key to use as the starting point for the list.
- **value** -- The value to set the key to.
- **flags** -- This can be used to specify an unsigned value between 0 and 2^64-1. Clients can choose to use this however makes sense for their application.
- **cas** -- This flag is used to turn the PUT into a Check-And-Set operation.
- **acquire** -- This flag is used to turn the PUT into a lock acquisition operation.
- **release** -- This flag is used to turn the PUT into a lock release operation.

**Returns** Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.put key='web/key1' value="Hello there"
salt '*' consul.put key='web/key1' value="Hello there" acquire='d5d371f4-c380-4280-12fd-8810be175592'
salt '*' consul.put key='web/key1' value="Hello there" release='d5d371f4-c380-4280-12fd-8810be175592'
```
salt.modules.consul.session_create

Used to create a session.

Parameters

- **consul_url** -- The Consul server URL.
- **lockdelay** -- Duration string using a "s" suffix for seconds. The default is 15s.
- **node** -- Must refer to a node that is already registered, if specified. By default, the agent's own node name is used.
- **name** -- A human-readable name for the session
- **checks** -- A list of associated health checks. It is highly recommended that, if you override this list, you include the default "serfHealth".
- **behavior** -- Can be set to either release or delete. This controls the behavior when a session is invalidated. By default, this is release, causing any locks that are held to be released. Changing this to delete causes any locks that are held to be deleted. delete is useful for creating ephemeral key/value entries.
- **ttl** -- Session is invalidated if it is not renewed before the TTL expires

Returns Boolean and message indicating success or failure.

CLI Example:

```bash
salt '*' consul.session_create node='node1' name='my-session' behavior='delete'
→ ttl='3600s'
```

salt.modules.consul.session_destroy

Destroy session

Parameters

- **consul_url** -- The Consul server URL.
- **session** -- The ID of the session to destroy.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

Returns Boolean & message of success or failure.

CLI Example:

```bash
salt '*' consul.session_destroy session='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'
```

salt.modules.consul.session_info

Information about a session

Parameters

- **consul_url** -- The Consul server URL.
- **session** -- The ID of the session to return information about.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

Returns Boolean & message of success or failure.

CLI Example:
salt modules consul session_list(consul_url=None, token=None, return_list=False, **kwargs)

Used to list sessions.

Parameters

- **consul_url** -- The Consul server URL.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.
- **return_list** -- By default, all information about the sessions is returned, using the return_list parameter will return a list of session IDs.

Returns  A list of all available sessions.

CLI Example:

```bash
salt '*' consul.session_list
```

salt modules consul status_leader(consul_url=None, token=None)

Returns the current Raft leader

Parameters  **consul_url** -- The Consul server URL.

Returns  The address of the Raft leader.

CLI Example:

```bash
salt '*' consul.status_leader
```

salt modules consul status_peers(consul_url, token=None)

Returns the current Raft peer set

Parameters  **consul_url** -- The Consul server URL.

Returns  Retrieves the Raft peers for the datacenter in which the agent is running.

CLI Example:

```bash
salt '*' consul.status_peers
```

21.9.95 salt modules container_resource

Common resources for LXC and systemd-nspawn containers

New in version 2015.8.0.

These functions are not designed to be called directly, but instead from the lxc, nspawn, and docker execution modules. They provide for common logic to be re-used for common actions.

salt modules container_resource cache_file(source)

Wrapper for cp.cache_file which raises an error if the file was unable to be cached.

CLI Example:

```bash
salt myminion container_resource.cache_file salt://foo/bar/baz.txt
```
salt.modules.container_resource.copy_to(name, source, dest, container_type=None, path=None, exec_driver=None, overwrite=False, makedirs=False)

Common logic for copying files to containers

path  path to the container parent (for LXC only) default: /var/lib/lxc (system default)

CLI Example:
salt myminion container_resource.copy_to mycontainer /local/file/path /container/
  → file/path container_type=docker exec_driver=nsenter

salt.modules.container_resource.run(name, cmd, container_type=None, exec_driver=None, output=None, no_start=False, stdin=None, python_shell=True, output_loglevel='debug', ignore_retcode=False, path=None, use_vt=False, keep_env=None)

Common logic for running shell commands in containers

path  path to the container parent (for LXC only) default: /var/lib/lxc (system default)

CLI Example:
salt myminion container_resource.run mycontainer 'ps aux' container_type=docker
  → exec_driver=nsenter output=stdout

21.9.96 salt.modules.cp

Minion side functions for salt-cp

salt.modules.cp.cache_dest(url, saltenv='base')

New in version Neon.

Returns the expected cache path for the file, if cached using cp.cache_file.

Note: This only returns the _expected_ path, it does not tell you if the URL is really cached. To check if the URL is cached, use cp.is_cached instead.

CLI Examples:
salt '*' cp.cache_dest https://foo.com/bar.rpm
salt '*' cp.cache_dest salt://my/file
salt '*' cp.cache_dest salt://my/file saltenv=dev

salt.modules.cp.cache_dir(path, saltenv='base', include_empty=False, include_pat=None, exclude_pat=None)

Download and cache everything under a directory from the master

include_pat  [None] Glob or regex to narrow down the files cached from the given path. If matching with a regex, the regex must be prefixed with E@, otherwise the expression will be interpreted as a glob.

New in version 2014.7.0.

exclude_pat  [None] Glob or regex to exclude certain files from being cached from the given path. If matching with a regex, the regex must be prefixed with E@, otherwise the expression will be interpreted as a glob.
Note: If used with `include_pat`, files matching this pattern will be excluded from the subset of files defined by `include_pat`.

New in version 2014.7.0.

CLI Examples:

```bash
cmd '*' cp.cache_dir salt://path/to/dir
cmd '*' cp.cache_dir salt://path/to/dir include_pat='E@*.py$'
```

**salt.modules.cp.cache_file** *(path, saltenv='base', source_hash=None)*

Used to cache a single file on the Minion.

- **source_hash** If `name` is an http(s) or ftp URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the file if the cached copy matches the specified hash.

New in version 2018.3.0.

CLI Example:

```bash
cmd '*' cp.cache_file salt://path/to/file
```

There are two ways of defining the fileserver environment (a.k.a. `saltenv`) from which to cache the file.

One is to use the `saltenv` parameter, and the other is to use a querystring syntax in the `salt://` URL. The below two examples are equivalent:

```bash
cmd '*' cp.cache_file salt://foo/bar.conf saltenv=config
cmd '*' cp.cache_file salt://foo/bar.conf?saltenv=config
```

If the path being cached is a `salt://` URL and the path does not exist, then `False` will be returned.

*Note*: It may be necessary to quote the URL when using the querystring method, depending on the shell being used to run the command.

**salt.modules.cp.cache_files** *(paths, saltenv='base')*

Used to gather many files from the Master, the gathered files will be saved in the minion cachedir reflective to the paths retrieved from the Master.

CLI Example:

```bash
cmd '*' cp.cache_files salt://path/to/file1, salt://path/to/file1
```

There are two ways of defining the fileserver environment (a.k.a. `saltenv`) from which to cache the files.

One is to use the `saltenv` parameter, and the other is to use a querystring syntax in the `salt://` URL. The below two examples are equivalent:

```bash
cmd '*' cp.cache_files salt://foo/bar.conf, salt://foo/baz.conf saltenv=config
```

The querystring method is less useful when all files are being cached from the same environment, but is a good way of caching files from multiple different environments in the same command. For example, the below command will cache the first file from the `config1` environment, and the second one from the `config2` environment.
salt ' '*' cp.cache_files salt://foo/bar.conf?saltenv=config1,salt://foo/bar.conf?saltenv=config2

Note: It may be necessary to quote the URL when using the querystring method, depending on the shell being used to run the command.

salt.modules.cp.cache_local_file(path)
Cache a local file on the minion in the localfiles cache
CLI Example:
salt ' '*' cp.cache_local_file /etc/hosts

salt.modules.cp.cache_master(saltenv='base')
Retrieve all of the files on the master and cache them locally
CLI Example:
salt ' '*' cp.cache_master

salt.modules.cp.envs()
List available environments for fileserver
CLI Example:
salt ' '*' cp.envs

salt.modules.cp.get_dir(path, dest, saltenv='base', makedirs=False, template=None, gzip=None, **kwargs)
Used to recursively copy a directory from the salt master
CLI Example:
salt ' '*' cp.get_dir salt://path/to/dir/ /minion/dest

get_dir supports the same template and gzip arguments as get_file.

salt.modules.cp.get_file(path, dest, saltenv='base', makedirs=False, template=None, gzip=None, **kwargs)
Changed in version 2018.3.0: dest can now be a directory
Used to get a single file from the salt master
CLI Example:
salt ' '*' cp.get_file salt://path/to/file /minion/dest

Template rendering can be enabled on both the source and destination file names like so:
salt ' '*' cp.get_file "salt://{{grains.os}}/vimrc" /etc/vimrc template=jinja

This example would instruct all Salt minions to download the vimrc from a directory with the same name as their os grain and copy it to /etc/vimrc

For larger files, the cp.get_file module also supports gzip compression. Because gzip is CPU-intensive, this should only be used in scenarios where the compression ratio is very high (e.g. pretty-printed JSON or YAML files).

Use the gzip named argument to enable it. Valid values are 1..9, where 1 is the lightest compression and 9 the heaviest. 1 uses the least CPU on the master (and minion), 9 uses the most.
There are two ways of defining the fileserver environment (a.k.a. `saltenv`) from which to retrieve the file. One is to use the `saltenv` parameter, and the other is to use a querystring syntax in the `salt://` URL. The below two examples are equivalent:

```bash
salt '*' cp.get_file salt://foo/bar.conf /etc/foo/bar.conf
salt '*' cp.get_file salt://foo/bar.conf?saltenv=config /etc/foo/bar.conf
```

**Note:** It may be necessary to quote the URL when using the querystring method, depending on the shell being used to run the command.

**salt.modules.cp.get_file_str** *(path, saltenv='base')*

Download a file from a URL to the Minion cache directory and return the contents of that file.

Returns `False` if Salt was unable to cache a file from a URL.

CLI Example:

```bash
salt '*' cp.get_file_str salt://my/file
```

**salt.modules.cp.get_template** *(path, dest, template='jinja', saltenv='base', makedirs=False, **kwargs)*

Render a file as a template before setting it down. Warning, order is not the same as in fileclient.cp for non-breaking old API.

CLI Example:

```bash
salt '*' cp.get_template salt://path/to/template /minion/dest
```

**salt.modules.cp.get_url** *(path, dest='', saltenv='base', makedirs=False, source_hash=None)*

Changed in version 2018.3.0: `dest` can now be a directory

Used to get a single file from a URL.

- **path** A URL to download a file from. Supported URL schemes are: `salt://`, `http://`, `https://`, `ftp://`, `s3://`, `swift://` and `file://` (local filesystem). If no scheme was specified, this is equivalent of using `file:///`. If a `file://` URL is given, the function just returns absolute path to that file on a local filesystem. The function returns `False` if Salt was unable to fetch a file from a `salt://` URL.

- **dest** The default behaviour is to write the fetched file to the given destination path. If this parameter is omitted or set as empty string (`''`), the function places the remote file on the local filesystem inside the Minion cache directory and returns the path to that file.

- **saltenv** [base] Salt fileserver environmnet from which to retrieve the file. Ignored if `path` is not a `salt://` URL.

- **source_hash** If `path` is an http(s) or ftp URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the file if the cached copy matches the specified hash.

  New in version 2018.3.0.

CLI Example:
salt.modules.cp.hash_file(path, saltenv='base')

Return the hash of a file, to get the hash of a file on the salt master file server prepend the path with salt://<file on server> otherwise, prepend the file with / for a local file.

CLI Example:
```
salt '*' cp.hash_file salt://path/to/file
```

salt.modules.cp.is_cached(path, saltenv='base')

Returns the full path to a file if it is cached locally on the minion otherwise returns a blank string

CLI Example:
```
salt '*' cp.is_cached salt://path/to/file
```

salt.modules.cp.list_master(saltenv='base', prefix='')

List all of the files stored on the master

CLI Example:
```
salt '*' cp.list_master
```

salt.modules.cp.list_master_dirs(saltenv='base', prefix='')

List all of the directories stored on the master

CLI Example:
```
salt '*' cp.list_master_dirs
```

salt.modules.cp.list_master_symlinks(saltenv='base', prefix='')

List all of the symlinks stored on the master

CLI Example:
```
salt '*' cp.list_master_symlinks
```

salt.modules.cp.list_minion(saltenv='base')

List all of the files cached on the minion

CLI Example:
```
salt '*' cp.list_minion
```

salt.modules.cp.list_states(saltenv='base')

List all of the available state modules in an environment

CLI Example:
```
salt '*' cp.list_states
```

salt.modules.cp.push(path, keep_symlinks=False, upload_path=None, remove_source=False)

WARNING Files pushed to the master will have global read permissions.

Push a file from the minion up to the master, the file will be saved to the salt master in the master's minion files cachedir (defaults to /var/cache/salt/master/minions/minion-id/files)
Since this feature allows a minion to push a file up to the master server it is disabled by default for security purposes. To enable, set `file_recv` to `True` in the master configuration file, and restart the master.

**keep_symlinks**  
Keep the path value without resolving its canonical form

**upload_path**  
Provide a different path inside the master's minion files cachedir

**remove_source**  
Remove the source file on the minion

New in version 2016.3.0.

CLI Example:

```
salt '*' cp.push /etc/fstab
salt '*' cp.push /etc/system-release keep_symlinks=True
salt '*' cp.push /etc/fstab upload_path='/new/path/fstab'
salt '*' cp.push /tmp/filename remove_source=True
```

**salt.modules.cp.push_dir** *(path, glob=None, upload_path=None)*

Push a directory from the minion up to the master, the files will be saved to the salt master in the master's minion files cachedir (defaults to `/var/cache/salt/master/minions/minion-id/files`). It also has a glob for matching specific files using globbing.

New in version 2014.7.0.

Since this feature allows a minion to push files up to the master server it is disabled by default for security purposes. To enable, set `file_recv` to `True` in the master configuration file, and restart the master.

**upload_path**  
Provide a different path and directory name inside the master's minion files cachedir

CLI Example:

```
salt '*' cp.push /usr/lib/mysql
salt '*' cp.push /usr/lib/mysql upload_path='/newmysql/path'
salt '*' cp.push_dir /etc/modprobe.d/ glob='*.conf'
```

**salt.modules.cp.recv** *(files, dest)*

Used with salt-cp, pass the files dict, and the destination.

This function receives small fast copy files from the master via salt-cp. It does not work via the CLI.

**salt.modules.cp.recv_chunked** *(dest, chunk, append=False, compressed=True, mode=None)*

This function receives files copied to the minion using salt-cp and is not intended to be used directly on the CLI.

**salt.modules.cp.stat_file** *(path, saltenv='base', octal=True)*

Return the permissions of a file, to get the permissions of a file on the salt master file server prepend the path with `salt://<file on server>` otherwise, prepend the file with `/` for a local file.

CLI Example:

```
salt '*' cp.stat_file salt://path/to/file
```
21.9.97 salt.modules.cpan

Manage Perl modules using CPAN

New in version 2015.5.0.

salt.modules.cpan.install(module)
  Install a Perl module from CPAN

  CLI Example:

  ```
  salt '*' cpan.install Template::Alloy
  ```

salt.modules.cpan.list()
  List installed Perl modules, and the version installed

  CLI Example:

  ```
  salt '*' cpan.list
  ```

salt.modules.cpan.remove(module, details=False)
  Attempt to remove a Perl module that was installed from CPAN. Because the cpan command doesn't actually support "uninstall"-like functionality, this function will attempt to do what it can, with what it has from CPAN. Until this function is declared stable, USE AT YOUR OWN RISK!

  CLI Example:

  ```
  salt '*' cpan.remove Old::Package
  ```

salt.modules.cpan.show(module)
  Show information about a specific Perl module

  CLI Example:

  ```
  salt '*' cpan.show Template::Alloy
  ```

salt.modules.cpan.show_config()
  Return a dict of CPAN configuration values

  CLI Example:

  ```
  salt '*' cpan.show_config
  ```

21.9.98 salt.modules.cron

Work with cron

Note: Salt does not escape cron metacharacters automatically. You should backslash-escape percent characters and any other metacharacters that might be interpreted incorrectly by the shell.

salt.modules.cron.get_entry(user, identifier=None, cmd=None)
  Return the specified entry from user's crontab. identifier will be used if specified, otherwise will lookup cmd
  Either identifier or cmd should be specified.

  user: User's crontab to query

  identifier: Search for line with identifier
**cmd**: Search for cron line with cmd

CLI Example:

```bash
salt '*' cron.get_entry root identifier=task1
```

**salt.modules.cron.list_tab(user)**

Return the contents of the specified user's crontab

CLI Example:

```bash
salt '*' cron.list_tab root
```

**salt.modules.cron.ls(user)**

This function is an alias of `list_tab`.

Return the contents of the specified user's crontab

CLI Example:

```bash
salt '*' cron.list_tab root
```

**salt.modules.cron.raw_cron(user)**

Return the contents of the user's crontab

CLI Example:

```bash
salt '*' cron.raw_cron root
```

**salt.modules.cron.rm(user, cmd, minute=None, hour=None, daymonth=None, month=None, dayweek=None, identifier=None)**

This function is an alias of `rm_job`.

Remove a cron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.

CLI Example:

```bash
salt '*' cron.rm_job root /usr/local/weekly
salt '*' cron.rm_job root /usr/bin/foo dayweek=1
```

**salt.modules.cron.rm_env(user, name)**

Remove cron environment variable for a specified user.

CLI Example:

```bash
salt '*' cron.rm_env root MAILTO
```

**salt.modules.cron.rm_job(user, cmd, minute=None, hour=None, daymonth=None, month=None, dayweek=None, identifier=None)**

Remove a cron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.

CLI Example:

```bash
salt '*' cron.rm_job root /usr/local/weekly
salt '*' cron.rm_job root /usr/bin/foo dayweek=1
```

**salt.modules.cron.rm_special(user, cmd, special=None, identifier=None)**

Remove a special cron job for a specified user.

CLI Example:
salt '!' cron.rm_special root /usr/bin/foo

salt.modules.cron.set_env(user, name, value=None)
Set up an environment variable in the crontab.

CLI Example:
salt '!' cron.set_env root MAILTO user@example.com

salt.modules.cron.set_job(user, minute, hour, daymonth, month, dayweek, cmd, commented=False, comment=None, identifier=None)
Sets a cron job up for a specified user.

CLI Example:
salt '!' cron.set_job root '!' '!' '!' '!' '!' 1 /usr/local/weekly

salt.modules.cron.set_special(user, special, cmd, commented=False, comment=None, identifier=None)
Set up a special command in the crontab.

CLI Example:
salt '!' cron.set_special root @hourly 'echo foobar'

salt.modules.cron.write_cron_file(user, path)
Writes the contents of a file to a user’s crontab

CLI Example:
salt '!' cron.write_cron_file root /tmp/new_cron

Changed in version 2015.8.9.

**Note:** Some OS’ do not support specifying user via the crontab command i.e. (Solaris, AIX)

salt.modules.cron.write_cron_file_verbose(user, path)
Writes the contents of a file to a user’s crontab and return error message on error

CLI Example:
salt '!' cron.write_cron_file_verbose root /tmp/new_cron

Changed in version 2015.8.9.

**Note:** Some OS’ do not support specifying user via the crontab command i.e. (Solaris, AIX)
21.9.99 salt.modules.cryptdev module

Salt module to manage Unix cryptsetup jobs and the crypttab file

New in version 2018.3.0.

salt.modules.cryptdev.active()

List existing device-mapper device details.

salt.modules.cryptdev.close(name)

Close a crypt device using cryptsetup.

CLI Example:

```bash
salt '*' cryptdev.close foo
```

salt.modules.cryptdev.crypttab(config='/etc/crypttab')

List the contents of the crypttab

CLI Example:

```bash
salt '*' cryptdev.crypttab
```

salt.modules.cryptdev.open(name, device, keyfile)

Open a crypt device using cryptsetup. The keyfile must not be None or 'none', because cryptsetup will otherwise ask for the password interactively.

CLI Example:

```bash
salt '*' cryptdev.open foo /dev/sdz1 /path/to/keyfile
```

salt.modules.cryptdev.rm_crypttab(name, config='/etc/crypttab')

Remove the named mapping from the crypttab. If the described entry does not exist, nothing is changed, but the command succeeds by returning 'absent'. If a line is removed, it returns 'change'.

CLI Example:

```bash
salt '*' cryptdev.rm_crypttab foo
```

salt.modules.cryptdev.set_crypttab(name, device, password='none', options='', config='/etc/crypttab', test=False, match_on='name')

Verify that this device is represented in the crypttab, change the device to match the name passed, or add the name if it is not present.

CLI Example:

```bash
salt '*' cryptdev.set_crypttab foo /dev/sdz1 mypassword swap,size=256
```

21.9.100 salt.modules.csf

Support for Config Server Firewall (CSF)

```text
maintainer  Mostafa Hussein <mostafa.hussein91@gmail.com>
maturity    new
platform    Linux
```
salt.modules.csf.allow(ip, port=None, proto='tcp', direction='in', port_origin='d', ip_origin='s', ttl=None, comment='')

Add an rule to csf allowed hosts See _access_rule(). 1- Add an IP: CLI Example:

```bash
salt '*' csf.allow 127.0.0.1
salt '*' csf.allow 127.0.0.1 comment="Allow localhost"
```

class salt.modules.csf.allow_port(port, proto='tcp', direction='both')

Like allow_ports, but it will append to the existing entry instead of replacing it. Takes a single port instead of a list of ports.

CLI Example:

```bash
salt '*' csf.allow_port 22 proto='tcp' direction='in'
```

class salt.modules.csf.allow_ports(ports, proto='tcp', direction='in')

Fully replace the incoming or outgoing ports line in the csf.conf file - e.g. TCP_IN, TCP_OUT, UDP_IN, UDP_OUT, etc.

CLI Example:

```bash
salt '*' csf.allow_ports ports="[22,80,443,4505,4506]" proto='tcp' direction='in'
```

class salt.modules.csf.build_directions(direction)

class salt.modules.csf.deny(ip, port=None, proto='tcp', direction='in', port_origin='d', ip_origin='d', ttl=None, comment='')

Add an rule to csf denied hosts See _access_rule(). 1- Deny an IP: CLI Example:

```bash
salt '*' csf.deny 127.0.0.1
salt '*' csf.deny 127.0.0.1 comment="Too localhosty"
```

class salt.modules.csf.disable()

Disable csf permanently CLI Example:

```bash
salt '*' csf.disable
```

class salt.modules.csf.disable_testing_mode()

class salt.modules.csf.enable()

Activate csf if not running CLI Example:

```bash
salt '*' csf.enable
```

class salt.modules.csf.enable_testing_mode()

class salt.modules.csf.exists(method, ip, port=None, proto='tcp', direction='in', port_origin='d', ip_origin='d', ttl=None, comment='')

Returns true a rule for the ip already exists based on the method supplied. Returns false if not found. CLI Example:

```bash
salt '*' csf.exists allow 1.2.3.4
salt '*' csf.exists tempdeny 1.2.3.4
```

class salt.modules.csf.get_option(option)

class salt.modules.csf.get_ports(proto='tcp', direction='in')

Lists ports from csf.conf based on direction and protocol. e.g. - TCP_IN, TCP_OUT, UDP_IN, UDP_OUT, etc.

CLI Example:
salt '...' csf.allow_port 22 proto='tcp' direction='in'
salt.modules.csf.get_skipped_nics(ipv6=False)
salt.modules.csf.get_testing_status()
salt.modules.csf.reload()
    Restart csf CLI Example:
    salt '...' csf.reload
salt.modules.csf.remove_rule(method, ip, port=None, proto='tcp', direction='in', port_origin='d', ip_origin='s', ttl=None, comment='')
salt.modules.csf.remove_temp_rule(ip)
salt.modules.csf.running()
    Check csf status CLI Example:
    salt '...' csf.running
salt.modules.csf.set_option(option, value)
salt.modules.csf.skip_nic(nic, ipv6=False)
salt.modules.csf.skip_nics(nics, ipv6=False)
salt.modules.csf.split_option(option)
salt.modules.csf.tempallow(ip=None, ttl=None, port=None, direction=None, comment='')
    Add an rule to the temporary ip allow list. See _access_rule(). 1- Add an IP: CLI Example:
    salt '...' csf.tempallow 127.0.0.1 3600 port=22 direction='in' comment='# Temp dev
    → ssh access'
salt.modules.csf.tempdeny(ip=None, ttl=None, port=None, direction=None, comment='')
    Add a rule to the temporary ip deny list. See _access_rule(). 1- Add an IP: CLI Example:
    salt '...' csf.tempdeny 127.0.0.1 300 port=22 direction='in' comment='# Brute force
    → attempt'
salt.modules.csf.unallow(ip)
    Remove a rule from the csf denied hosts See _access_rule(). 1- Deny an IP: CLI Example:
    salt '...' csf.unallow 127.0.0.1
salt.modules.csf.undeny(ip)
    Remove a rule from the csf denied hosts See _access_rule(). 1- Deny an IP: CLI Example:
    salt '...' csf.undeny 127.0.0.1
21.9.101 salt.modules.cyg

Manage cygwin packages.
Module file to accompany the cyg state.

salt.modules.cyg.check_valid_package(package, cyg_arch='x86_64', mirrors=None)
Check if the package is valid on the given mirrors.

Parameters
- **package** -- The name of the package
- **cyg_arch** -- The cygwin architecture
- **mirrors** -- any mirrors to check

Returns (bool): True if Valid, otherwise False

CLI Example:
salt '*' cyg.check_valid_package <package name>

salt.modules.cyg.install(packages=None, cyg_arch='x86_64', mirrors=None)
Install one or several packages.

- **packages** [None] The packages to install
- **cyg_arch** [x86_64] Specify the architecture to install the package under Current options are x86 and x86_64

CLI Example:
salt '*' cyg.install dos2unix
salt '*' cyg.install dos2unix mirrors="[[http://mirror': 'http://url/to/public/ →key]]"

salt.modules.cyg.list_(package='', cyg_arch='x86_64')
List locally installed packages.

- **package** [''] package name to check. else all
- **cyg_arch** : Cygwin architecture to use Options are x86 and x86_64

CLI Example:
salt '*' cyg.list

salt.modules.cyg.uninstall(packages, cyg_arch='x86_64', mirrors=None)
Uninstall one or several packages.

- **packages** The packages to uninstall.
- **cyg_arch** [x86_64] Specify the architecture to remove the package from Current options are x86 and x86_64

CLI Example:
salt '*' cyg.uninstall dos2unix
salt '*' cyg.uninstall dos2unix mirrors="[[http://mirror': 'http://url/to/public/ →key]]"

salt.modules.cyg.update(cyg_arch='x86_64', mirrors=None)
Update all packages.

- **cyg_arch** [x86_64] Specify the cygwin architecture update Current options are x86 and x86_64
CLI Example:

```
salt '*' cyg.update
salt '*' cyg.update dos2unix mirrors="[{'http://mirror': 'http://url/to/public/→key}]"
```

## 21.9.102 `salt.modules.daemontools`

`daemontools` service module. This module will create daemontools type service watcher.

This module is compatible with the `service` states, so it can be used to maintain services using the `provider` argument:

```
myservice:
   service.running:
      - provider: daemontools
```

### `salt.modules.daemontools.available(name)`

Returns `True` if the specified service is available, otherwise returns `False`.

CLI Example:

```
salt '*' daemontools.available foo
```

### `salt.modules.daemontools.disabled(name)`

Return `True` if the named service is enabled, false otherwise

New in version 2015.5.6.

CLI Example:

```
salt '*' daemontools.disabled <service name>
```

### `salt.modules.daemontools.enabled(name, **kwargs)`

Return `True` if the named service is enabled, false otherwise A service is considered enabled if in your service directory: - an executable ./run file exist - a file named "down" does not exist

New in version 2015.5.7.

name  Service name

CLI Example:

```
salt '*' daemontools.enabled <service name>
```

### `salt.modules.daemontools.full_restart(name)`

Calls daemontools.restart() function

CLI Example:

```
salt '*' daemontools.full_restart <service name>
```

### `salt.modules.daemontools.get_all()`

Return a list of all available services

CLI Example:

```
salt '*' daemontools.get_all
```
salt.modules.daemontools.missing(name)
The inverse of daemontools.available. Returns True if the specified service is not available, otherwise returns False.

CLI Example:
```
salt '*' daemontools.missing foo
```

salt.modules.daemontools.reload_(name)
Wrapper for term()

CLI Example:
```
salt '*' daemontools.reload <service name>
```

salt.modules.daemontools.restart(name)
Restart service via daemontools. This will stop/start service

CLI Example:
```
salt '*' daemontools.restart <service name>
```

salt.modules.daemontools.start(name)
Starts service via daemontools

CLI Example:
```
salt '*' daemontools.start <service name>
```

salt.modules.daemontools.status(name, sig=None)
Return the status for a service via daemontools, return pid if running

CLI Example:
```
salt '*' daemontools.status <service name>
```

salt.modules.daemontools.stop(name)
Stops service via daemontools

CLI Example:
```
salt '*' daemontools.stop <service name>
```

salt.modules.daemontools.term(name)
Send a TERM to service via daemontools

CLI Example:
```
salt '*' daemontools.term <service name>
```
21.9.103 salt.modules.data

Manage a local persistent data structure that can hold any arbitrary data specific to the minion

salt.modules.data.cas(key, value, old_value)
Check and set a value in the minion datastore

CLI Example:
```
salt '* data.cas <key> <value> <old_value>
```

salt.modules.data.clear()
Clear out all of the data in the minion datastore, this function is destructive!

CLI Example:
```
salt '* data.clear
```

salt.modules.data.dump(new_data)
Replace the entire datastore with a passed data structure

CLI Example:
```
salt '* data.dump '{'eggs': 'spam'}'
```

salt.modules.data.get(key, default=None)
Get a (list of) value(s) from the minion datastore
New in version 2015.8.0.

CLI Example:
```
salt '* data.get key
salt '* data.get ['$key1', 'key2']'
```

salt.modules.data.has_key(key)
Check if key is in the minion datastore
New in version 2015.8.0.

CLI Example:
```
salt '* data.has_key <mykey>
```

salt.modules.data.items()
Get items from the minion datastore
New in version 2015.8.0.

CLI Example:
```
salt '* data.items
```

salt.modules.data.keys()
Get all keys from the minion datastore
New in version 2015.8.0.

CLI Example:
```
salt '* data.keys
```
salt.modules.data.load()
Return all of the data in the minion datastore

CLI Example:
salt '*' data.load

salt.modules.data.pop(key, default=None)
Pop (return & delete) a value from the minion datastore

New in version 2015.5.2.

CLI Example:
salt '*' data.pop <key> "there was no val"

salt.modules.data.update(key, value)
Update a key with a value in the minion datastore

CLI Example:
salt '*' data.update <key> <value>

salt.modules.data.values()
Get values from the minion datastore

New in version 2015.8.0.

CLI Example:
salt '*' data.values

21.9.104 salt.modules.datadog_api
An execution module that interacts with the Datadog API
The following parameters are required for all functions.

api_key The datadog API key
app_key The datadog application key

Full argument reference is available on the Datadog API reference page https://docs.datadoghq.com/api/
salt.modules.datadog_api.cancel_downtime(api_key=None, app_key=None, scope=None, id=None)

Cancel a downtime by id or by scope.

CLI Example:
salt-call datadog.cancel_downtime scope='host:app01' \
api_key='0123456789' \
avi_key='9876543210'

Arguments - Either scope or id is required.

Parameters

- id -- The downtime ID
- scope -- The downtime scope
salt.modules.datadog_api.post_event(api_key=None, app_key=None, title=None, text=None, date_happened=None, priority=None, host=None, tags=None, alert_type=None, aggregation_key=None, source_type_name=None)

Post an event to the Datadog stream.

CLI Example

```
salt-call datadog.post_event api_key='0123456789' \   app_key='9876543210' \   title='Salt Highstate' \   text="Salt highstate was run on $(salt-call grains. →get id)" \   tags='["service:salt", "event:highstate"]'
```

Required arguments

Parameters

- `title` -- The event title. Limited to 100 characters.
- `text` -- The body of the event. Limited to 4000 characters. The text supports markdown.

Optional arguments

Parameters

- `date_happened` -- POSIX timestamp of the event.
- `priority` -- The priority of the event ('normal' or 'low').
- `host` -- Host name to associate with the event.
- `tags` -- A list of tags to apply to the event.
- `alert_type` -- "error", "warning", "info" or "success".
- `aggregation_key` -- An arbitrary string to use for aggregation, max length of 100 characters.
- `source_type_name` -- The type of event being posted.

salt.modules.datadog_api.schedule_downtime(scope, api_key=None, app_key=None, monitor_id=None, start=None, end=None, message=None, recurrence=None, timezone=None, test=False)

Schedule downtime for a scope of monitors.

CLI Example:

```
salt-call datadog.schedule_downtime 'host:app2' \   stop=$(date --date='30 minutes' +%s) \   app_key='0123456789' \   api_key='9876543210'
```

Optional arguments

Parameters

- `monitor_id` -- The ID of the monitor
- `start` -- Start time in seconds since the epoch
- `end` -- End time in seconds since the epoch
**message** -- A message to send in a notification for this downtime

**recurrence** -- Repeat this downtime periodically

**timezone** -- Specify the timezone

## 21.9.105 salt.modules.ddns

Support for RFC 2136 dynamic DNS updates.

**depends**

- dnspython Python module

**configuration** If you want to use TSIG authentication for the server, there are a couple of optional configuration parameters made available to support this (the keyname is only needed if the keyring contains more than one key):

```python
keyfile: keyring file (default=None)
keyname: key name in file (default=None)
keyalgorithm: algorithm used to create the key (default='HMAC-MD5.SIG-ALG.REG.INT').
Other possible values: hmac-sha1, hmac-sha224, hmac-sha256, hmac-sha384, hmac-sha512
```

The keyring file needs to be in json format and the key name needs to end with an extra period in the file, similar to this:

```json
{"keyname." : "keycontent"}
```

**salt.modules.ddns.add_host**(zone, name, ttl, ip, nameserver='127.0.0.1', replace=True, timeout=5, port=53, **kwargs)

Add, replace, or update the A and PTR (reverse) records for a host.

CLI Example:

```bash
salt ns1 ddns.add_host example.com host1 60 10.1.1.1
```

**salt.modules.ddns.delete**(zone, name, rdtype=None, data=None, nameserver='127.0.0.1', timeout=5, port=53, **kwargs)

Delete a DNS record.

CLI Example:

```bash
salt ns1 ddns.delete example.com host1 A
```

**salt.modules.ddns.delete_host**(zone, name, nameserver='127.0.0.1', timeout=5, port=53, **kwargs)

Delete the forward and reverse records for a host.

Returns true if any records are deleted.

CLI Example:

```bash
salt ns1 ddns.delete_host example.com host1
```

**salt.modules.ddns.update**(zone, name, ttl, rdtype, data, nameserver='127.0.0.1', timeout=5, replace=False, port=53, **kwargs)

Add, replace, or update a DNS record. nameserver must be an IP address and the minion running this module must have update privileges on that server. If replace is true, first deletes all records for this name and type.

CLI Example:
Support for Apache

Please note: The functions in here are Debian-specific. Placing them in this separate file will allow them to load only on Debian-based systems, while still loading under the `apache` namespace.

**salt.modules.deb_apache**

*a2disconf* - Runs `a2disconf` for the given conf.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```bash
salt '*' apache.a2disconf security
```

*a2dismod* - Runs `a2dismod` for the given mod.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```bash
salt '*' apache.a2dismod vhost_alias
```

*a2dissite* - Runs `a2dissite` for the given site.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```bash
salt '*' apache.a2dissite example.com
```

*a2enconf* - New in version 2016.3.0. Runs `a2enconf` for the given conf.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```bash
salt '*' apache.a2enconf security
```

*a2enmod* - Runs `a2enmod` for the given mod.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```bash
salt '*' apache.a2enmod vhost_alias
```
salt.modules.deb_apache.a2ensite(site)
      Runs a2ensite for the given site.
      This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).
      CLI Examples:

      salt '*' apache.a2ensite example.com

salt.modules.deb_apache.check_conf_enabled(conf)
      New in version 2016.3.0.
      Checks to see if the specific conf symlink is in /etc/apache2/conf-enabled.
      This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).
      CLI Examples:

      salt '*' apache.check_conf_enabled security
      salt '*' apache.check_conf_enabled security.conf

salt.modules.deb_apache.check_mod_enabled(mod)
      Checks to see if the specific mod symlink is in /etc/apache2/mods-enabled.
      This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).
      CLI Examples:

      salt '*' apache.check_mod_enabled status
      salt '*' apache.check_mod_enabled status.load
      salt '*' apache.check_mod_enabled status.conf

salt.modules.deb_apache.check_site_enabled(site)
      Checks to see if the specific site symlink is in /etc/apache2/sites-enabled.
      This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).
      CLI Examples:

      salt '*' apache.check_site_enabled example.com
      salt '*' apache.check_site_enabled example.com.conf

21.9.107  salt.modules.deb_postgres

Module to provide Postgres compatibility to salt for debian family specific tools.

salt.modules.deb_postgres.cluster_create(version, name='main', port=None, locale=None, encoding=None, datadir=None, allow_group_access=None, data_checksums=None, wal_segment_size=None)

      Adds a cluster to the Postgres server.
      CLI Example:

      salt '*' postgres.cluster_create '9.3'
      salt '*' postgres.cluster_create '9.3' 'main'
      salt '*' postgres.cluster_create '9.3' locale='fr_FR'

      (continues on next page)
salt.modules.deb_postgres.cluster_exists(version, name='main')
Checks if a given version and name of a cluster exists.
CLI Example:

```bash
salt '*' postgres.cluster_exists '9.3'
salt '*' postgres.cluster_exists '9.3' 'main'
```

salt.modules.deb_postgres.cluster_list( verbose=False)
Return a list of cluster of Postgres server (tuples of version and name).
CLI Example:

```bash
salt '*' postgres.cluster_list
salt '*' postgres.cluster_list verbose=True
```

salt.modules.deb_postgres.cluster_remove( version, name='main', stop=False)
Remove a cluster on a Postgres server. By default it doesn’t try to stop the cluster.
CLI Example:

```bash
salt '*' postgres.cluster_remove '9.3'
salt '*' postgres.cluster_remove '9.3' 'main'
salt '*' postgres.cluster_remove '9.3' 'main' stop=True
```

### 21.9.108 salt.modules.debconfmod

Support for Debconf

salt.modules.debconfmod.get_selections(fetchempty=True)
Answers to debconf questions for all packages in the following format:

```json
{
    'package': [[{'question', 'type', 'value'}, ...]
}
```

CLI Example:

```bash
salt '*' debconf.get_selections
```

salt.modules.debconfmod.set_(package, question, type, value, *extra)
Set answers to debconf questions for a package.

CLI Example:

```bash
salt '*' debconf.set <package> <question> <type> <value> [value> ...]
```

salt.modules.debconfmod.set_file(path, saltenv='base', **kwargs)
Set answers to debconf questions from a file.

CLI Example:
salt '§' debconf.set_file salt://pathto/pkg.selections

salt.modules.debconfmod.set_template(path, template, context, defaults, saltenv='base', **kwargs)
Set answers to debconf questions from a template.

  path  location of the file containing the package selections
  template  template format
  context  variables to add to the template environment
  default  default values for the template environment

CLI Example:
salt '§' debconf.set_template salt://pathto/pkg.selections.jinja jinja None None

salt.modules.debconfmod.show(name)
Answers to debconf questions for a package in the following format:

[[{'question', 'type', 'value'}, ...]

If debconf doesn't know about a package, we return None.

CLI Example:
salt '§' debconf.show <package name>

21.9.109 salt.modules.debian_ip

The networking module for Debian-based distros

References:

salt.modules.debian_ip.apply_network_settings(**settings)
Apply global network configuration.

CLI Example:
salt '*' ip.apply_network_settings

salt.modules.debian_ip.build_bond(iface, **settings)
Create a bond script in /etc/modprobe.d with the passed settings and load the bonding kernel module.

CLI Example:
salt '*' ip.build_bond bond0 mode=balance-alb

salt.modules.debian_ip.build_interface(iface, iface_type, enabled, **settings)
Build an interface script for a network interface.

CLI Example:
salt '*' ip.build_interface eth0 eth <settings>
salt.modules.debian_ip.build_network_settings(**settings)
Build the global network script.
CLI Example:

```
salt '*' ip.build_network_settings <settings>
```

salt.modules.debian_ip.build_routes(iface, **settings)
Add route scripts for a network interface using up commands.
CLI Example:

```
salt '*' ip.build_routes eth0 <settings>
```

salt.modules.debian_ip.down(iface, iface_type)
Shutdown a network interface
CLI Example:

```
salt '*' ip.down eth0 eth
```

salt.modules.debian_ip.get_bond(iface)
Return the content of a bond script
CLI Example:

```
salt '*' ip.get_bond bond0
```

salt.modules.debian_ip.get_interface(iface)
Return the contents of an interface script
CLI Example:

```
salt '*' ip.get_interface eth0
```

salt.modules.debian_ip.get_network_settings()
Return the contents of the global network script.
CLI Example:

```
salt '*' ip.get_network_settings
```

salt.modules.debian_ip.get_routes(iface)
Return the routes for the interface
CLI Example:

```
salt '*' ip.get_routes eth0
```

salt.modules.debian_ip.up(iface, iface_type)
Start up a network interface
CLI Example:

```
salt '*' ip.up eth0 eth
```
21.9.110 salt.modules.debian_service

Service support for Debian systems (uses update-rc.d and /sbin/service)

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see [here](#).

```python
salt.modules.debian_service.available(name)
    Returns True if the specified service is available, otherwise returns False.
    
    CLI Example:
    
    salt '*' service.available sshd
```

```python
salt.modules.debian_service.disable(name, **kwargs)
    Disable the named service to start at boot
    
    CLI Example:

    salt '*' service.disable <service name>
```

```python
salt.modules.debian_service.disabled(name)
    Return True if the named service is disabled, false otherwise

    CLI Example:

    salt '*' service.disabled <service name>
```

```python
salt.modules.debian_service.enable(name, **kwargs)
    Enable the named service to start at boot

    CLI Example:

    salt '*' service.enable <service name>
```

```python
salt.modules.debian_service.enabled(name, **kwargs)
    Return True if the named service is enabled, false otherwise

    CLI Example:

    salt '*' service.enabled <service name>
```

```python
salt.modules.debian_service.force_reload(name)
    Force-reload the named service

    CLI Example:

    salt '*' service.force_reload <service name>
```

```python
salt.modules.debian_service.get_all()
    Return all available boot services

    CLI Example:

    salt '*' service.get_all
```

```python
salt.modules.debian_service.get_disabled()
    Return a set of services that are installed but disabled
```
Salt Documentation, Release 3001.1

CLI Example:

```bash
salt '*' service.get_disabled
```

**salt.modules.debian_service.get_enabled()**
Return a list of service that are enabled on boot

CLI Example:

```bash
salt '*' service.get_enabled
```

**salt.modules.debian_service.missing(name)**
The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```bash
salt '*' service.missing sshd
```

**salt.modules.debian_service.reload_(name)**
Reload the named service

CLI Example:

```bash
salt '*' service.reload <service name>
```

**salt.modules.debian_service.restart(name)**
Restart the named service

CLI Example:

```bash
salt '*' service.restart <service name>
```

**salt.modules.debian_service.start(name)**
Start the specified service

CLI Example:

```bash
salt '*' service.start <service name>
```

**salt.modules.debian_service.status(name, sig=None)**
Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

Parameters

- `name (str) -- The name of the service to check`
- `sig (str) -- Signature to use to find the service via ps`

Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type bool

CLI Example:

```bash
salt '*' service.status <service name> [service signature]
```
salt.modules.debian_service.stop(name)

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

21.9.111 salt.modules.debuild_pkgbuild

Debian Package builder system

New in version 2015.8.0.

This system allows for all of the components to build debs safely in chrooted environments. This also provides a function to generate debian repositories

This module implements the pkgbuild interface

salt.modules.debuild_pkgbuild.build(runas, tgt, dest_dir, spec, sources, deps, env, template, saltenv='base', log_dir='/var/log/salt/pkgbuild')

Given the package destination directory, the tarball containing debian files (e.g. control) and package sources, use pbuilder to safely build the platform package

CLI Example:

```
Debian
```

```
salt '*' pkgbuild.make_src_pkg deb-8-x86_64 /var/www/html
   https://raw.githubusercontent.com/saltstack/libnacl/master/pkg/deb/python-...
   libnacl.control
   https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```

This example command should build the libnacl package for Debian using pbuilder and place it in /var/www/html/ on the minion

salt.modules.debuild_pkgbuild.make_repo(repodir, keyid=None, use_passphrase=False, gnupghome='/etc/salt/gpgkeys', runas='root', timeout=15.0)

Make a package repository and optionally sign it and packages present

Given the repodir (directory to create repository in), create a Debian repository and optionally sign it and packages present. This state is best used with onchanges linked to your package building states.

repodir The directory to find packages that will be in the repository.

keyid Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. This consists of the last 8 hex digits of the GPG key ID.

Utilizes Public and Private keys associated with keyid which have been loaded into the minion’s Pillar data. Leverages gpg-agent and gpg-preset-passphrase for caching keys, etc. These pillar values are assumed to be filenames which are present in gnupghome. The pillar keys shown below have to match exactly.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```
gpg_pkg_priv_keyname:  gpg_pkg_key.pem
```

```
gpg_pkg_pub_keyname:  gpg_pkg_key.pub
```
**env** Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository.

**use_passphrase** [False] New in version 2016.3.0.

Use a passphrase with the signing key presented in keyid. Passphrase is received from Pillar data which could be passed on the command line with `pillar` parameter. For example:

```python
pillar='{ "gpg_passphrase" : "my_passphrase" }'
```

**gnupghome** [/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with keyid.

**runas** [root] New in version 2016.3.0.

User to create the repository as, and optionally sign packages.

**timeout** [15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

CLI Example:

```
salt '*' pkgbuild.make_repo /var/www/html
```

salt.modules.debuild_pkgbuild.make_src_pkg(`dest_dir`, `spec`, `sources`, `env=None`, `saltenv='base', runas='root')`

Create a platform specific source package from the given platform spec/control file and sources

CLI Example:

**Debian**

```
salt '*' pkgbuild.make_src_pkg /var/www/html/

https://raw.githubusercontent.com/saltstack/libnacl/master/pkg/deb/python-
libnacl.control.tar.xz
https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```

This example command should build the libnacl SOURCE package and place it in /var/www/html/ on the minion

**dest_dir** Absolute path for directory to write source package

**spec** Absolute path to spec file or equivalent

**sources** Absolute path to source files to build source package from

**env** [None] A list or dictionary of environment variables to be set prior to execution. Example:

```
- env:
  - DEB_BUILD_OPTIONS: 'nocheck'
```

**Warning:** The above illustrates a common PyYAML pitfall, that yes, no, on, off, true, and false are all loaded as boolean True and False values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).
saltenv: base

Salt environment variables

User to create the files and directories

---

Note: Ensure the user has correct permissions to any files and directories which are to be utilized.

### 21.9.112  salt.modules.defaults

Module to work with salt formula defaults files

**salt.modules.defaults.deecopy**({source})

Allows deep copy of objects in formulas.

By default, Python does not copy objects, it creates bindings between a target and an object.

It is more typical to use this in a templating language in formulas, instead of directly on the command-line.

**salt.modules.defaults.get**({key, default="")

defaults.get is used much like pillar.get except that it will read a default value for a pillar from defaults.json or defaults.yaml files that are stored in the root of a salt formula.

CLI Example:

```bash
salt '*' defaults.get core:users:root
```

The defaults is computed from pillar key. The first entry is considered as the formula namespace.

For example, querying core:users:root will try to load salt://core/defaults.yaml and salt://core/defaults.json.

**salt.modules.defaults.merge**({dest, src, merge_lists=False, in_place=True})

Allows deep merging of dicts in formulas.

**merge_lists**  [False]  If True, it will also merge lists instead of replace their items.

**in_place**  [True]  If True, it will merge into dest dict, if not it will make a new copy from that dict and return it.

CLI Example:

```bash
salt '*' defaults.merge '{a: b}' '{d: e}'
```

It is more typical to use this in a templating language in formulas, instead of directly on the command-line.

**salt.modules.defaults.update**({dest, defaults, merge_lists=True, in_place=True})

Allows setting defaults for group of data set e.g. group for nodes.

This function is a combination of defaults.merge and defaults.deepcopy to avoid redundant in jinja.

Example:

```python
group01:
    defaults:
        enabled: True
        extra:
            - test
```

(continues on next page)
- stage

```
% do salt['defaults.update'](group01.nodes, group01.defaults) %
```

Each node will look like the following:

```
host01:
  enabled: True
  index: foo
  upstream: bar
extra:
  - test
  - stage
```

merge_lists [True] If True, it will also merge lists instead of replace their items.

in_place [True] If True, it will merge into dest dict. if not it will make a new copy from that dict and return it.

It is more typical to use this in a templating language in formulas, instead of directly on the command-line.

### 21.9.113 salt.modules.devinfo

maintainer Alberto Planas <aplanas@suse.com>
maturity new
depends None
platform Linux

**salt.modules.devinfo.filter** *(udev_in=None, udev_ex=None)*

Returns a list of devices, filtered under udev keys.

**udev_in** A dictionary of key:values that are expected in the device udev information

**udev_ex** A dictionary of key:values that are not expected in the device udev information (excluded)

The key is a lower case string, joined by dots, that represent a path in the udev information dictionary. For example, 'e.id_bus' will represent the udev entry `udev['E']['ID_BUS']`

If the udev entry is a list, the algorithm will check that at least one item match one item of the value of the parameters.

Returns list of devices that match *udev_in* and do not match *udev_ex*.

CLI Example:

```
salt '*' devinfo.filter udev_in='{"e.id_bus": "ata"}'
```
salt.modules.devinfo.hwinfo(items=None, short=True, listmd=False, devices=None)

Probe for hardware

- **items** List of hardware items to inspect. Default ['bios', 'cpu', 'disk', 'memory', 'network', 'partition']
- **short** Show only a summary. Default True.
- **devices** List of devices to show information from. Default None.

CLI Example:

```
salt '*' devinfo.hwinfo
salt '*' devinfo.hwinfo items='["disk"]' short=no
salt '*' devinfo.hwinfo items='["disk"]' short=no devices='[/dev/sda]'
salt '*' devinfo.hwinfo devices=/dev/sda
```

### 21.9.114 saltnodes.devmap

Device-Mapper module

salt.modules.devmap.multipath_flush(device)

Device-Mapper Multipath flush

CLI Example:

```
salt '*' devmap.multipath_flush mpath1
```

salt.modules.devmap.multipath_list()

Device-Mapper Multipath list

CLI Example:

```
salt '*' devmap.multipath_list
```

### 21.9.115 salt.modules.dig

Compendium of generic DNS utilities. The 'dig' command line tool must be installed in order to use this module.

salt.modules.dig.A(host, nameserver=None)

Return the A record for host.

Always returns a list.

CLI Example:

```
salt ns1 dig.A www.google.com
```

salt.modules.dig.AAAA(host, nameserver=None)

Return the AAAA record for host.

Always returns a list.

CLI Example:

```
salt ns1 dig.AAAA www.google.com
```
salt.modules.dig.MX(domain, resolve=False, nameserver=None)
Return a list of lists for the MX of domain.

If the resolve argument is True, resolve IPs for the servers.

It's limited to one IP, because although in practice it's very rarely a round robin, it is an acceptable configuration
and pulling just one IP lets the data be similar to the non-resolved version. If you think an MX has multiple
IPs, don't use the resolver here, resolve them in a separate step.

CLI Example:
salt nsl dig.MX google.com

salt.modules.dig.NS(domain, resolve=True, nameserver=None)
Return a list of IPs of the nameservers for domain

If resolve is False, don't resolve names.

CLI Example:
salt nsl dig.NS google.com

salt.modules.dig.SPF(domain, record='SPF', nameserver=None)
Return the allowed IPv4 ranges in the SPF record for domain.

If record is SPF and the SPF record is empty, the TXT record will be searched automatically. If you know the
domain uses TXT and not SPF, specifying that will save a lookup.

CLI Example:
salt nsl dig.SPF google.com

salt.modules.dig.TXT(host, nameserver=None)
Return the TXT record for host.

Always returns a list.

CLI Example:
salt nsl dig.TXT google.com

salt.modules.dig.check_ip(addr)
Check if address is a valid IP. returns True if valid, otherwise False.

CLI Example:
salt nsl dig.check_ip 127.0.0.1

21.9.116 salt.modules.disk

Module for managing disks and blockdevices

salt.modules.disk.blkid(device=None, token=None)
Return block device attributes: UUID, LABEL, etc. This function only works on systems where blkid is available.

device  Device name from the system
token   Any valid token used for the search
CLI Example:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>salt '*' disk.blkid</code></td>
<td>Retrieve the block id of a specified device</td>
</tr>
<tr>
<td><code>salt '*' disk.blkid /dev/sda</code></td>
<td>Retrieve the block id of a device with the path <code>/dev/sda</code></td>
</tr>
<tr>
<td><code>salt '*' disk.blkid token='UUID=6a38ee5-7235-44e7-8b22-816a403bad5d'</code></td>
<td>Assign a token to a device with the token identifier <code>UUID=6a38ee5-7235-44e7-8b22-816a403bad5d</code></td>
</tr>
<tr>
<td><code>salt '*' disk.blkid token='TYPE=ext4'</code></td>
<td>Assign a token to a device with the type <code>TYPE=ext4</code></td>
</tr>
</tbody>
</table>

### `salt.modules.disk.dump` (device, args=None)

Return all contents of dumpe2fs for a specified device

**CLI Example:**

```bash
salt '*' disk.dump /dev/sda1
```

### `salt.modules.disk.format_` (device, fs_type='ext4', inode_size=None, lazy_itable_init=None, fat=None, force=False)

Format a filesystem onto a device

New in version 2016.11.0.

- **device** The device in which to create the new filesystem
- **fs_type** The type of filesystem to create
- **inode_size** Size of the inodes
  - This option is only enabled for ext and xfs filesystems
- **lazy_itable_init** If enabled and the uninit_bg feature is enabled, the inode table will not be fully initialized by mke2fs. This speeds up filesystem initialization noticeably, but it requires the kernel to finish initializing the filesystem in the background when the filesystem is first mounted. If the option value is omitted, it defaults to 1 to enable lazy inode table zeroing.
  - This option is only enabled for ext filesystems
- **fat** FAT size option. Can be 12, 16 or 32, and can only be used on fat or vfat filesystems.
- **force** Force mke2fs to create a filesystem, even if the specified device is not a partition on a block special device. This option is only enabled for ext and xfs filesystems
  - This option is dangerous, use it with caution.

**CLI Example:**

```bash
salt '*' disk.format /dev/sdX1
```

### `salt.modules.disk.fstype` (device)

Return the filesystem name of the specified device

New in version 2016.11.0.

- **device** The name of the device

**CLI Example:**

```bash
salt '*' disk.fstype /dev/sdX1
```

### `salt.modules.disk.hdparms` (disks, args=None)

Retrieve all info's for all disks parse 'em into a nice dict (which, considering hdparm output, is quite a hassle)

New in version 2016.3.0.

**CLI Example:**

```bash
salt '*' disk.hdparms /dev/sda
```
salt.modules.disk.hpa(disks, size=None)
Get/set Host Protected Area settings

T13 INCITS 346-2001 (1367D) defines the BEER (Boot Engineering Extension Record) and PARTIES (Protected Area Run Time Interface Extension Services), allowing for a Host Protected Area on a disk.

It’s often used by OEMs to hide parts of a disk, and for overprovisioning SSD’s

**Warning**: Setting the HPA might clobber your data, be very careful with this on active disks!

New in version 2016.3.0.

CLI Example:
```bash
salt '*' disk.hpa /dev/sda
salt '*' disk.hpa /dev/sda 5%
salt '*' disk.hpa /dev/sda 10543256
```

salt.modules.disk.inodeusage(args=None)
Return inode usage information for volumes mounted on this minion

CLI Example:
```bash
salt '*' disk.inodeusage
```

salt.modules.disk.iostat(interval=1, count=5, disks=None)
Gather and return (averaged) IO stats.

New in version 2016.3.0.

Changed in version 2016.11.4: Added support for AIX

CLI Example:
```bash
salt '*' disk.iostat 1 5 disks=sda
```

salt.modules.disk.percent(args=None)
Return partition information for volumes mounted on this minion

CLI Example:
```bash
salt '*' disk.percent /var
```

salt.modules.disk.resize2fs(device)
Resizes the filesystem.

CLI Example: .. code-block:: bash
```bash
salt '*' disk.resize2fs /dev/sda1
```

salt.modules.disk.smart_attributes(dev, attributes=None, values=None)
Fetch SMART attributes Providing attributes will deliver only requested attributes Providing values will deliver only requested values for attributes

Default is the Backblaze recommended set (https://www.backblaze.com/blog/hard-drive-smart-stats/): (5,187,188,197,198)

New in version 2016.3.0.

CLI Example:
salt.modules.disk.tune(device, **kwargs)

Set attributes for the specified device

CLI Example:

```bash
salt '*' disk.tune /dev/sda1 read-ahead=1024 read-write=True
```

Valid options are: read-ahead, filesystem-read-ahead, read-only, read-write.

See the blockdev(8) manpage for a more complete description of these options.

salt.modules.disk.usage(args=None)

Return usage information for volumes mounted on this minion

Changed in version 2019.2.0: Default for SunOS changed to 1 kilobyte blocks

CLI Example:

```bash
salt '*' disk.usage
```

salt.modules.disk.wipe(device)

Remove the filesystem information

CLI Example:

```bash
salt '*' disk.wipe /dev/sda1
```

21.9.117  salt.modules.djangomod

Manage Django sites

salt.modules.djangomod.collectstatic(settings_module, bin_env=None, no_post_process=False, ignore=None, dry_run=False, clear=False, link=False, no_default_ignore=False, pythonpath=None, env=None, runas=None)

Collect static files from each of your applications into a single location that can easily be served in production.

CLI Example:

```bash
salt '*' django.collectstatic <settings_module>
```

salt.modules.djangomod.command(settings_module, command, bin_env=None, pythonpath=None, env=None, runas=None, **kwargs)

Run arbitrary django management command

CLI Example:

```bash
salt '*' django.command <settings_module> <command>
```

salt.modules.djangomod.createsuperuser(settings_module, username, email, bin_env=None, database=None, pythonpath=None, env=None, runas=None)

Create a super user for the database. This function defaults to use the --noinput flag which prevents the creation of a password for the superuser.

CLI Example:
salt '*' django.createsuperuser <settings_module> user user@example.com

```
salt.modules.djangomod.loaddata(settings_module, fixtures, bin_env=None, database=None, pythonpath=None, env=None)
```

Load fixture data

**Fixtures:** comma separated list of fixtures to load

**CLI Example:**

```
salt '*' django.loaddata <settings_module> <comma delimited list of fixtures>
```

```
salt.modules.djangomod.migrate(settings_module, app_label=None, migration_name=None, bin_env=None, database=None, pythonpath=None, env=None, noinput=True, runas=None)
```

Run migrate

Execute the Django-Admin migrate command (requires Django 1.7 or higher).

New in version 3000.

**settings_module** Specifies the settings module to use. The settings module should be in Python package syntax, e.g. mysite.settings. If this isn’t provided, django-admin will use the DJANGO_SETTINGS_MODULE environment variable.

**app_label** Specific app to run migrations for, instead of all apps. This may involve running other apps’ migrations too, due to dependencies.

**migration_name** Named migration to be applied to a specific app. Brings the database schema to a state where the named migration is applied, but no later migrations in the same app are applied. This may involve unapplying migrations if you have previously migrated past the named migration. Use the name zero to unapply all migrations for an app.

**bin_env** Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. /usr/bin/pip-2.7 or /usr/bin/pip-2.6. If a directory path is specified, it is assumed to be a virtualenv.

**database** Database to migrate. Defaults to ‘default’.

**pythonpath** Adds the given filesystem path to the Python import search path. If this isn’t provided, django-admin will use the PYTHONPATH environment variable.

**env** A list of environment variables to be set prior to execution.

Example:

```
module.run:
  - name: django.migrate
  - settings_module: my_django_app.settings
  - env:
    - DATABASE_USER: 'mydbuser'
```

**noinput** Suppresses all user prompts. Defaults to True.

**runas** The user name to run the command as.

**CLI Example:**

```
salt '*' django.migrate <settings_module>
salt '*' django.migrate <settings_module> <app_label>
salt '*' django.migrate <settings_module> <app_label> <migration_name>
```
salt.modules.djangomod.syncdb(\texttt{settings\_module, bin\_env=None, migrate=False, database=None, pythonpath=None, env=None, noinput=True, runas=None})

Run \texttt{syncdb}

Execute the Django-Admin \texttt{syncdb} command, if South is available on the minion the \texttt{migrate} option can be passed as \texttt{True} calling the migrations to run after the \texttt{syncdb} completes.

\textbf{NOTE:} The \texttt{syncdb} command was deprecated in Django 1.7 and removed in Django 1.9. For Django versions 1.9 or higher use the \texttt{migrate} command instead.

\textbf{CLI Example:}

\begin{verbatim}
salt '*' django.syncdb <settings_module>
\end{verbatim}

\section*{21.9.118 salt.modules.dnsmasq}

Module for managing dnsmasq

\texttt{salt.modules.dnsmasq.fullversion()}

Shows installed version of dnsmasq and compile options.

\textbf{CLI Example:}

\begin{verbatim}
salt '*' dnsmasq.fullversion
\end{verbatim}

\texttt{salt.modules.dnsmasq.get\_config(config\_file='/etc/dnsmasq.conf')}

Dumps all options from the config file.

\texttt{config\_file} The location of the config file from which to obtain contents. Defaults to /\texttt{etc/dnsmasq.conf}.

\textbf{CLI Examples:}

\begin{verbatim}
salt '*' dnsmasq.get\_config
salt '*' dnsmasq.get\_config config\_file='/etc/dnsmasq.conf'
\end{verbatim}

\texttt{salt.modules.dnsmasq.set\_config(config\_file='/etc/dnsmasq.conf', follow=True, **kwargs)}

Sets a value or a set of values in the specified file. By default, if conf-dir is configured in this file, salt will attempt to set the option in any file inside the conf-dir where it has already been enabled. If it does not find it inside any files, it will append it to the main config file. Setting follow to False will turn off this behavior.

If a config option currently appears multiple times (such as \texttt{dhcp-host}, which is specified at least once per host), the new option will be added to the end of the main config file (and not to any includes). If you need an option added to a specific include file, specify it as the \texttt{config\_file}.

\textbf{Parameters}

\begin{itemize}
\item \texttt{config\_file} (string) -- config file where settings should be updated / added.
\item \texttt{follow} (bool) -- attempt to set the config option inside any file within the \texttt{conf\_dir} where it has already been enabled.
\item \texttt{kwargs} -- key value pairs that contain the configuration settings that you want set.
\end{itemize}

\textbf{CLI Examples:}

\begin{verbatim}
salt '*' dnsmasq.set\_config domain=mydomain.com
salt '*' dnsmasq.set\_config follow=False domain=mydomain.com
salt '*' dnsmasq.set\_config config\_file='/etc/dnsmasq.conf' domain=mydomain.com
\end{verbatim}
salt.modules.dnsmasq.version()
    Shows installed version of dnsmasq.
    CLI Example:
    salt '*' dnsmasq.version

21.9.119 salt.modules.dnsutil

Compendium of generic DNS utilities.

Note: Some functions in the dnsutil execution module depend on dig.

salt.modules.dnsutil.A(host, nameserver=None)
    Return the A record(s) for host.
    Always returns a list.
    CLI Example:
    salt ns1 dnsutil.A www.google.com

salt.modules.dnsutil.AAAA(host, nameserver=None)
    Return the AAAA record(s) for host.
    Always returns a list.
    New in version 2014.7.5.
    CLI Example:
    salt ns1 dnsutil.AAAA www.google.com

salt.modules.dnsutil.MX(domain, resolve=False, nameserver=None)
    Return a list of lists for the MX of domain.
    If the 'resolve' argument is True, resolve IPs for the servers.
    It's limited to one IP, because although in practice it's very rarely a round robin, it is an acceptable configuration
    and pulling just one IP lets the data be similar to the non-resolved version. If you think an MX has multiple
    IPs, don't use the resolver here, resolve them in a separate step.
    CLI Example:
    salt ns1 dnsutil.MX google.com

salt.modules.dnsutil.NS(domain, resolve=True, nameserver=None)
    Return a list of IPs of the nameservers for domain
    If 'resolve' is False, don't resolve names.
    CLI Example:
    salt ns1 dnsutil.NS google.com

salt.modules.dnsutil.SPF(domain, record='SPF', nameserver=None)
    Return the allowed IPv4 ranges in the SPF record for domain.
If record is SPF and the SPF record is empty, the TXT record will be searched automatically. If you know the domain uses TXT and not SPF, specifying that will save a lookup.

CLI Example:
```
salt ns1 dnsutil.SPF google.com
```

```
salt.modules.dnsutil.check_ip(ip_addr)
Check that string ip_addr is a valid IP
```

CLI Example:
```
salt ns1 dnsutil.check_ip 127.0.0.1
```

```
salt.modules.dnsutil.hosts_append(hostsfile='/etc/hosts', ip_addr=None, entries=None)
Append a single line to the /etc/hosts file.
```

CLI Example:
```
salt '*' dnsutil.hosts_append /etc/hosts 127.0.0.1 ad1.yuk.co,ad2.yuk.co
```

```
salt.modules.dnsutil.hosts_remove(hostsfile='/etc/hosts', entries=None)
Remove a host from the /etc/hosts file. If doing so will leave a line containing only an IP address, then the line will be deleted. This function will leave comments and blank lines intact.
```

CLI Examples:
```
salt '*' dnsutil.hosts_remove /etc/hosts ad1.yuk.co
salt '*' dnsutil.hosts_remove /etc/hosts ad2.yuk.co,ad1.yuk.co
```

```
salt.modules.dnsutil.parse_hosts(hostsfile='/etc/hosts', hosts=None)
Parse /etc/hosts file.
```

CLI Example:
```
salt '*' dnsutil.parse_hosts
```

```
salt.modules.dnsutil.parse_zone(zonefile=None, zone=None)
Parses a zone file. Can be passed raw zone data on the API level.
```

CLI Example:
```
salt ns1 dnsutil.parse_zone /var/lib/named/example.com.zone
```

```
salt.modules.dnsutil.serial(zone='', update=False)
Return, store and update a dns serial for your zone files.
zone: a keyword for a specific zone
update: store an updated version of the serial in a grain
If update is False, the function will retrieve an existing serial or return the current date if no serial is stored. Nothing will be stored
If update is True, the function will set the serial to the current date if none exist or if the existing serial is for a previous date. If a serial for greater than the current date is already stored, the function will increment it.
This module stores the serial in a grain, you can explicitly set the stored value as a grain named dnsserial_<zone_name>.
```

CLI Example:
21.9.120  salt.modules.dockercompose module

Module to import docker-compose via saltstack
New in version 2016.3.0.

maintainer Jean Praloran <jeanpralo@gmail.com>
maturity new
depends docker-compose>=1.5
platform all

Introduction

This module allows one to deal with docker-compose file in a directory.
This is a first version only, the following commands are missing at the moment but will be built later on if the community is interested in this module:

- run
- logs
- port
- scale

Installation Prerequisites

This execution module requires at least version 1.4.0 of both docker-compose and Docker. docker-compose can easily be installed using pip.install:

```
salt myminion pip.install docker-compose>=1.5.0
```

How to use this module?

In order to use the module if you have no docker-compose file on the server you can issue the command create, it takes two arguments the path where the docker-compose.yml will be stored and the content of this latter:

```
# salt-call -l debug dockercompose.create /tmp/toto 'database:
  image: mongo:3.0
  command: mongod --smallfiles --quiet --logpath=/dev/null
  ' 
```

Then you can execute a list of method defined at the bottom with at least one argument (the path where the docker-compose.yml will be read) and an optional python list which corresponds to the services names:

```
# salt-call -l debug dockercompose.up /tmp/toto
# salt-call -l debug dockercompose.restart /tmp/toto '[database]'
# salt-call -l debug dockercompose.stop /tmp/toto
# salt-call -l debug dockercompose.rm /tmp/toto
```
Docker-compose method supported

- `up`
- `restart`
- `stop`
- `start`
- `pause`
- `unpause`
- `kill`
- `rm`
- `ps`
- `pull`
- `build`

Functions

- `docker-compose.yml management`
  - `dockercompose.create`
  - `dockercompose.get`
- `Manage containers`
  - `dockercompose.restart`
  - `dockercompose.stop`
  - `dockercompose.pause`
  - `dockercompose.unpause`
  - `dockercompose.start`
  - `dockercompose.kill`
  - `dockercompose.rm`
  - `dockercompose.up`
- `Manage containers image`
  - `dockercompose.pull`
  - `dockercompose.build`
- `Gather information about containers`
  - `dockercompose.ps`
- `Manage service definitions`
  - `dockercompose.service_create`
  - `dockercompose.service_upsert`
  - `dockercompose.service_remove`
  - `dockercompose.service_set_tag`
Detailed Function Documentation

salt.modules.dockercompose.build(path, service_names=None)
  Build image for containers in the docker-compose file. service_names is a python list, if omitted build images
  for all containers. Please note that at the moment the module does not allow you to upload your Dockerfile,
  nor any other file you could need with your docker-compose.yml, you will have to make sure the files you
  need are actually in the directory specified in the build keyword

  path Path where the docker-compose file is stored on the server

  service_names If specified will pull only the image for the specified services

  CLI Example:

  salt myminion dockercompose.build /path/where/docker-compose/stored
  salt myminion dockercompose.build /path/where/docker-compose/stored '[janus]'

salt.modules.dockercompose.create(path, docker_compose)
  Create and validate a docker-compose file into a directory

  path Path where the docker-compose file will be stored on the server

  docker_compose docker_compose file

  CLI Example:

  salt myminion dockercompose.create /path/where/docker-compose/stored content

salt.modules.dockercompose.get(path)
  Get the content of the docker-compose file into a directory

  path Path where the docker-compose file is stored on the server

  CLI Example:

  salt myminion dockercompose.get /path/where/docker-compose/stored

salt.modules.dockercompose.kill(path, service_names=None)
  Kill containers in the docker-compose file, service_names is a python list, if omitted kill all containers

  path Path where the docker-compose file is stored on the server

  service_names If specified will kill only the specified services

  CLI Example:

  salt myminion dockercompose.kill /path/where/docker-compose/stored
  salt myminion dockercompose.kill /path/where/docker-compose/stored '[janus]'

salt.modules.dockercompose.pause(path, service_names=None)
  Pause running containers in the docker-compose file, service_names is a python list, if omitted pause all con-
  tainers

  path Path where the docker-compose file is stored on the server

  service_names If specified will pause only the specified services

  CLI Example:

  salt myminion dockercompose.pause /path/where/docker-compose/stored
  salt myminion dockercompose.pause /path/where/docker-compose/stored '[janus]'

21.9. execution modules
salt.modules.dockercompose.ps(path)
List all running containers and report some information about them
path Path where the docker-compose file is stored on the server

CLI Example:
salt myminion dockercompose.ps /path/where/docker-compose/stored

salt.modules.dockercompose.pull(path, service_names=None)
Pull image for containers in the docker-compose file, service_names is a python list, if omitted pull all images
path Path where the docker-compose file is stored on the server
service_names If specified will pull only the image for the specified services

CLI Example:
salt myminion dockercompose.pull /path/where/docker-compose/stored
salt myminion dockercompose.pull /path/where/docker-compose/stored '[janus]'

salt.modules.dockercompose.restart(path, service_names=None)
Restart container(s) in the docker-compose file, service_names is a python list, if omitted restart all containers
path Path where the docker-compose file is stored on the server
service_names If specified will restart only the specified services

CLI Example:
salt myminion dockercompose.restart /path/where/docker-compose/stored
salt myminion dockercompose.restart /path/where/docker-compose/stored '[janus]'

salt.modules.dockercompose.rm(path, service_names=None)
Remove stopped containers in the docker-compose file, service_names is a python list, if omitted remove all stopped containers
path Path where the docker-compose file is stored on the server
service_names If specified will remove only the specified stopped services

CLI Example:
salt myminion dockercompose.rm /path/where/docker-compose/stored
salt myminion dockercompose.rm /path/where/docker-compose/stored '[janus]'

salt.modules.dockercompose.service_create(path, service_name, definition)
Create the definition of a docker-compose service This fails when the service already exists This does not pull or up the service This wil re-write your yaml file. Comments will be lost. Indentation is set to 2 spaces
path Path where the docker-compose file is stored on the server
service_name Name of the service to create
definition Service definition as yaml or json string

CLI Example:
salt myminion dockercompose.service_create /path/where/docker-compose/stored
    → service_name definition
salt.modules.dockercompose.service_remove(path, service_name)
Remove the definition of a docker-compose service This does not rm the container This will re-write your yaml file. Comments will be lost. Indentation is set to 2 spaces

path Path where the docker-compose file is stored on the server
service_name Name of the service to remove

CLI Example:
```
salt myminion dockercompose.service_remove /path/where/docker-compose/stored
  → service_name
```

salt.modules.dockercompose.service_set_tag(path, service_name, tag)
Change the tag of a docker-compose service This does not pull or up the service This will re-write your yaml file. Comments will be lost. Indentation is set to 2 spaces

path Path where the docker-compose file is stored on the server
service_name Name of the service to remove
tag Name of the tag (often used as version) that the service image should have

CLI Example:
```
salt myminion dockercompose.service_create /path/where/docker-compose/stored
  → service_name tag
```

salt.modules.dockercompose.service_upsert(path, service_name, definition)
Create or update the definition of a docker-compose service This does not pull or up the service This will re-write your yaml file. Comments will be lost. Indentation is set to 2 spaces

path Path where the docker-compose file is stored on the server
service_name Name of the service to create
definition Service definition as yaml or json string

CLI Example:
```
salt myminion dockercompose.service_upsert /path/where/docker-compose/stored
  → service_name definition
```

salt.modules.dockercompose.start(path, service_names=None)
Start containers in the docker-compose file, service_names is a python list, if omitted start all containers

path Path where the docker-compose file is stored on the server
service_names If specified will start only the specified services

CLI Example:
```
salt myminion dockercompose.start /path/where/docker-compose/stored
salt myminion dockercompose.start /path/where/docker-compose/stored 'janus'
```

salt.modules.dockercompose.stop(path, service_names=None)
Stop running containers in the docker-compose file, service_names is a python list, if omitted stop all containers

path Path where the docker-compose file is stored on the server
service_names If specified will stop only the specified services

CLI Example:
salt.myminion dockercompose.stop /path/where/docker-compose/stored
salt.myminion dockercompose.stop /path/where/docker-compose/stored '[janus]'

salt.modules.dockercompose.unpause(path, service_names=None)
Un-Pause containers in the docker-compose file, service_names is a python list, if omitted unpause all containers

path Path where the docker-compose file is stored on the server

service_names If specified will un-pause only the specified services

CLI Example:
salt.myminion dockercompose.pause /path/where/docker-compose/stored
salt.myminion dockercompose.pause /path/where/docker-compose/stored '[janus]'

salt.modules.dockercompose.up(path, service_names=None)
Create and start containers defined in the docker-compose.yml file located in path, service_names is a python list, if omitted create and start all containers

path Path where the docker-compose file is stored on the server

service_names If specified will create and start only the specified services

CLI Example:
salt.myminion dockercompose.up /path/where/docker-compose/stored
salt.myminion dockercompose.up /path/where/docker-compose/stored '[janus]'

21.9.121 salt.modules.dockermod

Management of Docker Containers

New in version 2015.8.0.

Changed in version 2017.7.0: This module has replaced the legacy docker execution module.

depends docker Python module

Note: Older releases of the Python bindings for Docker were called docker-py in PyPI. All releases of docker, and releases of docker-py >= 1.6.0 are supported. These python bindings can easily be installed using pip.install:
salt.myminion pip.install docker

To upgrade from docker-py to docker, you must first uninstall docker-py, and then install docker:
salt.myminion pip.uninstall docker-py
salt.myminion pip.install docker
Authentication

If you have previously performed a `docker login` from the minion, then the credentials saved in `~/.docker/config.json` will be used for any actions which require authentication. If not, then credentials can be configured in any of the following locations:

- Minion config file
- Grains
- Pillar data
- Master config file (requires `pillar_opts` to be set to `True` in Minion config file in order to work)

**Important:** Versions prior to 3000 require that Docker credentials are configured in Pillar data. Be advised that Pillar data is still recommended though, because this keeps the configuration from being stored on the Minion. Also, keep in mind that if one gets your `~/.docker/config.json`, the password can be decoded from its contents.

The configuration schema is as follows:

```yaml
docker-registries:
  <registry_url>:
    username: <username>
    password: <password>
```

For example:

```yaml
docker-registries:
  hub:
    username: foo
    password: s3cr3t
```

**Note:** As of the 2016.3.7, 2016.11.4, and 2017.7.0 releases of Salt, credentials for the Docker Hub can be configured simply by specifying `hub` in place of the registry URL. In earlier releases, it is necessary to specify the actual registry URL for the Docker Hub (i.e. `https://index.docker.io/v1/`).

More than one registry can be configured. Salt will look for Docker credentials in the `docker-registries` Pillar key, as well as any key ending in `-docker-registries`. For example:

```yaml
docker-registries:
  'https://mydomain.tld/registry:5000':
    username: foo
    password: s3cr3t

foo-docker-registries:
  https://index.foo.io/v1/: 
    username: foo
    password: s3cr3t

bar-docker-registries:
  https://index.bar.io/v1/: 
    username: foo
    password: s3cr3t
```
To login to the configured registries, use the `docker.login` function. This only needs to be done once for a given registry, and it will store/update the credentials in `~/.docker/config.json`.

**Note:** For Salt releases before 2016.3.7 and 2016.11.4, `docker.login` is not available. Instead, Salt will try to authenticate using each of your configured registries for each push/pull, behavior which is not correct and has been resolved in newer releases.

### Configuration Options

The following configuration options can be set to fine-tune how Salt uses Docker:

- `docker.url`: URL to the docker service (default: local socket).
- `docker.version`: API version to use (should not need to be set manually in the vast majority of cases)
- `docker.exec_driver`: Execution driver to use, one of `nsenter`, `lxc-attach`, or `docker-exec`. See the *Executing Commands Within a Running Container* section for more details on how this config parameter is used.

These configuration options are retrieved using `config.get` (click the link for further information).

### Executing Commands Within a Running Container

**Note:** With the release of Docker 1.13.1, the Execution Driver has been removed. Starting in versions 2016.3.6, 2016.11.4, and 2017.7.0, Salt defaults to using `docker exec` to run commands in containers, however for older Salt releases it will be necessary to set the `docker.exec_driver` config option to either `docker-exec` or `nsenter` for Docker versions 1.13.1 and newer.

Multiple methods exist for executing commands within Docker containers:

- `lxc-attach`: Default for older versions of docker
- `nsenter`: Enters container namespace to run command
- `docker-exec`: Native support for executing commands in Docker containers (added in Docker 1.3)

Adding a configuration option (see `config.get`) called `docker.exec_driver` will tell Salt which execution driver to use:

```
docker.exec_driver: docker-exec
```

If this configuration option is not found, Salt will use the appropriate interface (either `nsenter` or `lxc-attach`) based on the `Execution Driver` value returned from `docker info`. `docker-exec` will not be used by default, as it is presently (as of version 1.6.2) only able to execute commands as the effective user of the container. Thus, if a `USER` directive was used to run as a non-privileged user, `docker-exec` would be unable to perform the action as root. Salt can still use `docker-exec` as an execution driver, but must be explicitly configured (as in the example above) to do so at this time.

If possible, try to manually specify the execution driver, as it will save Salt a little work.

This execution module provides functions that shadow those from the `cmd` module. They are as follows:

- `docker.retcode`
- `docker.run`
- `docker.run_all`
- `docker.run_stderr`
- `docker.run_stdout`
- `docker.script`
- `docker.script_retcode`

**Detailed Function Documentation**

```python
class salt.modules.dockermod.DockerJSONDecoder(*, object_hook=None, parse_float=None, parse_int=None, parse_constant=None, strict=True, object_pairs_hook=None)
```

`decode(s, _w=None)`

Return the Python representation of `s` (a `str` instance containing a JSON document).

```python
salt.modules.dockermod.apply_(name, mods=None, **kwargs)
```

New in version 2019.2.0.

Apply states! This function will call highstate or state.sls based on the arguments passed in, `apply` is intended to be the main gateway for all state executions.

CLI Example:

```
salt 'docker' docker.apply web01
salt 'docker' docker.apply web01 test
salt 'docker' docker.apply web01 test,pkgs
```

```python
salt.modules.dockermod.build(path=None, repository=None, tag=None, cache=True, rm=True, api_response=False, fileobj=None, dockerfile=None, buildargs=None)
```

Changed in version 2018.3.0: If the built image should be tagged, then the repository and tag must now be passed separately using the `repository` and `tag` arguments, rather than together in the (now deprecated) `image` argument.

Builds a docker image from a Dockerfile or a URL

- `path` Path to directory on the Minion containing a Dockerfile
- `repository` Optional repository name for the image being built
  
  New in version 2018.3.0.
- `tag` [latest] Tag name for the image (required if `repository` is passed)
  
  New in version 2018.3.0.
- `image` Deprecated since version 2018.3.0: Use both `repository` and `tag` instead
- `cache` [True] Set to False to force the build process not to use the Docker image cache, and pull all required intermediate image layers
- `rm` [True] Remove intermediate containers created during build
- `api_response` [False] If True: an `API_Response` key will be present in the return data, containing the raw output from the Docker API.
- `fileobj` Allows for a file-like object containing the contents of the Dockerfile to be passed in place of a file `path` argument. This argument should not be used from the CLI, only from other Salt code.
**dockerfile**  Allows for an alternative Dockerfile to be specified. Path to alternative Dockefile is relative to the build path for the Docker container.

New in version 2016.11.0.

**buildargs**  A dictionary of build arguments provided to the docker build process.

**RETURN DATA**

A dictionary containing one or more of the following keys:

- **Id** - ID of the newly-built image
- **Time_Elapsed** - Time in seconds taken to perform the build
- **Intermediate_Containers** - IDs of containers created during the course of the build process

*(Only present if rm=False)*

- **Images** - A dictionary containing one or more of the following keys:
  - **Already_Pulled** - Layers that that were already present on the Minion
  - **Pulled** - Layers that that were pulled

*(Only present if the image specified by the "repository" and "tag" arguments was not present on the Minion, or if cache=False)*

- **Status** - A string containing a summary of the pull action (usually a message saying that an image was downloaded, or that it was up to date).

*(Only present if the image specified by the "repository" and "tag" arguments was not present on the Minion, or if cache=False)*

**CLI Example:**

```bash
salt myminion docker.build /path/to/docker/build/dir
salt myminion docker.build https://github.com/myuser/myrepo.git
  --repository=myimage tag=latest
salt myminion docker.build /path/to/docker/build/dir dockerfile=Dockefile.
  --different repository=myimage tag=dev
```

**salt.modules.dockermod.call**(name, function, *args, **kwargs)

Executes a Salt function inside a running container

New in version 2016.11.0.

The container does not need to have Salt installed, but Python is required.

**name**  Container name or ID

**function**  Salt execution module function

**CLI Example:**

```bash
salt myminion docker.call test.ping
salt myminion test.arg arg1 arg2 key1=val1
salt myminion dockerng.call compassionate_mirzakhani test.arg arg1 arg2 key1=val1
```

**salt.modules.dockermod.commit**(name, repository, tag='latest', message=None, author=None)

Changed in version 2018.3.0: The repository and tag must now be passed separately using the repository and tag arguments, rather than together in the (now deprecated) image argument.

Commits a container, thereby promoting it to an image. Equivalent to running the docker commit Docker CLI command.
name  Container name or ID to commit
repository  Repository name for the image being committed
          New in version 2018.3.0.
tag  [latest] Tag name for the image
          New in version 2018.3.0.
image  Deprecated since version 2018.3.0: Use both repository and tag instead
message  Commit message (Optional)
author  Author name (Optional)

RETURN DATA
A dictionary containing the following keys:
• Id  - ID of the newly-created image
• Image - Name of the newly-created image
• Time_Elapsed  - Time in seconds taken to perform the commit

CLI Example:
salt myminion docker.commit mycontainer myuser/myimage mytag

salt.modules.dockermod.compare_container(first, second, ignore=None)
This function is an alias of compare_containers.
          New in version 2017.7.0.
          Changed in version 2018.3.0: Renamed from docker.compare_container to docker.compare_containers (old function name remains as an alias)
Compare two containers’ Config and and HostConfig and return any differences between the two.
first  Name or ID of first container
second  Name or ID of second container
ignore  A comma-separated list (or Python list) of keys to ignore when comparing. This is useful when comparing two otherwise identical containers which have different hostnames.

CLI Examples:
salt myminion docker.compare_containers foo bar
salt myminion docker.compare_containers foo bar ignore=Hostname

salt.modules.dockermod.compare_container_networks(first, second)
New in version 2018.3.0.
Returns the differences between two containers’ networks. When a network is only present one of the two containers, that network’s diff will simply be represented with True for the side of the diff in which the network is present) and False for the side of the diff in which the network is absent.
This function works by comparing the contents of both containers’ Networks keys (under NetworkSettings) in the return data from docker.inspect_container. Because each network contains some items that either A) only set at runtime, B) naturally varying from container to container, or both, by default the following keys in each network are examined:
• Aliases
• Links
• IPAMConfig

The exception to this is if IPAMConfig is unset (i.e. null) in one container but not the other. This happens when no static IP configuration is set, and automatic IP configuration is in effect. So, in order to report on changes between automatic IP configuration in one container and static IP configuration in another container (as we need to do for the docker_container.running state), automatic IP configuration will also be checked in these cases.

This function uses the docker.compare_container_networks minion config option to determine which keys to examine. This provides flexibility in the event that features added in a future Docker release necessitate changes to how Salt compares networks. In these cases, rather than waiting for a new Salt release one can just set docker.compare_container_networks.

Changed in version 3000: This config option can now also be set in pillar data and grains. Additionally, it can be set in the master config file, provided that pillar_opts is enabled on the minion.

Note: The checks for automatic IP configuration described above only apply if IPAMConfig is among the keys set for static IP checks in docker.compare_container_networks.

first Name or ID of first container (old)
second Name or ID of second container (new)

CLI Example:
salt myminion docker.compare_container_networks foo bar

salt.modules.dockermod.compare_containers( first, second, ignore=None )
New in version 2017.7.0.

Changed in version 2018.3.0: Renamed from docker.compare_container to docker.compare_containers (old function name remains as an alias)

Compare two containers' Config and and HostConfig and return any differences between the two.

first Name or ID of first container
second Name or ID of second container
ignore A comma-separated list (or Python list) of keys to ignore when comparing. This is useful when comparing two otherwise identical containers which have different hostnames.

CLI Examples:
salt myminion docker.compare_containers foo bar
salt myminion docker.compare_containers foo bar ignore=Hostname

salt.modules.dockermod.compare_networks( first, second, ignore=[Name,Id,Created,Containers] )
New in version 2018.3.0.

Compare two networks and return any differences between the two

first Name or ID of first container
second Name or ID of second container
ignore [Name,Id,Created,Containers] A comma-separated list (or Python list) of keys to ignore when comparing.

CLI Example:
salt.myminion docker.compare_network foo bar

salt.modules.dockermod.connect_container_to_network(container, net_id, **kwargs)

New in version 2015.8.3.

Changed in version 2017.7.0: Support for ipv4_address argument added

Changed in version 2018.3.0: All arguments are now passed through to connect_container_to_network(), allowing for any new arguments added to this function to be supported automagically.

Connect container to network. See the connect_container_to_network() docs for information on supported arguments.

container Container name or ID
net_id Network name or ID

CLI Examples:

```
salt myminion docker.connect_container_to_network web-1 mynet
salt myminion docker.connect_container_to_network web-1 mynet ipv4_address=10.20.0.10
salt myminion docker.connect_container_to_network web-1
```

salt.modules.dockermod.connected(name, verbose=False)

New in version 2018.3.0.

Return a list of running containers attached to the specified network

name Network name
verbose [False] If True, return extended info about each container (IP configuration, etc.)

CLI Example:

```
salt myminion docker.connected net_name
```

salt.modules.dockermod.copy_from(name, source, dest, overwrite=False, makedirs=False)

Copy a file from inside a container to the Minion

name Container name
source Path of the file on the container's filesystem
dest Destination on the Minion. Must be an absolute path. If the destination is a directory, the file will be copied into that directory.
overwrite [False] Unless this option is set to True, then if a file exists at the location specified by the dest argument, an error will be raised.
makedirs [False] Create the parent directory on the container if it does not already exist.

RETURN DATA

A boolean (True if successful, otherwise False)

CLI Example:

```
salt myminion docker.copy_from mycontainer /var/log/nginx/access.log /home/myuser
```

salt.modules.dockermod.copy_to(name, source, dest, exec_driver=None, overwrite=False, makedirs=False)

Copy a file from the host into a container

21.9. execution modules
name  Container name

source  File to be copied to the container. Can be a local path on the Minion or a remote file from the Salt fileserver.

dest  Destination on the container. Must be an absolute path. If the destination is a directory, the file will be copied into that directory.

exec_driver  [None] If not passed, the execution driver will be detected as described above.

overwrite  [False] Unless this option is set to True, then if a file exists at the location specified by the dest argument, an error will be raised.

makedirs  [False] Create the parent directory on the container if it does not already exist.

RETURN DATA

A boolean (True if successful, otherwise False)

CLI Example:

```
salt myminion docker.copy_to mycontainer /tmp/foo /root/foo
```

```
salt.modules.dockermod.create(image, name=None, start=False, skip_translate=None, ignore_collisions=False, validate_ip_addrs=True, client_timeout=60,**kwargs)
```

Create a new container

image  Image from which to create the container

name  Name for the new container. If not provided, Docker will randomly generate one for you (it will be included in the return data).

start  [False] If True, start container after creating it

New in version 2018.3.0.

skip_translate  This function translates Salt CLI or SLS input into the format which docker-py expects. However, in the event that Salt’s translation logic fails (due to potential changes in the Docker Remote API, or to bugs in the translation code), this argument can be used to exert granular control over which arguments are translated and which are not.

Pass this argument as a comma-separated list (or Python list) of arguments, and translation for each passed argument name will be skipped. Alternatively, pass True and all translation will be skipped.

Skipping translation allows for arguments to be formatted directly in the format which docker-py expects. This allows for API changes and other issues to be more easily worked around. An example of using this option to skip translation would be:

```
salt myminion docker.create image=centos:7.3.1611 skip_translate=environment
≈    →environment="{\'FOO\': \'bar\'}"
```

See the following links for more information:

- docker-py Low-level API
- Docker Engine API

ignore_collisions  [False] Since many of docker-py’s arguments differ in name from their CLI counterparts (with which most Docker users are more familiar), Salt detects usage of these and aliases them to the docker-py version of that argument. However, if both the alias and the docker-py version of the same argument (e.g. env and environment) are used, an error will be raised. Set this argument to True to suppress these errors and keep the docker-py version of the argument.
**validate_ip_addrs** [True] For parameters which accept IP addresses as input, IP address validation will be performed. To disable, set this to **False**

**client_timeout** [60] Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

Note: This is only used if Salt needs to pull the requested image.

**CONTAINER CONFIGURATION ARGUMENTS**

**auto_remove (or rm)** [False] Enable auto-removal of the container on daemon side when the container’s process exits (analogous to running a docker container with --rm on the CLI).

Examples:
- auto_remove=True
- rm=True

**binds** Files/directories to bind mount. Each bind mount should be passed in one of the following formats:

- `<host_path>:<container_path>` - `host_path` is mounted within the container as `container_path` with read-write access.
- `<host_path>:<container_path>:<selinux_context>` - `host_path` is mounted within the container as `container_path` with read-write access. Additionally, the specified selinux context will be set within the container.
- `<host_path>:<container_path>:<read_only>` - `host_path` is mounted within the container as `container_path`, with the read-only or read-write setting explicitly defined.
- `<host_path>:<container_path>:<read_only>,<selinux_context>` - `host_path` is mounted within the container as `container_path`, with the read-only or read-write setting explicitly defined. Additionally, the specified selinux context will be set within the container.

 `<read_only>` can be either `ro` for read-write access, or `ro` for read-only access. When omitted, it is assumed to be read-write.

 `<selinux_context>` can be `z` if the volume is shared between multiple containers, or `Z` if the volume should be private.

Note: When both `<read_only>` and `<selinux_context>` are specified, there must be a comma before `<selinux_context>`.

Binds can be expressed as a comma-separated list or a Python list, however in cases where both ro/rw and an selinux context are specified, the binds *must* be specified as a Python list.

Examples:
- `binds=/srv/www:/var/www:ro`
- `binds=/srv/www:/var/www:rw`
- `binds=/srv/www:/var/www`
- `binds="[\'/srv/www:/var/www:ro,Z']"`
- `binds="[\'/srv/www:/var/www:rw,Z']"`
- `binds=/srv/www:/var/www:Z`
Note: The second and third examples above are equivalent to each other, as are the last two examples.

**blkio_weight**  Block IO weight (relative weight), accepts a weight value between 10 and 1000.

Example: `blkio_weight=100`

**blkio_weight_device**  Block IO weight (relative device weight), specified as a list of expressions in the format `PATH:WEIGHT`

Example: `blkio_weight_device=/dev/sda:100`

**cap_add**  List of capabilities to add within the container. Can be passed as a comma-separated list or a Python list. Requires Docker 1.2.0 or newer.

Examples:

- `cap_add=SYS_ADMIN,MKNOD`
- `cap_add="[SYS_ADMIN, MKNOD]"

**cap_drop**  List of capabilities to drop within the container. Can be passed as a comma-separated string or a Python list. Requires Docker 1.2.0 or newer.

Examples:

- `cap_drop=SYS_ADMIN,MKNOD`
- `cap_drop="[SYS_ADMIN, MKNOD]"

**command (or cmd)**  Command to run in the container

Example: `command=bash` or `cmd=bash`

Changed in version 2015.8.1: `cmd` is now also accepted

**cpuset_cpus (or cpuset)**  CPUs on which which to allow execution, specified as a string containing a range (e.g. `0-3`) or a comma-separated list of CPUs (e.g. `0,1`).

Examples:

- `cpuset_cpus="0-3"
- `cpuset=0,1`

**cpuset_mems**  Memory nodes on which which to allow execution, specified as a string containing a range (e.g. `0-3`) or a comma-separated list of MEMs (e.g. `0,1`). Only effective on NUMA systems.

Examples:

- `cpuset_mems="0-3"
- `cpuset_mems=0,1`

**cpu_group**  The length of a CPU period in microseconds

Example: `cpu_group=100000`

**cpu_period**  Microseconds of CPU time that the container can get in a CPU period

Example: `cpu_period=50000`

**cpu_shares**  CPU shares (relative weight), specified as an integer between 2 and 1024.

Example: `cpu_shares=512`
detach [False] If True, run the container's command in the background (daemon mode)

Example: `detach=True`

devices List of host devices to expose within the container

Examples:

- `devices="/dev/net/tun,/dev/xvda1:/dev/xvda1,/dev/xvdb1:/dev/xvdb1:r"
- `devices="#[dev/net/tun', '/dev/xvda1:/dev/xvda1', '/dev/xvdb1:/dev/xvdb1:r']"

device_read_bps Limit read rate (bytes per second) from a device, specified as a list of expressions in the format PATH:RATE, where RATE is either an integer number of bytes, or a string ending in kb, mb, or gb.

Examples:

- `device_read_bps="/dev/sda:1mb,/dev/sdb:5mb"
- `device_read_bps="#[dev/sda:100mb', '/dev/sdb:5mb']"

device_read_iops Limit read rate (I/O per second) from a device, specified as a list of expressions in the format PATH:RATE, where RATE is a number of I/O operations.

Examples:

- `device_read_iops="/dev/sda:1000,/dev/sdb:500"
- `device_read_iops="#[dev/sda:1000', '/dev/sdb:500']"

device_write_bps Limit write rate (bytes per second) from a device, specified as a list of expressions in the format PATH:RATE, where RATE is either an integer number of bytes, or a string ending in kb, mb or gb.

Examples:

- `device_write_bps="/dev/sda:100mb,/dev/sdb:50mb"
- `device_write_bps="#[dev/sda:100mb', '/dev/sdb:50mb']"

device_write_iops Limit write rate (I/O per second) from a device, specified as a list of expressions in the format PATH:RATE, where RATE is a number of I/O operations.

Examples:

- `device_write_iops="/dev/sda:1000,/dev/sdb:500"
- `device_write_iops="#[dev/sda:1000', '/dev/sdb:500']"

dns List of DNS nameservers. Can be passed as a comma-separated list or a Python list.

Examples:

- `dns=8.8.8.8,8.8.4.4`
- `dns="#[8.8.8.8', '8.8.4.4']"

Note: To skip IP address validation, use `validate_ip_addrs=False`

dns_opt Additional options to be added to the container's `resolv.conf` file

Example: `dns_opt=ndots:9`
**dns_search** List of DNS search domains. Can be passed as a comma-separated list or a Python list.

Examples:
- `dns_search=foo1.domain.tld,foo2.domain.tld`
- `dns_search=[foo1.domain.tld, foo2.domain.tld]`

**domainname** The domain name to use for the container

Example: `domainname=domain.tld`

**entrypoint** Entrypoint for the container. Either a string (e.g. "mycmd --arg1 --arg2") or a Python list (e.g. "['mycmd', 'arg1', 'arg2']")

Examples:
- `entrypoint='cat access.log'
- `entrypoint=['cat', 'access.log']`

**environment** (or `env`) Either a dictionary of environment variable names and their values, or a Python list of strings in the format `VARNAME=value`.

Examples:
- `environment='VAR1=value,VAR2=value'
- `environment=[VAR1=value, VAR2=value]
- `environment={'VAR1': 'value', 'VAR2': 'value'}`

**extra_hosts** Additional hosts to add to the container's /etc/hosts file. Can be passed as a comma-separated list or a Python list. Requires Docker 1.3.0 or newer.

Examples:
- `extra_hosts=web1:10.9.8.7,web2:10.9.8.8`
- `extra_hosts=['web1:10.9.8.7', 'web2:10.9.8.8']`
- `extra_hosts={'web1': '10.9.8.7', 'web2': '10.9.8.8'}`

---

**group_add** List of additional group names and/or IDs that the container process will run as

Examples:
- `group_add=web,network`
- `group_add=['web', 'network']`

**hostname** Hostname of the container. If not provided, and if a `name` has been provided, the hostname will default to the `name` that was passed.

Example: `hostname=web1`

**Warning:** If the container is started with `network_mode=host`, the hostname will be overridden by the hostname of the Minion.

**interactive** (or `stdin_open`): False Leave stdin open, even if not attached

Examples:
- interactive=True
- stdin_open=True

**ipc_mode (or ipc)** Set the IPC mode for the container. The default behavior is to create a private IPC namespace for the container, but this option can be used to change that behavior:

- container:<container_name_or_id> reuses another container shared memory, semaphores and message queues
- host: use the host's shared memory, semaphores and message queues

Examples:

- ipc_mode=container:foo
- ipc=host

| Warning: Using host gives the container full access to local shared memory and is therefore considered insecure. |

**isolation** Specifies the type of isolation technology used by containers

Example: isolation=hyperv

| Note: The default value on Windows server is process, while the default value on Windows client is hyperv. On Linux, only default is supported. |

**labels (or label)** Add metadata to the container. Labels can be set both with and without values:

Examples:

- labels=foo,bar=baz
- labels="['foo', 'bar=baz']"

Changed in version 2018.3.0: Labels both with and without values can now be mixed. Earlier releases only permitted one method or the other.

**links** Link this container to another. Links should be specified in the format <container_name_or_id>:<link_alias>. Multiple links can be passed, ether as a comma separated list or a Python list.

Examples:

- links=web1:link1,web2:link2,
- links="['web1:link1', 'web2:link2']"
- links="{'web1': 'link1', 'web2': 'link2'}"

**log_driver** Set container's logging driver. Requires Docker 1.6 or newer.

Example:

- log_driver=syslog

| Note: The logging driver feature was improved in Docker 1.13 introducing option name changes. Please see Docker's Configure logging drivers documentation for more information. |
**log_opt** Config options for the `log_driver` config option. Requires Docker 1.6 or newer.

Example:

- `log_opt="syslog-address=tcp://192.168.0.42,syslog-facility=daemon"
- `log_opt=\[\{syslog-address=tcp://192.168.0.42, \n  syslog-facility=daemon\}\]`
- `log_opt=\{
  'syslog-address': 'tcp://192.168.0.42',
  'syslog-facility': 'daemon'
\}`

**lxc_conf** Additional LXC configuration parameters to set before starting the container.

Examples:

- `lxc_conf="lxc.utsname=docker,lxc.arch=x86_64"
- `lxc_conf=\['lxc.utsname=docker', 'lxc.arch=x86_64']\`
- `lxc_conf=\{'lxc.utsname': 'docker', 'lxc.arch': 'x86_64'\}`

**Note:** These LXC configuration parameters will only have the desired effect if the container is using the LXC execution driver, which has been deprecated for some time.

**mac_address** MAC address to use for the container. If not specified, a random MAC address will be used.

Example: `mac_address=01:23:45:67:89:0a`

**mem_limit (or memory)** [0] Memory limit. Can be specified in bytes or using single-letter units (i.e. 512M, 2G, etc.). A value of 0 (the default) means no memory limit.

Examples:

- `mem_limit=512M`
- `memory=1073741824`

**mem_swappiness** Tune a container's memory swappiness behavior. Accepts an integer between 0 and 100.

Example: `mem_swappiness=60`

**memswap_limit (or memory_swap)** [-1] Total memory limit (memory plus swap). Set to -1 to disable swap. A value of 0 means no swap limit.

Examples:

- `memswap_limit=1G`
- `memory_swap=2147483648`

**network_disabled** [False] If True, networking will be disabled within the container.

Example: `network_disabled=True`

**network_mode** [bridge] One of the following:

- `bridge` - Creates a new network stack for the container on the docker bridge
- `none` - No networking (equivalent of the Docker CLI argument `--net=none`). Not to be confused with Python's `None`.
- `container:<name_or_id>` - Reuses another container's network stack
- `host` - Use the host's network stack inside the container
Warning: Using host mode gives the container full access to the hosts system's services (such as D-Bus), and is therefore considered insecure.

Examples:
  - network_mode=null
  - network_mode=container:web1

oom_killer_disable Whether to disable OOM killer
  Example: oom_killer_disable=False

oom_score_adj An integer value containing the score given to the container in order to tune OOM killer preferences
  Example: oom_score_adj=500

pid_mode Set to host to use the host container's PID namespace within the container. Requires Docker 1.5.0 or newer.
  Example: pid_mode=host

pids_limit Set the container's PID limit. Set to -1 for unlimited.
  Example: pids_limit=2000

port_bindings (or publish) Bind exposed ports which were exposed using the ports argument to docker. create. These should be passed in the same way as the --publish argument to the docker run CLI command:
  - ip:port:containerPort - Bind a specific IP and port on the host to a specific port within the container.
  - ip::containerPort - Bind a specific IP and an ephemeral port to a specific port within the container.
  - hostPort:containerPort - Bind a specific port on all of the host's interfaces to a specific port within the container.
  - containerPort - Bind an ephemeral port on all of the host's interfaces to a specific port within the container.

Multiple bindings can be separated by commas, or passed as a Python list. The below two examples are equivalent:
  - port_bindings="5000:5000,2123:2123/udp,8080"
  - port_bindings="["5000:5000", "2123:2123/udp", 8080]"

Port bindings can also include ranges:
  - port_bindings="14505-14506:4505-4506"

Note: When specifying a protocol, it must be passed in the containerPort value, as seen in the examples above.

ports A list of ports to expose on the container. Can be passed as comma-separated list or a Python list. If the protocol is omitted, the port will be assumed to be a TCP port.

Examples:
  - ports=1111,2222/udp
• ports="[1111, '2222/udp']"

privileged  [False] If True, runs the exec process with extended privileges
  Example: privileged=True

publish_all_ports (or publish_all): False  Publish all ports to the host
  Example: publish_all_ports=True

read_only  [False] If True, mount the container’s root filesystem as read only
  Example: read_only=True

restart_policy (or restart)  Set a restart policy for the container. Must be passed as a string in the format
  policy[:retry_count] where policy is one of always, unless-stopped, or on-failure, and
  retry_count is an optional limit to the number of retries. The retry count is ignored when using
  the always or unless-stopped restart policy.
  Examples:
    • restart_policy=on-failure:5
    • restart_policy=always

security_opt  Security configuration for MLS systems such as SELinux and AppArmor. Can be passed as a
  comma-separated list or a Python list.
  Examples:
    • security_opt=apparmor:unconfined, param2:value2
    • security_opt='["apparmor:unconfined", "param2:value2"]'

  Important: Some security options can contain commas. In these cases, this argument must be passed
  as a Python list, as splitting by comma will result in an invalid configuration.

  Note: See the documentation for security_opt at https://docs.docker.com/engine/reference/run/
  #security-configuration

shm_size  Size of /dev/shm
  Example: shm_size=128M

stop_signal  The signal used to stop the container. The default is SIGTERM.
  Example: stop_signal=SIGRTMIN+3

stop_timeout  Timeout to stop the container, in seconds
  Example: stop_timeout=5

storage_opt  Storage driver options for the container
  Examples:
    • storage_opt='dm.basesize=40G'
    • storage_opt="[dm.basesize=40G]"
    • storage_opt="{'dm.basesize': '40G'}"
**sysctls (or sysctl)** Set sysctl options for the container

Examples:

- `sysctl='fs.nr_open=1048576,kernel.pid_max=32768'
- `sysctls=['fs.nr_open=1048576', 'kernel.pid_max=32768']`
- `sysctls={'fs.nr_open': '1048576', 'kernel.pid_max': '32768'}`

**tmpfs** A map of container directories which should be replaced by tmpfs mounts, and their corresponding mount options. Can be passed as Python list of PATH:VALUE mappings, or a Python dictionary. However, since commas usually appear in the values, this option cannot be passed as a comma-separated list.

Examples:

- `tmpfs=['/run:rw,noexec,nosuid,size=65536k', '/var/lib/mysql:rw, noexec,nosuid,size=600m']`
- `tmpfs={'/run': 'rw,noexec,nosuid,size=65536k', '/var/lib/mysql': 'rw,noexec,nosuid,size=600m'}`

**tty** [False] Attach TTYs

Example: `tty=True`

**ulimits (or ulimit)** List of ulimits. These limits should be passed in the format `<ulimit_name>:<soft_limit>:<hard_limit>`, with the hard limit being optional. Can be passed as a comma-separated list or a Python list.

Examples:

- `ulimits="nofile=1024:1024,nproc=60"
- `ulimits=['nofile=1024:1024', 'nproc=60']`

**user** User under which to run exec process

Example: `user=foo`

**userns_mode (or user_ns_mode)** Sets the user namespace mode, when the user namespace remapping option is enabled.

Example: `userns_mode=host`

**volumes (or volume)** List of directories to expose as volumes. Can be passed as a comma-separated list or a Python list.

Examples:

- `volumes=/mnt/vol1,/mnt/vol2`
- `volume="/mnt/vol1", "/mnt/vol2"]`

**volumes_from** Container names or IDs from which the container will get volumes. Can be passed as a comma-separated list or a Python list.

Example: `volumes_from=foo,volumes_from=foo,bar,volumes_from="[foo, bar]"

**volume_driver** Sets the container's volume driver

Example: `volume_driver=foobar`

**working_dir (or workdir)** Working directory inside the container

Examples:
* working_dir=/var/log/nginx
* workdir=/var/www/myapp

**RETURN DATA**

A dictionary containing the following keys:

- **Id** - ID of the newly-created container
- **Name** - Name of the newly-created container

**CLI Example:**

```bash
# Create a data-only container
salt myminion docker.create myuser/mycontainer volumes="/mnt/vol1,/mnt/vol2"
```

```bash
# Create a CentOS 7 container that will stay running once started
salt myminion docker.create centos:7 name=mycent7 interactive=True tty=True
→command=bash
```

salt.modules.dockermod.create_network(**name**, **skip_translate=None**, **ignore_collisions=False**, **validate_ip_addrs=True**, **client_timeout=60**, **kwargs**)  

**Note:** This function supports all arguments for network and IPAM pool configuration which are available for the release of docker-py installed on the minion. For that reason, the arguments described below in the NETWORK CONFIGURATION ARGUMENTS and IP ADDRESS MANAGEMENT (IPAM) sections may not accurately reflect what is available on the minion. The docker.get_client_args function can be used to check the available arguments for the installed version of docker-py (they are found in the network_config and ipam_config sections of the return data), but Salt will not prevent a user from attempting to use an argument which is unsupported in the release of Docker which is installed. In those cases, network creation be attempted but will fail.

**name** Network name

**skip_translation** This function translates Salt CLI or SLS input into the format which docker-py expects. However, in the event that Salt’s translation logic fails (due to potential changes in the Docker Remote API, or to bugs in the translation code), this argument can be used to exert granular control over which arguments are translated and which are not.

Pass this argument as a comma-separated list (or Python list) of arguments, and translation for each passed argument name will be skipped. Alternatively, pass `True` and all translation will be skipped.

Skipping translation allows for arguments to be formatted directly in the format which docker-py expects. This allows for API changes and other issues to be more easily worked around. See the following links for more information:

- docker-py Low-level API
- Docker Engine API

New in version 2018.3.0.

**ignore_collisions** [False] Since many of docker-py’s arguments differ in name from their CLI counterparts (with which most Docker users are more familiar), Salt detects usage of these and aliases them to the docker-py version of that argument. However, if both the alias and the docker-py version of the same
argument (e.g. `options` and `driver_opts`) are used, an error will be raised. Set this argument to `True` to suppress these errors and keep the docker-py version of the argument.

New in version 2018.3.0.

`validate_ip_addrs` [True] For parameters which accept IP addresses as input, IP address validation will be performed. To disable, set this to `False`.

---

**Note:** When validating subnets, whether or not the IP portion of the subnet is a valid subnet boundary will not be checked. The IP will portion will be validated, and the subnet size will be checked to confirm it is a valid number (1-32 for IPv4, 1-128 for IPv6).

New in version 2018.3.0.

**NETWORK CONFIGURATION ARGUMENTS**

`driver` Network driver

Example: `driver=macvlan`

`driver_opts` (or `driver_opt`, or `options`) Options for the network driver. Either a dictionary of option names and values or a Python list of strings in the format `varname=value`.

Examples:

- `driver_opts='macvlan_mode=bridge,parent=eth0'`
- `driver_opts="[\'macvlan_mode=bridge\', \'parent=eth0\']"`
- `driver_opts="\{\'macvlan_mode\': \'bridge\', \'parent\': \'eth0\'\}"`

`check_duplicate` [True] If `True`, checks for networks with duplicate names. Since networks are primarily keyed based on a random ID and not on the name, and network name is strictly a user-friendly alias to the network which is uniquely identified using ID, there is no guaranteed way to check for duplicates. This option provides a best effort, checking for any networks which have the same name, but it is not guaranteed to catch all name collisions.

Example: `check_duplicate=False`

`internal` [False] If `True`, restricts external access to the network

Example: `internal=True`

`labels` Add metadata to the network. Labels can be set both with and without values.

Examples (with values):

- `labels="label1=value1,label2=value2"
- `labels="[\'label1=value1\', \'label2=value2\']"
- `labels="\{\'label1\': \'value1\', \'label2\': \'value2\'\}"`

Examples (without values):

- `labels=label1,label2`
- `labels="[\'label1\', \'label2\']"

`enable_ipv6` (or `ipv6`) [False] Enable IPv6 on the network

Example: `enable_ipv6=True`
**attachable** [False] If True, and the network is in the global scope, non-service containers on worker nodes will be able to connect to the network.

Example: attachable=True

**Note:** While support for this option was added in API version 1.24, its value was not added to the inpsect results until API version 1.26. The version of Docker which is available for CentOS 7 runs API version 1.24, meaning that while Salt can pass this argument to the API, it has no way of knowing the value of this config option in an existing Docker network.

**scope** Specify the network's scope (local, global or swarm)

Example: scope=local

**ingress** [False] If True, create an ingress network which provides the routing-mesh in swarm mode

Example: ingress=True

**IP ADDRESS MANAGEMENT (IPAM)**

This function supports networks with either IPv4, or both IPv4 and IPv6. If configuring IPv4, then you can pass the IPAM arguments as shown below, as individual arguments on the Salt CLI. However, if configuring IPv4 and IPv6, the arguments must be passed as a list of dictionaries, in the `ipam_pools` argument. See the CLI Examples below. These docs also have more information on these arguments.

**IPAM ARGUMENTS**

**ipam_driver** IPAM driver to use, if different from the default one

Example: ipam_driver=foo

**ipam_opts** Options for the IPAM driver. Either a dictionary of option names and values or a Python list of strings in the format `varname=value`.

Examples:

- `ipam_opts='foo=bar,baz=qux'`
- `ipam_opts="["foo=bar", "baz=quz"]"`
- `ipam_opts="\{"foo": "bar", "baz": "qux\}\}"`

**IPAM POOL ARGUMENTS**

**subnet** Subnet in CIDR format that represents a network segment

Example: subnet=192.168.50.0/25

**iprange (or ip_range)** Allocate container IP from a sub-range within the subnet

Subnet in CIDR format that represents a network segment

Example: iprange=192.168.50.64/26

**gateway** IPv4 gateway for the master subnet

Example: gateway=192.168.50.1
aux_addresses (or aux_address)  A dictionary of mapping container names to IP addresses which should be allocated for them should they connect to the network. Either a dictionary of option names and values or a Python list of strings in the format host=ipaddr.

Examples:
- aux_addresses='foo.bar.tld=192.168.50.10,hello.world.tld=192.168.50.11'
- aux_addresses=['foo.bar.tld=192.168.50.10', 'hello.world.tld=192.168.50.11']
- aux_addresses={"foo.bar.tld": '192.168.50.10', 'hello.world.tld': '192.168.50.11'}

CLI Examples:
```
salt myminion docker.create_network web_network driver=bridge
salt myminion docker.create_network macvlan_network driver=macvlan driver_opts={
    'parent': 'eth0'}
gateway=172.20.0.1 subnet=172.20.0.0/24
salt myminion docker.create_network mynet ipam_pools=['{"subnet": "10.0.0.0/24",
    "gateway": "10.0.0.1"},{"subnet": "fe3f:2180:26:1::60/123", "gateway":
    "fe3f:2180:26:1::61"}]
```

salt.modules.dockermod.create_volume(name, driver=None, driver_opts=None)
Create a new volume

New in version 2015.8.4.

- **name** name of volume
- **driver** Driver of the volume
- **driver_opts** Options for the driver volume

CLI Example:
```
salt myminion docker.create_volume my_volume driver=local
```

salt.modules.dockermod.dangling(prune=False, force=False)
Return top-level images (those on which no other images depend) which do not have a tag assigned to them. These include:
- Images which were once tagged but were later untagged, such as those which were superseded by committing a new copy of an existing tagged image.
- Images which were loaded using `docker.load` (or the `docker load` Docker CLI command), but not tagged.

- **prune** [False] Remove these images
- **force** [False] If True, and if prune=True, then forcibly remove these images.

RETURN DATA
If prune=False, the return data will be a list of dangling image IDs.
If prune=True, the return data will be a dictionary with each key being the ID of the dangling image, and the following information for each image:
• Comment - Any error encountered when trying to prune a dangling image
  
  (Only present if prune failed)

• Removed - A boolean (True if prune was successful, False if not)

CLI Example:

```
salt myminion docker.dangling
salt myminion docker.dangling prune=True
```

**salt.modules.dockermod.depends(name)**

Returns the containers and images, if any, which depend on the given image

**name** Name or ID of image

**RETURN DATA**

A dictionary containing the following keys:

• **Containers** - A list of containers which depend on the specified image

• **Images** - A list of IDs of images which depend on the specified image

CLI Example:

```
salt myminion docker.depends myimage
salt myminion docker.depends 0123456789ab
```

**salt.modules.dockermod.diff(name)**

Get information on changes made to container's filesystem since it was created. Equivalent to running the docker diff Docker CLI command.

**name** Container name or ID

**RETURN DATA**

A dictionary containing any of the following keys:

• **Added** - A list of paths that were added.

• **Changed** - A list of paths that were changed.

• **Deleted** - A list of paths that were deleted.

These keys will only be present if there were changes, so if the container has no differences the return dict will be empty.

CLI Example:

```
salt myminion docker.diff mycontainer
```

**salt.modules.dockermod.disconnect_all_containers_from_network(network_id)**

New in version 2018.3.0.

Runs docker.disconnect_container_from_network on all containers connected to the specified network, and returns the names of all containers that were disconnected.

**network_id** Network name or ID

CLI Examples:

```
salt myminion docker.disconnect_all_containers_from_network mynet
salt myminion docker.disconnect_all_containers_from_network 1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abacc21e14f7f014f729b2bc
```
salt.modules.dockermod.disconnect_container_from_network(container, network_id)
    Disconnect container from network
    container Container name or ID
    network_id Network name or ID
    CLI Examples:

    salt myminion docker.disconnect_container_from_network web-1 mynet
    salt myminion docker.disconnect_container_from_network web-1
    →1f9d2454d0872b68dd9e8744c6e7a4c6b86f10abacc21e14f7f014f729b2bc

salt.modules.dockermod.exists(name)
    Check if a given container exists
    name Container name or ID
    RETURN DATA
    A boolean (True if the container exists, otherwise False)
    CLI Example:

    salt myminion docker.exists mycontainer

salt.modules.dockermod.export(name, path, overwrite=False, makedirs=False, compression=None, **kwargs)
    Exports a container to a tar archive. It can also optionally compress that tar archive, and push it up to the
    Master.
    name Container name or ID
    path Absolute path on the Minion where the container will be exported
    overwrite [False] Unless this option is set to True, then if a file exists at the location specified by the path
    argument, an error will be raised.
    makedirs [False] If True, then if the parent directory of the file specified by the path argument does not
    exist, Salt will attempt to create it.
    compression [None] Can be set to any of the following:
        • gzip or gz for gzip compression
        • bzip2 or bzip2 for bzip2 compression
        • xz or lzma for XZ compression (requires xz-utils, as well as the lzma module from Python 3.3,
          available in Python 2 and Python 3.0-3.2 as backports.lzma)
        This parameter can be omitted and Salt will attempt to determine the compression type by examining
        the filename passed in the path parameter.
    push [False] If True, the container will be pushed to the master using cp.push.

    Note: This requires file_recv to be set to True on the Master.

    RETURN DATA
    A dictionary will containing the following keys:
        • Path - Path of the file that was exported
- Push - Reports whether or not the file was successfully pushed to the Master
  
  *(Only present if push=True)*

- Size - Size of the file, in bytes

- Size_Human - Size of the file, in human-readable units

- Time_Elapsed - Time in seconds taken to perform the export

CLI Examples:

```
salt myminion docker.export mycontainer /tmp/mycontainer.tar
salt myminion docker.export mycontainer /tmp/mycontainer.tar.xz push=True
```

```python
salt.modules.dockermod.get_client_args(limit=None)
```

New in version 2016.3.6, 2016.11.4, 2017.7.0.

Changed in version 2017.7.0: Replaced the container config args with the ones from the API's
`create_container()` function.

Changed in version 2018.3.0: Added ability to limit the input to specific client functions

Many functions in Salt have been written to support the full list of arguments for a given function in the `docker-py` Low-level API. However, depending on the version of docker-py installed on the minion, the available arguments may differ. This function will get the arguments for various functions in the installed version of docker-py, to be used as a reference.

**limit**  
An optional list of categories for which to limit the return. This is useful if only a specific set of arguments is desired, and also keeps other function's argspecs from needlessly being examined.

**AVAILABLE LIMITS**

- `create_container` - arguments accepted by `create_container()` (used by `docker.create`

- `host_config` - arguments accepted by `create_host_config()` (used to build the host config for `docker.create`

- `connect_container_to_network` - arguments used by `connect_container_to_network()` to construct an endpoint config when connecting to a network (used by `docker.connect_container_to_network`

- `create_network` - arguments accepted by `create_network()` (used by `docker.create_network`

- `ipam_config` - arguments used to create an IPAM pool (used by `docker.create_network` in the process of constructing an IPAM config dictionary)

CLI Example:

```
salt myminion docker.get_client_args
salt myminion docker.get_client_args logs
salt myminion docker.get_client_args create_container, connect_container_to_network
```

```python
salt.modules.dockermod.highstate(name, saltenv='base', **kwargs)
```

Apply a highstate to the running container

New in version 2019.2.0.

The container does not need to have Salt installed, but Python is required.

**name**  
Container name or ID

**saltenv** [base] Specify the environment from which to retrieve the SLS indicated by the `mods` parameter.

CLI Example:
salt myminion docker.highstate compassionate_mirzakhani

salt.modules.dockermod.history(name, quiet=False)
Return the history for an image. Equivalent to running the docker history Docker CLI command.

name  Container name or ID
quiet  [False] If True, the return data will simply be a list of the commands run to build the container.

```
$ salt myminion docker.history nginx:latest quiet=True
myminion:
  - FROM scratch
  - ADD file:ef063ed0ae9579362871b9f23d2bc0781ef7cd4de6ac822052cf6c9c5a12b1e2 in /
  - CMD [/bin/bash]
  - MAINTAINER NGINX Docker Maintainers "docker-maint@nginx.com"
  - apt-key adv --keyserver pgp.mit.edu --recv-keys 573BF6D6B3D8FBC641079A6ABABF5BD827BD9BF62
  - echo "deb http://nginx.org/packages/mainline/debian/ wheezy nginx" >> /etc/apt/sources.list
  - ENV NGINX_VERSION=1.7.10-1-wheezy
  - apt-get update && apt-get install -y ca-certificates nginx=${NGINX_VERSION} && rm -rf /var/lib/apt/lists/*
  - ln -sf /dev/stdout /var/log/nginx/access.log
  - ln -sf /dev/stderr /var/log/nginx/error.log
  - VOLUME [/var/cache/nginx]
  - EXPOSE map[80/tcp:443/tcp:][]
  - CMD [nginx -g daemon off;]
  - https://github.com/saltstack/salt/pull/22421
```

RETURN DATA
If quiet=False, the return value will be a list of dictionaries containing information about each step taken to build the image. The keys in each step include the following:

- Command - The command executed in this build step
- Id - Layer ID
- Size - Cumulative image size, in bytes
- Size_Human - Cumulative image size, in human-readable units
- Tags - Tag(s) assigned to this layer
- Time_Created_Epoch - Time this build step was completed (Epoch time)
- Time_Created_Local - Time this build step was completed (Minion's local timezone)

CLI Example:
```
salt myminion docker.exists mycontainer
```

salt.modules.dockermod.images(verbos=False, **kwargs)
Returns information about the Docker images on the Minion. Equivalent to running the docker images Docker CLI command.

all  [False] If True, untagged images will also be returned
verbose  [False] If True, a docker inspect will be run on each image returned.

RETURN DATA
A dictionary with each key being an image ID, and each value some general info about that image (time created, size, tags associated with the image, etc.)

CLI Example:

```python
salt myminion docker.images
salt myminion docker.images all=True
```

```
salt.modules.dockermod.import_(source, repository, tag='latest', api_response=False)
```

Changed in version 2018.3.0: The repository and tag must now be passed separately using the repository and tag arguments, rather than together in the (now deprecated) image argument.

Imports content from a local tarball or a URL as a new docker image

- **source** Content to import (URL or absolute path to a tarball). URL can be a file on the Salt filesytem (i.e. `salt://path/to/rootfs/tarball.tar.xz`). To import a file from a saltenv other than base (e.g. `dev`), pass it at the end of the URL (ex. `salt://path/to/rootfs/tarball.tar.xz?saltenv=dev`).

- **repository** Repository name for the image being imported
  
  New in version 2018.3.0.

- **tag** [latest] Tag name for the image
  
  New in version 2018.3.0.

- **image** Deprecated since version 2018.3.0: Use both repository and tag instead

- **api_response** [False] If True an api_response key will be present in the return data, containing the raw output from the Docker API.

**RETURN DATA**

A dictionary containing the following keys:

- **Id** - ID of the newly-created image
- **Image** - Name of the newly-created image
- **Time_Elapsed** - Time in seconds taken to perform the commit

CLI Example:

```python
salt myminion docker.import /tmp/cent7-minimal.tar.xz myuser/centos
salt myminion docker.import /tmp/cent7-minimal.tar.xz myuser/centos:7
salt myminion docker.import salt://dockerimages/cent7-minimal.tar.xz myuser/
  → centos:7
```

```
salt.modules.dockermod.info()
```

Returns a dictionary of system-wide information. Equivalent to running the `docker info` Docker CLI command.

CLI Example:

```python
salt myminion docker.info
```

```
salt.modules.dockermod.inspect(name)
```

Changed in version 2017.7.0: Volumes and networks are now checked, in addition to containers and images.

This is a generic container/image/volume/network inspecton function. It will run the following functions in order:

- **docker.inspect_container**
- `docker.inspect_image`
- `docker.inspect_volume`
- `docker.inspect_network`

The first of these to find a match will be returned.

**name** Container/image/volume/network name or ID

**RETURN DATA**
A dictionary of container/image/volume/network information

**CLI Example:**
```
salt myminion docker.inspect mycontainer
salt myminion docker.inspect busybox
```

salt.modules.dockermod.inspect_container(name)

Retrieves container information. Equivalent to running the `docker inspect` Docker CLI command, but will only look for container information.

**name** Container name or ID

**RETURN DATA**
A dictionary of container information

**CLI Example:**
```
salt myminion docker.inspect_container mycontainer
salt myminion docker.inspect_container 0123456789ab
```

salt.modules.dockermod.inspect_image(name)

Retrieves image information. Equivalent to running the `docker inspect` Docker CLI command, but will only look for image information.

**Note:** To inspect an image, it must have been pulled from a registry or built locally. Images on a Docker registry which have not been pulled cannot be inspected.

**name** Image name or ID

**RETURN DATA**
A dictionary of image information

**CLI Examples:**
```
salt myminion docker.inspect_image busybox
salt myminion docker.inspect_image centos:6
salt myminion docker.inspect_image 0123456789ab
```

salt.modules.dockermod.inspect_network(network_id)

Inspect Network

**network_id** ID of network

**CLI Example:**
salt modules.dockermod.inspect_volume(name)
Inspect Volume

New in version 2015.8.4.

name Name of volume

CLI Example:
salt myminion docker.inspect_volume my_volume

salt modules.dockermod.kill(name)
Kill all processes in a running container instead of performing a graceful shutdown

name Container name or ID

RETURN DATA
A dictionary will be returned, containing the following keys:

- status - A dictionary showing the prior state of the container as well as the new state
- result - A boolean noting whether or not the action was successful
- comment - Only present if the container cannot be killed

CLI Example:
salt myminion docker.kill mycontainer

salt modules.dockermod.layers(name)
Returns a list of the IDs of layers belonging to the specified image, with the top-most layer (the one corresponding to the passed name) appearing last.

name Image name or ID

CLI Example:
salt myminion docker.layers centos:7

salt modules.dockermod.list_containers(**kwargs)
Returns a list of containers by name. This is different from docker.ps in that docker.ps returns its results organized by container ID.

all [False] If True, stopped containers will be included in return data

CLI Example:
salt myminion docker.inspect_image <image>

salt modules.dockermod.list_tags()
Returns a list of tagged images

CLI Example:
salt myminion docker.list_tags

salt modules.dockermod.load(path, repository=None, tag=None)
Changed in version 2018.3.0: If the loaded image should be tagged, then the repository and tag must now be
passed separately using the `repository` and `tag` arguments, rather than together in the (now deprecated) `image` argument.

Load a tar archive that was created using `docker.save` (or via the Docker CLI using `docker save`).

**path** Path to docker tar archive. Path can be a file on the Minion, or the URL of a file on the Salt fileserver (i.e. `salt://path/to/docker/saved/image.tar`). To load a file from a saltenv other than `base` (e.g. `dev`), pass it at the end of the URL (ex. `salt://path/to/rootfs/tarball.tar.xz?saltenv=dev`).

**repository** If specified, the topmost layer of the newly-loaded image will be tagged with the specified repo using `docker.tag`. If a repository name is provided, then the `tag` argument is also required.

New in version 2018.3.0.

**tag** Tag name to go along with the repository name, if the loaded image is to be tagged.

New in version 2018.3.0.

**image** Deprecated since version 2018.3.0: Use both `repository` and `tag` instead

**RETURN DATA**

A dictionary will be returned, containing the following keys:

- **Path** - Path of the file that was saved
- **Layers** - A list containing the IDs of the layers which were loaded. Any layers in the file that was loaded, which were already present on the Minion, will not be included.
- **Image** - Name of tag applied to topmost layer
  
  *(Only present if tag was specified and tagging was successful)*
- **Time Elapsed** - Time in seconds taken to load the file
- **Warning** - Message describing any problems encountered in attempt to tag the topmost layer
  
  *(Only present if tag was specified and tagging failed)*

**CLI Example:**

```
salt myminion docker.load /path/to/image.tar
salt myminion docker.load salt://path/to/docker/saved/image.tar repository=myuser/
  → myimage tag=mytag
```

`salt.modules.dockermod.login(\*registries)`

New in version 2016.3.7,2016.11.4,2017.7.0.

Performs a `docker login` to authenticate to one or more configured repositories. See the documentation at the top of this page to configure authentication credentials.

Multiple registry URLs (matching those configured in Pillar) can be passed, and Salt will attempt to login to just those registries. If no registry URLs are provided, Salt will attempt to login to all configured registries.

**RETURN DATA**

A dictionary containing the following keys:

- **Results** - A dictionary mapping registry URLs to the authentication result. `True` means a successful login, `False` means a failed login.
- **Errors** - A list of errors encountered during the course of this function.

**CLI Example:**
salt modules.dockermod.logout("registries")

New in version 3001.

Performs a docker logout to remove the saved authentication details for one or more configured repositories.

Multiple registry URLs (matching those configured in Pillar) can be passed, and Salt will attempt to logout of just those registries. If no registry URLs are provided, Salt will attempt to logout of all configured registries.

RETURN DATA

A dictionary containing the following keys:

- **Results** - A dictionary mapping registry URLs to the authentication result. True means a successful logout, False means a failed logout.
- **Errors** - A list of errors encountered during the course of this function.

CLI Example:

salt myminion docker.logout
salt myminion docker.logout hub
salt myminion docker.logout hub https://mydomain.tld/registry/

salt modules.dockermod.logs(name, **kwargs)

Changed in version 2018.3.0: Support for all of docker-py's logs() function's arguments, with the exception of stream.

Returns the logs for the container. An interface to docker-py's logs() function.

- **name** Container name or ID
- **stdout** [True] Return stdout lines
- **stderr** [True] Return stdout lines
- **timestamps** [False] Show timestamps
- **tail** [all] Output specified number of lines at the end of logs. Either an integer number of lines or the string all.
- **since** Show logs since the specified time, passed as a UNIX epoch timestamp. Optionally, if timelib is installed on the minion the timestamp can be passed as a string which will be resolved to a date using timelib.strtodatetime().
- **follow** [False] If True, this function will block until the container exits and return the logs when it does. The default behavior is to return what is in the log at the time this function is executed.

CLI Examples:

# All logs
salt myminion docker.logs mycontainer
# Last 100 lines of log
salt myminion docker.logs mycontainer tail=100
# Just stderr
salt myminion docker.logs mycontainer stdout=False
# Logs since a specific UNIX timestamp
salt myminion docker.logs mycontainer since=1511688459

(continues on next page)
# Flexible format for "since" argument (requires timelib)

```
salt myminion docker.logs mycontainer since='1 hour ago'
salt myminion docker.logs mycontainer since='1 week ago'
salt myminion docker.logs mycontainer since='1 fortnight ago'
```

salt.modules.dockermod.networks(names=None, ids=None)

Changed in version 2017.7.0: The names and ids can be passed as a comma-separated list now, as well as a Python list.

Changed in version 2018.3.0: The Containers key for each network is no longer always empty.

- **names** Filter by name
- **ids** Filter by id

CLI Example:

```
salt myminion docker.networks names=network-web
salt myminion docker.networks
  → ids=1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abaccc21e14f7f014f729b2bc
```

salt.modules.dockermod.pause(name)

Pauses a container

- **name** Container name or ID

RETURN DATA

A dictionary will be returned, containing the following keys:

- **status** - A dictionary showing the prior state of the container as well as the new state
- **result** - A boolean noting whether or not the action was successful
- **comment** - Only present if the container cannot be paused

CLI Example:

```
salt myminion docker.pause mycontainer
```

salt.modules.dockermod.pid(name)

Returns the PID of a container

- **name** Container name or ID

CLI Example:

```
salt myminion docker.pid mycontainer
salt myminion docker.pid 0123456789ab
```

salt.modules.dockermod.port(name, private_port=None)

Returns port mapping information for a given container. Equivalent to running the docker port Docker CLI command.

- **name** Container name or ID

   Changed in version 2019.2.0: This value can now be a pattern expression (using the pattern-matching characters defined in fnmatch). If a pattern expression is used, this function will return a dictionary mapping container names which match the pattern to the mappings for those containers. When no pattern expression is used, a dictionary of the mappings for the specified container name will be returned.

---

21.9. execution modules
**private_port** [None] If specified, get information for that specific port. Can be specified either as a port number (i.e. 5000), or as a port number plus the protocol (i.e. 5000/udp).

If this argument is omitted, all port mappings will be returned.

**RETURN DATA**
A dictionary of port mappings, with the keys being the port and the values being the mapping(s) for that port.

**CLI Examples:**
```
salt myminion docker.port mycontainer
salt myminion docker.port mycontainer 5000
```

**salt.modules.dockermod.prune**(containers=False, networks=False, images=False, build=False, volumes=False, system=None, **filters**)

New in version 2019.2.0.

Prune Docker's various subsystems

**Note:** This requires docker-py version 2.1.0 or later.

containers  [False] If True, prunes stopped containers (documentation)
images  [False] If True, prunes unused images (documentation)
networks  [False] If False, prunes unreferenced networks (documentation)
build  [False] If True, clears the builder cache

**Note:** Only supported in Docker 17.07.x and newer. Additionally, filters do not apply to this argument.

volumes  [False] If True, prunes unreferenced volumes (documentation)

system  If True, prunes containers, images, networks, and builder cache. Assumed to be True if none of containers, images, networks, or build are set to True.

**Note:** volumes=True must still be used to prune volumes

filters
- dangling=True (images only) - remove only dangling images
- until=<timestamp> - only remove objects created before given timestamp. Not applicable to volumes. See the documentation links above for examples of valid time expressions.
- label - only remove objects matching the label expression. Valid expressions include labelname or labelname=value.

**CLI Examples:**
```
salt myminion docker.prune system=True
salt myminion docker.prune system=True until=12h
salt myminion docker.prune images=True dangling=True
salt myminion docker.prune images=True label=foo,bar=baz
```
salt.modules.dockermod.ps_(filters=None, **kwargs)

Returns information about the Docker containers on the Minion. Equivalent to running the docker ps Docker CLI command.

- all [False] If True, stopped containers will also be returned
- host: [False] If True, local host's network topology will be included
- verbose [False] If True, a docker inspect will be run on each container returned.
- filters: [None] A dictionary of filters to be processed on the container list. Available filters:
  - exited (int): Only containers with specified exit code
  - status (str): One of restarting, running, paused, exited
  - label (str): format either "key" or "key=value"

RETURN DATA

A dictionary with each key being an container ID, and each value some general info about that container (time created, name, command, etc.)

CLI Example:

```
salt myminion docker.ps
salt myminion docker.ps all=True
salt myminion docker.ps filters="{'label': 'role=web'}"
```

salt.modules.dockermod.pull(image, insecure_registry=False, api_response=False, client_timeout=60)

Changed in version 2018.3.0: If no tag is specified in the image argument, all tags for the image will be pulled. For this reason it is recommended to pass image using the repo:tag notation.

Pulls an image from a Docker registry

- image Image to be pulled
- insecure_registry [False] If True, the Docker client will permit the use of insecure (non-HTTPS) registries.
- api_response [False] If True, an API_Response key will be present in the return data, containing the raw output from the Docker API.

**Note:** This may result in a lot of additional return data, especially for larger images.

- client_timeout Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

RETURN DATA

A dictionary will be returned, containing the following keys:

- **Layers** - A dictionary containing one or more of the following keys:
  - Already_Pulled - Layers that were already present on the Minion
  - Pulled - Layers that were pulled
- **Status** - A string containing a summary of the pull action (usually a message saying that an image was downloaded, or that it was up to date).
- **Time_Elapsed** - Time in seconds taken to perform the pull

CLI Example:
```python
salt.modules.dockermod.push(image, insecure_registry=False, api_response=False, client_timeout=60)
```

**Description:**
Pushes an image to a Docker registry. See the documentation at top of this page to configure authentication credentials.

- **image** Image to be pushed. If just the repository name is passed, then all tagged images for the specified repo will be pushed. If the image name is passed in `repo:tag` notation, only the specified image will be pushed.
- **insecure_registry** [False] If `True`, the Docker client will permit the use of insecure (non-HTTPS) registries.
- **api_response** [False] If `True`, an `API_Response` key will be present in the return data, containing the raw output from the Docker API.
- **client_timeout** Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

**RETURN DATA**
A dictionary will be returned, containing the following keys:

- **Layers** - A dictionary containing one or more of the following keys:
  - `Already_Pushed` - Layers that were already present on the Minion
  - `Pushed` - Layers that were pushed
- **Time_Elapsed** - Time in seconds taken to perform the push

**CLI Example:**
```
salt myminion docker.push myuser/mycontainer
salt myminion docker.push myuser/mycontainer:mytag
```

```python
salt.modules.dockermod.remove_network(network_id)
```

**Description:**
Remove a network

- **network_id** Network name or ID

**CLI Examples:**
```
salt myminion docker.remove_network mynet
salt myminion docker.remove_network 1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abaccc21e14f7f014f729b2bc
```

```python
salt.modules.dockermod.remove_volume(name)
```

**Description:**
Remove a volume

- **name** Name of volume

**CLI Example:**
```
salt myminion docker.remove_volume my_volume
```
salt.modules.dockermod.rename(name, new_name)
New in version 2017.7.0.

Renames a container. Returns True if successful, and raises an error if the API returns one. If unsuccessful and the API returns no error (should not happen), then False will be returned.

name  Name or ID of existing container
new_name  New name to assign to container

CLI Example:
salt myminion docker.rename foo bar

salt.modules.dockermod.resolve_image_id(name)
New in version 2018.3.0.

Given an image name (or partial image ID), return the full image ID. If no match is found among the locally-pulled images, then False will be returned.

CLI Examples:
salt myminion docker.resolve_image_id foo
salt myminion docker.resolve_image_id foo:bar
salt myminion docker.resolve_image_id 36540f359ca3

salt.modules.dockermod.resolve_tag(name, **kwargs)
New in version 2017.7.2.

Changed in version 2018.3.0: Instead of matching against pulled tags using docker.list_tags, this function now simply inspects the passed image name using docker.inspect_image and returns the first matching tag. If no matching tags are found, it is assumed that the passed image is an untagged image ID, and the full ID is returned.

Inspects the specified image name and returns the first matching tag in the inspect results. If the specified image is not pulled locally, this function will return False.

name  Image name to resolve. If the image is found but there are no tags, this means that the image name passed was an untagged image. In this case the image ID will be returned.

all  [False] If True, a list of all matching tags will be returned. If the image is found but there are no tags, then a list will still be returned, but it will simply contain the image ID.

New in version 2018.3.0.
tags  Deprecated since version 2018.3.0.

CLI Examples:
salt myminion docker.resolve_tag busybox
salt myminion docker.resolve_tag centos:7 all=True
salt myminion docker.resolve_tag c9f378ac27d9

salt.modules.dockermod.restart(name, timeout=10)
Restarts a container

name  Container name or ID

timeout  [10] Timeout in seconds after which the container will be killed (if it has not yet gracefully shut down)

RETURN DATA
A dictionary will be returned, containing the following keys:
- **status** - A dictionary showing the prior state of the container as well as the new state
- **result** - A boolean noting whether or not the action was successful
- **restarted** - If restart was successful, this key will be present and will be set to True.

CLI Examples:

```
salt myminion docker.restart mycontainer
salt myminion docker.restart mycontainer timeout=20
```

```
salt.modules.dockermod.retcode(name, cmd, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)
```

Run `cmd.retcode` within a container

**name** Container name or ID in which to run the command

**cmd** Command to run

**exec_driver** [None] If not passed, the execution driver will be detected as described above.

**stdin** [None] Standard input to be used for the command

**output_loglevel** [debug] Level at which to log the output from the command. Set to quiet to suppress logging.

**use_vt** [False] Use SaltStack’s utils.vt to stream output to console.

**keep_env** [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container’s host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.retcode mycontainer 'ls -l /etc'
```

```
salt.modules.dockermod.rm_(name, force=False, volumes=False, **kwargs)
```

Removes a container

**name** Container name or ID

**force** [False] If True, the container will be killed first before removal, as the Docker API will not permit a running container to be removed. This option is set to False by default to prevent accidental removal of a running container.

**stop** [False] If True, the container will be stopped first before removal, as the Docker API will not permit a running container to be removed. This option is set to False by default to prevent accidental removal of a running container.

New in version 2017.7.0.

**timeout** Optional timeout to be passed to docker.stop if stopping the container.

New in version 2018.3.0.

**volumes** [False] Also remove volumes associated with container

RETURN DATA

A list of the IDs of containers which were removed

CLI Example:
salt myminion docker.rm mycontainer
salt myminion docker.rm mycontainer force=True

```
salt.modules.dockermod.rmi('names', **kwargs)
```
Removes an image

name Name (in repo:tag notation) or ID of image.
force [False] If True, the image will be removed even if the Minion has containers created from that image
prune [True] If True, untagged parent image layers will be removed as well, set this to False to keep them.

RETURN DATA
A dictionary will be returned, containing the following two keys:

- Layers - A list of the IDs of image layers that were removed
- Tags - A list of the tags that were removed
- Errors - A list of any errors that were encountered

CLI Examples:

```
salt myminion docker.rmi busybox
salt myminion docker.rmi busybox force=True
salt myminion docker.rmi foo bar baz
```

```
salt.modules.dockermod.run(name, cmd, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)
```
Run cmd.run within a container

name Container name or ID in which to run the command

logger:info: INFO: Running SaltStack command

cmd Command to run

exec_driver [None] If not passed, the execution driver will be detected as described above.

stdin [None] Standard input to be used for the command

output_loglevel [debug] Level at which to log the output from the command. Set to quiet to suppress logging.

use_vt [False] Use SaltStack's utils.vt to stream output to console.

keep_env [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.run mycontainer 'ls -l /etc'
```

```
salt.modules.dockermod.run_all(name, cmd, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)
```
Run cmd.run_all within a container

Note: While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.
name  Container name or ID in which to run the command

cmd  Command to run

exec_driver  [None] If not passed, the execution driver will be detected as described above.

stdin  [None] Standard input to be used for the command

output_loglevel  [debug] Level at which to log the output from the command. Set to quiet to suppress logging.

use_vt  [False] Use SaltStack's utils.vt to stream output to console.

keep_env  [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:
salt myminion docker.run_all mycontainer 'ls -l /etc'

salt.modules.dockermod.run_container(image, name=None, skip_translate=None, ignore_collisions=False, validate_ip_addrs=True, client_timeout=60, bg=False, replace=False, force=False, networks=None, **kwargs)

New in version 2018.3.0.

Equivalent to docker run on the Docker CLI. Runs the container, waits for it to exit, and returns the container's logs when complete.

Note: Not to be confused with docker.run, which provides a cmd.run-like interface for executing commands in a running container.

This function accepts the same arguments as docker.create, with the exception of start. In addition, it accepts the arguments from docker.logs, with the exception of follow, to control how logs are returned. Finally, the bg argument described below can be used to optionally run the container in the background (the default behavior is to block until the container exits).

bg  [False] If True, this function will not wait for the container to exit and will not return its logs. It will however return the container's name and ID, allowing for docker.logs to be used to view the logs.

Note: The logs will be inaccessible once the container exits if auto_remove is set to True, so keep this in mind.

replace  [False] If True, and if the named container already exists, this will remove the existing container. The default behavior is to return a False result when the container already exists.

force  [False] If True, and the named container already exists, and replace is also set to True, then the container will be forcibly removed. Otherwise, the state will not proceed and will return a False result.

networks  Networks to which the container should be connected. If automatic IP configuration is being used, the networks can be a simple list of network names. If custom IP configuration is being used, then this argument must be passed as a dictionary.

CLI Examples:
salt myminion docker.run_container myuser/myimage command=/usr/local/bin/myscript. →sh
# Run container in the background
salt myminion docker.run_container myuser/myimage command=/usr/local/bin/myscript. →sh bg=True
# Connecting to two networks using automatic IP configuration
salt myminion docker.run_container myuser/myimage command='perl /scripts/sync.py'
→networks=net1,net2
# net1 using automatic IP, net2 using static IPv4 address
salt myminion docker.run_container myuser/myimage command='perl /scripts/sync.py'
→networks='{"net1": {}, "net2": {"ipv4_address": "192.168.27.12"}}'

salt.modules.dockermod.run_stderr(name, cmd, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)
Run cmd.run_stderr within a container

name  Container name or ID in which to run the command

cmd  Command to run

exec_driver  [None] If not passed, the execution driver will be detected as described above.

stdin  [None] Standard input to be used for the command

output_loglevel  [debug] Level at which to log the output from the command. Set to quiet to suppress logging.

use_vt  [False] Use SaltStack's utils.vt to stream output to console.

keep_env  [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:
salt myminion docker.run_stderr mycontainer 'ls -l /etc'

salt.modules.dockermod.run_stdout(name, cmd, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)
Run cmd.run_stdout within a container

name  Container name or ID in which to run the command

cmd  Command to run

exec_driver  [None] If not passed, the execution driver will be detected as described above.

stdin  [None] Standard input to be used for the command

output_loglevel  [debug] Level at which to log the output from the command. Set to quiet to suppress logging.

use_vt  [False] Use SaltStack's utils.vt to stream output to console.

keep_env  [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:
salt myminion docker.run_stdout mycontainer 'ls -l /etc'

```python
salt.modules.dockermod.save(name, path, overwrite=False, makedirs=False, compression=None, **kwargs)
```

Saves an image and to a file on the minion. Equivalent to running the `docker save` Docker CLI command, but unlike `docker save` this will also work on named images instead of just images IDs.

**name** Name or ID of image. Specify a specific tag by using the `repo:tag` notation.

**path** Absolute path on the Minion where the image will be exported

**overwrite** [False] Unless this option is set to `True`, then if the destination file exists an error will be raised.

**makedirs** [False] If `True`, then if the parent directory of the file specified by the `path` argument does not exist, Salt will attempt to create it.

**compression** [None] Can be set to any of the following:

- `gzip` or `gz` for gzip compression
- `bzip2` or `bz2` for bzip2 compression
- `xz` or `lzma` for XZ compression (requires `xz-utils`, as well as the `lzma` module from Python 3.3, available in Python 2 and Python 3.0-3.2 as `backports.lzma`)

This parameter can be omitted and Salt will attempt to determine the compression type by examining the filename passed in the `path` parameter.

---

**Note:** Since the Docker API does not support `docker save`, compression will be a bit slower with this function than with `docker.export` since the image(s) will first be saved and then the compression done afterwards.

**push** [False] If `True`, the container will be pushed to the master using `cp.push`.

---

**Note:** This requires `file_recv` to be set to `True` on the Master.

---

**RETURN DATA**

A dictionary will be returned, containing the following keys:

- **Path** - Path of the file that was saved
- **Push** - Reports whether or not the file was successfully pushed to the Master
  
  *(Only present if `push=True`)*
- **Size** - Size of the file, in bytes
- **Size_Human** - Size of the file, in human-readable units
- **Time_Elapsed** - Time in seconds taken to perform the save

**CLI Examples:**

```bash
salt myminion docker.save centos:7 /tmp/cent7.tar
salt myminion docker.save 0123456789ab cdef01234567 /tmp/saved.tar
```
salt.modules.dockermod.script(name, source, saltenv='base', args=None, template=None, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', ignore_retcode=False, use_vt=False, keep_env=None)

Run `cmd.script` within a container

**Note:** While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

**name** Container name or ID

**source** Path to the script. Can be a local path on the Minion or a remote file from the Salt fileserver.

**args** A string containing additional command-line options to pass to the script.

**template** [None] Templating engine to use on the script before running.

**exec_driver** [None] If not passed, the execution driver will be detected as described *above*.

**stdin** [None] Standard input to be used for the script

**output_loglevel** [debug] Level at which to log the output from the script. Set to *quiet* to suppress logging.

**use_vt** [False] Use SaltStack's utils.vt to stream output to console.

**keep_env** [None] If not passed, only a sane default PATH environment variable will be set. If *True*, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.script mycontainer salt://docker_script.py
salt myminion docker.script mycontainer salt://scripts/runme.sh 'arg1 arg2 "arg 3"
   ...
salt myminion docker.script mycontainer salt://scripts/runme.sh stdin='one\ntwo\n   ...nthree\nfour\nfive\n' output_loglevel=quiet
```

salt.modules.dockermod.script_retcode(name, source, saltenv='base', args=None, template=None, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', ignore_retcode=False, use_vt=False, keep_env=None)

Run `cmd.script_retcode` within a container

**name** Container name or ID

**source** Path to the script. Can be a local path on the Minion or a remote file from the Salt fileserver.

**args** A string containing additional command-line options to pass to the script.

**template** [None] Templating engine to use on the script before running.

**exec_driver** [None] If not passed, the execution driver will be detected as described *above*.

**stdin** [None] Standard input to be used for the script

**output_loglevel** [debug] Level at which to log the output from the script. Set to *quiet* to suppress logging.

**use_vt** [False] Use SaltStack's utils.vt to stream output to console.

**keep_env** [None] If not passed, only a sane default PATH environment variable will be set. If *True*, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.
CLI Example:

```
salt myminion docker.script_retcode mycontainer salt://docker_script.py
salt myminion docker.script_retcode mycontainer salt://scripts/runme.sh 'arg1 arg2 "arg 3"'
salt myminion docker.script_retcode mycontainer salt://scripts/runme.sh stdin="one\ntwo\nthree\nfour\nfive\n" output_loglevel=quiet
```

`salt.modules.dockermod.search(name, official=False, trusted=False)`
Searches the registry for an image

- **name**: Search keyword
- **official** [False] Limit results to official builds
- **trusted** [False] Limit results to trusted builds

**RETURN DATA**
A dictionary with each key being the name of an image, and the following information for each image:

- **Description**: Image description
- **Official**: A boolean (True if an official build, False if not)
- **Stars**: Number of stars the image has on the registry
- **Trusted**: A boolean (True if a trusted build, False if not)

CLI Example:

```
salt myminion docker.search centos
salt myminion docker.search centos official=True
```

`salt.modules.dockermod.signal_(name, signal)`
Send a signal to a container. Signals can be either strings or numbers, and are defined in the Standard Signals section of the `signal(7)` manpage. Run `man 7 signal` on a Linux host to browse this manpage.

- **name**: Container name or ID
- **signal**: Signal to send to container

**RETURN DATA**
If the signal was successfully sent, `True` will be returned. Otherwise, an error will be raised.

CLI Example:

```
salt myminion docker.signal mycontainer SIGHUP
```

`salt.modules.dockermod.sls(name, mods=None, **kwargs)`
Apply the states defined by the specified SLS modules to the running container

New in version 2016.11.0.

The container does not need to have Salt installed, but Python is required.

- **name**: Container name or ID
- **mods** [None] A string containing comma-separated list of SLS with defined states to apply to the container.
- **saltenv** [base] Specify the environment from which to retrieve the SLS indicated by the `mods` parameter.
- **pillarenv** Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.
pillar Custom Pillar values, passed as a dictionary of key-value pairs

Note: Values passed this way will override Pillar values set via pillar_roots or an external Pillar source.

New in version 2018.3.0.

CLI Example:

```bash
salt myminion docker.sls compassionate_mirzakhani mods=rails,web
```

salt.modules.dockermod.sls_build(repository, tag='latest', base='opensuse/python', mods=None, dryrun=False, **kwargs)

Changed in version 2018.3.0: The repository and tag must now be passed separately using the repository and tag arguments, rather than together in the (now deprecated) image argument.

Build a Docker image using the specified SLS modules on top of base image

New in version 2016.11.0.

The base image does not need to have Salt installed, but Python is required.

repository Repository name for the image to be built
	new in version 2018.3.0.

tag [latest] Tag name for the image to be built
	new in version 2018.3.0.

name Deprecated since version 2018.3.0: Use both repository and tag instead

base [opensuse/python] Name or ID of the base image

mods A string containing comma-separated list of SLS with defined states to apply to the base image.

saltenv [base] Specify the environment from which to retrieve the SLS indicated by the mods parameter.

pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.

New in version 2018.3.0.

pillar Custom Pillar values, passed as a dictionary of key-value pairs

Note: Values passed this way will override Pillar values set via pillar_roots or an external Pillar source.

New in version 2018.3.0.

dryrun: False when set to True the container will not be committed at the end of the build. The dryrun succeed also when the state contains errors.

RETURN DATA

A dictionary with the ID of the new container. In case of a dryrun, the state result is returned and the container gets removed.

CLI Example:
```
salt myminion docker.sls_build imgname base=mybase mods=rails,web
```

```
salt.modules.dockermod.start_(name)
Start a container

name  Container name or ID

RETURN DATA
A dictionary will be returned, containing the following keys:

- **status** - A dictionary showing the prior state of the container as well as the new state
- **result** - A boolean noting whether or not the action was successful
- **comment** - Only present if the container cannot be started

CLI Example:
```
salt myminion docker.start mycontainer
```

```
salt.modules.dockermod.state(name)
Returns the state of the container

name  Container name or ID

RETURN DATA
A string representing the current state of the container (either running, paused, or stopped)

CLI Example:
```
salt myminion docker.state mycontainer
```

```
salt.modules.dockermod.stop(name, timeout=None, **kwargs)
Stops a running container

name  Container name or ID

unpause  [False] If True and the container is paused, it will be unpaused before attempting to stop the container.

timeout  Timeout in seconds after which the container will be killed (if it has not yet gracefully shut down)

Changed in version 2017.7.0: If this argument is not passed, then the container’s configuration will be checked. If the container was created using the stop_timeout argument, then the configured timeout will be used, otherwise the timeout will be 10 seconds.

RETURN DATA
A dictionary will be returned, containing the following keys:

- **status** - A dictionary showing the prior state of the container as well as the new state
- **result** - A boolean noting whether or not the action was successful
- **comment** - Only present if the container can not be stopped

CLI Examples:
```
salt myminion docker.stop mycontainer
salt myminion docker.stop mycontainer unpause=True
salt myminion docker.stop mycontainer timeout=20
```
salt.modules.dockermod.tag_(name, repository, tag='latest', force=False)
  Changed in version 2018.3.0: The repository and tag must now be passed separately using the repository
  and tag arguments, rather than together in the (now deprecated) image argument.

  Tag an image into a repository and return True. If the tag was unsuccessful, an error will be raised.
  name  ID of image
  repository  Repository name for the image to be built
    New in version 2018.3.0.
  tag  [latest] Tag name for the image to be built
    New in version 2018.3.0.
  image  Deprecated since version 2018.3.0: Use both repository and tag instead
  force  [False] Force apply tag

  CLI Example:
  
  | salt myminion docker.tag 0123456789ab myrepo/mycontainer mytag |

salt.modules.dockermod.top(name)
  Runs the docker top command on a specific container
  name  Container name or ID

  CLI Example:

  | RETURN DATA |
  | A list of dictionaries containing information about each process |
  
  | salt myminion docker.top mycontainer |
  | salt myminion docker.top 0123456789ab |

salt.modules.dockermod.unpause(name)
  Unpauses a container
  name  Container name or ID

  RETURN DATA
  A dictionary will be returned, containing the following keys:
    • status - A dictionary showing the prior state of the container as well as the new state
    • result - A boolean noting whether or not the action was successful
    • comment - Only present if the container can not be unpaused

  CLI Example:

  | salt myminion docker.pause mycontainer |

salt.modules.dockermod.version()
  Returns a dictionary of Docker version information. Equivalent to running the docker version Docker
  CLI command.

  CLI Example:

  | salt myminion docker.version |
salt.modules.dockermod.volumes(filters=None)
List existing volumes

New in version 2015.8.4.

filters There is one available filter: dangling=true

CLI Example:
salt myminion docker.volumes filters="{'dangling': True}"

salt.modules.dockermod.wait(name, ignore_already_stopped=False, fail_on_exit_status=False)
Wait for the container to exit gracefully, and return its exit code

Note: This function will block until the container is stopped.

name Container name or ID
ignore_already_stopped Boolean flag that prevents execution to fail, if a container is already stopped.
fail_on_exit_status Boolean flag to report execution as failure if exit_status is different than 0.

RETURN DATA
A dictionary will be returned, containing the following keys:

- **status** - A dictionary showing the prior state of the container as well as the new state
- **result** - A boolean noting whether or not the action was successful
- **exit_status** - Exit status for the container
- **comment** - Only present if the container is already stopped

CLI Example:
salt myminion docker.wait mycontainer

21.9.122 salt.modules.dpkg_lowpkg
Support for DEB packages

salt.modules.dpkg_lowpkg.bin_pkg_info(path, saltenv='base')
New in version 2015.8.0.

 Parses RPM metadata and returns a dictionary of information about the package (name, version, etc.).

path Path to the file. Can either be an absolute path to a file on the minion, or a salt fileserver URL (e.g. 
salt://path/to/file.rpm). If a salt fileserver URL is passed, the file will be cached to the minion 
so that it can be examined.

saltenv [base] Salt fileserver environment from which to retrieve the package. Ignored if path is a local file 
path on the minion.

CLI Example:
salt '*' lowpkg.bin_pkg_info /root/foo-1.2.3-1ubuntu1_all.deb
salt '*' lowpkg.bin_pkg_info salt://foo-1.2.3-1ubuntu1_all.deb
salt.modules.dpkg_lowpkg.file_dict(*packages, **kwargs)

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' lowpkg.file_dict hostname
salt '*' lowpkg.file_dict hostname mount
salt '*' lowpkg.file_dict
```

salt.modules.dpkg_lowpkg.file_list(*packages, **kwargs)

List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' lowpkg.file_list hostname
salt '*' lowpkg.file_list hostname mount
salt '*' lowpkg.file_list
```

salt.modules.dpkg_lowpkg.info(*packages, **kwargs)

Returns a detailed summary of package information for provided package names. If no packages are specified, all packages will be returned.

packages The names of the packages for which to return information.

failhard Whether to throw an exception if none of the packages are installed. Defaults to True.

New in version 2016.11.3.

CLI example:

```
salt '*' lowpkg.info
salt '*' lowpkg.info apache2 bash
salt '*' lowpkg.info 'php5*' failhard=false
```

salt.modules.dpkg_lowpkg.list_pkgs(*packages, **kwargs)

List the packages currently installed in a dict:

```
[{'<package_name>': '<version>'}
```

External dependencies:

Virtual package resolution requires aptitude. Because this function uses dpkg, virtual packages will be reported as not installed.

CLI Example:

```
salt '*' lowpkg.list_pkgs
salt '*' lowpkg.list_pkgs hostname
salt '*' lowpkg.list_pkgs hostname mount
```

salt.modules.dpkg_lowpkg.unpurge(*packages)

Change package selection for each package specified to 'install'

CLI Example:
21.9.123 salt.modules.drac

Manage Dell DRAC

salt.modules.drac.change_password(username, password, uid=None)
Change users password

CLI Example:
```
salt dell drac.change_password [USERNAME] [PASSWORD] [UID - optional]
salt dell drac.change_password diana secret
```

salt.modules.drac.create_user(username, password, permissions, users=None)
Create user accounts

CLI Example:
```
salt dell drac.create_user [USERNAME] [PASSWORD] [PRIVILEGES]
salt dell drac.create_user diana secret login,test_alerts,clear_logs
```

DRAC Privileges

- login : Login to iDRAC
- drac : Configure iDRAC
- user_management : Configure Users
- clear_logs : Clear Logs
- server_control_commands : Execute Server Control Commands
- console_redirection : Access Console Redirection
- virtual_media : Access Virtual Media
- test_alerts : Test Alerts
- debug_commands : Execute Debug Commands

salt.modules.drac.delete_user(username, uid=None)
Delete a user

CLI Example:
```
salt dell drac.delete_user [USERNAME] [UID - optional]
salt dell drac.delete_user diana 4
```

salt.modules.drac.email_alerts(action)
Enable/Disable email alerts

CLI Example:
```
salt dell drac.email_alerts True
salt dell drac.email_alerts False
```
salt.modules.drac.list_users()
   List all DRAC users
   CLI Example:
   ```
salt dell drac.list_users
   ```

salt.modules.drac.nameservers(*ns)
   Configure the nameservers on the DRAC
   CLI Example:
   ```
salt dell drac.nameservers [NAMESERVERS]
salt dell drac.nameservers ns1.example.com ns2.example.com
   ```

salt.modules.drac.network_info()
   Return Network Configuration
   CLI Example:
   ```
salt dell drac.network_info
   ```

salt.modules.drac.server_hardreset()
   Performs a reset (reboot) operation on the managed server.
   CLI Example:
   ```
salt dell drac.server_hardreset
   ```

salt.modules.drac.server_poweroff()
   Powers down the managed server.
   CLI Example:
   ```
salt dell drac.server_poweroff
   ```

salt.modules.drac.server_poweron()
   Powers up the managed server.
   CLI Example:
   ```
salt dell drac.server_poweron
   ```

salt.modules.drac.server_pxe()
   Configure server to PXE perform a one off PXE boot
   CLI Example:
   ```
salt dell drac.server_pxe
   ```

salt.modules.drac.server_reboot()
   Issues a power-cycle operation on the managed server. This action is similar to pressing the power button on
   the system's front panel to power down and then power up the system.
   CLI Example:
   ```
salt dell drac.server_reboot
   ```

salt.modules.drac.set_network(ip, netmask, gateway)
   Configure Network
CLI Example:

```
salt dell drac.set_network [DRAC IP] [NETMASK] [GATEWAY]
salt dell drac.set_network 192.168.0.2 255.255.255.0 192.168.0.1
```

```python
salt.modules.drac.set_permissions(username, permissions, uid=None)
```
Configure users permissions

CLI Example:

```
salt dell drac.set_permissions [USERNAME] [PRIVILEGES] [USER INDEX - optional]
salt dell drac.set_permissions diana login,test_alerts,clear_logs 4
```

**DRAC Privileges**
- login: Login to iDRAC
- drac: Configure iDRAC
- user_management: Configure Users
- clear_logs: Clear Logs
- server_control_commands: Execute Server Control Commands
- console_redirection: Access Console Redirection
- virtual_media: Access Virtual Media
- test_alerts: Test Alerts
- debug_commands: Execute Debug Commands

```python
salt.modules.drac.set_snmp(community)
```
Configure SNMP community string

CLI Example:

```
salt dell drac.set_snmp [COMMUNITY]
salt dell drac.set_snmp public
```

```python
salt.modules.drac.syslog(server, enable=True)
```
Configure syslog remote logging, by default syslog will automatically be enabled if a server is specified. However, if you want to disable syslog you will need to specify a server followed by False

CLI Example:

```
salt dell drac.syslog [SYSLOG IP] [ENABLE/DISABLE]
salt dell drac.syslog 0.0.0.0 False
```

```python
salt.modules.drac.system_info()
```
Return System information

CLI Example:

```
salt dell drac.system_info
```
21.9.124 `salt.modules.dracr`

Manage Dell DRAC.
New in version 2015.8.2.

**salt.modules.dracr.bare_rac_cmd**

```python
salt.modules.dracr.bare_rac_cmd(cmd, host=None, admin_username=None, admin_password=None)
```

**salt.modules.dracr.change_password**

```python
salt.modules.dracr.change_password(username, password, uid=None, host=None, admin_username=None, admin_password=None, module=None)
```

Change user's password

CLI Example:

```
salt dell dracr.change_password [USERNAME] [PASSWORD] uid=[OPTIONAL]
   host=<remote DRAC> admin_username=<DRAC user>
   admin_password=<DRAC PW>
salt dell dracr.change_password diana secret
```

Note that if only a username is specified then this module will look up details for all 16 possible DRAC users. This is time consuming, but might be necessary if one is not sure which user slot contains the one you want. Many late-model Dell chassis have 'root' as UID 1, so if you can depend on that then setting the password is much quicker. Raises an error if the supplied password is greater than 20 chars.

**salt.modules.dracr.create_user**

```python
salt.modules.dracr.create_user(username, password, permissions, users=None, host=None, admin_username=None, admin_password=None)
```

Create user accounts

CLI Example:

```
salt dell dracr.create_user [USERNAME] [PASSWORD] [PRIVILEGES]
salt dell dracr.create_user diana secret login,test_alerts,clear_logs
```

**DRAC Privileges**

- login : Login to iDRAC
- drac : Configure iDRAC
- user_management : Configure Users
- clear_logs : Clear Logs
- server_control_commands : Execute Server Control Commands
- console_redirection : Access Console Redirection
- virtual_media : Access Virtual Media
- test_alerts : Test Alerts
- debug_commands : Execute Debug Commands

**salt.modules.dracr.delete_user**

```python
salt.modules.dracr.delete_user(username, uid=None, host=None, admin_username=None, admin_password=None)
```

Delete a user

CLI Example:

```
salt dell dracr.delete_user [USERNAME] [UID - optional]
salt dell dracr.delete_user diana 4
```
salt.modules.dracr.deploy_password(username, password, host=None, admin_username=None, admin_password=None, module=None)

Change the QuickDeploy password, used for switches as well

CLI Example:
```
salt dell dracr.deploy_password [USERNAME] [PASSWORD]
    host=<remote DRAC> admin_username=<DRAC user>
    admin_password=<DRAC PW>
salt dell dracr.change_password diana secret
```

Note that if only a username is specified then this module will look up details for all 16 possible DRAC users. This is time consuming, but might be necessary if one is not sure which user slot contains the one you want. Many late-model Dell chassis have 'root' as UID 1, so if you can depend on that then setting the password is much quicker.

salt.modules.dracr.deploy_snmp(snmp, host=None, admin_username=None, admin_password=None, module=None)

Change the QuickDeploy SNMP community string, used for switches as well

CLI Example:
```
salt dell dracr.deploy_snmp SNMP_STRING
    host=<remote DRAC or CMC> admin_username=<DRAC user>
    admin_password=<DRAC PW>
salt dell dracr.deploy_password diana secret
```

salt.modules.dracr.email_alerts(action, host=None, admin_username=None, admin_password=None)

Enable/Disable email alerts

CLI Example:
```
salt dell dracr.email_alerts True
salt dell dracr.email_alerts False
```

salt.modules.dracr.get_chassis_datacenter(host=None, admin_username=None, admin_password=None)

Get the datacenter of the chassis.

host The chassis host.
admin_username The username used to access the chassis.
admin_password The password used to access the chassis.

CLI Example:
```
salt '*' dracr.set_chassis_location host=111.222.333.444
    admin_username=root admin_password=secret
```

salt.modules.dracr.get_chassis_location(host=None, admin_username=None, admin_password=None)

Get the location of the chassis.

host The chassis host.
admin_username The username used to access the chassis.
admin_password The password used to access the chassis.

CLI Example:
salt '*' dracr.set_chassis_location host=111.222.333.444
    admin_username=root admin_password=secret

salt.modules.dracr.get_chassis_name(host=None, admin_username=None, admin_password=None)

Get the name of a chassis.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

CLI Example:

salt '*' dracr.get_chassis_name host=111.222.333.444
    admin_username=root admin_password=secret

salt.modules.dracr.get_dns_dracname(host=None, admin_username=None, admin_password=None)

salt.modules.dracr.get_general(cfg_sec, cfg_var, host=None, admin_username=None, admin_password=None)

salt.modules.dracr.get_slotname(slot, host=None, admin_username=None, admin_password=None)

Get the name of a slot number in the chassis.

slot The number of the slot for which to obtain the name.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

CLI Example:

salt-call --local dracr.get_slotname 0 host=111.222.333.444
    admin_username=root admin_password=secret

salt.modules.dracr.idrac_general(blade_name, command, idrac_password=None, host=None, admin_username=None, admin_password=None)

Run a generic racadm command against a particular blade in a chassis. Blades are usually named things like 'server-1', 'server-2', etc. If the iDRAC has a different password than the CMC, then you can pass it with the idrac_password kwarg.

Parameters

- **blade_name** -- Name of the blade to run the command on
- **command** -- Command like to pass to racadm
- **idrac_password** -- Password for the iDRAC if different from the CMC
- **host** -- Chassis hostname
- **admin_username** -- CMC username
- **admin_password** -- CMC password

Returns stdout if the retcode is 0, otherwise a standard cmd.run_all dictionary

CLI Example:
salt fx2 chassis.cmd idrac_general server-1 'get BIOS.SysProfileSettings'

```python
salt.modules.dracr.inventory(host=None, admin_username=None, admin_password=None)
```

List the names of all slots in the chassis.

- **host**  The chassis host.
- **admin_username**  The username used to access the chassis.
- **admin_password**  The password used to access the chassis.

CLI Example:

```bash
salt-call --local dracr.list_slotnames host=111.222.333.444
admin_username=root admin_password=secret
```

```python
salt.modules.dracr.list_slotnames(host=None, admin_username=None, admin_password=None)
```

```python
salt.modules.dracr.list_users(host=None, admin_username=None, admin_password=None, module=None)
```

List all DRAC users

CLI Example:

```bash
salt dell dracr.list_users
```

```python
salt.modules.dracr.nameservers(ns, host=None, admin_username=None, admin_password=None, module=None)
```

Configure the nameservers on the DRAC

CLI Example:

```bash
salt dell dracr.nameservers [NAMESERVERS]
salt dell dracr.nameservers ns1.example.com ns2.example.com
admin_username=root admin_password=calvin module=server-1
host=192.168.1.1
```

```python
salt.modules.dracr.network_info(host=None, admin_username=None, admin_password=None, module=None)
```

Return Network Configuration

CLI Example:

```bash
salt dell dracr.network_info
```

```python
salt.modules.dracr.server_hardreset(host=None, admin_username=None, admin_password=None, module=None)
```

Performs a reset (reboot) operation on the managed server.

- **host**  The chassis host.
- **admin_username**  The username used to access the chassis.
- **admin_password**  The password used to access the chassis.
- **module**  The element to hard reset on the chassis such as a blade. If not provided, the chassis will be reset.

CLI Example:

```bash
salt dell dracr.server_hardreset
salt dell dracr.server_hardreset module=server-1
```
salt.modules.dracr.server_power

**status**

One of `powerup`, `powerdown`, `powercycle`, `hardreset`, `graceshutdown`

**host**
The chassis host.

**admin_username**
The username used to access the chassis.

**admin_password**
The password used to access the chassis.

**module**
The element to reboot on the chassis such as a blade. If not provided, the chassis will be rebooted.

**CLI Example:**
```
salt dell dracr.server_reboot
salt dell dracr.server_reboot module=server-1
```

salt.modules.dracr.server_poweroff

Powers down the managed server.

**host**
The chassis host.

**admin_username**
The username used to access the chassis.

**admin_password**
The password used to access the chassis.

**module**
The element to power off on the chassis such as a blade. If not provided, the chassis will be powered off.

**CLI Example:**
```
salt dell dracr.server_poweroff
salt dell dracr.server_poweroff module=server-1
```

salt.modules.dracr.server_poweron

Powers up the managed server.

**host**
The chassis host.

**admin_username**
The username used to access the chassis.

**admin_password**
The password used to access the chassis.

**module**
The element to power on located on the chassis such as a blade. If not provided, the chassis will be powered on.

**CLI Example:**
```
salt dell dracr.server_poweron
salt dell dracr.server_poweron module=server-1
```

salt.modules.dracr.server_powerstatus

Return the power status for the passed module.

**CLI Example:**
```
salt dell drac.server_powerstatus
```

salt.modules.dracr.server_pxe

Configure server to PXE perform a one off PXE boot
CLI Example:
```
salt dell dracr.server_pxe
```

```
salt.modules.dracr.server_reboot(host=None, admin_username=None, admin_password=None, module=None)
```

Issues a power-cycle operation on the managed server. This action is similar to pressing the power button on the system's front panel to power down and then power up the system.

- **host** The chassis host.
- **admin_username** The username used to access the chassis.
- **admin_password** The password used to access the chassis.
- **module** The element to reboot on the chassis such as a blade. If not provided, the chassis will be rebooted.

CLI Example:
```
salt dell dracr.server_reboot
salt dell dracr.server_reboot module=server-1
```

```
salt.modules.dracr.set_chassis_datacenter(location, host=None, admin_username=None, admin_password=None)
```

Set the location of the chassis.

- **location** The name of the datacenter to be set on the chassis.
- **host** The chassis host.
- **admin_username** The username used to access the chassis.
- **admin_password** The password used to access the chassis.

CLI Example:
```
salt '*' dracr.set_chassis_datacenter datacenter-name host=111.222.333.444 admin_username=root admin_password=secret
```

```
salt.modules.dracr.set_chassis_location(location, host=None, admin_username=None, admin_password=None)
```

Set the location of the chassis.

- **location** The name of the location to be set on the chassis.
- **host** The chassis host.
- **admin_username** The username used to access the chassis.
- **admin_password** The password used to access the chassis.

CLI Example:
```
salt '*' dracr.set_chassis_location location-name host=111.222.333.444 admin_username=root admin_password=secret
```

```
salt.modules.dracr.set_chassis_name(name, host=None, admin_username=None, admin_password=None)
```

Set the name of the chassis.

- **name** The name to be set on the chassis.
- **host** The chassis host.
- **admin_username** The username used to access the chassis.
admin_password  The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_chassis_name my-chassis host=111.222.333.444
admin_username=root admin_password=secret
```

```
salt.modules.dracr.set_dns_dracname(name, host=None, admin_username=None, admin_password=None)
salt.modules.dracr.set_general(cfg_sec, cfg_var, val, host=None, admin_username=None, admin_password=None)
salt.modules.dracr.set_network(ip, netmask, gateway, host=None, admin_username=None, admin_password=None)
```

Configure Network on the CMC or individual iDRAC. Use set_niccfg for blade and switch addresses.

CLI Example:

```
salt dell dracr.set_network [DRAC IP] [NETMASK] [GATEWAY]
salt dell dracr.set_network 192.168.0.2 255.255.255.0 192.168.0.1
admin_username=root admin_password=calvin host=192.168.1.1
```

```
salt.modules.dracr.set_niccfg(ip=None, netmask=None, gateway=None, dhcp=False, host=None, admin_username=None, admin_password=None, module=None)
salt.modules.dracr.set_nicvlan(vlan=None, host=None, admin_username=None, admin_password=None, module=None)
salt.modules.dracr.set_permissions(username, permissions, uid=None, host=None, admin_username=None, admin_password=None)
```

Configure users permissions

CLI Example:

```
salt dell dracr.set_permissions [USERNAME] [PRIVILEGES]
[USER INDEX - optional]
salt dell dracr.set_permissions diana login,test_alerts,clear_logs 4
```

**DRAC Privileges**

- login : Login to iDRAC
- drac : Configure iDRAC
- user_management : Configure Users
- clear_logs : Clear Logs
- server_control_commands : Execute Server Control Commands
- console_redirection : Access Console Redirection
- virtual_media : Access Virtual Media
- test_alerts : Test Alerts
- debug_commands : Execute Debug Commands

```
salt.modules.dracr.set_slotname(slot, name, host=None, admin_username=None, admin_password=None)
```

Set the name of a slot in a chassis.

slot  The slot number to change.
**name**  The name to set. Can only be 15 characters long.

**host**  The chassis host.

**admin_username**  The username used to access the chassis.

**admin_password**  The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_slotname 2 my-slotname host=111.222.333.444
    admin_username=root admin_password=secret
```

**salt.modules.dracr.set_snmp(**community, host=None, admin_username=None, admin_password=None)**

Configure CMC or individual iDRAC SNMP community string. Use deploy_snmp for configuring chassis switch SNMP.

CLI Example:

```
salt dell dracr.set_snmp [COMMUNITY]
salt dell dracr.set_snmp public
```

**salt.modules.dracr.syslog(**server, enable=True, host=None, admin_username=None, admin_password=None, module=None)**

Configure syslog remote logging, by default syslog will automatically be enabled if a server is specified. However, if you want to disable syslog you will need to specify a server followed by False

CLI Example:

```
salt dell dracr.syslog [SYSLOG IP] [ENABLE/DISABLE]
salt dell dracr.syslog 0.0.0.0 False
```

**salt.modules.dracr.system_info(**host=None, admin_username=None, admin_password=None, module=None)**

Return System information

CLI Example:

```
salt dell dracr.system_info
```

**salt.modules.dracr.update_firmware(**filename, host=None, admin_username=None, admin_password=None)**

Updates firmware using local firmware file

```
salt dell dracr.update_firmware firmware.exe
```

This executes the following command on your FX2 (using username and password stored in the pillar data)

```
racadm update -f firmware.exe -u user -p pass
```

**salt.modules.dracr.update_firmware_nfs_or_cifs(**filename, share, host=None, admin_username=None, admin_password=None)**

Executes the following for CIFS (using username and password stored in the pillar data)

```
racadm update -f <updatefile> -u user -p pass -l //IP-Address/share
```

Or for NFS (using username and password stored in the pillar data)
Salt command for CIFS:

```bash
salt dell dracr.update_firmware_nfs_or_cifs firmware.exe //IP-Address/\n```

Salt command for NFS:

```bash
salt dell dracr.update_firmware_nfs_or_cifs firmware.exe IP-address:/\n```

21.9.125 salt.modules.drbd

DRBD administration module

salt.modules.drbd.overview()

Show status of the DRBD devices, support two nodes only. drbd-overview is removed since drbd-utils-9.6.0, use status instead.

CLI Example:

```bash
salt '*' drbd.overview
```

salt.modules.drbd.status(name='all')

**Parameters**
- **name** (str) -- Resource name.
- **Returns**
  - drbd status of resource.
- **Return type**
  - list(dict(res))

CLI Example:

```bash
salt '*' drbd.status
salt '*' drbd.status name=<resource name>
```

21.9.126 salt.modules.dummyproxy_pkg module

Package support for the dummy proxy used by the test suite

salt.modules.dummyproxy_pkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)

salt.modules.dummyproxy_pkg.installed(name, version=None, refresh=False, fromrepo=None, skip_verify=False, pkgs=None, sources=None, **kwargs)

salt.modules.dummyproxy_pkg.list_pkgs(versions_as_list=False, **kwargs)

salt.modules.dummyproxy_pkg.remove(name=None, pkgs=None, **kwargs)

salt.modules.dummyproxy_pkg.upgrade(name=None, pkgs=None, refresh=True, skip_verify=True, normalize=True, **kwargs)
salt.modules.dummyproxy_pkg.version(*names, **kwargs)
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:
```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

### 21.9.127 salt.modules.dummyproxy_service module

Provide the service module for the dummy proxy used in integration tests

salt.modules.dummyproxy_service.enabled(name, sig=None)
Only the 'redbull' service is 'enabled' in the test

New in version 2016.11.3.

salt.modules.dummyproxy_service.get_all()
Return a list of all available services

New in version 2016.11.3.

CLI Example:
```
salt '*' service.get_all
```

salt.modules.dummyproxy_service.list_()
Return a list of all available services.

New in version 2016.11.3.

CLI Example:
```
salt '*' service.list
```

salt.modules.dummyproxy_service.restart(name, sig=None)
Restart the specified service with dummy.

New in version 2016.11.3.

CLI Example:
```
salt '*' service.restart <service name>
```

salt.modules.dummyproxy_service.running(name, sig=None)
Return whether this service is running.

New in version 2016.11.3.

salt.modules.dummyproxy_service.start(name, sig=None)
Start the specified service on the dummy

New in version 2016.11.3.

CLI Example:
```
salt '*' service.start <service name>
```
salt.modules.dummyproxy_service.status(name, sig=None)
Return the status for a service via dummy, returns a bool whether the service is running.
New in version 2016.11.3.
CLI Example:
```
salt '*' service.status <service name>
```
salt.modules.dummyproxy_service.stop(name, sig=None)
Stop the specified service on the dummy
New in version 2016.11.3.
CLI Example:
```
salt '*' service.stop <service name>
```

21.9.128 salt.modules.ebuildpkg
Support for Portage

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see [here](#).

**optdepends**
- portage Python adapter

For now all package names **MUST** include the package category, i.e. 'vim' will not work, 'app-editors/vim' will.

salt.modules.ebuildpkg.check_db(*names, **kwargs)
New in version 0.17.0.
Returns a dict containing the following information for each specified package:

1. A key `found`, which will be a boolean value denoting if a match was found in the package database.
2. If `found` is `False`, then a second key called `suggestions` will be present, which will contain a list of possible matches. This list will be empty if the package name was specified in `category/pkgname` format, since the suggestions are only intended to disambiguate ambiguous package names (ones submitted without a category).

CLI Examples:
```
salt '*' pkg.check_db <package1> <package2> <package3>
```

salt.modules.ebuildpkg.check_extra_requirements(pkgname, pkgver)
Check if the installed package already has the given requirements.

CLI Example:
```
salt '*' pkg.check_extra_requirements 'sys-devel/gcc' '~>4.1.2:4.1::gentoo[nls, fortran]'`
```

salt.modules.ebuildpkg.depclean(name=None, slot=None, fromrepo=None, pkgs=None)
Portage has a function to remove unused dependencies. If a package is provided, it will only removed the package if no other package depends on it.
name   The name of the package to be cleaned.
slot   Restrict the remove to a specific slot. Ignored if name is None.
fromrepo   Restrict the remove to a specific slot. Ignored if name is None.
pkgs   Clean multiple packages. slot and fromrepo arguments are ignored if this argument is present. Must be passed as a python list.

Return a list containing the removed packages:

CLI Example:
```
salt '*' pkg.depclean <package name>
```

salt.modules.ebuildpkg.ex_mod_init(low)
If the config option ebuild.enforce_nice_config is set to True, this module will enforce a nice tree structure for /etc/portage/package.* configuration files.

New in version 0.17.0: Initial automatic enforcement added when pkg is used on a Gentoo system.

Changed in version 2014.1.0-Hydrogen: Configure option added to make this behaviour optional, defaulting to off.

See also:
ebuild.ex_mod_init is called automatically when a state invokes a pkg state on a Gentoo system. salt.states.pkg.mod_init()
ebuild.ex_mod_init uses portage_config.enforce_nice_config to do the lifting. salt.modules.portage_config.enforce_nice_config()

CLI Example:
```
salt '*' pkg.ex_mod_init
```

salt.modules.ebuildpkg.install(name=None, refresh=False, pkgs=None, sources=None, slot=None, fromrepo=None, uses=None, binhost=None, **kwargs)
Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any emerge commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Install the passed package(s), add refresh=True to sync the portage tree before package is installed.

name   The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to emerge a package from the portage tree. To install a tbz2 package manually, use the "sources" option described below.

CLI Example:
```
salt '*' pkg.install <package name>
```

refresh   Whether or not to sync the portage tree before installing.

version   Install a specific version of the package, e.g. 1.0.9-r1. Ignored if "pkgs" or "sources" is passed.

slot   Similar to version, but specifies a valid slot to be installed. It will install the latest available version in the specified slot. Ignored if "pkgs" or "sources" or "version" is passed.

CLI Example:
fromrepo  Similar to slot, but specifies the repository from the package will be installed. It will install the latest available version in the specified repository. Ignored if "pkgs" or "sources" or "version" is passed.

CLI Example:

```
salt '*' pkg.install salt fromrepo='gentoo'
```

uses  Similar to slot, but specifies a list of use flag. Ignored if "pkgs" or "sources" or "version" is passed.

CLI Example:

```
salt '*' pkg.install sys-devel/gcc uses=['nptl','-nossp']
```

Multiple Package Installation Options:

pkgs  A list of packages to install from the portage tree. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo","bar","~category/package:slot::repository[use]"]'
```

sources  A list of tbz2 packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.tbz2"},{"bar": "salt://bar.tbz2"}]'
```

binhost  has two options try and force. try - tells emerge to try and install the package from a configured binhost. force - forces emerge to install the package from a binhost otherwise it fails out.

Returns a dict containing the new package names and versions:

```
{
'<package>': {
'old': '<old-version>',
'new': '<new-version>'
}}
```

salt.modules.ebuildpkg.latest_version(*names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.ebuildpkg.list_pkgs(versions_as_list=False, **kwargs)

List the packages currently installed in a dict:

```
{
'<package_name>': '<version>'
}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

salt.modules.ebuildpkg.list_upgrades(refresh=True, backtrack=3, **kwargs)

List all available package upgrades.
**refresh** Whether or not to sync the portage tree before checking for upgrades.

**backtrack** Specifies an integer number of times to backtrack if dependency calculation fails due to a conflict or an unsatisfied dependency (default: '3').

CLI Example:

```
salt '*' pkg.list_upgrades
```

salt.modules.ebuildpkg.porttree_matches(name)
Returns a list containing the matches for a given package name from the portage tree. Note that the specific version of the package will not be provided for packages that have several versions in the portage tree, but rather the name of the package (i.e. "dev-python/paramiko").

salt.modules.ebuildpkg.purge(name=None, slot=None, fromrepo=None, pkgs=None, **kwargs)
Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any emerge commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Portage does not have a purge, this function calls remove followed by depclean to emulate a purge process

**name** The name of the package to be deleted.

**slot** Restrict the remove to a specific slot. Ignored if name is None.

**fromrepo** Restrict the remove to a specific slot. Ignored if name is None.

Multiple Package Options:

**pkgs** Uninstall multiple packages. slot and fromrepo arguments are ignored if this argument is present. Must be passed as a python list.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package name> slot=4.4
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.ebuildpkg.refresh_db(**kwargs)
Update the portage tree using the first available method from the following list:

- emaint sync
- eix-sync
- emerge-webrsync
- emerge --sync

To prevent the portage tree from being synced within one day of the previous sync, add the following pillar data for this minion:

```
portage:
    sync_wait_one_day: True
```

CLI Example:
salt modules.ebuildpkg.remove(name=None, slot=None, fromrepo=None, pkgs=None, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any emerge commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Remove packages via emerge --unmerge.

name The name of the package to be deleted.

slot Restrict the remove to a specific slot. Ignored if name is None.

fromrepo Restrict the remove to a specific slot. Ignored if name is None.

Multiple Package Options:

pkgs Uninstall multiple packages. slot and fromrepo arguments are ignored if this argument is present.

Must be passed as a python list.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package name> slot=4.4 fromrepo=gentoo
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'

salt modules.ebuildpkg.update(pkg, slot=None, fromrepo=None, refresh=False, binhost=None, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any emerge commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Updates the passed package (emerge --update package)

slot Restrict the update to a particular slot. It will update to the latest version within the slot.

fromrepo Restrict the update to a particular repository. It will update to the latest version within the repository.

binhost has two options try and force. try - tells emerge to try and install the package from a configured binhost. force - forces emerge to install the package from a binhost otherwise it fails out.

Return a dict containing the new package names and versions:

```json
{"<package>": {"old": '<old-version>',
               "new": '<new-version>'}}
```

CLI Example:
salt '*' pkg.update <package name>
salt.modules.ebuildpkg.upgrade(refresh=True, binhost=None, backtrack=3, **kwargs)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any emerge commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Run a full system upgrade (emerge -uDN @world)

binhost has two options try and force. try - tells emerge to try and install the package from a configured binhost. force - forces emerge to install the package from a binhost otherwise it fails out.

backtrack Specifies an integer number of times to backtrack if dependency calculation fails due to a conflict or an unsatisfied dependency (default: '3').

Returns a dictionary containing the changes:

```json
{ '<package>': { 'old': '<old-version>', 'new': '<new-version>' }}
```

CLI Example:

```bash
salt '*' pkg.upgrade
```

salt.modules.ebuildpkg.upgrade_available(name, **kwargs)

Check whether or not an upgrade is available for a given package

CLI Example:

```bash
salt '*' pkg.upgrade_available <package name>
```

salt.modules.ebuildpkg.version(*names, **kwargs)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```bash
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

salt.modules.ebuildpkg.version_clean(version)

Clean the version string removing extra data.

CLI Example:

```bash
salt '*' pkg.version_clean <version_string>
```

salt.modules.ebuildpkg.version_cmp(pkg1, pkg2, **kwargs)

Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

CLI Example:

```bash
salt '*' pkg.version_cmp '0.2.4-0' '0.2.4.1-0'
```
21.9.129  salt.modules.eix

Support for Eix

salt.modules.eix.sync()
Sync portage/overlay trees and update the eix database

CLI Example:

```bash
salt '*' eix.sync
```

salt.modules.eix.update()
Update the eix database

CLI Example:

```bash
salt '*' eix.update
```

21.9.130  salt.modules.elasticsearch

Elasticsearch - A distributed RESTful search and analytics server

Module to provide Elasticsearch compatibility to Salt (compatible with Elasticsearch version 1.5.2+)

New in version 2015.8.0.

depends  elasticsearch-py

collection  This module accepts connection configuration details either as parameters or as configuration settings in /etc/salt/minion on the relevant minions:

```yaml
elasticsearch:
  host: '10.10.10.100:9200'

elasticsearch-cluster:
  hosts:
    - '10.10.10.100:9200'
    - '10.10.10.101:9200'
    - '10.10.10.102:9200'

elasticsearch-extra:
  hosts:
    - '10.10.10.100:9200'
  use_ssl: True
  verify_certs: True
  ca_certs: /path/to/custom_ca_bundle.pem
  number_of_shards: 1
  number_of_replicas: 0
  functions_blacklist:
    - 'saltutil.find_job'
    - 'pillar.items'
    - 'grains.items'
  proxies:
    - http: http://proxy:3128
    - https: http://proxy:1080
```

When specifying proxies the requests backend will be used and the 'proxies' data structure is passed as-is to that module.
This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

Some functionality might be limited by elasticsearch-py and Elasticsearch server versions.

salt.modules.elasticsearch.alias_create(indices, alias, hosts=None, body=None, profile=None, source=None)

Create an alias for a specific index/indices

indices Single or multiple indices separated by comma, use _all to perform the operation on all indices.
alias Alias name
body Optional definition such as routing or filter as defined in https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-aliases.html
source URL of file specifying optional definition such as routing or filter. Cannot be used in combination with body.

CLI example:
```
salt myminion elasticsearch.alias_create testindex_v1 testindex
```

salt.modules.elasticsearch.alias_delete(indices, aliases, hosts=None, body=None, profile=None, source=None)

Delete an alias of an index

indices Single or multiple indices separated by comma, use _all to perform the operation on all indices.
aliases Alias names separated by comma

CLI example:
```
salt myminion elasticsearch.alias_delete testindex_v1 testindex
```

salt.modules.elasticsearch.alias_exists(aliases, indices=None, hosts=None, profile=None)

Return a boolean indicating whether given alias exists

indices Single or multiple indices separated by comma, use _all to perform the operation on all indices.
aliases Alias names separated by comma

CLI example:
```
salt myminion elasticsearch.alias_exists None testindex
```

salt.modules.elasticsearch.alias_get(indices=None, aliases=None, hosts=None, profile=None)

Check for the existence of an alias and if it exists, return it

indices Single or multiple indices separated by comma, use _all to perform the operation on all indices.
aliases Alias names separated by comma

CLI example:
```
salt myminion elasticsearch.alias_get testindex
```

salt.modules.elasticsearch.cluster_get_settings(flat_settings=False, include_defaults=False, hosts=None, profile=None)

New in version 3000.

Return Elasticsearch cluster settings.

flat_settings Return settings in flat format.
include_defaults  Whether to return all default clusters setting.

CLI example:

```bash
salt myminion elasticsearch.cluster_get_settings
```

salt.modules.elasticsearch.cluster_health(index=None, level='cluster', local=False, hosts=None, profile=None)

New in version 2017.7.0.

Return Elasticsearch cluster health.

index  Limit the information returned to a specific index

level  Specify the level of detail for returned information, default 'cluster', valid choices are: 'cluster', 'indices', 'shards'

local  Return local information, do not retrieve the state from master node

CLI example:

```bash
salt myminion elasticsearch.cluster_health
```

salt.modules.elasticsearch.cluster_put_settings(body=None, flat_settings=False, hosts=None, profile=None)

New in version 3000.

Set Elasticsearch cluster settings.

body  The settings to be updated. Can be either 'transient' or 'persistent' (survives cluster restart) http://www.elastic.co/guide/en/elasticsearch/reference/current/cluster-update-settings.html

flat_settings  Return settings in flat format.

CLI example:

```bash
salt myminion elasticsearch.cluster_put_settings '{"persistent": {"indices.
→recovery.max_bytes_per_sec": "50mb"}}'
salt myminion elasticsearch.cluster_put_settings '{"transient": {"indices.
→recovery.max_bytes_per_sec": "50mb"}}'
```

salt.modules.elasticsearch.cluster_stats(nodes=None, hosts=None, profile=None)

New in version 2017.7.0.

Return Elasticsearch cluster stats.

nodes  List of cluster nodes (id or name) to display stats for. Use _local for connected node, empty for all

CLI example:

```bash
salt myminion elasticsearch.cluster_stats
```

salt.modules.elasticsearch.document_create(index, doc_type, body=None, id=None, hosts=None, profile=None, source=None)

Create a document in a specified index

index  Index name where the document should reside

doc_type  Type of the document

body  Document to store

source  URL of file specifying document to store. Cannot be used in combination with body.

id  Optional unique document identifier for specified doc_type (empty for random)
**CLI example:**
```
salt myminion elasticsearch.document_create testindex doctype1 '{}'
```

```python
salt.modules.elasticsearch.document_delete(index, doc_type, id, hosts=None, profile=None)
```
Delete a document from an index

- `index` Index name where the document resides
- `doc_type` Type of the document
- `id` Document identifier

**CLI example:**
```
salt myminion elasticsearch.document_delete testindex doctype1 AUx-384m0Bug_8U80wQZ
```

```python
salt.modules.elasticsearch.document_exists(index, id, doc_type='_all', hosts=None, profile=None)
```
Return a boolean indicating whether given document exists

- `index` Index name where the document resides
- `id` Document identifier
- `doc_type` Type of the document, use `_all` to fetch the first document matching the ID across all types

**CLI example:**
```
salt myminion elasticsearch.document_exists testindex AUx-384m0Bug_8U80wQZ
```

```python
salt.modules.elasticsearch.document_get(index, id, doc_type='_all', hosts=None, profile=None)
```
Check for the existence of a document and if it exists, return it

- `index` Index name where the document resides
- `id` Document identifier
- `doc_type` Type of the document, use `_all` to fetch the first document matching the ID across all types

**CLI example:**
```
salt myminion elasticsearch.document_get testindex AUx-384m0Bug_8U80wQZ
```

```python
salt.modules.elasticsearch.flush_synced(hosts=None, profile=None, **kwargs)
```
New in version 3000.

- `index` (Optional, string) A comma-separated list of index names; use `_all` or empty string for all indices. Defaults to `_all`.
- `ignore_unavailable` (Optional, boolean) If true, missing or closed indices are not included in the response. Defaults to false.
- `allow_no_indices` (Optional, boolean) If true, the request does not return an error if a wildcard expression or `_all` value retrieves only missing or closed indices. This parameter also applies to index aliases that point to a missing or closed index.
- `expand_wildcards` (Optional, string) Controls what kind of indices that wildcard expressions can expand to. Valid values are:
all - Expand to open and closed indices.
open - Expand only to open indices.
closed - Expand only to closed indices.
one - Wildcard expressions are not accepted.

The defaults settings for the above parameters depend on the API being used.

CLI example:

```
salt myminion elasticsearch.flush_synced index='index1,index2' ignore_unavailable=True allow_no_indices=True expand_wildcards='all'
```

```
salt.modules.elasticsearch.index_close(index, allow_no_indices=True, expand_wildcards='open', ignore_unavailable=True, hosts=None, profile=None)
```

New in version 2017.7.0.

Close specified index.

index Index to be closed

allow_no_indices Whether to ignore if a wildcard indices expression resolves into no concrete indices. (This includes _all string or when no indices have been specified)

expand_wildcards Whether to expand wildcard expression to concrete indices that are open, closed or both., default 'open', valid choices are: 'open', 'closed', 'none', 'all'

ignore_unavailable Whether specified concrete indices should be ignored when unavailable (missing or closed)

CLI example:

```
salt myminion elasticsearch.index_close testindex
```

```
salt.modules.elasticsearch.index_create(index, body=None, hosts=None, profile=None, source=None)
```

Create an index

index Index name

body Index definition, such as settings and mappings as defined in https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-create-index.html

source URL to file specifying index definition. Cannot be used in combination with body.

CLI example:

```
salt myminion elasticsearch.index_create testindex
salt myminion elasticsearch.index_create testindex2 '{"settings" : {"index" : { "number_of_shards" : 3, "number_of_replicas" : 2}}}'
```

```
salt.modules.elasticsearch.index_delete(index, hosts=None, profile=None)
```

Delete an index

index Index name

CLI example:

```
salt myminion elasticsearch.index_delete testindex
```

```
salt.modules.elasticsearch.index_exists(index, hosts=None, profile=None)
```

Return a boolean indicating whether given index exists

---

21.9. execution modules
**index**  Index name

CLI example:
```
salt myminion elasticsearch.index_exists testindex
```

```
salt.modules.elasticsearch.index_get(index, hosts=None, profile=None)
```
Check for the existence of an index and if it exists, return it

**index**  Index name

CLI example:
```
salt myminion elasticsearch.index_get testindex
```

```
salt.modules.elasticsearch.index_get_settings(hosts=None, profile=None, **kwargs)
```
New in version 3000.

**index**  (Optional, string) A comma-separated list of index names; use _all or empty string for all indices. Defaults to `_all`.

**name**  (Optional, string) The name of the settings that should be included

**allow_no_indices**  (Optional, boolean) Whether to ignore if a wildcard indices expression resolves into no concrete indices. (This includes _all string or when no indices have been specified)

**expand_wildcards**  (Optional, string) Whether to expand wildcard expression to concrete indices that are open, closed or both. Valid choices are: 'open', 'closed', 'none', 'all'

**flat_settings**  (Optional, boolean) Return settings in flat format

**ignore_unavailable**  (Optional, boolean) Whether specified concrete indices should be ignored when unavailable (missing or closed)

**include_defaults**  (Optional, boolean) Whether to return all default setting for each of the indices.

**local**  (Optional, boolean) Return local information, do not retrieve the state from master node

The defaults settings for the above parameters depend on the API version being used.

CLI example:
```
salt myminion elasticsearch.index_get_settings index=testindex
```

```
salt.modules.elasticsearch.index_open(index, allow_no_indices=True, expand_wildcards='closed', ignore_unavailable=True, hosts=None, profile=None)
```
New in version 2017.7.0.

Open specified index.

**index**  Index to be opened

**allow_no_indices**  Whether to ignore if a wildcard indices expression resolves into no concrete indices. (This includes _all string or when no indices have been specified)

**expand_wildcards**  Whether to expand wildcard expression to concrete indices that are open, closed or both., default 'closed', valid choices are: 'open', 'closed', 'none', 'all'

**ignore_unavailable**  Whether specified concrete indices should be ignored when unavailable (missing or closed)
salt.modules.elasticsearch.index_put_settings

New in version 3000.

Update existing index settings

body The index settings to be updated.
source URL to file specifying index definition. Cannot be used in combination with body.
index (Optional, string) A comma-separated list of index names; use _all or empty string to perform the operation on all indices
allow_no_indices (Optional, boolean) Whether to ignore if a wildcard indices expression resolves into no concrete indices. (This includes _all string or when no indices have been specified)
expand_wildcards (Optional, string) Whether to expand wildcard expression to concrete indices that are open, closed or both. Valid choices are: ‘open’, ‘closed’, ‘none’, ‘all’
flat_settings (Optional, boolean) Return settings in flat format (default: false)
ignore_unavailable (Optional, boolean) Whether specified concrete indices should be ignored when unavailable (missing or closed)
master_timeout (Optional, time units) Explicit operation timeout for connection to master node
preserve_existing (Optional, boolean) Whether to update existing settings. If set to true existing settings on an index remain unchanged, the default is false

The defaults settings for the above parameters depend on the API version being used.

..note:: Elasticsearch time units can be found here: https://www.elastic.co/guide/en/elasticsearch/reference/current/common-options.html#time-units

CLI example:
salt myminion elasticsearch.index_put_settings index=testindex body='{"settings": {"number_of_replicas": 2}}'

salt.modules.elasticsearch.index_template_create

Create an index template

name Index template name
source URL to file specifying template definition. Cannot be used in combination with body.

CLI example:
salt myminion elasticsearch.index_template_create testindex_templ '{ "template": "logstash-*", "order": 1, "settings": { "number_of_shards": 1 } }'

salt.modules.elasticsearch.index_template_delete

Delete an index template (type) along with its data

name Index template name
CLI example:
salt myminion elasticsearch.index_template_delete testindex_templ user

\[ \text{salt.modules.elasticsearch.index_template_exists(name, hosts=None, profile=None)} \]
Return a boolean indicating whether given index template exists

name  Index template name

CLI example:
salt myminion elasticsearch.index_template_exists testindex_templ

\[ \text{salt.modules.elasticsearch.index_template_get(name, hosts=None, profile=None)} \]
Retrieve template definition of index or index/type

name  Index template name

CLI example:
salt myminion elasticsearch.index_template_get testindex_templ

\[ \text{salt.modules.elasticsearch.info(hosts=None, profile=None)} \]
New in version 2017.7.0.
Return Elasticsearch information.

CLI example:
salt myminion elasticsearch.info
salt myminion elasticsearch.info profile=elasticsearch-extra

\[ \text{salt.modules.elasticsearch.mapping_create(index, doc_type, body=None, hosts=None, profile=None, source=None)} \]
Create a mapping in a given index

index  Index for the mapping
doc_type  Name of the document type

source  URL to file specifying mapping definition. Cannot be used in combination with body.

CLI example:
salt myminion elasticsearch.mapping_create testindex user '{
  "user": {
    "properties": {
      "message": {
        "type": "string",
        "store": true
      }
    }
  }
}'

\[ \text{salt.modules.elasticsearch.mapping_delete(index, doc_type, hosts=None, profile=None)} \]
Delete a mapping (type) along with its data. As of Elasticsearch 5.0 this is no longer available.

index  Index for the mapping
doc_type  Name of the document type

CLI example:
salt myminion elasticsearch.mapping_delete testindex user

\[ \text{salt.modules.elasticsearch.mapping_get(index, doc_type, hosts=None, profile=None)} \]
Retrieve mapping definition of index or index/type
index  Index for the mapping

doc_type  Name of the document type

CLI example:

```
salt myminion elasticsearch.mapping_get testindex user
```

```
salt.modules.elasticsearch.node_info(nodes=None, flat_settings=False, hosts=None, profile=None)
```

New in version 2017.7.0.

Return Elasticsearch node information.

nodes  List of cluster nodes (id or name) to display stats for. Use _local for connected node, empty for all

flat_settings  Flatten settings keys

CLI example:

```
salt myminion elasticsearch.node_info flat_settings=True
```

```
salt.modules.elasticsearch.ping(allow_failure=False, hosts=None, profile=None)
```

New in version 2017.7.0.

Test connection to Elasticsearch instance. This method does not fail if not explicitly specified.

allow_failure  Throw exception if ping fails

CLI example:

```
salt myminion elasticsearch.ping allow_failure=True
salt myminion elasticsearch.ping profile=elasticsearch-extra
```

```
salt.modules.elasticsearch.pipeline_create(id, body, hosts=None, profile=None)
```

New in version 2017.7.0.

Create Ingest pipeline by supplied definition. Available since Elasticsearch 5.0.

id  Pipeline id

CLI example:

```
salt myminion elasticsearch.pipeline_create mypipeline '{"description": "my custom pipeline", "processors": [{"set": {"field": "collector_timestamp_millis", "value": "{{_ingest.timestamp}}"}}]}'}
```

```
salt.modules.elasticsearch.pipeline_delete(id, hosts=None, profile=None)
```

New in version 2017.7.0.

Delete Ingest pipeline. Available since Elasticsearch 5.0.

id  Pipeline id

CLI example:

```
salt myminion elasticsearch.pipeline_delete mypipeline
```

```
salt.modules.elasticsearch.pipeline_get(id, hosts=None, profile=None)
```

New in version 2017.7.0.
Retrieve Ingest pipeline definition. Available since Elasticsearch 5.0.

id  Pipeline id
CLI example:

```
salt myminion elasticsearch.pipeline_get mypipeline
```

```
salt.modules.elasticsearch.pipeline_simulate(id, body, verbose=False, hosts=None, profile=None)
```

New in version 2017.7.0.
Simulate existing Ingest pipeline on provided data. Available since Elasticsearch 5.0.

id  Pipeline id
verbose  Specify if the output should be more verbose
CLI example:

```
salt myminion elasticsearch.pipeline_simulate mypipeline '{"docs": [{"_index": "_index", "_type": "type", "_id": "id", "_source": {"foo": "bar"}}, {"_index": "index", "_type": "type", "_id": "id", "_source": {"foo": "rab"}}]}', verbose=True
```

```
salt.modules.elasticsearch.repository_create(name, body, hosts=None, profile=None)
```

New in version 2017.7.0.
Create repository for storing snapshots. Note that shared repository paths have to be specified in path.repo Elasticsearch configuration option.

name  Repository name
CLI example:

```
salt myminion elasticsearch.repository_create testrepo '{"type": "fs", "settings": {"location": "/tmp/test", "compress": true}}'
```

```
salt.modules.elasticsearch.repository_delete(name, hosts=None, profile=None)
```

New in version 2017.7.0.
Delete existing repository.

name  Repository name
CLI example:

```
salt myminion elasticsearch.repository_delete testrepo
```

```
salt.modules.elasticsearch.repository_get(name, local=False, hosts=None, profile=None)
```

New in version 2017.7.0.
Get existing repository details.

name  Repository name
local  Retrieve only local information, default is false
CLI example:
**salt** myminion elasticsearch.repository_get testrepo

**salt.modules.elasticsearch.repository_verify**(name, hosts=None, profile=None)

New in version 2017.7.0.

Obtain list of cluster nodes which successfully verified this repository.

- **name**  Repository name
- **hosts**  None
- **profile**  None

**CLI example:**

```
salt myminion elasticsearch.repository_verify testrepo
```

**salt.modules.elasticsearch.search_template_create**(id, body=None, hosts=None, profile=None)

New in version 2017.7.0.

Create search template by supplied definition

- **id**  Template ID
- **body**  Search template definition

**CLI example:**

```
salt myminion elasticsearch.search_template_create mytemplate '{"template":{"query

→":"match":"title":"{{query_string}}}"}}'}
```

**salt.modules.elasticsearch.search_template_delete**(id, hosts=None, profile=None)

New in version 2017.7.0.

Delete existing search template definition.

- **id**  Template ID

**CLI example:**

```
salt myminion elasticsearch.search_template_delete mytemplate
```

**salt.modules.elasticsearch.search_template_get**(id, hosts=None, profile=None)

New in version 2017.7.0.

Obtain existing search template definition.

- **id**  Template ID

**CLI example:**

```
salt myminion elasticsearch.search_template_get mytemplate
```

**salt.modules.elasticsearch.snapshot_create**(repository, snapshot, body=None, hosts=None, profile=None)

New in version 2017.7.0.

Create snapshot in specified repository by supplied definition.

- **repository**  Repository name
- **snapshot**  Snapshot name
- **body**  Snapshot definition as in https://www.elastic.co/guide/en/elasticsearch/reference/current/
  modules-snapshots.html

**CLI example:**
salt.myminion.elasticsearch.snapshot_create testrepo testsnapshot '{"indices": "index_1,index_2","ignore_unavailable":true,"include_global_state":false}"

salt.modules.elasticsearch.snapshot_delete(repository, snapshot, hosts=None, profile=None)

New in version 2017.7.0.
Delete snapshot from specified repository.
repository  Repository name
snapshot  Snapshot name
CLI example:
salt myminion elasticsearch.snapshot_delete testrepo testsnapshot

salt.modules.elasticsearch.snapshot_get(repository, snapshot, ignore_unavailable=False, hosts=None, profile=None)

New in version 2017.7.0.
Obtain snapshot residing in specified repository.
repository  Repository name
snapshot  Snapshot name, use _all to obtain all snapshots in specified repository
ignore_unavailable  Ignore unavailable snapshots
CLI example:
salt myminion elasticsearch.snapshot_get testrepo testsnapshot

salt.modules.elasticsearch.snapshot_restore(repository, snapshot, body=None, hosts=None, profile=None)

New in version 2017.7.0.
Restore existing snapshot in specified repository by supplied definition.
repository  Repository name
snapshot  Snapshot name
CLI example:
salt myminion elasticsearch.snapshot_restore testrepo testsnapshot '{"indices": "index_1,index_2","ignore_unavailable":true,"include_global_state":true}"

salt.modules.elasticsearch.snapshot_status(repository=None, snapshot=None, ignore_unavailable=False, hosts=None, profile=None)

New in version 2017.7.0.
Obtain status of all currently running snapshots.
repository  Particular repository to look for snapshots
snapshot  Snapshot name
ignore_unavailable  Ignore unavailable snapshots
CLI example:
21.9.131 salt.modules.environ

Support for getting and setting the environment variables of the current salt process.

salt.modules.environ.get(key, default="")

Get a single salt process environment variable.

key String used as the key for environment lookup.

default If the key is not found in the environment, return this value. Default: ”

CLI Example:

```bash
salt '*' environ.get foo
salt '*' environ.get baz default=False
```

salt.modules.environ.has_value(key, value=None)

Determine whether the key exists in the current salt process environment dictionary. Optionally compare the current value of the environment against the supplied value string.

key Must be a string. Used as key for environment lookup.

value: Optional. If key exists in the environment, compare the current value with this value. Return True if they are equal.

CLI Example:

```bash
salt '*' environ.has_value foo
```

salt.modules.environ.item(keys, default="")

Get one or more salt process environment variables. Returns a dict.

keys Either a string or a list of strings that will be used as the keys for environment lookup.

default If the key is not found in the environment, return this value. Default: ”

CLI Example:

```bash
salt '*' environ.item foo
salt '*' environ.item ['foo', 'baz'] default=None
```

salt.modules.environ.items()

Return a dict of the entire environment set for the salt process

CLI Example:

```bash
salt '*' environ.items
```

salt.modules.environ.setenv(environ, false_unsets=False, clear_all=False, update_minion=False, permanent=False)

Set multiple salt process environment variables from a dict. Returns a dict.

environ Must be a dict. The top-level keys of the dict are the names of the environment variables to set. Each key’s value must be a string or False. Refer to the 'false_unsets' parameter for behavior when a value set to False.
false_unsets If a key's value is False and false_unsets is True, then the key will be removed from the salt processes environment dict entirely. If a key's value is False and false_unsets is not True, then the key's value will be set to an empty string. Default: False

clear_all USE WITH CAUTION! This option can unset environment variables needed for salt to function properly. If clear_all is True, then any environment variables not defined in the environ dict will be deleted. Default: False

update_minion If True, apply these environ changes to the main salt-minion process. If False, the environ changes will only affect the current salt subprocess. Default: False

permanent On Windows minions this will set the environment variable in the registry so that it is always added as an environment variable when applications open. If you want to set the variable to HKLM instead of HKCU just pass in "HKLM" for this parameter. On all other minion types this will be ignored. Note: This will only take affect on applications opened after this has been set.

CLI Example:

```
salt '*' environ.setenv '{"foo": "bar", "baz": "quux"}'}
salt '*' environ.setenv '{"a": "b", "c": False}' false_unsets=True
```

```
salt.modules.environ.setval(key, val, false_unsets=False, permanent=False)
```
Set a single salt process environment variable. Returns True on success.

key The environment key to set. Must be a string.

val The value to set. Must be a string or False. Refer to the 'false_unsets' parameter for behavior when set to False.

false_unsets If val is False and false_unsets is True, then the key will be removed from the salt processes environment dict entirely. If val is False and false_unsets is not True, then the key's value will be set to an empty string. Default: False.

permanent On Windows minions this will set the environment variable in the registry so that it is always added as an environment variable when applications open. If you want to set the variable to HKLM instead of HKCU just pass in "HKLM" for this parameter. On all other minion types this will be ignored. Note: This will only take affect on applications opened after this has been set.

CLI Example:

```
salt '*' environ.setval foo bar
salt '*' environ.setval baz val=False false_unsets=True
salt '*' environ.setval baz bar permanent=True
salt '*' environ.setval baz bar permanent=HKLM
```

21.9.132 salt.modules.eselect

Support for eselect, Gentoo's configuration and management tool.

```
salt.modules.eselect.exec_action(module, action, module_parameter=None, action_parameter=None, state_only=False)
```
Execute an arbitrary action on a module.

module name of the module to be executed

action name of the module's action to be run

module_parameter additional params passed to the defined module

action_parameter additional params passed to the defined action
state_only  don't return any output but only the success/failure of the operation

CLI Example (updating the php implementation used for apache2):

```bash
salt '*' eeselect.exec_action php update action_parameter='apache2'
```

```

salt.modules.eeselect.get_current_target(module, module_parameter=None, action_parameter=None)
```

Get the currently selected target for the given module.

- **module** name of the module to be queried for its current target
- **module_parameter** additional params passed to the defined module
- **action_parameter** additional params passed to the 'show' action

CLI Example (current target of system-wide java-vm):

```bash
salt '*' eeselect.get_current_target java-vm action_parameter='system'
```

CLI Example (current target of kernel symlink):

```bash
salt '*' eeselect.get_current_target kernel
```

```

salt.modules.eeselect.get_modules()
```

List available eeselect modules.

CLI Example:

```bash
salt '*' eeselect.get_modules
```

```

salt.modules.eeselect.get_target_list(module, action_parameter=None)
```

List available targets for the given module.

- **module** name of the module to be queried for its targets
- **action_parameter** additional params passed to the defined action

  New in version 2016.11.0.

CLI Example:

```bash
salt '*' eeselect.get_target_list kernel
```

```

salt.modules.eeselect.set_target(module, target, module_parameter=None, action_parameter=None)
```

Set the target for the given module. Target can be specified by index or name.

- **module** name of the module for which a target should be set
- **target** name of the target to be set for this module
- **module_parameter** additional params passed to the defined module
- **action_parameter** additional params passed to the defined action

CLI Example (setting target of system-wide java-vm):

```bash
salt '*' eeselect.set_target java-vm icedtea-bin-7 action_parameter='system'
```

CLI Example (setting target of kernel symlink):

```bash
salt '*' eeselect.set_target kernel
```
21.9.133 salt.modules.esxcluster module

Module used to access the esxcluster proxy connection methods
salt.modules.esxcluster.get_details()

21.9.134 salt.modules.esxdatacenter module

Module used to access the esxdatacenter proxy connection methods
salt.modules.esxdatacenter.get_details()

21.9.135 salt.modules.esxi

Glues the VMware vSphere Execution Module to the VMware ESXi Proxy Minions to the esxi proxy module. New in version 2015.8.4.
Depends: vSphere Remote Execution Module (salt.modules.vsphere)
For documentation on commands that you can direct to an ESXi host via proxy, look in the documentation for salt.modules.vsphere.
This execution module calls through to a function in the ESXi proxy module called ch_config, which looks up the function passed in the command parameter in salt.modules.vsphere and calls it.
To execute commands with an ESXi Proxy Minion using the vSphere Execution Module, use the esxi.cmd <vsphere-function-name> syntax. Both args and kwargs needed for various vsphere execution module functions must be passed through in a kwargs- type manor.

```
salt 'esxi-proxy' esxi.cmd system_info
salt 'esxi-proxy' esxi.cmd get_service_policy service_name='ssh'
```

salt.modules.esxi.cmd(command, *args, **kwargs)
salt.modules.esxi.get_details()

21.9.136 salt.modules.esxvm module

Module used to access the esx proxy connection methods
salt.modules.esxvm.get_details()
21.9.137 salt.modules.etcd_mod

Execution module to work with etcd

    depends
    • python-etcd

Configuration

To work with an etcd server you must configure an etcd profile. The etcd config can be set in either the Salt Minion configuration file or in pillar:

```
my_etd_config:
    etcd.host: 127.0.0.1
    etcd.port: 4001
```

It is technically possible to configure etcd without using a profile, but this is not considered to be a best practice, especially when multiple etcd servers or clusters are available.

```
 etcd.host: 127.0.0.1
 etcd.port: 4001
```

Note: The etcd configuration can also be set in the Salt Master config file, but in order to use any etcd configurations defined in the Salt Master config, the pillar_opts must be set to True.

Be aware that setting pillar_opts to True has security implications as this makes all master configuration settings available in all minion’s pillars.

salt.modules.etcd_mod.get_ (key, recurse=False, profile=None, **kwargs)

New in version 2014.7.0.

Get a value from etcd, by direct path. Returns None on failure.

CLI Examples:

```
salt myminion etcd.get /path/to/key
salt myminion etcd.get /path/to/key profile=my_etcd_config
salt myminion etcd.get /path/to/key recurse=True profile=my_etcd_config
salt myminion etcd.get /path/to/key host=127.0.0.1 port=2379
```

salt.modules.etcd_mod.ls_ (path='/', profile=None, **kwargs)

New in version 2014.7.0.

Return all keys and dirs inside a specific path. Returns an empty dict on failure.

CLI Example:

```
salt myminion etcd.ls /path/to/dir/
salt myminion etcd.ls /path/to/dir/ profile=my_etcd_config
salt myminion etcd.ls /path/to/dir/ host=127.0.0.1 port=2379
```

salt.modules.etcd_mod.rm_ (key, recurse=False, profile=None, **kwargs)

New in version 2014.7.0.

Delete a key from etcd. Returns True if the key was deleted, False if it was not and None if there was a failure.

CLI Example:
salt.myminion.etcd.rm /path/to/key
salt.myminion.etcd.rm /path/to/key profile=my_etcd_config
salt.myminion.etcd.rm /path/to/key host=127.0.0.1 port=2379
salt.myminion.etcd.rm /path/to/dir recurse=True profile=my_etcd_config

salt.modules.etcd_mod.set_(key, value, profile=None, ttl=None, directory=False, **kwargs)
New in version 2014.7.0.
Set a key in etcd by direct path. Optionally, create a directory or set a TTL on the key. Returns None on failure.
CLI Example:
salt.myminion.etcd.set /path/to/key value
salt.myminion.etcd.set /path/to/key value profile=my_etcd_config
salt.myminion.etcd.set /path/to/key value host=127.0.0.1 port=2379
salt.myminion.etcd.set /path/to/dir '' directory=True
salt.myminion.etcd.set /path/to/key value ttl=5

salt.modules.etcd_mod.tree(path='', profile=None, **kwargs)
New in version 2014.7.0.
Recurse through etcd and return all values. Returns None on failure.
CLI Example:
salt.myminion.etcd.tree
salt.myminion.etcd.tree profile=my_etcd_config
salt.myminion.etcd.tree host=127.0.0.1 port=2379
salt.myminion.etcd.tree /path/to/keys profile=my_etcd_config

salt.modules.etcd_mod.update(fields, path='', profile=None, **kwargs)
New in version 2016.3.0.
Sets a dictionary of values in one call. Useful for large updates in syndic environments. The dictionary can contain a mix of formats such as:

```
{
  '/some/example/key': 'bar',
  '/another/example/key': 'baz'
}
```

Or it may be a straight dictionary, which will be flattened to look like the above format:

```
{
  'some': {
    'example': {
      'key': 'bar'
    }
  },
  'another': {
    'example': {
      'key': 'baz'
    }
  }
}
```

You can even mix the two formats and it will be flattened to the first format. Leading and trailing '/' will be removed.
Empty directories can be created by setting the value of the key to an empty dictionary.
The 'path' parameter will optionally set the root of the path to use.

CLI Example:

```
salt myminion etcd.update "{'/path/to/key': 'baz', '/another/key': 'bar'}"
```

```
salt myminion etcd.update "{'/path/to/key': 'baz', '/another/key': 'bar'}"
```

```
profile=my_etcd_config
```

```
host=127.0.0.1  port=2379
```

```
path='some/root'
```

**salt.modules.etcd_mod.watch** *(key, recurse=False, profile=None, timeout=0, index=None, **kwargs)*

New in version 2016.3.0.

Makes a best effort to watch for a key or tree change in etcd. Returns a dict containing the new key value (or None if the key was deleted), the modifiedIndex of the key, whether the key changed or not, the path to the key that changed and whether it is a directory or not.

If something catastrophic happens, returns {}.

CLI Example:

```
salt myminion etcd.watch /path/to/key
```

```
salt myminion etcd.watch /patch/to/key
```

```
profile=my_etcd_config index=10
```

```
host=127.0.0.1  port=2379
```

**21.9.138 salt.modules.ethtool module**

Module for running ethtool command

New in version 2016.3.0.

- **codeauthor** Krzysztof Pawlowski <msciciel@msciciel.eu>
- **maturity** new
- **depends** python-ethtool
- **platform** linux

**salt.modules.ethtool.set_coalesce** *(devname, **kwargs)*

Changes the coalescing settings of the specified network device

CLI Example:

```
salt '*' ethtool.set_coalesce <devname> [adaptive_rx=on|off] [adaptive_tx=on|off]
```

```
[rx_usecs=N] [tx_usecs=N] [rx_frames=N] [tx_frames=N] [tx_usecs_irq=N] [rx_usecs_irq=N] [tx_frames_irq=N] [tx_usecs_irq=N] [rx_frames_irq=N] [tx_frames_irq=N] [sample_interval=N]
```

**salt.modules.ethtool.set_offload** *(devname, **kwargs)*

Changes the offload parameters and other features of the specified network device

CLI Example:
salt 's' ethtool.set_offload <devname> tcp_segmentation_offload=on

salt.modules.ethtool.set_ring(devname, **kwargs)
Changes the rx/tx ring parameters of the specified network device
CLI Example:
salt 's' ethtool.set_ring <devname> [rx=N] [rx_mini=N] [rx_jumbo=N] [tx=N]

salt.modules.ethtool.show_coalesce(devname)
Queries the specified network device for coalescing information
CLI Example:
salt 's' ethtool.show_coalesce <devname>

salt.modules.ethtool.show_driver(devname)
Queries the specified network device for associated driver information
CLI Example:
salt 's' ethtool.show_driver <devname>

salt.modules.ethtool.show_offload(devname)
Queries the specified network device for the state of protocol offload and other features
CLI Example:
salt 's' ethtool.show_offload <devname>

salt.modules.ethtool.show_ring(devname)
Queries the specified network device for rx/tx ring parameter information
CLI Example:
salt 's' ethtool.show_ring <devname>

21.9.139 salt.modules.event

Use the Salt Event System to fire events from the master to the minion and vice-versa.
salt.modules.event.fire(data, tag)
Fire an event on the local minion event bus. Data must be formed as a dict.
CLI Example:
salt 's' event.fire '{"data":"my event data"}' 'tag'

salt.modules.event.fire_master(data, tag, preload=None)
Fire an event off up to the master server
CLI Example:
salt 's' event.fire_master '{"data":"my event data"}' 'tag'

salt.modules.event.send(tag, data=None, preload=None, with_env=False, with_grains=False, with_pillar=False, with_env_opts=False, **kwargs)
Send an event to the Salt Master
New in version 2014.7.0.

Parameters

- **tag** -- A tag to give the event. Use slashes to create a namespace for related events. E.g., `myco/build/buildserver1/start`, `myco/build/buildserver1/success`, `myco/build/buildserver1/failure`.

- **data** -- A dictionary of data to send in the event. This is free-form. Send any data points that are needed for whoever is consuming the event. Arguments on the CLI are interpreted as YAML so complex data structures are possible.

- **with_env** (Specify `True` to include all environment variables, or specify a list of strings of variable names to include.) -- Include environment variables from the current shell environment in the event data as `environ`. This is a short-hand for working with systems that seed the environment with relevant data such as Jenkins.

- **with_grains** (Specify `True` to include all grains, or specify a list of strings of grain names to include.) -- Include grains from the current minion in the event data as `grains`.

- **with_pillar** (Specify `True` to include all Pillar values, or specify a list of strings of Pillar keys to include. It is a best-practice to only specify a relevant subset of Pillar data.) -- Include Pillar values from the current minion in the event data as `pillar`. Remember Pillar data is often sensitive data so be careful. This is useful for passing ephemeral Pillar values through an event. Such as passing the `pillar={}` kwarg in `state.sls` from the Master, through an event on the Minion, then back to the Master.

- **with_env_opts** (Specify `True` to include `saltenv` and `pillarenv` values or `False` to omit them.) -- Include `saltenv` and `pillarenv` set on minion at the moment when event is send into event data.

- **kwargs** -- Any additional keyword arguments passed to this function will be interpreted as key-value pairs and included in the event data. This provides a convenient alternative to YAML for simple values.

CLI Example:

```bash
salt-call event.send myco/mytag foo=Foo bar=Bar
salt-call event.send 'myco/mytag' '{foo: Foo, bar: Bar}'
```

A convenient way to allow Jenkins to execute `salt-call` is via sudo. The following rule in sudoers will allow the `jenkins` user to run only the following command.

```
/etc/sudoers (allow preserving the environment):
jenkins ALL=(ALL) NOPASSWD:SETENV: /usr/bin/salt-call event.send*
```

Call Jenkins via sudo (preserve the environment):

```bash
sudo -E salt-call event.send myco/jenkins/build/success with_env=[BUILD_ID, BUILD_URL, GIT_BRANCH, GIT_COMMIT]
```
21.9.140 salt.modules.extfs

Module for managing ext2/3/4 file systems

salt.modules.extfs.attributes(device, args=None)  
Return attributes from dumpe2fs for a specified device  

CLI Example:

dev/sda1

salt.modules.extfs.blocks(device, args=None)  
Return block and inode info from dumpe2fs for a specified device  

CLI Example:

dev/sda1

salt.modules.extfs.dump(device, args=None)  
Return all contents of dumpe2fs for a specified device  

CLI Example:

dev/sda1

salt.modules.extfs.mkfs(device, fs_type, **kwargs)  
Create a file system on the specified device  

CLI Example:

dev/sda1 fs_type=ext4_opts='acl, noexec'

Valid options are:

- block_size: 1024, 2048 or 4096
- check: check for bad blocks
- direct: use direct IO
- ext_opts: extended file system options (comma-separated)
- fragment_size: size of fragments
- force: setting force to True will cause mke2fs to specify the -F option twice (it is already set once); this is truly dangerous
- blocks_per_group: number of blocks in a block group
- number_of_groups: ext4 option for a virtual block group
- bytes_per_inode: set the bytes/inode ratio
- inode_size: size of the inode
- journal: set to True to create a journal (default on ext3/4)
- journal_opts: options for the fs journal (comma separated)
- blocks_file: read bad blocks from file
- label: label to apply to the file system
- reserved: percentage of blocks reserved for super-user
- last_dir: last mounted directory
• **test**: set to True to not actually create the file system (mke2fs -n)
• **number_of_inodes**: override default number of inodes
• **creator_os**: override "creator operating system" field
• **opts**: mount options (comma separated)
• **revision**: set the filesystem revision (default 1)
• **super**: write superblock and group descriptors only
• **fs_type**: set the filesystem type (REQUIRED)
• **usage_type**: how the filesystem is going to be used
• **super**: set the UUID for the file system

See the `mke2fs(8)` manpage for a more complete description of these options.

```python
salt.modules.extfs.tune(device, **kwargs)
```
Set attributes for the specified device (using tune2fs)

CLI Example:

```
salt '*' extfs.tune /dev/sda1 force=True label=wildstallyns opts='acl,noexec'
```

Valid options are:

• **max**: max mount count
• **count**: mount count
• **error**: error behavior
• **extended_opts**: extended options (comma separated)
• **force**: force, even if there are errors (set to True)
• **group**: group name or gid that can use the reserved blocks
• **interval**: interval between checks
• **journal**: set to True to create a journal (default on ext3/4)
• **journal_opts**: options for the fs journal (comma separated)
• **label**: label to apply to the file system
• **reserved**: percentage of blocks reserved for super-user
• **last_dir**: last mounted directory
• **opts**: mount options (comma separated)
• **feature**: set or clear a feature (comma separated)
• **mmp_check**: mmp check interval
• **reserved**: reserved blocks count
• **quota_opts**: quota options (comma separated)
• **time**: time last checked
• **user**: user or uid who can use the reserved blocks
• **uuid**: set the UUID for the file system

See the `mke2fs(8)` manpage for a more complete description of these options.
21.9.141 salt.modules.file

Manage information about regular files, directories, and special files on the minion, set/read user, group, mode, and data

```python
class salt.modules.file.AttrChanges(added, removed)

property added
    Alias for field number 0

property removed
    Alias for field number 1
```

salt.modules.file.access(path, mode)

New in version 2014.1.0.

test whether the Salt process has the specified access to the file. One of the following modes must be specified:

CLI Example:

```
salt '*' file.access /path/to/file f
salt '*' file.access /path/to/file x
```

salt.modules.file.append(path, *args, **kwargs)

New in version 0.9.5.

append text to the end of a file

path  path to file

*args  strings to append to file

CLI Example:

```
salt '*' file.append /etc/motd \n    "With all thine offerings thou shalt offer salt." \n    "Salt is what makes things taste bad when it isn't in them."
```

Attention

If you need to pass a string to append and that string contains an equal sign, you must include the argument name, args. For example:

```
salt '*' file.append /etc/motd args='cheese=spam'
salt '*' file.append /etc/motd args=['cheese=spam','spam=cheese']
```

salt.modules.file.apply_template_on_contents(contents, template, context, defaults, saltenv)

return the contents after applying the templating engine

contents  template string

template  template format

context  Overrides default context variables passed to the template.

defaults  Default context passed to the template.

CLI Example:
salt 'file.apply_template_on_contents'
    contents='This is a {{ template }} string.'
    template=jinja
    "context={}" "defaults={'template': 'cool}'"
    saltenv=base

salt.modules.file.basename(path)
    Returns the final component of a pathname
    New in version 2015.5.0.
    This can be useful at the CLI but is frequently useful when scripting.

    {% set filename = salt['file.basename'](source_file) %}

    CLI Example:
    salt '*' file.basename 'test/test.config'

salt.modules.file.blockreplace(path, marker_start='#-- start managed zone --', marker_end='#-- end managed zone --', content='', append_if_not_found=False, prepend_if_not_found=False, backup='.bak', dry_run=False, show_changes=True, append_newline=False)
    New in version 2014.1.0.
    Replace content of a text block in a file, delimited by line markers
    A block of content delimited by comments can help you manage several lines entries without worrying about old entries removal.

    Note: This function will store two copies of the file in-memory (the original version and the edited version) in order to detect changes and only edit the targeted file if necessary.

    path  Filesystem path to the file to be edited
    marker_start The line content identifying a line as the start of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output
    marker_end The line content identifying the end of the content block. As of versions 2017.7.5 and 2018.3.1, everything up to the text matching the marker will be replaced, so it's important to ensure that your marker includes the beginning of the text you wish to replace.
    content The content to be used between the two lines identified by marker_start and marker_stop.
    append_if_not_found: False If markers are not found and set to True then, the markers and content will be appended to the file.
    prepend_if_not_found: False If markers are not found and set to True then, the markers and content will be prepended to the file.
    backup The file extension to use for a backup of the file if any edit is made. Set to False to skip making a backup.
    dry_run: False If True, do not make any edits to the file and simply return the changes that would be made.
    show_changes: True Controls how changes are presented. If True, this function will return a unified diff of the changes made. If False, then it will return a boolean (True if any changes were made, otherwise False).
append_newline: False  Controls whether or not a newline is appended to the content block. If the value of this argument is True then a newline will be added to the content block. If it is False, then a newline will not be added to the content block. If it is None then a newline will only be added to the content block if it does not already end in a newline.

New in version 2016.3.4.

Changed in version 2017.7.5,2018.3.1: New behavior added when value is None.

Changed in version 2019.2.0: The default value of this argument will change to None to match the behavior of the file.blockreplace state

CLI Example:
salt '*' file.blockreplace /etc/hosts '#-- start managed zone foobar : DO NOT EDIT --'
      '#-- end managed zone foobar --' '$10.0.1.1 foo.foobar
10.0.1.2 bar.foobar' True

salt.modules.file.chattr('files, **kwargs)
New in version 2018.3.0.

Change the attributes of files. This function accepts one or more files and the following options:

operator  Can be wither add or remove. Determines whether attributes should be added or removed from files

attributes One or more of the following characters: aAcCdDeijPsStTu, representing attributes to add to/remove from files

version a version number to assign to the file(s)

flags One or more of the following characters: RVf, representing flags to assign to chattr (recurse, verbose, suppress most errors)

CLI Example:
salt '*' file.chattr foo1.txt foo2.txt operator=add attributes=ai
salt '*' file.chattr foo3.txt operator=remove attributes=i version=2

salt.modules.file.check_file_meta(name, sfn, source, source_sum, user, group, mode, attrs, saltenv, contents=None, seuser=None, serole=None, stype=None, serange=None)

Check for the changes in the file metadata.

CLI Example:
salt '*' file.check_file_meta /etc/httpd/conf.d/httpd.conf salt://http/httpd.conf
      '$(hash_type: 'md5', 'hsum': <md5sum>)' root, root, '755' base

Note: Supported hash types include sha512, sha384, sha256, sha224, sha1, and md5.

name  Path to file destination
sfn  Template-processed source file contents
source  URL to file source
source_sum  File checksum information as a dictionary
Salt Documentation, Release 3001.1

```python
{hash_type: md5, hsum: <md5sum>}
```

**user**  Destination file user owner
**group**  Destination file group owner
**mode**  Destination file permissions mode
**attrs**  Destination file attributes
  New in version 2018.3.0.
**saltenv**  Salt environment used to resolve source files
**contents**  File contents
**seuser**  selinux user attribute
  New in version 3001.
**serole**  selinux role attribute
  New in version 3001.
**setype**  selinux type attribute
  New in version 3001.
**serange**  selinux range attribute
  New in version 3001.

**salt.modules.file.check_hash(path, file_hash)**
Check if a file matches the given hash string

Returns **True** if the hash matches, otherwise **False**.

**path**  Path to a file local to the minion.
**hash**  The hash to check against the file specified in the **path** argument.
  Changed in version 2016.11.4.

For this and newer versions the hash can be specified without an accompanying hash type (e.g. `e138491e9d5b97023cea823fe17bac22`), but for earlier releases it is necessary to also specify the hash type in the format `<hash_type>=<hash_value>` (e.g. `md5=e138491e9d5b97023cea823fe17bac22`).

CLI Example:

```bash
salt '*' file.check_hash /etc/fstab e138491e9d5b97023cea823fe17bac22
```

**salt.modules.file.check_managed(name, source, source_hash, source_hash_name, user, group, mode, attrs, template, context, defaults, saltenv, contents=None, skip_verify=False, seuser=None, serole=None, setype=None, serange=None, **kwargs)**

Check to see what changes need to be made for a file

CLI Example:

```bash
salt '*' file.check_managed /etc/httpd/conf.d/httpd.conf salt://http/httpd.conf '->(hash_type: 'md5', 'hsum': <md5sum>)' root, root, '755' jinja True None None''
```
salt.modules.file.check_managed_changes(name, source, source_hash, source_hash_name, user, group, mode, attrs, template, context, defaults, saltenv, contents=None, skip_verify=False, keep_mode=False, seuser=None, serole=None, setype=None, serange=None, **kwargs)

Return a dictionary of what changes need to be made for a file

Changed in version 3001: selinux attributes added

CLI Example:

```bash
salt '*' file.checkManagedChanges /etc/httpd/conf.d/httpd.conf salt://http/...httpd.conf '{hash_type: 'md5', 'hsum': <md5sum>}' root, root, '755' jinja True
```

salt.modules.file.check_perms(name, ret, user, group, mode, attrs=None, follow_symlinks=False, seuser=None, serole=None, setype=None, serange=None)

Check the permissions on files, modify attributes and chown if needed. File attributes are only verified if lsattr(1) is installed.

Changed in version 3001: Added selinux options

CLI Example:

```bash
salt '*' file.check_perms /etc/sudoers '{}' root root 400 ai
```

Changed in version 2014.1.3: follow_symlinks option added

salt.modules.file.chgrp(path, group)

Change the group of a file

path path to the file or directory

group group owner

CLI Example:

```bash
salt '*' file.chgrp /etc/passwd root
```

salt.modules.file.chown(path, user, group)

Chown a file, pass the file the desired user and group

path path to the file or directory

user user owner

group group owner

CLI Example:

```bash
salt '*' file.chown /etc/passwd root root
```

salt.modules.file.comment(path, regex, char='#', backup='.bak')

Deprecated since version 0.17.0: Use replace() instead.

Comment out specified lines in a file

path The full path to the file to be edited

regex A regular expression used to find the lines that are to be commented; this pattern will be wrapped in parenthesis and will move any preceding/trailing ^ or $ characters outside the parenthesis (e.g., the pattern ^foo$ will be rewritten as ^(foo)$)

char: # The character to be inserted at the beginning of a line in order to comment it out
backup: **.bak** The file will be backed up before edit with this file extension

**Warning:** This backup will be overwritten each time `sed / comment / uncomment` is called. Meaning the backup will only be useful after the first invocation.

CLI Example:

```
salt '*' file.comment /etc/modules pcspkr
```

**salt.modules.file.comment_line** *(path, regex, char='#', cmnt=True, backup=':bak')*

Comment or Uncomment a line in a text file.

**Parameters**

- **path** -- string The full path to the text file.
- **regex** -- string A regex expression that begins with ^ that will find the line you wish to comment. Can be as simple as `^color` =
- **char** -- string The character used to comment a line in the type of file you're referencing. Default is #
- **cmnt** -- boolean True to comment the line. False to uncomment the line. Default is True.
- **backup** -- string The file extension to give the backup file. Default is .bak Set to False/None to not keep a backup.

**Returns** boolean Returns True if successful, False if not.

CLI Example:
The following example will comment out the pcspkr line in the /etc/modules file using the default # character and create a backup file named modules.bak

```
salt '*' file.comment_line '/etc/modules' '^pcspkr'
```

CLI Example:
The following example will uncomment the log_level setting in minion config file if it is set to either warning, info, or debug using the # character and create a backup file named minion.bk

```
salt '*' file.comment_line 'C:\salt\conf\minion' '^log_level: (warning|info|debug) →' '#' False '.bk'
```

**salt.modules.file.contains** *(path, text)*

Deprecated since version 0.17.0: Use `search()` instead.

Return True if the file at path contains text.

CLI Example:

```
salt '*' file.contains /etc/crontab 'mymaintenance.sh'
```

**salt.modules.file.contains_glob** *(path, glob_expr)*

Deprecated since version 0.17.0: Use `search()` instead.

Return True if the given glob matches a string in the named file.

CLI Example:
**salt** file.contains_glob /etc/foobar '*cheese*'  

salt.modules.file.contains_regex(path, regex, lchar='')  

Deprecated since version 0.17.0: Use search() instead.  
Return True if the given regular expression matches on any line in the text of a given file.  
If the lchar argument (leading char) is specified, it will strip lchar from the left side of each line before trying to match.  

CLI Example:  
salt '*' file.contains_regex /etc/crontab  

salt.modules.file.copy(src, dst, recurse=False, remove_existing=False)  
Copy a file or directory from source to dst.  
In order to copy a directory, the recurse flag is required, and will by default overwrite files in the destination with the same path, and retain all other existing files. (similar to cp -r on unix)  
remove_existing will remove all files in the target directory, and then copy files from the source.  

Note: The copy function accepts paths that are local to the Salt minion. This function does not support salt://, http://, or the other additional file paths that are supported by states.file.managed and states.file.recurse.  

CLI Example:  
salt '*' file.copy /path/to/src /path/to/dst  
salt '*' file.copy /path/to/src_dir /path/to/dst_dir recurse=True  
remove_existing=True  
salt '*' file.copy /path/to/src_dir /path/to/dst_dir recurse=True remove_  

salt.modules.file.delete_backup(path, backup_id)  
New in version 0.17.0.  
Delete a previous version of a file that was backed up using Salt's file state backup system.  
path The path on the minion to check for backups  
backup_id The numeric id for the backup you wish to delete, as found using file.list_backups  

CLI Example:  
salt '*' file.delete_backup /var/cache/salt/minion/file_backup/home/foo/bar/baz.  

salt.modules.file.dirname(path)  
Returns the directory component of a pathname  
New in version 2015.5.0.  
This can be useful at the CLI but is frequently useful when scripting.
CLI Example:

```
salt '* file.dirname 'test/path/filename.config'
```

### `salt.modules.file.diskusage(path)`
Recursively calculate disk usage of path and return it in bytes

CLI Example:

```
salt '* file.diskusage /path/to/check
```

### `salt.modules.file.extract_hash(hash_fn, hash_type='sha256', file_name='', source='', source_hash_name=None)`

#### Changed in version 2016.3.5:
Prior to this version, only the `file_name` argument was considered for file-name matches in the hash file. This would be problematic for cases in which the user was relying on a remote checksum file that they do not control, and they wished to use a different name for that file on the minion from the filename on the remote server (and in the checksum file). For example, managing `/tmp/myfile.tar.gz` when the remote file was at `https://mydomain.tld/different_name.tar.gz`. The `file.managed` state now also passes this function the source URI as well as the `source_hash_name` (if specified). In cases where `source_hash_name` is specified, it takes precedence over both the `file_name` and `source`. When it is not specified, `file_name` takes precedence over `source`. This allows for better capability for matching hashes.

#### Changed in version 2016.11.0:
File name and source URI matches are no longer disregarded when `source_hash_name` is specified. They will be used as fallback matches if there is no match to the `source_hash_name` value.

This routine is called from the `file.managed` state to pull a hash from a remote file. Regular expressions are used line by line on the `source_hash` file, to find a potential candidate of the indicated hash type. This avoids many problems of arbitrary file layout rules. It specifically permits pulling hash codes from debian `*.dsc` files.

If no exact match of a hash and filename are found, then the first hash found (if any) will be returned. If no hashes at all are found, then `None` will be returned.

For example:

```
openerp_7.0-latest-1.tar.gz:
  file.managed:
    - name: /tmp/openerp_7.0-20121227-075624-1_all.deb
    - source: http://nightly.openerp.com/7.0/nightly/deb/openerp_7.0-20121227-
      →075624-1.tar.gz
    - source_hash: http://nightly.openerp.com/7.0/nightly/deb/openerp_7.0-
      →20121227-075624-1.dsc
```

CLI Example:

```
salt '* file.extract_hash /path/to/hash/file sha512 /etc/foo
```

### `salt.modules.file.file_exists(path)`
Tests to see if path is a valid file. Returns True/False.

CLI Example:

```
salt '* file.file_exists /etc/passwd
```
salt.modules.file.find(path, *args, **kwargs)

Approximate the Unix find(1) command and return a list of paths that meet the specified criteria.

The options include match criteria:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>path-glob # case sensitive</td>
</tr>
<tr>
<td>iname</td>
<td>path-glob # case insensitive</td>
</tr>
<tr>
<td>regex</td>
<td>path-regexp # case sensitive</td>
</tr>
<tr>
<td>iregex</td>
<td>path-regexp # case insensitive</td>
</tr>
<tr>
<td>type</td>
<td>file-types # match any listed type</td>
</tr>
<tr>
<td>user</td>
<td>users # match any listed user</td>
</tr>
<tr>
<td>group</td>
<td>groups # match any listed group</td>
</tr>
<tr>
<td>size</td>
<td>[+:-]number[size-unit] # default unit = byte</td>
</tr>
<tr>
<td>mtime</td>
<td>interval # modified since date</td>
</tr>
<tr>
<td>grep</td>
<td>regex # search file contents</td>
</tr>
</tbody>
</table>

and/or actions:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>delete</td>
<td>[= file-types] # default type = 'f'</td>
</tr>
<tr>
<td>exec</td>
<td>command [arg ...] # where {} is replaced by pathname</td>
</tr>
<tr>
<td>print</td>
<td>[= print-opts]</td>
</tr>
</tbody>
</table>

and/or depth criteria:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>maxdepth</td>
<td>maximum depth to transverse in path</td>
</tr>
<tr>
<td>mindepth</td>
<td>minimum depth to transverse before checking files or directories</td>
</tr>
</tbody>
</table>

The default action is print=path

path-glob:

* = match zero or more chars
? = match any char
[abc] = match a, b, or c
[!abc] or [^abc] = match anything except a, b, and c
[x-y] = match chars x through y
[!x-y] or [^x-y] = match anything except chars x through y
{a,b,c} = match a or b or c

path-regex: a Python Regex (regular expression) pattern to match pathnames

file-types: a string of one or more of the following:

a: all file types
b: block device
c: character device
d: directory
p: FIFO (named pipe)
f: plain file
l: symlink
s: socket

users: a space and/or comma separated list of user names and/or uids

groups: a space and/or comma separated list of group names and/or gids

size-unit:
Salt Documentation, Release 3001.1

b: bytes
k: kilobytes
m: megabytes
g: gigabytes
t: terabytes

interval:

\[[<\text{num}>w] [<\text{num}>d] [<\text{num}>h] [<\text{num}>m] [<\text{num}>s]\]

where:
  w: week
  d: day
  h: hour
  m: minute
  s: second

print-opts: a comma and/or space separated list of one or more of the following:

group: group name
md5: MD5 digest of file contents
mode: file permissions (as integer)
mtime: last modification time (as time_t)
name: file basename
path: file absolute path
size: file size in bytes
type: file type
user: user name

CLI Examples:

```
salt '.*' file.find / type=f name=\*.bak size=+10m
salt '.*' file.find /var mtime=+30d size=+10m print=path,size,mtime
salt '.*' file.find /var/log name=\*[0-9] mtime=+30d size=+10m delete
```

salt.modules.file.get_devmm(name)
Get major/minor info from a device

CLI Example:

```
salt '.*' file.get_devmm /dev/chr
```

salt.modules.file.get_diff(file1, file2, saltenv='base', show_filenames=True, show_changes=True, template=False, source_hash_file1=None, source_hash_file2=None)
Return unified diff of two files

file1 The first file to feed into the diff utility
  Changed in version 2018.3.0: Can now be either a local or remote file. In earlier releases, this had to be a file local to the minion.

file2 The second file to feed into the diff utility
  Changed in version 2018.3.0: Can now be either a local or remote file. In earlier releases, this had to be a file on the salt fileserver (i.e. salt://somefile.txt)

show_filenames: True Set to False to hide the filenames in the top two lines of the diff.

show_changes: True If set to False, and there are differences, then instead of a diff a simple message stating that show_changes is set to False will be returned.
**template**: False Set to True if two templates are being compared. This is not useful except for within states, with the obfuscate_templates option set to True.

New in version 2018.3.0.

**source_hash_file1** If file1 is an http(s)/ftp URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the archive if the cached copy matches the specified hash.

New in version 2018.3.0.

**source_hash_file2** If file2 is an http(s)/ftp URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the archive if the cached copy matches the specified hash.

New in version 2018.3.0.

CLI Examples:

```bash
salt '*' file.get_diff /home/fred/.vimrc salt://users/fred/.vimrc
salt '*' file.get_diff /tmp/foo.txt /tmp/bar.txt
```

```python
salt.modules.file.get_gid(path, follow_symlinks=True)
```

Return the id of the group that owns a given file

- **path** file or directory of which to get the gid
- **follow_symlinks** indicated if symlinks should be followed

CLI Example:

```bash
salt '*' file.get_gid /etc/passwd
```

Changed in version 0.16.4: follow_symlinks option added

```python
salt.modules.file.get_group(path, follow_symlinks=True)
```

Return the group that owns a given file

- **path** file or directory of which to get the group
- **follow_symlinks** indicated if symlinks should be followed

CLI Example:

```bash
salt '*' file.get_group /etc/passwd
```

Changed in version 0.16.4: follow_symlinks option added

```python
salt.modules.file.get_hash(path, form='sha256', chunk_size=65536)
```

Get the hash sum of a file

This is better than get_sum for the following reasons:

- It does not read the entire file into memory.

- It does not return a string on error. The returned value of get_sum cannot really be trusted since it is vulnerable to collisions: get_sum(..., 'xyz') == 'Hash xyz not supported'

- **path** path to the file or directory
- **form** desired sum format
- **chunk_size** amount to sum at once
CLI Example:

```python
salt '*' file.get_hash /etc/shadow
```

```
salt.modules.file.get_managed(name, template, source, source_hash, source_hash_name, user, group, mode, attrs, saltenv, context, defaults, skip_verify=False, **kwargs)
```

Return the managed file data for file.managed.

- **name**: location where the file lives on the server.
- **template**: template format.
- **source**: managed source file.
- **source_hash**: hash of the source file.
- **source_hash_name**: When `source_hash` refers to a remote file, this specifies the filename to look for in that file.
  - New in version 2016.3.5.
- **user**: Owner of file.
- **group**: Group owner of file.
- **mode**: Permissions of file.
- **attrs**: Attributes of file.
  - New in version 2018.3.0.
- **context**: Variables to add to the template context.
- **defaults**: Default values of for context_dict.
- **skip_verify**: If True, hash verification of remote file sources (http://, https://, ftp://) will be skipped, and the `source_hash` argument will be ignored.
  - New in version 2016.3.0.

CLI Example:

```python
salt '*' file.get_managed /etc/httpd/conf.d/httpd.conf jinja salt://http/httpd.conf '{hash_type: 'md5', 'hsum': <md5sum>}' None root root '755' base None None
```

```
salt.modules.file.get_mode(path, follow_symlinks=True)
```

Return the mode of a file.

- **path**: file or directory of which to get the mode.
- **follow_symlinks**: indicated if symlinks should be followed.

CLI Example:

```python
salt '*' file.get_mode /etc/passwd
```

Changed in version 2014.1.0: `follow_symlinks` option added.

```
salt.modules.file.get_selinux_context(path)
```

Get an SELinux context from a given path.

CLI Example:

```python
salt '*' file.get_selinux_context /etc/hosts
```
salt.modules.file.get_source_sum(file_name='', source='', source_hash=None, source_hash_name=None, saltenv='base')

New in version 2016.11.0.

Used by file.get_managed to obtain the hash and hash type from the parameters specified below.

**file_name** Optional file name being managed, for matching with file.extract_hash.

**source** Source file, as used in file and other states. If source_hash refers to a file containing hashes, then this filename will be used to match a filename in that file. If the source_hash is a hash expression, then this argument will be ignored.

**source_hash** Hash file/expression, as used in file and other states. If this value refers to a remote URL or absolute path to a local file, it will be cached and file.extract_hash will be used to obtain a hash from it.

**source_hash_name** Specific file name to look for when source_hash refers to a remote file, used to disambiguate ambiguous matches.

**saltenv**: base Salt fileserver environment from which to retrieve the source_hash. This value will only be used when source_hash refers to a file on the Salt fileserver (i.e. one beginning with salt://).

CLI Example:

```shell
salt '*' file.get_source_sum /tmp/foo.tar.gz source=http://mydomain.tld/foo.tar.gz source_hash=499ae16dcae71eeb7c3a30c75ea7a1a6
salt '*' file.get_source_sum /tmp/foo.tar.gz source=http://mydomain.tld/foo.tar.gz source_hash_name=./dir2/foo.tar.gz
```

salt.modules.file.get_sum(path, form='sha256')

Return the checksum for the given file. The following checksum algorithms are supported:

- md5
- sha1
- sha224
- sha256 (default)
- sha384
- sha512

**path** path to the file or directory

**form** desired sum format

CLI Example:

```shell
salt '*' file.get_sum /etc/passwd sha512
```

salt.modules.file.get_uid(path, follow_symlinks=True)

Return the id of the user that owns a given file

**path** file or directory of which to get the uid

**follow_symlinks** indicated if symlinks should be followed

CLI Example:
salt '*/' file.get_uid /etc/passwd

Changed in version 0.16.4: follow_symlinks option added

salt.modules.file.get_user(path, follow_symlinks=True)
Return the user that owns a given file

    path  file or directory of which to get the user
    follow_symlinks  indicated if symlinks should be followed

CLI Example:
salt '*/' file.get_user /etc/passwd

Changed in version 0.16.4: follow_symlinks option added

salt.modules.file.gid_to_group(gid)
Convert the group id to the group name on this system

    gid  gid to convert to a group name

CLI Example:
salt '*/' file.gid_to_group 0

salt.modules.file.grep(path, pattern, *opts)
Grep for a string in the specified file

    path  Path to the file to be searched

    pattern  Pattern to match. For example: test, or a[0-5]
    opts  Additional command-line flags to pass to the grep command. For example: -v, or -i -B2

    Note: This function's return value is slated for refinement in future versions of Salt

    Note: Globbing is supported (i.e. /var/log/foo/*.log, but if globbing is being used then the path
should be quoted to keep the shell from attempting to expand the glob expression.

    Note: The options should come after a double-dash (as shown in the examples below) to keep Salt's own
argument parser from interpreting them.

CLI Example:
salt '*/' file.grep /etc/passwd nobody
salt '*/' file.grep /etc/sysconfig/network-scripts/ifcfg-eth0 ipaddr -- -i
salt '*/' file.grep /etc/sysconfig/network-scripts/*ipaddr -- -i -B2
salt '*/' file.grep "*/etc/sysconfig/network-scripts/*" ipaddr -- -i -l

salt.modules.file.group_to_gid(group)
Convert the group to the gid on this system

    group  group to convert to its gid

CLI Example:

21.9. execution modules
salt '*' file.group_to_gid root

```python
salt.modules.file.is_blkdev(name)
Check if a file exists and is a block device.
CLI Example:
salt '*' file.is_blkdev /dev/blk
```

```python
salt.modules.file.is_chrdev(name)
Check if a file exists and is a character device.
CLI Example:
salt '*' file.is_chrdev /dev/chr
```

```python
salt.modules.file.is_fifo(name)
Check if a file exists and is a FIFO.
CLI Example:
salt '*' file.is_fifo /dev/fifo
```

```python
salt.modules.file.is_hardlink(path)
Check if the path is a hard link by verifying that the number of links is larger than 1
CLI Example:
salt '*' file.is_hardlink /path/to/link
```

```python
salt.modules.file.is_link(path)
Check if the path is a symbolic link
CLI Example:
salt '*' file.is_link /path/to/link
```

```python
salt.modules.file.join(*args)
Return a normalized file system path for the underlying OS
New in version 2014.7.0.
This can be useful at the CLI but is frequently useful when scripting combining path variables:

```yaml
{%- set www_root = '/var' %}
{%- set app_dir = 'myapp' %}

myapp_config:
  file:
    - managed
    - name: {{ salt['file.join'](www_root, app_dir, 'config.yaml') }}
```

CLI Example:

```bash
salt '*' file.join '/usr' 'local' 'bin'
```

```python
salt.modules.file.lchown(path, user, group)
Chown a file, pass the file the desired user and group without following symlinks.
path   path to the file or directory
```
**user** user owner

**group** group owner

CLI Example:

```bash
classic '*' file.chown /etc/passwd root root
```

salt.modules.file.line(path, content=None, match=None, mode=None, location=None, before=None, after=None, show_changes=True, backup=False, quiet=False, indent=True)

New in version 2015.8.0.

Line-focused editing of a file.

**Note:** file.line exists for historic reasons, and is not generally recommended. It has a lot of quirks. You may find file.replace to be more suitable.

file.line is most useful if you have single lines in a file (potentially a config file) that you would like to manage. It can remove, add, and replace a single line at a time.

**path** Filesystem path to the file to be edited.

**content** Content of the line. Allowed to be empty if mode='delete'.

**match** Match the target line for an action by a fragment of a string or regular expression.

If neither before nor after are provided, and match is also None, match falls back to the content value.

**mode** Defines how to edit a line. One of the following options is required:

- **ensure** If line does not exist, it will be added. If before and after are specified either zero lines, or lines that contain the content line are allowed to be in between before and after. If there are lines, and none of them match then it will produce an error.

- **replace** If line already exists, the entire line will be replaced.

- **delete** Delete the line, if found.

- **insert** Nearly identical to ensure. If a line does not exist, it will be added.

  The differences are that multiple (and non-matching) lines are allowed between before and after, if they are specified. The line will always be inserted right before before. insert also allows the use of location to specify that the line should be added at the beginning or end of the file.

  **Note:** If mode='insert' is used, at least one of location, before, or after is required. If location is used, before and after are ignored.

**location** In mode='insert' only, whether to place the content at the beginning or end of a the file. If location is provided, before and after are ignored. Valid locations:

- **start** Place the content at the beginning of the file.

- **end** Place the content at the end of the file.

**before** Regular expression or an exact case-sensitive fragment of the string. Will be tried as both a regex and a part of the line. Must match exactly one line in the file. This value is only used in ensure and insert modes. The content will be inserted just before this line, with matching indentation unless indent=False.
after  Regular expression or an exact case-sensitive fragment of the string. Will be tried as both a regexp and a
part of the line. Must match exactly one line in the file. This value is only used in ensure and insert
modes. The content will be inserted directly after this line, unless before is also provided. If before
is not provided, indentation will match this line, unless indent=False.

show_changes  Output a unified diff of the old file and the new file. If False return a boolean if any changes
were made. Default is True

Note:  Using this option will store two copies of the file in-memory (the original version and the edited
version) in order to generate the diff.

backup  Create a backup of the original file with the extension: "Year-Month-Day-Hour-Minutes-Seconds".
quiet  Do not raise any exceptions. E.g. ignore the fact that the file that is tried to be edited does not exist and
nothing really happened.
indent  Keep indentation with the previous line. This option is not considered when the delete mode is
specified. Default is True

CLI Example:

```
salt '*' file.line /etc/nsswitch.conf "networks: files dns after="hosts:..""
```

Note:  If an equal sign (=) appears in an argument to a Salt command, it is interpreted as a keyword argument
in the format of key=val. That processing can be bypassed in order to pass an equal sign through to the
remote shell command by manually specifying the kwarg:

```
salt '*' file.line /path/to/file content="CREATEMAIL_SPOOL=no" match="CREATE_MAIL_..SPOOL=yes" mode="replace"
```

Examples:

Here's a simple config file.

```
[some_config]
# Some config file
# this line will go away
here=False
away=True
goodbye=away
```

```
salt '\' file.line /some/file.conf mode=delete match=away
```

This will produce:

```
[some_config]
# Some config file
here=False
away=True
goodbye=away
```

If that command is executed 2 more times, this will be the result:
If we reset the file to its original state and run

```bash
salt `*` file.line /some/file.conf mode=replace match=away content=here
```

Three passes will this state will result in this file:

```yaml
[some_config]
# Some config file
here=False
here
here
```

Each pass replacing the first line found.

Given this file:

```
insert after me
something
insert before me
```

The following command

```bash
salt `*` file.line /some/file.txt mode=insert after="insert after me" before="insert before me" content=thrice
```

If that command is executed 3 times, the result will be:

```
insert after me
something
thrice
thrice
thrice
insert before me
```

If the mode is ensure instead, it will fail each time. To succeed, we need to remove the incorrect line between before and after:

```
insert after me
insert before me
```

With an ensure mode, this will insert thrice the first time and make no changes for subsequent calls. For something simple this is fine, but if you have instead blocks like this:

```yaml
Begin SomeBlock
  foo = bar
End

Begin AnotherBlock
  another = value
End
```
And you try to use ensure this way:

```bash
salt \* file.line /tmp/fun.txt mode="ensure" content="this = should be my content
← after="Begin SomeBlock" before="End"
```

This will fail because there are multiple End lines. Without that problem, it still would fail because there is a non-matching line, foo = bar. Ensure only allows either zero, or the matching line present to be present in between before and after.

**salt.modules.file.link**(src, path)
New in version 2014.1.0.
Create a hard link to a file

CLI Example:

```bash
salt \* file.link /path/to/file /path/to/link
```

**salt.modules.file.list_backups**(path, limit=None)
New in version 0.17.0.
Lists the previous versions of a file backed up using Salt's file state backup system.

- **path** The path on the minion to check for backups
- **limit** Limit the number of results to the most recent N backups

CLI Example:

```bash
salt \* file.list_backups /foo/bar/baz.txt
```

**salt.modules.file.list_backups_dir**(path, limit=None)
Lists the previous versions of a directory backed up using Salt's file state backup system.

- **path** The directory on the minion to check for backups
- **limit** Limit the number of results to the most recent N backups

CLI Example:

```bash
salt \* file.list_backups_dir /foo/bar/baz/
```

**salt.modules.file.lsattr**(path)
New in version 2018.3.0.

- Changed in version 2018.3.1: If lsattr is not installed on the system, None is returned.
- Changed in version 2018.3.4: If on AIX, None is returned even if in filesystem as lsattr on AIX is not the same thing as the linux version.

Obtain the modifiable attributes of the given file. If path is to a directory, an empty list is returned.

- **path** path to file to obtain attributes of. File/directory must exist.

CLI Example:

```bash
salt \* file.lsattr foo1.txt
```

**salt.modules.file.lstat**(path)
New in version 2014.1.0.

Returns the lstat attributes for the given file or dir. Does not support symbolic links.

CLI Example:
salt 'ls' file.lstat /path/to/file

salt.modules.file.makedirs_(path, user=None, group=None, mode=None)
Ensure that the directory containing this path is available.

Note: The path must end with a trailing slash otherwise the directory/directories will be created up to the parent directory. For example if path is /opt/code, then it would be treated as /opt/ but if the path ends with a trailing slash like /opt/code/, then it would be treated as /opt/code/.

CLI Example:
salt '*' file.makedirs /opt/code/

salt.modules.file.makedirs_perms(name, user=None, group=None, mode='0755')
Taken and modified from os.makedirs to set user, group and mode for each directory created.

CLI Example:
salt '*' file.makedirs_perms /opt/code

salt.modules.file.manage_file(name, sfn, source, source_sum, user, group, mode, attrs, saltenv, backup, makedirs=False, template=None, show_changes=True, contents=None, dir_mode=None, follow_symlinks=True, skip_verify=False, keep_mode=False, encoding=None, encoding_errors='strict', seuser=None, serole=None, setype=None, serange=None, **kwargs)
Checks the destination against what was retrieved with get_managed and makes the appropriate modifications (if necessary).

name location to place the file
sfn location of cached file on the minion
This is the path to the file stored on the minion. This file is placed on the minion using cp.cache_file. If the hash sum of that file matches the source_sum, we do not transfer the file to the minion again.
This file is then grabbed and if it has template set, it renders the file to be placed into the correct place on the system using salt.files.utils.copyfile()
ret The initial state return data structure. Pass in None to use the default structure.
source file reference on the master
source_sum sum hash for source
user user owner
group group owner
backup backup_mode
attrs attributes to be set on file: "" means remove all of them
New in version 2018.3.0.
makedirs make directories if they do not exist
template format of templating
show_changes Include diff in state return
contents: contents to be placed in the file

21.9. execution modules
dir_mode  mode for directories created with makedirs

skip_verify: False If True, hash verification of remote file sources (http://, https://, ftp://) will be skipped, and the source_hash argument will be ignored.

New in version 2016.3.0.

keep_mode: False If True, and the source is a file from the Salt fileserv (or a local file on the minion), the mode of the destination file will be set to the mode of the source file.

Note: keep_mode does not work with salt-ssh.

As a consequence of how the files are transferred to the minion, and the inability to connect back to the master with salt-ssh, salt is unable to stat the file as it exists on the fileserv and thus cannot mirror the mode on the salt-ssh minion

dir_mode mode for directories created with makedirs

skip_verify: False If True, hash verification of remote file sources (http://, https://, ftp://) will be skipped, and the source_hash argument will be ignored.

New in version 2016.3.0.

keep_mode: False If True, and the source is a file from the Salt fileserv (or a local file on the minion), the mode of the destination file will be set to the mode of the source file.

Note: keep_mode does not work with salt-ssh.

As a consequence of how the files are transferred to the minion, and the inability to connect back to the master with salt-ssh, salt is unable to stat the file as it exists on the fileserv and thus cannot mirror the mode on the salt-ssh minion

dir_mode mode for directories created with makedirs

skip_verify: False If True, hash verification of remote file sources (http://, https://, ftp://) will be skipped, and the source_hash argument will be ignored.

New in version 2016.3.0.

keep_mode: False If True, and the source is a file from the Salt fileserv (or a local file on the minion), the mode of the destination file will be set to the mode of the source file.

Note: keep_mode does not work with salt-ssh.

As a consequence of how the files are transferred to the minion, and the inability to connect back to the master with salt-ssh, salt is unable to stat the file as it exists on the fileserv and thus cannot mirror the mode on the salt-ssh minion

dir_mode mode for directories created with makedirs

skip_verify: False If True, hash verification of remote file sources (http://, https://, ftp://) will be skipped, and the source_hash argument will be ignored.

New in version 2016.3.0.

keep_mode: False If True, and the source is a file from the Salt fileserv (or a local file on the minion), the mode of the destination file will be set to the mode of the source file.

Note: keep_mode does not work with salt-ssh.

As a consequence of how the files are transferred to the minion, and the inability to connect back to the master with salt-ssh, salt is unable to stat the file as it exists on the fileserv and thus cannot mirror the mode on the salt-ssh minion

dir_mode mode for directories created with makedirs

skip_verify: False If True, hash verification of remote file sources (http://, https://, ftp://) will be skipped, and the source_hash argument will be ignored.

New in version 2016.3.0.

keep_mode: False If True, and the source is a file from the Salt fileserv (or a local file on the minion), the mode of the destination file will be set to the mode of the source file.

Note: keep_mode does not work with salt-ssh.

As a consequence of how the files are transferred to the minion, and the inability to connect back to the master with salt-ssh, salt is unable to stat the file as it exists on the fileserv and thus cannot mirror the mode on the salt-ssh minion

salt '∗' file.mknod /dev/chr c 180 31
salt '∗' file.mknod /dev/blk b 8 999
salt '∗' file.mknod /dev/fifo p

salt.modules.file.mknod_blkdev(name, major, minor, user=None, group=None, mode='0660')
New in version 0.17.0.
Create a block device.

CLI Example:
salt '∗' file.mknod_blkdev /dev/blk 8 999

salt.modules.file.mknod_chrdev(name, major, minor, user=None, group=None, mode='0660')
New in version 0.17.0.
Create a character device.

CLI Example:
salt '∗' file.mknod_chrdev /dev/chr 180 31

salt.modules.file.mknod_fifo(name, user=None, group=None, mode='0660')
New in version 0.17.0.
Create a FIFO pipe.

CLI Example:
salt '∗' file.mknod_fifo /dev/fifo

salt.modules.file.move(src, dst)
Move a file or directory

CLI Example:
salt '∗' file.move /path/to/src /path/to/dst

salt.modules.file.normpath(path)
Returns Normalize path, eliminating double slashes, etc.

New in version 2015.5.0.
This can be useful at the CLI but is frequently useful when scripting.

{% from salt['file.normpath'](tpldir + '/../vars.jinja') import parent_vars %}

CLI Example:
salt '∗' file.normpath 'a/b/c/..

salt.modules.file.open_files(by_pid=False)
Return a list of all physical open files on the system.

CLI Examples:
salt '∗' file.open_files
salt '∗' file.open_files by_pid=True
salt.modules.file.pardir()
    Return the relative parent directory path symbol for underlying OS
    New in version 2014.7.0.
    This can be useful when constructing Salt Formulas.
    
    {% set pardir = salt['file.pardir']() %}
    {% set final_path = salt['file.join']('subdir', pardir, 'confdir') %}

    CLI Example:
    
    salt '*' file.pardir

salt.modules.file.patch(originalfile, patchfile, options='', dry_run=False)
    New in version 0.10.4.
    Apply a patch to a file or directory.
    Equivalent to:
    
    patch <options> -i <patchfile> <originalfile>
    
    Or, when a directory is patched:
    
    patch <options> -i <patchfile> -d <originalfile> -p0
    
    originalfile  The full path to the file or directory to be patched
    patchfile   A patch file to apply to originalfile
    options Options to pass to patch.
    
    CLI Example:
    
    salt '*' file.patch /opt/file.txt /tmp/file.txt.patch

salt.modules.file.path_exists_glob(path)
    Tests to see if path after expansion is a valid path (file or directory). Expansion allows usage of ? * and character ranges []. Tilde expansion is not supported. Returns True/False.
    New in version 2014.7.0.
    
    CLI Example:
    
    salt '*' file.path_exists_glob /etc/pam*/pass*

salt.modules.file.prepend(path, *args, **kwargs)
    New in version 2014.7.0.
    Prepend text to the beginning of a file
    
    path  path to file
    *args strings to prepend to the file
    
    CLI Example:
    
    salt '*' file.prepend /etc/motd "With all thine offerings thou shalt offer salt." "Salt is what makes things taste bad when it isn't in them."
Attention

If you need to pass a string to append and that string contains an equal sign, you must include the argument name, args. For example:

```
salt '*' file.prepend /etc/motd args='cheese=spam'
salt '*' file.prepend /etc/motd args=[\'cheese=spam\',\'spam=cheese\']
```

salt.modules.file.psed(path, before, after, limit='', backup='.bak', flags='gMS', escape_all=False, multi=False)

Deprecated since version 0.17.0: Use `replace()` instead.

Make a simple edit to a file (pure Python version)

Equivalent to:

```
sed <backup> <options> "<limit>/ <before>/ <after>/ <flags> <file>"
```

**path**  The full path to the file to be edited

**before** A pattern to find in order to replace with **after**

**after** Text that will replace **before**

**limit:** '' An initial pattern to search for before searching for **before**

**backup:** .bak The file will be backed up before edit with this file extension; **WARNING:** each time `sed/comment/uncomment` is called will overwrite this backup

**flags:** **gMS**

Flags to modify the search. Valid values are:

- **g**: Replace all occurrences of the pattern, not just the first.
- **I**: Ignore case.
- **L**: Make \w, \W, \b, \B, \s and \S dependent on the locale.
- **M**: Treat multiple lines as a single line.
- **S**: Make . match all characters, including newlines.
- **U**: Make \w, \W, \b, \B, \d, \D, \s and \S dependent on Unicode.
- **X**: Verbose (whitespace is ignored).

**multi:** **False** If True, treat the entire file as a single line

Forward slashes and single quotes will be escaped automatically in the **before** and **after** patterns.

CLI Example:

```
salt '*' file.sed /etc/httpd/httpd.conf 'LogLevel warn' 'LogLevel info'
```

salt.modules.file.read(path, binary=False)

New in version 2017.7.0.

Return the content of the file.

CLI Example:
salt '*' file.read /path/to/file

salt.modules.file.readdir(path)
    New in version 2014.1.0.
    Return a list containing the contents of a directory
    CLI Example:
    salt '*' file.readdir /path/to/dir/

salt.modules.file.readlink(path, canonicalize=False)
    New in version 2014.1.0.
    Return the path that a symlink points to If canonicalize is set to True, then it return the final target
    CLI Example:
    salt '*' file.readlink /path/to/link

salt.modules.file.remove(path)
    Remove the named file. If a directory is supplied, it will be recursively deleted.
    CLI Example:
    salt '*' file.remove /tmp/foo

    Changed in version Neon: The method now works on all types of file system entries, not just files, directories and symlinks.

salt.modules.file.rename(src, dst)
    Rename a file or directory
    CLI Example:
    salt '*' file.rename /path/to/src /path/to/dst

salt.modules.file.replace(path, pattern, repl, count=0, flags=8, bufsize=1, append_if_not_found=False, prepend_if_not_found=False, not_found_content=None, backup='.bak', dry_run=False, search_only=False, show_changes=True, ignore_if_missing=False, preserve_inode=True, backslash_literal=False)

    New in version 0.17.0.
    Replace occurrences of a pattern in a file. If show_changes is True, then a diff of what changed will be returned, otherwise a True will be returned when changes are made, and False when no changes are made.
    This is a pure Python implementation that wraps Python’s sub().
    path Filesystem path to the file to be edited. If a symlink is specified, it will be resolved to its target.
    pattern A regular expression, to be matched using Python’s search().
    repl The replacement text
    count: 0 Maximum number of pattern occurrences to be replaced. If count is a positive integer n, only n occurrences will be replaced, otherwise all occurrences will be replaced.
    flags (list or int) A list of flags defined in the re module documentation from the Python standard library. Each list item should be a string that will correlate to the human-friendly flag name. E.g., ['IGNORECASE', 'MULTILINE']. Optionally, flags may be an int, with a value corresponding to the XOR (|) of all the desired flags. Defaults to 8 (which supports 'MULTILINE').
bufsize (int or str) How much of the file to buffer into memory at once. The default value \texttt{1} processes one line at a time. The special value \texttt{file} may be specified which will read the entire file into memory before processing.

append\_if\_not\_found: False New in version 2014.7.0.
If set to \texttt{True}, and pattern is not found, then the content will be appended to the file.

prepend\_if\_not\_found: False New in version 2014.7.0.
If set to \texttt{True} and pattern is not found, then the content will be prepended to the file.

not\_found\_content New in version 2014.7.0.
Content to use for append/prepend if not found. If None (default), uses repl. Useful when repl uses references to group in pattern.

backup: .bak The file extension to use for a backup of the file before editing. Set to False to skip making a backup.

dry\_run: False If set to \texttt{True}, no changes will be made to the file, the function will just return the changes that would have been made (or a \texttt{True}/\texttt{False} value if show\_changes is set to \texttt{False}).

search\_only: False If set to true, this no changes will be performed on the file, and this function will simply return \texttt{True} if the pattern was matched, and \texttt{False} if not.

show\_changes: True If \texttt{True}, return a diff of changes made. Otherwise, return \texttt{True} if changes were made, and \texttt{False} if not.

Note: Using this option will store two copies of the file in memory (the original version and the edited version) in order to generate the diff. This may not normally be a concern, but could impact performance if used with large files.

ignore\_if\_missing: False New in version 2015.8.0.
If set to \texttt{True}, this function will simply return \texttt{False} if the file doesn’t exist. Otherwise, an error will be thrown.

preserve\_inode: True New in version 2015.8.0.
Preserve the inode of the file, so that any hard links continue to share the inode with the original filename. This works by \textit{copying} the file, reading from the copy, and writing to the file at the original inode. If \texttt{False}, the file will be \textit{moved} rather than copied, and a new file will be written to a new inode, but using the original filename. Hard links will then share an inode with the backup, instead (if using backup to create a backup copy).

backslash\_literal: False New in version 2016.11.7.
Interpret backslashes as literal backslashes for the repl and not escape characters. This will help when using append/prepend so that the backslashes are not interpreted for the repl on the second run of the state.

If an equal sign (\texttt{=}) appears in an argument to a Salt command it is interpreted as a keyword argument in the format \texttt{key=val}. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' file.replace /path/to/file pattern='=' repl='';
salt '*' file.replace /path/to/file pattern="bind-address\s*=" repl='bind-address: '
```

CLI Examples:
salt.modules.file.restore_backup(path, backup_id)

New in version 0.17.0.

Restore a previous version of a file that was backed up using Salt’s file state backup system.

**path** The path on the minion to check for backups

**backup_id** The numeric id for the backup you wish to restore, as found using `file.list_backups`

CLI Example:

```bash
salt '*' file.restore_backup /foo/bar/baz.txt 0
```

salt.modules.file.restorecon(path, recursive=False)

Reset the SELinux context on a given path

CLI Example:

```bash
salt '*' file.restorecon /home/user/.ssh/authorized_keys
```

salt.modules.file.rmdir(path)

New in version 2014.1.0.

Remove the specified directory. Fails if a directory is not empty.

CLI Example:

```bash
salt '*' file.rmdir /tmp/foo/
```

salt.modules.file.search(path, pattern, flags=8, bufsize=1, ignore_if_missing=False, multiline=False)

New in version 0.17.0.

Search for occurrences of a pattern in a file

Except for multiline, params are identical to `replace()`.

**multiline** If true, inserts 'MULTILINE' into `flags` and sets `bufsize` to 'file'.

New in version 2015.8.0.

CLI Example:

```bash
salt '*' file.search /etc/crontab 'mymaintenance.sh'
```

salt.modules.file.sed(path, before, after, limit='', backup='.bak', options='-r -e', flags='g', escape_all=False, negate_match=False)

Deprecated since version 0.17.0: Use `replace()` instead.

Make a simple edit to a file

Equivalent to:

```bash
sed <backup> <options> "/<limit>/ s/<before>/<after>/<flags> <file>"
```

path The full path to the file to be edited
before  A pattern to find in order to replace with after

after  Text that will replace before

limit:  ''  An initial pattern to search for before searching for before

backup: .bak  The file will be backed up before edit with this file extension; WARNING: each time sed/comment/uncomment is called will overwrite this backup

options:  -r  -e  Options to pass to sed

flags:  g  Flags to modify the sed search; e.g., i for case-insensitive pattern matching

negate_match: False  Negate the search command (!)

New in version 0.17.0.

Forward slashes and single quotes will be escaped automatically in the before and after patterns.

CLI Example:

```shell
salt '*' file.sed /etc/httpd/httpd.conf 'LogLevel warn' 'LogLevel info'
```

salt.modules.file.sed_contains(path, text, limit='', flags='g')

Deprecated since version 0.17.0: Use search() instead.

Return True if the file at path contains text. Utilizes sed to perform the search (line-wise search).

Note: the p flag will be added to any flags you pass in.

CLI Example:

```shell
salt '*' file.contains /etc/crontab 'mymaintenance.sh'
```

salt.modules.file.seek_read(path, size, offset)

New in version 2014.1.0.

Seek to a position on a file and read it

path  path to file

seek  amount to read at once

offset  offset to start into the file

CLI Example:

```shell
salt '*' file.seek_read /path/to/file 4096 0
```

salt.modules.file.seek_write(path, data, offset)

New in version 2014.1.0.

Seek to a position on a file and write to it

path  path to file

data  data to write to file

offset  position in file to start writing

CLI Example:

```shell
salt '*' file.seek_write /path/to/file 'some data' 4096
```

salt.modules.file.set_mode(path, mode)

Set the mode of a file
**path**  file or directory of which to set the mode

**mode**  mode to set the path to

CLI Example:

```bash
salt '*' file.set_mode /etc/passwd 0644
```

**salt.modules.file.set_selinux_context**  (*path*,  *user=None*,  *role=None*,  *type=None*,  *range=None*,  *persist=False*)

Changed in version 3001: Added persist option

Set a specific SELinux label on a given path

CLI Example:

```bash
salt '*' file.set_selinux_context path <user> <role> <type> <range>
salt '*' file.set_selinux_context /etc/yum.repos.d/epel.repo system_u object_r
    → system_conf_t s0
```

**salt.modules.file.source_list**  (*source*,  *source_hash*,  *saltenv*)

Check the source list and return the source to use

CLI Example:

```bash
salt '*' file.source_list salt://http/httpd.conf
salt '*' file.source_list '{hash_type: 'md5', 'hsum': ...
    → <md5sum>}' base
```

**salt.modules.file.stats**  (*path*,  *hash_type=None*,  *follow_symlinks=True*)

Return a dict containing the stats for a given file

CLI Example:

```bash
salt '*' file.stats /etc/passwd
```

**salt.modules.file.statvfs**  (*path*)

New in version 2014.1.0.

Perform a statvfs call against the filesystem that the file resides on

CLI Example:

```bash
salt '*' file.statvfs /path/to/file
```

**salt.modules.file.symlink**  (*src*,  *path*)

Create a symbolic link (symlink, soft link) to a file

CLI Example:

```bash
salt '*' file.symlink /path/to/file /path/to/link
```

**salt.modules.file.touch**  (*name*,  *atime=None*,  *mtime=None*)

New in version 0.9.5.

Just like the touch command, create a file if it doesn't exist or simply update the atime and mtime if it already does.

**atime**: Access time in Unix epoch time

**mtime**: Last modification in Unix epoch time

CLI Example:
salt 'salt '*' file.touch /var/log/emptyfile

salt.modules.file.truncate(path, length)
New in version 2014.1.0.
Seek to a position on a file and delete everything after that point
path    path to file
length   offset into file to truncate
CLI Example:
salt 'salt '*' file.truncate /path/to/file 512

salt.modules.file.uid_to_user(uid)
Convert a uid to a user name
uid    uid to convert to a username
CLI Example:
salt 'salt '*' file.uid_to_user 0

salt.modules.file.uncomment(path, regex, char='#', backup='.bak')
Deprecated since version 0.17.0: Use replace() instead.
Uncomment specified commented lines in a file
path    The full path to the file to be edited
regex   A regular expression used to find the lines that are to be uncommented. This regex should not include the comment character. A leading ^ character will be stripped for convenience (for easily switching between comment() and uncomment()).
char:    # The character to remove in order to uncomment a line
backup:  .bak The file will be backed up before edit with this file extension; WARNING: each time sed/comment/uncomment is called will overwrite this backup
CLI Example:
salt 'salt '*' file.uncomment /etc/hosts.deny 'ALL: PARANOID'

salt.modules.file.user_to_uid(user)
Convert user name to a uid
user    user name to convert to its uid
CLI Example:
salt 'salt '*' file.user_to_uid root

salt.modules.file.write(path, *args, **kwargs)
New in version 2014.7.0.
Write text to a file, overwriting any existing contents.
path    path to file
*args   strings to write to the file
CLI Example:
Attention

If you need to pass a string to append and that string contains an equal sign, you must include the argument name, args. For example:

```
salt '*' file.write /etc/motd args='cheese=spam'
salt '*' file.write /etc/motd args="['cheese=spam','spam=cheese']"
```

21.9.142 salt.modules.firewalld

Support for firewalld.

New in version 2015.2.0.

salt.modules.firewalld.add_interface(zone, interface, permanent=True)
- Bind an interface to a zone
  New in version 2016.3.0.
  CLI Example:

  ```
salt '*' firewalld.add_interface zone eth0
  ```

salt.modules.firewalld.add_masquerade(zone=None, permanent=True)
- Enable masquerade on a zone. If zone is omitted, default zone will be used.
  New in version 2015.8.0.
  CLI Example:

  ```
salt '*' firewalld.add_masquerade
  ```

To enable masquerade on a specific zone

```
salt '*' firewalld.add_masquerade dmz
```

salt.modules.firewalld.add_port(zone, port, permanent=True, force_masquerade=False)
- Allow specific ports in a zone.
  New in version 2015.8.0.
  CLI Example:

  ```
salt '*' firewalld.add_port internal 443/tcp
  ```

  force_masquerade when a zone is created ensure masquerade is also enabled on that zone.

salt.modules.firewalld.add_port_fwd(zone, src, dest='tcp', dstaddr='', permanent=True, force_masquerade=False)
- Add port forwarding.
  New in version 2015.8.0.
CLI Example:

```bash
salt '*' firewalld.add_port_fwd public 80 443 tcp
```

*force_masquerade*  when a zone is created ensure masquerade is also enabled on that zone.

**salt.modules.firewalld.add_rich_rule**(`zone, rule, permanent=True`)  
Add a rich rule to a zone  
New in version 2016.11.0.  
CLI Example:  

```bash
salt '*' firewalld.add_rich_rule zone 'rule'
```

**salt.modules.firewalld.add_service**(`service, zone=None, permanent=True`)  
Add a service for zone. If zone is omitted, default zone will be used.  
CLI Example:  

```bash
salt '*' firewalld.add_service ssh
```

To assign a service to a specific zone:  

```bash
salt '*' firewalld.add_service ssh my_zone
```

**salt.modules.firewalld.add_service_port**(`service, port`)  
Add a new port to the specified service.  
New in version 2016.11.0.  
CLI Example:  

```bash
salt '*' firewalld.add_service_port zone 80
```

**salt.modules.firewalld.add_service_protocol**(`service, protocol`)  
Add a new protocol to the specified service.  
New in version 2016.11.0.  
CLI Example:  

```bash
salt '*' firewalld.add_service_protocol zone ssh
```

**salt.modules.firewalld.add_source**(`zone, source, permanent=True`)  
Bind a source to a zone  
New in version 2016.3.0.  
CLI Example:  

```bash
salt '*' firewalld.add_source zone 192.168.1.0/24
```

**salt.modules.firewalld.allow_icmp**(`zone, icmp, permanent=True`)  
Allow a specific ICMP type on a zone  
New in version 2015.8.0.  
CLI Example:
salt '*' firewalld.allow_icmp zone echo-reply

salt.modules.firewalld.block_icmp(zone, icmp, permanent=True)
Block a specific ICMP type on a zone
New in version 2015.8.0.
CLI Example:
salt '*' firewalld.block_icmp zone echo-reply

salt.modules.firewalld.default_zone()
Print default zone for connections and interfaces
CLI Example:
salt '*' firewalld.default_zone

salt.modules.firewalld.delete_service(name, restart=True)
Delete an existing service
CLI Example:
salt '*' firewalld.delete_service my_service

By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False
salt '*' firewalld.delete_service my_service False

salt.modules.firewalld.delete_zone(zone, restart=True)
Delete an existing zone
CLI Example:
salt '*' firewalld.delete_zone my_zone

By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False
salt '*' firewalld.delete_zone my_zone False

salt.modules.firewalld.get_icmp_types(permanent=True)
Print predefined icmptypes
CLI Example:
salt '*' firewalld.get_icmp_types

salt.modules.firewalld.get_interfaces(zone, permanent=True)
List interfaces bound to a zone
New in version 2016.3.0.
CLI Example:
salt '*' firewalld.get_interfaces zone

salt.modules.firewalld.get_masquerade(zone=None, permanent=True)
Show if masquerading is enabled on a zone. If zone is omitted, default zone will be used.
CLI Example:
salt 'x' firewalld.get_masquerade zone

salt.modules.firewalld.get_rich_rules(zone, permanent=True)
List rich rules bound to a zone
New in version 2016.11.0.
CLI Example:
salt 'x' firewalld.get_rich_rules zone

salt.modules.firewalld.get_service_ports(service)
List ports of a service.
New in version 2016.11.0.
CLI Example:
salt 'x' firewalld.get_service_ports zone

salt.modules.firewalld.get_service_protocols(service)
List protocols of a service.
New in version 2016.11.0.
CLI Example:
salt 'x' firewalld.get_service_protocols zone

salt.modules.firewalld.get_services(permanent=True)
Print predefined services
CLI Example:
salt 'x' firewalld.get_services

salt.modules.firewalld.get_sources(zone, permanent=True)
List sources bound to a zone
New in version 2016.3.0.
CLI Example:
salt 'x' firewalld.get_sources zone

salt.modules.firewalld.get_zones(permanent=True)
Print predefined zones
CLI Example:
salt 'x' firewalld.get_zones

salt.modules.firewalld.list_all(zone=None, permanent=True)
List everything added for or enabled in a zone
CLI Example:
salt 'x' firewalld.list_all

List a specific zone
salt '*' firewalld.list_all my_zone

salt.modules.firewalld.list_icmp_block(zone, permanent=True)
List ICMP blocks on a zone
New in version 2015.8.0.
CLI Example:
salt '*' firewalld.list_icmp_block zone

salt.modules.firewalld.list_port_fwd(zone, permanent=True)
List port forwarding
New in version 2015.8.0.
CLI Example:
salt '*' firewalld.list_port_fwd public

salt.modules.firewalld.list_ports(zone, permanent=True)
List all ports in a zone.
New in version 2015.8.0.
CLI Example:
salt '*' firewalld.list_ports

salt.modules.firewalld.list_services(zone=None, permanent=True)
List services added for zone as a space separated list. If zone is omitted, default zone will be used.
CLI Example:
salt '*' firewalld.list_services

List a specific zone
salt '*' firewalld.list_services my_zone

salt.modules.firewalld.list_zones(permanent=True)
List everything added for or enabled in all zones
CLI Example:
salt '*' firewalld.list_zones

salt.modules.firewalld.make_permanent()
Make current runtime configuration permanent.
New in version 2016.3.0.
CLI Example:
salt '*' firewalld.make_permanent

salt.modules.firewalld.new_service(name, restart=True)
Add a new service
CLI Example:
salt '★' firewalld.new_service my_service

By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False

salt '★' firewalld.new_service my_service False

salt.modules.firewalld.new_zone(zone, restart=True)
Add a new zone

CLI Example:
	salt '★' firewalld.new_zone my_zone

By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False

salt '★' firewalld.new_zone my_zone False

salt.modules.firewalld.reload_rules()
Reload the firewall rules, which makes the permanent configuration the new runtime configuration without losing state information.

New in version 2016.11.0.

CLI Example:
	salt '★' firewalld.reload_rules

salt.modules.firewalld.remove_interface(zone, interface, permanent=True)
Remove an interface bound to a zone

New in version 2016.3.0.

CLI Example:
	salt '★' firewalld.remove_interface zone eth0

salt.modules.firewalld.remove_masquerade(zone=None, permanent=True)
Remove masquerade on a zone. If zone is omitted, default zone will be used.

New in version 2015.8.0.

CLI Example:
	salt '★' firewalld.remove_masquerade

To remove masquerade on a specific zone
	salt '★' firewalld.remove_masquerade dmz

salt.modules.firewalld.remove_port(zone, port, permanent=True)
Remove a specific port from a zone.

New in version 2015.8.0.

CLI Example:
	salt '★' firewalld.remove_port internal 443/tcp

salt.modules.firewalld.remove_port_fwd(zone, src, dest, proto='tcp', dstaddr='', permanent=True)
Remove Port Forwarding.

21.9. execution modules
New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.remove_port_fwd public 80 443 tcp
```

**salt.modules.firewalld.remove_rich_rule** *(zone, rule, permanent=True)*

Add a rich rule to a zone

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.remove_rich_rule zone 'rule'
```

**salt.modules.firewalld.remove_service** *(service, zone=None, permanent=True)*

Remove a service from zone. This option can be specified multiple times. If zone is omitted, default zone will be used.

CLI Example:

```
salt '*' firewalld.remove_service ssh
```

To remove a service from a specific zone

```
salt '*' firewalld.remove_service ssh dmz
```

**salt.modules.firewalld.remove_service_port** *(service, port)*

Remove a port from the specified service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.remove_service_port zone 80
```

**salt.modules.firewalld.remove_service_protocol** *(service, protocol)*

Remove a protocol from the specified service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.remove_service_protocol zone ssh
```

**salt.modules.firewalld.remove_source** *(zone, source, permanent=True)*

Remove a source bound to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewalld.remove_source zone 192.168.1.0/24
```

**salt.modules.firewalld.set_default_zone** *(zone)*

Set default zone

CLI Example:

```
salt '*' firewalld.set_default_zone damian
```
salt.modules.firewalld.version()
    Return version from firewall-cmd

    CLI Example:
    
    salt '*' firewalld.version

21.9.143 salt.modules.freebsd_sysctl

Module for viewing and modifying sysctl parameters

salt.modules.freebsd_sysctl.assign(name, value)
    Assign a single sysctl parameter for this minion

    CLI Example:
    
    salt '*' sysctl.assign net.inet.icmplim 50

salt.modules.freebsd_sysctl.get(name)
    Return a single sysctl parameter for this minion

    CLI Example:
    
    salt '*' sysctl.get hw.physmem

salt.modules.freebsd_sysctl.persist(name, value, config='/etc/sysctl.conf')
    Assign and persist a simple sysctl parameter for this minion

    CLI Example:
    
    salt '*' sysctl.persist net.inet.icmplim 50
    salt '*' sysctl.persist coretemp_load NO config=/boot/loader.conf

salt.modules.freebsd_sysctl.show(config_file=False)
    Return a list of sysctl parameters for this minion

    CLI Example:
    
    salt '*' sysctl.show

21.9.144 salt.modules.freebsd_update module

Support for freebsd-update utility on FreeBSD.

New in version 2017.7.0.

    maintainer  George Mamalakis <mamalos@gmail.com>
    maturity    new
    platform    FreeBSD

salt.modules.freebsd_update.fetch(**kwargs)
    New in version 2016.3.4.

    freebsd-update fetch wrapper. Based on the currently installed world and the configuration options set, fetch all available binary updates.

    **kwargs: Parameters of freebsd-update command.
salt.modules.freebsd_update.ids(**kwargs)
    New in version 2016.3.4.
    freebsd-update IDS wrapper function. Compares the system against a "known good" index of the installed
    release.
    **kwargs: Parameters of freebsd-update command.

salt.modules.freebsd_update.install(**kwargs)
    New in version 2016.3.4.
    freebsd-update install wrapper. Install the most recently fetched updates or upgrade.
    **kwargs: Parameters of freebsd-update command.

salt.modules.freebsd_update.rollback(**kwargs)
    New in version 2016.3.4.
    freebsd-update rollback wrapper. Uninstalls the most recently installed updates.
    **kwargs: Parameters of freebsd-update command.

salt.modules.freebsd_update.update(**kwargs)
    New in version 2016.3.4.
    Command that simplifies freebsd-update by running freebsd-update fetch first and then freebsd-update install.
    **kwargs: Parameters of freebsd-update command.

salt.modules.freebsd_update.upgrade(**kwargs)
    New in version 2016.3.4.
    Dummy function used only to print a message that upgrade is not available. The reason is that upgrade needs
    manual intervention and reboot, so even if used with:
    yes | freebsd-upgrade -r VERSION
    the additional freebsd-update install that needs to run after the reboot cannot be implemented easily.
    **kwargs: Parameters of freebsd-update command.

21.9.145 salt.modules.freebsdjail

The jail module for FreeBSD

salt.modules.freebsdjail.fstab(jail)
    Display contents of a fstab(5) file defined in specified jail's configuration. If no file is defined, return False.
    CLI Example:

    salt '*' jail.fstab <jail name>

salt.modules.freebsdjail.get_enabled()
    Return which jails are set to be run
    CLI Example:

    salt '*' jail.get_enabled

salt.modules.freebsdjail.is_enabled()
    See if jail service is actually enabled on boot
    CLI Example:
salt 'jail.is_enabled <jail name>

salt.modules.freebsdjail.restart(jail='')
    Restart the specified jail or all, if none specified
    CLI Example:
    salt '*' jail.restart [jail name]

salt.modules.freebsdjail.show_config(jail)
    Display specified jail's configuration
    CLI Example:
    salt '*' jail.show_config <jail name>

salt.modules.freebsdjail.start(jail='')
    Start the specified jail or all, if none specified
    CLI Example:
    salt '*' jail.start [jail name]

salt.modules.freebsdjail.status(jail)
    See if specified jail is currently running
    CLI Example:
    salt '*' jail.status <jail name>

salt.modules.freebsdjail.stop(jail='')
    Stop the specified jail or all, if none specified
    CLI Example:
    salt '*' jail.stop [jail name]

salt.modules.freebsdjail.sysctl()
    Dump all jail related kernel states (sysctl)
    CLI Example:
    salt '*' jail.sysctl

21.9.146  salt.modules.freebsdkmod

Module to manage FreeBSD kernel modules

salt.modules.freebsdkmod.available()
    Return a list of all available kernel modules
    CLI Example:
    salt '*' kmod.available

salt.modules.freebsdkmod.check_available(mod)
    Check to see if the specified kernel module is available
    CLI Example:
salt 'v' kmod.check_available vmm

salt.modules.freebsdkmod.is_loaded(mod)
Check to see if the specified kernel module is loaded
CLI Example:
salt 'v' kmod.is_loaded vmm

salt.modules.freebsdkmod.load(mod, persist=False)
Load the specified kernel module
mod Name of the module to add
persist Write the module to sysrc kld_modules to make it load on system reboot
CLI Example:
salt 'v' kmod.load bhyve

salt.modules.freebsdkmod.lsmod()
Return a dict containing information about currently loaded modules
CLI Example:
salt 'v' kmod.lsmod

salt.modules.freebsdkmod.mod_list(onlyPersist=False)
Return a list of the loaded module names
CLI Example:
salt 'v' kmod.mod_list

salt.modules.freebsdkmod.remove(mod, persist=False, comment=True)
Remove the specified kernel module
mod Name of module to remove
persist Also remove module from /boot/loader.conf
comment If persist is set don't remove line from /boot/loader.conf but only comment it
CLI Example:
salt 'v' kmod.remove vmm

21.9.147 salt.modules.freebsdpkg
Remote package support using pkg_add(1)

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.
Warning: This module has been completely rewritten. Up to and including version 0.17.0, it supported pkg_add(1), but checked for the existence of a pkgng local database and, if found, would provide some of pkgng’s functionality. The rewrite of this module has removed all pkgng support, and moved it to the pkgng execution module. For versions <= 0.17.0, the documentation here should not be considered accurate. If your Minion is running one of these versions, then the documentation for this module can be viewed using the sys.doc function:
salt bsdminion sys.doc pkg

This module acts as the default package provider for FreeBSD 9 and older. If you need to use pkgng on a FreeBSD 9 system, you will need to override the pkg provider by setting the providers parameter in your Minion config file, in order to use pkgng.

providers:
  pkg: pkgng

More information on pkgng support can be found in the documentation for the pkgng module.

This module will respect the PACKAGEROOT and PACKAGESITE environment variables, if set, but these values can also be overridden in several ways:

1. Salt configuration parameters. The configuration parameters freebsdpkg.PACKAGEROOT and freebsdpkg.PACKAGESITE are recognized. These config parameters are looked up using config.get and can thus be specified in the Master config file, Grains, Pillar, or in the Minion config file. Example:

2. CLI arguments. Both the packageroot (used interchangeably with fromrepo for API compatibility) and packagesite CLI arguments are recognized, and override their config counterparts from section 1 above.

   salt -G 'os:FreeBSD' pkg.install zsh fromrepo=ftp://ftp2.freebsd.org/
   salt -G 'os:FreeBSD' pkg.install zsh packageroot=ftp://ftp2.freebsd.org/
   salt -G 'os:FreeBSD' pkg.install zsh packagesite=ftp://ftp2.freebsd.org/pub/
   FreeBSD/ports/ia64/packages-9-stable/Latest/

   .. note::

   These arguments can also be passed through in states:

   .. code-block:: yaml

   zsh:
     pkg.installed:

salt.modules.freebsdpkg.file_dict(*packages, **kwargs)

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system’s package database (not generally recommended).

CLI Examples:

salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
**salt.modules.freebsdpkg.file_list**(*packages*, **kwargs*)

List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

**CLI Examples:**
```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

**salt.modules.freebsdpkg.install**(*name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs*)

Install package(s) using `pkg_add(1)`

- **name** The name of the package to be installed.
- **refresh** Whether or not to refresh the package database before installing.
- **fromrepo** or **packageroot** Specify a package repository from which to install. Overrides the system default, as well as the PACKAGEROOT environment variable.
- **packagesite** Specify the exact directory from which to install the remote package. Overrides the PACKAGE-SITE environment variable, if present.

**Multiple Package Installation Options:**

- **pkgs** A list of packages to install from a software repository. Must be passed as a python list.
  
  **CLI Example:**
  ```
salt '*' pkg.install pkgs='["foo", "bar"]'
  ```

- **sources** A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.
  
  **CLI Example:**
  ```
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"}, {"bar": "salt://bar.deb"}]'
  ```

Return a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

**CLI Example:**
```
salt '*' pkg.install <package name>
```

**salt.modules.freebsdpkg.latest_version**(*names*, **kwargs*)

`pkg_add(1)` is not capable of querying for remote packages, so this function will always return results as if there is no package available for install or upgrade.

**CLI Example:**
```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

**salt.modules.freebsdpkg.list_pkgs**(*versions_as_list=False, with_origin=False, **kwargs*)

List the packages currently installed as a dict:
```python
{'<package_name>': '<version>'}
```

**with_origin** [False] Return a nested dictionary containing both the origin name and version for each installed package.

New in version 2014.1.0.

CLI Example:

```bash
salt '*' pkg.list_pkgs
```

salt.modules.freebsdpkg.refresh_db(**kwargs)

pkg_add(1) does not use a local database of available packages, so this function simply returns True. It exists merely for API compatibility.

CLI Example:

```bash
salt '*' pkg.refresh_db
```

salt.modules.freebsdpkg.remove(name= None, pkgs= None, **kwargs)

Remove packages using pkg_delete(1)

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```bash
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['"foo", "bar"]'
```

salt.modules.freebsdpkg.version(*names, **kwargs)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

**with_origin** [False] Return a nested dictionary containing both the origin name and version for each specified package.

New in version 2014.1.0.

CLI Example:

```bash
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```
21.9.148  salt.modules.freebsdports

Install software from the FreeBSD ports(7) system

New in version 2014.1.0.

This module allows you to install ports using BATCH=yes to bypass configuration prompts. It is recommended to use the ports state to install ports, but it is also possible to use this module exclusively from the command line.

```python
salt minion-id ports.config security/nmap IPV6=off
salt minion-id ports.install security/nmap
```

salt.modules.freebsdports.config(name, reset=False, **kwargs)

Modify configuration options for a given port. Multiple options can be specified. To see the available options for a port, use ports.showconfig.

- **name**: The port name, in category/name format
- **reset**: [False] If True, runs a make rmconfig for the port, clearing its configuration before setting the desired options

CLI Examples:

```python
salt '*' ports.config security/nmap IPV6=off
```

salt.modules.freebsdports.deinstall(name)

De-install a port.

CLI Example:

```python
salt '*' ports.deinstall security/nmap
```

salt.modules.freebsdports.install(name, clean=True)

Install a port from the ports tree. Installs using BATCH=yes for non-interactive building. To set config options for a given port, use ports.config.

- **clean**: [True] If True, cleans after installation. Equivalent to running make install clean BATCH=yes.

Note: It may be helpful to run this function using the -t option to set a higher timeout, since compiling a port may cause the Salt command to exceed the default timeout.

CLI Example:

```python
salt -t 1200 '*' ports.install security/nmap
```

salt.modules.freebsdports.list_all()

Lists all ports available.

CLI Example:

```python
salt '*' ports.list_all
```

**Warning:** Takes a while to run, and returns a LOT of output

salt.modules.freebsdports.rmconfig(name)

Clear the cached options for the specified port; run a make rmconfig
**name**  The name of the port to clear

CLI Example:

```bash
salt '*' ports.rmconfig security/nmap
```

**salt.modules.freebsdports.search(name)**

Search for matches in the ports tree. Globs are supported, and the category is optional

CLI Examples:

```bash
salt '*' ports.search 'security/*'
salt '*' ports.search 'security/n*'  
salt '*' ports.search nmap
```

**Warning:** Takes a while to run

**salt.modules.freebsdports.showconfig(name, default=False, dict_return=False)**

Show the configuration options for a given port.

**default**  [False] Show the default options for a port (not necessarily the same as the current configuration)

**dict_return**  [False] Instead of returning the output of `make showconfig`, return the data in a dictionary

CLI Example:

```bash
salt '*' ports.showconfig security/nmap
salt '*' ports.showconfig security/nmap default=True
```

**salt.modules.freebsdports.update(extract=False)**

Update the ports tree

**extract**  [False] If True, runs a portsnap extract after fetching, should be used for first-time installation of the ports tree.

CLI Example:

```bash
salt '*' ports.update
```

---

**21.9.149  salt.modules.freebsdservice**

The service module for FreeBSD

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

**salt.modules.freebsdservice.available(name, jail=None)**

Check that the given service is available.

Changed in version 2016.3.4.

jail: optional jid or jail name

CLI Example:
salt '*' service.available sshd

```
salt.modules.freebsdservice.disable(name, **kwargs)
    Disable the named service to start at boot
    Arguments the same as for enable()
    Changed in version 2016.3.4.
    jail (optional keyword argument) the jail's id or name
    chroot (optional keyword argument) the jail's chroot, if the jail's /etc is not mounted read-write
    CLI Example:
    salt '*' service.disable <service name>
```

```
salt.modules.freebsdservice.disabled(name, **kwargs)
    Return True if the named service is enabled, false otherwise
    CLI Example:
    salt '*' service.disabled <service name>
```

```
salt.modules.freebsdservice.enable(name, **kwargs)
    Enable the named service to start at boot
    name service name
    config [/etc/rc.conf] Config file for managing service. If config value is empty string, then
    /etc/rc.conf.d/<service> used. See man rc.conf(5) for details.
    Also service.config variable can be used to change default.
    Changed in version 2016.3.4.
    jail (optional keyword argument) the jail's id or name
    chroot (optional keyword argument) the jail's chroot, if the jail's /etc is not mounted read-write
    CLI Example:
    salt '*' service.enable <service name>
```

```
salt.modules.freebsdservice.enabled(name, **kwargs)
    Return True if the named service is enabled, false otherwise
    name Service name
    Changed in version 2016.3.4.
    Support for jail (representing jid or jail name) keyword argument in kwargs
    CLI Example:
    salt '*' service.enabled <service name>
```

```
salt.modules.freebsdservice.get_all(jail=None)
    Return a list of all available services
    Changed in version 2016.3.4.
    jail: optional jid or jail name
    CLI Example:
```
salt '...' service.get_all

```python
salt.modules.freebsdservice.get_disabled(jail=None)
```
Return what services are available but not enabled to start at boot

Changed in version 2016.3.4.
Support for jail (representing jid or jail name) keyword argument in kwargs

CLI Example:
```
salt '...' service.get_disabled
```

salt.modules.freebsdservice.get_enabled(jail=None)
Return what services are set to run on boot

Changed in version 2016.3.4.
Support for jail (representing jid or jail name) keyword argument in kwargs

CLI Example:
```
salt '...' service.get_enabled
```

salt.modules.freebsdservice.missing(name, jail=None)
The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.

Changed in version 2016.3.4.
jail: optional jid or jail name

CLI Example:
```
salt '...' service.missing sshd
```

salt.modules.freebsdservice.reload_(name, jail=None)
Restart the named service

Changed in version 2016.3.4.
jail: optional jid or jail name

CLI Example:
```
salt '...' service.reload <service name>
```

salt.modules.freebsdservice.restart(name, jail=None)
Restart the named service

Changed in version 2016.3.4.
jail: optional jid or jail name

CLI Example:
```
salt '...' service.restart <service name>
```

salt.modules.freebsdservice.start(name, jail=None)
Start the specified service

Changed in version 2016.3.4.
jail: optional jid or jail name

CLI Example:

```
salt '*' service.start <service name>
```

```
salt.modules.freebsdservice.status(name, sig=None, jail=None)
```

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False
values is returned.

Changed in version 2016.3.4.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

Parameters

- **name** *(str)* -- The name of the service to check
- **sig** *(str)* -- Signature to use to find the service via ps

Returns

True if running, False otherwise
dict: Maps service name to True if running, False otherwise

Return type: bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

```
salt.modules.freebsdservice.stop(name, jail=None)
```

Stop the specified service

Changed in version 2016.3.4.

jail: optional jid or jail name

CLI Example:

```
salt '*' service.stop <service name>
```

### 21.9.150 salt.modules.freezer module

maintainer Alberto Planas <aplanas@suse.com>
maturity new
depends None
platform Linux

```
salt.modules.freezer.freeze(name=None, force=False, **kwargs)
```

Save the list of package and repos in a freeze file.

As this module is built on top of the pkg module, the user can send extra attributes to the underlying pkg
module via kwargs. This function will call pkg.list_pkgs and pkg.list_repos, and any additional
arguments will be passed through to those functions.

- **name** Name of the frozen state. Optional.
- **force** If true, overwrite the state. Optional.

CLI Example:
salt '*' freezer.freeze
salt '*' freezer.freeze pre_install
salt '*' freezer.freeze force=True root=/chroot

salt.modules.freezer.list()  
Return the list of frozen states.

CLI Example:

    salt '*' freezer.list

salt.modules.freezer.restore(name=None, clean=False, **kwargs)  
Make sure that the system contains the packages and repos from a frozen state.

Read the list of packages and repositories from the freeze file, and compare it with the current list of packages and repos. If there is any difference, all the missing packages are repos will be installed, and all the extra packages and repos will be removed.

As this module is build on top of the pkg module, the user can send extra attributes to the underlying pkg module via kwargs. This function will call pkg.list_repos, pkg.mod_repo, pkg.list_pkgs, pkg.install, pkg.remove and pkg.del_repo, and any additional arguments will be passed through to those functions.

name  Name of the frozen state. Optional.

clean  If True remove the frozen information YAML from the cache

    New in version 3000.

CLI Example:

    salt '*' freezer.restore
    salt '*' freezer.restore root=/chroot

salt.modules.freezer.status(name=None)  
Return True if there is already a frozen state.

A frozen state is merely a list of packages (including the version) in a specific time. This information can be used to compare with the current list of packages, and revert the installation of some extra packages that are in the system.

name  Name of the frozen state. Optional.

CLI Example:

    salt '*' freezer.status
    salt '*' freezer.status pre_install

21.9.151 salt.modules.gcp_addon module

A route is a rule that specifies how certain packets should be handled by the virtual network. Routes are associated with virtual machine instances by tag, and the set of routes for a particular VM is called its routing table. For each packet leaving a virtual machine, the system searches that machine’s routing table for a single best matching route.

    New in version 2018.3.0.

This module will create a route to send traffic destined to the Internet through your gateway instance.

    codeauthor  Pratik Bandarkar <pratik.bandarkar@gmail.com>
maturity new
depends google-api-python-client
platform Linux

salt.modules.gcp_addon.route_create(credential_file=None, project_id=None, name=None,
dest_range=None, next_hop_instance=None, instance_zone=None, tags=None, network=None, priority=None)

Create a route to send traffic destined to the Internet through your gateway instance

credential_file [string] File location of application default credential. For more information, refer: https://developers.google.com/identity/protocols/application-default-credentials

project_id [string] Project ID where instance and network resides.

name [string] name of the route to create

next_hop_instance [string] the name of an instance that should handle traffic matching this route.

instance_zone [string] zone where instance("next_hop_instance") resides

network [string] Specifies the network to which the route will be applied.

dest_range [string] The destination range of outgoing packets that the route will apply to.

tags [list] (optional) Identifies the set of instances that this route will apply to.

priority [int] (optional) Specifies the priority of this route relative to other routes. default=1000

CLI Example:

salt 'salt-master.novalocal' gcp.route_create credential_file=/root/secret_key.json project_id=cp100-170315
name=derby-db-route1 next_hop_instance=instance-1 instance_zone=us-central1-a network=default
dest_range=0.0.0.0/0 tags=["no-ip"] priority=700

In above example, the instances which are having tag "no-ip" will route the packet to instance "instance-1"(if packet is intended to other network)

21.9.152 salt.modules.gem

Manage ruby gems.

salt.modules.gem.install(gems, ruby=None, gem_bin=None, runas=None, version=None, rdoc=False,
ri=False, pre_releases=False, proxy=None, source=None)

Installs one or several gems.

Parameters

- **gems** -- string The gems to install
- **gem_bin** -- string : None Full path to gem binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use.
  Ignored if gem_bin is specified.
- **runas** -- string : None The user to run gem as.
- **version** -- string : None Specify the version to install for the gem. Doesn't play nice
  with multiple gems at once
- **rdoc** -- boolean : False Generate RDoc documentation for the gem(s). For rubygems > 3
  this is interpreted as the --no-document arg and the ri option will then be ignored
• **ri** -- boolean : False Generate RI documentation for the gem(s). For rubygems > 3 this is interpreted as the --no-document arg and the rdoc option will then be ignored

• **pre_releases** -- boolean : False Include pre-releases in the available versions

• **proxy** -- string : None Use the specified HTTP proxy server for all outgoing traffic. Format: http://hostname[:port]

**source** [None] Use the specified HTTP gem source server to download gem. Format: http://hostname[:port]

CLI Example:

```bash
salt '*' gem.install vagrant
salt '*' gem.install redphone gem_bin=/opt/sensu/embedded/bin/gem
```

salt.modules.gem.list_(*prefix='', ruby=None, runas=None, gem_bin=None*)

List locally installed gems.

**Parameters**

• **prefix** -- string : Only list gems when the name matches this prefix.

• **gem_bin** -- string : None Full path to gem binary to use.

• **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if gem_bin is specified.

• **runas** -- string : None The user to run gem as.

CLI Example:

```bash
salt '*' gem.list
```

salt.modules.gem.list_upgrades(ruby=None, runas=None, gem_bin=None*)

New in version 2015.8.0.

Check if an upgrade is available for installed gems

gem_bin [None] Full path to gem binary to use.

ruby [None] If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if gem_bin is specified.

runas [None] The user to run gem as.

CLI Example:

```bash
salt '*' gem.list_upgrades
```

salt.modules.gem.sources_add(source_uri, ruby=None, runas=None, gem_bin=None*)

Add a gem source.

**Parameters**

• **source_uri** -- string The source URI to add.

• **gem_bin** -- string : None Full path to gem binary to use.

• **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if gem_bin is specified.

• **runas** -- string : None The user to run gem as.
CLI Example:

```bash
salt '*' gem.sources_add http://rubygems.org/
```

**salt.modules.gem.sources_list**(ruby=None, runas=None, gem_bin=None)

List the configured gem sources.

**Parameters**

- **gem_bin** -- string : None Full path to gem binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** -- string : None The user to run gem as.

CLI Example:

```bash
salt '*' gem.sources_list
```

**salt.modules.gem.sources_remove**(source_uri, ruby=None, runas=None, gem_bin=None)

Remove a gem source.

**Parameters**

- **source_uri** -- string The source URI to remove.
- **gem_bin** -- string : None Full path to gem binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** -- string : None The user to run gem as.

CLI Example:

```bash
salt '*' gem.sources_remove http://rubygems.org/
```

**salt.modules.gem.uninstall**(gems, ruby=None, runas=None, gem_bin=None)

Uninstall one or several gems.

**Parameters**

- **gems** -- string The gems to uninstall.
- **gem_bin** -- string : None Full path to gem binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** -- string : None The user to run gem as.

CLI Example:

```bash
salt '*' gem.uninstall vagrant
```

**salt.modules.gem.update**(gems, ruby=None, runas=None, gem_bin=None)

Update one or several gems.

**Parameters**

- **gems** -- string The gems to update.
- **gem_bin** -- string : None Full path to gem binary to use.
• **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if **gem_bin** is specified.

• **runas** -- string : None The user to run gem as.

**CLI Example:**

```bash
salt '*' gem.update vagrant
```

salt.modules.gem.update_system( **version=**'', **ruby=**None, **runas=**None, **gem_bin=**None)

Update rubygems.

**Parameters**

• **version** -- string : (newest) The version of rubygems to install.

• **gem_bin** -- string : None Full path to gem binary to use.

• **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if **gem_bin** is specified.

• **runas** -- string : None The user to run gem as.

**CLI Example:**

```bash
salt '*' gem.update_system
```

salt.modules.gem.version( **ruby=**None, **runas=**None, **gem_bin=**None)

Print out the version of gem

**Parameters**

• **gem_bin** -- string : None Full path to gem binary to use.

• **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if **gem_bin** is specified.

• **runas** -- string : None The user to run gem as.

**CLI Example:**

```bash
salt '*' gem.version
```

**21.9.153 salt.modules.genesis**

Module for managing container and VM images

New in version 2014.7.0.

salt.modules.genesis.avail_platforms()

Return which platforms are available

**CLI Example:**

```bash
salt myminion genesis.avail_platforms
```

salt.modules.genesis.bootstrap( **platform=**'', **root=**'', **img_format=**'dir', **fs_format=**'ext2', **fs_opts=**None, **arch=**None, **flavor=**None, **repo_url=**None, **static_qemu=**None, **img_size=**None, **mount_dir=**None, **pkg_cache=**None, **pkgs=**None, **exclude_pkgs=**None, **epel_url=**''http://download.fedoraproject.org/pub/epel/6/i386/epel-release-6-8.noarch.rpm'')

**21.9. execution modules** 1851
Create an image for a specific platform.

Please note that this function **MUST** be run as root, as images that are created make files belonging to root.

- **platform** Which platform to use to create the image. Currently supported platforms are rpm, deb and pacman.
- **root** Local path to create the root of the image filesystem.
- **img_format** Which format to create the image in. By default, just copies files into a directory on the local filesystem (dir). Future support will exist for sparse.
- **fs_format** When using a non-dir img_format, which filesystem to format the image to. By default, ext2.
- **fs_opts** When using a non-dir img_format, a dict of opts may be specified.
- **arch** Architecture to install packages for, if supported by the underlying bootstrap tool. Currently only used for deb.
- **flavor** Which flavor of operating system to install. This correlates to a specific directory on the distribution repositories. For instance, wheezy on Debian.
- **repo_url** Mainly important for Debian-based repos. Base URL for the mirror to install from. (e.x.: http://ftp.debian.org/debian/)
- **static_qemu** Local path to the static qemu binary required for this arch. (e.x.: /usr/bin/qemu-amd64-static)
- **pkg_confs** The location of the conf files to copy into the image, to point the installer to the right repos and configuration.
- **img_size** If img_format is not dir, then the size of the image must be specified.
- **mount_dir** If img_format is not dir, then the image must be mounted somewhere. If the mount_dir is not specified, then it will be created at /opt/salt-genesis.<random_uuid>. This directory will be unmounted and removed when the process is finished.
- **pkg_cache** This points to a directory containing a cache of package files to be copied to the image. It does not need to be specified.
- **pkgs** A list of packages to be installed on this image. For RedHat, this will include yum, centos-release and iputils by default.
- **exclude_pkgs** A list of packages to be excluded. If you do not want to install the defaults, you need to include them in this list.
- **epel_url** The URL to download the EPEL release package from.

CLI Examples:

```
salt myminion genesis.bootstrap pacman /root/arch
salt myminion genesis.bootstrap rpm /root/redhat
salt myminion genesis.bootstrap deb /root/wheezy arch=amd64
  → flavor=wheezy static_qemu=/usr/bin/qemu-x86_64-static
```

**salt.modules.genesis.**`ldd_deps`*(filename, ret=None)*

Recurse through a set of dependencies reported by `ldd`, to find associated dependencies.

Please note that this does not necessarily resolve all (non-package) dependencies for a file; but it does help.

CLI Example:

```
salt myminion genesis.ldd_deps bash salt myminion genesis.ldd_deps /bin/bash
```

**salt.modules.genesis.**`mksls`*(fmt, src, dst=None)*

Convert an installation file/script to an SLS file. Currently supports kickstart, preseed, and autoyast.

CLI Examples:
salt <minion> genesis.mksls kickstart /path/to/kickstart.cfg
salt <minion> genesis.mksls kickstart /path/to/kickstart.cfg /path/to/dest.sls

New in version Beryllium.
salt.modules.genesis.pack(name, root, path=None, pack_format='tar', compress='bzip2')
Pack up a directory structure, into a specific format
CLI Examples:
salt myminion genesis.pack centos /root/centos
salt myminion genesis.pack centos /root/centos pack_format='tar'
salt.modules.genesis.unpack(name, dest=None, path=None, pack_format='tar', compress='bz2')
Unpack an image into a directory structure
CLI Example:
salt myminion genesis.unpack centos /root/centos

21.9.154 salt.modules.gentoo_service
Top level package command wrapper, used to translate the os detected by grains to the correct service manager

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see here.
salt.modules.gentoo_service.available(name)
Returns True if the specified service is available, otherwise returns False.
CLI Example:
salt '*' service.available sshd
salt.modules.gentoo_service.disable(name, **kwargs)
Disable the named service to start at boot
CLI Example:
salt '*' service.disable <service name> <runlevels=runlevel1,runlevel2>
salt '*' service.disable <service name> <runlevels=single-runlevel>
salt.modules.gentoo_service.disabled(name)
Return True if the named service is enabled, false otherwise
CLI Example:
salt '*' service.disabled <service name> <runlevels=[runlevel]>
salt.modules.gentoo_service.enable(name, **kwargs)
Enable the named service to start at boot
CLI Example:
salt '*' service.enable <service name> <runlevels=single-runlevel>
salt '*' service.enable <service name> <runlevels=[runlevel1,runlevel2]>
salt.modules.gentoo_service.enabled(name, **kwargs)
Return True if the named service is enabled, false otherwise

CLI Example:
```
salt '*' service.enabled <service name> <runlevels=single-runlevel>
salt '*' service.enabled <service name> <runlevels=[runlevel1,runlevel2]>
```

salt.modules.gentoo_service.get_all()
Return all available boot services

CLI Example:
```
salt '*' service.get_all
```

salt.modules.gentoo_service.get_disabled()
Return a set of services that are installed but disabled

CLI Example:
```
salt '*' service.get_disabled
```

salt.modules.gentoo_service.get_enabled()
Return a list of service that are enabled on boot

CLI Example:
```
salt '*' service.get_enabled
```

salt.modules.gentoo_service.missing(name)
The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.

CLI Example:
```
salt '*' service.missing sshd
```

salt.modules.gentoo_service.reload_(name)
Reload the named service

CLI Example:
```
salt '*' service.reload <service name>
```

salt.modules.gentoo_service.restart(name)
Restart the named service

CLI Example:
```
salt '*' service.restart <service name>
```

salt.modules.gentoo_service.start(name)
Start the specified service

CLI Example:
```
salt '*' service.start <service name>
```

salt.modules.gentoo_service.status(name, sig=None)
Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.
Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

**Parameters**

- **name** *(str)* -- The name of the service to check
- **sig** *(str)* -- Signature to use to find the service via `ps`

**Returns**  True if running, False otherwise
dict: Maps service name to True if running, False otherwise

**Return type**  bool

CLI Example:
```
salt '*' service.status <service name> [service signature]
```

**salt.modules.gentoo_service.stop(name)**
Stop the specified service

CLI Example:
```
salt '*' service.stop <service name>
```

**salt.modules.gentoo_service.zap(name)**
Resets service state

CLI Example:
```
salt '*' service.zap <service name>
```

---

**21.9.155 salt.modules.gentoolkitmod**

Support for Gentoolkit

**salt.modules.gentoolkitmod.eclean_dist**(destructive=False, package_names=False, size_limit=0, time_limit=0, fetch_restricted=False, exclude_file='/etc/eclean/distfiles.exclude')

Clean obsolete portage sources

- **destructive**  Only keep minimum for reinstallation
- **package_names**  Protect all versions of installed packages. Only meaningful if used with destructive=True
- **size_limit** ::=  Don't delete distfiles bigger than <size>.  <size> is a size specification: "10M" is "ten megabytes", "200K" is "two hundreds kilobytes", etc. Units are: G, M, K and B.
- **time_limit** ::=  Don't delete distfiles files modified since <time> <time> is an amount of time: "1y" is "one year", "2w" is "two weeks", etc. Units are: y (years), m (months), w (weeks), d (days) and h (hours).
- **fetch_restricted**  Protect fetch-restricted files. Only meaningful if used with destructive=True
- **exclude_file**  Path to exclusion file. Default is /etc/eclean/distfiles.exclude This is the same default eclean-dist uses. Use None if this file exists and you want to ignore.

Returns a dict containing the cleaned, saved, and deprecated dists:

```json
{
'cleaned': {<dist file>: <size>},
'deprecated': {<package>: <dist file>},
'saved': {<package>: <dist file>},
'total_cleaned': <size>
}
```
CLI Example:
```
salt '*' gentoolkit.eclean_dist destructive=True
```

salt.modules.gentoolkitmod.eclean_pkg(
destructive=False, package_names=False, time_limit=0, 
exclude_file='/etc/eclean/packages.exclude')
Clean obsolete binary packages

destructive  Only keep minimum for reinstallation

package_names  Protect all versions of installed packages. Only meaningful if used with destructive=True

time_limit  <time>  Don't delete distfiles files modified since <time>  <time> is an amount of time: "1y" is "one 
year", "2w" is "two weeks", etc. Units are: y (years), m (months), w (weeks), d (days) and h (hours).

exclude_file  Path to exclusion file. Default is /etc/eclean/packages.exclude This is the same default eclean-pkg 
uses. Use None if this file exists and you want to ignore.

Returns a dict containing the cleaned binary packages:
```
{'cleaned': {'<dist file>': '<size>'}, 
'total_cleaned': '<size>'
}
```

CLI Example:
```
salt '*' gentoolkit.eclean_pkg destructive=True
```

salt.modules.gentoolkitmod.glsa_check_list(glsa_list)
List the status of Gentoo Linux Security Advisories

glsa_list  can contain an arbitrary number of GLSA ids, filenames containing GLSAs or the special identifiers 
'all' and 'affected'

Returns a dict containing glsa ids with a description, status, and CVEs:
```
{<glsa_id>: {'description': '<glsa_description>', 
'status': '<glsa_status>', 
'CVEs': ['<list of CVEs>']}}
```

CLI Example:
```
salt '*' gentoolkit.glsa_check_list 'affected'
```

salt.modules.gentoolkitmod.revdep_rebuild(lib=None)
Fix up broken reverse dependencies

lib  Search for reverse dependencies for a particular library rather than every library on the system. It can be 
a full path to a library or basic regular expression.

CLI Example:
```
salt '*' gentoolkit.revdep_rebuild
```
21.9.156 salt.modules.git

Support for the Git SCM

```python
salt.modules.git.add(cwd, filename, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None)
```

Changed in version 2015.8.0: The `--verbose` command line argument is now implied

**Interface to** `git-add(1)`

- **cwd** The path to the git checkout
- **filename** The location of the file/directory to add, relative to `cwd`
- **opts** Any additional options to add to the command line, in a single string

| Note: | On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with options (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing. |

- **git_opts** Any additional options to add to git command itself (not the `add` subcommand), in a single string.
  This is useful for passing `--c` to run git with temporary changes to the git configuration.
  New in version 2017.7.0.

| Note: | This is only supported in git 1.7.2 and newer. |

- **user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

- **password**
  Windows only. Required when specifying **user**. This parameter will be ignored on non-Windows platforms.
  New in version 2016.3.4.

- **ignore_retcode** `[False]` If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.
  New in version 2015.8.0.

- **output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

| Note: | This only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters. |

New in version 2018.3.1.

**CLI Examples:**

```bash
salt myminion git.add /path/to/repo foo/bar.py
salt myminion git.add /path/to/repo foo/bar.py opts='--dry-run'
```

salt.modules.git.archive(cwd, output, rev='HEAD', prefix=None, git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None, **kwargs)

Changed in version 2015.8.0: Returns `True` if successful, raises an error if not.

**Interface to** `git-archive(1)`, exports a tarball/zip file of the repository
cwd  The path to be archived

Note: `git archive` permits a partial archive to be created. Thus, this path does not need to be the root of the git repository. Only the files within the directory specified by `cwd` (and its subdirectories) will be in the resulting archive. For example, if there is a git checkout at `/tmp/foo`, then passing `/tmp/foo/bar` as the `cwd` will result in just the files underneath `/tmp/foo/bar` to be exported as an archive.

output  The path of the archive to be created

overwrite  [False] Unless set to `True`, Salt will over write an existing archive at the path specified by the `output` argument.

New in version 2015.8.0.

rev  [HEAD] The revision from which to create the archive

format  Manually specify the file format of the resulting archive. This argument can be omitted, and `git archive` will attempt to guess the archive type (and compression) from the filename. `zip`, `tar`, `tar.gz`, and `tgz` are extensions that are recognized automatically, and `git` can be configured to support other archive types with the addition of `git` configuration keys.

See the `git-archive(1)` manpage explanation of the `--format` argument (as well as the `CONFIGURATION` section of the manpage) for further information.

New in version 2015.8.0.

prefix  Prepend `<prefix>` to every filename in the archive. If unspecified, the name of the directory at the top level of the repository will be used as the prefix (e.g. if `cwd` is set to `/foo/bar/baz`, the prefix will be `baz`, and the resulting archive will contain a top-level directory by that name).

Note: The default behavior if the `--prefix` option for `git archive` is not specified is not to prepend a prefix, so Salt's behavior differs slightly from `git archive` in this respect. Use `prefix=''` to create an archive with no prefix.

Changed in version 2015.8.0: The behavior of this argument has been changed slightly. As of this version, it is necessary to include the trailing slash when specifying a prefix, if the prefix is intended to create a top-level directory.

git_opts  Any additional options to add to `git` command itself (not the `archive` subcommand), in a single string. This is useful for passing `-c` to run `git` with temporary changes to the `git` configuration.

New in version 2017.7.0.

Note: This is only supported in `git 1.7.2` and newer.

user  User under which to run the `git` command. By default, the command is run by the user under which the minion is running.

password  Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.
ignore_retcode  [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note:  This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.archive /path/to/repo /path/to/archive.tar
```

salt.modules.git.branch(cwd, name=None, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None)

Interface to git-branch(1)

cwd  The path to the git checkout

name  Name of the branch on which to operate. If not specified, the current branch will be assumed.

opts  Any additional options to add to the command line, in a single string

Note:  To create a branch based on something other than HEAD, pass the name of the revision as opts. If the revision is in the format remotename/branch, then this will also set the remote tracking branch. Additionally, on the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with opts= (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts  Any additional options to add to git command itself (not the branch subcommand), in a single string. This is useful for passing -c to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note:  This is only supported in git 1.7.2 and newer.

user  User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode  [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.
Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```bash
# Set remote tracking branch
salt myminion git.branch /path/to/repo mybranch opts='--set-upstream-to origin/mybranch'
# Create new branch
salt myminion git.branch /path/to/repo mybranch upstream/somebranch
# Delete branch
salt myminion git.branch /path/to/repo mybranch opts='--delete'
# Rename branch (2015.8.0 and later)
salt myminion git.branch /path/to/repo newbranch opts='--branch oldbranch'
```

salt.modules.git.checkout(cwd, rev=None, force=False, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None)

Interface to `git-checkout(1)`

cwd  The path to the git checkout

opts  Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with opts= (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

git_opts  Any additional options to add to git command itself (not the checkout subcommand), in a single string. This is useful for passing -c to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

rev  The remote branch or revision to checkout.

Changed in version 2015.8.0: Optional when using -b or -B in opts.

force  [False] Force a checkout even if there might be overwritten changes

user  User under which to run the git command. By default, the command is run by the user under which the minion is running.

password  

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode  [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.
Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```bash
# Checking out local local revisions
salt myminion git.checkout /path/to/repo somebranch user=jeff
salt myminion git.checkout /path/to/repo opts='testbranch -- conf/file1 file2'
salt myminion git.checkout /path/to/repo rev=origin/mybranch opts='--track'
# Checking out remote revision into new branch
salt myminion git.checkout /path/to/repo upstream/master opts='--b newbranch'
# Checking out current revision into new branch (2015.8.0 and later)
salt myminion git.checkout /path/to/repo opts='--b newbranch'
```

```
salt.modules.git.clone(cwd, url=None, name=None, opts='', git_opts='', user=None, password=None, identity=None, https_user=None, https_pass=None, ignore_retcode=False, saltenv='base', output_encoding=None)
```

Interface to `git-clone(1)`

- **cwd**: Location of git clone
  
  Changed in version 2015.8.0: If `name` is passed, then the clone will be made within this directory.

- **url**: The URL of the repository to be cloned
  
  Changed in version 2015.8.0: Argument renamed from `repository` to `url`.

- **name**: Optional alternate name for the top-level directory to be created by the clone
  
  New in version 2015.8.0.

- **opts**: Any additional options to add to the command line, in a single string

- **git_opts**: Any additional options to add to `git` command itself (not the `clone` subcommand), in a single string.
  
  This is useful for passing `-c` to run `git` with temporary changes to the `git` configuration.

  New in version 2017.7.0.

  Note: This is only supported in `git 1.7.2` and newer.

- **user**: User under which to run the `git` command. By default, the command is run by the user under which the minion is running.

- **password**: Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.4.

- **identity**: Path to a private key to use for ssh URLs

  Warning: Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphrase-less. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.
Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

**https_user** Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

New in version 2015.5.0.

**https_pass** Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

New in version 2015.5.0.

**ignore_retcode** [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**saltenv** The default salt environment to pull sls files from

New in version 2016.3.1.

**output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.clone /path/to/repo_parent_dir git://github.com/saltstack/salt.
```

salt.modules.git.commit(`cwd`, `message`, `opts```, `git_opts```, `user=None`, `password=None`, `filename=None`, `ignore_retcode=False`, `output_encoding=None``)

Interface to `git-commit`

**cwd** The path to the git checkout

**message** Commit message

**opts** Any additional options to add to the command line, in a single string. These opts will be added to the end of the git command being run.

**Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

The `--` option should not be passed here, as the commit message will be defined by the `message` argument.

**git_opts** Any additional options to add to git command itself (not the `commit` subcommand), in a single string. This is useful for passing `--c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.
user  User under which to run the git command. By default, the command is run by the user under which the
minion is running.

password

Windows only. Required when specifying user. This parameter will be ignored on non-
Windows platforms.

New in version 2016.3.4.

filename  The location of the file/directory to commit, relative to cwd. This argument is optional, and can be
used to commit a file without first staging it.

Note: This argument only works on files which are already tracked by the git repository.

New in version 2015.8.0.

ignore_retcode  [False] If True, do not log an error to the minion log if the git command returns a nonzero
exit status.

New in version 2015.8.0.

output_encoding  Use this option to specify which encoding to use to decode the output from any git com-
mands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an
encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

salt myminion git.commit /path/to/repo 'The commit message'
salt myminion git.commit /path/to/repo 'The commit message' filename=foo/bar.py

salt.modules.git.config_get(key, cwd=None, user=None, password=None, ignore_retcode=False,
output_encoding=None, **kwargs)

Get the value of a key in the git configuration file

key  The name of the configuration key to get

Changed in version 2015.8.0: Argument renamed from setting_name to key

cwd  The path to the git checkout

Changed in version 2015.8.0: Now optional if global is set to True

global  [False] If True, query the global git configuration. Otherwise, only the local git configuration will be
queried.

New in version 2015.8.0.

all  [False] If True, return a list of all values set for key. If the key does not exist, None will be returned.

New in version 2015.8.0.
user  User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode  [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note:  This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.config_get user.name cwd=/path/to/repo
salt myminion git.config_get user.email global=True
salt myminion git.config_get core.gitproxy cwd=/path/to/repo all=True
```

salt.modules.git.config_get_regexp (key, value_regex=None, cwd=None, user=None, password=None, ignore_retcode=False, output_encoding=None, **kwargs)

New in version 2015.8.0.

Get the value of a key or keys in the git configuration file using regexes for more flexible matching. The return data is a dictionary mapping keys to lists of values matching the value_regex. If no values match, an empty dictionary will be returned.

key  Regex on which key names will be matched

value_regex  If specified, return all values matching this regex. The return data will be a dictionary mapping keys to lists of values matching the regex.

Important:  Only values matching the value_regex will be part of the return data. So, if key matches a multivar, then it is possible that not all of the values will be returned. To get all values set for a multivar, simply omit the value_regex argument.

cwd  The path to the git checkout

global  [False] If True, query the global git configuration. Otherwise, only the local git configuration will be queried.

user  User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.
New in version 2016.3.4.

**ignore_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

**output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```bash
# Matches any values for key 'foo.bar'
salt myminion git.config_get_regexp /path/to/repo foo.bar
# Matches any value starting with 'baz' set for key 'foo.bar'
salt myminion git.config_get_regexp /path/to/repo foo.bar 'baz.*'
# Matches any key starting with 'user.'
salt myminion git.config_get_regexp '^user\.' global=True
```

salt.modules.git.config_set(key, value=None, multivar=None, cwd=None, user=None, password=None, ignore_retcode=False, output_encoding=None, **kwargs)

Changed in version 2015.8.0: Return the value(s) of the key being set

Set a key in the git configuration file

**cwd** The path to the git checkout. Must be an absolute path, or the word global to indicate that a global key should be set.

Changed in version 2014.7.0: Made cwd argument optional if is_global=True

**key** The name of the configuration key to set

Changed in version 2015.8.0: Argument renamed from setting_name to key

**value** The value to set for the specified key. Incompatible with the multivar argument.

Changed in version 2015.8.0: Argument renamed from setting_value to value

**add** [False] Add a value to a key, creating/updating a multivar

New in version 2015.8.0.

**multivar** Set a multivar all at once. Values can be comma-separated or passed as a Python list. Incompatible with the value argument.

New in version 2015.8.0.

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.
global  [False] If True, set a global variable

output_encoding  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.config_set user.email me@example.com cwd=/path/to/repo
salt myminion git.config_set user.email foo@bar.com global=True
```

salt.modules.git.config_unset(key, value_regex=None, cwd=None, user=None, password=None, ignore_retcode=False, output_encoding=None, **kwargs)

New in version 2015.8.0.

Unset a key in the git configuration file

cwd  The path to the git checkout. Must be an absolute path, or the word global to indicate that a global key should be unset.

key  The name of the configuration key to unset

value_regex  Regular expression that matches exactly one key, used to delete a single value from a multivar. Ignored if all is set to True.

all  [False] If True unset all values for a multivar. If False, and key is a multivar, an error will be raised.

global  [False] If True, unset set a global variable. Otherwise, a local variable will be unset.

user  User under which to run the git command. By default, the command is run by the user under which the minion is running.

password  

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode  [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

output_encoding  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.config_unset /path/to/repo foo.bar
salt myminion git.config_unset /path/to/repo foo.bar all=True
```
salt.modules.git.current_branch(cwd, user=None, password=None, ignore_retcode=False, output_encoding=None)

Returns the current branch name of a local checkout. If HEAD is detached, return the SHA1 of the revision which is currently checked out.

cwd The path to the git checkout

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

New in version 2018.3.1.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

CLI Example:

```
salt myminion git.current_branch /path/to/repo
```

salt.modules.git.describe(cwd, rev='HEAD', user=None, password=None, ignore_retcode=False, output_encoding=None)

Returns the git-describe(1) string (or the SHA1 hash if there are no tags) for the given revision.

cwd The path to the git checkout

rev [HEAD] The revision to describe

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.
Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.describe /path/to/repo
salt myminion git.describe /path/to/repo develop
```

salt.modules.git.diff(cwd, item1=None, item2=None, opts="", git_opts="", user=None, password=None, no_index=False, cached=False, paths=None, output_encoding=None)

New in version 2015.8.12, 2016.3.3, 2016.11.0.

Interface to `git-diff(1)`

**cwd** The path to the git checkout

**item1 and item2** Revision(s) to pass to the `git diff` command. One or both of these arguments may be ignored if some of the options below are set to `True`. When `cached` is `False`, and no revisions are passed to this function, then the current working tree will be compared against the index (i.e. unstaged changes). When two revisions are passed, they will be compared to each other.

**opts** Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=´ (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

**git_opts** Any additional options to add to git command itself (not the `diff` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**no_index** [False] When it is necessary to diff two files in the same repo against each other, and not diff two different revisions, set this option to `True`. If this is left `False` in these instances, then a normal `git diff` will be performed against the index (i.e. unstaged changes), and files in the `paths` option will be used to narrow down the diff output.

Note: Requires Git 1.5.1 or newer. Additionally, when set to `True`, `item1` and `item2` will be ignored.

**cached** [False] If `True`, compare staged changes to `item1` (if specified), otherwise compare them to the most recent commit.
paths  File paths to pass to the git diff command. Can be passed as a comma-separated list or a Python list.

output_encoding  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```bash
# Perform diff against the index (staging area for next commit)
salt myminion git.diff /path/to/repo

# Compare staged changes to the most recent commit
salt myminion git.diff /path/to/repo cached=True

# Compare staged changes to a specific revision
salt myminion git.diff /path/to/repo mybranch cached=True

# Perform diff against the most recent commit (includes staged changes)
salt myminion git.diff /path/to/repo HEAD

# Diff two commits
salt myminion git.diff /path/to/repo abcdef1 aabbccd

# Diff two commits, only showing differences in the specified paths
salt myminion git.diff /path/to/repo abcdef1 aabbccd paths=path/to/file1,path/to/file2

# Diff two files with one being outside the working tree
salt myminion git.diff /path/to/repo no_index=True paths=path/to/file1,/absolute/path/to/file2
```

salt.modules.git.discard_local_changes(cwd, path='.', user=None, password=None, ignore_retcode=False, output_encoding=None)

New in version 2019.2.0.

Runs a git checkout -- <path> from the directory specified by cwd.

cwd  The path to the git checkout

path  path relative to cwd (defaults to .)

user  User under which to run the git command. By default, the command is run by the user under which the minion is running.

password  Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

ignore_retcode  [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

output_encoding  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.
CLI Example:

```shell
salt myminion git.discard_local_changes /path/to/repo
salt myminion git.discard_local_changes /path/to/repo path=foo
```

```python
salt.modules.git.fetch(cwd, remote=None, force=False, refspecs=None, opts='', user=None, password=None, identity=None, ignore_retcode=False, saltenv='base', output_encoding=None)
```

Changed in version 2015.8.2: Return data is now a dictionary containing information on branches and tags that were added/updated

Interface to `git-fetch(1)`

cwd  The path to the git checkout

remote  Optional remote name to fetch. If not passed, then git will use its default behavior (as detailed in `git-fetch(1)`).  
    New in version 2015.8.0.

force  Force the fetch even when it is not a fast-forward.  
    New in version 2015.8.0.

refspecs  Override the refspec(s) configured for the remote with this argument. Multiple refspecs can be passed, comma-separated.  
    New in version 2015.8.0.

opts  Any additional options to add to the command line, in a single string

```python
Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.
```  

git_opts  Any additional options to add to git command itself (not the `fetch` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.  
    New in version 2017.7.0.

```python
Note: This is only supported in git 1.7.2 and newer.
```

user  User under which to run the git command. By default, the command is run by the user under which the minion is running.

password  
    Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.  
    New in version 2016.3.4.

identity  Path to a private key to use for ssh URLs

```python
Warning: Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphrase-less. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.
```
Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

**ignore_recode** [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**saltenv** The default salt environment to pull sls files from

New in version 2016.3.1.

**output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.fetch /path/to/repo upstream
salt myminion git.fetch /path/to/repo identity=/root/.ssh/id_rsa
```

salt.modules.git.init(`cwd`, `bare=False`, `template=None`, `separate_git_dir=None`, `shared=None`, `opts=''; git_opts=''; user=None`, `password=None`, `ignore_recode=False`, `output_encoding=None`)

Interface to `git-init(1)`

**cwd** The path to the directory to be initialized

**bare** [False] If `True`, init a bare repository

New in version 2015.8.0.

**template** Set this argument to specify an alternate template directory

New in version 2015.8.0.

**separate_git_dir** Set this argument to specify an alternate `$GIT_DIR`

New in version 2015.8.0.

**shared** Set sharing permissions on git repo. See `git-init(1)` for more details.

New in version 2015.8.0.

**opts** Any additional options to add to the command line, in a single string

**Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

**git_opts** Any additional options to add to git command itself (not the `init` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.
user  User under which to run the git command. By default, the command is run by the user under which the
minion is running.

password

Windows only. Required when specifying user. This parameter will be ignored on non-
Windows platforms.

New in version 2016.3.4.

ignore_retcode  [False] If True, do not log an error to the minion log if the git command returns a nonzero
exit status.

New in version 2015.8.0.

output_encoding  Use this option to specify which encoding to use to decode the output from any git com-
mands which are run. This should not be needed in most cases.

Note:  This should only be needed if the files in the repository were created with filenames using an
encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.init /path/to/repo
# Init a bare repo (before 2015.8.0)
salt myminion git.init /path/to/bare/repo.git opts='--bare'
# Init a bare repo (2015.8.0 and later)
salt myminion git.init /path/to/bare/repo.git bare=True
```

salt.modules.git.is_worktree(cwd, user=None, password=None, output_encoding=None)

New in version 2015.8.0.

This function will attempt to determine if cwd is part of a worktree by checking its .git to see if it is a file
containing a reference to another gitdir.

cwd  path to the worktree to be removed

user  User under which to run the git command. By default, the command is run by the user under which the
minion is running.

password

Windows only. Required when specifying user. This parameter will be ignored on non-
Windows platforms.

New in version 2016.3.4.

output_encoding  Use this option to specify which encoding to use to decode the output from any git com-
mands which are run. This should not be needed in most cases.

Note:  This should only be needed if the files in the repository were created with filenames using an
encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.
CLI Example:

```
salt myminion git.is_worktree /path/to/repo
```

```
salt.modules.git.list_branches(cwd, remote=False, user=None, password=None, ignore_retcode=False, output_encoding=None)
```

New in version 2015.8.0.

Return a list of branches

`cwd` The path to the git checkout

`remote` [False] If `True`, list remote branches. Otherwise, local branches will be listed.

**Warning:** This option will only return remote branches of which the local checkout is aware, use `git.fetch` to update remotes.

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode** [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.list_branches /path/to/repo
salt myminion git.list_branches /path/to/repo remote=True
```

```
salt.modules.git.list_tags(cwd, user=None, password=None, ignore_retcode=False, output_encoding=None)
```

New in version 2015.8.0.

Return a list of tags

`cwd` The path to the git checkout

`user` User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.
New in version 2016.3.4.

**ignore_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.list_tags /path/to/repo
```

salt.modules.git.list_worktrees(cwd=None, stale=False, user=None, password=None, output_encoding=None, **kwargs)

New in version 2015.8.0.

Returns information on worktrees

Changed in version 2015.8.4: Version 2.7.0 added the list subcommand to `git-worktree(1)` which provides a lot of additional information. The return data has been changed to include this information, even for pre-2.7.0 versions of git. In addition, if a worktree has a detached head, then any tags which point to the worktree's HEAD will be included in the return data.

**Note:** By default, only worktrees for which the worktree directory is still present are returned, but this can be changed using the all and stale arguments (described below).

cwd The path to the git checkout

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

    Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

all [False] If True, then return all worktrees tracked under $GIT_DIR/worktrees, including ones for which the gitdir is no longer present.

stale [False] If True, return only worktrees whose gitdir is no longer present.

**Note:** Only one of all and stale can be set to True.

**output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.
Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```shell
salt myminion git.list_worktrees /path/to/repo
salt myminion git.list_worktrees /path/to/repo all=True
salt myminion git.list_worktrees /path/to/repo stale=True
```

```python
salt.modules.git.ls_remote(cwd=None, remote='origin', ref=None, opts='', git_opts='', user=None, password=None, identity=None, https_user=None, https_pass=None, ignore_retcode=False, output_encoding=None, saltenv='base')
```

Interface to `git-ls-remote(1)`.

- **cwd** The path to the git checkout. Optional (and ignored if present) when `remote` is set to a URL instead of a remote name.
- **remote** [origin] The name of the remote to query. Can be the name of a git remote (which exists in the git checkout defined by the `cwd` parameter), or the URL of a remote repository.
  
  Changed in version 2015.8.0: Argument renamed from `repository` to `remote`

- **ref** The name of the ref to query. Optional, if not specified, all refs are returned. Can be a branch or tag name, or the full name of the reference (for example, to get the hash for a Github pull request number 1234, `ref` can be set to `refs/pull/1234/head`)

  Changed in version 2015.8.0: Argument renamed from `branch` to `ref`

  Changed in version 2015.8.4: Defaults to returning all refs instead of master.

- **opts** Any additional options to add to the command line, in a single string

  New in version 2015.8.0.

- **git_opts** Any additional options to add to `git` command itself (not the `ls_remote` subcommand), in a single string. This is useful for passing `-c` to run `git` with temporary changes to the `git` configuration.

  New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

- **user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

- **password**

  Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.4.

- **identity** Path to a private key to use for ssh URLs

Warning: Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphrase-less. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.
Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

**https_user** Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

New in version 2015.5.0.

**https_pass** Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

New in version 2015.5.0.

**ignore_retcode** [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**saltenv** The default salt environment to pull sls files from

New in version 2016.3.1.

**output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.ls_remote /path/to/repo origin master
salt myminion git.ls_remote remote=https://mydomain.tld/repo.git ref=mytag opts='--tags'
```

salt.modules.git.merge (cwd, rev=None, opts='', user=None, password=None, identity=None, ignore_retcode=False, output_encoding=None, **kwargs)

Interface to `git-merge(1)`

**cwd** The path to the git checkout

**rev** Revision to merge into the current branch. If not specified, the remote tracking branch will be merged.

New in version 2015.8.0.

**opts** Any additional options to add to the command line, in a single string

**Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

**git_opts** Any additional options to add to git command itself (not the `merge` subcommand), in a single string.

This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.
user  User under which to run the git command. By default, the command is run by the user under which the
minion is running.

password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity  Path to a private key to use for ssh URLs. Salt will not attempt to use passphrase-protected keys
unless invoked from the minion using salt-call, to prevent blocking waiting for user input. Key can
also be specified as a SaltStack file server URL, eg. salt://location/identity_file.

Note: For greater security with passphraseless private keys, see the sshd(8) manpage for information
on securing the keypair from the remote side in the authorized_keys file.

New in version 2018.3.5,2019.2.1,3000.

ignore_retcode  [False] If True, do not log an error to the minion log if the git command returns a nonzero
exit status.

New in version 2015.8.0.

output_encoding  Use this option to specify which encoding to use to decode the output from any git com-
mands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an
encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
# Fetch first...
salt myminion git.fetch /path/to/repo
# ... then merge the remote tracking branch
salt myminion git.merge /path/to/repo
# ... or merge another rev
salt myminion git.merge /path/to/repo rev=upstream/foo
```

salt.modules.git.merge_base(cwd, refs=None, octopus=False, is_ancestor=False, independent=False,
    fork_point=None, opts='', git_opts='', user=None, password=None, ignore_retcode=False,
    output_encoding=None, **kwargs)

New in version 2015.8.0.

Interface to git-merge-base(1).

cwd  The path to the git checkout

refs  Any refs/commits to check for a merge base. Can be passed as a comma-separated list or a Python list.

all  [False] Return a list of all matching merge bases. Not compatible with any of the below options except for
octopus.

octopus  [False] If True, then this function will determine the best common ancestors of all specified commits,
in preparation for an n-way merge. See here for a description of how these bases are determined.

Set all to True with this option to return all computed merge bases, otherwise only the "best" will be returned.
**is_ancestor** [False] If True, then instead of returning the merge base, return a boolean telling whether or not the first commit is an ancestor of the second commit.

**Note:** This option requires two commits to be passed.

Changed in version 2015.8.2: Works properly in git versions older than 1.8.0, where the **--is-ancestor** CLI option is not present.

**independent** [False] If True, this function will return the IDs of the refs/commits passed which cannot be reached by another commit.

**fork_point** If passed, then this function will return the commit where the commit diverged from the ref specified by **fork_point**. If no fork point is found, None is returned.

**Note:** At most one commit is permitted to be passed if a **fork_point** is specified. If no commits are passed, then HEAD is assumed.

**opts** Any additional options to add to the command line, in a single string

**Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with **opts=** (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

This option should not be necessary unless new CLI arguments are added to *git-merge-base*(1) and are not yet supported in Salt.

**git_opts** Any additional options to add to git command itself (not the **merge-base** subcommand), in a single string. This is useful for passing **-c** to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying **user**. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

**output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:
salt modules.git.merge_tree(cwd, ref1, ref2, base=None, user=None, password=None, ignore_retcode=False, output_encoding=None)

New in version 2015.8.0.

Interface to git-merge-tree(1), shows the merge results and conflicts from a 3-way merge without touching the index.

cwd The path to the git checkout
ref1 First ref/commit to compare
ref2 Second ref/commit to compare
base The base tree to use for the 3-way-merge. If not provided, then git.merge_base will be invoked on ref1 and ref2 to determine the merge base to use.
user User under which to run the git command. By default, the command is run by the user under which the minion is running.
password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.
ignore_retcode [False] if True, do not log an error to the minion log if the git command returns a nonzero exit status.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:
salt myminion git.merge_tree /path/to/repo HEAD upstream/mybranch
salt myminion git.merge_tree /path/to/repo HEAD upstream/mybranch base=aaf3c3d

salt modules.git.pull(cwd, opts='', git_opts='', user=None, password=None, identity=None, ignore_retcode=False, saltenv='base', output_encoding=None)

Interface to git-pull(1)

cwd The path to the git checkout
opts Any additional options to add to the command line, in a single string
**Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

**git_opts** Any additional options to add to the git command itself (not the `pull` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**identity** Path to a private key to use for ssh URLs

**Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphrase-less. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

**ignore_retcode** [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**saltenv** The default salt environment to pull sls files from

New in version 2016.3.1.

**output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.pull /path/to/repo opts='--rebase origin master'
```
salt.modules.git.push(cwd, remote=None, ref=None, opts='', git_opts='', user=None, password=None, identity=None, ignore_retcode=False, saltenv='base', output_encoding=None, **kwargs)

Interface to `git-push(1)`

cwd  The path to the git checkout

remote  Name of the remote to which the ref should be pushed

New in version 2015.8.0.

ref  [master] Name of the ref to push

**Note:** Being a refspec, this argument can include a colon to define local and remote ref names.

opts  Any additional options to add to the command line, in a single string

**Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

git_opts  Any additional options to add to the git command itself (not the `push` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

user  User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity  Path to a private key to use for ssh URLs

**Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphrase-less. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

ignore_retcode  [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.
saltenv  The default salt environment to pull sls files from

New in version 2016.3.1.

output_encoding  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note:  This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```bash
# Push master as origin/master
salt myminion git.push /path/to/repo origin master
# Push issue21 as upstream/develop
salt myminion git.push /path/to/repo upstream issue21:develop
# Delete remote branch 'upstream/temp'
salt myminion git.push /path/to/repo upstream :temp
```

```python
salt.modules.git.rebase(cwd, rev='master', opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None)
```

Interface to `git-rebase(1)`

- **cwd**  The path to the git checkout
- **rev**  [master] The revision to rebase onto the current branch
- **opts**  Any additional options to add to the command line, in a single string

Note:  On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

- **git_opts**  Any additional options to add to git command itself (not the `rebase` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note:  This is only supported in git 1.7.2 and newer.

- **user**  User under which to run the git command. By default, the command is run by the user under which the minion is running.
- **password**  Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

- **ignore_retcode**  [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

- **output_encoding**  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.
Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.rebase /path/to/repo master
salt myminion git.rebase /path/to/repo 'origin master'
salt myminion git.rebase /path/to/repo origin/master opts='--onto newbranch'
```

```
salt.modules.git.remote_get(cwd, remote='origin', user=None, password=None, redact_auth=True, ignore_retcode=False, output_encoding=None)
```

Get the fetch and push URL for a specific remote

cwd The path to the git checkout

remote [origin] Name of the remote to query

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

redact_auth [True] Set to False to include the username/password if the remote uses HTTPS Basic Auth. Otherwise, this information will be redacted.

**Warning:** Setting this to False will not only reveal any HTTPS Basic Auth that is configured, but the return data will also be written to the job cache. When possible, it is recommended to use SSH for authentication.

New in version 2015.5.6.

ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.remote_get /path/to/repo
salt myminion git.remote_get /path/to/repo upstream
```
salt.modules.git.remote_refs(url, heads=False, tags=False, user=None, password=None, identity=None, https_user=None, https_pass=None, ignore_retcode=False, output_encoding=None, saltenv='base', **kwargs)

New in version 2015.8.0.

Return the remote refs for the specified URL by running git ls-remote.

url URL of the remote repository

filter Optionally provide a ref name to git ls-remote. This can be useful to make this function run faster on repositories with many branches/tags.

New in version 2019.2.0.

heads [False] Restrict output to heads. Can be combined with tags.

tags [False] Restrict output to tags. Can be combined with heads.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity Path to a private key to use for ssh URLs

Warning: Unless Salt is invoked from the minion using salt-call, the key(s) must be passphrase-less. For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the authorized_keys file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using salt-call, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file

Changed in version 2016.3.0.

https_user Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

https_pass Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

saltenv The default salt environment to pull sls files from

New in version 2016.3.1.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:
salt.modules.git.remote_set(cwd, url, remote='origin', user=None, password=None, https_user=None, https_pass=None, push_url=None, push_https_user=None, push_https_pass=None, ignore_retcode=False, output_encoding=None)

cwd  The path to the git checkout

url  Remote URL to set

remote  [origin] Name of the remote to set

push_url  If unset, the push URL will be identical to the fetch URL.

    New in version 2015.8.0.

user  User under which to run the git command. By default, the command is run by the user under which the
    minion is running.

password

    Windows only. Required when specifying user. This parameter will be ignored on non-
    Windows platforms.

    New in version 2016.3.4.

https_user  Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

    New in version 2015.5.0.

https_pass  Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

    New in version 2015.5.0.

push_https_user  Set HTTP Basic Auth user for push_url. Ignored if push_url is unset. Only accepted
    for HTTPS URLs.

    New in version 2015.8.0.

push_https_pass  Set HTTP Basic Auth password for push_url. Ignored if push_url is unset. Only ac-
    cepted for HTTPS URLs.

    New in version 2015.8.0.

ignore_retcode  [False] If True, do not log an error to the minion log if the git command returns a nonzero
    exit status.

    New in version 2015.8.0.

output_encoding  Use this option to specify which encoding to use to decode the output from any git com-
    mands which are run. This should not be needed in most cases.

    Note:  This should only be needed if the files in the repository were created with filenames using an
    encoding other than UTF-8 to handle Unicode characters.

    New in version 2018.3.1.

CLI Examples:
salt.modules.git.remotes(cwd, user=None, password=None, redact_auth=True, ignore_retcode=False, output_encoding=None)

Get fetch and push URLs for each remote in a git checkout

- **cwd**  The path to the git checkout
- **user**  User under which to run the git command. By default, the command is run by the user under which the minion is running.
- **password**  Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

Warning: Setting this to `False` will not only reveal any HTTPS Basic Auth that is configured, but the return data will also be written to the job cache. When possible, it is recommended to use SSH for authentication.

- **ignore_retcode**  `[False]` If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

output_encoding  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

- **output_encoding**  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Warning: Setting this to `False` will not only reveal any HTTPS Basic Auth that is configured, but the return data will also be written to the job cache. When possible, it is recommended to use SSH for authentication.

- **ignore_retcode**  `[False]` If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

- **output_encoding**  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

CLI Example:

```
salt myminion git.remotes /path/to/repo
```

salt.modules.git.reset(cwd, opts='', git_opts='', user=None, password=None, identity=None, ignore_retcode=False, output_encoding=None)

Interface to `git-reset(1)`, returns the stdout from the git command

- **cwd**  The path to the git checkout
- **opts**  Any additional options to add to the command line, in a single string
Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with opts= (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

**git_opts** Any additional options to add to git command itself (not the reset subcommand), in a single string. This is useful for passing -c to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**identity** Path to a private key to use for ssh URLs. Salt will not attempt to use passphrase-protected keys unless invoked from the minion using salt-call, to prevent blocking waiting for user input. Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file.

Note: For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the authorized_keys file.

New in version 2018.3.5, 2019.2.1, 3000.

**ignore_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```bash
salt myminion git.reset /path/to/repo ac3ee5c
salt myminion git.reset /path/to/repo opts='--hard origin/master'
```

salt.modules.git.rev_parse(cwd, rev=None, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None)

New in version 2015.8.0.

Interface to git-rev-parse(1)

**cwd** The path to the git checkout
**rev** Revision to parse. See the SPECIFYING REVISIONS section of the git-rev-parse(1) manpage for details on how to format this argument.

This argument is optional when using the options in the Options for Files section of the git-rev-parse(1) manpage.

**opts** Any additional options to add to the command line, in a single string

**git_opts** Any additional options to add to git command itself (not the rev-parse subcommand), in a single string. This is useful for passing -c to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

**output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
# Get the full SHA1 for HEAD
salt myminion git.rev_parse /path/to/repo HEAD
# Get the short SHA1 for HEAD
salt myminion git.rev_parse /path/to/repo HEAD opts='--short'
# Get the develop branch's upstream tracking branch
salt myminion git.rev_parse /path/to/repo 'develop@{upstream}' opts='--abbrev-ref'
# Get the SHA1 for the commit corresponding to tag v1.2.3
salt myminion git.rev_parse /path/to/repo 'v1.2.3^[commit]'
# Find out whether or not the repo at /path/to/repo is a bare repository
salt myminion git.rev_parse /path/to/repo opts='--is-bare-repository'
```

**salt.modules.git.revision** (cwd, rev='HEAD', short=False, user=None, password=None, ignore_retcode=False, output_encoding=None)

Returns the SHA1 hash of a given identifier (hash, branch, tag, HEAD, etc.)

**cwd** The path to the git checkout

**rev** [HEAD] The revision

**short** [False] If True, return an abbreviated SHA1 git hash
**user**  User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode**  [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output_encoding**  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.revision /path/to/repo mybranch
```

```
salt.modules.git.rm_(cwd, filename, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None)
```

Interface to `git-rm(1)`

**cwd**  The path to the git checkout

**filename**  The location of the file/directory to remove, relative to `cwd`

Note: To remove a directory, `-r` must be part of the `opts` parameter.

**opts**  Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

**git_opts**  Any additional options to add to `git` command itself (not the `rm` subcommand), in a single string. This is useful for passing `-c` to run `git` with temporary changes to the `git` configuration.

New in version 2017.7.0.

Note: This is only supported in `git 1.7.2` and newer.

**user**  User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.
New in version 2016.3.4.

**ignore_retcode**  [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Examples:

```bash
salt myminion git.rm /path/to/repo foo/bar.py
salt myminion git.rm /path/to/repo foo/bar.py opts='--dry-run'
salt myminion git.rm /path/to/repo foo/baz opts='--'
```

salt.modules.git.stash(cwd, action='save', opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None)

Interface to git-stash(1), returns the stdout from the git command

**cwd** The path to the git checkout

**opts** Any additional options to add to the command line, in a single string. Use this to complete the git stash command by adding the remaining arguments (i.e. 'save <stash comment>', 'apply stash@{2}', 'show', etc.). Omitting this argument will simply run git stash.

**git_opts** Any additional options to add to git command itself (not the stash subcommand), in a single string. This is useful for passing -c to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying **user**. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode**  [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.
New in version 2018.3.1.

CLI Examples:

```bash
salt myminion git.stash /path/to/repo save opts='work in progress'
salt myminion git.stash /path/to/repo apply opts='stash@{1} '
salt myminion git.stash /path/to/repo drop opts='stash@{1} '
salt myminion git.stash /path/to/repo list
```

```
salt.modules.git.status(cwd, user=None, password=None, ignore_retcode=False, output_encoding=None)
```

Changed in version 2015.8.0: Return data has changed from a list of lists to a dictionary

Returns the changes to the repository

**cwd** The path to the git checkout

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password** Windows only. Required when specifying **user**. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```bash
salt myminion git.status /path/to/repo
```

```
salt.modules.git.submodule(cwd, command, opts='', git_opts='', user=None, password=None, identity=None, ignore_retcode=False, saltenv='base', output_encoding=None, **kwargs)
```

Changed in version 2015.8.0: Added the **command** argument to allow for operations other than update to be run on submodules, and deprecated the **init** argument. To do a submodule update with init=True moving forward, use command=update opts='--init'

Interface to `git-submodule(1)`

**cwd** The path to the submodule

**command** Submodule command to run, see `git-submodule(1) <git submodule>` for more information. Any additional arguments after the command (such as the URL when adding a submodule) must be passed in the **opts** parameter.

New in version 2015.8.0.

**kwargs**
opts  Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with opts=
(as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts  Any additional options to add to git command itself (not the submodule subcommand), in a single string. This is useful for passing -c to run git with temporary changes to the git configuration.
New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

init  [False] If True, ensures that new submodules are initialized

Deprecated since version 2015.8.0: Pass init as the command parameter, or include --init in the opts param with command set to update.

user  User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.
New in version 2016.3.4.

identity  Path to a private key to use for ssh URLs

Warning: Unless Salt is invoked from the minion using salt-call, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the authorized_keys file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using salt-call, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file

Changed in version 2016.3.0.

ignore_retcode  [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

saltenv  The default salt environment to pull sls files from

New in version 2016.3.1.

output_encoding  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.
CLI Example:

```bash
# Update submodule and ensure it is initialized (before 2015.8.0)
salt myminion git.submodule /path/to/repo/sub/repo init=True
# Update submodule and ensure it is initialized (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo update opts='--init'

# Rebase submodule (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo update opts='--rebase'

# Add submodule (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo add opts='https://mydomain.tld/repo.git'

# Unregister submodule (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo deinit
```

salt.modules.git.symbolic_ref(cwd, ref, value=None, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None)

New in version 2015.8.0.

Interface to git-symbolic-ref

- **cwd** The path to the git checkout
- **ref** Symbolic ref to read/modify
- **value** If passed, then the symbolic ref will be set to this value and an empty string will be returned.
  - If not passed, then the ref to which ref points will be returned, unless --delete is included in opts (in which case the symbolic ref will be deleted).
- **opts** Any additional options to add to the command line, in a single string
- **git_opts** Any additional options to add to git command itself (not the symbolic-refs subcommand), in a single string. This is useful for passing -c to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

- **user** User under which to run the git command. By default, the command is run by the user under which the minion is running.
- **password**
  - Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.
- **ignore_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.
- **output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.
Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```bash
# Get ref to which HEAD is pointing
salt myminion git.symbolic_ref /path/to/repo HEAD
# Set/overwrite symbolic ref 'FOO' to local branch 'foo'
salt myminion git.symbolic_ref /path/to/repo FOO refs/heads/foo
# Delete symbolic ref 'FOO'
salt myminion git.symbolic_ref /path/to/repo FOO opts='--delete'
```

New in version 2018.3.4.

```python
salt.modules.git.tag(cwd, name, ref='HEAD', message=None, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None)
```

Interface to `git-tag(1)`, adds and removes tags.

cwd The path to the main git checkout or a linked worktree

name Name of the tag

ref [HEAD] Which ref to tag (defaults to local clone's HEAD)

Note: This argument is ignored when either -d or --delete is present in the opts passed to this function.

message Optional message to include with the tag. If provided, an annotated tag will be created.

opts Any additional options to add to the command line, in a single string

Note: Additionally, on the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with opts= (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts Any additional options to add to git command itself (not the worktree subcommand), in a single string. This is useful for passing -c to run git with temporary changes to the git configuration.

Note: This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.
Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

CLI Example:

```bash
# Create an non-annotated tag
salt myminion git.tag /path/to/repo v1.2
# Create an annotated tag
salt myminion git.tag /path/to/repo v1.2 message='Version 1.2'
# Delete the tag
salt myminion git.tag /path/to/repo v1.2 opts='--delete'
```

**salt.modules.git.version** *(versioninfo=False)*

New in version 2015.8.0.

Returns the version of Git installed on the minion

versioninfo [False] If True, return the version in a versioninfo list (e.g. [2, 5, 0])

CLI Example:

```bash
salt myminion git.version
```

**salt.modules.git.worktree_add** *(cwd, worktree_path, ref=None, reset_branch=None, force=None, detach=False, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None, **kwargs)*

New in version 2015.8.0.

Interface to `git-worktree(1)`, adds a worktree

**cwd** The path to the git checkout

**worktree_path** Path to the new worktree. Can be either absolute, or relative to cwd.

**branch** Name of new branch to create. If omitted, will be set to the basename of the worktree_path. For example, if the worktree_path is `/foo/bar/baz`, then branch will be `baz`.

**ref** Name of the ref on which to base the new worktree. If omitted, then HEAD is used, and a new branch will be created, named for the basename of the worktree_path. For example, if the worktree_path is `/foo/bar/baz` then a new branch `baz` will be created, and pointed at HEAD.

**reset_branch** [False] If False, then `git-worktree(1)` will fail to create the worktree if the targeted branch already exists. Set this argument to True to reset the targeted branch to point at ref, and checkout the newly-reset branch into the new worktree.

**force** [False] By default, `git-worktree(1)` will not permit the same branch to be checked out in more than one worktree. Set this argument to True to override this.

**opts** Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` to avoid causing errors with Salt's own argument parsing.

All CLI options for adding worktrees as of Git 2.5.0 are already supported by this function as of Salt 2015.8.0, so using this argument is unnecessary unless new CLI arguments are added to `git-worktree(1)` and are not yet supported in Salt.

**git_opts** Any additional options to add to git command itself (not the worktree subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.
New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

**user**  User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**  
Windows only. Required when specifying **user**. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode**  [False] If **True**, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output_encoding**  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.worktree_add /path/to/repo/main ../hotfix ref=origin/master
salt myminion git.worktree_add /path/to/repo/main ../hotfix branch=hotfix21\n  → ref=v2.1.9.3
```

salt.modules.git.worktree_prune( **cwd**, **dry_run**=False, **verbose**=True, **expire**=None, **opts**=”,
  **git_opts**=”; **user**=None, **password**=None, **ignore_retcode**=False,
  **output_encoding**=None)

New in version 2015.8.0.

Interface to **git-worktree(1)**, prunes stale worktree administrative data from the gitdir

cwd  The path to the main git checkout or a linked worktree

dry_run  [False] If **True**, then this function will report what would have been pruned, but no changes will be made.

verbose  [True] Report all changes made. Set to **False** to suppress this output.

expire  Only prune unused worktree data older than a specific period of time. The date format for this parameter is described in the documentation for the **gc.pruneWorktreesExpire** config param in the **git-config(1)** manpage.

opts  Any additional options to add to the command line, in a single string

**Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with **opts=** to avoid causing errors with Salt’s own argument parsing.

All CLI options for pruning worktrees as of Git 2.5.0 are already supported by this function as of Salt 2015.8.0, so using this argument is unnecessary unless new CLI arguments are added to **git-worktree(1)**
and are not yet supported in Salt.

**git_opts**  Any additional options to add to git command itself (not the `worktree` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

**user**  User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode**  [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output_encoding**  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.worktree_prune /path/to/repo
dry_run=True
salt myminion git.worktree_prune /path/to/repo expire=1.day.ago
```

salt.modules.git.worktree_rm(cwd, user=None, output_encoding=None)

New in version 2015.8.0.

Recursively removes the worktree located at `cwd`, returning `True` if successful. This function will attempt to determine if `cwd` is actually a worktree by invoking `git.is_worktree`. If the path does not correspond to a worktree, then an error will be raised and no action will be taken.

**Warning:** There is no undoing this action. Be VERY careful before running this function.

**cwd**  Path to the worktree to be removed

**user**  Used for path expansion when `cwd` is not an absolute path. By default, when `cwd` is not absolute, the path will be assumed to be relative to the home directory of the user under which the minion is running. Setting this option will change the home directory from which path expansion is performed.

**output_encoding**  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.
Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.worktree_rm /path/to/worktree
```

21.9.157 salt.modules.github module

Module for interacting with the GitHub v3 API.

New in version 2016.3.0.

depends PyGithub python module

Configuration

Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'github' key by default, if defined.

For example:

```
github:
    token: abc1234
    org_name: my_organization

    # optional: some functions require a repo_name, which
    # can be set in the config file, or passed in at the CLI.
    repo_name: my_repo

    # optional: it can be dangerous to change the privacy of a repository
    # in an automated way. set this to True to allow privacy modifications
    allow_repo_privacy_changes: False
```

```
salt.modules.github.add_repo(name, description=None, homepage=None, private=None, has_issues=None, has_wiki=None, has_downloads=None, auto_init=None, gitignore_template=None, license_template=None, profile='github')
```

Create a new github repository.

name The name of the team to be created.

description The description of the repository.

homepage The URL with more information about the repository.

private The visibility of the repository. Note that private repositories require a paid GitHub account.

has_issues Whether to enable issues for this repository.

has_wiki Whether to enable the wiki for this repository.

has_downloads Whether to enable downloads for this repository.

auto_init Whether to create an initial commit with an empty README.
**gitignore_template**  The desired language or platform for a .gitignore, e.g "Haskell".

**license_template**  The desired LICENSE template to apply, e.g "mit" or "mozilla".

**profile**  The name of the profile configuration to use. Defaults to github.

CLI Example:

```bash
salt myminion github.add_repo 'repo_name'
```

New in version 2016.11.0.

**salt.modules.github.add_team** *(name, description=None, repo_names=None, privacy=None, permission=None, profile='github')*

Create a new Github team within an organization.

- **name**  The name of the team to be created.
- **description**  The description of the team.
- **repo_names**  The names of repositories to add the team to.
- **privacy**  The level of privacy for the team, can be 'secret' or 'closed'.
- **permission**  The default permission for new repositories added to the team, can be 'pull', 'push' or 'admin'.
- **profile**  The name of the profile configuration to use. Defaults to github.

CLI Example:

```bash
salt myminion github.add_team 'team_name'
```

New in version 2016.11.0.

**salt.modules.github.add_team_member** *(name, team_name, profile='github')*

Adds a team member to a team with team_name.

- **name**  The name of the team member to add.
- **team_name**  The name of the team of which to add the user.
- **profile**  The name of the profile configuration to use. Defaults to github.

CLI Example:

```bash
salt myminion github.add_team_member 'user_name' 'team_name'
```

New in version 2016.11.0.

**salt.modules.github.add_team_repo** *(repo_name, team_name, profile='github', permission=None)*

Adds a repository to a team with team_name.

- **repo_name**  The name of the repository to add.
- **team_name**  The name of the team of which to add the repository.
- **profile**  The name of the profile configuration to use. Defaults to github.
- **permission**  The permission for team members within the repository, can be 'pull', 'push' or 'admin'. If not specified, the default permission specified on the team will be used.

New in version 2017.7.0.

CLI Example:

```bash
salt myminion github.add_team_repo 'my_repo' 'team_name'
```
New in version 2016.11.0.

**salt.modules.github.add_user(name, profile='github')**

Add a GitHub user.

- **name** The user for which to obtain information.
- **profile** The name of the profile configuration to use. Defaults to `github`.

CLI Example:
```
salt myminion github.add_user github-handle
```

**salt.modules.github.edit_repo(name, description=None, homepage=None, private=None, has_issues=None, has_wiki=None, has_downloads=None, profile='github')**

Updates an existing Github repository.

- **name** The name of the team to be created.
- **description** The description of the repository.
- **homepage** The URL with more information about the repository.
- **private** The visibility of the repository. Note that private repositories require a paid GitHub account.
- **has_issues** Whether to enable issues for this repository.
- **has_wiki** Whether to enable the wiki for this repository.
- **has_downloads** Whether to enable downloads for this repository.
- **profile** The name of the profile configuration to use. Defaults to `github`.

CLI Example:
```
salt myminion github.add_repo 'repo_name'
```

New in version 2016.11.0.

**salt.modules.github.edit_team(name, description=None, privacy=None, permission=None, profile='github')**

Updates an existing Github team.

- **name** The name of the team to be edited.
- **description** The description of the team.
- **privacy** The level of privacy for the team, can be `secret` or `closed`.
- **permission** The default permission for new repositories added to the team, can be `pull`, `push` or `admin`.
- **profile** The name of the profile configuration to use. Defaults to `github`.

CLI Example:
```
salt myminion github.edit_team 'team_name' description='Team description'
```

New in version 2016.11.0.

**salt.modules.github.get_issue(issue_number, repo_name=None, profile='github', output='min')**

Return information about a single issue in a named repository.

- **issue_number** The number of the issue to retrieve.
repo_name  The name of the repository from which to get the issue. This argument is required, either passed via the CLI, or defined in the configured profile. A repo_name passed as a CLI argument will override the repo_name defined in the configured profile, if provided.

profile  The name of the profile configuration to use. Defaults to github.

output  The amount of data returned by each issue. Defaults to min. Change to full to see all issue output.

CLI Example:

```bash
salt myminion github.get_issue 514
salt myminion github.get_issue 514 repo_name=salt
```

salt.modules.github.get_issue_comments(issue_number, repo_name=None, profile='github', since=None, output='min')

Return information about the comments for a given issue in a named repository.

New in version 2016.11.0.

issue_number  The number of the issue for which to retrieve comments.

repo_name  The name of the repository to which the issue belongs. This argument is required, either passed via the CLI, or defined in the configured profile. A repo_name passed as a CLI argument will override the repo_name defined in the configured profile, if provided.

profile  The name of the profile configuration to use. Defaults to github.

since  Only comments updated at or after this time are returned. This is a timestamp in ISO 8601 format: YYYY-MM-DDTHH:MM:SSZ.

output  The amount of data returned by each issue. Defaults to min. Change to full to see all issue output.

CLI Example:

```bash
salt myminion github.get_issue_comments 514
salt myminion github.get_issue 514 repo_name=salt
```

salt.modules.github.get_issues(repo_name=None, profile='github', milestone=None, state='open', assignee=None, creator=None, mentioned=None, labels=None, sort='created', direction='desc', since=None, output='min', per_page=None)

Returns information for all issues in a given repository, based on the search options.

New in version 2016.11.0.

repo_name  The name of the repository for which to list issues. This argument is required, either passed via the CLI, or defined in the configured profile. A repo_name passed as a CLI argument will override the repo_name defined in the configured profile, if provided.

profile  The name of the profile configuration to use. Defaults to github.

milestone  The number of a GitHub milestone, or a string of either * or none.

    If a number is passed, it should refer to a milestone by its number field. Use the github.get_milestone function to obtain a milestone's number.

    If the string * is passed, issues with any milestone are accepted. If the string none is passed, issues without milestones are returned.

state  Indicates the state of the issues to return. Can be either open, closed, or all. Default is open.

assignee  Can be the name of a user. Pass in none (as a string) for issues with no assigned user or * for issues assigned to any user.
creator The user that created the issue.

mentioned A user that’s mentioned in the issue.

labels A string of comma separated label names. For example, bug, ui, @high.

sort What to sort results by. Can be either created, updated, or comments. Default is created.

direction The direction of the sort. Can be either asc or desc. Default is desc.

since Only issues updated at or after this time are returned. This is a timestamp in ISO 8601 format: YYYY-MM-DDTHH:MM:SSZ.

output The amount of data returned by each issue. Defaults to min. Change to full to see all issue output.

per_page GitHub paginates data in their API calls. Use this value to increase or decrease the number of issues gathered from GitHub, per page. If not set, GitHub defaults are used. Maximum is 100.

CLI Example:

```
salt myminion github.get_issues my-github-repo
```

```
salt.modules.github.get_milestone(number=None, name=None, repo_name=None, profile='github', output='min')
```

Return information about a single milestone in a named repository.

New in version 2016.11.0.

number The number of the milestone to retrieve. If provided, this option will be favored over name.

name The name of the milestone to retrieve.

repo_name The name of the repository for which to list issues. This argument is required, either passed via the CLI, or defined in the configured profile. A repo_name passed as a CLI argument will override the repo_name defined in the configured profile, if provided.

profile The name of the profile configuration to use. Defaults to github.

output The amount of data returned by each issue. Defaults to min. Change to full to see all issue output.

CLI Example:

```
salt myminion github.get_milestone 72
salt myminion github.get_milestone name=my_milestone
```

```
salt.modules.github.get_milestones(repo_name=None, profile='github', state='open', sort='due_on', direction='asc', output='min', per_page=None)
```

Return information about milestones for a given repository.

New in version 2016.11.0.

repo_name The name of the repository for which to list issues. This argument is required, either passed via the CLI, or defined in the configured profile. A repo_name passed as a CLI argument will override the repo_name defined in the configured profile, if provided.

profile The name of the profile configuration to use. Defaults to github.

state The state of the milestone. Either open, closed, or all. Default is open.

sort What to sort results by. Either due_on or completeness. Default is due_on.

direction The direction of the sort. Either asc or desc. Default is asc.

output The amount of data returned by each issue. Defaults to min. Change to full to see all issue output.
**per_page** GitHub paginates data in their API calls. Use this value to increase or decrease the number of issues gathered from GitHub, per page. If not set, GitHub defaults are used.

CLI Example:

```
salt myminion github.get_milestones
```

```
salt.modules.github.get_prs(repo_name=None, profile='github', state='open', head=None, base=None, sort='created', direction='desc', output='min', per_page=None)
```

Returns information for all pull requests in a given repository, based on the search options provided.

New in version 2017.7.0.

- **repo_name** The name of the repository for which to list pull requests. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the `repo_name` defined in the configured profile, if provided.
- **profile** The name of the profile configuration to use. Defaults to `github`.
- **state** Indicates the state of the pull requests to return. Can be either `open`, `closed`, or `all`. Default is `open`.
- **head** Filter pull requests by head user and branch name in the format of `user:ref-name`. Example: `'github:new-script-format'`. Default is `None`.
- **base** Filter pulls by base branch name. Example: `gh-pages`. Default is `None`.
- **sort** What to sort results by. Can be either `created`, `updated`, `popularity` (comment count), or `long-running` (age, filtering by pull requests updated within the last month). Default is `created`.
- **direction** The direction of the sort. Can be either `asc` or `desc`. Default is `desc`.
- **output** The amount of data returned by each pull request. Defaults to `min`. Change to `full` to see all pull request output.
- **per_page** GitHub paginates data in their API calls. Use this value to increase or decrease the number of pull requests gathered from GitHub, per page. If not set, GitHub defaults are used. Maximum is 100.

CLI Example:

```
salt myminion github.get_prs
salt myminion github.get_prs base=2016.11
```

```
salt.modules.github.get_repo_info(repo_name, profile='github', ignore_cache=False)
```

Return information for a given repo.

New in version 2016.11.0.

- **repo_name** The name of the repository.
- **profile** The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.get_repo_info
salt myminion github.get_repo_info salt profile='my-github-profile'
```

```
salt.modules.github.get_repo_teams(repo_name, profile='github')
```

Return teams belonging to a repository.

New in version 2017.7.0.

- **repo_name** The name of the repository from which to retrieve teams.
- **profile** The name of the profile configuration to use. Defaults to `github`.
CLI Example:

```
salt myminion github.get_repo_teams salt
salt myminion github.get_repo_teams salt profile='my-github-profile'
```

**salt.modules.github.get_team**(name, profile='github')

Returns the team details if a team with the given name exists, or None otherwise.

- **name** The team name for which to obtain information.
- **profile** The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.get_team 'team_name'
```

**salt.modules.github.get_user**(name, profile='github', user_details=False)

Get a GitHub user by name.

- **name** The user for which to obtain information.
- **profile** The name of the profile configuration to use. Defaults to `github`.
- **user_details** Prints user information details. Defaults to `False`. If the user is already in the organization and user_details is set to False, the get_user function returns `True`. If the user is not already present in the organization, user details will be printed by default.

CLI Example:

```
salt myminion github.get_user github-handle
salt myminion github.get_user github-handle user_details=true
```

**salt.modules.github.is_team_member**(name, team_name, profile='github')

Returns True if the github user is in the team with team_name, or False otherwise.

- **name** The name of the user whose membership to check.
- **team_name** The name of the team to check membership in.
- **profile** The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.is_team_member 'user_name' 'team_name'
```

New in version 2016.11.0.

**salt.modules.github.list_members_without_mfa**(profile='github', ignore_cache=False)

List all members (in lower case) without MFA turned on.

- **profile** The name of the profile configuration to use. Defaults to `github`.
- **ignore_cache** Bypasses the use of cached team repos.

CLI Example:

```
salt myminion github.list_members_without_mfa
```

New in version 2016.11.0.

**salt.modules.github.list_private_repos**(profile='github')

List private repositories within the organization. Dependent upon the access rights of the profile token.

New in version 2016.11.0.
profile  The name of the profile configuration to use. Defaults to github.

CLI Example:

```
salt myminion github.list_private_repos
salt myminion github.list_private_repos profile='my-github-profile'
```

**salt.modules.github.list_public_repos(profile='github')**

List public repositories within the organization.

New in version 2016.11.0.

profile  The name of the profile configuration to use. Defaults to github.

CLI Example:

```
salt myminion github.list_public_repos
salt myminion github.list_public_repos profile='my-github-profile'
```

**salt.modules.github.list_repos(profile='github')**

List all repositories within the organization. Includes public and private repositories within the organization. Dependent upon the access rights of the profile token.

New in version 2016.11.0.

profile  The name of the profile configuration to use. Defaults to github.

CLI Example:

```
salt myminion github.list_repos
salt myminion github.list_repos profile='my-github-profile'
```

**salt.modules.github.list_team_members(team_name, profile='github', ignore_cache=False)**

Gets the names of team members in lower case.

team_name  The name of the team from which to list members.

profile  The name of the profile configuration to use. Defaults to github.

ignore_cache  Bypasses the use of cached team members.

CLI Example:

```
salt myminion github.list_team_members 'team_name'
```

New in version 2016.11.0.

**salt.modules.github.list_team_repos(team_name, profile='github', ignore_cache=False)**

Gets the repo details for a given team as a dict from repo_name to repo details. Note that repo names are always in lower case.

team_name  The name of the team from which to list repos.

profile  The name of the profile configuration to use. Defaults to github.

ignore_cache  Bypasses the use of cached team repos.

CLI Example:

```
salt myminion github.list_team_repos 'team_name'
```

New in version 2016.11.0.
salt.modules.github.list_teams(profile='github', ignore_cache=False)
Lists all teams with the organization.

profile  The name of the profile configuration to use. Defaults to github.

ignore_cache  Bypasses the use of cached teams.

CLI Example:

```
salt myminion github.list_teams
```

New in version 2016.11.0.

salt.modules.github.list_users(profile='github', ignore_cache=False)
List all users within the organization.

profile  The name of the profile configuration to use. Defaults to github.

ignore_cache  Bypasses the use of cached users.

New in version 2016.11.0.

CLI Example:

```
salt myminion github.list_users
salt myminion github.list_users profile='my-github-profile'
```

salt.modules.github.remove_repo(name, profile='github')
Remove a Github repository.

name  The name of the repository to be removed.

profile  The name of the profile configuration to use. Defaults to github.

CLI Example:

```
salt myminion github.remove_repo 'my-repo'
```

New in version 2016.11.0.

salt.modules.github.remove_team(name, profile='github')
Remove a github team.

name  The name of the team to be removed.

profile  The name of the profile configuration to use. Defaults to github.

CLI Example:

```
salt myminion github.remove_team 'team_name'
```

New in version 2016.11.0.

salt.modules.github.remove_team_member(name, team_name, profile='github')
Removes a team member from a team with team_name.

name  The name of the team member to remove.

team_name  The name of the team from which to remove the user.

profile  The name of the profile configuration to use. Defaults to github.

CLI Example:
salt myminion github.remove_team_member 'user_name' 'team_name'

New in version 2016.11.0.

salt.modules.github.remove_team_repo(\textit{repo_name}, \textit{team_name}, profile='github')
Removes a repository from a team with team_name.

\textit{repo_name}  The name of the repository to remove.
\textit{team_name}  The name of the team of which to remove the repository.
\textit{profile}  The name of the profile configuration to use. Defaults to github.

CLI Example:
salt myminion github.remove_team_repo 'my_repo' 'team_name'

New in version 2016.11.0.

salt.modules.github.remove_user(\textit{name}, profile='github')
Remove a Github user by name.

\textit{name}  The user for which to obtain information.
\textit{profile}  The name of the profile configuration to use. Defaults to github.

CLI Example:
salt myminion github.remove_user github-handle

21.9.158 salt.modules.glance

Module for handling openstack glance calls.

\textbf{optdepends}
- glanceclient Python adapter

\textbf{configuration}  This module is not usable until the following are specified either in a pillar or in the minion's config file:

\begin{verbatim}
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.insecure: False  #(optional)
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
\end{verbatim}

If configuration for multiple openstack accounts is required, they can be set up as different configuration profiles: For example:

\begin{verbatim}
openstack1:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/

openstack2:
  keystone.user: admin
  keystone.password: verybadpass
\end{verbatim}

(continues on next page)
With this configuration in place, any of the glance functions can make use of a configuration profile by declaring it explicitly. For example:

```bash
salt '*' glance.image_list profile=openstack1
```

**salt.modules.glance.image_create**

Create an image (glance image-create)

CLI Example, old format:

```bash
salt '*' glance.image_create name=f16-jeos disk_format=qcow2 container_format=ovf
```

CLI Example, new format resembling Glance API v2:

```bash
salt '*' glance.image_create name=f16-jeos disk_format=qcow2 container_format=ovf visibility=public
```

The parameter 'visibility' defaults to 'public' if not specified.

**salt.modules.glance.image_delete**

Delete an image (glance image-delete)

CLI Examples:

```bash
salt '*' glance.image_delete c2eb2eb0-53e1-4a80-b990-8ec887eae7df
salt '*' glance.image_delete id=c2eb2eb0-53e1-4a80-b990-8ec887eae7df
salt '*' glance.image_delete name=f16-jeos
```

**salt.modules.glance.image_list**

Return a list of available images (glance image-list)

CLI Example:

```bash
salt '*' glance.image_list
```

**salt.modules.glance.image_schema**

Returns names and descriptions of the schema "image"'s properties for this profile's instance of glance

CLI Example:

```bash
sicl '*' glance.image_schema
```

**salt.modules.glance.image_show**

Return details about a specific image (glance image-show)

CLI Example:

```bash
sicl '*' glance.image_show
```

**salt.modules.glance.image_update**

Update properties of given image. Known to work for: - min_ram (in MB) - protected (bool) - visibility ('public' or 'private')

CLI Example:
salt.modules.glance.image_update

```
salt '*' glance.image_update id=c2eb2eb0-53e1-4a80-b990-8ec887eae7df
salt '*' glance.image_update name=f16-jeos
```

`salt.modules.glance.schema_get(name, profile=None)`

Known valid names of schemas are:
- image
- images
- member
- members

CLI Example:

```
salt '*' glance.schema_get name=f16-jeos
```

### 21.9.159 salt.modules.glanceng

Glance module for interacting with OpenStack Glance

New in version 2018.3.0.

:depends: shade

Example configuration

```
```glance:
  cloud: default
```

```
```glance:
  auth:
    username: admin
    password: password123
    user_domain_name: mydomain
    project_name: myproject
    project_domain_name: myproject
    auth_url: https://example.org:5000/v3
    identity_api_version: 3
```

salt.modules.glanceng.compare_changes(obj, **kwargs)

Compare two dicts returning only keys that exist in the first dict and are different in the second one

salt.modules.glanceng.get_openstack_cloud(auth=None)

Return an openstack_cloud

salt.modules.glanceng.get_operator_cloud(auth=None)

Return an operator_cloud

salt.modules.glanceng.image_create(auth=None, **kwargs)

Create an image

CLI Example:

```
salt '*' glanceng.image_create name=cirros file=cirros.raw disk_format=raw
salt '*' glanceng.image_create name=cirros file=cirros.raw disk_format=raw hw_→scsi_model=virtio-scsi hw_disk_bus=scsi
```
salt.modules.glanceng.image_delete(auth=None, **kwargs)
Delete an image

CLI Example:
```
salt '*' glanceng.image_delete name=image1
salt '*' glanceng.image_delete name=0e4febc2a5ab4f2c8f374b054162506d
```

salt.modules.glanceng.image_get(auth=None, **kwargs)
Get a single image

CLI Example:
```
salt '*' glanceng.image_get name=image1
salt '*' glanceng.image_get name=0e4febc2a5ab4f2c8f374b054162506d
```

salt.modules.glanceng.image_list(auth=None, **kwargs)
List images

CLI Example:
```
salt '*' glanceng.image_list
salt '*' glanceng.image_list
```

salt.modules.glanceng.image_search(auth=None, **kwargs)
Search for images

CLI Example:
```
salt '*' glanceng.image_search name=image1
salt '*' glanceng.image_search
```

salt.modules.glanceng.setup_clouds(auth=None)
Call functions to create Shade cloud objects in __context__ to take advantage of Shade's in-memory caching across several states

salt.modules.glanceng.update_image_properties(auth=None, **kwargs)
Update properties for an image

CLI Example:
```
salt '*' glanceng.update_image_properties name=image1 hw_scsi_model=virtio-scsi
  → hw_disk_bus=scsi
salt '*' glanceng.update_image_properties name=0e4febc2a5ab4f2c8f374b054162506d
  → min_ram=1024
```

21.9.160 salt.modules.glassfish module

Module for working with the Glassfish/Payara 4.x management API .. versionadded:: Carbon :depends: requests

salt.modules.glassfish.create_admin_object_resource(name, server=None, **kwargs)
Create a JMS destination

salt.modules.glassfish.create_connector_c_pool(name, server=None, **kwargs)
Create a connection pool

salt.modules.glassfish.create_connector_resource(name, server=None, **kwargs)
Create a connection resource
<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>create_jdbc_connection_pool(name, server=None, **kwargs)</code></td>
<td>Create a connection resource</td>

</tbody>
</table>

21.9. execution modules
```python
salt.modules.glassfish.update_connector_c_pool(name, server=None, **kwargs)
Update a connection pool

salt.modules.glassfish.update_connector_resource(name, server=None, **kwargs)
Update a connection resource

salt.modules.glassfish.update_jdbc_connection_pool(name, server=None, **kwargs)
Update a JDBC pool

salt.modules.glassfish.update_jdbc_resource(name, server=None, **kwargs)
Update a JDBC resource

salt.modules.glassfish.update_system_properties(data, server=None)
Update system properties
```

### 21.9.161 salt.modules.glusterfs

Manage a glusterfs pool

```python
salt.modules.glusterfs.add_volume_bricks(name, bricks)
Add brick(s) to an existing volume

name  Volume name

bricks List of bricks to add to the volume

CLI Example:
```
salt '*' glusterfs.add_volume_bricks <volume> <bricks>
```

```python
salt.modules.glusterfs.create_volume(name, bricks, stripe=False, replica=False, device_vg=False, transport='tcp', start=False, force=False, arbiter=False)
Create a glusterfs volume

name  Name of the gluster volume

bricks Bricks to create volume from, in <peer>:<brick path> format. For multiple bricks use list format: ["<peer1>:<brick1>","<peer2>:<brick2>"]

stripe Stripe count, the number of bricks should be a multiple of the stripe count for a distributed striped volume

replica Replica count, the number of bricks should be a multiple of the replica count for a distributed replicated volume

arbiter If true, specifies volume should use arbiter brick(s). Valid configuration limited to "replica 3 arbiter 1" per Gluster documentation. Every third brick in the brick list is used as an arbiter brick. New in version 2019.2.0.

device_vg If true, specifies volume should use block backend instead of regular posix backend. Block device backend volume does not support multiple bricks

transport Transport protocol to use, can be 'tcp', 'rdma' or 'tcp,rdma'

start Start the volume after creation

force Force volume creation, this works even if creating in root FS

CLI Examples:
```
Salt Documentation, Release 3001.1

salt host1 glusterfs.create newvolume host1:/brick
salt gluster1 glusterfs.create vol2 '["gluster1:/export/vol2/brick",
,→"gluster2:/export/vol2/brick"]' replica=2 start=True

salt.modules.glusterfs.delete_volume(target, stop=True)
Deletes a gluster volume
target Volume to delete
stop [True] If True, stop volume before delete
CLI Example:
salt '*' glusterfs.delete_volume <volume>

salt.modules.glusterfs.disable_quota_volume(name)
Disable quota on a glusterfs volume.
name Name of the gluster volume
CLI Example:
salt '*' glusterfs.disable_quota_volume <volume>

salt.modules.glusterfs.enable_quota_volume(name)
Enable quota on a glusterfs volume.
name Name of the gluster volume
CLI Example:
salt '*' glusterfs.enable_quota_volume <volume>

salt.modules.glusterfs.get_max_op_version()
New in version 2019.2.0.
Returns the glusterfs volume's max op-version value Requires Glusterfs version > 3.9
CLI Example: .. code-block:: bash
salt '*' glusterfs.get_max_op_version
salt.modules.glusterfs.get_op_version(name)
New in version 2019.2.0.
Returns the glusterfs volume op-version
name Name of the glusterfs volume
CLI Example:
salt '*' glusterfs.get_op_version <volume>

salt.modules.glusterfs.get_version()
New in version 2019.2.0.
Returns the version of glusterfs. CLI Example: .. code-block:: bash
salt '*' glusterfs.get_version

21.9. execution modules

1913


salt.modules.glusterfs.info(name=None)
   New in version 2015.8.4.
   Return gluster volume info.
   name  Optional name to retrieve only information of one volume
   CLI Example:
   
   salt '*' glusterfs.info

salt.modules.glusterfs.list_quota_volume(name)
   List quotas of glusterfs volume
   name  Name of the gluster volume
   CLI Example:
   
   salt '*' glusterfs.list_quota_volume <volume>

salt.modules.glusterfs.list_volumes()
   List configured volumes
   CLI Example:
   
   salt '*' glusterfs.list_volumes

salt.modules.glusterfs.peer(name)
   Add another node into the peer list.
   name  The remote host to probe.
   CLI Example:
   
   salt 'one.gluster.*' glusterfs.peer two

GLUSTER direct CLI example (to show what salt is sending to gluster):
   $ gluster peer probe ftp2

GLUSTER CLI 3.4.4 return example (so we know what we are parsing): #if the "peer" is the local host: peer probe: success: on localhost not needed
   #if the peer was just added: peer probe: success
   #if the peer was already part of the cluster: peer probe: success: host ftp2 port 24007 already in peer list

salt.modules.glusterfs.peer_status()
   Return peer status information
   The return value is a dictionary with peer UUIDs as keys and dicts of peer information as values. Hostnames are listed in one list. GlusterFS separates one of the hostnames but the only reason for this seems to be which hostname happens to be used first in peering.
   CLI Example:
   
   salt '*' glusterfs.peer_status

GLUSTER direct CLI example (to show what salt is sending to gluster):
   $ gluster peer status

GLUSTER CLI 3.4.4 return example (so we know what we are parsing):
Number of Peers: 2
Hostname: ftp2 Port: 24007 Uuid: cbcb256b-e66e-4ec7-a718-21082d396c24 State: Peer in Cluster (Connected)
Hostname: ftp3 Uuid: 5ea10457-6cb2-427b-a770-7897509625e9 State: Peer in Cluster (Connected)

**salt.modules.glusterfs.set_op_version**(version)

Set the glusterfs volume op-version

**version** Version to set the glusterfs volume op-version

CLI Example:

```
salt '*' glusterfs.set_op_version <volume>
```

**salt.modules.glusterfs.set_quota_volume**(name, path, size, enable_quota=False)

Set quota to glusterfs volume.

**name** Name of the gluster volume

**path** Folder path for restriction in volume ("/")

**size** Hard-limit size of the volume (MB/GB)

**enable_quota** Enable quota before set up restriction

CLI Example:

```
salt '*' glusterfs.set_quota_volume <volume> <path> <size> enable_quota=True
```

**salt.modules.glusterfs.start_volume**(name, force=False)

Start a gluster volume

**name** Volume name

**force** Force the volume start even if the volume is started .. versionadded:: 2015.8.4

CLI Example:

```
salt '*' glusterfs.start mycluster
```

**salt.modules.glusterfs.status**(name)

Check the status of a gluster volume.

**name** Volume name

CLI Example:

```
salt '*' glusterfs.status myvolume
```

**salt.modules.glusterfs.stop_volume**(name, force=False)

Stop a gluster volume

**name** Volume name

**force** Force stop the volume

New in version 2015.8.4.

CLI Example:
salt '*' glusterfs.stop_volume mycluster

glusterfs.unset_quota_volume

Unset quota on glusterfs volume

name Name of the gluster volume

path Folder path for restriction in volume

CLI Example:

salt '*' glusterfs.unset_quota_volume <volume> <path>

21.9.162 salt.modules.gnomedesktop

 GNOME implementations

salt.modules.gnomedesktop.get

Get key in a particular GNOME schema

CLI Example:

salt '*' gnome.get user=<username> schema=org.gnome.desktop.screensaver key=idle-activation-enabled

gnome.getClockFormat

Return the current clock format, either 12h or 24h format.

CLI Example:

salt '*' gnome.getClockFormat user=<username>

gnome.getClockShowDate

Return the current setting, if the date is shown in the clock

CLI Example:

salt '*' gnome.getClockShowDate user=<username>

gnome.getIdleActivation

Get whether the idle activation is enabled

CLI Example:

salt '*' gnome.getIdleActivation user=<username>

gnome.getIdleDelay

Return the current idle delay setting in seconds

CLI Example:

salt '*' gnome.getIdleDelay user=<username>

gnome.ping

A test to ensure the GNOME module is loaded

CLI Example:
salt '*' gnome.ping user=<username>

salt.modules.gnomedesktop.setClockFormat(clockFormat, **kwargs)
    Set the clock format, either 12h or 24h format.
    CLI Example:
    salt '*' gnome.setClockFormat <12h|24h> user=<username>

salt.modules.gnomedesktop.setClockShowDate(*value, **kwargs)
    Set whether the date is visible in the clock
    CLI Example:
    salt '*' gnome.setClockShowDate <True|False> user=<username>

salt.modules.gnomedesktop.setIdleActivation(*value, **kwargs)
    Set whether the idle activation is enabled
    CLI Example:
    salt '*' gnome.setIdleActivation <True|False> user=<username>

salt.modules.gnomedesktop.setIdleDelay(*delaySeconds, **kwargs)
    Set the current idle delay setting in seconds
    CLI Example:
    salt '*' gnome.setIdleDelay <seconds> user=<username>

salt.modules.gnomedesktop.set_(schema=None, key=None, user=None, value=None, **kwargs)
    Set key in a particular GNOME schema
    CLI Example:
    salt '*' gnome.set user=<username> schema=org.gnome.desktop.screensaver key=idle-activation-enabled value=False

21.9.163 salt.modules.google_chat

Module for sending messages to google chat.

New in version 2019.2.0.

To use this module you need to configure a webhook in the google chat room where you would like the message to be sent, see:

https://developers.google.com/hangouts/chat/how-tos/webhooks

salt.modules.google_chat.sendMessage(*url, *message)
    Send a message to the google chat room specified in the webhook url.
    salt '*' google_chat.sendMessage "https://chat.googleapis.com/v1/spaces/example_space/messages?key=example_key" "This is a test message"
21.9.164  salt.modules.gpg

Manage a GPG keychains, add keys, create keys, retrieve keys from keyservers. Sign, encrypt and sign plus encrypt text and files.

New in version 2015.5.0.

Note: The python-gnupg library and gpg binary are required to be installed.

salt.modules.gpg.create_key(key_type='RSA', key_length=1024, name_real='Autogenerated Key', name_comment='Generated by SaltStack', name_email=None, subkey_type=None, subkey_length=None, expire_date=None, use_passphrase=False, user=None, gnupghome=None)

Create a key in the GPG keychain

Note: GPG key generation requires a lot of entropy and randomness. Difficult to do over a remote connection, consider having another process available which is generating randomness for the machine. Also especially difficult on virtual machines, consider the rng-tools package.

The create_key process takes awhile so increasing the timeout may be necessary, e.g. -t 15.

key_type  The type of the primary key to generate. It must be capable of signing. 'RSA' or 'DSA'.
key_length  The length of the primary key in bits.
name_real  The real name of the user identity which is represented by the key.
name_comment  A comment to attach to the user id.
name_email  An email address for the user.
subkey_type  The type of the secondary key to generate.
subkey_length  The length of the secondary key in bits.
expire_date  The expiration date for the primary and any secondary key. You can specify an ISO date, A number of days/weeks/months/years, an epoch value, or 0 for a non-expiring key.
use_passphrase  Whether to use a passphrase with the signing key. Passphrase is received from Pillar.
user  Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.

CLI Example:

```
salt -t 15 '*' gpg.create_key
```

salt.modules.gpg.decrypt(user=None, text=None, filename=None, output=None, use_passphrase=False, gnupghome=None, bare=False)

Decrypt a message or file

user  Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.

text  The encrypted text to decrypt.
filename  The encrypted filename to decrypt.
output  The filename where the decrypted data will be written, default is standard out.

use_passphrase  Whether to use a passphrase with the signing key. Passphrase is received from Pillar.

gnupghome  Specify the location where GPG keyring and related files are stored.

bare  If True, return the (armored) decrypted block as a string without the standard comment/res dict.

CLI Example:

```bash
salt '*' gpg.decrypt filename="/path/to/important.file.gpg"
salt '*' gpg.decrypt filename="/path/to/important.file.gpg" use_passphrase=True
```

salt.modules.gpg.delete_key(keyid=None, fingerprint=None, delete_secret=False, user=None, gnupghome=None)

Get a key from the GPG keychain

keyid  The keyid of the key to be deleted.

fingerprint  The fingerprint of the key to be deleted.

delete_secret  Whether to delete a corresponding secret key prior to deleting the public key. Secret keys must be deleted before deleting any corresponding public keys.

user  Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.

gnupghome  Specify the location where GPG keyring and related files are stored.

CLI Example:

```bash
salt '*' gpg.delete_key keyid=3FAD9F1E
salt '*' gpg.delete_key fingerprint=53C96788253E58416D28BCD352952C84C3252192
salt '*' gpg.delete_key keyid=3FAD9F1E user=username
salt '*' gpg.delete_key keyid=3FAD9F1E user=username delete_secret=True
```

salt.modules.gpg.encrypt(user=None, recipients=None, text=None, filename=None, output=None, sign=None, use_passphrase=False, gnupghome=None, bare=False)

Encrypt a message or file

user  Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.

recipients  The fingerprints for those recipient whom the data is being encrypted for.

text  The text to encrypt.

filename  The filename to encrypt.

output  The filename where the signed file will be written, default is standard out.

sign  Whether to sign, in addition to encrypt, the data. True to use default key or fingerprint to specify a different key to sign with.

use_passphrase  Whether to use a passphrase with the signing key. Passphrase is received from Pillar.

gnupghome  Specify the location where GPG keyring and related files are stored.

bare  If True, return the (armored) encrypted block as a string without the standard comment/res dict.

CLI Example:
```python
salt '*' gpg.encrypt text='Hello there. How are you?'
salt '*' gpg.encrypt filename='/path/to/important.file'
salt '*' gpg.encrypt filename='/path/to/important.file' use_passphrase=True
```

salt.modules.gpg.export_key(keyids=None, secret=False, user=None, gnupghome=None)

Export a key from the GPG keychain

- **keyids** The key ID(s) of the key(s) to be exported. Can be specified as a comma separated string or a list. Anything which GnuPG itself accepts to identify a key - for example, the key ID or the fingerprint could be used.
- **secret** Export the secret key identified by the keyids information passed.
- **user** Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.
- **gnupghome** Specify the location where GPG keyring and related files are stored.

CLI Example:

```bash
salt '*' gpg.export_key keyids=3FAD9F1E
salt '*' gpg.export_key keyids=3FAD9F1E secret=True
salt '*' gpg.export_key keyids=['3FAD9F1E','3FBD8F1E'] user=username
```

salt.modules.gpg.get_key(keyid=None, fingerprint=None, user=None, gnupghome=None)

Get a key from the GPG keychain

- **keyid** The key ID (short or long) of the key to be retrieved.
- **fingerprint** The fingerprint of the key to be retrieved.
- **user** Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.
- **gnupghome** Specify the location where GPG keyring and related files are stored.

CLI Example:

```bash
salt '*' gpg.get_key keyid=3FAD9F1E
salt '*' gpg.get_key fingerprint=53C96788253E58416D20BCD352952C84C3252192
salt '*' gpg.get_key keyid=3FAD9F1E user=username
```

salt.modules.gpg.get_secret_key(keyid=None, fingerprint=None, user=None, gnupghome=None)

Get a key from the GPG keychain

- **keyid** The key ID (short or long) of the key to be retrieved.
- **fingerprint** The fingerprint of the key to be retrieved.
- **user** Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.
- **gnupghome** Specify the location where GPG keyring and related files are stored.

CLI Example:
```python
salt '*' gpg.get_secret_key keyid=3FAD9F1E
salt '*' gpg.get_secret_key fingerprint=53C96788253E58416D20B1CD352952C84C3252192
salt '*' gpg.get_secret_key keyid=3FAD9F1E user=username
```

salt.modules.gpg.import_key(\n    text=None, filename=None, user=None, gnupghome=None)\n
Import a key from text or file

**text**  The text containing to import.

**filename**  The filename containing the key to import.

**user**  Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.

**gnupghome**  Specify the location where GPG keyring and related files are stored.

CLI Example:

```bash
salt '*' gpg.import_key text='-----BEGIN PGP PUBLIC KEY BLOCK-----
...
-----END PGP PUBLIC KEY BLOCK-----'
salt '*' gpg.import_key filename='/path/to/public-key-file'
```

salt.modules.gpg.list_keys(\n    user=None, gnupghome=None)\n
List keys in GPG keychain

**user**  Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.

**gnupghome**  Specify the location where GPG keyring and related files are stored.

CLI Example:

```bash
salt '*' gpg.list_keys
```

salt.modules.gpg.list_secret_keys(\n    user=None, gnupghome=None)\n
List secret keys in GPG keychain

**user**  Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.

**gnupghome**  Specify the location where GPG keyring and related files are stored.

CLI Example:

```bash
salt '*' gpg.list_secret_keys
```

salt.modules.gpg.receive_keys(\n    keyserver=None, keys=None, user=None, gnupghome=None)\n
Receive key(s) from keyserver and add them to keychain

**keyserver**  Keyserver to use for searching for GPG keys, defaults to pgp.mit.edu

**keys**  The keyID(s) to retrieve from the keyserver. Can be specified as a comma separated string or a list.

**user**  Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.

**gnupghome**  Specify the location where GPG keyring and related files are stored.

CLI Example:
salt '!' gpg.receive_keys keys='3FAD9F1E'
salt '!' gpg.receive_keys keys='[3FAD9F1E,3FBD9F2E]'
salt '!' gpg.receive_keys keys=3FAD9F1E user=username

**salt.modules.gpg.search_keys**(text, keyserver=None, user=None)

Search keys from keyserver

- **text** Text to search the keyserver for, e.g. email address, keyID or fingerprint.
- **keyserver** Keyserver to use for searching for GPG keys, defaults to pgp.mit.edu.
- **user** Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.

CLI Example:

```
salt '!' gpg.search_keys user@example.com
salt '!' gpg.search_keys user@example.com keyserver=keyserver.ubuntu.com
salt '!' gpg.search_keys user@example.com keyserver=keyserver.ubuntu.com user=username
```

**salt.modules.gpg.sign**(user=None, keyid=None, text=None, filename=None, output=None, use_passphrase=False, gnupghome=None)

Sign message or file

- **user** Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.
- **keyid** The keyid of the key to set the trust level for, defaults to first key in the secret keyring.
- **text** The text to sign.
- **filename** The filename to sign.
- **output** The filename where the signed file will be written, default is standard out.
- **use_passphrase** Whether to use a passphrase with the signing key. Passphrase is received from Pillar.
- **gnupghome** Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt '!' gpg.sign text='Hello there. How are you?'
salt '!' gpg.sign filename='/path/to/important.file'
salt '!' gpg.sign filename='/path/to/important.file' use_passphrase=True
```

**salt.modules.gpg.trust_key**(keyid=None, fingerprint=None, trust_level=None, user=None)

Set the trust level for a key in GPG keychain

- **keyid** The keyid of the key to set the trust level for.
- **fingerprint** The fingerprint of the key to set the trust level for.
- **trust_level** The trust level to set for the specified key, must be one of the following: expired, unknown, not_trusted, marginally, fully, ultimately
user  Which user’s keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.

CLI Example:

```bash
salt '*' gpg.trust_key keyid='3FAD9F1E' trust_level='marginally'
salt '*' gpg.trust_key fingerprint='53C96788253E58416D20BCD352952C84C3252192' trust_level='not_trusted'
salt '*' gpg.trust_key keys=3FAD9F1E trust_level='ultimately' user='username'
```

salt.modules.gpg.verify(text=None, user=None, filename=None, gnupghome=None, signature=None, trustmodel=None)

Verify a message or file

- **text**  The text to verify.
- **filename**  The filename to verify.
- **user**  Which user’s keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.
- **gnupghome**  Specify the location where GPG keyring and related files are stored.
- **signature**  Specify the filename of a detached signature.

New in version 2018.3.0.

**trustmodel**

Explicitly define the used trust model. One of:

- pgp
- classic
- tofu
- tofu+pgp
- direct
- always
- auto

New in version 2019.2.0.

CLI Example:

```bash
salt '*' gpg.verify text='Hello there. How are you?'
salt '*' gpg.verify filename='/path/to/important.file'
salt '*' gpg.verify filename='/path/to/important.file' use_passphrase=True
salt '*' gpg.verify filename='/path/to/important.file' trustmodel=direct
```
21.9.165 salt.modules.grafana4 module

Module for working with the Grafana v4 API

New in version 2017.7.0.

depends  requests

configuration  This module requires a configuration profile to be configured in the minion config, min-
ion pillar, or master config. The module will use the 'grafana' key by default, if defined.

For example:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_user: admin
  grafana_password: admin
  grafana_timeout: 3
```

salt.modules.grafana4.create_datasource(orgname=None, profile='grafana', **kwargs)
Create a new datasource in an organisation.

name  Name of the data source.

type  Type of the datasource (‘graphite’, ‘influxdb’ etc.).

access  Use proxy or direct.

url  The URL to the data source API.

user  Optional - user to authenticate with the data source.

password  Optional - password to authenticate with the data source.

database  Optional - database to use with the data source.

basicAuth  Optional - set to True to use HTTP basic auth to authenticate with the data source.

basicAuthUser  Optional - HTTP basic auth username.

basicAuthPassword  Optional - HTTP basic auth password.

jsonData  Optional - additional json data to post (eg. "timeInterval").

isDefault  Optional - set data source as default.

withCredentials  Optional - Whether credentials such as cookies or auth headers should be sent with cross-site
requests.

typeLogoUrl  Optional - Logo to use for this datasource.

orgname  Name of the organization in which the data source should be created.

profile  Configuration profile used to connect to the Grafana instance. Default is ‘grafana’.

CLI Example:

```
salt '*' grafana4.create_datasource
```

salt.modules.grafana4.create_org(profile='grafana', **kwargs)
Create a new organization.

name  Name of the organization.

profile  Configuration profile used to connect to the Grafana instance. Default is ‘grafana’.

CLI Example:
salt 'salt' grafana4.create_org <name>

salt.modules.grafana4.create_org_user(**kwargs)
Add user to the organization.

loginOrEmail  Login or email of the user.
role
Role of the user for this organization. Should be one of:
• Admin
• Editor
• Read Only Editor
• Viewer
orgname  Name of the organization in which users are added.
profile  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
salt 'salt' grafana4.create_org_user <orgname> loginOrEmail=<loginOrEmail> role=<role>

salt.modules.grafana4.create_update_dashboard(**kwargs)
Create or update a dashboard.
dashboard  A dict that defines the dashboard to create/update.
overwrite  Whether the dashboard should be overwritten if already existing.
orgname  Name of the organization.
profile  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
salt 'salt' grafana4.create_update_dashboard dashboard=<dashboard> overwrite=True orgname=<orgname>

salt.modules.grafana4.create_user(**kwargs)
Create a new user.
login  Login of the new user.
password  Password of the new user.
email  Email of the new user.
name  Optional - Full name of the new user.
profile  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
salt 'salt' grafana4.create_user login=<login> password=<password> email=<email>

salt.modules.grafana4.delete_dashboard(slug, orgname=None, profile='grafana')
Delete a dashboard.
slug  Slug (name) of the dashboard.
**orgname**  Name of the organization.

**profile**  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.delete_dashboard <slug>
```

`salt.modules.grafana4.delete_datasource(datasourceid, orgname=None, profile='grafana')`

Delete a datasource.

**datasourceid**  Id of the datasource.

**profile**  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.delete_datasource <datasource_id>
```

`salt.modules.grafana4.delete_org(orgid, profile='grafana')`

Delete an organization.

**orgid**  Id of the organization.

**profile**  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.delete_org <org_id>
```

`salt.modules.grafana4.delete_org_user(userid, orgname=None, profile='grafana')`

Remove user from the organization.

**userid**  Id of the user.

**orgname**  Name of the organization in which users are updated.

**profile**  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.delete_org_user <user_id> <orgname>
```

`salt.modules.grafana4.delete_user(userid, profile='grafana')`

Delete a user.

**userid**  Id of the user.

**profile**  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.delete_user <user_id>
```

`salt.modules.grafana4.delete_user_org(userid, orgid, profile='grafana')`

Remove a user from an organization.

**userid**  Id of the user.

**orgid**  Id of the organization.

**profile**  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
salt 'salt '*' grafana4.delete_user_org <user_id> <org_id>

salt.modules.grafana4.get_dashboard(slug, orgname=None, profile='grafana')
Get a dashboard.
slug Slug (name) of the dashboard.
orgname Name of the organization.
profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
salt 'salt '*' grafana4.get_dashboard <slug>

salt.modules.grafana4.get_datasource(name, orgname=None, profile='grafana')
Show a single datasource in an organisation.
name Name of the datasource.
orgname Name of the organization.
profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
salt 'salt '*' grafana4.get_datasource <name> <orgname>

salt.modules.grafana4.get_datasources(orgname=None, profile='grafana')
List all datasources in an organisation.
orgname Name of the organization.
profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
salt 'salt '*' grafana4.get_datasources <orgname>

salt.modules.grafana4.get_org(name, profile='grafana')
Show a single organization.
name Name of the organization.
profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
salt 'salt '*' grafana4.get_org <name>

salt.modules.grafana4.get_org_address(orgname=None, profile='grafana')
Get the organization address.
orgname Name of the organization in which users are updated.
profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
salt 'salt '*' grafana4.get_org_address <orgname>

salt.modules.grafana4.get_org_prefs(orgname=None, profile='grafana')
Get the organization preferences.
orgname  Name of the organization in which users are updated.
profile  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_org_prefs <orgname>
```

```
salt.modules.grafana4.get_org_users( orgname=None, profile='grafana' )
Get the list of users that belong to the organization.
```

orgname  Name of the organization.
profile  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_org_users <orgname>
```

```
salt.modules.grafana4.get_orgs( profile='grafana' )
List all organizations.
```

profile  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_orgs
```

```
salt.modules.grafana4.get_user( login, profile='grafana' )
Show a single user.
```

login  Login of the user.
profile  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_user <login>
```

```
salt.modules.grafana4.get_user_data( userid, profile='grafana' )
Get user data.
```

userid  Id of the user.
profile  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_user_data <user_id>
```

```
salt.modules.grafana4.get_user_orgs( userid, profile='grafana' )
Get the list of organisations a user belong to.
```

userid  Id of the user.
profile  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_user_orgs <user_id>
```

```
salt.modules.grafana4.get_users( profile='grafana' )
List all users.
```

```
salt '*' grafana4.get_users
```

```
salt.modules.grafana4.get_users( profile='grafana' )
List all users.
```

```
salt '*' grafana4.get_users
```

```
salt.modules.grafana4.get_users( profile='grafana' )
List all users.
```

```
salt '*' grafana4.get_users
```
profile  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_users
```

```
salt.modules.grafana4.switch_org(orgname, profile='grafana')
```

Switch the current organization.

**name**  Name of the organization to switch to.

**profile**  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.switch_org <name>
```

```
salt.modules.grafana4.update_datasource(datasourceid, orgname=None, profile='grafana', **kwargs)
```

Update a datasource.

**datasourceid**  Id of the datasource.

**name**  Name of the data source.

**type**  Type of the datasource ('graphite', 'influxdb' etc.).

**access**  Use proxy or direct.

**url**  The URL to the data source API.

**user**  Optional - user to authenticate with the data source.

**password**  Optional - password to authenticate with the data source.

**database**  Optional - database to use with the data source.

**basicAuth**  Optional - set to True to use HTTP basic auth to authenticate with the data source.

**basicAuthUser**  Optional - HTTP basic auth username.

**basicAuthPassword**  Optional - HTTP basic auth password.

**jsonData**  Optional - additional json data to post (eg. "timeInterval").

**isDefault**  Optional - set data source as default.

**withCredentials**  Optional - Whether credentials such as cookies or auth headers should be sent with cross-site requests.

**typeLogoUrl**  Optional - Logo to use for this datasource.

**profile**  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.update_datasource <datasourceid>
```

```
salt.modules.grafana4.update_org(orgid, profile='grafana', **kwargs)
```

Update an existing organization.

**orgid**  Id of the organization.

**name**  New name of the organization.

**profile**  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.
CLI Example:

```
salt '*' grafana4.update_org <org_id> name=<name>
```

`salt.modules.grafana4.update_org_address`(orgname=None, profile='grafana', **kwargs)
Update the organization address.

- **orgname**: Name of the organization in which users are updated.
- **address1**: Optional - address1 of the org.
- **address2**: Optional - address2 of the org.
- **city**: Optional - city of the org.
- **zip_code**: Optional - zip_code of the org.
- **state**: Optional - state of the org.
- **country**: Optional - country of the org.
- **profile**: Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.update_org_address <orgname> country=<country>
```

`salt.modules.grafana4.update_org_prefs`(orgname=None, profile='grafana', **kwargs)
Update the organization preferences.

- **orgname**: Name of the organization in which users are updated.
- **theme**: Selected theme for the org.
- **homeDashboardId**: Home dashboard for the org.
- **timezone**: Timezone for the org (one of: "browser", "utc", or ").
- **profile**: Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.update_org_prefs <orgname> theme=<theme> timezone=<timezone>
```

`salt.modules.grafana4.update_org_user`(userid, orgname=None, profile='grafana', **kwargs)
Update user role in the organization.

- **userid**: Id of the user.
- **loginOrEmail**: Login or email of the user.
- **role**: Role of the user for this organization. Should be one of:
  - Admin
  - Editor
  - Read Only Editor
  - Viewer
- **orgname**: Name of the organization in which users are updated.
- **profile**: Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
salt '!' grafana4.update_org_user <user_id> <orgname> loginOrEmail=<loginOrEmail> &role=<role>

salt.modules.grafana4.update_user(userid, profile='grafana', **kwargs)
Update an existing user.

- **userid** Id of the user.
- **login** Optional - Login of the user.
- **email** Optional - Email of the user.
- **name** Optional - Full name of the user.
- **profile** Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
salt '!' grafana4.update_user <user_id> login=<login> email=<email>

salt.modules.grafana4.update_user_password(userid, profile='grafana', **kwargs)
Update a user password.

- **userid** Id of the user.
- **password** New password of the user.
- **profile** Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
salt '!' grafana4.update_user_password <user_id> password=<password>

salt.modules.grafana4.update_user_permissions(userid, profile='grafana', **kwargs)
Update a user password.

- **userid** Id of the user.
- **isGrafanaAdmin** Whether user is a Grafana admin.
- **profile** Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
salt '!' grafana4.update_user_permissions <user_id> isGrafanaAdmin=<true|false>

21.9.166 salt.modules.grains

Return/control aspects of the grains data

Grains set or altered with this module are stored in the 'grains' file on the minions. By default, this file is located at:
/etc/salt/grains

**Note:** This does NOT override any grains set in the minion config file.

salt.modules.grains.append(key, val, convert=False, delimiter=':')
New in version 0.17.0.

Append a value to a list in the grains config file. If the grain doesn't exist, the grain key is added and the value is appended to the new grain as a list item.

21.9. execution modules
key  The grain key to be appended to
val  The value to append to the grain key
convert  If convert is True, convert non-list contents into a list. If convert is False and the grain contains
non-list contents, an error is given. Defaults to False.
delimiter  The key can be a nested dict key. Use this parameter to specify the delimiter you use, instead of the
default :. You can now append values to a list in nested dictionary grains. If the list doesn’t exist at this
level, it will be created.

New in version 2014.7.6.

CLI Example:

```
salt '*' grains.append key val
```

salt.modules.grains.delkey(key, force=False)
New in version 2017.7.0.
Remove a grain completely from the grain system, this will remove the grain key and value
key  The grain key from which to delete the value.
force  Force remove the grain even when it is a mapped value. Defaults to False

CLI Example:

```
salt '*' grains.delkey key
```

salt.modules.grains.delval(key, destructive=False, force=False)
New in version 0.17.0.
Delete a grain value from the grains config file. This will just set the grain value to None. To completely
remove the grain, run grains.delkey or pass destructive=True to grains.delval.
key  The grain key from which to delete the value.
destructive  Delete the key, too. Defaults to False.
force  Force remove the grain even when it is a mapped value. Defaults to False

CLI Example:

```
salt '*' grains.delval key
```

salt.modules.grains.equals(key, value)
Used to make sure the minion’s grain key/value matches.
Returns True if matches otherwise False.
New in version 2017.7.0.

CLI Example:

```
salt '*' grains.equals fqdn <expected_fqdn>
salt '*' grains.equals systemd:version 219
```

salt.modules.grains.fetch(key, default='', delimiter=':', ordered=True)
Attempt to retrieve the named value from grains, if the named value is not available return the passed default.
The default return is an empty string.
The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict
in grains looks like this:
{'pkg': {'apache': 'httpd'}}

To retrieve the value associated with the apache key in the pkg dict this key can be passed:

pkg:apache

**Parameters**

- **delimiter** -- Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.
  
  New in version 2014.7.0.

- **ordered** -- Outputs an ordered dict if applicable (default: True)
  
  New in version 2016.11.0.

**CLI Example:**

```bash
salt '*' grains.get pkg:apache
salt '*' grains.get abc::def|ghi delimiter='|
```

**salt.modules.grains.filter_by(lookup_dict, grain='os_family', merge=None, default='default', base=None)**

New in version 0.17.0.

Look up the given grain in a given dictionary for the current OS and return the result

Although this may occasionally be useful at the CLI, the primary intent of this function is for use in Jinja to make short work of creating lookup tables for OS-specific data. For example:

```jinja
{%
  set apache = salt['grains.filter_by']({
    'Debian': {'pkg': 'apache2', 'srv': 'apache2'},
    'RedHat': {'pkg': 'httpd', 'srv': 'httpd'},
  }, default='Debian') %}
```

myapache:

 pkg.installed:
   - name: {{ apache.pkg }}
 service.running:
   - name: {{ apache.srv }}

Values in the lookup table may be overridden by values in Pillar. An example Pillar to override values in the example above could be as follows:

```yaml
apache:
  lookup:
    pkg: apache_13
    srv: apache
```

The call to `filter_by()` would be modified as follows to reference those Pillar values:

```jinja
{%
  set apache = salt['grains.filter_by']({
    ...,
  }, merge=salt['pillar.get']('apache:lookup')) %}
```

**Parameters**
• **lookup_dict** -- A dictionary, keyed by a grain, containing a value or values relevant to systems matching that grain. For example, a key could be the grain for an OS and the value could be the name of a package on that particular OS.

Changed in version 2016.11.0: The dictionary key could be a globbing pattern. The function will return the corresponding `lookup_dict` value where grain value matches the pattern. For example:

```python
# this will render 'got some salt' if Minion ID begins from 'salt'
salt '*' grains.filter_by '{salt*: got some salt, default: salt is not here}' id
```

• **grain** -- The name of a grain to match with the current system's grains. For example, the value of the "os_family" grain for the current system could be used to pull values from the `lookup_dict` dictionary.

Changed in version 2016.11.0: The grain value could be a list. The function will return the `lookup_dict` value for a first found item in the list matching one of the `lookup_dict` keys.

• **merge** -- A dictionary to merge with the results of the grain selection from `lookup_dict`. This allows Pillar to override the values in the `lookup_dict`. This could be useful, for example, to override the values for non-standard package names such as when using a different Python version from the default Python version provided by the OS (e.g., `python26-mysql` instead of `python-mysql`).

• **default** -- default `lookup_dict`'s key used if the grain does not exists or if the grain value has no match on `lookup_dict`. If unspecified the value is "default".

New in version 2014.1.0.

• **base** -- A `lookup_dict` key to use for a base dictionary. The grain-selected `lookup_dict` is merged over this and then finally the `merge` dictionary is merged. This allows common values for each case to be collected in the base and overridden by the grain selection dictionary and the merge dictionary. Default is unset.

New in version 2015.5.0.

CLI Example:

```python
salt '*' grains.filter_by '{Debian: Debheads rule, RedHat: I love my hat}'
# this one will render {D: {E: I, G: H}, J: K}

# next one renders {A: {B: G}, D: J}
salt '*' grains.filter_by '{default: {A: {B: C}, D: E}, F: {A: {B: G}}, H: {D: I}}' 'xxx' '{D: J}' 'F' 'default'

# next same as above when default='H' instead of 'F' renders {A: {B: C}, D: J}
```

salt.modules.grains.get(key, default='', delimiter=':', ordered=True)

Attempt to retrieve the named value from grains, if the named value is not available return the passed default. The default return is an empty string.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in grains looks like this:

```python
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the apache key in the pkg dict this key can be passed:
pkg:apache

Parameters

- **delimiter** -- Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.
  
  New in version 2014.7.0.

- **ordered** -- Outputs an ordered dict if applicable (default: True)
  
  New in version 2016.11.0.

CLI Example:
```
salt '*' grains.get pkg:apache
salt '*' grains.get abc::def|ghi delimiter=' '|'
```

salt.modules.grains.get_or_set_hash(name, length=8, chars='abcdefghijklmnopqrstuvwxyz0123456789!@#$%^&*(-_=+)')

Perform a one-time generation of a hash and write it to the local grains. If that grain has already been set return the value instead.

This is useful for generating passwords or keys that are specific to a single minion that don't need to be stored somewhere centrally.

State Example:
```
some_mysql_user:
  mysql_user:
    - present
    - host: localhost
    - password: {{ salt['grains.get_or_set_hash']('mysql:some_mysql_user') }}
```

CLI Example:
```
salt '*' grains.get_or_set_hash 'django:SECRET_KEY' 50
```

**Warning**: This function could return strings which may contain characters which are reserved as directives by the YAML parser, such as strings beginning with % . To avoid issues when using the output of this function in an SLS file containing YAML+Jinja, surround the call with single quotes.

salt.modules.grains.has_value(key)

Determine whether a key exists in the grains dictionary.

Given a grains dictionary that contains the following structure:
```
{"pkg":{"apache": 'httpd'}}
```

One would determine if the apache key in the pkg dict exists by:
```
pkg:apache
```

CLI Example:
```
salt '*' grains.has_value pkg:apache
```
salt.modules.grains.item(*args, **kwargs)

Return one or more grains

CLI Example:

```
salt '*' grains.item os
salt '*' grains.item os osrelease oscodename
```

Sanitized CLI Example:

```
salt '*' grains.item host sanitize=True
```

salt.modules.grains.items(sanitize=False)

Return all of the minion's grains

CLI Example:

```
salt '*' grains.items
```

Sanitized CLI Example:

```
salt '*' grains.items sanitize=True
```

salt.modules.grains.ls()

Return a list of all available grains

CLI Example:

```
salt '*' grains.ls
```

class PythonClass:
    def method(self):
        # Python code for the method

```

salt.modules.grains.remove(key, val=': ')

New in version 0.17.0.

Remove a value from a list in the grains config file

key The grain key to remove.

val The value to remove.

delimiter The key can be a nested dict key. Use this parameter to specify the delimiter you use, instead of the
default :. You can now append values to a list in nested dictionary grains. If the list doesn't exist at this
level, it will be created.

New in version 2015.8.2.

CLI Example:

```
salt '*' grains.remove key val
```

class PythonClass:
    def method(self):
        # Python code for the method

```

salt.modules.grains.set(key, val='', force=False, destructive=False, delimiter=': ')

Set a key to an arbitrary value. It is used like setval but works with nested keys.

This function is conservative. It will only overwrite an entry if its value and the given one are not a list or a
dict. The force parameter is used to allow overwriting in all cases.

New in version 2015.8.0.

Parameters

- **force** -- Force writing over existing entry if given or existing values are list or dict. De-
defaults to False.
- **destructive** -- If an operation results in a key being removed, delete the key, too. Defaults to False.

- **delimiter** -- Specify an alternate delimiter to use when traversing a nested dict, the default being **CLI Example:**

```
salt '*' grains.set 'apps:myApp:port' 2209
salt '*' grains.set 'apps:myApp' '{port: 2209}'
```

```python
salt.modules.grains.setval(key, val, destructive=False, refresh_pillar=True)
```

Set a grains value in the grains config file

**key** The grain key to be set.

**val** The value to set the grain key to.

**destructive** If an operation results in a key being removed, delete the key, too. Defaults to False.

**refresh_pillar** Whether pillar will be refreshed. Defaults to True.

**CLI Example:**

```
salt '*' grains.setval key val
salt '*' grains.setval key "{'sub-key': 'val', 'sub-key2': 'val2'}"
```

```python
salt.modules.grains.setvals(grains, destructive=False, refresh_pillar=True)
```

Set new grains values in the grains config file

**destructive** If an operation results in a key being removed, delete the key, too. Defaults to False.

**refresh_pillar** Whether pillar will be refreshed. Defaults to True.

**CLI Example:**

```
salt '*' grains.setvals "{'key1': 'val1', 'key2': 'val2'}"
```

### 21.9.167 **salt.modules.groupadd**

Manage groups on Linux, OpenBSD and NetBSD

**Important:** If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to 'group.info' is not available), see [here](#).

```python
salt.modules.groupadd.add(name, gid=None, system=False, root=None)
```

Add the specified group

**name** Name of the new group

**gid** Use GID for the new group

**system** Create a system account

**root** Directory to chroot into

**CLI Example:**

```
salt '*' group.add foo 3456
```

**21.9. execution modules** 1937
salt.modules.groupadd.adduser(name, username, root=None)
    Add a user in the group.
    name  Name of the group to modify
    username  Username to add to the group
    root  Directory to chroot into
    CLI Example:
    ```
salt '*' group.adduser foo bar
    ```
    Verifies if a valid username 'bar' as a member of an existing group 'foo', if not then adds it.

salt.modules.groupadd.chgid(name, gid, root=None)
    Change the gid for a named group
    name  Name of the group to modify
    gid  Change the group ID to GID
    root  Directory to chroot into
    CLI Example:
    ```
salt '*' group.chgid foo 4376
    ```

salt.modules.groupadd.delete(name, root=None)
    Remove the named group
    name  Name group to delete
    root  Directory to chroot into
    CLI Example:
    ```
salt '*' group.delete foo
    ```

salt.modules.groupadd.deluser(name, username, root=None)
    Remove a user from the group.
    name  Name of the group to modify
    username  Username to delete from the group
    root  Directory to chroot into
    CLI Example:
    ```
salt '*' group.deluser foo bar
    ```
    Removes a member user 'bar' from a group 'foo'. If group is not present then returns True.

salt.modules.groupadd.getent(refresh=False, root=None)
    Return info on all groups
    refresh  Force a refresh of group information
    root  Directory to chroot into
    CLI Example:
    ```
salt '*' group.getent
    ```
salt.modules.groupadd.info\(\text{name, root=None}\)
Return information about a group

- **name** Name of the group
- **root** Directory to chroot into

CLI Example:

```
salt '*' group.info foo
```

salt.modules.groupadd.members\(\text{name, members_list, root=None}\)
Replaces members of the group with a provided list.

- **name** Name of the group to modify
- **members_list** Username list to set into the group
- **root** Directory to chroot into

CLI Example:

```
salt '*' group.members foo 'user1,user2,user3,...'
```

Replaces a membership list for a local group 'foo'. foo:x:1234:user1,user2,user3,...

**21.9.168 salt.modules.grub_legacy**

Support for GRUB Legacy

salt.modules.grub_legacy.conf()
Parse GRUB conf file

CLI Example:

```
salt '*' grub.conf
```

salt.modules.grub_legacy.version()
Return server version from grub --version

CLI Example:

```
salt '*' grub.version
```

**21.9.169 salt.modules.guestfs**

Interact with virtual machine images via libguestfs

- **depends**
  - libguestfs

salt.modules.guestfs.mount\(\text{location, access='rw', root=None}\)
Mount an image

CLI Example:

```
salt '*' guest.mount /srv/images/fedora.qcow
```
salt.modules.guestfs.umount(name, disk=None)
Unmount an image

CLI Example:
```
salt '*' guestfs.umount /mountpoint disk=/srv/images/fedora.qcow
```

21.9.170 salt.modules.hadoop

Support for hadoop

maintainer Yann Jouanin <yann.jouanin@intelunix.fr>
maturity new
depends
platform linux

salt.modules.hadoop.dfs(command=None, *args)
Execute a command on DFS

CLI Example:
```
salt '*' hadoop.dfs ls /
```

salt.modules.hadoop.dfs_absent(path)
Check if a file or directory is absent on the distributed FS.

CLI Example:
```
salt '*' hadoop.dfs_absent /some_random_file
```

Returns True if the file is absent

salt.modules.hadoop.dfs_present(path)
Check if a file or directory is present on the distributed FS.

CLI Example:
```
salt '*' hadoop.dfs_present /some_random_file
```

Returns True if the file is present

salt.modules.hadoop.dfsadmin_report(arg=None)
New in version 2019.2.0.
Reports basic filesystem information and statistics. Optional flags may be used to filter the list of displayed
DataNodes.

arg [live] [dead] [decommissioning]

CLI Example:
```
salt '*' hadoop.dfsadmin -report
```

salt.modules.hadoop.namenode_format(force=None)
Format a name node

CLI Example:
```
salt '*' hadoop.namenode_format force=True
```
salt.modules.hadoop.version()
Return version from hadoop version

CLI Example:
salt '*' hadoop.version

21.9.171 salt.modules.haproxyconn

Support for haproxy
New in version 2014.7.0.
salt.modules.haproxyconn.disable_server(name, backend, socket='/var/run/haproxy.sock')
Disable server in haproxy.

- name: Server to disable
- backend: haproxy backend, or all backends if "*" is supplied
- socket: haproxy stats socket, default /var/run/haproxy.sock

CLI Example:
salt '*' haproxy.disable_server db1.example.com mysql

salt.modules.haproxyconn.enable_server(name, backend, socket='/var/run/haproxy.sock')
Enable Server in haproxy

- name: Server to enable
- backend: haproxy backend, or all backends if "*" is supplied
- socket: haproxy stats socket, default /var/run/haproxy.sock

CLI Example:
salt '*' haproxy.enable_server web1.example.com www

salt.modules.haproxyconn.get_backend(backend, socket='/var/run/haproxy.sock')
Receive information about a specific backend.

- backend: haproxy backend
- socket: haproxy stats socket, default /var/run/haproxy.sock

CLI Example:
salt '*' haproxy.get_backend mysql

salt.modules.haproxyconn.get_sessions(name, backend, socket='/var/run/haproxy.sock')
New in version 2016.11.0.
Get number of current sessions on server in backend (scur)

- name: Server name
- backend: haproxy backend
- socket: haproxy stats socket, default /var/run/haproxy.sock

CLI Example:
salt '*' haproxy.get_sessions web1.example.com www

salt.modules.haproxyconn.get_weight(name, backend, socket='/var/run/haproxy.sock')
Get server weight
name  Server name
backend  haproxy backend
socket  haproxy stats socket, default /var/run/haproxy.sock
CLI Example:
salt '*' haproxy.get_weight web1.example.com www

salt.modules.haproxyconn.list_backends(servers=True, socket='/var/run/haproxy.sock')
List HaProxy Backends
socket  haproxy stats socket, default /var/run/haproxy.sock
servers  list backends with servers
CLI Example:
salt '*' haproxy.list_backends

salt.modules.haproxyconn.list_frontends(socket='''/var/run/haproxy.sock'')
List HaProxy frontends
socket  haproxy stats socket, default /var/run/haproxy.sock
CLI Example:
salt '*' haproxy.list_frontends

salt.modules.haproxyconn.list_servers(backend, socket='''/var/run/haproxy.sock'; objectify=False)
List servers in haproxy backend.
backend  haproxy backend
socket  haproxy stats socket, default /var/run/haproxy.sock
CLI Example:
salt '*' haproxy.list_servers mysql

salt.modules.haproxyconn.set_state(name, backend, state, socket='''/var/run/haproxy.sock'')
Force a server's administrative state to a new state. This can be useful to disable load balancing and/or any traffic to a server. Setting the state to "ready" puts the server in normal mode, and the command is the equivalent of the "enable server" command. Setting the state to "maint" disables any traffic to the server as well as any health checks. This is the equivalent of the "disable server" command. Setting the mode to "drain" only removes the server from load balancing but still allows it to be checked and to accept new persistent connections. Changes are propagated to tracking servers if any.
name  Server name
backend  haproxy backend
state  A string of the state to set. Must be 'ready', 'drain', or 'maint'
socket  haproxy stats socket, default /var/run/haproxy.sock
CLI Example:

```bash
salt '*' haproxy.set_state my_proxy_server my_backend ready
```

```
salt.modules.haproxyconn.set_weight(name, backend, weight=0, 
    socket='/var/run/haproxy.sock')
```

Set server weight

- **name** Server name
- **backend** haproxy backend
- **weight** Server Weight
- **socket** haproxy stats socket, default /var/run/haproxy.sock

CLI Example:

```bash
salt '*' haproxy.set_weight web1.example.com www 13
```

```
salt.modules.haproxyconn.show_backends(socket='/var/run/haproxy.sock')
```

Show HaProxy Backends

- **socket** haproxy stats socket, default /var/run/haproxy.sock

CLI Example:

```bash
salt '*' haproxy.show_backends
```

```
salt.modules.haproxyconn.show_frontends(socket='/var/run/haproxy.sock')
```

Show HaProxy frontends

- **socket** haproxy stats socket, default /var/run/haproxy.sock

CLI Example:

```bash
salt '*' haproxy.show_frontends
```

```
salt.modules.haproxyconn.wait_state(backend, server, value='up', timeout=300, 
    socket='/var/run/haproxy.sock')
```

Wait for a specific server state

- **backend** haproxy backend
- **server** targeted server
- **value** state value
- **timeout** timeout before giving up state value, default 5 min
- **socket** haproxy stats socket, default /var/run/haproxy.sock

CLI Example:

```bash
salt '*' haproxy.wait_state mysql server01 up 60
```
21.9.172 salt.modules.hashutil

A collection of hashing and encoding functions

salt.modules.hashutil.base64_b64decode(instr)

Decode a base64-encoded string using the "modern" Python interface

New in version 2016.3.0.

CLI Example:

```
salt '*' hashutil.base64_b64decode 'Z2V0IHNhbHRlZA=='
```

salt.modules.hashutil.base64_b64encode(instr)

Encode a string as base64 using the "modern" Python interface.

Among other possible differences, the "modern" encoder does not include newline ('n') characters in the encoded output.

New in version 2016.3.0.

CLI Example:

```
salt '*' hashutil.base64_b64encode 'get salted'
```

salt.modules.hashutil.base64_decodefile(instr, outfile)

Decode a base64-encoded string and write the result to a file

New in version 2016.3.0.

CLI Example:

```
salt '*' hashutil.base64_decodefile instr='Z2V0IHNhbHRlZAo=' outfile='/path/to/→binary_file'
```

salt.modules.hashutil.base64_decodestring(instr)

Decode a base64-encoded byte-like object using the "modern" Python interface

New in version 3000.

CLI Example:

```
salt '*' hashutil.base64_decodestring instr='Z2V0IHNhbHRlZAo='
```

salt.modules.hashutil.base64_encodefile(fname)

Read a file from the file system and return as a base64 encoded string

New in version 2016.3.0.

Pillar example:

```
path:
  to:
    data: |
      {{ salt.hashutil.base64_encodefile('/path/to/binary_file') | indent(6) }}
```

The file.decode state function can be used to decode this data and write it to disk.

CLI Example:

```
salt '*' hashutil.base64_encodefile /path/to/binary_file
```
salt.modules.hashutil.base64_encodestring(instr)
Encode a byte-like object as base64 using the "modern" Python interface.

Among other possible differences, the "modern" encoder includes a newline ('n') character after every 76 characters and always at the end of the encoded byte-like object.

New in version 3000.

CLI Example:

```
salt '*' hashutil.base64_encodestring 'get salted'
```

salt.modules.hashutil.digest(instr, checksum='md5')
Return a checksum digest for a string

instr A string

CLI Example:

```
salt '*' hashutil.digest 'get salted'
```

salt.modules.hashutil.digest_file(infile, checksum='md5')
Return a checksum digest for a file

infile A file path
checksum [md5] The hashing algorithm to use to generate checksums. Wraps the hashutil.digest execution function.

CLI Example:

```
salt '*' hashutil.digest_file /path/to/file
```

salt.modules.hashutil.github_signature(string, shared_secret, challenge_hmac)
Verify a challenging hmac signature against a string / shared-secret for github webhooks.

New in version 2017.7.0.

Returns a boolean if the verification succeeded or failed.

CLI Example:

```
salt '*' hashutil.github_signature '{"ref":...} ' 'shared secret'
  →'sha1=bc6550fc290acf5b42283fa8deaf55cea0f8c206'
```

salt.modules.hashutil.hmac_compute(string, shared_secret)
New in version 3000.

Compute a HMAC SHA256 digest using a string and secret.

CLI Example:

```
salt '*' hashutil.hmac_compute 'get salted' 'shared secret'
```

salt.modules.hashutil.hmac_signature(string, shared_secret, challenge_hmac)
Verify a challenging hmac signature against a string / shared-secret

New in version 2014.7.0.

Returns a boolean if the verification succeeded or failed.

CLI Example:
salt '\*' hashutil.hmac_signature 'get salted' 'shared secret'
→ 'eBWF9bStXg+NIP5AOwppB5HMvZiYMPzEM9W5YMm/AmQ='

salt.modules.hashutil.md5_digest(instr)
Generate an md5 hash of a given string
New in version 2014.7.0.

CLI Example:
salt '\*' hashutil.md5_digest 'get salted'

salt.modules.hashutil.sha256_digest(instr)
Generate an sha256 hash of a given string
New in version 2014.7.0.

CLI Example:
salt '\*' hashutil.sha256_digest 'get salted'

salt.modules.hashutil.sha512_digest(instr)
Generate an sha512 hash of a given string
New in version 2014.7.0.

CLI Example:
salt '\*' hashutil.sha512_digest 'get salted'

21.9.173 salt.modules.heat module

Module for handling OpenStack Heat calls
New in version 2017.7.0.

depends
    • heatclient Python module

configuration This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion's config file. For example:

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.insecure: False  #(optional)
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'  # Optional
keystone.region_name: 'RegionOne'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```
opstack1:
    keystone.user: admin
    keystone.password: verybadpass
    keystone.tenant: admin
    keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
```

(continues on next page)
With this configuration in place, any of the heat functions can make use of a configuration profile by declaring it explicitly. For example:

```bash
salt '*' heat.flavor_list profile=openstack1
```

**salt.modules.heat.create_stack**
(name=None, template_file=None, environment=None, parameters=None, poll=0, rollback=False, timeout=60, profile=None)

Create a stack (heat stack-create)

- **name** Name of the new stack
- **template_file** File of template
- **environment** File of environment
- **parameters** Parameter dict used to create the stack
- **poll** Poll and report events until stack complete
- **rollback** Enable rollback on create failure
- **timeout** Stack creation timeout in minutes
- **profile** Profile to build on

CLI Example:

```bash
salt '*' heat.create_stack name=mystack \  template_file=salt://template.yaml \  environment=salt://environment.yaml \  parameters="{"image": "Debian 8", "flavor": "m1.small"}" \  poll=5 rollback=False timeout=60 profile=openstack1
```

New in version 2017.7.5,2018.3.1: The spelling mistake in parameter *environment* was corrected to *environment*. The *environment* spelling mistake has been removed in Salt 3000.

**salt.modules.heat.delete_stack**
(name=None, poll=0, timeout=60, profile=None)

Delete a stack (heat stack-delete)

- **name** Name of the stack
- **poll** Poll and report events until stack complete
- **timeout** Stack creation timeout in minute
- **profile** Profile to use

CLI Examples:

```bash
salt '*' heat.delete_stack name=mystack poll=5 \  profile=openstack1
```

**salt.modules.heat.list_stack**
(profile=None)

Return a list of available stack (heat stack-list)

- **profile** Profile to use
CLI Example:
```
salt '*' heat.list_stack profile=openstack1
```

salt.modules.heat.show_stack(name=None, profile=None)
Return details about a specific stack (heat stack-show)

name  Name of the stack
profile  Profile to use

CLI Example:
```
salt '*' heat.show_stack name=mystack profile=openstack1
```

salt.modules.heat.template_stack(name=None, profile=None)
Return template a specific stack (heat stack-template)

name  Name of the stack
profile  Profile to use

CLI Example:
```
salt '*' heat.template_stack name=mystack profile=openstack1
```

salt.modules.heat.update_stack(name=None, template_file=None, environment=None, parameters=None, poll=0, rollback=False, timeout=60, profile=None)
Update a stack (heat stack-template)

name  Name of the stack
template_file  File of template
environment  File of environment
parameters  Parameter dict used to update the stack
poll  Poll and report events until stack complete
rollback  Enable rollback on update failure
timeout  Stack creation timeout in minutes
profile  Profile to build on

CLI Example:
```
salt '*' heat.update_stack name=mystack \   
  template_file=salt://template.yaml \   
  environment=salt://environment.yaml \   
  parameters="{"image": "Debian 8", "flavor": "m1.small"}" \   
  poll=5 rollback=False timeout=60 profile=openstack1
```

New in version 2017.7.5,2018.3.1: The spelling mistake in parameter enviroment was corrected to environment. The enviroment spelling mistake has been removed in Salt 3000.
21.9.174  salt.modules.helm module

Interface with Helm

   depends pyhelm Python package

Note: This module use the helm-cli. The helm-cli binary have to be present in your Salt-Minion path.

**Helm-CLI vs Salt-Modules**

This module is a wrapper of the helm binary. All helm v3.0 command are implemented.

To install a chart with the helm-cli:

```
helm install grafana stable/grafana --wait --values /path/to/values.yaml
```

To install a chart with the Salt-Module:

```
salt '*' helm.install grafana stable/grafana values='/path/to/values.yaml' flags='[...
'wait']"
```

**Detailed Function Documentation**

salt.modules.helm.completion(*shell*, *flags=None*, *kvflags=None*)

Generate auto-completions script for Helm for the specified shell (bash or zsh). Return the shell auto-completion content.

- **shell** (string) One of ['bash', 'zsh'].
- **flags** (list) Flags in argument of the command without values. ex: ['help', '--help']
- **kvflags** (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.completion bash
```

salt.modules.helm.create(*name*, *flags=None*, *kvflags=None*)

Creates a chart directory along with the common files and directories used in a chart. Return True if succeed, else the error message.

- **name** (string) The chart name to create.
- **flags** (list) Flags in argument of the command without values. ex: ['help', '--help']
- **kvflags** (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.create NAME
```

salt.modules.helm.dependency_build(*chart*, *flags=None*, *kvflags=None*)

Build out the charts/ directory from the Chart.lock file. Return True if succeed, else the error message.

- **chart** (string) The chart name to build dependency.
- **flags** (list) Flags in argument of the command without values. ex: ['help', '--help']
**Salt Documentation, Release 3001.1**

`kvflags` (dict) Flags in argument of the command with values. ex: `{v: 2, '--v': 4}

CLI Example:
```
salt '*' helm.dependency_build CHART
```

salt.modules.helm.dependency_list(*chart, flags=None, kvflags=None*)
List all of the dependencies declared in a chart. Return chart dependencies if succeed, else the error message.

- **chart** (string) The chart name to list dependency.
- **flags** (list) Flags in argument of the command without values. ex: ['help', '--help']
- **kvflags** (dict) Flags in argument of the command with values. ex: `{v: 2, '--v': 4}

CLI Example:
```
salt '*' helm.dependency_list CHART
```

salt.modules.helm.dependency_update(*chart, flags=None, kvflags=None*)
Update the on-disk dependencies to mirror Chart.yaml. Return True if succeed, else the error message.

- **chart** (string) The chart name to update dependency.
- **flags** (list) Flags in argument of the command without values. ex: ['help', '--help']
- **kvflags** (dict) Flags in argument of the command with values. ex: `{v: 2, '--v': 4}

CLI Example:
```
salt '*' helm.dependency_update CHART
```

salt.modules.helm.env(*flags=None, kvflags=None*)
Prints out all the environment information in use by Helm. Return Helm environments variables if succeed, else the error message.

- **flags** (list) Flags in argument of the command without values. ex: ['help', '--help']
- **kvflags** (dict) Flags in argument of the command with values. ex: `{v: 2, '--v': 4}

CLI Example:
```
salt '*' helm.env
```

salt.modules.helm.get_all(*release, flags=None, kvflags=None*)
Prints a human readable collection of information about the notes, hooks, supplied values, and generated manifest file of the given release. Return release information if succeed, else the error message.

- **release** (string) Release name to get information from.
- **flags** (list) Flags in argument of the command without values. ex: ['help', '--help']
- **kvflags** (dict) Flags in argument of the command with values. ex: `{v: 2, '--v': 4}

CLI Example:
```
salt '*' helm.get_all RELEASE
```

salt.modules.helm.get_hooks(*release, flags=None, kvflags=None*)
Prints a human readable collection of information about the hooks of the given release. Return release hooks information if succeed, else the error message.

- **release** (string) Release name to get hooks information from.
**flags** (list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags** (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.get_hooks RELEASE
```

**salt.modules.helm.get_manifest**(release, flags=None, kvflags=None)

Prints a human readable collection of information about the manifest of the given release. Return release manifest information if succeed, else the error message.

**release** (string) Release name to get manifest information from.

**flags** (list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags** (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.get_manifest RELEASE
```

**salt.modules.helm.get_notes**(release, flags=None, kvflags=None)

Prints a human readable collection of information about the notes of the given release. Return release notes information if succeed, else the error message.

**release** (string) Release name to get notes information from.

**flags** (list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags** (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.get_notes RELEASE
```

**salt.modules.helm.get_values**(release, flags=None, kvflags=None)

Prints a human readable collection of information about the values of the given release. Return release values information if succeed, else the error message.

**release** (string) Release name to get values information from.

**flags** (list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags** (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.get_values RELEASE
```

```
# In YAML format
salt '*' helm.get_values RELEASE kvflags="{'output': 'yaml'}"
```

**salt.modules.helm.help**(command, flags=None, kvflags=None)

Provides help for any command in the application. Return the full help if succeed, else the error message.

**command** (string) Command to get help. ex: 'get'

**flags** (list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags** (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:
salt '.*' helm.help COMMAND

salt.modules.helm.history(release, flags=None, kvflags=None)
Prints historical revisions for a given release. Return release historic if succeed, else the error message.

release (string) Release name to get history from.

flags (list) Flags in argument of the command without values. ex: ['help', '--help']

kvflags (dict) Flags in argument of the command with values. ex: {v: 2, '--v': 4}

CLI Example:
salt '.*' helm.history RELEASE

# In YAML format
salt '.*' helm.history RELEASE kvflags="{'output': 'yaml'}"

salt.modules.helm.install(release, chart, values=None, version=None, namespace=None, set=None, flags=None, kvflags=None)
Installs a chart archive. Return True if succeed, else the error message.

release (string) Release name to get values information from.

chart (string) Chart name to install.

values (string) Absolute path to the values.yaml file.

version (string) The exact chart version to install. If this is not specified, the latest version is installed.

namespace (string) The namespace scope for this request.

set (string or list) Set a values on the command line.

flags (list) Flags in argument of the command without values. ex: ['help', '--help']

kvflags (dict) Flags in argument of the command with values. ex: {v: 2, '--v': 4}

CLI Example:
salt '.*' helm.install RELEASE CHART

# With values file.
salt '.*' helm.install RELEASE CHART values="/path/to/values.yaml"

salt.modules.helm.lint(path, values=None, namespace=None, set=None, flags=None, kvflags=None)
Takes a path to a chart and runs a series of tests to verify that the chart is well-formed. Return True if succeed, else the error message.

path (string) The path to the chart to lint.

values (string) Absolute path to the values.yaml file.

namespace (string) The namespace scope for this request.

set (string or list) Set a values on the command line.

flags (list) Flags in argument of the command without values. ex: ['help', '--help']

kvflags (dict) Flags in argument of the command with values. ex: {v: 2, '--v': 4}

CLI Example:
salt '.*' helm.lint PATH
salt.modules.helm.list_(namespace=None, flags=None, kvflags=None)

Lists all of the releases. By default, it lists only releases that are deployed or failed. Return the list of release if succeed, else the error message.

namespace (string) The namespace scope for this request.
flags (list) Flags in argument of the command without values. ex: ['help', '--help']
kvflags (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

salt '*' helm.list
# In YAML format
salt '*' helm.list kvflags="{'output': 'yaml'}"

salt.modules.helm.package(chart, flags=None, kvflags=None)

Packages a chart into a versioned chart archive file. If a path is given, this will look at that path for a chart (which must contain a Chart.yaml file) and then package that directory. Return True if succeed, else the error message.

chart (string) Chart name to package. Can be an absolute path.
flags (list) Flags in argument of the command without values. ex: ['help', '--help']
kvflags (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

salt '*' helm.package CHART
# With destination path.
salt '*' helm.package CHART kvflags="{'destination': '/path/to/the/package'}"

salt.modules.helm.plugin_install(path, flags=None, kvflags=None)

Install a Helm plugin from a url to a VCS repo or a local path. Return True if succeed, else the error message.

path (string) Path to the local plugin. Can be an url.
flags (list) Flags in argument of the command without values. ex: ['help', '--help']
kvflags (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

salt '*' helm.plugin_install PATH

salt.modules.helm.plugin_list(flags=None, kvflags=None)

List installed Helm plugins. Return the plugin list if succeed, else the error message.

flags (list) Flags in argument of the command without values. ex: ['help', '--help']
kvflags (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

salt '*' helm.plugin_list

salt.modules.helm.plugin_uninstall(plugin, flags=None, kvflags=None)

Uninstall a Helm plugin. Return True if succeed, else the error message.

plugin (string) The plugin to uninstall.
flags (list) Flags in argument of the command without values. ex: ['help', '--help']
kvflags (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:
```shell
salt '*' helm.plugin_uninstall PLUGIN
```

```
salt.modules.helm.plugin_update(plugin, flags=None, kvflags=None)
```
Update a Helm plugin. Return True if succeed, else the error message.

**plugin** (string) The plugin to update.

flags (list) Flags in argument of the command without values. ex: ['help', '--help']

kvflags (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:
```shell
salt '*' helm.plugin_update PLUGIN
```

```
salt.modules.helm.pull(pkg, flags=None, kvflags=None)
```
Retrieve a package from a package repository, and download it locally. Return True if succeed, else the error message.

pkg (string) The package to pull. Can be url or repo/chartname.

flags (list) Flags in argument of the command without values. ex: ['help', '--help']

kvflags (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:
```shell
salt '*' helm.pull PKG
```

# With destination path to write the chart.
```shell
salt '*' helm.pull PKG kvflags="{'destination': '/path/to/the/chart'}"
```

```
salt.modules.helm.repo_add(name, url, namespace=None, flags=None, kvflags=None)
```
Add a chart repository. Return True if succeed, else the error message.

name (string) The local name of the repository to install. Have to be unique.

url (string) The url to the repository.

namespace (string) The namespace scope for this request.

flags (list) Flags in argument of the command without values. ex: ['help', '--help']

kvflags (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:
```shell
salt '*' helm.repo_add NAME URL
```

```
salt.modules.helm.repo_index(directory, namespace=None, flags=None, kvflags=None)
```
Read the current directory and generate an index file based on the charts found. Return True if succeed, else the error message.

directory (string) The path to the index.

namespace (string) The namespace scope for this request.

flags (list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags** (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.index DIRECTORY
```

`salt.modules.helm.repo_list(namespace=None, flags=None, kvflags=None)`

List a chart repository. Return the repository list if succeed, else the error message.

- **namespace** (string) The namespace scope for this request.
- **flags** (list) Flags in argument of the command without values. ex: ['help', '--help']
- **kvflags** (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.repo_list

# In YAML Format
salt '*' helm.repo_list kvflags="{'output': 'yaml'}"
```

`salt.modules.helm.repo_manage(present=None, absent=None, prune=False, namespace=None, flags=None, kvflags=None)`

Manage charts repository. Return the summery of all actions.

- **present** (list) List of repository to be present. It’s a list of dict: [{'name': 'local_name', 'url': 'repository_url'}]
- **absent** (list) List of local name repository to be absent.
- **prune** (boolean - default: False) If True, all repository already present but not in the present list would be removed.
- **namespace** (string) The namespace scope for this request.
- **flags** (list) Flags in argument of the command without values. ex: ['help', '--help']
- **kvflags** (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.repo_manage present="[['name': 'LOCAL_NAME', 'url': 'REPO_URL']]"

→ absent="['LOCAL_NAME']"
```

`salt.modules.helm.repo_remove(name, namespace=None, flags=None, kvflags=None)`

Remove a chart repository. Return True if succeed, else the error message.

- **name** (string) The local name of the repository to remove.
- **namespace** (string) The namespace scope for this request.
- **flags** (list) Flags in argument of the command without values. ex: ['help', '--help']
- **kvflags** (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.repo_remove NAME
```

`salt.modules.helm.repo_update(namespace=None, flags=None, kvflags=None)`

Update all charts repository. Return True if succeed, else the error message.

- **namespace** (string) The namespace scope for this request.
- **flags** (list) Flags in argument of the command without values. ex: ['help', '--help']
kvflags (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:
```
salt '*' helm.repo_update
```

```
salt.modules.helm.rollback (release, revision, namespace=None, flags=None, kvflags=None)
```
Rolls back a release to a previous revision. To see release revision number, execute the history module. Return True if succeed, else the error message.

release (string) The name of the release to managed.
revision (string) The revision number to roll back to.
namespace (string) The namespace scope for this request.
flags (list) Flags in argument of the command without values. ex: ['help', '--help']
kvflags (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:
```
salt '*' helm.rollback RELEASE REVISION
```
# In dry-run mode.
```
salt '*' helm.rollback RELEASE REVISION flags=['dry-run']
```

```
salt.modules.helm.search_hub (keyword, flags=None, kvflags=None)
```
Search the Helm Hub or an instance of Monocular for Helm charts. Return the research result if succeed, else the error message.

keyword (string) The keyword to search in the hub.
flags (list) Flags in argument of the command without values. ex: ['help', '--help']
kvflags (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:
```
salt '*' helm.search_hub KEYWORD
```
# In YAML Format
```
salt '*' helm.search_hub KEYWORD kvflags="{'output': 'yaml'}"
```

```
salt.modules.helm.search_repo (keyword, flags=None, kvflags=None)
```
Search reads through all of the repositories configured on the system, and looks for matches. Search of these repositories uses the metadata stored on the system. Return the research result if succeed, else the error message.

keyword (string) The keyword to search in the repo.
flags (list) Flags in argument of the command without values. ex: ['help', '--help']
kvflags (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:
```
salt '*' helm.search_repo KEYWORD
```
# In YAML Format
```
salt '*' helm.search_repo KEYWORD kvflags="{'output': 'yaml'}"
```
salt.modules.helm.show_all(chart=chart, flags=None, kvflags=None)
Inspects a chart (directory, file, or URL) and displays all its content (values.yaml, Charts.yaml, README).
Return chart information if succeed, else the error message.

- **chart** (string) The chart to inspect.
- **flags** (list) Flags in argument of the command without values. ex: ['help', '--help']
- **kvflags** (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:
```
salt '*' helm.show_all CHART
```

salt.modules.helm.show_chart(chart=chart, flags=None, kvflags=None)
Inspects a chart (directory, file, or URL) and displays the contents of the Charts.yaml file. Return chart information if succeed, else the error message.

- **chart** (string) The chart to inspect.
- **flags** (list) Flags in argument of the command without values. ex: ['help', '--help']
- **kvflags** (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:
```
salt '*' helm.show_chart CHART
```

salt.modules.helm.show_readme(chart=chart, flags=None, kvflags=None)
Inspects a chart (directory, file, or URL) and displays the contents of the README file. Return chart information if succeed, else the error message.

- **chart** (string) The chart to inspect.
- **flags** (list) Flags in argument of the command without values. ex: ['help', '--help']
- **kvflags** (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:
```
salt '*' helm.show_readme CHART
```

salt.modules.helm.show_values(chart=chart, flags=None, kvflags=None)
Inspects a chart (directory, file, or URL) and displays the contents of the values.yaml file. Return chart information if succeed, else the error message.

- **chart** (string) The chart to inspect.
- **flags** (list) Flags in argument of the command without values. ex: ['help', '--help']
- **kvflags** (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:
```
salt '*' helm.show_values CHART
```

salt.modules.helm.status(release=release, namespace=None, flags=None, kvflags=None)
Show the status of the release. Return the release status if succeed, else the error message.

- **release** (string) The release to status.
- **namespace** (string) The namespace scope for this request.
- **flags** (list) Flags in argument of the command without values. ex: ['help', '--help']
**kvflags** (dict) Flags in argument of the command with values. ex: `{v: 2, '--v': 4}

CLI Example:

```yaml
salt '*' helm.status RELEASE

# In YAML format
salt '*' helm.status RELEASE kvflags="{'output': 'yaml'}"
```

**salt.modules.helm.template** *(name, chart, values=None, output_dir=None, set=None, flags=None, kvflags=None)*

Render chart templates locally and display the output. Return the chart renderer if succeed, else the error message.

**name** (string) The template name.

**chart** (string) The chart to template.

**values** (string) Absolute path to the values.yaml file.

**output_dir** (string) Absolute path to the output directory.

**set** (string or list) Set a values on the command line.

**flags** (list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags** (dict) Flags in argument of the command with values. ex: `{v: 2, '--v': 4}

CLI Example:

```yaml
salt '*' helm.template NAME CHART

# With values file.
salt '*' helm.template NAME CHART values='/path/to/values.yaml' output_dir='path/to/output/dir'
```

**salt.modules.helm.test** *(release, flags=None, kvflags=None)*

Runs the tests for a release. Return the test result if succeed, else the error message.

**release** (string) The release name to test.

**flags** (list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags** (dict) Flags in argument of the command with values. ex: `{v: 2, '--v': 4}

CLI Example:

```yaml
salt '*' helm.test RELEASE
```

**salt.modules.helm.uninstall** *(release, namespace=None, flags=None, kvflags=None)*

Uninstall the release name. Return True if succeed, else the error message.

**release** (string) The name of the release to managed.

**namespace** (string) The namespace scope for this request.

**flags** (list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags** (dict) Flags in argument of the command with values. ex: `{v: 2, '--v': 4}

CLI Example:
salt '*

helm.uninstall RELEASE

# In dry-run mode.
salt '*

helm.uninstall RELEASE flags=['dry-run']

---

salt.modules.helm.upgrade(release, chart, values=None, version=None, namespace=None, set=None, flags=None, kvflags=None)

Upgrades a release to a new version of a chart. Return True if succeed, else the error message.

release (string) The name of the release to managed.

chart (string) The chart to managed.

values (string) Absolute path to the values.yaml file.

version (string) The exact chart version to install. If this is not specified, the latest version is installed.

namespace (string) The namespace scope for this request.

set (string or list) Set a values on the command line.

flags (list) Flags in argument of the command without values. ex: ['help', '--help']

kvflags (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

salt '*

helm.upgrade RELEASE CHART

# In dry-run mode.
salt '*

helm.upgrade RELEASE CHART flags=['dry-run']

# With values file.
salt '*

helm.upgrade RELEASE CHART values='/path/to/values.yaml'

---

salt.modules.helm.verify(path, flags=None, kvflags=None)

Verify that the given chart has a valid provenance file. Return True if succeed, else the error message.

path (string) The path to the chart file.

flags (list) Flags in argument of the command without values. ex: ['help', '--help']

kvflags (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

salt '*

helm.verify PATH

---

salt.modules.helm.version(flags=None, kvflags=None)

Show the version for Helm. Return version information if succeed, else the error message.

flags (list) Flags in argument of the command without values. ex: ['help', '--help']

kvflags (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

salt '*

helm.version
21.9.175  salt.modules.hg

Support for the Mercurial SCM

salt.modules.hg.archive(cwd, output, rev='tip', fmt=None, prefix=None, user=None)
  Export a tarball from the repository
  
  cwd  The path to the Mercurial repository
  
  output  The path to the archive tarball
  
  rev: tip  The revision to create an archive from
  
  fmt: None  Format of the resulting archive. Mercurial supports: tar, tbz2, tgz, zip, uzip, and files formats.
  
  prefix  [None] Prepend <prefix>/ to every filename in the archive
  
  user  [None] Run hg as a user other than what the minion runs as
  
  If prefix is not specified it defaults to the basename of the repo directory.
  
  CLI Example:
  
  salt '*' hg.archive /path/to/repo output=/tmp/archive.tgz fmt=tgz

salt.modules.hg.clone(cwd, repository, opts=None, user=None, identity=None)
  Clone a new repository
  
  cwd  The path to the Mercurial repository
  
  repository  The hg URI of the repository
  
  opts  [None] Any additional options to add to the command line
  
  user  [None] Run hg as a user other than what the minion runs as
  
  identity  [None] Private SSH key on the minion server for authentication (ssh://)
  
  New in version 2015.5.0.
  
  CLI Example:
  
  salt '*' hg.clone /path/to/repo https://bitbucket.org/birkenfeld/sphinx

salt.modules.hg.describe(cwd, rev='tip', user=None)
  Mimic git describe and return an identifier for the given revision
  
  cwd  The path to the Mercurial repository
  
  rev: tip  The path to the archive tarball
  
  user  [None] Run hg as a user other than what the minion runs as
  
  CLI Example:
  
  salt '*' hg.describe /path/to/repo

salt.modules.hg.pull(cwd, opts=None, user=None, identity=None, repository=None)
  Perform a pull on the given repository
  
  cwd  The path to the Mercurial repository
  
  repository  [None] Perform pull from the repository different from .hg/hgrc:[paths]:default
  
  opts  [None] Any additional options to add to the command line
  
  user  [None] Run hg as a user other than what the minion runs as
**identity**  [None] Private SSH key on the minion server for authentication (ssh://)

New in version 2015.5.0.

CLI Example:

```bash
salt '*' hg.pull /path/to/repo opts=-u
```

**_salt.modules.hg.revision_** *(cwd, rev='tip', short=False, user=None)*

Returns the long hash of a given identifier (hash, branch, tag, HEAD, etc)

- **cwd** The path to the Mercurial repository
- **rev** `tip` The revision
- **short** `False` Return an abbreviated commit hash
- **user** [None] Run hg as a user other than what the minion runs as

CLI Example:

```bash
salt '*' hg.revision /path/to/repo mybranch
```

**_salt.modules.hg.status_** *(cwd, opts=None, user=None)*

Show changed files of the given repository

- **cwd** The path to the Mercurial repository
- **opts** [None] Any additional options to add to the command line
- **user** [None] Run hg as a user other than what the minion runs as

CLI Example:

```bash
salt '*' hg.status /path/to/repo
```

**_salt.modules.hg.update_** *(cwd, rev, force=False, user=None)*

Update to a given revision

- **cwd** The path to the Mercurial repository
- **rev** The revision to update to
- **force** [False] Force an update
- **user** [None] Run hg as a user other than what the minion runs as

CLI Example:

```bash
salt devserver1 hg.update /path/to/repo somebranch
```

### 21.9.176 _salt.modules.highstate_doc module_

This module renders highstate configuration into a more human readable format.

How it works:

*highstate or lowstate* data is parsed with a *processor* this defaults to *highstate_doc.processor_markdown*. The processed data is passed to a *jinja* template that builds up the document content.

configuration: Pillar
# the following defaults can be overridden
highstate_doc.config:

    # list of regex of state names to ignore in `highstate_doc.process_lowstates`
    filter_id_regex:
        - '.*!doc_skip$'

    # list of regex of state functions to ignore in `highstate_doc.process_lowstates`
    filter_state_function_regex:
        - 'file.accumulated'

    # dict of regex to replace text after `highstate_doc.render`. (remove passwords)
    text_replace_regex:
        'password:.*^': '[PASSWORD]'

    # limit size of files that can be included in doc (10000 bytes)
max_render_file_size: 10000

    # advanced option to set a custom lowstate processor
processor: highstate_doc.processor_markdown

State example

```yaml
{{sls}}

    note:
        highstate_doc.note:
            - name: example
            - order: 0
            - contents: |
                example `highstate_doc.note`

        processor:
            - 'rendered file.'

        requisites:
            - 'processor'

    a file we don't want in the doc !doc_skip:
        file.managed:
            - name: /root/passwords
            - contents: |password:sadefgq34y45h56q|
            # also could use 'highstate_doc.config: text_replace_regex' to replace
            # password string. 'password:.*^': '[PASSWORD]'
```

To create the help document build a State that uses `highstate_doc.render`. For performance it's advised to not included this state in your `top.sls` file.

```yaml
# example `salt://makereadme.sls`
make helpfile:

    file.managed:
        - name: /root/README.md
        - contents: \{salt.highstate_doc.render()|json\}
        - show_diff: \{opts['test']\}
        - mode: '0640'
        - order: last
```

Run our `makereadme.sls` state to create `/root/README.md`.

```bash
# first ensure `highstate` return without errors or changes
```
Creating a document collection

From the master we can run the following script to create a collection of all your minion documents.

```python
#!/bin/python
import os
import salt.client
s = salt.client.LocalClient()
# NOTE: because of issues with `cp.push` use `highstate_doc.read_file`
o = s.cmd('*','highstate_doc.read_file', ['/root/README.md'])
for m in o:
    d = o.get(m)
    if d and not d.endswith('is not available. '):
        # mkdir m
directory = os.path.dirname(file_path)
        if not os.path.exists(m):
            os.makedirs(m)
        with open(m + '/README.md', 'wb') as f:
            f.write(d)
        print('ADDED: ' + m + '/README.md')
```

Once the master has a collection of all the README files. You can use pandoc to create HTML versions of the markdown.

```bash
#!/bin/bash
readme_files=$(find $dest -type f -path "*/README.md" -print)
for f in $readme_files ; do
    ff=${f#$dest/}
    minion=${ff%%/*}
    echo "process: $dest/$minion/$basename $f"
    cat $dest/$minion/$basename $f | pandoc --standalone --from markdown_github --to html --include-in-header $dest/style.html > $dest/$minion/$basename $f.html
done
```

It is also nice to put the help files in source control.

```
# git init git add -A git commit -am 'updated docs' git push -f
```

---

21.9. execution modules
Other hints

If you wish to customize the document format:

```python
# you could also create a new `processor` for perhaps reStructuredText
# highstate_doc.config:
# processor: doc_custom.processor_rst

# example `salt://makereadme.jinja`

{{opts['id']}}</code>

{{# lowstates is set from highstate_doc.render() #}}
{{# if lowstates is missing use salt.highstate_doc.process_lowstates() #}}
{% for s in lowstates %}
{{s.id}}
{% endfor %}

```

# example `salt://makereadme.sls`

{% import_text "makereadme.jinja" as makereadme %}

{{sls}} or:

- name: /root/README_other.md
- contents: {{salt.highstate_doc.render(jinja_template_text=makereadme)|json}}
- mode: '0640'

Some replace_text_regex values that might be helpful:

**CERTS**

{PLAIN}.*': '{PLAIN}XXXXXXX'
```

---

salt.modules.highstate_doc.markdown_basic_jinja_template(**kwargs)

Return text for a simple markdown jinja template

This function can be used from the highstate_doc.render modules jinja_template_function option.

salt.modules.highstate_doc.markdown_default_jinja_template(**kwargs)

Return text for a markdown jinja template that included a header

This function can be used from the highstate_doc.render modules jinja_template_function option.

salt.modules.highstate_doc.markdown_full_jinja_template(**kwargs)

Return text for an advanced markdown jinja template

This function can be used from the highstate_doc.render modules jinja_template_function option.

salt.modules.highstate_doc.process_lowstates(**kwargs)

return processed lowstate data that was not blacklisted

render_module_function is used to provide your own. defaults to from_lowstate

salt.modules.highstate_doc.processor_markdown(lowstate_item, config, **kwargs)

Takes low state data and returns a dict of processed data that is by default used in a jinja template when rendering a markdown highstate_doc.

This lowstate_item_markdown given a lowstate item, returns a dict like:

| vars: | # the raw lowstate_item that was processed |
| id: | # the 'id' of the state. |
| id_full: | # combo of the state type and id "state: id" |
| state: | # name of the salt state module |
| function: | # name of the state function |
| name: | # value of 'name:' passed to the salt state module |
| state_function: | # the state name and function name |
| markdown: | # text data to describe a state |
| requisites: | # requisite like [watch_in, require_in] |
| details: | # state name, parameters and other details like file contents |

21.9. execution modules

1965
salt.modules.highstate_doc.read_file(name)

output the contents of a file:

this is a workaround if the cp.push module does not work. https://github.com/saltstack/salt/issues/37133

help the master output the contents of a document that might be saved on the minions filesystem.

```python
#!/bin/python
import os
import salt.client
s = salt.client.LocalClient()
o = s.cmd('*','highstate_doc.read_file', ['/root/README.md'])
for m in o:
    d = o.get(m)
    if d and not d.endswith('is not available. '):
        # mkdir m
        directory = os.path.dirname(file_path)
        if not os.path.exists(m):
            os.makedirs(m)
        with open(m + '/README.md','wb') as fin:
            fin.write(d)
        print('ADDED: ' + m + '/README.md')
```

salt.modules.highstate_doc.render(jinja_template_text=None, jinja_template_function='highstate_doc.markdown_default_jinja_template', **kwargs)

Render highstate to a text format (default Markdown)

if jinja_template_text is not set, jinja_template_function is used.

jinja_template_text: jinja text that the render uses to create the document. jinja_template_function: a salt module call that returns template text.

Options highstate_doc.markdown_basic_jinja_template
highstate_doc.markdown_default_jinja_template
highstate_doc.markdown_full_jinja_template

21.9.177 salt.modules.hosts

Manage the information in the hosts file

salt.modules.hosts.add_host(ip, alias)

Add a host to an existing entry, if the entry is not in place then create it with the given host

CLI Example:

```
salt '*' hosts.add_host <ip> <alias>
```

salt.modules.hosts.get_alias(ip)

Return the list of aliases associated with an ip

Aliases (host names) are returned in the order in which they appear in the hosts file. If there are no aliases associated with the IP, an empty list is returned.

CLI Example:

```
salt '*' hosts.get_alias <ip addr>
```

salt.modules.hosts.get_ip(host)

Return the ip associated with the named host

CLI Example:
salt '*' hosts.get_ip <hostname>

salt.modules.hosts.has_pair(ip, alias)
    Return true if the alias is set
    CLI Example:
    salt '*' hosts.has_pair <ip> <alias>

salt.modules.hosts.list_hosts()
    Return the hosts found in the hosts file in this format:
    
    ```
    {'<ip addr>': ['alias1', 'alias2', ...]}
    ```
    CLI Example:
    salt '*' hosts.list_hosts

salt.modules.hosts.rm_host(ip, alias)
    Remove a host entry from the hosts file
    CLI Example:
    salt '*' hosts.rm_host <ip> <alias>

salt.modules.hosts.set_comment(ip, comment)
    Set the comment for a host to an existing entry, if the entry is not in place then return False
    CLI Example:
    salt '*' hosts.set_comment <ip> <comment>

salt.modules.hosts.set_host(ip, alias, comment=None)
    Set the host entry in the hosts file for the given ip, this will overwrite any previous entry for the given ip
    Changed in version 2016.3.0: If alias does not include any host names (it is the empty string or contains only whitespace), all entries for the given IP address are removed.
    CLI Example:
    salt '*' hosts.set_host <ip> <alias>

21.9.178  salt.modules.http

Module for making various web calls. Primarily designed for webhooks and the like, but also useful for basic http testing.
New in version 2015.5.0.

salt.modules.http.query(url, **kwargs)
    New in version 2015.5.0.
    Query a resource, and decode the return data
    Passes through all the parameters described in the *utils.http.query* function:
salt.utils.http.query(url, method='GET', params=None, data=None, data_file=None, header_dict=None, header_list=None, header_file=None, user_name=None, password=None, auth=None, decode=False, decode_type='auto', status=False, headers=False, text=False, cookies=None, cookie_jar=None, cookie_format='lwp', persist_session=False, session_cookie_jar=None, data_render=False, data_renderer=None, header_render=False, header_renderer=None, template_dict=None, test=False, test_url=None, node='minion', port=80, opts=None, backend=None, ca_bundle=None, verify_ssl=None, cert=None, text_out=None, headers_out=None, decode_out=None, stream=False, streaming_callback=None, header_callback=None, handle=False, agent='Salt/3001.1', hide_fields=None, raise_error=True, formdata=False, formdata_fieldname=None, formdata_filename=None, decode_body=True, **kwargs)

Query a resource, and decode the return data

raise_error [True] If False, and if a connection cannot be made, the error will be suppressed and the body of the return will simply be None.

CLI Example:

```
salt '*' http.query http://somelink.com/
salt '*' http.query http://somelink.com/ method=POST params=
→'key1=val1&key2=val2'
salt '*' http.query http://somelink.com/ method=POST data='<xml>
→somecontent</xml>'
```

salt.modules.http.update_ca_bundle(target=None, source=None, merge_files=None)

Update the local CA bundle file from a URL

New in version 2015.5.0.

CLI Example:

```
salt '*' http.update_ca_bundle
salt '*' http.update_ca_bundle target=/path/to/cacerts.pem
salt '*' http.update_ca_bundle source=https://example.com/cacerts.pem
```

If the target is not specified, it will be pulled from the ca_cert configuration variable available to the minion. If it cannot be found there, it will be placed at <<FILE_ROOTS>>/cacerts.pem.

If the source is not specified, it will be pulled from the ca_cert_url configuration variable available to the minion. If it cannot be found, it will be downloaded from the cURL website, using an http (not https) URL. USING THE DEFAULT URL SHOULD BE AVOIDED!

merge_files may also be specified, which includes a string or list of strings representing a file or files to be appended to the end of the CA bundle, once it is downloaded.

CLI Example:

```
salt '*' http.update_ca_bundle merge_files=/path/to/mycert.pem
```

salt.modules.http.wait_for_successful_query(url, wait_for=300, **kwargs)

Query a resource until a successful response, and decode the return data

CLI Example:

```
salt '*' http.wait_for_successful_query http://somelink.com/ wait_for=160 request_.
→interval=
```

(continues on next page)
21.9.179 salt.modules.icinga2 module

Module to provide icinga2 compatibility to salt.

New in version 2017.7.0.

depends

- icinga2 server

salt.modules.icinga2.generate_cert(domain)
Generate an icinga2 client certificate and key.

Returns: icinga2 pki new-cert --cn domain.tld --key /etc/icinga2/pki/domain.tld.key --cert /etc/icinga2/pki/domain.tld.crt

CLI Example:

```
salt '*' icinga2.generate_cert domain.tld
```

salt.modules.icinga2.generate_ticket(domain)
Generate and save an icinga2 ticket.

Returns: icinga2 pki ticket --cn domain.tld

CLI Example:

```
salt '*' icinga2.generate_ticket domain.tld
```

salt.modules.icinga2.node_setup(domain, master, ticket)
Setup the icinga2 node.

Returns: icinga2 node setup --ticket TICKET_ID --endpoint master.domain.tld --zone domain.tld --master_host master.domain.tld --trustedcert /etc/icinga2/pki/trusted-master.crt

CLI Example:

```
salt '*' icinga2.node_setup domain.tld master.domain.tld TICKET_ID
```

salt.modules.icinga2.request_cert(domain, master, ticket, port)
Request CA cert from master icinga2 node.

Returns: icinga2 pki request --host master.domain.tld --port 5665 --ticket TICKET_ID --key /etc/icinga2/pki/domain.tld.key --cert /etc/icinga2/pki/domain.tld.crt --trustedcert /etc/icinga2/pki/trusted-master.crt --ca /etc/icinga2/pki/ca.crt

CLI Example:

```
salt '*' icinga2.request_cert domain.tld master.domain.tld TICKET_ID
```

salt.modules.icinga2.save_cert(domain, master)
Save the certificate for master icinga2 node.

Returns: icinga2 pki save-cert --key /etc/icinga2/pki/domain.tld.key --cert /etc/icinga2/pki/domain.tld.crt --trustedcert /etc/icinga2/pki/trusted-master.crt --host master.domain.tld

CLI Example:
**21.9.180 salt.modules.ifttt**

Support for IFTTT

New in version 2015.8.0.

Requires an api_key in /etc/salt/minion:

```python
ifttt:
    secret_key: '280d4699-a817-4719-ba6f-ca56e573e44f'
```

salt.modules.ifttt.trigger_event(event=None, **kwargs)

Trigger a configured event in IFTTT.

**Parameters**
- `event` -- The name of the event to trigger.

**Returns**
A dictionary with status, text, and error if result was failure.

---

**21.9.181 salt.modules.ilo**

Manage HP ILO

**depends** hpontcfg (SmartStart Scripting Toolkit Linux Edition)

salt.modules.ilo.change_password(username, password)

Reset a users password

CLI Example:

```
salt '*' ilo.change_password damianMyerscough
```

salt.modules.ilo.change_username(old_username, new_username)

Change a username

CLI Example:

```
salt '*' ilo.change_username damian diana
```

salt.modules.ilo.configure_network(ip, netmask, gateway)

Configure Network Interface

CLI Example:

```
salt '*' ilo.configure_network [IP ADDRESS] [NETMASK] [GATEWAY]
```

salt.modules.ilo.configure_snmp(community, snmp_port=161, snmp_trapport=161)

Configure SNMP

CLI Example:

```
salt '*' ilo.configure_snmp [COMMUNITY STRING] [SNMP PORT] [SNMP TRAP PORT]
```

salt.modules.ilo.create_user(name, password, *privileges)

Create user

CLI Example:
If no permissions are specified, the user will only have a read-only account.

Supported privileges:
- `ADMIN_PRIV` Enables the user to administer user accounts.
- `REMOTE_CONS_PRIV` Enables the user to access the Remote Console functionality.
- `RESET_SERVER_PRIV` Enables the user to remotely manipulate the server power setting.
- `VIRTUAL_MEDIA_PRIV` Enables the user permission to access the virtual media functionality.
- `CONFIG_ILO_PRIV` Enables the user to configure iLO settings.

```python
salt '*' ilo.create_user damian secretagent VIRTUAL_MEDIA_PRIV
```

CLI Example:
```
salt '*' ilo.create_user damian secretagent VIRTUAL_MEDIA_PRIV
```

```python
salt.modules.ilo.delete_ssh_key(username)

Delete a user's SSH key from the ILO

CLI Example:
```
salt '*' ilo.delete_ssh_key damian
```

```python
salt.modules.ilo.delete_user(username)

Delete a user

CLI Example:
```
salt '*' ilo.delete_user damian
```

```python
salt.modules.ilo.disable_dhcp()

Disable DHCP

CLI Example:
```
salt '*' ilo.disable_dhcp
```

```python
salt.modules.ilo.disable_ssh()

Disable the SSH daemon

CLI Example:
```
salt '*' ilo.disable_ssh
```

```python
salt.modules.ilo.enable_dhcp()

Enable DHCP

CLI Example:
```
salt '*' ilo.enable_dhcp
```

```python
salt.modules.ilo.enable_ssh()

Enable the SSH daemon

CLI Example:
```
salt '*' ilo.enable_ssh
```

```python
salt.modules.ilo.get_user(username)

Returns local user information, excluding the password

CLI Example:
```
salt '*' ilo.get_user damian
```

21.9. execution modules
salt '*' ilo.get_user damian

salt.modules.ilo.global_settings()
    Show global settings
    CLI Example:
    
    salt '*' ilo.global_settings

salt.modules.ilo.list_users()
    List all users
    CLI Example:
    
    salt '*' ilo.list_users

salt.modules.ilo.list_users_info()
    List all users in detail
    CLI Example:
    
    salt '*' ilo.list_users_info

salt.modules.ilo.network()
    Grab the current network settings
    CLI Example:
    
    salt '*' ilo.network

salt.modules.ilo.set_http_port(port=80)
    Configure the port HTTP should listen on
    CLI Example:
    
    salt '*' ilo.set_http_port 8880

salt.modules.ilo.set_https_port(port=443)
    Configure the port HTTPS should listen on
    CLI Example:
    
    salt '*' ilo.set_https_port 4334

salt.modules.ilo.set_ssh_key(public_key)
    Configure SSH public keys for specific users
    CLI Example:
    
    salt '*' ilo.set_ssh_key "ssh-dss AAAAB3NzaC1kc3MAAAACBA... damian"

    The SSH public key needs to be DSA and the last argument in the key needs to be the username (case-sensitive) of the ILO username.

salt.modules.ilo.set_ssh_port(port=22)
    Enable SSH on a user defined port
    CLI Example:
21.9.182 salt.modules.incron

Work with incron

salt.modules.incron.list_tab(user)
   Return the contents of the specified user's incrontab
   CLI Example:
   ```
salt '*' incron.list_tab root
   ```

salt.modules.incron.ls(user)
   This function is an alias of list_tab.
   Return the contents of the specified user's incrontab
   CLI Example:
   ```
salt '*' incron.list_tab root
   ```

salt.modules.incron.raw_incron(user)
   Return the contents of the user's incrontab
   CLI Example:
   ```
salt '*' incron.raw_incron root
   ```

salt.modules.incron.raw_system_incron()
   Return the contents of the system wide incrontab
   CLI Example:
   ```
salt '*' incron.raw_system_incron
   ```

salt.modules.incron.rm(user, path, mask, cmd)
   This function is an alias of rm_job.
   Remove a incron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.
   CLI Example:
   ```
salt '*' incron.rm_job root /path
   ```

salt.modules.incron.rm_job(user, path, mask, cmd)
   Remove a incron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.
   CLI Example:
   ```
salt '*' incron.rm_job root /path
   ```

salt.modules.incron.set_job(user, path, mask, cmd)
   Sets an incron job up for a specified user.
   CLI Example:
salt '*' incron.set_job root '/root' 'IN_MODIFY' 'echo "$$ $@ $# $% $&"'

salt.modules.incron.write_incron_file\(user, path\)

Writes the contents of a file to a user's inicrontab

CLI Example:

```
salt '*' incron.write_incron_file root /tmp/new_incron
```

salt.modules.incron.write_incron_file_verbose\(user, path\)

Writes the contents of a file to a user's inicrontab and return error message on error

CLI Example:

```
salt '*' incron.write_incron_file_verbose root /tmp/new_incron
```

21.9.183 salt.modules.influxdb08mod

InfluxDB - A distributed time series database

Module to provide InfluxDB compatibility to Salt (compatible with InfluxDB version 0.5-0.8)

New in version 2014.7.0.

depends

- influxdb Python module (>= 1.0.0)

configuration This module accepts connection configuration details either as parameters or as configuration settings in /etc/salt/minion on the relevant minions:

```python
influxdb08.host: 'localhost'
influxdb08.port: 8086
influxdb08.user: 'root'
influxdb08.password: 'root'
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

salt.modules.influxdb08mod.db_create\(name, user=None, password=None, host=None, port=None\)

Create a database

name Database name to create
user The user to connect as
password The password of the user
host The host to connect to
port The port to connect to

CLI Example:

```
salt '*' influxdb08.db_create <name>
salt '*' influxdb08.db_create <name> <user> <password> <host> <port>
```

salt.modules.influxdb08mod.db_exists\(name, user=None, password=None, host=None, port=None\)

Checks if a database exists in Influxdb
**name**  Database name to create
**user**  The user to connect as
**password**  The password of the user
**host**  The host to connect to
**port**  The port to connect to

CLI Example:

```
salt '*' influxdb08.db_exists <name>
salt '*' influxdb08.db_exists <name> <user> <password> <host> <port>
```

salt.modules.influxdb08mod.db_list(*user=None, password=None, host=None, port=None*)
List all InfluxDB databases

**user**  The user to connect as
**password**  The password of the user
**host**  The host to connect to
**port**  The port to connect to

CLI Example:

```
salt '*' influxdb08.db_list
salt '*' influxdb08.db_list <user> <password> <host> <port>
```

salt.modules.influxdb08mod.db_remove(*name, user=None, password=None, host=None, port=None*)
Remove a database

**name**  Database name to remove
**user**  The user to connect as
**password**  The password of the user
**host**  The host to connect to
**port**  The port to connect to

CLI Example:

```
salt '*' influxdb08.db_remove <name>
salt '*' influxdb08.db_remove <name> <user> <password> <host> <port>
```

salt.modules.influxdb08mod.login_test(*name, password, database=None, host=None, port=None*)
Checks if a credential pair can log in at all.

If a database is specified: it will check for database user existence. If a database is not specified: it will check for cluster admin existence.

**user**  The user to connect as
**password**  The password of the user
**database**  The database to try to log in to
**host**  The host to connect to
**port**  The port to connect to
CLI Example:
```
salt '*' influxdb08.login_test <name>
salt '*' influxdb08.login_test <name> <database>
salt '*' influxdb08.login_test <name> <database> <user> <password> <host> <port>
```

```python
salt.modules.influxdb08mod.query(database, query, time_precision='s', chunked=False, user=None, password=None, host=None, port=None)
```

Querying data
- `database`: The database to query
- `query`: Query to be executed
- `time_precision`: Time precision to use ('s', 'm', or 'u')
- `chunked`: Whether is chunked or not
- `user`: The user to connect as
- `password`: The password of the user
- `host`: The host to connect to
- `port`: The port to connect to

CLI Example:
```
salt '*' influxdb08.query <database> <query>
salt '*' influxdb08.query <database> <query> <time_precision> <chunked> <user>, → <password> <host> <port>
```

```python
salt.modules.influxdb08mod.retention_policy_add(database, name, duration, replication, default=False, user=None, password=None, host=None, port=None)
```

Add a retention policy.
- `database`: The database to operate on.
- `name`: Name of the policy to modify.
- `duration`: How long InfluxDB keeps the data.
- `replication`: How many copies of the data are stored in the cluster.
- `default`: Whether this policy should be the default or not. Default is False.

CLI Example:
```
salt '*' influxdb08.retention_policy_add metrics default 1d 1
```

```python
salt.modules.influxdb08mod.retention_policy_alter(database, name, duration, replication, default=False, user=None, password=None, host=None, port=None)
```

Modify an existing retention policy.
- `database`: The database to operate on.
- `name`: Name of the policy to modify.
- `duration`: How long InfluxDB keeps the data.
- `replication`: How many copies of the data are stored in the cluster.
- `default`: Whether this policy should be the default or not. Default is False.
Salt Documentation, Release 3001.1

 CLI Example:

```
salt '*' influxdb08.retention_policy_modify metrics default 1d 1
```

```
salt.modules.influxdb08mod.retention_policy_exists(database, name, user=None, password=None, host=None, port=None)
```

Check if a retention policy exists.

database The database to operate on.

name Name of the policy to modify.

 CLI Example:

```
salt '*' influxdb08.retention_policy_exists metrics default
```

```
salt.modules.influxdb08mod.retention_policy_get(database, name, user=None, password=None, host=None, port=None)
```

Get an existing retention policy.

database The database to operate on.

name Name of the policy to modify.

 CLI Example:

```
salt '*' influxdb08.retention_policy_get metrics default
```

```
salt.modules.influxdb08mod.user_chpass(name, passwd, database=None, user=None, password=None, host=None, port=None)
```

Change password for a cluster admin or a database user.

If a database is specified: it will update database user password. If a database is not specified: it will update cluster admin password.

name User name for whom to change the password

passwd New password

database The database on which to operate

user The user to connect as

password The password of the user

host The host to connect to

port The port to connect to

 CLI Example:

```
salt '*' influxdb08.user_chpass <name> <passwd>
salt '*' influxdb08.user_chpass <name> <passwd> <database>
salt '*' influxdb08.user_chpass <name> <passwd> <database> <user> <password> ←<host> <port>
```

```
salt.modules.influxdb08mod.user_create(name, passwd, database=None, user=None, password=None, host=None, port=None)
```

Create a cluster admin or a database user.

If a database is specified: it will create database user. If a database is not specified: it will create a cluster admin.

21.9. execution modules
name  User name for the new user to create
passwd  Password for the new user to create
database  The database to create the user in
user  The user to connect as
password  The password of the user
host  The host to connect to
port  The port to connect to

CLI Example:

```
salt '*' influxdb08.user_create <name> <passwd>
salt '*' influxdb08.user_create <name> <passwd> <database>
salt '*' influxdb08.user_create <name> <passwd> <database> <user> <password>
  → <host> <port>
```

salt.modules.influxdb08mod.user_exists(name, database=None, user=None, password=None, host=None, port=None)

Checks if a cluster admin or database user exists.

If a database is specified: it will check for database user existence. If a database is not specified: it will check for cluster admin existence.

name  User name
database  The database to check for the user to exist
user  The user to connect as
password  The password of the user
host  The host to connect to
port  The port to connect to

CLI Example:

```
salt '*' influxdb08.user_exists <name>
salt '*' influxdb08.user_exists <name> <database>
salt '*' influxdb08.user_exists <name> <database> <user> <password> <host> <port>
```

salt.modules.influxdb08mod.user_list(database=None, user=None, password=None, host=None, port=None)

List cluster admins or database users.

If a database is specified: it will return database users list. If a database is not specified: it will return cluster admins list.

database  The database to list the users from
user  The user to connect as
password  The password of the user
host  The host to connect to
port  The port to connect to

CLI Example:
### salt.modules.influxdb08mod.user_remove

Remove a cluster admin or a database user.

If a database is specified: it will remove the database user. If a database is not specified: it will remove the cluster admin.

- **name** User name to remove
- **database** The database to remove the user from
- **user** User name for the new user to delete
- **user** The user to connect as
- **password** The password of the user
- **host** The host to connect to
- **port** The port to connect to

**CLI Example:**

```
salt '*' influxdb08.user_remove <name>
salt '*' influxdb08.user_remove <name> <database>
salt '*' influxdb08.user_remove <name> <database> <user> <password> <host> <port>
```

### 21.9.184 salt.modules.influxdbmod

InfluxDB - A distributed time series database

Module to provide InfluxDB compatibility to Salt (compatible with InfluxDB version 0.9+)

**depends**

- influxdb Python module (>= 3.0.0)

**configuration** This module accepts connection configuration details either as parameters or as configuration settings in `/etc/salt/minion` on the relevant minions:

```
influxdb.host: 'localhost'
influxdb.port: 8086
influxdb.user: 'root'
influxdb.password: 'root'
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

Most functions in this module allow you to override or provide some or all of these settings via keyword arguments:

```
salt '*' influxdb.foo_function influxdb_user='influxadmin' influxdb_
    →password='s3cr1t'
```

would override user and password while still using the defaults for host and port.
salt.modules.influxdbmod.alter_retention_policy(database, name, duration, replication, 
    default=False, **client_args)

Modify an existing retention policy.

name Name of the retention policy to modify.

database Name of the database for which the retention policy was defined.

duration New duration of given retention policy.

  Durations such as 1h, 90m, 12h, 7d, and 4w, are all supported and mean 1 hour, 90 minutes, 12 hours, 7 day, and 4 weeks, respectively. For infinite retention – meaning the data will never be deleted – use 'INF' for duration. The minimum retention period is 1 hour.

replication New replication of given retention policy.

  This determines how many independent copies of each data point are stored in a cluster.

default [False] Whether or not to set the modified policy as default.

CLI Example:

```bash
salt '*' influxdb.alter_retention_policy metrics default 1d 1
```

salt.modules.influxdbmod.continuous_query_exists(database, name, **client_args)

Check if continuous query with given name exists on the database.

database Name of the database for which the continuous query was defined.

name Name of the continuous query to check.

CLI Example:

```bash
salt '*' influxdb.continuous_query_exists metrics default
```

salt.modules.influxdbmod.create_continuous_query(database, name, query, re-
    sample_time=None, coverage_period=None, **client_args)

Create a continuous query.

database Name of the database for which the continuous query will be created on.

name Name of the continuous query to create.

query The continuous query string.

resample_time [None] Duration between continuous query resampling.

coverage_period [None] Duration specifying time period per sample.

CLI Example:

```bash
salt '*' influxdb.create_continuous_query mydb cq_month 'SELECT mean(*) INTO mydb.a_month.:MEASUREMENT FROM mydb.a_week./.* GROUP BY time(5m), *'
```

salt.modules.influxdbmod.create_db(name, **client_args)

Create a database.

name Name of the database to create.

CLI Example:

```bash
salt '*' influxdb.create_db <name>
```
salt.modules.influxdbmod.create_retention_policy(database, name, duration, replication, default=False, **client_args)

Create a retention policy.

**database** Name of the database for which the retention policy will be created.

**name** Name of the new retention policy.

**duration** Duration of the new retention policy.

Durations such as 1h, 90m, 12h, 7d, and 4w, are all supported and mean 1 hour, 90 minutes, 12 hours, 7 day, and 4 weeks, respectively. For infinite retention – meaning the data will never be deleted – use 'INF' for duration. The minimum retention period is 1 hour.

**replication** Replication factor of the retention policy.

This determines how many independent copies of each data point are stored in a cluster.

**default** [False] Whether or not the policy as default will be set as default.

CLI Example:
```
salt '*' influxdb.create_retention_policy metrics default 1d 1
```

salt.modules.influxdbmod.create_user(name, passwd, admin=False, **client_args)

Create a user.

**name** Name of the user to create.

**passwd** Password of the new user.

**admin** [False] Whether the user should have cluster administration privileges or not.

CLI Example:
```
salt '*' influxdb.create_user <name> <password>
salt '*' influxdb.create_user <name> <password> admin=True
```

salt.modules.influxdbmod.db_exists(name, **client_args)

Checks if a database exists in InfluxDB.

**name** Name of the database to check.

CLI Example:
```
salt '*' influxdb.db_exists <name>
```

salt.modules.influxdbmod.drop_continuous_query(database, name, **client_args)

Drop a continuous query.

**database** Name of the database for which the continuous query will be drop from.

**name** Name of the continuous query to drop.

CLI Example:
```
salt '*' influxdb.drop_continuous_query mydb my_cq
```

salt.modules.influxdbmod.drop_db(name, **client_args)

Drop a database.

**name** Name of the database to drop.

CLI Example:
salt '*$' influxdb.drop_db <name>

salt.modules.influxdbmod.drop_retention_policy(database, name, **client_args)
   Drop a retention policy.
   database  Name of the database for which the retention policy will be dropped.
   name  Name of the retention policy to drop.

   CLI Example:
   salt '*$' influxdb.drop_retention_policy mydb mypr

salt.modules.influxdbmod.get_continuous_query(database, name, **client_args)
   Get an existing continuous query.
   database  Name of the database for which the continuous query was defined.
   name  Name of the continuous query to get.

   CLI Example:
   salt '*$' influxdb.get_continuous_query mydb cq_month

salt.modules.influxdbmod.get_retention_policy(database, name, **client_args)
   Get an existing retention policy.
   database  Name of the database for which the retention policy was defined.
   name  Name of the retention policy.

   CLI Example:
   salt '*$' influxdb.get_retention_policy metrics default

salt.modules.influxdbmod.grant_admin_privileges(name, **client_args)
   Grant cluster administration privileges to a user.
   name  Name of the user to whom admin privileges will be granted.

   CLI Example:
   salt '*$' influxdb.grant_admin_privileges <name>

salt.modules.influxdbmod.grant_privilege(database, privilege, username, **client_args)
   Grant a privilege on a database to a user.
   database  Name of the database to grant the privilege on.
   privilege  Privilege to grant. Can be one of 'read', 'write' or 'all'.
   username  Name of the user to grant the privilege to.

salt.modules.influxdbmod.list_dbs(**client_args)
   List all InfluxDB databases.

   CLI Example:
   salt '*$' influxdb.list_dbs

salt.modules.influxdbmod.list_privileges(name, **client_args)
   List privileges from a user.
name  Name of the user from whom privileges will be listed.

CLI Example:
```bash
salt '*' influxdb.list_privileges <name>
```

```python
salt.modules.influxdbmod.list_users(**client_args)
```
List all users.

CLI Example:
```bash
salt '*' influxdb.list_users
```

```python
salt.modules.influxdbmod.query(database, query, **client_args)
```
Execute a query.

- **database**  Name of the database to query on.
- **query**  InfluxQL query string.

```python
salt.modules.influxdbmod.remove_user(name, **client_args)
```
Remove a user.

- **name**  Name of the user to remove

CLI Example:
```bash
salt '*' influxdb.remove_user <name>
```

```python
salt.modules.influxdbmod.retention_policy_exists(database, name, **client_args)
```
Check if retention policy with given name exists.

- **database**  Name of the database for which the retention policy was defined.
- **name**  Name of the retention policy to check.

CLI Example:
```bash
salt '*' influxdb.retention_policy_exists metrics default
```

```python
salt.modules.influxdbmod.revoke_admin_privileges(name, **client_args)
```
Revoke cluster administration privileges from a user.

- **name**  Name of the user from whom admin privileges will be revoked.

CLI Example:
```bash
salt '*' influxdb.revoke_admin_privileges <name>
```

```python
salt.modules.influxdbmod.revoke_privilege(database, privilege, username, **client_args)
```
Revoke a privilege on a database from a user.

- **database**  Name of the database to grant the privilege on.
- **privilege**  Privilege to grant. Can be one of 'read', 'write' or 'all'.
- **username**  Name of the user to grant the privilege to.

```python
salt.modules.influxdbmod.set_user_password(name, passwd, **client_args)
```
Change password of a user.

- **name**  Name of the user for whom to set the password.
- **passwd**  New password of the user.
CLI Example:

```bash
salt '*' influxdb.set_user_password <name> <password>
```

```
salt.modules.influxdbmod.user_exists(name, **client_args)
```
Check if a user exists.

- **name** Name of the user to check.

CLI Example:

```bash
salt '*' influxdb.user_exists <name>
```

```
salt.modules.influxdbmod.user_info(name, **client_args)
```
Get information about given user.

- **name** Name of the user for which to get information.

CLI Example:

```bash
salt '*' influxdb.user_info <name>
```

## 21.9.185 salt.modules.influxdbmod

This module have been tested on influxdb API v1.2.1, other versions of the API are likely workable.

**depends** libinfluxdb, https://github.com/steverweber/libinfluxdb

libinfluxdb can be installed using `pip install libinfluxdb`

API documents can be found on your influxdb server at:

https://INFOBLOX/wapidoc

**configuration** The following configuration defaults can be defined (pillar or config files '/etc/salt/master.d/influxdb.conf'):

```yaml
infoblox.config:
  api_sslverify: True
  api_url: 'https://INFOBLOX/wapi/v1.2.1'
  api_user: 'username'
  api_key: 'password'
```

Many of the functions accept `api_opts` to override the API config.

```bash
salt-call influxdb.get_host name=my.host.com api_url: ->'https://INFOBLOX/wapi/v1.2.1'
api_user=admin
api_key=passs
```

```
salt.modules.influxdbmod.create_a(data, **api_opts)
```
Create A record.

This is a helper function to `create_object`. See your influxdb API for full `data` format.

CLI Example:

```bash
salt-call influxdb.create_a data =
  name: 'fastlinux.math.example.ca'
  ipv4addr: '127.0.0.1'
  view: External
```
salt.modules.infoblox.create_cname(data, **api_opts)
Create a cname record.

CLI Example:

```
salt-call infoblox.create_cname data={
  "name": "example.example.com",
  "zone": "example.com",
  "view": "Internal",
  "canonical": "example-ha-0.example.com"
}
```

salt.modules.infoblox.create_host(data, **api_opts)
Add host record

Avoid race conditions, use func:nextavailableip for ipv4,6addrs:

- func:nextavailableip:network/ZG54dfgsrDFEFfssfsZLzA:10.0.0.0/8/default
- func:nextavailableip:10.0.0.0/8
- func:nextavailableip:10.0.0.0/8,external
- func:nextavailableip:10.0.0.3-10.0.0.10

See your infoblox API for full data format.

CLI Example:

```
salt-call infoblox.create_host data =
{
  'name': 'hostname.example.ca',
  'aliases': ['hostname.math.example.ca'],
  'extattrs': [{
    'Business Contact': {
      'value': 'example@example.ca'
    },
    'Pol8 Classification': {
      'value': 'Restricted'
    },
    'Primary OU': {
      'value': 'CS'
    },
    'Technical Contact': {
      'value': 'example@example.ca'
    }
  },
  'ipv4addr': [{
    'configure_for_dhcp': True,
    'ipv4addr': 'func:nextavailableip:129.97.139.0/24',
    'mac': '00:50:56:84:6e:ae'}],
  'ipv6addr': []
}
```

salt.modules.infoblox.create_ipv4_range(data, **api_opts)
Create a ipv4 range

This is a helper function to create_object See your infoblox API for full data format.

CLI Example:

```
salt-call infoblox.create_ipv4_range data=
{
  'start_addr': '129.97.150.160',
  'end_addr': '129.97.150.170'
}
```

salt.modules.infoblox.create_object(object_type, data, **api_opts)
Create raw infoblox object. This is a low level api call.

CLI Example:

```
salt-call infoblox.update_object object_type=record:host data={} 
```

salt.modules.infoblox.delete_a(name=None, ipv4addr=None, allow_array=False, **api_opts)
Delete A record

If the A record is used as a round robin you can set allow_array=True to delete all records for the host-name.

21.9. execution modules

1985
CLI Examples:

```
salt-call infoblox.delete_a name=abc.example.com
salt-call infoblox.delete_a ipv4addr=192.168.3.5
salt-call infoblox.delete_a name=acname.example.com allow_array=True
```

`salt.modules.infoblox.delete_cname(name=None, canonical=None, **api_opts)`  
Delete CNAME. This is a helper call to delete_object.  
If record is not found, return True  
CLI Examples:

```
salt-call infoblox.delete_cname name=example.example.com
salt-call infoblox.delete_cname canonical=example-ha-0.example.com
```

`salt.modules.infoblox.delete_host(name=None, mac=None, ipv4addr=None, **api_opts)`  
Delete host  
CLI Example:

```
salt-call infoblox.delete_host name=example.domain.com
salt-call infoblox.delete_host ipv4addr=123.123.122.12  
salt-call infoblox.delete_host ipv4addr=123.123.122.12 mac=00:50:56:84:6e:ae
```

`salt.modules.infoblox.delete_ipv4_range(start_addr=None, end_addr=None, **api_opts)`  
Delete ip range.  
CLI Example:

```
salt-call infoblox.delete_ipv4_range start_addr=123.123.122.12
```

`salt.modules.infoblox.delete_object(objref, **api_opts)`  
Delete infoblox object. This is a low level api call.  
CLI Example:

```
salt-call infoblox.delete_object objref=[ref_of_object]
```

`salt.modules.infoblox.diff_objects(obja, objb)`  
Diff two complex infoblox objects. This is used from salt states to detect changes in objects.  
Using func:nextavailableip will not cause a diff if the ipaddress is in range  

`salt.modules.infoblox.get_a(name=None, ipv4addr=None, allow_array=True, **api_opts)`  
Get A record  
CLI Examples:

```
salt-call infoblox.get_a name=abc.example.com
salt-call infoblox.get_a ipv4addr=192.168.3.5
```

`salt.modules.infoblox.get_cname(name=None, canonical=None, return_fields=None, **api_opts)`  
Get CNAME information.  
CLI Examples:

```
salt-call infoblox.get_cname name=example.example.com
salt-call infoblox.get_cname canonical=example-ha-0.example.com
```
salt.modules.infoblox.get_host(name=None, ipv4addr=None, mac=None, return_fields=None, **api_opts)

Get host information

CLI Examples:

```bash
salt-call infoblox.get_host hostname.domain.ca
salt-call infoblox.get_host ipv4addr=123.123.122.12
salt-call infoblox.get_host mac=00:50:56:84:6e:ae
```

salt.modules.infoblox.get_host_advanced(name=None, ipv4addr=None, mac=None, **api_opts)

Get all host information

CLI Example:

```bash
salt-call infoblox.get_host_advanced hostname.domain.ca
```

salt.modules.infoblox.get_host_domainname(name, domains=None, **api_opts)

Get host domain name

- If no domains are passed, the hostname is checked for a zone in infoblox, if no zone split on first dot.
- If domains are provided, the best match out of the list is returned.
- If none are found the return is None
- dots at end of names are ignored.

CLI Example:

```bash
salt-call uwel.get_host_domainname name=localhost.t.domain.com  # returns: t.domain.com
→domains=[['domain.com', 't.domain.com.']]  # returns: t.domain.com
```

salt.modules.infoblox.get_host_hostname(name, domains=None, **api_opts)

Get hostname

- If no domains are passed, the hostname is checked for a zone in infoblox, if no zone split on first dot.
- If domains are provided, the best match out of the list is truncated from the fqdn leaving the hostname.
- If no matching domains are found the fqdn is returned.
- dots at end of names are ignored.

CLI Examples:

```bash
salt-call infoblox.get_host_hostname fqdn=localhost.xxx.t.domain.com  # returns: localhost.xxx
→domains=[['domain.com', 't.domain.com.']]  # returns: localhost
salt-call infoblox.get_host_hostname fqdn=localhost.xxx.t.domain.com
```

salt.modules.infoblox.get_host_ipv4(name=None, mac=None, allow_array=False, **api_opts)

Get ipv4 address from host record.

Use allow_array to return possible multiple values.

CLI Examples:
salt-call infoblox.get_host_ipv4 host=localhost.domain.com
salt-call infoblox.get_host_ipv4 mac=00:50:56:84:6e:ae

salt.modules.infoblox.get_host_ipv4addr_info(ipv4addr=None, mac=None, discovered_data=None, return_fields=None, **api_opts)
Get host ipv4addr information
CLI Examples:
salt-call infoblox.get_ipv4addr ipv4addr=123.123.122.12
salt-call infoblox.get_ipv4addr mac=00:50:56:84:6e:ae
salt-call infoblox.get_ipv4addr mac=00:50:56:84:6e:ae return_fields=host return_fields=mac,host,configure_for_dhcp,ipv4addr

salt.modules.infoblox.get_host_ipv6addr_info(ipv6addr=None, mac=None, discovered_data=None, return_fields=None, **api_opts)
Get host ipv6addr information
CLI Example:
salt-call infoblox.get_host_ipv6addr_info ipv6addr=2001:db8:85a3:8d3:1349:8a2e:370:7348

salt.modules.infoblox.get_host_mac(name=None, allow_array=False, **api_opts)
Get mac address from host record.
Use allow_array to return possible multiple values.
CLI Example:
salt-call infoblox.get_host_mac host=localhost.domain.com

salt.modules.infoblox.get_ipv4_range(start_addr=None, end_addr=None, return_fields=None, **api_opts)
Get ip range
CLI Example:
salt-call infoblox.get_ipv4_range start_addr=123.123.122.12

salt.modules.infoblox.get_network(ipv4addr=None, network=None, return_fields=None, **api_opts)
Get list of all networks. This is helpful when looking up subnets to use with func:nextavailableip
This call is often slow and not cached!
some return_fields comment, network, network_view, ddns_domainname, disable, enable_ddns
CLI Example:
salt-call infoblox.get_network

salt.modules.infoblox.get_object(objref, data=None, return_fields=None, max_results=None, ensure_none_or_one_result=False, **api_opts)
Get raw infoblox object. This is a low level api call.
CLI Example:
salt-call infoblox.get_object objref=[_ref of object]

salt.modules.infoblox.is_ipaddr_in_ipfunc_range(ipaddr, ipfunc)
Return true if the ipaddress is in the range of the nextavailableip function

CLI Example:

salt-call infoblox.is_ipaddr_in_ipfunc_range ipaddr="10.0.2.2" ipfunc="func:nextavailableip:10.0.0.0/8"

salt.modules.infoblox.update_cname(name, data, **api_opts)
Update CNAME. This is a helper call to update_object.
Find a CNAME _ref then call update_object with the record data.

CLI Example:

salt-call infoblox.update_cname name=example.example.com data="{
    'canonical': 'example-ha-0.example.com',
    'use_ttl': true,
    'ttl': 200,
    'comment': 'Salt managed CNAME'}"

salt.modules.infoblox.update_host(name, data, **api_opts)
Update host record. This is a helper call to update_object.
Find a hosts _ref then call update_object with the record data.

CLI Example:

salt-call infoblox.update_host name=fqdn data={}

salt.modules.infoblox.update_object(objref, data, **api_opts)
Update raw infoblox object. This is a low level api call.

CLI Example:

salt-call infoblox.update_object objref=[ref_of_object] data={}

21.9.186 salt.modules.ini_manage

Edit ini files

maintainer <akilesh1597@gmail.com>
maturity new
depends re
platform all

(for example /etc/sysctl.conf)

salt.modules.ini_manage.get_ini(file_name, separator="=")
Retrieve whole structure from an ini file and return it as dictionary.

API Example:
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.get_ini',
       [path_to_ini_file])

CLI Example:
salt '*' ini.get_ini /path/to/ini

salt.modules.ini_manage.get_option(file_name, section, option, separator='=')
Get value of a key from a section in an ini file. Returns None if no matching key was found.

API Example:
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.get_option',
       [path_to_ini_file, section_name, option])

CLI Example:
salt '*' ini.get_option /path/to/ini section_name option_name

salt.modules.ini_manage.get_section(file_name, section, separator='=')
Retrieve a section from an ini file. Returns the section as dictionary. If the section is not found, an empty dictionary is returned.

API Example:
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.get_section',
       [path_to_ini_file, section_name])

CLI Example:
salt '*' ini.get_section /path/to/ini section_name

salt.modules.ini_manage.remove_option(file_name, section, option, separator='=')
Remove a key/value pair from a section in an ini file. Returns the value of the removed key, or None if nothing was removed.

API Example:
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.remove_option',
       [path_to_ini_file, section_name, option])

CLI Example:
salt '*' ini.remove_option /path/to/ini section_name option_name

salt.modules.ini_manage.remove_section(file_name, section, separator='=')
Remove a section in an ini file. Returns the removed section as dictionary, or None if nothing was removed.

API Example:
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.remove_section',
       [path_to Ini_file, section_name])

CLI Example:
salt '*i' ini.remove_section /path/to/ini section_name

salt.modules.ini_manage.set_option(file_name, sections=None, separator='=')
Edit an ini file, replacing one or more sections. Returns a dictionary containing the changes made.

file_name path of ini file
sections [None] A dictionary representing the sections to be edited ini file The keys are the section names and the values are the dictionary containing the options If the ini file does not contain sections the keys and values represent the options
separator [=] A character used to separate keys and values. Standard ini files use the "=" character.

New in version 2016.11.0.

API Example:
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.set_option',
       ['path_toIni_file', '{"section_to_change": {"key": "value"}}']

CLI Example:
salt '*i' ini.set_option /path/to/ini '{section_foo: {key: value}}'

21.9.187 salt.modules.inspectlib package

Submodules

salt.modules.inspectlib.collector module

class salt.modules.inspectlib.collector.Inspector(cachedir=None, piddir=None, pidfile=name=None)

DEFAULT_MINION_CONFIG_PATH = '/etc/salt/minion'
IGNORE_FS_TYPES = ['autofs', 'cifs', 'nfs', 'nfs4']
IGNORE_MOUNTS = ['proc', 'sysfs', 'devtmpfs', 'tmpfs', 'fuse.gvfs-fuse-daemon']
IGNORE_PATHS = ['/tmp', '/var/tmp', '/lost+found', '/var/run', '/var/lib/rpm', '/.snapshots', '/.zfs', '/etc/ssh', '/root', '/home']
MODE = ['configuration', 'payload', 'all']
build(format='qcow2', path='tmp')
Build an image using Kiwi.

Parameters
- format --
- path --
Returns

create_snapshot()
Open new snapshot.

Returns

export (description, local=False, path=’/tmp’, format=’qcow2’)
Export description for Kiwi.

Parameters
• local --
• path --

Returns

request_snapshot (mode, priority=19, **kwargs)
Take a snapshot of the system.

reuse_snapshot()
Open an existing, latest snapshot.

Returns

snapshot (mode)
Take a snapshot of the system.

salt.modules.inspectlib.collector.is_alive(pidfile)
Check if PID is still alive.

salt.modules.inspectlib.collector.main(dbfile, pidfile, mode)
Main analyzer routine.

salt.modules.inspectlib.dbhandle module

class salt.modules.inspectlib.dbhandle.DBHandle(path)

class salt.modules.inspectlib.dbhandle.DBHandleBase(path)
Handle for the volatile database, which serves the purpose of caching the inspected data. This database can be destroyed or corrupted, so it should be simply re-created from scratch.

close()
Close the database connection.

flush(table)
Flush the table.

open(new=False)
Init the database, if required.

purge()
Purge whole database.
salt.modules.inspectlib.exceptions module

**exception** salt.modules.inspectlib.exceptions.

**InspectorKiwiProcessorException**
Kiwi builder/exporter exception.

**exception** salt.modules.inspectlib.exceptions.

**InspectorQueryException**
Exception that is only for the inspector query.

**exception** salt.modules.inspectlib.exceptions.

**InspectorSnapshotException**
Snapshot exception.

**exception** salt.modules.inspectlib.exceptions.

**SIException**
System information exception.

salt.modules.inspectlib.query module

**class** salt.modules.inspectlib.query.

**Query**(scope, cachedir=None)
Query the system. This class is actually puts all Salt features together, so there would be no need to pick it from various places.

**SCOPES** = ['changes', 'configuration', 'identity', 'system', 'software', 'services', 'payload', 'all']

**class** salt.modules.inspectlib.query.

**SysInfo**(systype)
System information.

Module contents

**class** salt.modules.inspectlib.

**EnvLoader**(cachedir=None, piddir=None, pidfilename=None)
Load environment.

**DB_FILE** = '_minion_collector.db'

**DEFAULT_CACHE_PATH** = '/var/cache/salt'

**DEFAULT_PID_PATH** = '/var/run'

**PID_FILE** = '_minion_collector.pid'

21.9.188 salt.modules.inspectlib.entities module

**class** salt.modules.inspectlib.entities.

**AllowedDir**
Allowed directories

**class** salt.modules.inspectlib.entities.

**IgnoredDir**
Ignored directories

**class** salt.modules.inspectlib.entities.

**Package**
Package.

**class** salt.modules.inspectlib.entities.

**PackageCfgFile**
Config file, belongs to the package

**class** salt.modules.inspectlib.entities.

**PayloadFile**
Payload file.
21.9.189 salt.modules.inspectlib.fsdb module

codeauthor Bo Maryniuk <bo@suse.de>

class salt.modules.inspectlib.fsdb.CsvDB(path)
File-based CSV database. This database is in-memory operating relatively small plain text csv files.

close()
Close the database.

Returns

create_table_from_object(obj)
Create a table from the object. NOTE: This method doesn't stores anything.

Parameters obj --

Returns

delete(obj, matches=None, mt=None, lt=None, eq=None)
Delete object from the database.

Parameters

• obj --

• matches --

• mt --

• lt --

• eq --

Returns

flush(table)
Flush table.

Parameters table --

Returns

get(obj, matches=None, mt=None, lt=None, eq=None)
Get objects from the table.

Parameters

• table_name --

• matches -- Regexp.

• mt -- More than.

• lt -- Less than.

• eq -- Equals.

Returns

is_closed()
Return if the database is closed.

Returns

list()
List all the databases on the given path.
Returns

`list_tables()`
Load existing tables and their descriptions.

Returns

`new()`
Create a new database and opens it.

Returns

`open(dbname=None)`
Open database from the path with the name or latest. If there are no yet databases, create a new implicitly.

Returns

`purge(dbid)`
Purge the database.

Parameters `dbid` --

Returns

`store(obj, distinct=False)`
Store an object in the table.

Parameters

• `obj` -- An object to store
• `distinct` -- Store object only if there is none identical of such. If at least one field is different, store it.

Returns

`update(obj, matches=None, mt=None, lt=None, eq=None)`
Update object(s) in the database.

Parameters

• `obj` --
• `matches` --
• `mt` --
• `lt` --
• `eq` --

Returns

`class salt.modules.inspectlib.fsdb.CsvDBEntity`
Serializable object for the table.
21.9.190 salt.modules.inspectlib.kiwiproc module

class salt.modules.inspectlib.kiwiproc.KiwiExporter(grains, format)
Exports system description as Kiwi configuration.

    export(name)
    Export to the Kiwi config.xml as text.

    Returns

    load(**descr)
    Load data by keys.

    Parameters data --

    Returns

21.9.191 salt.modules.inspector module

Module for full system inspection.

salt.modules.inspector.build(format='qcow2', path='/tmp/')
Build an image from a current system description. The image is a system image can be output in bootable ISO or QCOW2 formats.

    Node uses the image building library Kiwi to perform the actual build.

    Parameters:

    • format: Specifies output format: "qcow2" or "iso. Default: qcow2.

    • path: Specifies output path where to store built image. Default: /tmp.

    CLI Example:

    salt myminion inspector.build
    salt myminion inspector.build format=iso path=/opt/builds/

salt.modules.inspector.delete(all=False, *databases)
Remove description snapshots from the system.

    ::parameter: all. Default: False. Remove all snapshots, if set to True.

    CLI example:

    salt myminion inspector.delete <ID> <ID1> <ID2>..
    salt myminion inspector.delete all=True

salt.modules.inspector.export(local=False, path='/tmp', format='qcow2')
Export an image description for Kiwi.

    Parameters:

    • local: Specifies True or False if the export has to be in the local file. Default: False.

    • path: If local=True, then specifies the path where file with the Kiwi description is written. Default: /tmp.

    CLI Example:

    salt myminion inspector.export
    salt myminion inspector.export format=iso path=/opt/builds/
salt.modules.inspector.inspect\(mode='all', priority=19, **kwargs\)

Start node inspection and save the data to the database for further query.

Parameters:

- **mode**: Clarify inspection mode: configuration, payload, all (default)
  - payload
    - **filter**: Comma-separated directories to track payload.
- **priority**: (advanced) Set priority of the inspection. Default is low priority.

CLI Example:

```
salt '*' inspector.inspect
salt '*' inspector.inspect configuration
salt '*' inspector.inspect payload filter=/opt,/ext/oracle
```

salt.modules.inspector.query\(*args, **kwargs\)

Query the node for specific information.

Parameters:

- **scope**: Specify scope of the query.
  - **System**: Return system data.
  - **Software**: Return software information.
  - **Services**: Return known services.
  - **Identity**: Return user accounts information for this system.
    - **accounts**: Can be either 'local', 'remote' or 'all' (equal to "local,remote"). Remote accounts cannot be resolved on all systems, but only those, which supports `passwd -S -a`.
    - **disabled**: True (or False, default) to return only disabled accounts.
  - **payload**: Payload scope parameters:
    - **filter**: Include only results which path starts from the filter string.
    - **time**: Display time in Unix ticks or format according to the configured TZ (default) Values: ticks, tz (default)
    - **size**: Format size. Values: B, KB, MB, GB
    - **type**: Include payload type. Values (comma-separated): directory (or dir), link, file (default)
      Example (returns everything): type=directory,link,file
    - **owners**: Resolve UID/GID to an actual names or leave them numeric (default). Values: name (default), id
    - **brief**: Return just a list of payload elements, if True. Default: False.
    - **all**: Return all information (default).

CLI Example:

```
salt '*' inspector.query scope=system
salt '*' inspector.query scope=payload type=file,link filter=/etc size=Kb size=KB
->brief=False
```
salt.modules.inspector.snapshots()
List current description snapshots.

   CLI Example:

```
salt myminion inspector.snapshots
```

21.9.192 salt.modules.introspect

Functions to perform introspection on a minion, and return data in a format usable by Salt States

salt.modules.introspect.enabled_service_owners()
Return which packages own each of the services that are currently enabled.

   CLI Example:

```
salt myminion introspect.enabled_service_owners
```

salt.modules.introspect.running_service_owners(exclude='/dev', '/home', '/media', '/proc',
   '/run', '/sys', '/tmp', '/var')
Determine which packages own the currently running services. By default, excludes files whose full path starts
with /dev, /home, /media, /proc, /run, /sys, /tmp and /var. This can be overridden by passing in a
new list to exclude.

   CLI Example:

```
salt myminion introspect.running_service_owners
```

salt.modules.introspect.service_highstate(required=True)
Return running and enabled services in a highstate structure. By default also returns package dependencies
for those services, which means that package definitions must be created outside this function. To drop the
package dependencies, set requires to False.

   CLI Example:

```
salt myminion introspect.service_highstate
salt myminion introspect.service_highstate requires=False
```

21.9.193 salt.modules.iosconfig module

Cisco IOS configuration manipulation helpers

New in version 2019.2.0.

This module provides a collection of helper functions for Cisco IOS style configuration manipulation. This module
does not have external dependencies and can be used from any Proxy or regular Minion.

salt.modules.iosconfig.clean(config=None, path=None, saltenv='base')
Return a clean version of the config, without any special signs (such as ! as an individual line) or empty lines,
but just lines with significant value in the configuration of the network device.

   config  The configuration sent as text. This argument is ignored when path is configured.

   path    Absolute or remote path from where to load the configuration text. This argument allows any URI
            supported by cp.get_url, e.g., salt://, https://, s3://, ftp://, etc.

   saltenv: base  Salt fileserver environment from which to retrieve the file. Ignored if path is not a salt://
            URL.

   CLI Example:
salt.modules.iosconfig.diff_text(candidate_config=None, candidate_path=None, running_config=None, running_path=None, saltenv='base')

Return the diff, as text, between the candidate and the running config.

candidate_config The candidate configuration sent as text. This argument is ignored when candidate_path is set.

candidate_path Absolute or remote path from where to load the candidate configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

running_config The running configuration sent as text. This argument is ignored when running_path is set.

running_path Absolute or remote path from where to load the running configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

saltenv: base Salt fileserver environment from which to retrieve the file. Ignored if candidate_path or running_path is not a `salt://` URL.

CLI Example:

```
salt '*' iosconfig.diff_text candidate_path=salt://path/to/candidate.cfg running_path=salt://path/to/running.cfg
```

salt.modules.iosconfig.diff_tree(candidate_config=None, candidate_path=None, running_config=None, running_path=None, saltenv='base')

Return the diff, as Python dictionary, between the candidate and the running configuration.

candidate_config The candidate configuration sent as text. This argument is ignored when candidate_path is set.

candidate_path Absolute or remote path from where to load the candidate configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

running_config The running configuration sent as text. This argument is ignored when running_path is set.

running_path Absolute or remote path from where to load the running configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

saltenv: base Salt fileserver environment from which to retrieve the file. Ignored if candidate_path or running_path is not a `salt://` URL.

CLI Example:

```
salt '*' iosconfig.diff_tree candidate_path=salt://path/to/candidate.cfg running_path=salt://path/to/running.cfg
```

salt.modules.iosconfig.merge_diff(initial_config=None, initial_path=None, merge_config=None, merge_path=None, saltenv='base')

Return the merge diff, as text, after merging the merge config into the initial config.

initial_config The initial configuration sent as text. This argument is ignored when initial_path is set.

initial_path Absolute or remote path from where to load the initial configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

merge_config The config to be merged into the initial config, sent as text. This argument is ignored when merge_path is set.
merge_path  Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.
saltenv: **base**  Salt fileserver environment from which to retrieve the file. Ignored if `initial_path` or `merge_path` is not a `salt://` URL.

CLI Example:

```
salt '*' iosconfig.merge_diff initial_path=salt://path/to/running.cfg merge_path=salt://path/to/merge.cfg
```

```
salt.modules.iosconfig.merge_text(initial_config=None, initial_path=None, merge_config=None, merge_path=None, saltenv='base')
```

Return the merge result of the `initial_config` with the `merge_config`, as plain text.

**initial_config**  The initial configuration sent as text. This argument is ignored when `initial_path` is set.

**initial_path**  Absolute or remote path from where to load the initial configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**merge_config**  The config to be merged into the initial config, sent as text. This argument is ignored when `merge_path` is set.

**merge_path**  Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**saltenv: base**  Salt fileserver environment from which to retrieve the file. Ignored if `initial_path` or `merge_path` is not a `salt://` URL.

CLI Example:

```
salt '*' iosconfig.merge_text initial_path=salt://path/to/running.cfg merge_path=salt://path/to/merge.cfg
```

```
salt.modules.iosconfig.merge_tree(initial_config=None, initial_path=None, merge_config=None, merge_path=None, saltenv='base')
```

Return the merge tree of the `initial_config` with the `merge_config`, as a Python dictionary.

**initial_config**  The initial configuration sent as text. This argument is ignored when `initial_path` is set.

**initial_path**  Absolute or remote path from where to load the initial configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**merge_config**  The config to be merged into the initial config, sent as text. This argument is ignored when `merge_path` is set.

**merge_path**  Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**saltenv: base**  Salt fileserver environment from which to retrieve the file. Ignored if `initial_path` or `merge_path` is not a `salt://` URL.

CLI Example:

```
salt '*' iosconfig.merge_tree initial_path=salt://path/to/running.cfg merge_path=salt://path/to/merge.cfg
```

```
salt.modules.iosconfig.tree(config=None, path=None, with_tags=False, saltenv='base')
```

Transform Cisco IOS style configuration to structured Python dictionary. Depending on the value of the `with_tags` argument, this function may provide different views, valuable in different situations.

**config**  The configuration sent as text. This argument is ignored when `path` is configured.
path  Absolute or remote path from where to load the configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

with_tags:  **False**  Whether this function should return a detailed view, with tags.

saltenv:  **base**  Salt fileserver environment from which to retrieve the file. Ignored if `path` is not a `salt://` URL.

CLI Example:
```
salt '*' iosconfig.tree path=salt://path/to/my/config.txt
salt '*' iosconfig.tree path=https://bit.ly/2mAdq7z
```

## 21.9.194  salt.modules.ipmi

Support IPMI commands over LAN. This module does not talk to the local systems hardware through IPMI drivers. It uses a python module `pyghmi`.

**depends**  Python module `pyghmi`. You can install `pyghmi` using pip:

```
pip install pyghmi
```

**configuration**  The following configuration defaults can be define (pillar or config files):

```json
ipmi.config:
    api_host: 127.0.0.1
    api_user: admin
    api_pass: apassword
    api_port: 623
    api_kg: None
```

Usage can override the config defaults:
```
salt-call ipmi.get_user api_host=myipmienabled.system
    api_user=admin api_pass=pass
    uid=1
```

**salt.modules.ipmi.create_user**  (`uid`, `name`, `password`, `channel=14`, `callback=False`, `link_auth=True`, `ipmi_msg=True`, `privilege_level='administrator'`, `**kwargs`)

create/ensure a user is created with provided settings.

**Parameters**

-  **privilege_level**  --  User Privilege Limit. (Determines the maximum privilege level that the user is allowed to switch to on the specified channel.)  * callback * user * operator * administrator * proprietary * no_access

-  **kwargs**  --

  -  `api_host=127.0.0.1`
  -  `api_user=admin`
  -  `api_pass=example`
  -  `api_port=623`
  -  `api_kg=None`

**CLI Examples:**

```
```
salt-call ipmi.create_user uid=2 name=steverweber api_host=172.168.0.7 api_pass=nevertell

salt.modules.ipmi.fast_connect_test(**kwargs)
Returns True if connection success. This uses an aggressive timeout value!

Parameters **kwargs --
- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

CLI Examples:
salt-call ipmi.fast_connect_test api_host=172.168.0.9

salt.modules.ipmi.get_bootdev(**kwargs)
Get current boot device override information.
Provides the current requested boot device. Be aware that not all IPMI devices support this. Even in BMCs that claim to, occasionally the BIOS or UEFI fail to honor it. This is usually only applicable to the next reboot.

Parameters **kwargs --
- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

CLI Example:
salt-call ipmi.get_bootdev api_host=127.0.0.1 api_user=admin api_pass=password

salt.modules.ipmi.get_channel_access(channel=14, read_mode='non_volatile', **kwargs)

Parameters
- channel -- number [1:7]
- read_mode --
  - non_volatile = get non-volatile Channel Access
  - volatile = get present volatile (active) setting of Channel Access
- **kwargs --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
Return Data

A Python dict with the following keys/values:

```python
{
    'alerting':
    'per_msg_auth':
    'user_level_auth':
    'access_mode': { (ONE OF)
        0: 'disabled',
        1: 'pre_boot',
        2: 'always',
        3: 'shared'
    }
    'privilege_level': { (ONE OF)
        1: 'callback',
        2: 'user',
        3: 'operator',
        4: 'administrator',
        5: 'proprietary'
    }
}
```

CLI Examples:

```
salt-call ipmi.get_channel_access channel=1
```

salt.modules.ipmi.get_channel_info(channel=14, **kwargs)

Get channel info

Parameters

- **channel** -- number [1:7]
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Return Data

channel session supports

- no_session: channel is session-less
- single: channel is single-session
- multi: channel is multi-session
- auto: channel is session-based (channel could alternate between single- and multi-session operation, as can occur with a serial/modem channel that supports connection mode auto-detect)

CLI Examples:

```
salt-call ipmi.get_channel_info
```
salt.modules.ipmi.get_channel_max_user_count(channel=14,**kwargs)
Get max users in channel

Parameters
- **channel** -- number [1:7]
- **kwargs**
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Returns int -- often 16

CLI Examples:
```
salt-call ipmi.get_channel_max_user_count
```

salt.modules.ipmi.get_health(**kwargs)
Get Summarize health

This provides a summary of the health of the managed system. It additionally provides an iterable list of reasons for warning, critical, or failed assessments.

good health: {'badreadings': [], 'health': 0}

Parameters **kwargs
- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

CLI Example:
```
salt-call ipmi.get_health api_host=127.0.0.1 api_user=admin api_pass=pass
```

salt.modules.ipmi.get_power(**kwargs)
Get current power state

The response, if successful, should contain 'powerstate' key and either 'on' or 'off' to indicate current state.

Parameters **kwargs
- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

CLI Example:
salt-call ipmi.get_power api_host=127.0.0.1 api_user=admin api_pass=pass

salt.modules.ipmi.get_sensor_data(**kwargs)
Get sensor readings
Iterates sensor reading objects

Parameters

**kwargs --
- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

CLI Example:
salt-call ipmi.get_sensor_data api_host=127.0.0.1 api_user=admin api_pass=pass

salt.modules.ipmi.get_user(uid, channel=14, **kwargs)
Get user from uid and access on channel

Parameters

- **uid** -- user number [1:16]
- **channel** -- number [1:7]
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Return Data

- **name**: (str)
- **uid**: (int)
- **channel**: (int)
- **access**:
  - callback (bool)
  - link_auth (bool)
  - ipmi_msg (bool)
  - privilege_level: (str)[callback, user, operator, administrator, proprietary, no_access]

CLI Examples:
salt-call ipmi.get_user uid=2

salt.modules.ipmi.get_user_access(uid, channel=14, **kwargs)
Get user access

Parameters
- **uid** -- user number [1:16]
- **channel** -- number [1:7]
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Return Data

channel_info:
- max_user_count = maximum number of user IDs on this channel
- enabled_users = count of User ID slots presently in use
- users_with_fixed_names = count of user IDs with fixed names

access:
- callback
- link_auth
- ipmi_msg
- privilege_level: [reserved, callback, user, operator, administrator, proprietary, no_access]

CLI Examples:

```bash
salt-call ipmi.get_user_access uid=2
```

salt.modules.ipmi.get_user_name(uid, return_none_on_error=True, **kwargs)

Get user name

Parameters

- **uid** -- user number [1:16]
- **return_none_on_error** -- return None on error
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

CLI Examples:

```bash
salt-call ipmi.get_user_name uid=2
```

salt.modules.ipmi.get_users(channel=14, **kwargs)

get list of users and access information

Parameters

- **channel** -- number [1:7]
- **kwargs** --
api_host=127.0.0.1
api_user=admin
api_pass=example
api_port=623
api_kg=None

Returns

- name: (str)
- uid: (int)
- channel: (int)
- access:
  - callback (bool)
  - link_auth (bool)
  - ipmi_msg (bool)
  - privilege_level: (str)[callback, user, operator, administrator, proprietary, no_access]

CLI Examples:
```
salt-call ipmi.get_users api_host=172.168.0.7
```

```
salt.modules.ipmi.raw_command(netfn, command, bridge_request=None, data=None, retry=True, delay_xmit=None, **kwargs)
```

Send raw ipmi command

This allows arbitrary IPMI bytes to be issued. This is commonly used for certain vendor specific commands.

Parameters

- **netfn** -- Net function number
- **command** -- Command value
- **bridge_request** -- The target slave address and channel number for the bridge request.
- **data** -- Command data as a tuple or list
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Returns dict -- The response from IPMI device

CLI Examples:
```
salt-call ipmi.raw_command netfn=0x06 command=0x46 data=[0x02]
# this will return the name of the user with id 2 in bytes
```

```
salt.modules.ipmi.set_bootdev(bootdev='default', persist=False, uefiboott=False, **kwargs)
```

Set boot device to use on next reboot
Parameters

- **bootdev** --
  - network: Request network boot
  - hd: Boot from hard drive
  - safe: Boot from hard drive, requesting 'safe mode'
  - optical: boot from CD/DVD/BD drive
  - setup: Boot into setup utility
  - default: remove any IPMI directed boot device request

- **persist** -- If true, ask that system firmware use this device beyond next boot. Be aware many systems do not honor this

- **uefiboot** -- If true, request UEFI boot explicitly. Strictly speaking, the spec suggests that if not set, the system should BIOS boot and offers no "don't care" option. In practice, this flag not being set does not preclude UEFI boot on any system I've encountered.

- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=none

Returns dict or True -- If callback is not provided, the response

CLI Examples:

```
salt-call ipmi.set_bootdev bootdev=network persist=True
```

```
salt.modules.ipmi.set_channel_access(channel=14, access_update_mode='non_volatile',
                                      alerting=False, per_msg_auth=False,
                                      user_level_auth=False, access_mode='always',
                                      privilege_update_mode='non_volatile', privilege_level='administrator', **kwargs)
```

Set channel access

Parameters

- **channel** -- number [1:7]

- **access_update_mode** --
  - 'dont_change' = don't set or change Channel Access
  - 'non_volatile' = set non-volatile Channel Access
  - 'volatile' = set volatile (active) setting of Channel Access

- **alerting** -- PEF Alerting Enable/Disable
  - True = enable PEF Alerting
  - False = disable PEF Alerting on this channel (Alert Immediate command can still be used to generate alerts)

- **per_msg_auth** -- Per-message Authentication
• True = enable
• False = disable Per-message Authentication. [Authentication required to activate any session on this channel, but authentication not used on subsequent packets for the session.]

• **user_level_auth** -- User Level Authentication Enable/Disable
  - True = enable User Level Authentication. All User Level commands are to be authenticated per the Authentication Type that was negotiated when the session was activated.
  - False = disable User Level Authentication. Allow User Level commands to be executed without being authenticated. If the option to disable User Level Command authentication is accepted, the BMC will accept packets with Authentication Type set to None if they contain user level commands. For outgoing packets, the BMC returns responses with the same Authentication Type that was used for the request.

• **access_mode** -- Access Mode for IPMI messaging (PEF Alerting is enabled/disabled separately from IPMI messaging)
  - disabled = disabled for IPMI messaging
  - pre_boot = pre-boot only channel only available when system is in a powered down state or in BIOS prior to start of boot.
  - always = channel always available regardless of system mode. BIOS typically dedicates the serial connection to the BMC.
  - shared = same as always available, but BIOS typically leaves the serial port available for software use.

• **privilege_update_mode** -- Channel Privilege Level Limit. This value sets the maximum privilege level that can be accepted on the specified channel.
  - dont_change = don’t set or change channel Privilege Level Limit
  - non_volatile = non-volatile Privilege Level Limit according
  - volatile = volatile setting of Privilege Level Limit

• **privilege_level** -- Channel Privilege Level Limit
  - reserved = unused
  - callback
  - user
  - operator
  - administrator
  - proprietary = used by OEM

• **kwargs**
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

CLI Examples:
salt-call ipmi.set_channel_access privilege_level='administrator'

salt.modules.ipmi.set_identify(on=True, duration=600, **kwargs)

Request identify light

Request the identify light to turn off, on for a duration, or on indefinitely. Other than error exceptions,

Parameters

- **on** -- Set to True to force on or False to force off
- **duration** -- Set if wanting to request turn on for a duration in seconds, None = indefinitely.
- **kwargs**
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

CLI Examples:

```
salt-call ipmi.set_identify
```

salt.modules.ipmi.set_power(state='power_on', wait=True, **kwargs)

Request power state change

Parameters

- **name**
  - power_on -- system turn on
  - power_off -- system turn off (without waiting for OS)
  - shutdown -- request OS proper shutdown
  - reset -- reset (without waiting for OS)
  - boot -- If system is off, then 'on', else 'reset'
- **ensure** -- If (bool True), do not return until system actually completes requested state change for 300 seconds. If a non-zero (int), adjust the wait time to the requested number of seconds
- **kwargs**
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Returns dict -- A dict describing the response retrieved

CLI Examples:
salt-call ipmi.set_power state=shutdown wait=True

salt.modules.ipmi.set_user_access(uid, channel=14, callback=True, link_auth=True, ipmi_msg=True, privilege_level='administrator', **kwargs)

Set user access

Parameters

- **uid** -- user number [1:16]
- **channel** -- number [1:7]
- **callback** -- User Restricted to Callback
  - False = User Privilege Limit is determined by the User Privilege Limit parameter, below, for both callback and non-callback connections.
  - True = User Privilege Limit is determined by the User Privilege Limit parameter for callback connections, but is restricted to Callback level for non-callback connections. Thus, a user can only initiate a Callback when they 'call in' to the BMC, but once the callback connection has been made, the user could potentially establish a session as an Operator.
- **link_auth** -- User Link authentication enable/disable (used to enable whether this user's name and password information will be used for link authentication, e.g. PPP CHAP) for the given channel. Link authentication itself is a global setting for the channel and is enabled/disabled via the serial/modem configuration parameters.
- **ipmi_msg** -- User IPMI Messaging: (used to enable/disable whether this user's name and password information will be used for IPMI Messaging. In this case, 'IPMI Messaging' refers to the ability to execute generic IPMI commands that are not associated with a particular payload type. For example, if IPMI Messaging is disabled for a user, but that user is enabled for activating the SOL payload type, then IPMI commands associated with SOL and session management, such as Get SOL Configuration Parameters and Close Session are available, but generic IPMI commands such as Get SEL Time are unavailable.)
- **privilege_level** -- User Privilege Limit. (Determines the maximum privilege level that the user is allowed to switch to on the specified channel.)
  - callback
  - user
  - operator
  - administrator
  - proprietary
  - no_access
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

CLI Examples:
salt-call ipmi.set_user_access uid=2 privilege_level='operator'

salt.modules.ipmi.set_user_name(uid, name, **kwargs)
Set user name

Parameters

- **uid** -- user number [1:16]
- **name** -- username (limit of 16 bytes)
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

CLI Examples:
salt-call ipmi.set_user_name uid=2 name='steverweber'

salt.modules.ipmi.set_user_password(uid, mode='set_password', password=None, **kwargs)
Set user password and (modes)

Parameters

- **uid** -- id number of user. see: get_names_uid()['name']
- **mode** --
  - disable = disable user connections
  - enable = enable user connections
  - set_password = set or ensure password
  - test_password = test password is correct
- **password** -- max 16 char string (optional when mode is [disable or enable])
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Returns True on success when mode = test_password, return False on bad password

CLI Example:
salt-call ipmi.set_user_password api_host=127.0.0.1 api_user=admin api_pass=pass uid=1 password=newPass
salt-call ipmi.set_user_password uid=1 mode=enable
salt.modules.ipmi.user_delete\(uid, channel=14,*\textit{kwargs}\)
Delete user (helper)

**Parameters**

- \textbf{uid} -- user number [1:16]
- \textbf{channel} -- number [1:7]
- \textbf{kwargs} --
  - api\_host=127.0.0.1
  - api\_user=admin
  - api\_pass=example
  - api\_port=623
  - api\_kg=None

**CLI Examples:**

```
salt-call ipmi.user_delete uid=2
```

21.9.195 \texttt{salt.modules.ipset}

Support for ipset

\texttt{salt.modules.ipset.add(setname=None, entry=None, family=’ipv4’,*\textit{kwargs})}

Append an entry to the specified set.

**CLI Example:**

```
salt '*' ipset.add setname 192.168.1.26
```

\texttt{salt.modules.ipset.check(set=None, entry=None, family=’ipv4’)}

Check that an entry exists in the specified set.

\texttt{set} The ipset name

\texttt{entry} An entry in the ipset. This parameter can be a single IP address, a range of IP addresses, or a subnet block. Example:

```
192.168.0.1
192.168.0.2-192.168.0.19
192.168.0.0/25
```

\texttt{family} IP protocol version: ipv4 or ipv6

**CLI Example:**

```
salt '*' ipset.check setname '192.168.0.1 comment "Hello"'
```

\texttt{salt.modules.ipset.check\_set(set=None, family=’ipv4’)}

Check that given ipset set exists.

New in version 2014.7.0.

**CLI Example:**

21.9. \texttt{execution modules}
salt 'salt '*' ipset.check_set setname

salt.modules.ipset.delete(set=None, entry=None, family='ipv4', **kwargs)
Delete an entry from the specified set.
CLI Example:
salt 'salt '*' ipset.delete setname 192.168.0.3,AA:BB:CC:DD:EE:FF

salt.modules.ipset.delete_set(set=None, family='ipv4')
New in version 2014.7.0.
Delete ipset set.
CLI Example:
salt 'salt '*' ipset.delete_set custom_set
IPv6:
salt 'salt '*' ipset.delete_set custom_set family=ipv6

salt.modules.ipset.flush(set=None, family='ipv4')
Flush entries in the specified set. Flush all sets if set is not specified.
CLI Example:
salt 'salt '*' ipset.flush
salt 'salt '*' ipset.flush set
IPv6:
salt 'salt '*' ipset.flush
salt 'salt '*' ipset.flush set

salt.modules.ipset.list_sets(family='ipv4')
New in version 2014.7.0.
List all ipset sets.
CLI Example:
salt 'salt '*' ipset.list_sets

salt.modules.ipset.long_range(start, end)
salt.modules.ipset.new_set(set=None, set_type=None, family='ipv4', comment=False, **kwargs)
New in version 2014.7.0.
Create new custom set
CLI Example:
salt 'salt '*' ipset.new_set custom_set list:set
salt 'salt '*' ipset.new_set custom_set list:set comment=True
IPv6:
salt 'salt '*' ipset.new_set custom_set list:set family=ipv6
salt.modules.ipset.rename_set(set=None, new_set=None, family='ipv4')

New in version 2014.7.0.

Delete ipset set.

CLI Example:

```
salt '*' ipset.rename_set custom_set new_set=new_set_name
IPv6:
salt '*' ipset.rename_set custom_set new_set=new_set_name family=ipv6
```

salt.modules.ipset.test(set=None, entry=None, family='ipv4', **kwargs)

Test if an entry is in the specified set.

CLI Example:

```
salt '*' ipset.test setname 192.168.0.2
IPv6:
salt '*' ipset.test setname fd81:fc56:9ac7::/48
```

salt.modules.ipset.version()

Return version from ipset --version

CLI Example:

```
salt '*' ipset.version
```

21.9.196 salt.modules.iptables

Support for iptables

Configuration Options

The following options can be set in the minion config, grains, pillar, or master config. The configuration is read using config.get.

- iptables.save_filters: List of REGEX strings to FILTER OUT matching lines

  This is useful for filtering out chains, rules, etc that you do not wish to persist, such as ephemeral Docker rules.

  The default is to not filter out anything.

```
iptables.save_filters:
  - "-j CATTLE_PREROUTING"
  - "-j DOCKER"
  - "-A POSTROUTING"
  - "-A CATTLE_POSTROUTING"
  - "-A FORWARD"
```

salt.modules.iptables.append(table='filter', chain=None, rule=None, family='ipv4')

Append a rule to the specified table/chain.

This function accepts a rule in a standard iptables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.
CLI Example:

```bash
salt '*' iptables.append filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'
```

IPv6:
```bash
salt '*' iptables.append filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT' \
    family=ipv6
```

```python
salt.modules.iptables.build_rule(table='filter', chain=None, command=None, position='', full=None, family='ipv4', **kwargs)
```

Build a well-formatted iptables rule based on kwargs. A table and chain are not required, unless full is True.

If full is True, then table, chain and command are required. command may be specified as either a short option (T) or a long option (--insert). This will return the iptables command, exactly as it would be used from the command line.

If a position is required (as with \-I or \-D), it may be specified as position. This will only be useful if full is True.

If state is passed, it will be ignored, use connstate. If connstate is passed in, it will automatically be changed to state.

To pass in jump options that doesn't take arguments, pass in an empty string.

**Note:** Whereas iptables will accept \-p, \--proto\{c[o[l]\} as synonyms of \--protocol, if \--proto appears in an iptables command after the appearance of \-m policy, it is interpreted as the \--proto option of the policy extension (see the iptables-extensions(8) man page).

CLI Examples:

```bash
salt '*' iptables.build_rule match=state \ 
    connstate=RELATED,ESTABLISHED jump=ACCEPT
salt '*' iptables.build_rule filter INPUT command=I position=3 \ 
    full=True match=state connstate=RELATED,ESTABLISHED jump=ACCEPT
salt '*' iptables.build_rule filter INPUT command=A \ 
    full=True match=state connstate=RELATED,ESTABLISHED \ 
    source='127.0.0.1' jump=ACCEPT
.. Invert Rules
salt '*' iptables.build_rule filter INPUT command=A \ 
    full=True match=state connstate=RELATED,ESTABLISHED \ 
    source='!127.0.0.1' jump=ACCEPT
salt '*' iptables.build_rule filter INPUT command=A \ 
    full=True match=state connstate=RELATED,ESTABLISHED \ 
    destination='!not 127.0.0.1' jump=ACCEPT
```

IPv6:
```bash
salt '*' iptables.build_rule match=state \ 
    connstate=RELATED,ESTABLISHED jump=ACCEPT \ 
    family=ipv6
salt '*' iptables.build_rule filter INPUT command=I position=3 \ 
    full=True match=state connstate=RELATED,ESTABLISHED jump=ACCEPT \ 
    family=ipv6
```
salt.modules.iptables.check(table='filter', chain=None, rule=None, family='ipv4')
Check for the existence of a rule in the table and chain

This function accepts a rule in a standard iptables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' iptables.check filter INPUT \
   rule='^-m state --state RELATED,ESTABLISHED -j ACCEPT'
```

IPv6:
```
salt '*' iptables.check filter INPUT \
   rule='^-m state --state RELATED,ESTABLISHED -j ACCEPT' \ 
   family=ipv6
```

salt.modules.iptables.check_chain(table='filter', chain=None, family='ipv4')
New in version 2014.1.0.
Check for the existence of a chain in the table

CLI Example:

```
salt '*' iptables.check_chain filter INPUT
```

IPv6:
```
salt '*' iptables.check_chain filter INPUT family=ipv6
```

salt.modules.iptables.delete(table, chain=None, position=None, rule=None, family='ipv4')
Delete a rule from the specified table/chain, specifying either the rule in its entirety, or the rule's position in the chain.

This function accepts a rule in a standard iptables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Examples:

```
salt '*' iptables.delete filter INPUT position=3
salt '*' iptables.delete filter INPUT \
   rule='^-m state --state RELATED,ESTABLISHED -j ACCEPT'
```

IPv6:
```
salt '*' iptables.delete filter INPUT position=3 family=ipv6
salt '*' iptables.delete filter INPUT \
   rule='^-m state --state RELATED,ESTABLISHED -j ACCEPT' \ 
   family=ipv6
```

salt.modules.iptables.delete_chain(table='filter', chain=None, family='ipv4')
New in version 2014.1.0.
Delete custom chain to the specified table.

CLI Example:

```
salt '*' iptables.delete_chain filter CUSTOM_CHAIN
```

IPv6:
```
salt '*' iptables.delete_chain filter CUSTOM_CHAIN family=ipv6
```
salt.modules.iptables.flush

Flush the chain in the specified table, flush all chains in the specified table if not specified chain.

CLI Example:

```
salt '*' iptables.flush filter INPUT
IPv6:
salt '*' iptables.flush filter INPUT family=ipv6
```

salt.modules.iptables.get_policy

Return the current policy for the specified table/chain

CLI Example:

```
salt '*' iptables.get_policy filter INPUT
IPv6:
salt '*' iptables.get_policy filter INPUT family=ipv6
```

salt.modules.iptables.get_rules

Return a data structure of the current, in-memory rules

CLI Example:

```
salt '*' iptables.get_rules
IPv6:
salt '*' iptables.get_rules family=ipv6
```

salt.modules.iptables.get_saved_policy

Return the current policy for the specified table/chain

CLI Examples:

```
salt '*' iptables.get_saved_policy filter INPUT
salt '*' iptables.get_saved_policy filter INPUT conf_file=/etc/iptables.saved
IPv6:
salt '*' iptables.get_saved_policy filter INPUT family=ipv6
salt '*' iptables.get_saved_policy filter INPUT conf_file=/etc/iptables.saved conf_file=ipv6
```

salt.modules.iptables.get_saved_rules

Return a data structure of the rules in the conf file

CLI Example:

```
salt '*' iptables.get_saved_rules
IPv6:
salt '*' iptables.get_saved_rules family=ipv6
```

salt.modules.iptables.insert

Insert a rule into the specified table/chain, at the specified position.

This function accepts a rule in a standard iptables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a
If the position specified is a negative number, then the insert will be performed counting from the end of the list. For instance, a position of -1 will insert the rule as the second to last rule. To insert a rule in the last position, use the append function instead.

CLI Examples:

```bash
salt '*' iptables.insert filter INPUT position=3 \
   rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'

IPv6:
salt '*' iptables.insert filter INPUT position=3 \
   rule='-m state --state RELATED,ESTABLISHED -j ACCEPT' \
   family=ipv6
```

```
salt.modules.iptables.new_chain(table='filter', chain=None, family='ipv4')
```

New in version 2014.1.0.

Create new custom chain to the specified table.

CLI Example:

```
salt '*' iptables.new_chain filter CUSTOM_CHAIN

IPv6:
salt '*' iptables.new_chain filter CUSTOM_CHAIN family=ipv6
```

```
salt.modules.iptables.save(filename=None, family='ipv4')
```

Save the current in-memory rules to disk

CLI Example:

```
salt '*' iptables.save /etc/sysconfig/iptables

IPv6:
salt '*' iptables.save /etc/sysconfig/iptables family=ipv6
```

```
salt.modules.iptables.set_policy(table='filter', chain=None, policy=None, family='ipv4')
```

Set the current policy for the specified table/chain

CLI Example:

```
salt '*' iptables.set_policy filter INPUT ACCEPT

IPv6:
salt '*' iptables.set_policy filter INPUT ACCEPT family=ipv6
```

```
salt.modules.iptables.version(family='ipv4')
```

Return version from iptables --version

CLI Example:

```
salt '*' iptables.version

IPv6:
salt '*' iptables.version family=ipv6
```
21.9.197  salt.modules.iwtools module

Support for Wireless Tools for Linux

salt.modules.iwtools.list_interfaces(style=None)
List all of the wireless interfaces
CLI Example:
salt minion iwtools.list_interfaces

salt.modules.iwtools.scan(iface, style=None)
List networks on a wireless interface
CLI Examples:
salt minion iwtools.scan wlp3s0 salt minion iwtools.scan wlp3s0 list

salt.modules.iwtools.set_mode(iface, mode)
List networks on a wireless interface
CLI Example:
salt minion iwtools.set_mode wlp3s0 Managed

21.9.198  salt.modules.jboss7

Module for managing JBoss AS 7 through the CLI interface.
New in version 2015.5.0.

In order to run each function, jboss_config dictionary with the following properties must be passed:

- cli_path: the path to jboss-cli script, for example: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
- controller: the IP address and port of controller, for example: 10.11.12.13:9999
- cli_user: username to connect to jboss administration console if necessary
- cli_password: password to connect to jboss administration console if necessary

Example:

```python
jboss_config:
    cli_path: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
    controller: 10.11.12.13:9999
    cli_user: 'jbossadm'
    cli_password: 'jbossadm'
```

salt.modules.jboss7.create_datasource(jboss_config, name, datasource_properties, profile=None)
Create datasource in running jboss instance

jboss_config  Configuration dictionary with properties specified above.
name  Datasource name
datasource_properties
A dictionary of datasource properties to be created:
- driver-name: mysql
- connection-url: 'jdbc:mysql://localhost:3306/sampleDatabase'
- jndi-name: 'java:jboss/datasources/sampleDS'
- user-name: sampleuser
- password: secret
- min-pool-size: 3
- use-java-context: True

**profile**  The profile name (JBoss domain mode only)

**CLI Example:**

```bash
```

salt.modules.jboss7.create_simple_binding (jboss_config, binding_name, value, profile=None)

Create a simple jndi binding in the running jboss instance

**jboss_config**  Configuration dictionary with properties specified above.

**binding_name**  Binding name to be created

**value**  Binding value

**profile**  The profile name (JBoss domain mode only)

**CLI Example:**

```bash
salt '*' jboss7.create_simple_binding \
'{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", \
"controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm"} my_binding_name my_binding_value
```

salt.modules.jboss7.deploy (jboss_config, source_file)

Deploy the application on the jboss instance from the local file system where minion is running.

**jboss_config**  Configuration dictionary with properties specified above.

**source_file**  Source file to deploy from

**CLI Example:**

```bash
```

salt.modules.jboss7.list_deployments (jboss_config)

List all deployments on the jboss instance

**jboss_config**  Configuration dictionary with properties specified above.

**CLI Example:**

```bash

```
salt.modules.jboss7.read_datasource(jboss_config, name, profile=None)

Read datasource properties in the running jboss instance.

- **jboss_config**: Configuration dictionary with properties specified above.
- **name**: Datasource name
- **profile**: Profile name (JBoss domain mode only)

CLI Example:

```bash
```

salt.modules.jboss7.read_simple_binding(jboss_config, binding_name, profile=None)

Read jndi binding in the running jboss instance.

- **jboss_config**: Configuration dictionary with properties specified above.
- **binding_name**: Binding name to be created
- **profile**: The profile name (JBoss domain mode only)

CLI Example:

```bash
```

salt.modules.jboss7.reload_(jboss_config, host=None)

Reload running jboss instance.

- **jboss_config**: Configuration dictionary with properties specified above.
- **host**: The name of the host. JBoss domain mode only - and required if running in domain mode. The host name is the "name" attribute of the "host" element in host.xml

CLI Example:

```bash
```

salt.modules.jboss7.remove_datasource(jboss_config, name, profile=None)

Remove an existing datasource from the running jboss instance.

- **jboss_config**: Configuration dictionary with properties specified above.
- **name**: Datasource name
- **profile**: The profile (JBoss domain mode only)

CLI Example:

```bash
salt '*' jboss7.remove_datasource '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm"}'
```
salt.modules.jboss7.status(
jboss_config, host=None, server_config=None)
Get status of running jboss instance.

jboss_config Configuration dictionary with properties specified above.
host The name of the host. JBoss domain mode only - and required if running in domain mode. The host
name is the "name" attribute of the "host" element in host.xml

server_config The name of the Server Configuration. JBoss Domain mode only - and required if running in
domain mode.

CLI Example:

```salt '*' jboss7.status '{"cli_path": "integration.modules.sysmod.SysModuleTest.
test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm"}'
```

salt.modules.jboss7.stop_server(
jboss_config, host=None)
Stop running jboss instance

jboss_config Configuration dictionary with properties specified above.
host The name of the host. JBoss domain mode only - and required if running in domain mode. The host
name is the "name" attribute of the "host" element in host.xml

CLI Example:

```

salt.modules.jboss7.undeploy(
jboss_config, deployment)
Undeploy the application from jboss instance

jboss_config Configuration dictionary with properties specified above.
deployment Deployment name to undeploy

CLI Example:

```

salt.modules.jboss7.update_datasource(
jboss_config, name, new_properties, profile=None)
Update an existing datasource in running jboss instance. If the property doesn't exist if will be created, if it
does, it will be updated with the new value

jboss_config Configuration dictionary with properties specified above.
name Datasource name

new_properties
A dictionary of datasource properties to be updated. For example:

- driver-name: mysql
- connection-url: 'jdbc:mysql://localhost:3306/sampleDatabase'
- jndi-name: 'java:jboss.datasources/sampleDS'
**Salt Documentation, Release 3001.1**

- user-name: sampleuser
- password: secret
- min-pool-size: 3
- use-java-context: True

**profile** The profile name (JBoss domain mode only)

**CLI Example:**

```bash
```

**salt.modules.jboss7.update_simple_binding** *(jboss_config, binding_name, value, profile=None)*

Update the simple jndi binding in the running jboss instance

**jboss_config** Configuration dictionary with properties specified above.

**binding_name** Binding name to be updated

**value** New binding value

**profile** The profile name (JBoss domain mode only)

**CLI Example:**

```bash
salt '*' jboss7.update_simple_binding '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm"} my_binding_name my_binding_value
```

**21.9.199 salt.modules.jboss7_cli**

Module for low-level interaction with JbossAS7 through CLI.

This module exposes two ways of interaction with the CLI, either through commands or operations.

**Note:** Following JBoss documentation ([https://developer.jboss.org/wiki/CommandLineInterface](https://developer.jboss.org/wiki/CommandLineInterface)): "Operations are considered a low level but comprehensive way to manage the AS controller, i.e. if it can't be done with operations it can't be done in any other way. Commands, on the other hand, are more user-friendly in syntax, although most of them still translate into operation requests and some of them even into a few composite operation requests, i.e. commands also simplify some management operations from the user's point of view."

The difference between calling a command or operation is in handling the result. Commands return a zero return code if operation is successful or return non-zero return code and print an error to standard output in plain text, in case of an error.

Operations return a json-like structure, that contain more information about the result. In case of a failure, they also return a specific return code. This module parses the output from the operations and returns it as a dictionary so that an execution of an operation can then be verified against specific errors.

**In order to run each function, jboss_config dictionary with the following properties must be passed:**

- cli_path: the path to jboss-cli script, for example: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
controller: the IP address and port of controller, for example: 10.11.12.13:9999

cli_user: username to connect to jboss administration console if necessary

cli_password: password to connect to jboss administration console if necessary

Example:

```python
jboss_config:
    cli_path: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
    controller: 10.11.12.13:9999
    cli_user: 'jbossadm'
    cli_password: 'jbossadm'
```

salt.modules.jboss7_cli.run_command(jboss_config, command, fail_on_error=True)

Execute a command against jboss instance through the CLI interface.

- **jboss_config**: Configuration dictionary with properties specified above.
- **command**: Command to execute against jboss instance
- **fail_on_error (default=True)**: Is true, raise CommandExecutionError exception if execution fails. If false, 'success' property of the returned dictionary is set to False

CLI Example:

```bash
salt '*' jboss7_cli.run_command '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm"}' my_command
```

salt.modules.jboss7_cli.run_operation(jboss_config, operation, fail_on_error=True, retries=1)

Execute an operation against jboss instance through the CLI interface.

- **jboss_config**: Configuration dictionary with properties specified above.
- **operation**: An operation to execute against jboss instance
- **fail_on_error (default=True)**: Is true, raise CommandExecutionError exception if execution fails. If false, 'success' property of the returned dictionary is set to False
- **retries**: Number of retries in case of "JBAS012144: Could not connect to remote" error.

CLI Example:

```bash
salt '*' jboss7_cli.run_operation '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm"}' my_operation
```

### 21.9.200 salt.modules.jenkinsmodule

Module for controlling Jenkins

- **depends**: python-jenkins

New in version 2016.3.0.

- **depends** python-jenkins Python module (not to be confused with jenkins)

**configuration** This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:
jenkins:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15

salt.modules.jenkinsmod.build_job(name=None, parameters=None)
Initiate a build for the provided job.

Parameters

- name -- The name of the job is check if it exists.
- parameters -- Parameters to send to the job.

Returns True is successful, otherwise raise an exception.

CLI Example:
salt '*' jenkins.build_job jobname

salt.modules.jenkinsmod.create_job(name=None, config_xml=None, saltenv='base')
Return the configuration file.

Parameters

- name -- The name of the job is check if it exists.
- config_xml -- The configuration file to use to create the job.
- saltenv -- The environment to look for the file in.

Returns The configuration file used for the job.

CLI Example:
salt '*' jenkins.create_job jobname
salt '*' jenkins.create_job jobname config_xml='salt://jenkins/config.xml'

salt.modules.jenkinsmod.delete_job(name=None)
Return true is job is deleted successfully.

Parameters name -- The name of the job to delete.

Returns Return true if job is deleted successfully.

CLI Example:
salt '*' jenkins.delete_job jobname

salt.modules.jenkinsmod.disable_job(name=None)
Return true is job is disabled successfully.

Parameters name -- The name of the job to disable.

Returns Return true if job is disabled successfully.

CLI Example:
salt '*' jenkins.disable_job jobname

salt.modules.jenkinsmod.enable_job(name=None)
Return true is job is enabled successfully.

Parameters name -- The name of the job to enable.
Returns: Return true if job is enabled successfully.

CLI Example:
```
salt '*' jenkins.enable_job jobname
```

```python
salt.modules.jenkinsmod.get_job_config(name=None)
```
Return the current job configuration for the provided job.

Parameters:
- **name**: The name of the job to return the configuration for.

Returns: The configuration for the job specified.

CLI Example:
```
salt '*' jenkins.get_job_config jobname
```

```python
salt.modules.jenkinsmod.get_job_info(name=None)
```
Return information about the Jenkins job.

Parameters:
- **name**: The name of the job is check if it exists.

Returns: Information about the Jenkins job.

CLI Example:
```
salt '*' jenkins.get_job_info jobname
```

```python
salt.modules.jenkinsmod.get_jobs()
```
Return the currently configured jobs.

Returns: The currently configured jobs.

CLI Example:
```
salt '*' jenkins.get_jobs
```

```python
salt.modules.jenkinsmod.get_version()
```
Return version of Jenkins

Returns: The version of Jenkins

CLI Example:
```
salt '*' jenkins.get_version
```

```python
salt.modules.jenkinsmod.job_exists(name=None)
```
Check whether the job exists in configured Jenkins jobs.

Parameters:
- **name**: The name of the job is check if it exists.

Returns: True if job exists, False if job does not exist.

CLI Example:
```
salt '*' jenkins.job_exists jobname
```

```python
salt.modules.jenkinsmod.job_status(name=None)
```
Return the current status, enabled or disabled, of the job.

Parameters:
- **name**: The name of the job to return status for

Returns: Return true if enabled or false if disabled.
**CLI Example:**

```
salt '*' jenkins.job_status jobname
```

`salt.modules.jenkinsmod.plugin_installed(name)`  
New in version 2016.11.0.  
Return if the plugin is installed for the provided plugin name.

- **Parameters**  
  - `name` -- The name of the parameter to confirm installation.

- **Returns** True if plugin exists, False if plugin does not exist.

**CLI Example:**

```
salt '*' jenkins.plugin_installed pluginName
```

`salt.modules.jenkinsmod.run(script)`  
New in version 2017.7.0.  
Execute a script on the jenkins master

- **Parameters**  
  - `script` -- The script

**CLI Example:**

```
salt '*' jenkins.run 'Jenkins.instance.doSafeRestart()'
```

`salt.modules.jenkinsmod.update_job(name=None, config_xml=None, saltenv='base')`  
Return the updated configuration file.

- **Parameters**
  - `name` -- The name of the job is check if it exists.
  - `config_xml` -- The configuration file to use to create the job.
  - `saltenv` -- The environment to look for the file in.

- **Returns** The configuration file used for the job.

**CLI Example:**

```
salt '*' jenkins.update_job jobname
salt '*' jenkins.update_job jobname config_xml='salt://jenkins/config.xml'
```

### 21.9.201 `salt.modules.jinja`

Module for checking jinja maps and verifying the result of loading JSON/YAML files  
New in version 3000.

`salt.modules.jinja.import_json(path)`  
Loads JSON data from the specified path

- **CLI Example:**

```
salt myminion jinja.import_JSON myformula/foo.json
```
salt.modules.jinja.import_yaml(path)
Loads YAML data from the specified path

CLI Example:
salt myminion jinja.import_yaml myformula/foo.yaml

salt.modules.jinja.load_map(path, value)
Loads the map at the specified path, and returns the specified value from that map.

CLI Example:
# Assuming the map is loaded in your formula SLS as follows:
# {% from "myformula/map.jinja" import myformula with context %}
# the following syntax can be used to load the map and check the
# results:
salt myminion jinja.load_map myformula/map.jinja myformula

21.9.202 salt.modules.jira_mod module

JIRA Execution module

New in version 2019.2.0.

Execution module to manipulate JIRA tickets via Salt.

This module requires the jira Python library to be installed.

Configuration example:

```yaml
jira:
  server: https://jira.atlassian.org
  username: salt
  password: pass
```

salt.modules.jira_mod.add_comment(issue_key, comment, visibility=None, is_internal=False, server=None, username=None, password=None)
Add a comment to an existing ticket. Return True when it successfully added the comment.

issue_key The issue ID to add the comment to.
comment The body of the comment to be added.
visibility: None A dictionary having two keys:
  • type: is role (or group if the JIRA server has configured comment visibility for groups).
  • value: the name of the role (or group) to which viewing of this comment will be restricted.

is_internal: False Whether a comment has to be marked as Internal in Jira Service Desk.

CLI Example:
salt '*' jira.add_comment NE-123 'This is a comment'

salt.modules.jira_mod.assign_issue(issue_key, assignee, server=None, username=None, password=None)
Assign the issue to an existing user. Return True when the issue has been properly assigned.
issue_key  The JIRA ID of the ticket to manipulate.
assignee  The name of the user to assign the ticket to.

CLI Example:
```
salt '*' jira.assign_issue NET-123 example_user
```

salt.modules.jira_mod.create_issue(project, summary, description, template_engine='jinja', context=None, defaults=None, saltenv='base', issuetype='Bug', priority='Normal', labels=None, assignee=None, server=None, username=None, password=None, **kwargs)

Create a JIRA issue using the named settings. Return the JIRA ticket ID.

project  The name of the project to attach the JIRA ticket to.
summary  The summary (title) of the JIRA ticket. When the template_engine argument is set to a proper value of an existing Salt template engine (e.g., jinja, mako, etc.) it will render the summary before creating the ticket.
description  The full body description of the JIRA ticket. When the template_engine argument is set to a proper value of an existing Salt template engine (e.g., jinja, mako, etc.) it will render the description before creating the ticket.
template_engine: jinja  The name of the template engine to be used to render the values of the summary and description arguments. Default: jinja.
context: None  The context to pass when rendering the summary and description. This argument is ignored when template_engine is set as None
defaults: None  Default values to pass to the Salt rendering pipeline for the summary and description arguments. This argument is ignored when template_engine is set as None.
saltenv: base  The Salt environment name (for the rendering system).
issuetype: Bug  The type of the JIRA ticket. Default: Bug.
labels: None  A list of labels to add to the ticket.
assignee: None  The name of the person to assign the ticket to.

CLI Examples:
```
salt '*' jira.create_issue NET 'Ticket title' 'Ticket description'
salt '*' jira.create_issue NET 'Issue on {{ opts.id }}' 'Error detected on {{ opts.id }}' template_engine=jinja
```

salt.modules.jira_mod.issue_closed(issue_key, server=None, username=None, password=None)

Check if the issue is closed.

issue_key  The JIRA ID of the ticket to close.

Returns:
- True: the ticket exists and it is closed.
- False: the ticket exists and it has not been closed.
- None: the ticket does not exist.

CLI Example:
```
salt '*' jira.issue_closed NE-123
```
21.9.203 salt.modules.junos

Module to interact with Junos devices.

maturity    new
dependencies junos-eznc, jxmlease

Note: Those who wish to use junos-eznc (PyEZ) version >= 2.1.0, must use the latest salt code from github until the next release.

Refer to junos for information on connecting to junos proxy.

class salt.modules.junos.HandleFileCopy(path, **kwargs)
To figure out proper path either from proxy local file system or proxy cache or on master. If required, then only copy from master to proxy

salt.modules.junos.cli(command=None, **kwargs)
Executes the CLI commands and returns the output in specified format. (default is text) The output can also be stored in a file.

command (required)  The command to execute on the Junos CLI
format  [text] Format in which to get the CLI output (either text or xml)
dev_timeout  [30] The NETCONF RPC timeout (in seconds)
dest  Destination file where the RPC output is stored. Note that the file will be stored on the proxy minion. To push the files to the master use cp.push.

CLI Examples:

```python
salt 'device_name' junos.cli 'show system commit'
salt 'device_name' junos.cli 'show system alarms' format=xml dest=/home/user/cli_output.txt
```

salt.modules.junos.commit(**kwargs)
To commit the changes loaded in the candidate configuration.

dev_timeout  [30] The NETCONF RPC timeout (in seconds)
comment  Provide a comment for the commit
confirm  Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.
sync  [False] When True, on dual control plane systems, requests that the candidate configuration on one control plane be copied to the other control plane, checked for correct syntax, and committed on both Routing Engines.
force_sync  [False] When True, on dual control plane systems, force the candidate configuration on one control plane to be copied to the other control plane.
full  When True, requires all the daemons to check and evaluate the new configuration.
detail  When True, return commit detail

CLI Examples:

```python
salt 'device_name' junos.commit comment='Committing via saltstack' detail=True
salt 'device_name' junos.commit dev_timeout=60 confirm=10
salt 'device_name' junos.commit sync=True dev_timeout=90
```
salt.modules.junos.commit_check()
Perform a commit check on the configuration

CLI Example:
```
salt 'device_name' junos.commit_check
```

salt.modules.junos.diff(**kwargs)
Returns the difference between the candidate and the current configuration

id [0] The rollback ID value (0-49)

CLI Example:
```
salt 'device_name' junos.diff id=3
```

salt.modules.junos.facts()
Displays the facts gathered during the connection. These facts are also stored in Salt grains.

CLI Example:
```
salt 'device_name' junos.facts
```

salt.modules.junos.facts_refresh()
Reload the facts dictionary from the device. Usually only needed if, the device configuration is changed by some other actor. This function will also refresh the facts stored in the salt grains.

CLI Example:
```
salt 'device_name' junos.facts_refresh
```

salt.modules.junos.file_copy(src, dest)
Copies the file from the local device to the junos device

src  The source path where the file is kept.
dest  The destination path on the where the file will be copied

CLI Example:
```
salt 'device_name' junos.file_copy /home/m2/info.txt info_copy.txt
```

salt.modules.junos.get_table(table, table_file, path=None, target=None, key=None, key_items=None, filters=None, table_args=None)
New in version 3001.
Retrieve data from a Junos device using Tables/Views

**table** (required) Name of PyEZ Table

**table_file** (required) YAML file that has the table specified in table parameter

**path**: Path of location of the YAML file. defaults to op directory in jnpr.junos.op

**target**: if command need to run on FPC, can specify fpc target

**key**: To overwrite key provided in YAML

**key_items**: To select only given key items

**filters**: To select only filter for the dictionary from columns

**table_args**: key/value pair which should render Jinja template command or are passed as args to rpc call in op table
CLI Example:

```python
salt 'device_name' junos.get_table RouteTable routes.yml
salt 'device_name' junos.get_table EthPortTable ethport.yml table_args={!
   "interface_name": "ge-3/2/2"}
salt 'device_name' junos.get_table EthPortTable ethport.yml salt://tables
```

`salt.modules.junos.install_config(path=None, **kwargs)`
Installs the given configuration file into the candidate configuration. Commits the changes if the commit checks or throws an error.

- **path (required)** Path where the configuration/template file is present. If the file has a .conf extension, the content is treated as text format. If the file has a .xml extension, the content is treated as XML format. If the file has a .set extension, the content is treated as Junos OS set commands.

- **mode** [exclusive] The mode in which the configuration is locked. Can be one of private, dynamic, batch, exclusive, ephemeral

- **dev_timeout** [30] Set NETCONF RPC timeout. Can be used for commands which take a while to execute.

- **overwrite** [False] Set to True if you want this file is to completely replace the configuration file. Sets action to override

**Note:** This option cannot be used if format is "set".

- **merge** [False] If set to True will set the load-config action to merge. the default load-config action is 'replace' for xml/json/text config

- **format** Determines the format of the contents

- **update** [False] Compare a complete loaded configuration against the candidate configuration. For each hierarchy level or configuration object that is different in the two configurations, the version in the loaded configuration replaces the version in the candidate configuration. When the configuration is later committed, only system processes that are affected by the changed configuration elements parse the new configuration. This action is supported from PyEZ 2.1.

- **comment** Provide a comment for the commit

- **confirm** Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.

- **diffs_file** Path to the file where the diff (difference in old configuration and the committed configuration) will be stored. Note that the file will be stored on the proxy minion. To push the files to the master use `cp.push`.

- **template_vars** Variables to be passed into the template processing engine in addition to those present in pillar, the minion configuration, grains, etc. You may reference these variables in your template like so:

  ```python
  {{ template_vars["var_name"] }}
  ```

CLI Examples:

```python
salt 'device_name' junos.install_config 'salt://production/network/routers/config.
   ->set'
salt 'device_name' junos.install_config 'salt://templates/replace_config.conf' replace=True comment='Committed via SaltStack'
```
salt 'device_name' junos.install_config 'salt://my_new_configuration.conf' dev_timeout=300 diffs_file='/salt/confs/old_config.conf' overwrite=True
salt 'device_name' junos.install_config 'salt://syslog_template.conf' template_→vars='{"syslog_host": "10.180.222.7"}'

salt.modules.junos.install_os(path=None, **kwargs)
Installs the given image on the device. After the installation is complete the device is rebooted, if reboot=True is given as a keyworded argument.

path (required) Path where the image file is present on the proxy minion
remote_path [/var/tmp] If the value of path is a file path on the local (Salt host's) filesystem, then the image is copied from the local filesystem to the :remote_path: directory on the target Junos device. The default is /var/tmp. If the value of :path: or is a URL, then the value of :remote_path: is unused.

dev_timeout [1800] The NETCONF RPC timeout (in seconds). This argument was added since most of the time the ”package add” RPC takes a significant amount of time. So this :timeout: value will be used in the context of the SW installation process. Defaults to 30 minutes (30*60=1800 seconds)
timeout [1800] Alias to dev_timeout for backward compatibility
reboot [False] Whether to reboot after installation
no_copy [False] If True the software package will not be SCP’d to the device
bool validate: When True this method will perform a config validation against the new image
bool issu: False When True allows unified in-service software upgrade (ISSU) feature enables you to upgrade between two different Junos OS releases with no disruption on the control plane and with minimal disruption of traffic.
bool nssu: False When True allows nonstop software upgrade (NSSU) enables you to upgrade the software running on a Juniper Networks EX Series Virtual Chassis or a Juniper Networks EX Series Ethernet Switch with redundant Routing Engines with a single command and minimal disruption to network traffic.
bool all_re: True When True (default), executes the software install on all Routing Engines of the Junos device. When False, execute the software install only on the current Routing Engine.
New in version 3001.

Note: Any additional keyword arguments specified are passed down to PyEZ sw.install() as is. Please refer to below URL for PyEZ sw.install() documentation: https://pyez.readthedocs.io/en/latest/jnpr.junos.utils.html#jnpr.junos.utils.sw.SW.install

CLI Examples:
salt 'device_name' junos.install_os 'salt://images/junos_image.tgz' reboot=True
salt 'device_name' junos.install_os 'salt://junos_16_1.tgz' dev_timeout=300

salt.modules.junos.load(path=None, **kwargs)
Loads the configuration from the file provided onto the device.

path (required) Path where the configuration/template file is present. If the file has a .conf extension, the content is treated as text format. If the file has a .xml extension, the content is treated as XML format. If the file has a .set extension, the content is treated as Junos OS set commands.
overwrite [False] Set to True if you want this file is to completely replace the configuration file. Sets action to override
Note: This option cannot be used if format is "set".

merge [False] If set to True will set the load-config action to merge. The default load-config action is 'replace' for xml/json/text config

update [False] Compare a complete loaded configuration against the candidate configuration. For each hierarchy level or configuration object that is different in the two configurations, the version in the loaded configuration replaces the version in the candidate configuration. When the configuration is later committed, only system processes that are affected by the changed configuration elements parse the new configuration. This action is supported from PyEZ 2.1.

format Determines the format of the contents

template_vars Variables to be passed into the template processing engine in addition to those present in pillar, the minion configuration, grains, etc. You may reference these variables in your template like so:

```{{ template_vars['var_name'] }}```

CLI Examples:

```salt 'device_name' junos.load 'salt://production/network/routers/config.set'
salt 'device_name' junos.load 'salt://templates/replace_config.conf' replace=True
salt 'device_name' junos.load 'salt://my_new_configuration.conf' overwrite=True
salt 'device_name' junos.load 'salt://syslog_template.conf' template_vars='{{"syslog_host": "10.180.222.7"}}'
```

salt.modules.junos.lock()
Attempts an exclusive lock on the candidate configuration. This is a non-blocking call.

Note: When locking, it is important to remember to call `junos.unlock` once finished. If locking during orchestration, remember to include a step in the orchestration job to unlock.

CLI Example:

```salt 'device_name' junos.lock```

salt.modules.junos.ping(`dest_ip=None, **kwargs`) Send a ping RPC to a device

`dest_ip` The IP of the device to ping
`dev_timeout` [30] The NETCONF RPC timeout (in seconds)
`rapid` [False] When True, executes ping at 100pps instead of 1pps
`ttl` Maximum number of IP routers (IP hops) allowed between source and destination
`routing_instance` Name of the routing instance to use to send the ping
`interface` Interface used to send traffic
`count` [5] Number of packets to send

CLI Examples:
salt.modules.junos.rollback(**kwargs)
Roll back the last committed configuration changes and commit

id [0] The rollback ID value (0-49)
dev_timeout [30] The NETCONF RPC timeout (in seconds)
comment Provide a comment for the commit
confirm Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.
diffs_file Path to the file where the diff (difference in old configuration and the committed configuration) will be stored. Note that the file will be stored on the proxy minion. To push the files to the master use cp.push.

CLI Example:
salt 'device_name' junos.rollback id=10

salt.modules.junos.rpc(cmd=None, dest=None, **kwargs)
This function executes the RPC provided as arguments on the junos device. The returned data can be stored in a file.
cmd The RPC to be executed
dest Destination file where the RPC output is stored. Note that the file will be stored on the proxy minion. To push the files to the master use cp.push.
format [xml] The format in which the RPC reply is received from the device
dev_timeout [30] The NETCONF RPC timeout (in seconds)
filter Used with the get-config RPC to get specific configuration
terse [False] Amount of information you want
interface_name Name of the interface to query

CLI Example:
salt 'device' junos.rpc get_config dest=/var/log/config.txt format=text filter='"><configuration><system/>"'
salt 'device' junos.rpc get-interface-information dest=/home/user/interface.xml filter="interface_name='lo0' terse=True"
salt 'device' junos.rpc get-chassis-inventory

salt.modules.junos.set_hostname(hostname=None, **kwargs)
Set the device’s hostname
hostname The name to be set
comment Provide a comment to the commit
dev_timeout [30] The NETCONF RPC timeout (in seconds)
confirm Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.

CLI Example:
salt 'device_name' junos.set_hostname salt-device

salt.modules.junos.shutdown(**kwargs)
Shut down (power off) or reboot a device running Junos OS. This includes all Routing Engines in a Virtual Chassis or a dual Routing Engine system.

Note: One of shutdown or reboot must be set to True or no action will be taken.

- **shutdown** [False] Set this to True if you want to shutdown the machine. This is a safety mechanism so that the user does not accidentally shutdown the junos device.
- **reboot** [False] If True, reboot instead of shutting down
- **at** Used when rebooting, to specify the date and time the reboot should take place. The value of this option must match the JunOS CLI reboot syntax.
- **in_min** Used when shutting down. Specify the delay (in minutes) before the device will be shut down.

CLI Examples:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>salt 'device_name' junos.shutdown reboot=True</td>
<td></td>
</tr>
<tr>
<td>salt 'device_name' junos.shutdown shutdown=True in_min=10</td>
<td></td>
</tr>
<tr>
<td>salt 'device_name' junos.shutdown shutdown=True</td>
<td></td>
</tr>
</tbody>
</table>

salt.modules.junos.timeoutDecorator(function)

salt.modules.junos.unlock()
Unlocks the candidate configuration.

CLI Example:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>salt 'device_name' junos.unlock</td>
<td></td>
</tr>
</tbody>
</table>

salt.modules.junos.zeroize()
Resets the device to default factory settings

Note: In case of non-root user, proxy_reconnect will not be able to re-connect to the device as zeroize will delete the local user’s configuration. For more details on zeroize functionality, please refer [https://www.juniper.net/documentation/en_US/junos/topics/reference/command-summary/request-system-zeroize.html](https://www.juniper.net/documentation/en_US/junos/topics/reference/command-summary/request-system-zeroize.html)

CLI Example:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>salt 'device_name' junos.zeroize</td>
<td></td>
</tr>
</tbody>
</table>
21.9.204 salt.modules.k8s

Salt module to manage Kubernetes cluster

New in version 2016.3.0.

Roadmap:

- Add creation of K8S objects (pod, rc, service, ...)
- Add replace of K8S objects (pod, rc, service, ...)
- Add deletion of K8S objects (pod, rc, service, ...)
- Add rolling update
- Add (auto)scalling

salt.modules.k8s.create_namespace(name, apiserver_url=None)

New in version 2016.3.0.

Create kubernetes namespace from the name, similar to the functionality added to kubectl since v.1.2.0: ..

```bash
tool create namespaces namespace-name
```

CLI Example:

```
salt '*' k8s.create_namespace namespace_name
salt '*' k8s.create_namespace namespace_name http://kube-master.cluster.local
```

salt.modules.k8s.create_secret(namespace, name, sources, apiserver_url=None, force=False, update=False, saltenv='base')

New in version 2016.3.0.

Create k8s secrets in the defined namespace from the list of files

CLI Example:

```
salt '*' k8s.create_secret namespace_name secret_name sources
salt '*' k8s.create_secret namespace_name secret_name sources http://kube-master.cluster.local
```

Sources are either dictionary of {name: path, name1: path} pairs or array of strings defining paths.

Example of paths array:

```
['/full/path/filename', "file:///full/path/filename", "salt://secret/storage/file.txt", 'http://user:password@securesite.com/secret-file.json']
```

Example of dictionaries:

```
{"name1": '/full/path/filename', name2: "salt://secret/storage/file.txt"}
```

optional parameters accepted:
update=[false] default value is false if set to false, and secret is already present on the cluster - warning will be returned and no changes to the secret will be done. In case it is set to "true" and secret is present but data is differ - secret will be updated.

force=[true] default value is true if the to False, secret will not be created in case one of the files is not valid kubernetes secret. e.g. capital letters in secret name or _ in case force is set to True, wrong files will be skipped but secret will be created any way.

saltenv=[‘base’] default value is base in case ‘salt://’ path is used, this parameter can change the visibility of files

salt.modules.k8s.delete_secret(namespace, name, apiserver_url=None, force=True)
New in version 2016.3.0.
Delete kubernetes secret in the defined namespace. Namespace is the mandatory parameter as well as name.
CLI Example:

```bash
salt '*' k8s.delete_secret namespace_name secret_name
salt '*' k8s.delete_secret namespace_name secret_name http://kube-master.cluster.local
```

salt.modules.k8s.get_labels(node=None, apiserver_url=None)
New in version 2016.3.0.
Get labels from the current node

CLI Example:

```bash
salt '*' k8s.get_labels
salt '*' k8s.get_labels kube-node.cluster.local http://kube-master.cluster.local
```

salt.modules.k8s.get_namespaces(namespace='', apiserver_url=None)
New in version 2016.3.0.
Get one or all kubernetes namespaces.

If namespace parameter is omitted, all namespaces will be returned back to user, similar to following kubectl example:

```bash
kubectl get namespaces -o json
```

In case namespace is set by user, the output will be similar to the one from kubectl:

```bash
kubectl get namespaces namespace_name -o json
```

CLI Example:

```bash
salt '*' k8s.get_namespaces
salt '*' k8s.get_namespaces namespace_name http://kube-master.cluster.local
```

salt.modules.k8s.get_secrets(namespace, name='', apiserver_url=None, decode=False, brief=False)
Get k8s namespaces

CLI Example:

```bash
salt '*' k8s.get_secrets namespace_name
salt '*' k8s.get_secrets namespace_name secret_name http://kube-master.cluster.local
```
salt.modules.k8s.label_absent(name, node=None, apiserver_url=None)

Delete label to the current node

CLI Example:

```
salt '*' k8s.label_absent hw/disktype
salt '*' k8s.label_absent hw/disktype kube-node.cluster.local http://kube-master.cluster.local
```

salt.modules.k8s.label_folder_absent(name, node=None, apiserver_url=None)

Delete label folder to the current node

CLI Example:

```
salt '*' k8s.label_folder_absent hw
salt '*' k8s.label_folder_absent hw/ kube-node.cluster.local http://kube-master.cluster.local
```

salt.modules.k8s.label_present(name, value, node=None, apiserver_url=None)

Set label to the current node

CLI Example:

```
salt '*' k8s.label_present hw/disktype ssd
salt '*' k8s.label_present hw/disktype ssd kube-node.cluster.local http://kube-master.cluster.local
```

salt.modules.k8s.update_secret(namespace, name, sources, apiserver_url=None, force=True, saltenv='base')

New in version 2016.3.0.

alias to k8s.create_secret with update=true

CLI Example:

```
salt '*' k8s.update_secret namespace_name secret_name sources [apiserver_url] @
[force=true] [update=false] [saltenv='base']
```

sources are either dictionary of {name: path, name1: path} pairs or array of strings defining paths.

Example of paths array:

```
['/full/path/filename', 
"file:///full/path/filename", 
"salt://secret/storage/file.txt", 
"http://user:password@securesite.com/secret-file.json"]
```

Example of dictionaries:

```
{"nameit": '/full/path/filename', name2: "salt://secret/storage/file.txt"}
```

optional parameters accepted:
force=[true] default value is true if the to False, secret will not be created in case one of the files is not valid kubernetes secret. e.g. capital letters in secret name or _ in case force is set to True, wrong files will be skipped but secret will be created any way.

saltenv=['base'] default value is base in case ‘salt://’ path is used, this parameter can change the visibility of files

### 21.9.205 `salt.modules.kapacitor` module

Kapacitor execution module.

**configuration** This module accepts connection configuration details either as parameters or as configuration settings in `/etc/salt/minion` on the relevant minions:

```
kapacitor.host: 'localhost'
kapacitor.port: 9092
```

New in version 2016.11.0.

Also protocol and SSL settings could be configured:

```
kapacitor.unsafe_ssl: 'false'
kapacitor.protocol: 'http'
```

New in version 2019.2.0.

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

#### `salt.modules.kapacitor.define_task(name, tick_script, task_type='stream', database=None, retention_policy='default', dbrps=None)`

Define a task. Serves as both create/update.

**name** Name of the task.

**tick_script** Path to the TICK script for the task. Can be a salt:// source.

**task_type** Task type. Defaults to 'stream'

**dbrps** A list of databases and retention policies in "dbname","rpname" format to fetch data from. For backward compatibility, the value of 'database' and 'retention_policy' will be merged as part of dbrps.

New in version 2019.2.0.

**database** Which database to fetch data from.

**retention_policy** Which retention policy to fetch data from. Defaults to 'default'.

CLI Example:

```
salt '*' kapacitor.define_task cpu salt://kapacitor/cpu.tick database=telegraf
```

#### `salt.modules.kapacitor.delete_task(name)`

Delete a kapacitor task.

**name** Name of the task to delete.

CLI Example:

```
salt '*' kapacitor.delete_task cpu
```
salt.modules.kapacitor.disable_task(name)
Disable a kapacitor task.

name Name of the task to disable.

CLI Example:
```
salt '*' kapacitor.disable_task cpu
```

salt.modules.kapacitor.enable_task(name)
Enable a kapacitor task.

name Name of the task to enable.

CLI Example:
```
salt '*' kapacitor.enable_task cpu
```

salt.modules.kapacitor.get_task(name)
Get a dict of data on a task.

name Name of the task to get information about.

CLI Example:
```
salt '*' kapacitor.get_task cpu
```

salt.modules.kapacitor.version()
Get the kapacitor version.

21.9.206 salt.modules.kerberos

Manage Kerberos KDC

configuration In order to manage your KDC you will need to generate a keytab that can authenticate without requiring a password.

```
# ktadd -k /root/secure.keytab kadmin/admin kadmin/changepw
```

On the KDC minion you will need to add the following to the minion configuration file so Salt knows what keytab to use and what principal to authenticate as.

```
auth_keytab: /root/auth.keytab
auth_principal: kadmin/admin
```

salt.modules.kerberos.create_keytab(name, keytab, enctypes=None)
Create keytab

CLI Example:
```
salt 'kdc.example.com' kerberos.create_keytab host/host1.example.com host1.example.com.keytab
```

salt.modules.kerberos.create_principal(name, enctypes=None)
Create Principal

CLI Example:
```
salt 'kdc.example.com' kerberos.create_principal host/example.com
```
salt.modules.kerberos.delete_principal(name)
    Delete Principal
    CLI Example:
    ```
    salt 'kdc.example.com' kerberos.delete_principal host/example.com@EXAMPLE.COM
    ```

salt.modules.kerberos.get_policy(name)
    Get policy details
    CLI Example:
    ```
    salt 'kdc.example.com' kerberos.get_policy my_policy
    ```

salt.modules.kerberos.get_principal(name)
    Get principal details
    CLI Example:
    ```
    salt 'kdc.example.com' kerberos.get_principal root/admin
    ```

salt.modules.kerberos.get_privs()
    Current privileges
    CLI Example:
    ```
    salt 'kdc.example.com' kerberos.get_privs
    ```

salt.modules.kerberos.list_policies()
    List policies
    CLI Example:
    ```
    salt 'kdc.example.com' kerberos.list_policies
    ```

salt.modules.kerberos.list_principals()
    Get all principals
    CLI Example:
    ```
    salt 'kde.example.com' kerberos.list_principals
    ```

21.9.207  salt.modules.kernelpkg_linux_apt

Manage Linux kernel packages on APT-based systems

salt.modules.kernelpkg_linux_apt.active()
    Return the version of the running kernel.
    CLI Example:
    ```
    salt '*' kernelpkg.active
    ```

salt.modules.kernelpkg_linux_apt.cleanup(keep_latest=True)
    Remove all unused kernel packages from the system.
    
    keep_latest [True] In the event that the active kernel is not the latest one installed, setting this to True will retain the latest kernel package, in addition to the active one. If False, all kernel packages other than the active one will be removed.
Salt Documentation, Release 3001.1

CLI Example:

```
salt '*' kernelpkg.cleanup
```

salt.modules.kernelpkg_linux_apt.latest_available()
Return the version of the latest kernel from the package repositories.

CLI Example:

```
salt '*' kernelpkg.latest_available
```

salt.modules.kernelpkg_linux_apt.latest_installed()
Return the version of the latest installed kernel.

CLI Example:

```
salt '*' kernelpkg.latest_installed
```

Note: This function may not return the same value as `active()` if a new kernel has been installed and the system has not yet been rebooted. The `needs_reboot()` function exists to detect this condition.

salt.modules.kernelpkg_linux_apt.list_installed()
Return a list of all installed kernels.

CLI Example:

```
salt '*' kernelpkg.list_installed
```

salt.modules.kernelpkg_linux_apt.needs_reboot()
Detect if a new kernel version has been installed but is not running. Returns True if a new kernel is installed, False otherwise.

CLI Example:

```
salt '*' kernelpkg.needs_reboot
```

salt.modules.kernelpkg_linux_apt.remove(release)
Remove a specific version of the kernel.

release The release number of an installed kernel. This must be the entire release number as returned by `list_installed()`, not the package name.

CLI Example:

```
salt '*' kernelpkg.remove 4.4.0-70-generic
```

salt.modules.kernelpkg_linux_apt.upgrade(reboot=False, at_time=None)
Upgrade the kernel and optionally reboot the system.

reboot [False] Request a reboot if a new kernel is available.

at_time [immediate] Schedule the reboot at some point in the future. This argument is ignored if `reboot=False`. See `reboot()` for more details on this argument.

CLI Example:

```
salt '*' kernelpkg.upgrade
salt '*' kernelpkg.upgrade reboot=True at_time=1
```
Note: An immediate reboot often shuts down the system before the minion has a chance to return, resulting in errors. A minimal delay (1 minute) is useful to ensure the result is delivered to the master.

salt.modules.kernelpkg_linux_apt.upgrade_available()
Detect if a new kernel version is available in the repositories. Returns True if a new kernel is available, False otherwise.

CLI Example:
```
salt '*' kernelpkg.upgrade_available
```

21.9.208 salt.modules.kernelpkg_linux_yum
Manage Linux kernel packages on YUM-based systems

salt.modules.kernelpkg_linux_yum.active()
Return the version of the running kernel.

CLI Example:
```
salt '*' kernelpkg.active
```

salt.modules.kernelpkg_linux_yum.cleanup(keep_latest=True)
Remove all unused kernel packages from the system.

**keep_latest** [True] In the event that the active kernel is not the latest one installed, setting this to True will retain the latest kernel package, in addition to the active one. If False, all kernel packages other than the active one will be removed.

CLI Example:
```
salt '*' kernelpkg.cleanup
```

salt.modules.kernelpkg_linux_yum.latest_available()
Return the version of the latest kernel from the package repositories.

CLI Example:
```
salt '*' kernelpkg.latest_available
```

salt.modules.kernelpkg_linux_yum.latest_installed()
Return the version of the latest installed kernel.

CLI Example:
```
salt '*' kernelpkg.latest_installed
```

Note: This function may not return the same value as active() if a new kernel has been installed and the system has not yet been rebooted. The needs_reboot() function exists to detect this condition.

salt.modules.kernelpkg_linux_yum.list_installed()
Return a list of all installed kernels.

CLI Example:
salt ' '*' kernelpkg.list_installed

salt.modules.kernelpkg_linux_yum.needs_reboot()
Detected if a new kernel version has been installed but is not running. Returns True if a new kernel is installed, False otherwise.

CLI Example:
salt ' '*' kernelpkg.needs_reboot

salt.modules.kernelpkg_linux_yum.remove(release)
Remove a specific version of the kernel.

release The release number of an installed kernel. This must be the entire release number as returned by list_installed(), not the package name.

CLI Example:
salt ' '*' kernelpkg.remove 3.10.0-327.el7

salt.modules.kernelpkg_linux_yum.upgrade(reboot=False, at_time=None)
Upgrade the kernel and optionally reboot the system.

reboot [False] Request a reboot if a new kernel is available.
at_time [immediate] Schedule the reboot at some point in the future. This argument is ignored if reboot=False. See reboot() for more details on this argument.

CLI Example:
salt ' '*' kernelpkg.upgrade
salt ' '*' kernelpkg.upgrade reboot=True at_time=1

Note: An immediate reboot often shuts down the system before the minion has a chance to return, resulting in errors. A minimal delay (1 minute) is useful to ensure the result is delivered to the master.

salt.modules.kernelpkg_linux_yum.upgrade_available()
Detect if a new kernel version is available in the repositories. Returns True if a new kernel is available, False otherwise.

CLI Example:
salt ' '*' kernelpkg.upgrade_available

21.9.209 salt.modules.key
Functions to view the minion’s public key information

salt.modules.key.finger(hash_type=None)
Return the minion’s public key fingerprint

hash_type The hash algorithm used to calculate the fingerprint

CLI Example:
salt ' '*' key.finger
salt.modules.key.\texttt{finger_master}(hash\_type=None)
Return the fingerprint of the master's public key on the minion.

\texttt{hash\_type} The hash algorithm used to calculate the fingerprint

CLI Example:

```
salt '*' key.finger_master
```

## 21.9.210 salt.modules.keyboard

Module for managing keyboards on supported POSIX-like systems using systemd, or such as Redhat, Debian and Gentoo.

salt.modules.keyboard.\texttt{get\_sys}()
Get current system keyboard setting

CLI Example:

```
salt '*' keyboard.get_sys
```

salt.modules.keyboard.\texttt{get\_x}()
Get current X keyboard setting

CLI Example:

```
salt '*' keyboard.get_x
```

salt.modules.keyboard.\texttt{set\_sys}(layout)
Set current system keyboard setting

CLI Example:

```
salt '*' keyboard.set_sys dvorak
```

salt.modules.keyboard.\texttt{set\_x}(layout)
Set current X keyboard setting

CLI Example:

```
salt '*' keyboard.set_x dvorak
```

## 21.9.211 salt.modules.keystone

Module for handling openstack keystone calls.

\texttt{optdepends}
- keystoneclient Python adapter

\texttt{configuration} This module is not usable until the following are specified either in a pillar or in the minion's config file:

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.tenant_id: f80919baedab48ec8931f200c65a50df
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
```
OR (for token based authentication)

```yaml
keystone.token: 'ADMIN'
keystone.endpoint: 'http://127.0.0.1:35357/v2.0'
```

If configuration for multiple openstack accounts is required, they can be set up as different configuration profiles. For example:

```
openstack1:
    keystone.user: admin
    keystone.password: verybadpass
    keystone.tenant: admin
    keystone.tenant_id: f8091baedab48ec8931f200c65a50df
    keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'

openstack2:
    keystone.user: admin
    keystone.password: verybadpass
    keystone.tenant: admin
    keystone.tenant_id: f8091baedab48ec8931f200c65a50df
    keystone.auth_url: 'http://127.0.0.2:5000/v2.0/
```

With this configuration in place, any of the keystone functions can make use of a configuration profile by declaring it explicitly. For example:

```bash
salt '*' keystone.tenant_list profile=openstack1
```

salt.modules.keystone.api_version(profile=None, **connection_args)

Returns the API version derived from endpoint's response.

CLI Example:

```bash
salt '*' keystone.api_version
```

salt.modules.keystone.auth(profile=None, **connection_args)

Set up keystone credentials. Only intended to be used within Keystone-enabled modules.

CLI Example:

```bash
salt '*' keystone.auth
```

salt.modules.keystone.ec2_credentials_create(user_id=None, name=None, tenant_id=None, tenant=None, profile=None, **connection_args)

Create EC2-compatible credentials for user per tenant

CLI Examples:

```bash
salt '*' keystone.ec2_credentials_create name=admin tenant=admin

salt '*' keystone.ec2_credentials_create user_id=c965f79c4f864aa9c3b41904e67082 tenant_id=722787eb540849158668370dc627ec5f
```

salt.modules.keystone.ec2_credentials_delete(user_id=None, name=None, access_key=None, profile=None, **connection_args)

Delete EC2-compatible credentials

CLI Examples:
salt.modules.keystone.ec2_credentials_delete

Return ec2_credentials for a user (keystone ec2-credentials-get)

CLI Examples:

```shell
salt '*' keystone.ec2_credentials_delete access_key=5f66d2f24f604b8bb9cd28886106f442
salt '*' keystone.ec2_credentials_delete name=admin access_key=5f66d2f24f604b8bb9cd28886106f442
```

salt.modules.keystone.ec2_credentials_get

Return a list of ec2_credentials for a specific user (keystone ec2-credentials-list)

CLI Examples:

```shell
salt '*' keystone.ec2_credentials_get user_id=c965f79c4f864eaa9c3b41904e67082 access=722787eb540849158668370
salt '*' keystone.ec2_credentials_get user_id=c965f79c4f864eaa9c3b41904e67082 name=nova
salt '*' keystone.ec2_credentials_get user_id=c965f79c4f864eaa9c3b41904e67082 access=722787eb540849158668370 name=nova
```

salt.modules.keystone.ec2_credentials_list

Create an endpoint for an Openstack service

CLI Examples:

```shell
salt '*' keystone.endpoint_create nova http://public/url http://internal/url
salt '*' keystone.endpoint_create nova url=http://public/url interface='public', region=RegionOne
```

salt.modules.keystone.endpoint_delete

Delete endpoints of an Openstack service

CLI Examples:

```shell
salt '*' keystone.endpoint_delete nova [region=RegionOne]
salt '*' keystone.endpoint_delete nova interface=admin [region=RegionOne]
```

salt.modules.keystone.endpoint_get

Return a specific endpoint (keystone endpoint-get)

CLI Example:
salt 'v2' keystone.endpoint_get nova [region=RegionOne]
salt 'v3' keystone.endpoint_get nova interface=admin [region=RegionOne]

salt.modules.keystone.endpoint_list(profile=None, **connection_args)
   Return a list of available endpoints (keystone endpoints-list)
   
   CLI Example:
   
   salt '*' keystone.endpoint_list

salt.modules.keystone.project_create(name, domain, description=None, enabled=True, profile=None, **connection_args)
   Create a keystone project. Overrides keystone tenant_create form api V2. For keystone api V3.
   
   New in version 2016.11.0.
   
   name The project name, which must be unique within the owning domain.
   
   domain The domain name.
   
   description The project description.
   
   enabled Enables or disables the project.
   
   profile Configuration profile - if configuration for multiple openstack accounts required.
   
   CLI Examples:
   
   salt '*' keystone.project_create nova default description='Nova Compute Project'
salt '*' keystone.project_create test default enabled=False

salt.modules.keystone.project_delete(project_id=None, name=None, profile=None, **connection_args)
   Delete a project (keystone project-delete). Overrides keystone tenant-delete form api V2. For keystone api V3 only.
   
   New in version 2016.11.0.
   
   project_id The project id.
   
   name The project name.
   
   profile Configuration profile - if configuration for multiple openstack accounts required.
   
   CLI Examples:
   
   salt '*' keystone.project_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_delete project_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_delete name= demo

salt.modules.keystone.project_get(project_id=None, name=None, profile=None, **connection_args)
   Return a specific projects (keystone project-get) Overrides keystone tenant-get form api V2. For keystone api V3 only.
   
   New in version 2016.11.0.
   
   project_id The project id.
   
   name The project name.
   
   profile Configuration profile - if configuration for multiple openstack accounts required.
CLI Examples:

```
salt '*' keystone.project_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_get project_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_get name=nova
```

```
salt '*' keystone.project_list
```

```
salt.modules.keystone.project_list(profile=None, **connection_args)
Return a list of available projects (keystone projects-list). Overrides keystone tenants-list form api V2. For keystone api V3 only.
New in version 2016.11.0.
```

```
profile Configuration profile - if configuration for multiple openstack accounts required.
```

```
CLI Example:
salt '*' keystone.project_list
```

```
salt.modules.keystone.project_update(project_id=None, name=None, description=None, enabled=None, profile=None, **connection_args)
Update a tenant's information (keystone project-update) The following fields may be updated: name, description, enabled. Can only update name if targeting by ID
Overrides keystone tenant_update form api V2. For keystone api V3 only.
New in version 2016.11.0.
```

```
project_id The project id.
name The project name, which must be unique within the owning domain.
description The project description.
enabled Enables or disables the project.
profile Configuration profile - if configuration for multiple openstack accounts required.
```

```
CLI Examples:
salt '*' keystone.project_update name=admin enabled=True
salt '*' keystone.project_update c965f79c4f864eaaa9c3b41904e67082 name=admin
email=admin@domain.com
```

```
salt.modules.keystone.role_create(name, profile=None, **connection_args)
Create a named role.
```

```
CLI Example:
salt '*' keystone.role_create admin
```

```
salt.modules.keystone.role_delete(role_id=None, name=None, profile=None, **connection_args)
Delete a role (keystone role-delete)
```

```
CLI Examples:
salt '*' keystone.role_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.role_delete role_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.role_delete name=admin
```

```
salt.modules.keystone.role_get(role_id=None, name=None, profile=None, **connection_args)
Return a specific roles (keystone role-get)
```

21.9. execution modules
CLI Examples:

```
salt '*' keystone.role_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.role_get role_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.role_get name=nova
```

```
salt modules.keystone.role_list(profile=None, **connection_args)
```

Return a list of available roles (keystone role-list)

CLI Example:

```
salt '*' keystone.role_list
```

```
salt modules.keystone.service_create(name, service_type, description=None, profile=None, **connection_args)
```

Add service to Keystone service catalog

CLI Examples:

```
salt '*' keystone.service_create nova compute 'OpenStack Compute Service'
```

```
salt modules.keystone.service_delete(service_id=None, name=None, profile=None, **connection_args)
```

Delete a service from Keystone service catalog

CLI Examples:

```
salt '*' keystone.service_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.service_delete name=nova
```

```
salt modules.keystone.service_get(service_id=None, name=None, profile=None, **connection_args)
```

Return a specific services (keystone service-get)

CLI Examples:

```
salt '*' keystone.service_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.service_get service_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.service_get name=nova
```

```
salt modules.keystone.service_list(profile=None, **connection_args)
```

Return a list of available services (keystone services-list)

CLI Example:

```
salt '*' keystone.service_list
```

```
salt modules.keystone.tenant_create(name, description=None, enabled=True, profile=None, **connection_args)
```

Create a keystone tenant

CLI Examples:

```
salt '*' keystone.tenant_create nova description='nova tenant'
salt '*' keystone.tenant_create test enabled=False
```

```
salt modules.keystone.tenant_delete(tenant_id=None, name=None, profile=None, **connection_args)
```

Delete a tenant (keystone tenant-delete)

CLI Examples:
salt.modules.keystone.tenant_delete( tenant_id=None, name=None, **connection_args )

Return a specific tenants (keystone tenant-delete)

CLI Examples:
salt '*' keystone.tenant_delete c965f79c4f864eeaa9c3b41904e67082
salt '*' keystone.tenant_delete tenant_id=c965f79c4f864eeaa9c3b41904e67082
salt '*' keystone.tenant_delete name=demo

salt.modules.keystone.tenant_get( tenant_id=None, name=None, profile=None, **connection_args )

Return a specific tenants (keystone tenant-get)

CLI Examples:
salt '*' keystone.tenant_get c965f79c4f864eeaa9c3b41904e67082
salt '*' keystone.tenant_get tenant_id=c965f79c4f864eeaa9c3b41904e67082
salt '*' keystone.tenant_get name=nova

salt.modules.keystone.tenant_list( profile=None, **connection_args )

Return a list of available tenants (keystone tenants-list)

CLI Example:
salt '*' keystone.tenant_list

salt.modules.keystone.tenant_update( tenant_id=None, name=None, description=None, enabled=None, profile=None, **connection_args )

Update a tenant's information (keystone tenant-update) The following fields may be updated: name, description, enabled. Can only update name if targeting by ID

CLI Examples:
salt '*' keystone.tenant_update name=admin enabled=True
salt '*' keystone.tenant_update c965f79c4f864eeaa9c3b41904e67082 name=admin email=admin@domain.com

salt.modules.keystone.token_get( profile=None, **connection_args )

Return the configured tokens (keystone token-get)

CLI Example:
salt '*' keystone.token_get c965f79c4f864eeaa9c3b41904e67082

salt.modules.keystone.user_create( name, password, email, tenant_id=None, enabled=True, profile=None, project_id=None, description=None, **connection_args )

Create a user (keystone user-create)

CLI Examples:
salt '*' keystone.user_create name=jack password=zero email=jack@halloweentown.org tenant_id=a28a7b5a999a455f84b1f5210264375e enabled=True

salt.modules.keystone.user_delete( user_id=None, name=None, profile=None, **connection_args )

Delete a user (keystone user-delete)

CLI Examples:
salt '*' keystone.user_delete c965f79c4f864eeaa9c3b41904e67082
salt '*' keystone.user_delete user_id=c965f79c4f864eeaa9c3b41904e67082
salt '*' keystone.user_delete name=nova

21.9. execution modules
salt.modules.keystone.user_get(user_id=None, name=None, profile=None, **connection_args)

Return a specific users (keystone user-get)

CLI Examples:

```
salt '*' keystone.user_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_get user_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_get name=nova
```

salt.modules.keystone.user_list(profile=None, **connection_args)

Return a list of available users (keystone user-list)

CLI Example:

```
salt '*' keystone.user_list
```

salt.modules.keystone.user_password_update(user_id=None, name=None, password=None, profile=None, **connection_args)

Update a user's password (keystone user-password-update)

CLI Examples:

```
salt '*' keystone.user_password_update c965f79c4f864eaaa9c3b41904e67082
    → password=12345
salt '*' keystone.user_password_update user_id=c965f79c4f864eaaa9c3b41904e67082
    → password=12345
salt '*' keystone.user_password_update name=nova password=12345
```

salt.modules.keystone.user_role_add(user_id=None, user=None, tenant_id=None, tenant=None, role_id=None, role=None, profile=None, project_id=None, project_name=None, **connection_args)

Add role for user in tenant (keystone user-role-add)

CLI Examples:

```
salt '*' keystone.user_role_add user_id=298ce377245c4ec9b70e1c639c89e654
    → tenant_id=7167a092ee4bae8c4ead4f9d15bb3b
    → role_id=ce377245c4ec9b70e1c639c89e8ced4
salt '*' keystone.user_role_add user=admin tenant=admin role=admin
```

salt.modules.keystone.user_role_list(user_id=None, tenant_id=None, user_name=None, tenant_name=None, profile=None, project_id=None, project_name=None, **connection_args)

Return a list of available user_roles (keystone user-roles-list)

CLI Examples:

```
salt '*' keystone.user_role_list user_id=298ce377245c4ec9b70e1c639c89e654
    → tenant_id=7167a092ee4bae8c4ead4f9d15bb3b
salt '*' keystone.user_role_list user_name=admin tenant_name=admin
```

salt.modules.keystone.user_role_remove(user_id=None, user=None, tenant_id=None, tenant=None, role_id=None, role=None, profile=None, project_id=None, project_name=None, **connection_args)

Remove role for user in tenant (keystone user-role-remove)

CLI Examples:
**salt.modules.keystone.user_role_remove**

```
salt '*' keystone.user_role_remove user_id=298ce377245c4ec9b70e1c639c89e654
→ tenant_id=7167a92ce84bae8ceaad4bf9d15bb3b role=
→ id=ce377245c4ec9b70e1c639c89e8ced4
```

```
salt '*' keystone.user_role_remove user=admin tenant=admin role=admin
```

**salt.modules.keystone.user_update**

Update a user’s information (keystone user-update) The following fields may be updated: name, email, enabled, tenant. Because the name is one of the fields, a valid user id is required.

CLI Examples:

```
salt '*' keystone.user_update user_id=c965f79c4f864eaaa9c3b41904e67082
→ name=newname
```

```
salt '*' keystone.user_update c965f79c4f864eaaa9c3b41904e67082 name=newname
→ email=newemail@domain.com
```

**salt.modules.keystone.user_verify_password**

Verify a user's password

CLI Examples:

```
salt '*' keystone.user_verify_password name=test password=foobar
```

```
salt '*' keystone.user_verify_password user_id=c965f79c4f864eaaa9c3b41904e67082
→ password=foobar
```

---

**21.9.212 salt.modules.keystoneng**

Keystone module for interacting with OpenStack Keystone

New in version 2018.3.0.

:depends: shade

Example configuration

```
keystone:
  cloud: default
```

```
keystone:
  auth:
    username: admin
    password: password123
    user_domain_name: mydomain
    project_name: myproject
    project_domain_name: myproject
    auth_url: https://example.org:5000/v3
    identity_api_version: 3
```

**salt.modules.keystoneng.compare_changes**

Compare two dicts returning only keys that exist in the first dict and are different in the second one

**salt.modules.keystoneng.domain_create**

Create a domain

CLI Example:
salt '*' keystoneeng.domain_create name=domain1

salt.modules.keystoneng.domain_delete(auth=None, **kwargs)
    Delete a domain
    CLI Example:
    
salt '*' keystoneeng.domain_delete name=domain1
    salt '*' keystoneeng.domain_delete name=b62e76fbee74e8f77073f591cf211e

salt.modules.keystoneng.domain_get(auth=None, **kwargs)
    Get a single domain
    CLI Example:
    
    salt '*' keystoneeng.domain_get name=domain1
    salt '*' keystoneeng.domain_get name=b62e76fbee74e8f77073f591cf211e

salt.modules.keystoneng.domain_list(auth=None, **kwargs)
    List domains
    CLI Example:
    
    salt '*' keystoneeng.domain_list

salt.modules.keystoneng.domain_search(auth=None, **kwargs)
    Search domains
    CLI Example:
    
    salt '*' keystoneeng.domain_search
    salt '*' keystoneeng.domain_search name=domain1

salt.modules.keystoneng.domain_update(auth=None, **kwargs)
    Update a domain
    CLI Example:
    
    salt '*' keystoneeng.domain_update name=domain1 new_name=newdomain
    salt '*' keystoneeng.domain_update name=domain1 enabled=True description='new description'

salt.modules.keystoneng.endpoint_create(auth=None, **kwargs)
    Create an endpoint
    CLI Example:
    
    salt '*' keystoneeng.endpoint_create interface=admin service=glance url=https://example.org:9292
    salt '*' keystoneeng.endpoint_create interface=public service=glance region=RegionOne url=https://example.org:9292
    salt '*' keystoneeng.endpoint_create interface=admin service=glance url=https://example.org:9292 enabled=True

salt.modules.keystoneng.endpoint_delete(auth=None, **kwargs)
    Delete an endpoint
    CLI Example:
Salt Documentation, Release 3001.1

```python
salt 'salt '*' keystoneng.endpoint_delete id=3bee4bd8c2b040ee966adfdaf0bfca9

salt.modules.keystoneng.endpoint_get(auth=None, **kwargs)
Get a single endpoint

CLI Example:
salt 'salt '*' keystoneng.endpoint_get id=02cfaa173b2460f98e40eda3748dae5

salt.modules.keystoneng.endpoint_list(auth=None, **kwargs)
List endpoints

CLI Example:
salt 'salt '*' keystoneng.endpoint_list

salt.modules.keystoneng.endpoint_search(auth=None, **kwargs)
Search endpoints

CLI Example:
salt 'salt '*' keystoneng.endpoint_search
salt 'salt '*' keystoneng.endpoint_search id=02cfaa173b2460f98e40eda3748dae5

salt.modules.keystoneng.endpoint_update(auth=None, **kwargs)
Update an endpoint

CLI Example:
salt 'salt '*' keystoneng.endpoint_update endpoint_id=4f961ad09d2d48948896b6b7c6a797170
  interface=public enabled=False
salt 'salt '*' keystoneng.endpoint_update endpoint_id=4f961ad09d2d48948896b6b7c6a797170
  region=newregion
salt 'salt '*' keystoneng.endpoint_update endpoint_id=4f961ad09d2d48948896b6b7c6a797170
  service_name_or_id=glance url=https://example.org:9292

salt.modules.keystoneng.get_entity(ent_type, **kwargs)
Attempt to query Keystone for more information about an entity

salt.modules.keystoneng.get_openstack_cloud(auth=None)
Return an openstack_cloud

salt.modules.keystoneng.get_operator_cloud(auth=None)
Return an operator_cloud

salt.modules.keystoneng.group_create(auth=None, **kwargs)
Create a group

CLI Example:
salt 'salt '*' keystoneng.group_create name=group1
salt 'salt '*' keystoneng.group_create name=group2 domain=domain1 description='my group2

salt.modules.keystoneng.group_delete(auth=None, **kwargs)
Delete a group

CLI Example:
```
salt 'salt' keystoneng.group_delete name=group1
salt '*' keystoneng.group_delete name=group2 domain_
  --id=b62e76fbee4f8f9f775f91cf211e
salt '*' keystoneng.group_delete name=0e4febc2a5ab4f2c8f374b054162506d

salt.modules.keystoneng.group_get(auth=None, **kwargs)
Get a single group

CLI Example:
salt '*' keystoneng.group_get name=group1
salt '*' keystoneng.group_get name=group2 domain_
  --id=b62e76fbee4f8f9f775f91cf211e
salt '*' keystoneng.group_get name=0e4febc2a5ab4f2c8f374b054162506d

salt.modules.keystoneng.group_list(auth=None, **kwargs)
List groups

CLI Example:
salt '*' keystoneng.group_list
dsalt '*' keystoneng.group_list domain_id=b62e76fbee4f8f9f775f91cf211e

salt.modules.keystoneng.group_search(auth=None, **kwargs)
Search for groups

CLI Example:
salt '*' keystoneng.group_search name=group1
dsalt '*' keystoneng.group_search domain_id=b62e76fbee4f8f9f775f91cf211e

salt.modules.keystoneng.group_update(auth=None, **kwargs)
Update a group

CLI Example:
salt '*' keystoneng.group_update name=group1 description='new description'
salt '*' keystoneng.group_create name=group2 domain_
  --id=b62e76fbee4f8f9f775f91cf211e new_name=newgroupname
dsalt '*' keystoneng.group_create name=0e4febc2a5ab4f2c8f374b054162506d new_
  --name=newgroupname

salt.modules.keystoneng.project_create(auth=None, **kwargs)
Create a project

CLI Example:
salt '*' keystoneng.project_create name=project1
dsalt '*' keystoneng.project_create name=project2 domain_
  --id=b62e76fbee4f8f9f775f91cf211e
dsalt '*' keystoneng.project_create name=project3 enabled=False description='myProject3'

salt.modules.keystoneng.project_delete(auth=None, **kwargs)
Delete a project

CLI Example:
salt ' '*' keystoneng.project_delete name=project1
salt ' '*' keystoneng.project_delete name=project2 domain_
   ...id=b62e76fbee4e8fb77073f591cf211e
salt ' '*' keystoneng.project_delete name=f315afcf12f24ad88c92b936c38f2d5a

salt.modules.keystoneng.project_get(auth=None, **kwargs)
    Get a single project
    CLI Example:
    
salt ' '*' keystoneng.project_get name=project1
salt ' '*' keystoneng.project_get name=project2 domain_
   ...id=b62e76fbee4e8fb77073f591cf211e
salt ' '*' keystoneng.project_get name=f315afcf12f24ad88c92b936c38f2d5a

salt.modules.keystoneng.project_list(auth=None, **kwargs)
    List projects
    CLI Example:
    
salt ' '*' keystoneng.project_list
salt ' '*' keystoneng.project_list domain_id=b62e76fbee4e8fb77073f591cf211e

salt.modules.keystoneng.project_search(auth=None, **kwargs)
    Search projects
    CLI Example:
    
salt ' '*' keystoneng.project_search
salt ' '*' keystoneng.project_search name=project1
salt ' '*' keystoneng.project_search domain_id=b62e76fbee4e8fb77073f591cf211e

salt.modules.keystoneng.project_update(auth=None, **kwargs)
    Update a project
    CLI Example:
    
salt ' '*' keystoneng.project_update name=project1 new_name=newproject
salt ' '*' keystoneng.project_update name=project2 enabled=False description='new
description'

salt.modules.keystoneng.role_assignment_list(auth=None, **kwargs)
    List role assignments
    CLI Example:
    
salt ' '*' keystoneng.role_assignment_list

salt.modules.keystoneng.role_create(auth=None, **kwargs)
    Create a role
    CLI Example:
    
salt ' '*' keystoneng.role_create name=role1
salt ' '*' keystoneng.role_create name=role1 domain_
   ...id=b62e76fbee4e8fb77073f591cf211e

salt.modules.keystoneng.role_delete(auth=None, **kwargs)
    Delete a role
    }
CLI Example:
```python
salt '*' keystoneng.role_delete name=role1 domain_id=b62e76fbee4e8fb77073f591cf211e
salt '*' keystoneng.role_delete name=role1 domain_id=b62e76fbee4e8fb77073f591cf211e
```

```
salt.modules.keystoneng.role_get(auth=None, **kwargs)
Get a single role

CLI Example:
```python
salt '*' keystoneng.role_get name=role1
salt '*' keystoneng.role_get name=role1 domain_id=b62e76fbee4e8fb77073f591cf211e
salt '*' keystoneng.role_get name=role1 domain_id=b62e76fbee4e8fb77073f591cf211e
```

```
salt.modules.keystoneng.role_grant(auth=None, **kwargs)
Grant a role in a project/domain to a user/group

CLI Example:
```python
salt '*' keystoneng.role_grant name=role1 user=user1 project=project1
salt '*' keystoneng.role_grant name=role1 user=user1 project=project1
ddb3e0ed74e4c7f8027bad4af03339d group=user1
dc3a18a83b4610b7a7f7ba01465548
salt '*' keystoneng.role_grant name=role1 user=user1 project=project1
ddb3e0ed74e4c7f8027bad4af03339d
dc3a18a83b4610b7a7f7ba01465548
```

```
salt.modules.keystoneng.role_list(auth=None, **kwargs)
List roles

CLI Example:
```python
salt '*' keystoneng.role_list
salt '*' keystoneng.role_list domain_id=b62e76fbee4e8fb77073f591cf211e
```

```
salt.modules.keystoneng.role_revoke(auth=None, **kwargs)
Grant a role in a project/domain to a user/group

CLI Example:
```python
salt '*' keystoneng.role_revoke name=role1 user=user1 project=project1
salt '*' keystoneng.role_revoke name=role1 user=user1 project=project1
ddb3e0ed74e4c7f8027bad4af03339d group=user1
dc3a18a83b4610b7a7f7ba01465548
salt '*' keystoneng.role_revoke name=role1 user=user1 project=project1
ddb3e0ed74e4c7f8027bad4af03339d
dc3a18a83b4610b7a7f7ba01465548
```

```
salt.modules.keystoneng.role_search(auth=None, **kwargs)
Search roles

CLI Example:
```python
salt '*' keystoneng.role_search
salt '*' keystoneng.role_search name=role1
db3e0ed74e4c7f8027bad4af03339d
dc3a18a83b4610b7a7f7ba01465548
```

```
salt.modules.keystoneng.role_update(auth=None, **kwargs)
Update a role

CLI Example:
salt '***' keystoneng.role_update name=role1 new_name=newrole
salt '***' keystoneng.role_update name=1eb6edd5525e4ac39af571addee673559 new_name=newrole

salt.modules.keystoneng.service_create(auth=None, **kwargs)
Create a service

CLI Example:
salt '***' keystoneng.service_create name=glance type=image
salt '***' keystoneng.service_create name=glance type=image description="Image"

salt.modules.keystoneng.service_delete(auth=None, **kwargs)
Delete a service

CLI Example:
salt '***' keystoneng.service_delete name=glance
salt '***' keystoneng.service_delete name=3cc13ed2f744ab815331554430e8ec

salt.modules.keystoneng.service_get(auth=None, **kwargs)
Get a single service

CLI Example:
salt '***' keystoneng.service_get name=glance
salt '***' keystoneng.service_get name=5a5804638944b3ab54f7fbc22305a

salt.modules.keystoneng.service_list(auth=None, **kwargs)
List services

CLI Example:
salt '***' keystoneng.service_list

salt.modules.keystoneng.service_search(auth=None, **kwargs)
Search services

CLI Example:
salt '***' keystoneng.service_search
salt '***' keystoneng.service_search name=glance
salt '***' keystoneng.service_search name=135f0403f8e544dc9008c6739ecda860

salt.modules.keystoneng.service_update(auth=None, **kwargs)
Update a service

CLI Example:
salt '***' keystoneng.service_update name=cinder type=volumev2
salt '***' keystoneng.service_update name=cinder description='new description'
salt '***' keystoneng.service_update name=ab4d35e269f147b3ae2d849f77f588f8
enabled=False

salt.modules.keystoneng.setup_clouds(auth=None)
Call functions to create Shade cloud objects in __context__ to take advantage of Shade’s in-memory caching across several states

salt.modules.keystoneng.user_create(auth=None, **kwargs)
Create a user
CLI Example:

```bash
salt '*' keystoneng.user_create name=user1
salt '*' keystoneng.user_create name=user2 password=1234 enabled=False
salt '*' keystoneng.user_create name=user3 domain_
  →id=b62e76fbee4e8fb77073f591cf211e
```

**salt.modules.keystoneng.user_delete** *(auth=*, **kwargs)*
Delete a user

CLI Example:

```bash
salt '*' keystoneng.user_delete name=user1
salt '*' keystoneng.user_delete name=user2 domain_
  →id=b62e76fbee4e8fb77073f591cf211e
salt '*' keystoneng.user_delete name=a42cbbfa1e894e839fd0f584d22e321f
```

**salt.modules.keystoneng.user_get** *(auth=*, **kwargs)*
Get a single user

CLI Example:

```bash
salt '*' keystoneng.user_get name=user1
salt '*' keystoneng.user_get name=user1 domain_id=b62e76fbee4e8fb77073f591cf211e
salt '*' keystoneng.user_get name=02cffaa173b2460f98e40eda3748dae5
```

**salt.modules.keystoneng.user_list** *(auth=*, **kwargs)*
List users

CLI Example:

```bash
salt '*' keystoneng.user_list
salt '*' keystoneng.user_list domain_id=b62e76fbee4e8fb77073f591cf211e
```

**salt.modules.keystoneng.user_search** *(auth=*, **kwargs)*
List users

CLI Example:

```bash
salt '*' keystoneng.user_search
salt '*' keystoneng.user_search domain_id=b62e76fbee4e8fb77073f591cf211e
```

**salt.modules.keystoneng.user_update** *(auth=*, **kwargs)*
Update a user

CLI Example:

```bash
salt '*' keystoneng.user_update name=user1 enabled=False description='new'
  →description'
salt '*' keystoneng.user_update name=user1 new_name=newuser
```
21.9.213 salt.modules.keystore

Module to interact with keystores

salt.modules.keystore.add(name, keystore, passphrase, certificate, private_key=None)

Adds certificates to an existing keystore or creates a new one if necessary.

Parameters

- **name** -- alias for the certificate
- **keystore** -- The path to the keystore file to query
- **passphrase** -- The passphrase to use to decode the keystore
- **certificate** -- The PEM public certificate to add to keystore. Can be a string for file.
- **private_key** -- (Optional for TrustedCert) The PEM private key to add to the keystore

CLI Example:

```
salt '*' keystore.add aliasname /tmp/test.store changeit /tmp/testcert.crt
salt '*' keystore.add aliasname /tmp/test.store changeit certificate="-----BEGIN CERTIFICATE-----
...
-----END CERTIFICATE-----"
salt '*' keystore.add keyname /tmp/test.store changeit /tmp/512.cert private_key=/tmp/512.key
```

salt.modules.keystore.list(keystore, passphrase, alias=None, return_cert=False)

Lists certificates in a keytool managed keystore.

Parameters

- **keystore** -- The path to the keystore file to query
- **passphrase** -- The passphrase to use to decode the keystore
- **alias** -- (Optional) If found, displays details on only this key
- **return_certs** -- (Optional) Also return certificate PEM.

Warning: There are security implications for using return_cert to return decrypted certificates.

CLI Example:

```
salt '*' keystore.list /usr/lib/jvm/java-8/jre/lib/security/cacerts changeit
salt '*' keystore.list /usr/lib/jvm/java-8/jre/lib/security/cacerts changeit debian:verisign_-_g5.pem
```

salt.modules.keystore.remove(name, keystore, passphrase)

Removes a certificate from an existing keystore. Returns True if remove was successful, otherwise False.

Parameters

- **name** -- alias for the certificate
- **keystore** -- The path to the keystore file to query
- **passphrase** -- The passphrase to use to decode the keystore

CLI Example:

```
salt '*' keystore.remove aliasname /tmp/test.store changeit
```
21.9.214 salt.modules.kmod

Module to manage Linux kernel modules

salt.modules.kmod.available()
Return a list of all available kernel modules

CLI Example:
```
salt '*' kmod.available
```

salt.modules.kmod.check_available(mod)
Check to see if the specified kernel module is available

CLI Example:
```
salt '*' kmod.check_available kvm
```

salt.modules.kmod.is_loaded(mod)
Check to see if the specified kernel module is loaded

CLI Example:
```
salt '*' kmod.is_loaded kvm
```

salt.modules.kmod.load(mod, persist=False)
Load the specified kernel module

mod Name of module to add
persist Write module to /etc/modules to make it load on system reboot

CLI Example:
```
salt '*' kmod.load kvm
```

salt.modules.kmod.lsmod()
Return a dict containing information about currently loaded modules

CLI Example:
```
salt '*' kmod.lsmod
```

salt.modules.kmod.mod_list(only_persist=False)
Return a list of the loaded module names

only_persist Only return the list of loaded persistent modules

CLI Example:
```
salt '*' kmod.mod_list
```

salt.modules.kmod.remove(mod, persist=False, comment=True)
Remove the specified kernel module

mod Name of module to remove
persist Also remove module from /etc/modules
comment If persist is set don't remove line from /etc/modules but only comment it

CLI Example:
21.9.215 salt.modules.kubeadm module

maintainer Alberto Planas <aplanas@suse.com>
maturity new
depends None
platform Linux

salt.modules.kubeadm.alpha_certs_renew(rootfs=None)
New in version TBD.

Renews certificates for a Kubernetes cluster

rootfs The path to the real host root filesystem

CLI Example:

```bash
salt '*' kubeadm.alpha_certs_renew
```

salt.modules.kubeadm.alpha_kubeconfig_user(client_name, apiserver_advertise_address=None, apiserver_bind_port=None, cert_dir=None, org=None, token=None, rootfs=None)

New in version TBD.

Outputs a kubeconfig file for an additional user

client_name The name of the user. It will be used as the CN if client certificates are created
apiserver_advertise_address The IP address the API server is accessible on
apiserver_bind_port The port the API server is accessible on (default 6443)
cert_dir The path where certificates are stored (default "/etc/kubernetes/pki")
or The organization of the client certificate
token The token that should be used as the authentication mechanism for this kubeconfig, instead of client certificates
rootfs The path to the real host root filesystem

CLI Example:

```bash
salt '*' kubeadm.alpha_kubeconfig_user client_name=user
```

salt.modules.kubeadm.alpha_kubelet_config_download(kubeconfig=None, kubeplet_version=None, rootfs=None)

New in version TBD.

Downloads the kubelet configuration from the cluster ConfigMap kubelet-config-1.X

kubeconfig The kubeconfig file to use when talking to the cluster. The default values in
/etc/kubernetes/admin.conf
kubeplet_version The desired version for the kubelet
rootfs The path to the real host root filesystem
CLI Example:

```bash
salt '*' kubeadm.alpha_kubelet_config_download
salt '*' kubeadm.alpha_kubelet_config_download kubelet_version='1.14.0'
```

**salt.modules.kubeadm.alpha_kubelet_config_enable_dynamic**(node_name, kubeconfig=None, kubelet_version=None, rootfs=None)

New in version TBD.

Enables or updates dynamic kubelet configuration for a node

- **node_name**: Name of the node that should enable the dynamic kubelet configuration
- **kubeconfig**: The kubeconfig file to use when talking to the cluster. The default values in `/etc/kubernetes/admin.conf`
- **kubelet_version**: The desired version for the kubelet
- **rootfs**: The path to the real host root filesystem

CLI Example:

```bash
salt '*' kubeadm.alpha_kubelet_config_enable_dynamic node-1
```

**salt.modules.kubeadm.alpha_selfhost_pivot**(cert_dir=None, config=None, kubeconfig=None, store_certs_in_secrets=False, rootfs=None)

New in version TBD.

Converts a static Pod-hosted control plane into a self-hosted one

- **cert_dir**: The path where certificates are stored (default "/etc/kubernetes/pki")
- **config**: Path to kubeadm configuration file
- **kubeconfig**: The kubeconfig file to use when talking to the cluster. The default values in `/etc/kubernetes/admin.conf`
- **store_certs_in_secrets**: Enable storing certs in secrets
- **rootfs**: The path to the real host root filesystem

CLI Example:

```bash
salt '*' kubeadm.alpha_selfhost_pivot
```

**salt.modules.kubeadm.config_images_list**(config=None, feature_gates=None, kubernetes_version=None, kubeconfig=None, rootfs=None)

New in version TBD.

Print a list of images kubeadm will use

- **config**: Path to kubeadm configuration file
- **feature_gates**: A set of key=value pairs that describe feature gates for various features
- **kubernetes_version**: Choose a specific Kubernetes version for the control plane (default "stable-1")
- **kubeconfig**: The kubeconfig file to use when talking to the cluster. The default values in `/etc/kubernetes/admin.conf`
- **rootfs**: The path to the real host root filesystem
CLI Example:

```
salt '*' kubeadm.config_images_list
```

```
salt.modules.kubeadm.config_images_pull(config=None, cri_socket=None, feature_gates=None, kubernetes_version=None, kubeconfig=None, rootfs=None)
```

New in version TBD.

Pull images used by kubeadm

- **config** Path to kubeadm configuration file
- **cri_socket** Path to the CRI socket to connect
- **feature_gates** A set of key=value pairs that describe feature gates for various features
- **kubernetes_version** Choose a specific Kubernetes version for the control plane (default "stable-1")
- **kubeconfig** The kubeconfig file to use when talking to the cluster. The default values in /etc/kubernetes/admin.conf
- **rootfs** The path to the real host root filesystem

CLI Example:

```
salt '*' kubeadm.config_images_pull
```

```
salt.modules.kubeadm.config_migrate(old_config, new_config=None, kubeconfig=None, rootfs=None)
```

New in version TBD.

Read an older version of the kubeadm configuration API types from a file, and output the similar config object for the newer version

- **old_config** Path to the kubeadm config file that is using the old API version and should be converted
- **new_config** Path to the resulting equivalent kubeadm config file using the new API version. If not specified, the output will be returned
- **kubeconfig** The kubeconfig file to use when talking to the cluster. The default values in /etc/kubernetes/admin.conf
- **rootfs** The path to the real host root filesystem

CLI Example:

```
salt '*' kubeadm.config_migrate /oldconfig.cfg
```

```
salt.modules.kubeadm.config_print_init_defaults(component_configs=None, kubeconfig=None, rootfs=None)
```

New in version TBD.

Return default init configuration, that can be used for 'kubeadm init'

- **component_configs** A comma-separated list for component config API object to print the default values for (valid values: KubeProxyConfiguration, KubeletConfiguration)
- **kubeconfig** The kubeconfig file to use when talking to the cluster. The default values in /etc/kubernetes/admin.conf
- **rootfs** The path to the real host root filesystem

CLI Example:
salt 'salt '*' kubeadm.config_print_init_defaults

```python
salt.modules.kubeadm.config_print_join_defaults(component_configs=None, kubeconfig=None, rootfs=None)
```

New in version TBD.

Return default join configuration, that can be used for 'kubeadm join'

- **component_config** A comma-separated list for component config API object to print the default values for (valid values: KubeProxyConfiguration, KubeletConfiguration)
- **kubeconfig** The kubeconfig file to use when talking to the cluster. The default values in /etc/kubernetes/admin.conf
- **rootfs** The path to the real host root filesystem

CLI Example:

```shell
salt '*' kubeadm.config_print_join_defaults
```

salt.modules.kubeadm.config_upload_from_file(config, kubeconfig=None, rootfs=None)

New in version TBD.

Upload a configuration file to the in-cluster ConfigMap for kubeadm configuration

- **config** Path to a kubeadm configuration file
- **kubeconfig** The kubeconfig file to use when talking to the cluster. The default values in /etc/kubernetes/admin.conf
- **rootfs** The path to the real host root filesystem

CLI Example:

```shell
salt '*' kubeadm.config_upload_from_file /config.cfg
```

salt.modules.kubeadm.config_upload_from_flags(apiserveradvertise_address=None, apiserver_bind_port=None, apiserver_cert_extra_sans=None, cert_dir=None, cri_socket=None, feature_gates=None, kubernetes_version=None, node_name=None, pod_network_cidr=None, service_cidr=None, service_dns_domain=None, kubeconfig=None, rootfs=None)

New in version TBD.

Create the in-cluster configuration file for the first time using flags

- **apiserveradvertise_address** The IP address the API server will advertise it’s listening on
- **apiserver_bind_port** The port the API server is accessible on (default 6443)
- **apiserver_cert_extra_sans** Optional extra Subject Alternative Names (SANs) to use for the API Server serving certificate
- **cert_dir** The path where to save and store the certificates (default ”/etc/kubernetes/pki”)
- **cri_socket** Path to the CRI socket to connect
- **feature_gates** A set of key=value pairs that describe feature gates for various features
**kubernetes_version** Choose a specific Kubernetes version for the control plane (default "stable-1")

**node_name** Specify the node name

**pod_network_cidr** Specify range of IP addresses for the pod network

**service_cidr** Use alternative range of IP address for service VIPs (default "$10.96.0.0/12")

**service_dns_domain** Use alternative domain for services (default "cluster.local")

**kubeconfig** The kubeconfig file to use when talking to the cluster. The default values in 
/etc/kubernetes/admin.conf

**rootfs** The path to the real host root filesystem

CLI Example:

```
salt '*' kubeadm.config_upload_from_flags
```

**salt.modules.kubeadm.config_view** *(kubeconfig=None, rootfs=None)*

New in version TBD.

View the kubeadm configuration stored inside the cluster

**kubeconfig** The kubeconfig file to use when talking to the cluster. The default values in 
/etc/kubernetes/admin.conf

**rootfs** The path to the real host root filesystem

CLI Example:

```
salt '*' kubeadm.config_view
```

**salt.modules.kubeadm.init** *(apiserver_advertise_address=None, api-server_bind_port=None, api-server_cert_extra_sans=None, cert_dir=None, certificate_key=None, config=None, cri_socket=None, experimental_upload_certs=False, feature_gates=None, ignore_preflight_errors=None, image_repository=None, kubernetes_version=None, node_name=None, pod_network_cidr=None, service_cidr=None, service_dns_domain=None, skip_certificate_key_print=False, skip_phases=None, skip_token_print=False, token=None, token_ttl=None, rootfs=None)*

New in version TBD.

Command to set up the Kubernetes control plane

**apiserver_advertise_address** The IP address the API server will advertise it's listening on

**apiserver_bind_port** The port the API server is accessible on (default 6443)

**apiserver_cert_extra_sans** Optional extra Subject Alternative Names (SANs) to use for the API Server serving certificate

**cert_dir** The path where to save and store the certificates (default "/etc/kubernetes/pki")

**certificate_key** Key used to encrypt the control-plane certificates in the kubeadm-certs Secret

**config** Path to a kubeadm configuration file

**cri_socket** Path to the CRI socket to connect

**experimental_upload_certs** Upload control-plane certificate to the kubeadm-certs Secret

**feature_gates** A set of key=value pairs that describe feature gates for various features

**ignore_preflight_errors** A list of checks whose errors will be shown as warnings
**image_repository**  Choose a container registry to pull control plane images from

**kubernetes_version**  Choose a specific Kubernetes version for the control plane (default "stable-1")

**node_name**  Specify the node name

**pod_network_cidr**  Specify range of IP addresses for the pod network

**service_cidr**  Use alternative range of IP address for service VIPs (default "10.96.0.0/12")

**service_dns_domain**  Use alternative domain for services (default "cluster.local")

**skip_certificate_key_print**  Don't print the key used to encrypt the control-plane certificates

**skip_phases**  List of phases to be skipped

**skip_token_print**  Skip printing of the default bootstrap token generated by 'kubeadm init'

**token**  The token to use for establishing bidirectional trust between nodes and control-plane nodes. The token must match a regular expression, that by default is `[a-z0-9][6.][a-z0-9][16]`

**token_ttl**  The duration before the token is automatically deleted (1s, 2m, 3h). If set to '0' the token will never expire. Default value is 24h0m0s

**rootfs**  The path to the real host root filesystem

**CLI Example:**

```
salt '*' kubeadm.init pod_network_cidr='10.244.0.0/16'
```

```
salt.modules.kubeadm.join(api_server_endpoint=None, api_server_advertise_address=None, api_server_bind_port=None, certificate_key=None, config=None, cri_socket=None, discovery_file=None, discovery_token=None, discovery_token_ca_cert_hash=None, discovery_token_unsafe_skip_ca_verification=False, experimental_control_plane=False, ignore PREFlight_errors=None, node_name=None, skip_phases=None, tls_bootstrap_token=None, token=None, rootfs=None)
```

New in version TBD.

Command to join to an existing cluster

**api_server_endpoint**  IP address or domain name and port of the API Server

**apiserver_advertise_address**  If the node should host a new control plane instance, the IP address the API Server will advertise it's listening on

**apiserver_bind_port**  If the node should host a new control plane instance, the port the API Server to bind to (default 6443)

**certificate_key**  Use this key to decrypt the certificate secrets uploaded by init

**config**  Path to a kubeadm configuration file

**cri_socket**  Path to the CRI socket to connect

**discovery_file**  For file-based discovery, a file or URL from which to load cluster information

**discovery_token**  For token-based discovery, the token used to validate cluster information fetched from the API Server

**discovery_token_ca_cert_hash**  For token-based discovery, validate that the root CA public key matches this hash (format: "<type>:<value>")

**discovery_token_unsafe_skip_ca_verification**  For token-based discovery, allow joining without 'discovery-token-ca-cert-hash' pinning
**experimental_control_plane** Create a new control plane instance on this node

**ignore PREFLIGHT_ERRORS** A list of checks whose errors will be shown as warnings

**node_name** Specify the node name

**skip_phases** List of phases to be skipped

**tls_bootstrap_token** Specify the token used to temporarily authenticate with the Kubernetes Control Plane while joining the node

**token** Use this token for both discovery-token and tls-bootstrap-token when those values are not provided

**rootfs** The path to the real host root filesystem

CLI Example:
```
salt '*' kubeadm.join 10.160.65.165:6443 token='token'
```

salt.modules.kubeadm.join_params(create if needed=False)
New in version TBD.
Return the parameters required for joining into the cluster

**create if needed** If the token bucket is empty and this parameter is True, a new token will be created.

CLI Example:
```
salt '*' kubeadm.join_params
salt '*' kubeadm.join_params create if needed=True
```

salt.modules.kubeadm.reset(cert_dir=None, cri_socket=None, ignore PREFLIGHT_ERRORS=None, kubeconfig=None, rootfs=None)
New in version TBD.
Revert any changes made to this host by 'kubeadm init' or 'kubeadm join'

**cert_dir** The path to the directory where the certificates are stored (default "/etc/kubernetes/pki")

**cri_socket** Path to the CRI socket to connect

**ignore PREFLIGHT_ERRORS** A list of checks whose errors will be shown as warnings

**kubeconfig** The kubeconfig file to use when talking to the cluster. The default values in 
/etc/kubernetes/admin.conf

**rootfs** The path to the real host root filesystem

CLI Example:
```
salt '*' kubeadm.join 10.160.65.165:6443 token='token'
```

salt.modules.kubeadm.token_create(token=None, config=None, description=None, groups=None, ttl=None, usages=None, kubeconfig=None, rootfs=None)
New in version TBD.
Create bootstrap tokens on the server

**token** Token to write, if None one will be generated. The token must match a regular expression, that by default is [a-z0-9][6],[a-z0-9][16]

**config** Path to kubeadm configuration file

**description** A human friendly description of how this token is used
groups List of extra groups that this token will authenticate, default to ['system:bootstrappers:kubeadm:default-node-token']

ttl The duration before the token is automatically deleted (1s, 2m, 3h). If set to '0' the token will never expire. Default value is 24h0m0s

usages Describes the ways in which this token can be used. The default value is ['signing', 'authentication']

kubeconfig The kubeconfig file to use when talking to the cluster. The default values in /etc/kubernetes/admin.conf

rootfs The path to the real host root filesystem

CLI Example:

```bash
salt '*' kubeadm.token_create
salt '*' kubeadm.token_create alb2c.0123456789abcdef
salt '*' kubeadm.token_create ttl='6h'
salt '*' kubeadm.token_create usages="['signing']"
```

salt.modules.kubeadm.token_delete(token, kubeconfig=None, rootfs=None)
New in version TBD.
Delete bootstrap tokens on the server

token Token to write, if None one will be generated. The token must match a regular expression, that by default is [a-z0-9][6].[a-z0-9][16]

kubeconfig The kubeconfig file to use when talking to the cluster. The default values in /etc/kubernetes/admin.conf

rootfs The path to the real host root filesystem

CLI Example:

```bash
salt '*' kubeadm.token_delete alb2c
salt '*' kubeadm.token_create alb2c.0123456789abcdef
```

salt.modules.kubeadm.token_generate(kubeconfig=None, rootfs=None)
New in version TBD.
Generate and return a bootstrap token, but do not create it on the server

kubeconfig The kubeconfig file to use when talking to the cluster. The default values in /etc/kubernetes/admin.conf

rootfs The path to the real host root filesystem

CLI Example:

```bash
salt '*' kubeadm.token_generate
```

salt.modules.kubeadm.token_list(kubeconfig=None, rootfs=None)
New in version TBD.
List bootstrap tokens on the server

kubeconfig The kubeconfig file to use when talking to the cluster. The default values in /etc/kubernetes/admin.conf

rootfs The path to the real host root filesystem

CLI Example:
salt 'salt '*' kubeadm.token_list

salt.modules.kubeadm.version(kubeconfig=None, rootfs=None)

New in version TBD.

Return the version of kubeadm

kubeconfig The kubeconfig file to use when talking to the cluster. The default values in /etc/kubernetes/admin.conf

rootfs The path to the real host root filesystem

CLI Example:
salt 'salt '*' kubeadm.version

21.9.216 salt.modules.kubernetesmod

Module for handling kubernetes calls.

optdepends

- kubernetes Python client

configuration The k8s API settings are provided either in a pillar, in the minion's config file, or in master's config file:

```
kubernetes.kubeconfig: '/path/to/kubeconfig'
kubernetes.kubeconfig-data: '<base64 encoded kubeconfig content'
kubernetes.context: 'context'
```

These settings can be overridden by adding context and 'kubeconfig or kubeconfig_data' parameters when calling a function.

The data format for kubernetes.kubeconfig-data value is the content of kubeconfig base64 encoded in one line.

Only kubeconfig or kubeconfig_data should be provided. In case both are provided kubeconfig entry is preferred.

salt 'salt '*' kubernetes.nodes kubeconfig=/etc/salt/k8s/kubeconfig context=minikube

Changed in version 2019.2.0.

Warning: Configuration options changed in 2019.2.0. The following configuration options have been removed:

- kubernetes.user
- kubernetes.password
- kubernetes.api_url
- kubernetes.certificate-authority-data/file
- kubernetes.client-certificate-data/file
- kubernetes.client-key-data/file

Please use now:

- kubernetes.kubeconfig or kubernetes.kubeconfig_data
- kubernetes.context
salt.modules.kubernetesmod.configmaps(namespace='default', **kwargs)

Return a list of kubernetes configmaps defined in the namespace

CLI Examples:

```bash
salt '*' kubernetes.configmaps
salt '*' kubernetes.configmaps namespace=default
```

salt.modules.kubernetesmod.create_configmap(name, namespace, data, source=None, template=None, saltenv='base', **kwargs)

Creates the kubernetes configmap as defined by the user.

CLI Examples:

```bash
salt 'minion1' kubernetes.create_configmap settings default '{
  "example.conf": "# example file"
}'
salt 'minion2' kubernetes.create_configmap name=settings
  namespace=default data='{"example.conf": "# example file"}''
```

salt.modules.kubernetesmod.create_deployment(name, namespace, metadata, spec, source, template, saltenv, **kwargs)

Creates the kubernetes deployment as defined by the user.

salt.modules.kubernetesmod.create_namespace(name, **kwargs)

Creates a namespace with the specified name.

CLI Example: `salt '*' kubernetes.create_namespace salt`

salt.modules.kubernetesmod.create_pod(name, namespace, metadata, spec, source, template, saltenv, **kwargs)

Creates the kubernetes deployment as defined by the user.

salt.modules.kubernetesmod.create_secret(name, namespace='default', data=None, source=None, template=None, saltenv='base', **kwargs)

Creates the kubernetes secret as defined by the user.

CLI Examples:

```bash
salt 'minion1' kubernetes.create_secret passwords default '{
  "db": "letmein"
}'
salt 'minion2' kubernetes.create_secret name=passwords
  namespace=default data='{"db": "letmein"}''
```

salt.modules.kubernetesmod.create_service(name, namespace, metadata, spec, source, template, saltenv, **kwargs)

Creates the kubernetes service as defined by the user.

salt.modules.kubernetesmod.delete_configmap(name, namespace='default', **kwargs)

Deletes the kubernetes configmap defined by name and namespace

CLI Examples:

```bash
salt '*' kubernetes.delete_configmap settings default
salt '*' kubernetes.delete_configmap name=settings namespace=default
```

salt.modules.kubernetesmod.delete_deployment(name, namespace='default', **kwargs)

Deletes the kubernetes deployment defined by name and namespace

CLI Examples:
salt.modules.kubernetesmod.delete_namespace(name, **kwargs)
Deletes the kubernetes namespace defined by name

CLI Examples:
salt '*' kubernetes.delete_namespace salt
salt '*' kubernetes.delete_namespace name=salt

salt.modules.kubernetesmod.delete_pod(name, namespace='default', **kwargs)
Deletes the kubernetes pod defined by name and namespace

CLI Examples:
salt '*' kubernetes.delete_pod guestbook-708336848-5nl8c default
salt '*' kubernetes.delete_pod name=guestbook-708336848-5nl8c namespace=default

salt.modules.kubernetesmod.delete_secret(name, namespace='default', **kwargs)
Deletes the kubernetes secret defined by name and namespace

CLI Examples:
salt '*' kubernetes.delete_secret confidential default
salt '*' kubernetes.delete_secret name=confidential namespace=default

salt.modules.kubernetesmod.delete_service(name, namespace='default', **kwargs)
Deletes the kubernetes service defined by name and namespace

CLI Examples:
salt '*' kubernetes.delete_service my-nginx default
salt '*' kubernetes.delete_service name=my-nginx namespace=default

salt.modules.kubernetesmod.deployments(namespace='default', **kwargs)
Return a list of kubernetes deployments defined in the namespace

CLI Examples:
salt '*' kubernetes.deployments
salt '*' kubernetes.deployments namespace=default

salt.modules.kubernetesmod.namespaces(**kwargs)
Return the names of the available namespaces

CLI Examples:
salt '*' kubernetes.namespaces
salt '*' kubernetes.namespaces kubeconfig=/etc/salt/k8s/kubeconfig
  context=minikube

salt.modules.kubernetesmod.node(name, **kwargs)
Return the details of the node identified by the specified name

CLI Examples:
salt '*' kubernetes.node name='minikube'
salt.modules.kubernetesmod.node_add_label(node_name, label_name, label_value, **kwargs)
Set the value of the label identified by label_name to label_value on the node identified by the name node_name.
Creates the label if not present.

CLI Examples:
```
salt '*' kubernetes.node_add_label node_name="minikube" label_name="foo" label_value="bar"
```

salt.modules.kubernetesmod.node_labels(name, **kwargs)
Return the labels of the node identified by the specified name.

CLI Examples:
```
salt '*' kubernetes.node_labels name="minikube"
```

salt.modules.kubernetesmod.node_remove_label(node_name, label_name, **kwargs)
Removes the label identified by label_name from the node identified by the name node_name.

CLI Examples:
```
salt '*' kubernetes.node_remove_label node_name="minikube" label_name="foo"
```

salt.modules.kubernetesmod.nodes(**kwargs)
Return the names of the nodes composing the kubernetes cluster.

CLI Examples:
```
salt '*' kubernetes.nodes
salt '*' kubernetes.nodes kubeconfig=/etc/salt/k8s/kubeconfig context=minikube
```

salt.modules.kubernetesmod.ping(**kwargs)
Checks connections with the kubernetes API server. Returns True if the connection can be established, False otherwise.

CLI Example: salt '*' kubernetes.ping

salt.modules.kubernetesmod.pods(namespace='default', **kwargs)
Return a list of kubernetes pods defined in the namespace.

CLI Examples:
```
salt '*' kubernetes.pods
salt '*' kubernetes.pods namespace=default
```

salt.modules.kubernetesmod.replace_configmap(name, data, source=None, template=None, saltenv='base', namespace='default', **kwargs)
Replaces an existing configmap with a new one defined by name and namespace with the specified data.

CLI Examples:
```
salt 'minion1' kubernetes.replace_configmap settings default '{"example.conf": "# example file"}'
salt 'minion2' kubernetes.replace_configmap name=settings namespace=default data='{"example.conf": "# example file"}'
```
salt.modules.kubernetesmod.replace_deployment(name, metadata, spec, source, template, saltenv, namespace='default', **kwargs)

Replaces an existing deployment with a new one defined by name and namespace, having the specified metadata and spec.

salt.modules.kubernetesmod.replace_secret(name, data, source=None, template=None, saltenv='base', namespace='default', **kwargs)

Replaces an existing secret with a new one defined by name and namespace, having the specified data.

CLI Examples:

```
salt 'minion1' kubernetes.replace_secret name=passwords data='"db": "letmein"'
salt 'minion2' kubernetes.replace_secret name=passwords namespace=saltstack data='"db": "passw0rd"'
```

salt.modules.kubernetesmod.replace_service(name, metadata, spec, source, template, old_service, saltenv, namespace='default', **kwargs)

Replaces an existing service with a new one defined by name and namespace, having the specified metadata and spec.

salt.modules.kubernetesmod.secrets(namespace='default', **kwargs)

Return a list of kubernetes secrets defined in the namespace

CLI Examples:

```
salt '*' kubernetes.secrets
salt '*' kubernetes.secrets namespace=default
```

salt.modules.kubernetesmod.services(namespace='default', **kwargs)

Return a list of kubernetes services defined in the namespace

CLI Examples:

```
salt '*' kubernetes.services
salt '*' kubernetes.services namespace=default
```

salt.modules.kubernetesmod.show_configmap(name, namespace='default', **kwargs)

Return the kubernetes configmap defined by name and namespace.

CLI Examples:

```
salt '*' kubernetes.show_configmap game-config default
salt '*' kubernetes.show_configmap name=game-config namespace=default
```

salt.modules.kubernetesmod.show_deployment(name, namespace='default', **kwargs)

Return the kubernetes deployment defined by name and namespace

CLI Examples:

```
salt '*' kubernetes.show_deployment my-nginx default
salt '*' kubernetes.show_deployment name=my-nginx namespace=default
```

salt.modules.kubernetesmod.show_namespace(name, **kwargs)

Return information for a given namespace defined by the specified name

CLI Examples:
salt '*' kubernetes.show_namespace kube-system

salt.modules.kubernetesmod.show_pod(name, namespace='default', **kwargs)
    Return POD information for a given pod name defined in the namespace
    CLI Examples:
    
    salt '*' kubernetes.show_pod guestbook-708336848-fqr2x
    salt '*' kubernetes.show_pod guestbook-708336848-fqr2x namespace=default

salt.modules.kubernetesmod.show_secret(name, namespace='default', decode=False, **kwargs)
    Return the kubernetes secret defined by name and namespace. The secrets can be decoded if specified by the user. Warning: this has security implications.
    CLI Examples:
    
    salt '*' kubernetes.show_secret confidential default
    salt '*' kubernetes.show_secret name=confidential namespace=default
    salt '*' kubernetes.show_secret name=confidential decode=True

salt.modules.kubernetesmod.show_service(name, namespace='default', **kwargs)
    Return the kubernetes service defined by name and namespace
    CLI Examples:
    
    salt '*' kubernetes.show_service my-nginx default
    salt '*' kubernetes.show_service name=my-nginx namespace=default

21.9.217 salt.modules.launchctl_service

Module for the management of MacOS systems that use launchd/launchctl

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see here.

depends
    • plistlib Python module

salt.modules.launchctl_service.available(job_label)
    Check that the given service is available.
    CLI Example:
    
    salt '*' service.available com.openssh.sshd

salt.modules.launchctl_service.disabled(job_label, runas=None)
    Return True if the named service is disabled, false otherwise
    CLI Example:
    
    salt '*' service.disabled <service label>

salt.modules.launchctl_service.enabled(job_label, runas=None)
    Return True if the named service is enabled, false otherwise
    CLI Example:
salt '*' service.enabled <service label>

salt.modules.launchctl_service.get_all()
Return all installed services
   CLI Example:
   salt '*' service.get_all

salt.modules.launchctl_service.missing(job_label)
The inverse of service.available Check that the given service is not available.
   CLI Example:
   salt '*' service.missing com.openssh.sshd

salt.modules.launchctl_service.restart(job_label, runas=None)
Restart the named service
   CLI Example:
   salt '*' service.restart <service label>

salt.modules.launchctl_service.start(job_label, runas=None)
Start the specified service
   CLI Example:
   salt '*' service.start org.ntp.ntpd
   salt '*' service.start /System/Library/LaunchDaemons/org.ntp.ntpd.plist

salt.modules.launchctl_service.status(name, runas=None)
Return the status for a service via systemd. If the name contains globbing, a dict mapping service name to True/False values is returned.
   Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)
   Parameters
   - name (str) -- The name of the service to check
   - runas (str) -- User to run launchctl commands
   Returns  True if running, False otherwise dict: Maps service name to True if running, False otherwise
   Return type  bool
   CLI Example:
   salt '*' service.status <service name>

salt.modules.launchctl_service.stop(job_label, runas=None)
Stop the specified service
   CLI Example:
   salt '*' service.stop <service label>
   salt '*' service.stop org.ntp.ntpd
   salt '*' service.stop /System/Library/LaunchDaemons/org.ntp.ntpd.plist
21.9.218 salt.modules.layman

Support for Layman

salt.modules.layman.add(overlay)
Add the given overlay from the cached remote list to your locally installed overlays. Specify ‘ALL’ to add all overlays from the remote list.

Return a list of the new overlay(s) added:

CLI Example:

```bash
salt '*' layman.add <overlay name>
```

salt.modules.layman.delete(overlay)
Remove the given overlay from the your locally installed overlays. Specify ‘ALL’ to remove all overlays.

Return a list of the overlays(s) that were removed:

CLI Example:

```bash
salt '*' layman.delete <overlay name>
```

salt.modules.layman.list_all()
List all overlays, including remote ones.

Return a list of available overlays:

CLI Example:

```bash
salt '*' layman.list_all
```

salt.modules.layman.list_local()
List the locally installed overlays.

Return a list of installed overlays:

CLI Example:

```bash
salt '*' layman.list_local
```

salt.modules.layman.sync(overlay='ALL')
Update the specified overlay. Use ‘ALL’ to synchronize all overlays. This is the default if no overlay is specified.

```
overlay  Name of the overlay to sync. (Defaults to ‘ALL’)
```

CLI Example:

```bash
salt '*' layman.sync
```

21.9.219 salt.modules.ldap3

Query and modify an LDAP database (alternative interface)

New in version 2016.3.0.

This is an alternative to the ldap interface provided by the ldapmod execution module.

```
depends
  * ldap Python module
```
exception salt.modules.ldap3.LDAPError(message, cause=None)

Base class of all LDAP exceptions raised by backends.

This is only used for errors encountered while interacting with the LDAP server; usage errors (e.g., invalid backend name) will have a different type.

Variables

cause -- backend exception object, if applicable

salt.modules.ldap3.add(connect_spec, dn, attributes)

Add an entry to an LDAP database.

Parameters

- connect_spec -- See the documentation for the connect_spec parameter for connect().

- dn -- Distinguished name of the entry.

- attributes -- Non-empty dict mapping each of the new entry's attributes to a non-empty iterable of values.

Returns True if successful, raises an exception otherwise.

CLI example:

```python
salt '*' ldap3.add "{
'url': 'ldaps://ldap.example.com/',
'bind': {
    'method': 'simple',
    'password': 'secret',
},
}" "dn='dc=example,dc=com'' "attributes={'example': 'values'}"
```

salt.modules.ldap3.change(connect_spec, dn, before, after)

Modify an entry in an LDAP database.

This does the same thing as modify(), but with a simpler interface. Instead of taking a list of directives, it takes a before and after view of an entry, determines the differences between the two, computes the directives, and executes them.

Any attribute value present in before but missing in after is deleted. Any attribute value present in after but missing in before is added. Any attribute value in the database that is not mentioned in either before or after is not altered. Any attribute value that is present in both before and after is ignored, regardless of whether that attribute value exists in the database.

Parameters

- connect_spec -- See the documentation for the connect_spec parameter for connect().

- dn -- Distinguished name of the entry.

- before -- The expected state of the entry before modification. This is a dict mapping each attribute name to an iterable of values.

- after -- The desired state of the entry after modification. This is a dict mapping each attribute name to an iterable of values.

Returns True if successful, raises an exception otherwise.

CLI example:
```python
salt '*' ldap3.change "{
   'url': 'ldaps://ldap.example.com/',
   'bind': {
      'method': 'simple',
      'password': 'secret'}
}" dn='cn=admin,dc=example,dc=com'
before="{'example_value': 'before_val'}"
after="{'example_value': 'after_val'}"
```

```python
salt.modules.ldap3.connect(connect_spec=None)
Connect and optionally bind to an LDAP server.

Parameters
```
connect_spec -- This can be an LDAP connection object returned by a previous
call to connect() (in which case the argument is simply returned), None (in which case an
empty dict is used), or a dict with the following keys:
  - 'backend' Optional; default depends on which Python LDAP modules are installed.
    Name of the Python LDAP module to use. Only 'ldap' is supported at the moment.
  - 'url' Optional; defaults to 'ldapi:///'. URL to the LDAP server.
  - 'bind' Optional; defaults to None. Describes how to bind an identity to the LDAP
    connection. If None, an anonymous connection is made. Valid keys:
      - 'method' Optional; defaults to None. The authentication method to use. Valid
        values include but are not necessarily limited to 'simple', 'sasl', and None.
        If None, an anonymous connection is made. Available methods depend on the
        chosen backend.
      - 'mechanism' Optional; defaults to 'EXTERNAL'. The SASL mechanism to use.
        Ignored unless the method is 'sasl'. Available methods depend on the chosen
        backend and the server's capabilities.
      - 'credentials' Optional; defaults to None. An object specific to the chosen
        SASL mechanism and backend that represents the authentication credentials. Ig-
        nored unless the method is 'sasl'.
        For the 'ldap' backend, this is a dictionary. If None, an empty dict is used. Keys:
          - 'args' Optional; defaults to an empty list. A list of arguments to pass to the
            SASL mechanism constructor. See the SASL mechanism constructor docu-
            mentation in the ldap.sasl Python module.
          - 'kwargs' Optional; defaults to an empty dict. A dict of keyword arguments
            to pass to the SASL mechanism constructor. See the SASL mechanism con-
            structor documentation in the ldap.sasl Python module.
      - 'dn' Optional; defaults to an empty string. The distinguished name to bind.
      - 'password' Optional; defaults to an empty string. Password for binding. Ignored
        if the method is 'sasl'.
      - 'tls' Optional; defaults to None. A backend-specific object containing settings to over-
        ride default TLS behavior.
        For the 'ldap' backend, this is a dictionary. Not all settings in this dictionary are
        supported by all versions of python-ldap or the underlying TLS library. If None,
        an empty dict is used. Possible keys:
          - 'starttls' If present, initiate a TLS connection using StartTLS. (The value
            associated with this key is ignored.)
```
- `'cacertdir'` Set the path of the directory containing CA certificates.
- `'cacertfile'` Set the pathname of the CA certificate file.
- `'certfile'` Set the pathname of the certificate file.
- `'cipher_suite'` Set the allowed cipher suite.
- `'crlcheck'` Set the CRL evaluation strategy. Valid values are 'none', 'peer', and 'all'.
- `'crlfile'` Set the pathname of the CRL file.
- `'dhfile'` Set the pathname of the file containing the parameters for Diffie-Hellman ephemeral key exchange.
- `'keyfile'` Set the pathname of the certificate key file.
- `'newctx'` If present, instruct the underlying TLS library to create a new TLS context. (The value associated with this key is ignored.)
- `'protocol_min'` Set the minimum protocol version.
- `'random_file'` Set the pathname of the random file when `/dev/random` and `/dev/urandom` are not available.
- `'require_cert'` Set the certificate validation policy. Valid values are 'never', 'hard', 'demand', 'allow', and 'try'.
  - `'opts'` Optional; defaults to None. A backend-specific object containing options for the backend.

For the `'ldap'` backend, this is a dictionary of OpenLDAP options to set. If None, an empty dict is used. Each key is a the name of an OpenLDAP option constant without the 'LDAP_OPT_' prefix, then converted to lower case.

Returns

an object representing an LDAP connection that can be used as the `connect_spec` argument to any of the functions in this module (to avoid the overhead of making and terminating multiple connections).

This object should be used as a context manager. It is safe to nest `with` statements.

CLI example:

```python
salt '*' ldap3.connect "{
    'url': 'ldaps://ldap.example.com/',
    'bind': {
        'method': 'simple',
        'dn': 'cn=admin,dc=example,dc=com',
        'password': 'secret'
    }
}
```

salt.modules.ldap3.delete(`connect_spec, dn`)
Delete an entry from an LDAP database.

Parameters

- `connect_spec` -- See the documentation for the `connect_spec` parameter for `connect()`.
- `dn` -- Distinguished name of the entry.

Returns True if successful, raises an exception otherwise.

CLI example:
salt documentation, release 3001.1

```
salt '*' ldap3.delete 
  {'url': 'ldaps://ldap.example.com/',
   'bind': {
     'method': 'simple',
     'password': 'secret'}}
dn='cn=admin,dc=example,dc=com'
```

salt.modules.ldap3.modify(connect_spec, dn, directives)
Modify an entry in an LDAP database.

Parameters

- **connect_spec** -- See the documentation for the connect_spec parameter for connect().
- **dn** -- Distinguished name of the entry.
- **directives** -- Iterable of directives that indicate how to modify the entry. Each directive is a tuple of the form (op, attr, vals), where:
  - **op** identifies the modification operation to perform. One of:
    - 'add' to add one or more values to the attribute
    - 'delete' to delete some or all of the values from the attribute. If no values are specified with this operation, all of the attribute’s values are deleted. Otherwise, only the named values are deleted.
    - 'replace' to replace all of the attribute's values with zero or more new values
  - **attr** names the attribute to modify
  - **vals** is an iterable of values to add or delete

Returns True if successful, raises an exception otherwise.

CLI example:

```
salt '*' ldap3.modify 
  {'url': 'ldaps://ldap.example.com/',
   'bind': {
     'method': 'simple',
     'password': 'secret'}}
dn='cn=admin,dc=example,dc=com'
directives='('add', 'example', ['example_val'])'
```

salt.modules.ldap3.search(connect_spec, base, scope='subtree', filterstr='(objectClass=*)', attrlist=None, attrsonly=0)
Search an LDAP database.

Parameters

- **connect_spec** -- See the documentation for the connect_spec parameter for connect().
- **base** -- Distinguished name of the entry at which to start the search.
- **scope** -- One of the following:
  - 'subtree' Search the base and all of its descendants.
  - 'base' Search only the base itself.
  - 'onelevel' Search only the base’s immediate children.
- **filterstr** -- String representation of the filter to apply in the search.
• **attrlist** -- Limit the returned attributes to those in the specified list. If None, all
attributes of each entry are returned.

• **attrsonly** -- If non-zero, don’t return any attribute values.

Returns a dict of results. The dict is empty if there are no results. The dict maps each returned
entry’s distinguished name to a dict that maps each of the matching attribute names to a list
of its values.

CLI example:

```python
salt '*' ldap3.search "{
    'url': 'ldaps://ldap.example.com/',
    'bind': {
        'method': 'simple',
        'dn': 'cn=admin,dc=example,dc=com',
        'password': 'secret',
    },
}" "base='dc=example,dc=com'
```

### 21.9.220 salt.modules.ldapmod

Salt interface to LDAP commands

**depends**

• ldap Python module

**configuration** In order to connect to LDAP, certain configuration is required in the minion config on
the LDAP server. The minimum configuration items that must be set are:

```
ldap.basedn: dc=acme,dc=com (example values, adjust to suit)
```

If your LDAP server requires authentication then you must also set:

```
ldap.anonymous: False
ldap.binddn: admin
ldap.bindpw: password
```

In addition, the following optional values may be set:

```
ldap.server: localhost (default=localhost, see warning below)
ldap.port: 389 (default=389, standard port)
ldap.tls: False (default=False, no TLS)
ldap.no_verify: False (default=False, verify TLS)
ldap.anonymous: True (default=True, bind anonymous)
ldap.scope: 2 (default=2, ldap.SCOPE_SUBTREE)
ldap.attrs: [saltAttr] (default=None, return all attributes)
```

**Warning:** At the moment this module only recommends connection to LDAP services listening on `localhost`. This is deliberate to avoid the potentially dangerous situation of multiple minions sending identical update commands to the same LDAP server. It’s easy enough to override this behavior, but badness may ensue - you have been warned.

**salt.modules.ldapmod.search** *(filter, dn=None, scope=None, attrs=None, **kwargs)*

Run an arbitrary LDAP query and return the results.

**CLI Example:**
salt 'ldaphost' ldap.search "filter=cn=myhost"

Return data:

```
{
    'myhost': {
        'count': 1,
        'results': [[
            'saltKeyValue': ['ntpserver=ntp.acme.local',
                            'foo=myfoo'],
            'saltState': ['foo', 'bar']],
        'time': {'human': '1.2ms', 'raw': '0.00123'}}
}
```

Search and connection options can be overridden by specifying the relevant option as key=value pairs, for example:

```
salt 'ldaphost' ldap.search filter=cn=myhost dn=ou=hosts,o=acme,c=gb scope=1 attrs='' server='localhost' port='7393' tls=True bindpw='ssh'
```

21.9.221 salt.modules.libcloud_compute module

Apache Libcloud Compute Management

Connection module for Apache Libcloud Compute management for a full list of supported clouds, see http://libcloud.readthedocs.io/en/latest/compute/supported_providers.html

Clouds include Amazon EC2, Azure, Google GCE, VMware, OpenStack Nova

New in version 2018.3.0.

configuration This module uses a configuration profile for one or multiple cloud providers

```
libcloud_compute:
    profile_test1:
        driver: google
        key: service-account@googlecloud.net
        secret: /path/to.key.json
    profile_test2:
        driver: arm
        key: 12345
        secret: mysecret
```

depends apache-libcloud

```
salt.modules.libcloud_compute.attach_volume(node_id, volume_id, profile, device=None, **libcloud_kwargs)
```

Attaches volume to node.

Parameters

- **node_id**(str) -- Node ID to target
- **volume_id**(str) -- Volume ID from which to attach
- **profile**(str) -- The profile key
- **device**(str) -- Where the device is exposed, e.g. '/dev/sdb'
- **libcloud_kwargs**(dict) -- Extra arguments for the driver's attach_volume method

CLI Example:
salt.myminion.libcloud_compute.detach_volume voll profile1

salt.modules.libcloud_compute.copy_image(source_region, image_id, name, profile, description=None, **libcloud_kwargs)

Copies an image from a source region to the current region.

Parameters

- **source_region** (str) -- Region to copy the node from.
- **image_id** (str) -- Image to copy.
- **name** (str) -- Name for new image.
- **profile** (str) -- The profile key
- **description** -- Description for new image.
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's copy_image method

CLI Example:
salt myminion libcloud_compute.copy_image us-east1 image1 'new image' profile1

salt.modules.libcloud_compute.create_image(node_id, name, profile, description=None, **libcloud_kwargs)

Create an image from a node

Parameters

- **node_id** (str) -- Node to run the task on.
- **name** (str) -- Name for new image.
- **profile** (str) -- The profile key
- **description** (description) -- Description for new image.
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's create_image method

CLI Example:
salt myminion libcloud_compute.create_image server1 my_image profile1
salt.myminion.libcloud_compute.create_image.server1 my_image profile1 description='test image'

salt.modules.libcloud_compute.create_key_pair(name, profile, **libcloud_kwargs)

Create a single key pair by name

Parameters

- **name** (str) -- Name of the key pair to create.
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's create_key_pair method

CLI Example:
salt myminion libcloud_compute.create_key_pair pair1 profile1

salt.modules.libcloud_compute.create_volume(size, name, profile, location_id=None, **libcloud_kwargs)

Create a storage volume

Parameters

21.9. execution modules
**salt.modules.libcloud_compute.create_volume**(size, name, location_id, profile, libcloud_kwargs)

Create a storage volume

Parameters

- **size** *(int)* -- Size of volume in gigabytes (required)
- **name** *(str)* -- Name of the volume to be created
- **location_id** *(str)* -- Which data center to create a volume in. If empty, undefined behavior will be selected. (optional)
- **profile** *(str)* -- The profile key
- **libcloud_kwargs** *(dict)* -- Extra arguments for the driver's list_volumes method

CLI Example:

```
salt myminion libcloud_compute.create_volume 1000 vol1 profile1
```

**salt.modules.libcloud_compute.create_volume_snapshot**(volume_id, profile, name=None, libcloud_kwargs)

Create a storage volume snapshot

Parameters

- **volume_id** *(str)* -- Volume ID from which to create the new snapshot.
- **profile** *(str)* -- The profile key
- **name** *(str)* -- Name of the snapshot to be created (optional)
- **libcloud_kwargs** *(dict)* -- Extra arguments for the driver's create_volume_snapshot method

CLI Example:

```
salt myminion libcloud_compute.create_volume_snapshot vol1 profile1
```

**salt.modules.libcloud_compute.delete_image**(image_id, profile, libcloud_kwargs)

Delete an image of a node

Parameters

- **image_id** *(str)* -- Image to delete
- **profile** *(str)* -- The profile key
- **libcloud_kwargs** *(dict)* -- Extra arguments for the driver's delete_image method

CLI Example:

```
salt myminion libcloud_compute.delete_image image1 profile1
```

**salt.modules.libcloud_compute.delete_key_pair**(name, profile, libcloud_kwargs)

Delete a key pair

Parameters

- **name** *(str)* -- Key pair name.
- **profile** *(str)* -- The profile key
- **libcloud_kwargs** *(dict)* -- Extra arguments for the driver's import_key_pair_from_xxx method

CLI Example:

```
salt myminion libcloud_compute.delete_key_pair pair1 profile1
```

**salt.modules.libcloud_compute.destroy_node**(node_id, profile, libcloud_kwargs)

Destroy a node in the cloud
Parameters

- `node_id` (str) -- Unique ID of the node to destroy
- `profile` (str) -- The profile key
- `libcloud_kwargs` (dict) -- Extra arguments for the driver's `destroy_node` method

CLI Example:

```bash
salt myminion libcloud_compute.destroy_node as-2346 profile1
```

`salt.modules.libcloud_compute.destroy_volume`(*volume_id*, *profile*, **`libcloud_kwargs`*)
Destroy a volume.

Parameters

- `volume_id` (str) -- Volume ID from which to destroy
- `profile` (str) -- The profile key
- `libcloud_kwargs` (dict) -- Extra arguments for the driver's `destroy_volume` method

CLI Example:

```bash
salt myminion libcloud_compute.destroy_volume vol1 profile1
```

`salt.modules.libcloud_compute.destroy_volume_snapshot`(*volume_id*, *snapshot_id*, *profile*, **`libcloud_kwargs`*)
Destroy a volume snapshot.

Parameters

- `volume_id` (str) -- Volume ID from which the snapshot belongs
- `snapshot_id` (str) -- Volume Snapshot ID from which to destroy
- `profile` (str) -- The profile key
- `libcloud_kwargs` (dict) -- Extra arguments for the driver's `destroy_volume_snapshot` method

CLI Example:

```bash
salt myminion libcloud_compute.destroy_volume_snapshot snap1 profile1
```

`salt.modules.libcloud_compute.detach_volume`(*volume_id*, *profile*, **`libcloud_kwargs`*)
Detaches a volume from a node.

Parameters

- `volume_id` (str) -- Volume ID from which to detach
- `profile` (str) -- The profile key
- `libcloud_kwargs` (dict) -- Extra arguments for the driver's `detach_volume` method

CLI Example:

```bash
salt myminion libcloud_compute.detach_volume vol1 profile1
```

`salt.modules.libcloud_compute.extra`(*method*, *profile*, **`libcloud_kwargs`*)
Call an extended method on the driver

Parameters

- `method` (str) -- Driver's method name
• **profile** (str) -- The profile key
• **libcloud_kwargs** (dict) -- Extra arguments for the driver's method

CLI Example:
```
salt myminion libcloud_compute.extra ex_get_permissions google container_name=my_ →container object_name=me.jpg --out=yaml
```

salt.modules.libcloud_compute.get_image(image_id, profile, **libcloud_kwargs)
Get an image of a node

Parameters
• **image_id** (str) -- Image to fetch
• **profile** (str) -- The profile key
• **libcloud_kwargs** (dict) -- Extra arguments for the driver's delete_image method

CLI Example:
```
salt myminion libcloud_compute.get_image image1 profile1
```

salt.modules.libcloud_compute.get_key_pair(name, profile, **libcloud_kwargs)
Get a single key pair by name

Parameters
• **name** (str) -- Name of the key pair to retrieve.
• **profile** (str) -- The profile key
• **libcloud_kwargs** (dict) -- Extra arguments for the driver's get_key_pair method

CLI Example:
```
salt myminion libcloud_compute.get_key_pair pair1 profile1
```

salt.modules.libcloud_compute.import_key_pair(name, key, profile, key_type=None, **libcloud_kwargs)
Import a new public key from string or a file path

Parameters
• **name** (str) -- Key pair name.
• **key** (str or path str) -- Public key material, the string or a path to a file
• **profile** (str) -- The profile key
• **key_type** (str) -- The key pair type, either FILE or STRING. Will detect if not pro-
vided and assume that if the string is a path to an existing path it is a FILE, else
STRING.
• **libcloud_kwargs** (dict) -- Extra arguments for the driver's import_key_pair_from_xxx method

CLI Example:
```
salt myminion libcloud_compute.import_key_pair pair1 key_value_data123 profile1
salt myminion libcloud_compute.import_key_pair pair1 /path/to/key profile1
```

salt.modules.libcloud_compute.list_images(profile, location_id=None, **libcloud_kwargs)
Return a list of images for this cloud

Parameters
• **profile** (str) -- The profile key
• **location_id** (str) -- The location key, from list_locations
• **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_images method

CLI Example:
salt myminion libcloud_compute.list_images profile1

salt.modules.libcloud_compute.list_key_pairs(profile, **libcloud_kwargs)
List all the available key pair objects.
Parameters
• **profile** (str) -- The profile key
• **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_key_pairs method

CLI Example:
salt myminion libcloud_compute.list_key_pairs profile1

salt.modules.libcloud_compute.list_locations(profile, **libcloud_kwargs)
Return a list of locations for this cloud
Parameters
• **profile** (str) -- The profile key
• **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_locations method

CLI Example:
salt myminion libcloud_compute.list_locations profile1

salt.modules.libcloud_compute.list_nodes(profile, **libcloud_kwargs)
Return a list of nodes
Parameters
• **profile** (str) -- The profile key
• **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_nodes method

CLI Example:
salt myminion libcloud_compute.list_nodes profile1

salt.modules.libcloud_compute.list_sizes(profile, location_id=None, **libcloud_kwargs)
Return a list of node sizes
Parameters
• **profile** (str) -- The profile key
• **location_id** (str) -- The location key, from list_locations
• **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_sizes method

CLI Example:
salt myminion libcloud_compute.list_sizes profile1
salt myminion libcloud_compute.list_sizes profile1 us-east1

salt.modules.libcloud_compute.list_volume_snapshots(volume_id, profile, **libcloud_kwargs)
Return a list of storage volumes snapshots for this cloud
Parameters

- **volume_id**(str) -- The volume identifier
- **profile**(str) -- The profile key
- **libcloud_kwargs**(dict) -- Extra arguments for the driver's list_volume_snapshots method

CLI Example:

```
salt myminion libcloud_compute.list_volume_snapshots voll profile1
```

```
salt.modules.libcloud_compute.list_volumes(profile, **libcloud_kwargs)
```

Return a list of storage volumes for this cloud

**Parameters**

- **profile**(str) -- The profile key
- **libcloud_kwargs**(dict) -- Extra arguments for the driver's list_volumes method

CLI Example:

```
salt myminion libcloud_compute.list_volumes profile1
```

```
salt.modules.libcloud_compute.reboot_node(node_id, profile, **libcloud_kwargs)
```

Reboot a node in the cloud

**Parameters**

- **node_id**(str) -- Unique ID of the node to reboot
- **profile**(str) -- The profile key
- **libcloud_kwargs**(dict) -- Extra arguments for the driver's reboot_node method

CLI Example:

```
salt myminion libcloud_compute.reboot_node as-2346 profile1
```

### 21.9.222 salt.modules.libcloud_dns module

**Apache Libcloud DNS Management**

Connection module for Apache Libcloud DNS management

New in version 2016.11.0.

**configuration**  This module uses a configuration profile for one or multiple DNS providers

```
libcloud_dns:
  profile_test1:
    driver: cloudflare
    key: 12345
    secret: mysecret
  profile_test2:
    driver: godaddy
    key: 12345
    secret: mysecret
    shopper_id: 12345
```
depends apache-libcloud

salt.modules.libcloud_dns.create_record(name, zone_id, type, data, profile)
Create a new record.
Parameters

- **name** (str) -- Record name without the domain name (e.g. www). Note: If you want to create a record for a base domain name, you should specify empty string ('') for this argument.
- **zone_id** (str) -- Zone where the requested record is created.
- **type** (str) -- DNS record type (A, AAAA, ...).
- **data** (str) -- Data for the record (depends on the record type).
- **profile** (str) -- The profile key

CLI Example:
salt myminion libcloud_dns.create_record www google.com A 12.32.12.2 profile1

salt.modules.libcloud_dns.create_zone(domain, profile, type='master', ttl=None)
Create a new zone.
Parameters

- **domain** (str) -- Zone domain name (e.g. example.com)
- **profile** (str) -- The profile key
- **type** (str) -- Zone type (master / slave).
- **ttl** (int) -- TTL for new records. (optional)

CLI Example:
salt myminion libcloud_dns.create_zone google.com profile1

salt.modules.libcloud_dns.delete_record(zone_id, record_id, profile)
Delete a record.
Parameters

- **zone_id** (str) -- Zone to delete.
- **record_id** (str) -- Record to delete.
- **profile** (str) -- The profile key

Return type bool

CLI Example:
salt myminion libcloud_dns.delete_record google.com www profile1

salt.modules.libcloud_dns.delete_zone(zone_id, profile)
Delete a zone.
Parameters

- **zone_id** (str) -- Zone to delete.
- **profile** (str) -- The profile key

Return type bool

CLI Example:
salt myminion libcloud_dns.delete_zone google.com profile1
salt.modules.libcloud_dns.extra(method, profile, **libcloud_kwargs)
Call an extended method on the driver

Parameters

- `method` (str) -- Driver's method name
- `profile` (str) -- The profile key
- `libcloud_kwargs` (dict) -- Extra arguments for the driver's delete_container method

CLI Example:
```
salt myminion libcloud_dns.extra ex_get_permissions google container_name=my_ ...
   container object_name=me.jpg --out=yaml
```

salt.modules.libcloud_dns.get_bind_data(zone_id, profile)
Export Zone to the BIND compatible format.

Parameters

- `zone_id` (str) -- Zone to export.
- `profile` (str) -- The profile key

Returns
Zone data in BIND compatible format.
Return type str

CLI Example:
```
salt myminion libcloud_dns.get_bind_data google.com profile1
```

salt.modules.libcloud_dns.get_record(zone_id, record_id, profile)
Get record information for the given zone_id on the given profile

Parameters

- `zone_id` (str) -- Zone to export.
- `record_id` (str) -- Record to delete.
- `profile` (str) -- The profile key

CLI Example:
```
salt myminion libcloud_dns.get_record google.com www profile1
```

salt.modules.libcloud_dns.get_zone(zone_id, profile)
Get zone information for the given zone_id on the given profile

Parameters

- `zone_id` (str) -- Zone to export.
- `profile` (str) -- The profile key

CLI Example:
```
salt myminion libcloud_dns.get_zone google.com profile1
```

salt.modules.libcloud_dns.list_record_types(profile)
List available record types for the given profile, e.g. A, AAAA

Parameters

- `profile` (str) -- The profile key

CLI Example:
```
salt myminion libcloud_dns.list_record_types profile1
```

salt.modules.libcloud_dns.list_records(zone_id, profile, type=None)
List records for the given zone_id on the given profile
Parameters

- **zone_id** (str) -- Zone to export.
- **profile** (str) -- The profile key
- **type** (str) -- The record type, e.g. A, NS

CLI Example:

```bash
salt myminion libcloud_dns.list_records google.com profile1
```

salt.modules.libcloud_dns.list_zones(profile)

List zones for the given profile

**Parameters**

- **profile** (str) -- The profile key

CLI Example:

```bash
salt myminion libcloud_dns.list_zones profile1
```

salt.modules.libcloud_dns.update_zone(zone_id, domain, profile, type='master', ttl=None)

Update an existing zone.

**Parameters**

- **zone_id** (str) -- Zone ID to update.
- **domain** (str) -- Zone domain name (e.g. example.com)
- **profile** (str) -- The profile key
- **type** (str) -- Zone type (master / slave).
- **ttl** (int) -- TTL for new records. (optional)

CLI Example:

```bash
salt myminion libcloud_dns.update_zone google.com google.com profile1 type=slave
```

### 21.9.223 salt.modules.libcloud_loadbalancer

Apache Libcloud Load Balancer Management

Connection module for Apache Libcloud Storage load balancer management for a full list of supported clouds, see [http://libcloud.readthedocs.io/en/latest/loadbalancer/supported_providers.html](http://libcloud.readthedocs.io/en/latest/loadbalancer/supported_providers.html)

Clouds include Amazon ELB, ALB, Google, Aliyun, CloudStack, Softlayer

New in version 2018.3.0.

**configuration**

This module uses a configuration profile for one or multiple Storage providers

```yaml
libcloud_loadbalancer:
  profile_test1:
    driver: gce
    key: G00G0123456789ABCXYZ
    secret: mysecret
  profile_test2:
    driver: alb
    key: 12345
    secret: mysecret
```

**depends**

apache-libcloud
Add a new member to the load balancer

Parameters

- `balancer_id` (str) -- id of a load balancer you want to fetch
- `ip` (str) -- IP address for the new member
- `port` (int) -- Port for the new member
- `profile` (str) -- The profile key
- `libcloud_kwargs` (dict) -- Extra arguments for the driver's `balancer_attach_member` method

CLI Example:

```bash
salt myminion libcloud_storage.balancer_attach_member balancer123 1.2.3.4 80
```

Add a new member to the load balancer

Parameters

- `balancer_id` (str) -- id of a load balancer you want to fetch
- `ip` (str) -- IP address for the new member
- `port` (int) -- Port for the new member
- `profile` (str) -- The profile key
- `libcloud_kwargs` (dict) -- Extra arguments for the driver's `balancer_detach_member` method

CLI Example:

```bash
salt myminion libcloud_storage.balancer_detach_member balancer123 member123
```

Create a new load balancer instance

Parameters

- `name` (str) -- Name of the new load balancer (required)
- `port` (str) -- Port the load balancer should listen on, defaults to 80
- `protocol` (str) -- Loadbalancer protocol, defaults to http.
- `algorithm` (str) -- Load balancing algorithm, defaults to ROUND_ROBIN. See Algorithm type in Libcloud documentation for a full listing.
- `profile` (str) -- The profile key
- `libcloud_kwargs` (dict) -- Extra arguments for the driver's `create_balancer` method

Returns

- The details of the new balancer

CLI Example:
salt myminion libcloud_storage.create_balancer my_balancer 80 http profile1

salt.modules.libcloud_loadbalancer.destroy_balancer(balancer_id, profile, **libcloud_kwargs)

Destroy a load balancer

Parameters

- **balancer_id** (str) -- LoadBalancer ID which should be used
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's destroy_balancer method

Returns

True if the destroy was successful, otherwise False.

Return type: bool

CLI Example:
salt myminion libcloud_storage.destroy_balancer balancer_1 profile1

salt.modules.libcloud_loadbalancer.extra(method, profile, **libcloud_kwargs)

Call an extended method on the driver

Parameters

- **method** (str) -- Driver's method name
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's method

CLI Example:
salt myminion libcloud_loadbalancer.extra ex_get_permissions google container_name=my_container object_name=me.jpg --out=yaml

salt.modules.libcloud_loadbalancer.get_balancer(balancer_id, profile, **libcloud_kwargs)

Get the details for a load balancer by ID

Parameters

- **balancer_id** (str) -- id of a load balancer you want to fetch
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's get_balancer method

Returns

the load balancer details

CLI Example:
salt myminion libcloud_storage.get_balancer balancer123 profile1

salt.modules.libcloud_loadbalancer.get_balancer_by_name(name, profile, **libcloud_kwargs)

Get the details for a load balancer by name

Parameters

- **name** (str) -- Name of a load balancer you want to fetch
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_balancers method

Returns

the load balancer details
CLI Example:

```
salt myminion libcloud_storage.get_balancer_by_name my_balancer profile1
```

```
salt.modules.libcloud_loadbalancer.list_balancer_members(balancer_id, profile, **libcloud_kwargs)
```

List the members of a load balancer

Parameters

- **balancer_id** (str) -- id of a load balancer you want to fetch
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_balancer_members method

CLI Example:

```
salt myminion libcloud_storage.list_balancer_members balancer123 profile1
```

```
salt.modules.libcloud_loadbalancer.list_balancers(profile, **libcloud_kwargs)
```

Return a list of load balancers.

Parameters

- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_balancers method

CLI Example:

```
salt myminion libcloud_storage.list_balancers profile1
```

```
salt.modules.libcloud_loadbalancer.list_protocols(profile, **libcloud_kwargs)
```

Return a list of supported protocols.

Parameters

- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_protocols method

Returns a list of supported protocols

Return type: list of str

CLI Example:

```
salt myminion libcloud_storage.list_protocols profile1
```

```
salt.modules.libcloud_loadbalancer.list_supported_algorithms(profile, **libcloud_kwargs)
```

Get the supported algorithms for a profile

Parameters

- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_supported_algorithms method

Returns The supported algorithms

CLI Example:

```
salt myminion libcloud_storage.list_supported_algorithms profile1
```
21.9.224 `salt.modules.libcloud_storage`

Apache Libcloud Storage Management

Connection module for Apache Libcloud Storage (object/blob) management for a full list of supported clouds, see http://libcloud.readthedocs.io/en/latest/storage/supported_providers.html

Clouds include Amazon S3, Google Storage, Aliyun, Azure Blobs, Ceph, OpenStack swift

New in version 2018.3.0.

**configuration**  This module uses a configuration profile for one or multiple Storage providers

```yaml
libcloud_storage:
  profile_test1:
    driver: google_storage
    key: G00G0123456789ABCXYZ
    secret: mysecret
  profile_test2:
    driver: s3
    key: 12345
    secret: mysecret
```

**depends** apache-libcloud

`salt.modules.libcloud_storage.create_container(container_name, profile, **libcloud_kwargs)`

Create a container in the cloud

Parameters

- `container_name` (str) -- Container name
- `profile` (str) -- The profile key
- `libcloud_kwargs` (dict) -- Extra arguments for the driver's create_container method

CLI Example:

```
salt myminion libcloud_storage.create_container MyFolder profile1
```

`salt.modules.libcloud_storage.delete_container(container_name, profile, **libcloud_kwargs)`

Delete an object container in the cloud

Parameters

- `container_name` (str) -- Container name
- `profile` (str) -- The profile key
- `libcloud_kwargs` (dict) -- Extra arguments for the driver's delete_container method

Returns True if an object container has been successfully deleted, False otherwise.

Return type `bool`

CLI Example:

```
salt myminion libcloud_storage.delete_container MyFolder profile1
```

`salt.modules.libcloud_storage.delete_object(container_name, object_name, profile, **libcloud_kwargs)`

Delete an object in the cloud

Parameters

- `container_name` (str) -- Container name
- `object_name` (str) -- Object name
- `profile` (str) -- The profile key
- `libcloud_kwargs` (dict) -- Extra arguments for the driver's delete_object method

Returns True if an object has been successfully deleted, False otherwise.

Return type `bool`
- `container_name` (str) -- Container name
- `object_name` (str) -- Object name
- `profile` (str) -- The profile key
- `libcloud_kwargs` (dict) -- Extra arguments for the driver's delete_object method

Returns: True if an object has been successfully deleted, False otherwise.

Return type: bool

CLI Example:
```bash
salt myminion libcloud_storage.delete_object MyFolder me.jpg profile1
```

```
salt.modules.libcloud_storage.download_object(
    container_name,
    object_name,
    destination_path,  
    overwrite_existing=False,
    delete_on_failure=True,
    **libcloud_kwargs
)
```

Download an object to the specified destination path.

Parameters
- `container_name` (str) -- Container name
- `object_name` (str) -- Object name
- `destination_path` (str) -- Full path to a file or a directory where the incoming file will be saved.
- `profile` (str) -- The profile key
- `overwrite_existing` (bool) -- True to overwrite an existing file, defaults to False.
- `delete_on_failure` (bool) -- True to delete a partially downloaded file if the download was not successful (hash mismatch / file size).
- `libcloud_kwargs` (dict) -- Extra arguments for the driver's download_object method

Returns: True if an object has been successfully downloaded, False otherwise.

Return type: bool

CLI Example:
```bash
salt myminion libcloud_storage.download_object MyFolder me.jpg /tmp/me.jpg profile1
```

```
salt.modules.libcloud_storage.extra(
    method, profile, **libcloud_kwargs
)
```

Call an extended method on the driver

Parameters
- `method` (str) -- Driver's method name
- `profile` (str) -- The profile key
- `libcloud_kwargs` (dict) -- Extra arguments for the driver's delete_container method

CLI Example:
```bash
salt myminion libcloud_storage.extra ex_get_permissions google container_name=my_container object_name=me.jpg --out=yaml
```
salt.modules.libcloud_storage.get_container(container_name, profile, **libcloud_kwargs)
List container details for the given container_name on the given profile

Parameters

- **container_name** (str) -- Container name
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's get_container method

CLI Example:
```
salt myminion libcloud_storage.get_container MyFolder profile1
```

salt.modules.libcloud_storage.get_container_object(container_name, object_name, profile, **libcloud_kwargs)
Get the details for a container object (file or object in the cloud)

Parameters

- **container_name** (str) -- Container name
- **object_name** (str) -- Object name
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's get_container_object method

CLI Example:
```
salt myminion libcloud_storage.get_container_object MyFolder MyFile.xyz profile1
```

salt.modules.libcloud_storage.list_container_objects(container_name, profile, **libcloud_kwargs)
List container objects (e.g. files) for the given container_id on the given profile

Parameters

- **container_name** (str) -- Container name
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_container_objects method

CLI Example:
```
salt myminion libcloud_storage.list_container_objects MyFolder profile1
```

salt.modules.libcloud_storage.list_containers(profile, **libcloud_kwargs)
Return a list of containers.

Parameters

- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_containers method

CLI Example:
```
salt myminion libcloud_storage.list_containers profile1
```

salt.modules.libcloud_storage.upload_object(file_path, container_name, object_name, profile, extra=None, verify_hash=True, headers=None, **libcloud_kwargs)
Upload an object currently located on a disk.
Parameters

- **file_path** *(str)* -- Path to the object on disk.
- **container_name** *(str)* -- Destination container.
- **object_name** *(str)* -- Object name.
- **profile** *(str)* -- The profile key.
- **verify_hash** *(bool)* -- Verify hash.
- **extra** *(dict)* -- Extra attributes (driver specific). (optional)
- **headers** *(dict)* -- (optional) Additional request headers, such as CORS headers. For example: `headers = {'Access-Control-Allow-Origin': 'http://mozilla.com'}`
- **libcloud_kwargs** *(dict)* -- Extra arguments for the driver's `upload_object` method.

Returns

The object name in the cloud

Return type

str

CLI Example:

```
salt myminion libcloud_storage.upload_object /file/to/me.jpg MyFolder me.jpg profile1
```

### 21.9.225 salt.modules.linux_acl

Support for Linux File Access Control Lists

The Linux ACL module requires the `getfacl` and `setfacl` binaries.

salt.modules.linux_acl.delfacl(*acl_type, acl_name='', *args, **kwargs*)

Remove specific FACL from the specified file(s)

CLI Examples:

```
salt '*' acl.delfacl user myuser /tmp/house/kitchen
salt '*' acl.delfacl default:group mygroup /tmp/house/kitchen
salt '*' acl.delfacl d:u myuser /tmp/house/kitchen
salt '*' acl.delfacl g myuser /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.delfacl user myuser /tmp/house/kitchen recursive=True
```

salt.modules.linux_acl.getfacl(*args, **kwargs*)

Return (extremely verbose) map of FACLs on specified file(s)

CLI Examples:

```
salt '*' acl.getfacl /tmp/house/kitchen
salt '*' acl.getfacl /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.getfacl /tmp/house/kitchen /tmp/house/livingroom recursive=True
```

salt.modules.linux_acl.modfacl(*acl_type, acl_name='', perms='', *args, **kwargs*)

Add or modify a FACL for the specified file(s)

CLI Examples:

```
salt '*' acl.modfacl user myuser rwx /tmp/house/kitchen
salt '*' acl.modfacl default:group mygroup rx /tmp/house/kitchen
salt '*' acl.modfacl d:u myuser 7 /tmp/house/kitchen
```

(continues on next page)
salt.modules.linux_acl.

**version()**
Return facl version from getfacl --version

CLI Example:

```
salt '*' acl.version
```

salt.modules.linux_acl.

**wipefacls(**args, **kwargs)**
Remove all FACLs from the specified file(s)

CLI Examples:

```
salt '*' acl.wipefacls /tmp/house/kitchen
salt '*' acl.wipefacls /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.wipefacls /tmp/house/kitchen /tmp/house/livingroom recursive=True
```

21.9.226 salt.modules.linux_ip module

The networking module for Non-RH/Deb Linux distros

salt.modules.linux_ip.

**down**(iface, iface_type=None)
Shutdown a network interface

CLI Example:

```
salt '*' ip.down eth0
```

salt.modules.linux_ip.

**get_interface**(iface)
Return the contents of an interface script

CLI Example:

```
salt '*' ip.get_interface eth0
```

salt.modules.linux_ip.

**get_routes**(iface=None)
Return the current routing table

CLI Examples:

```
salt '*' ip.get_routes
salt '*' ip.get_routes eth0
```

salt.modules.linux_ip.

**up**(iface, iface_type=None)
Start up a network interface

CLI Example:

```
salt '*' ip.up eth0
```
21.9.227 salt.modules.linux_lvm

Support for Linux LVM2

salt.modules.linux_lvm.fullversion()

Return all version info from lvm version

CLI Example:

```
salt '*' lvm.fullversion
```

salt.modules.linux_lvm.lvcreate(lvname, vgname, size=None, extents=None, snapshot=None, pv=None, thinvolume=False, thinpool=False, force=False, **kwargs)

Create a new logical volume, with option for which physical volume to be used

CLI Examples:

```
salt '*' lvm.lvcreate new_volume_name vg_name
size = 10G
salt '*' lvm.lvcreate new_volume_name vg_name
extents = 100
pv = /dev/sdb
salt '*' lvm.lvcreate new_snapshot vg_name
snapshot = volume_name
size = 3G
```

New in version to_complete.

Support for thin pools and thin volumes

CLI Examples:

```
salt '*' lvm.lvcreate new_thinpool_name vg_name
size = 20G
→ thinpool=True
salt '*' lvm.lvcreate new_thinvolume_name vg_name/thinpool_name
size = 10G
→ thinvolume=True
```

salt.modules.linux_lvm.lvdisplay(lvname='', quiet=False)

Return information about the logical volume(s)

lvname logical device name
quiet if the logical volume is not present, do not show any error

CLI Examples:

```
salt '*' lvm.lvdisplay
salt '*' lvm.lvdisplay /dev/vg_myserver/root
```

salt.modules.linux_lvm.lvremove(lvname, vgname)

Remove a given existing logical volume from a named existing volume group

CLI Example:

```
salt '*' lvm.lvremove lvname vgname force=True
```

salt.modules.linux_lvm.lvresize(size=None, lvpath=None, extents=None)

Return information about the logical volume(s)

CLI Examples:

```
salt '*' lvm.lvresize +12M /dev/mapper/vg1-test
salt '*' lvm.lvresize lvpath=/dev/mapper/vg1-test extents=+100%FREE
```

salt.modules.linux_lvm.pvcreate(devices, override=True, **kwargs)

Set a physical device to be used as an LVM physical volume

override Skip devices, if they are already LVM physical volumes
CLI Examples:

```bash
salt mymachine lvm.pvcreate /dev/sdb1,/dev/sdb2
salt mymachine lvm.pvcreate /dev/sdb1 dataalignmentoffset=7s
```

```python
salt.modules.linux_lvm.pvdisplay(pvname='', real=False, quiet=False)
```

Return information about the physical volume(s)

- `pvname` physical device name
- `real` dereference any symlinks and report the real device

New in version 2015.8.7.

- `quiet` if the physical volume is not present, do not show any error

CLI Examples:

```bash
salt '*' lvm.pvdisplay
salt '*' lvm.pvdisplay /dev/md0
```

```python
salt.modules.linux_lvm.pvremove(devices, override=True)
```

Remove a physical device being used as an LVM physical volume

- `override` Skip devices, if they are already not used as LVM physical volumes

CLI Examples:

```bash
salt mymachine lvm.pvremove /dev/sdb1,/dev/sdb2
```

```python
salt.modules.linux_lvm.version()
```

Return LVM version from lvm version

CLI Example:

```bash
salt '*' lvm.version
```

```python
salt.modules.linux_lvm.vgcreate(vgname, devices, **kwargs)
```

Create an LVM volume group

CLI Examples:

```bash
salt mymachine lvm.vgcreate my_vg /dev/sdb1,/dev/sdb2
salt mymachine lvm.vgcreate my_vg /dev/sdb1 clustered=y
```

```python
salt.modules.linux_lvm.vgdisplay(vgname='', quiet=False)
```

Return information about the volume group(s)

- `vgname` volume group name
- `quiet` if the volume group is not present, do not show any error

CLI Examples:

```bash
salt '*' lvm.vgdisplay
salt '*' lvm.vgdisplay nova-volumes
```

```python
salt.modules.linux_lvm.vgextend(vgname, devices)
```

Add physical volumes to an LVM volume group

CLI Examples:

```bash
salt mymachine lvm.vgextend my_vg /dev/sdb1,/dev/sdb2
salt mymachine lvm.vgextend my_vg /dev/sdb1
```

```python
salt.modules.linux_lvm.vgremove(vgname)
```

Remove an LVM volume group
21.9.228  salt.modules.linux_service

If Salt’s OS detection does not identify a different virtual service module, the minion will fall back to using this basic module, which simply wraps sysvinit scripts.

`salt.modules.linux_service.available(name)`

Returns `True` if the specified service is available, otherwise returns `False`.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.linux_service.get_all()`

Return a list of all available services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.linux_service.missing(name)`

The inverse of service.available. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.linux_service.reload_(name)`

Refreshes config files by calling service reload. Does not perform a full restart.

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.linux_service.restart(name)`

Restart the specified service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.linux_service.run(name, action)`

Run the specified service with an action.

name  Service name.

action  Action name (like start, stop, reload, restart).

CLI Example:

```
salt '*' service.run apache2 reload
salt '*' service.run postgresql initdb
```
salt.modules.linux_service.start(name)
Start the specified service

CLI Example:
```
salt '*' service.start <service name>
```

salt.modules.linux_service.status(name, sig=None)
Return the status for a service. If the name contains globbing, a dict mapping service name to PID or empty string is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

Parameters

- **name** *(str)* -- The name of the service to check
- **sig** *(str)* -- Signature to use to find the service via ps

Returns
PID if running, empty otherwise dict: Maps service name to PID if running, empty string otherwise

Return type string

CLI Example:
```
salt '*' service.status <service name> [service signature]
```

salt.modules.linux_service.stop(name)
Stop the specified service

CLI Example:
```
salt '*' service.stop <service name>
```

21.9.229 salt.modules.linux_shadow

Manage the shadow file on Linux systems

**Important:** If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to 'shadow.info' is not available), see [here](#).

salt.modules.linux_shadow.default_hash()

Returns the default hash used for unset passwords

CLI Example:
```
salt '*' shadow.default_hash
```

salt.modules.linux_shadow.del_password(name, root=None)

New in version 2014.7.0.

Delete the password from name user

name User to delete
root Directory to chroot into

CLI Example:
```
salt '*' shadow.del_password username
```
salt.modules.linux_shadow.gen_password

Generate hashed password

**Note:** When called this function is called directly via remote-execution, the password argument may be displayed in the system's process list. This may be a security risk on certain systems.

- **password**  Plaintext password to be hashed.
- **crypt_salt**  Cryptographic salt. If not given, a random 8-character salt will be generated.
- **algorithm**  The following hash algorithms are supported:
  - md5
  - blowfish (not in mainline glibc, only available in distros that add it)
  - sha256
  - sha512 (default)

**CLI Example:**

```
salt '*' shadow.gen_password 'I_am_password'
salt '*' shadow.gen_password 'I_am_password' crypt_salt='I_am_salt'
algorithm=sha256
```

salt.modules.linux_shadow.info

Return information for the specified user

- **name**  User to get the information for
- **root**  Directory to chroot into

**CLI Example:**

```
salt '*' shadow.info root
```

salt.modules.linux_shadow.list_users

Return a list of all shadow users

- **root**  Directory to chroot into

**CLI Example:**

```
salt '*' shadow.list_users
```

salt.modules.linux_shadow.lock_password

Lock the password from specified user

- **name**  User to lock
- **root**  Directory to chroot into

**CLI Example:**

```
salt '*' shadow.lock_password username
```

salt.modules.linux_shadow.set_date

Sets the value for the date the password was last changed to days since the epoch (January 1, 1970). See man chage.

- **name**  User to modify
- **date**  Date the password was last changed
- **root**  Directory to chroot into

**CLI Example:**

```
salt '*' shadow.set_date name date root
```
```
salt '*' shadow.set_date username 0
```

**salt.modules.linux_shadow.set_expire**(name, expire, root=None)

Changed in version 2014.7.0.

Sets the value for the date the account expires as days since the epoch (January 1, 1970). Using a value of -1 will clear expiration. See man chage.

- **name**: User to modify
- **date**: Date the account expires
- **root**: Directory to chroot into

CLI Example:
```
salt '*' shadow.set_expire username -1
```

**salt.modules.linux_shadow.set_inactdays**(name, inactdays, root=None)

Set the number of days of inactivity after a password has expired before the account is locked. See man chage.

- **name**: User to modify
- **inactdays**: Set password inactive after this number of days
- **root**: Directory to chroot into

CLI Example:
```
salt '*' shadow.set_inactdays username 7
```

**salt.modules.linux_shadow.set_maxdays**(name, maxdays, root=None)

Set the maximum number of days during which a password is valid. See man chage.

- **name**: User to modify
- **maxdays**: Maximum number of days during which a password is valid
- **root**: Directory to chroot into

CLI Example:
```
salt '*' shadow.set_maxdays username 90
```

**salt.modules.linux_shadow.set_mindays**(name, mindays, root=None)

Set the minimum number of days between password changes. See man chage.

- **name**: User to modify
- **mindays**: Minimum number of days between password changes
- **root**: Directory to chroot into

CLI Example:
```
salt '*' shadow.set_mindays username 7
```

**salt.modules.linux_shadow.set_password**(name, password, use_usermod=False, root=None)

Set the password for a named user. The password must be a properly defined hash. The password hash can be generated with this command:
```
python -c "import crypt; print crypt.crypt('password', '\$6\$SALTsalt')"
```

SALTsalt is the 8-character cryptographic salt. Valid characters in the salt are $, /, and any alphanumeric character.

Keep in mind that the $6 represents a sha512 hash, if your OS is using a different hashing algorithm this needs to be changed accordingly

- **name**: User to set the password
- **password**: Password already hashed
- **use_usermod**: Use usermod command to better compatibility
- **root**: Directory to chroot into

CLI Example:
salt '...' shadow.set_password root '$1$UYCIxa628.9qXjpQCjM4a..' 

salt.modules.linux_shadow.set_warndays(name, warndays, root=None)
Set the number of days of warning before a password change is required. See man chage.
    name   User to modify
    warndays Number of days of warning before a password change is required
    root   Directory to chroot into
CLI Example:
    salt '...' shadow.set_warndays username 7

salt.modules.linux_shadow.unlock_password(name, root=None)
New in version 2016.11.0.
Unlock the password from name user
    name   User to unlock
    root   Directory to chroot into
CLI Example:
    salt '...' shadow.unlock_password username

21.9.230 salt.modules.linux_sysctl
Module for viewing and modifying sysctl parameters
salt.modules.linux_sysctl.assign(name, value, ignore=False)
Assign a single sysctl parameter for this minion
    Parameters
    • name   -- Name of sysctl setting
    • value  -- Desired value of sysctl setting
    • ignore -- Optional boolean to pass --ignore to sysctl (Default: False)
CLI Example:
    salt '...' sysctl.assign net.ipv4.ip_forward 1

salt.modules.linux_sysctl.default_config()
Linux hosts using systemd 207 or later ignore /etc/sysctl.conf and only load from /etc/sysctl.d/*.conf. This function will do the proper checks and return a default config file which will be valid for the Minion. Hosts running systemd >= 207 will use /etc/sysctl.d/99-salt.conf.
CLI Example:
    salt -G 'kernel:Linux' sysctl.default_config

salt.modules.linux_sysctl.get(name, ignore=False)
Return a single sysctl parameter for this minion
    Parameters
    • name   -- Name of sysctl setting
    • ignore -- Optional boolean to pass --ignore to sysctl (Default: False)
CLI Example:
salt Documentation, Release 3001.1

```python
salt '*' sysctl.get net.ipv4.ip_forward
```

**salt.modules.linux_sysctl.persist(name, value, config=None, ignore=False)**

Assign and persist a simple sysctl parameter for this minion. If `config` is not specified, a sensible default will be chosen using `sysctl.default_config`.

**Parameters**

- `name` -- Name of sysctl setting
- `value` -- Desired value of sysctl setting
- `config` -- Optional path to sysctl.conf
- `ignore` -- Optional boolean to pass --ignore to sysctl (Default: False)

**CLI Example:**

```bash
salt '*' sysctl.persist net.ipv4.ip_forward 1
```

**salt.modules.linux_sysctl.show(config_file=False)**

Return a list of sysctl parameters for this minion.

**Parameters**

- `config_file` -- Pull data from the system configuration file instead of the live kernel.

**CLI Example:**

```bash
salt '*' sysctl.show
```

### 21.9.231 salt.modules.localemod

Module for managing locales on POSIX-like systems.

**salt.modules.localemod.avail(locale)**

Check if a locale is available.

New in version 2014.7.0.

**CLI Example:**

```bash
salt '*' locale.avail 'en_US.UTF-8'
```

**salt.modules.localemod.gen_locale(locale, **kwargs)**

Generate a locale. Options:

New in version 2014.7.0.

- `locale` -- Any locale listed in /usr/share/i18n/locales or /usr/share/i18n/SUPPORTED for Debian and Gentoo based distributions, which require the charmap to be specified as part of the locale when generating it.
- `verbose` -- Show extra warnings about errors that are normally ignored.

**CLI Example:**

```bash
salt '*' locale.gen_locale en_US.UTF-8
salt '*' locale.gen_locale 'en_IE.UTF-8 UTF-8' # Debian/Gentoo only
```

**salt.modules.localemod.get_locale()**

Get the current system locale.

**CLI Example:**

```bash
```
salt 'x' locale.get_locale

salt.modules.localemod.list_avail()
Lists available (compiled) locales

CLI Example:

salt 'x' locale.list_avail

salt.modules.localemod.set_locale(locale)
Sets the current system locale

CLI Example:

salt 'x' locale.set_locale 'en_US.UTF-8'

21.9.232 salt.modules.locate

Module for using the locate utilities

salt.modules.locate.locate(pattern, database='', limit=0, **kwargs)
Performs a file lookup. Valid options (and their defaults) are:

basename=False
count=False
eexisting=False
follow=True
ignore=False
nofollow=False
wholename=True
regex=False
database=<locate's default database>
limit=<integer, not set by default>

See the manpage for locate(1) for further explanation of these options.

CLI Example:

salt 'x' locate.locate

salt.modules.locate.stats()
Returns statistics about the locate database

CLI Example:

salt 'x' locate.stats

salt.modules.locate.updatedb()
Updates the locate database

CLI Example:

salt 'x' locate.updatedb

salt.modules.locate.version()
Returns the version of locate

CLI Example:
21.9.233 salt.modules.logadm

Module for managing Solaris logadm based log rotations.

salt.modules.logadm.list_conf(conf_file='/etc/logadm.conf', log_file=None, include_unset=False)

Show parsed configuration

New in version 2018.3.0.

- **conf_file** [string] path to logadm.conf, defaults to /etc/logadm.conf
- **log_file** [string] optional show only one log file
- **include_unset** [boolean] include unset flags in output

CLI Example:

```
salt '*' logadm.list_conf
salt '*' logadm.list_conf log=/var/log/syslog
salt '*' logadm.list_conf include_unset=False
```

salt.modules.logadm.remove(name, conf_file='/etc/logadm.conf')

Remove log pattern from logadm

CLI Example:

```
salt '*' logadm.remove myapplog
```

salt.modules.logadm.rotate(name, pattern=None, conf_file='/etc/logadm.conf', **kwargs)

Set up pattern for logging.

- **name** [string] alias for entryname
- **pattern** [string] alias for log_file
- **conf_file** [string] optional path to alternative configuration file
- **kwargs** [boolean|string|int] optional additional flags and parameters

Note: name and pattern were kept for backwards compatibility reasons.

name is an alias for the entryname argument, pattern is an alias for log_file. These aliases will only be used if the entryname and log_file arguments are not passed.

For a full list of arguments see `logadm.show_args`.

CLI Example:

```
salt '*' logadm.rotate myapplog pattern='/var/log/myapp/*.log' count=7
salt '*' logadm.rotate myapplog log_file='/var/log/myapp/*.log' count=4
        --owner=myappd mode='0700'
```

salt.modules.logadm.show_args()

Show which arguments map to which flags and options.

New in version 2018.3.0.

CLI Example:

```
salt '*' logadm.show_args
```

salt.modules.logadm.show_conf(conf_file='/etc/logadm.conf', name=None)

Show configuration
conf_file  [string] path to logadm.conf, defaults to /etc/logadm.conf
name  [string] optional show only a single entry

CLI Example:

```
salt '*' logadm.show_conf
salt '*' logadm.show_conf name=/var/log/syslog
```

### 21.9.234 salt.modules.logmod module

**On-demand logging**

New in version 2017.7.0.

The sole purpose of this module is logging messages in the (proxy) minion. It comes very handy when debugging complex Jinja templates, for example:

```
{% for var in range(10) %}
  {%- do salt.log.info(var) -%}
{% endfor %}
```

CLI Example:

```
salt '*' log.error "Please don't do that, this module is not for CLI use!"
```

salt.modules.logmod.critical(message)
Log message at level CRITICAL.

salt.modules.logmod.debug(message)
Log message at level DEBUG.

salt.modules.logmod.error(message)
Log message at level ERROR.

salt.modules.logmod.exception(message)
Log message at level EXCEPTION.

salt.modules.logmod.info(message)
Log message at level INFO.

salt.modules.logmod.warning(message)
Log message at level WARNING.

### 21.9.235 salt.modules.logrotate

Module for managing logrotate.

salt.modules.logrotate.get(key, value=None, conf_file='/etc/logrotate.conf')
Get the value for a specific configuration line.

**Parameters**

- **key (str)** -- The command or stanza block to configure.
- **value (str)** -- The command value or command of the block specified by the key parameter.
- **conf_file (str)** -- The logrotate configuration file.

**Returns** The value for a specific configuration line.

**Return type** bool|int|str
CLI Example:

```
salt '*' logrotate.get rotate
salt '*' logrotate.get /var/log/wtmp rotate /etc/logrotate.conf
```

```python
salt.modules.logrotate.set_(key, value, setting=None, conf_file='etc/logrotate.conf')
```

Set a new value for a specific configuration line.

**Parameters**

- `key` *(str)* -- The command or block to configure.
- `value` *(str)* -- The command value or command of the block specified by the `key` parameter.
- `setting` *(str)* -- The command value for the command specified by the `value` parameter.
- `conf_file` *(str)* -- The logrotate configuration file.

**Returns**

A boolean representing whether all changes succeeded.

**Return type** `bool`

CLI Example:

```
salt '*' logrotate.set rotate 2
```

Can also be used to set a single value inside a multiline configuration block. For instance, to change `rotate` in the following block:

```
/var/log/wtmp {
    monthly
    create 0664 root root
    rotate 1
}
```

Use the following command:

```
salt '*' logrotate.set /var/log/wtmp rotate 2
```

This module also has the ability to scan files inside an include directory, and make changes in the appropriate file.

```python
salt.modules.logrotate.show_conf(conf_file='etc/logrotate.conf')
```

Show parsed configuration

**Parameters**

- `conf_file` *(str)* -- The logrotate configuration file.

**Returns**

The parsed configuration.

**Return type** `dict`

CLI Example:

```
salt '*' logrotate.show_conf
```

---

21.9. execution modules
21.9.236  salt.modules.lvs

Support for LVS (Linux Virtual Server)

salt.modules.lvs.add_server(protocol=None, service_address=None, server_address=None, packet_forward_method='dr', weight=1, **kwargs)

Add a real server to a virtual service.

**protocol** The service protocol(only support tcp, udp and fwmark service).

**service_address** The LVS service address.

**server_address** The real server address.

**packet_forward_method** The LVS packet forwarding method(dr for direct routing, tunnel for tunneling, nat for network access translation).

**weight** The capacity of a server relative to the others in the pool.

CLI Example:
```
salt '*' lvs.add_server tcp 1.1.1.1:80 192.168.0.11:8080 nat 1
```

salt.modules.lvs.add_service(protocol=None, service_address=None, scheduler='wlc')

Add a virtual service.

**protocol** The service protocol(only support tcp, udp and fwmark service).

**service_address** The LVS service address.

**scheduler** Algorithm for allocating TCP connections and UDP datagrams to real servers.

CLI Example:
```
salt '*' lvs.add_service tcp 1.1.1.1:80 rr
```

salt.modules.lvs.check_server(protocol=None, service_address=None, server_address=None, **kwargs)

Check the real server exists in the specified service.

CLI Example:
```
salt '*' lvs.check_server tcp 1.1.1.1:80 192.168.0.11:8080
```

salt.modules.lvs.check_service(protocol=None, service_address=None, **kwargs)

Check the virtual service exists.

CLI Example:
```
salt '*' lvs.check_service tcp 1.1.1.1:80
```

salt.modules.lvs.clear()

Clear the virtual server table

CLI Example:
```
salt '*' lvs.clear
```

salt.modules.lvs.delete_server(protocol=None, service_address=None, server_address=None)

Delete the realserver from the virtual service.

**protocol** The service protocol(only support tcp, udp and fwmark service).

**service_address** The LVS service address.

**server_address** The real server address.

CLI Example:
```
salt '*' lvs.delete_server tcp 1.1.1.1:80 192.168.0.11:8080
```
salt.modules.lvs.delete_service(protocol=None, service_address=None)
Delete the virtual service.
  protocol  The service protocol(only support tcp, udp and fwmark service).
  service_address  The LVS service address.
CLI Example:
```
salt '*' lvs.delete_service tcp 1.1.1.1:80
```

salt.modules.lvs.edit_server(protocol=None, service_address=None, server_address=None, packet_forward_method=None, weight=None, **kwargs)
Edit a real server to a virtual service.
  protocol  The service protocol(only support tcp, udp and fwmark service).
  service_address  The LVS service address.
  server_address  The real server address.
  packet_forward_method  The LVS packet forwarding method(dr for direct routing, tunnel for tunneling, nat for network access translation).
  weight  The capacity of a server relative to the others in the pool.
CLI Example:
```
salt '*' lvs.edit_server tcp 1.1.1.1:80 192.168.0.11:8080 nat 1
```

salt.modules.lvs.edit_service(protocol=None, service_address=None, scheduler=None)
Edit the virtual service.
  protocol  The service protocol(only support tcp, udp and fwmark service).
  service_address  The LVS service address.
  scheduler  Algorithm for allocating TCP connections and UDP datagrams to real servers.
CLI Example:
```
salt '*' lvs.edit_service tcp 1.1.1.1:80 rr
```

salt.modules.lvs.get_rules()
Get the virtual server rules
CLI Example:
```
salt '*' lvs.get_rules
```

salt.modules.lvs.list(protocol=None, service_address=None)
List the virtual server table if service_address is not specified. If a service_address is selected, list this service only.
CLI Example:
```
salt '*' lvs.list
```

salt.modules.lvs.zero(protocol=None, service_address=None)
Zero the packet, byte and rate counters in a service or all services.
CLI Example:
```
salt '*' lvs.zero
```
21.9.237  salt.modules.lxc

Control Linux Containers via Salt

**depends**  lxc package for distribution

lxc >= 1.0 (even beta alpha) is required

```python
salt.modules.lxc.add_veth(name, interface_name, bridge=None, path=None)
```

Add a veth to a container. Note: this function doesn’t update the container config, just add the interface at runtime

- **name**: Name of the container
- **interface_name**: Name of the interface in the container
- **bridge**: Name of the bridge to attach the interface to (facultative)

CLI Examples:

```bash
salt '*' lxc.add_veth container_name eth1 br1
salt '*' lxc.add_veth container_name eth1
```

```python
salt.modules.lxc.apply_network_profile(name, network_profile, nic_opts=None, path=None)
```

New in version 2015.5.0.

Apply a network profile to a container

- **network_profile**: profile name or default values (dict)
- **nic_opts**: values to override in defaults (dict) indexed by nic card names
- **path**: path to the container parent

New in version 2015.8.0.

CLI Examples:

```bash
salt 'minion' lxc.apply_network_profile web1 centos
salt 'minion' lxc.apply_network_profile web1 centos
  nic_opts='{"eth0": {"mac": "xx:xx:xx:xx:xx:xx"}}'
salt 'minion' lxc.apply_network_profile web1
  "{"eth0": {"mac": "xx:xx:xx:xx:xx:yy"}}"
  nic_opts='{"eth0": {"mac": "xx:xx:xx:xx:xx:xx"}}'
```

The special case to disable use of ethernet nics:

```bash
salt 'minion' lxc.apply_network_profile web1 centos
  "{eth0: {"disable": true}}"
```

```python
salt.modules.lxc.attachable(name, path=None)
```

Return True if the named container can be attached to via the lxc-attach command

- **path**: path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```bash
salt 'minion' lxc.attachable ubuntu
```

```python
salt.modules.lxc.bootstrap(name, config=None, approve_key=True, install=True, pub_key=None, priv_key=None, bootstrap_url=None, force_install=False, unconditional_install=False, path=None, bootstrap_delay=None, bootstrap_args=None, bootstrap_shell=None)
```

Install and configure Salt in a container.

- **config**: Minion configuration options. By default, the master option is set to the target host’s master.
- **approve_key**: Request a pre-approval of the generated minion key. Requires that the salt-master be configured to either auto-accept all keys or expect a signing request from the target host. Default: True
**path**  
path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

**pub_key**  
Explicit public key to pressed the minion with (optional). This can be either a filepath or a string representing the key

**priv_key**  
Explicit private key to pressed the minion with (optional). This can be either a filepath or a string representing the key

**bootstrap_delay**  
Delay in seconds between end of container creation and bootstrapping. Useful when waiting for container to obtain a DHCP lease.

New in version 2015.5.0.

**bootstrap_url**  
url, content or filepath to the salt bootstrap script

**bootstrap_args**  
salt bootstrap script arguments

**bootstrap_shell**  
shell to execute the script into

**install**  
Whether to attempt a full installation of salt-minion if needed.

**force_install**  
Force installation even if salt-minion is detected, this is the way to run vendor bootstrap scripts even if a salt minion is already present in the container

**unconditional_install**  
Run the script even if the container seems seeded

CLI Examples:

```
salt 'minion' lxc.bootstrap container_name [config=config_data] \  
   [approve_key=(True|False)] [install=(True|False)]
```

```
salt '*' lxc.clone myclone orig=orig_container
salt '*' lxc.clone myclone orig=orig_container snapshot=True
```

salt.modules.lxc.clone(name, orig, profile=None, network_profile=None, nic_opts=None, **kwargs)  
Create a new container as a clone of another container

**name**  
Name of the container

**orig**  
Name of the original container to be cloned

**profile**  
Profile to use in container cloning (see lxc.get_container_profile). Values in a profile will be overridden by the Container Cloning Arguments listed below.

**path**  
path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

**Container Cloning Arguments**

**snapshot**  
Use Copy On Write snapshots (LVM)

**size**  
[1G] Size of the volume to create. Only applicable if backing=lvm.

**backing**  
The type of storage to use. Set to lvm to use an LVM group. Defaults to filesystem within /var/lib/lxc.

**network_profile**  
Network profile to use for container

New in version 2015.8.0.

**nic_opts**  
give extra opts overriding network profile values

New in version 2015.8.0.

CLI Examples:

```
salt '*' lxc.clone myclone orig=orig_container
salt '*' lxc.clone myclone orig=orig_container snapshot=True
```

salt.modules.lxc.cloud_init(name, vm_=None, **kwargs)  
Thin wrapper to lxc.init to be used from the saltcloud lxc driver

**name**  
Name of the container may be None and then guessed from saltcloud mapping

**vm_**  
saltcloud mapping defaults for the vm

CLI Example:

```
salt '*' lxc.cloud_init foo
```

salt.modules.lxc.cloud_init_interface(name, vm_=None, **kwargs)  
Interface between salt.cloud.lxc driver and lxc.init vm_ is a mapping of vm opts in the salt.cloud format as documented for the lxc driver.
This can be used either:
- from the salt cloud driver
- because you find the argument to give easier here than using directly lxc.init

**Warning:** BE REALLY CAREFUL CHANGING DEFAULTS !! IT'S A RETRO COMPATIBLE INTERFACE WITH THE SALT CLOUD DRIVER (ask kiorky).

<table>
<thead>
<tr>
<th><strong>name</strong></th>
<th>name of the lxc container to create</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>pub_key</strong></td>
<td>public key to preseed the minion with. Can be the keycontent or a filepath</td>
</tr>
<tr>
<td><strong>priv_key</strong></td>
<td>private key to preseed the minion with. Can be the keycontent or a filepath</td>
</tr>
<tr>
<td><strong>path</strong></td>
<td>path to the container parent directory (default: /var/lib/lxc)</td>
</tr>
<tr>
<td><strong>profile</strong></td>
<td>profile selection</td>
</tr>
<tr>
<td><strong>network_profile</strong></td>
<td>network profile selection</td>

<tr>
<td><strong>lvname</strong></td>
<td>if using LVM: lvname</td>
</tr>
<tr>
<td><strong>thinpool</strong></td>
<td>if using LVM: thinpool</td>
</tr>
<tr>
<td><strong>ip</strong></td>
<td>ip for the primary nic</td>
</tr>
<tr>
<td><strong>mac</strong></td>
<td>mac address for the primary nic</td>
</tr>
</tbody>
</table>
netmask  netmask for the primary nic (24) = vm_.get('netmask', '24')
bridge  bridge for the primary nic (lxcbr0)
gateway  network gateway for the container

additional_ips  additional ips which will be wired on the main bridge (br0) which is connected to internet. Be aware that you may use manual virtual mac addresses providen by you provider (online, ovh, etc). This is a list of mappings {ip: '', mac: '', netmask:''} Set gateway to None and an interface with a gateway to escape from another interface that eth0. eg:

- {'mac': '00:16:3e:01:29:40', 'gateway': None, (default) 'link': 'br0', (default) 'netmask': '', (default) 'ip': '22.1.4.25'}

users  administrative users for the container default: [root] and [root, ubuntu] on ubuntu
default_nic  name of the first interface, you should really not override this

CLI Example:

salt '*' lxc.cloud_init_interface foo

salt.modules.lxc.copy_to(name, source, dest, overwrite=False, makedirs=False, path=None)

Changed in version 2015.8.0: Function renamed from \lxc.cp to \lxc.copy_to for consistency with other container types. \lxc.cp will continue to work, however. For versions 2015.2.x and earlier, use \lxc.cp.

Copy a file or directory from the host into a container
name  Container name
source  File to be copied to the container
path  path to the container parent default: /var/lib/lxc (system default)
	new in version 2015.8.0.
dest  Destination on the container. Must be an absolute path.
	new in version 2015.5.0: If the destination is a directory, the file will be copied into that directory.
overwrite  [False] Unless this option is set to True, then if a file exists at the location specified by the dest argument, an error will be raised.

new in version 2015.8.0.
makedirs : False
Create the parent directory on the container if it does not already exist.

new in version 2015.5.0.

CLI Example:

salt 'minion' lxc.copy_to /tmp/foo /root/foo
salt 'minion' lxc.cp /tmp/foo /root/foo

salt.modules.lxc.create(name, config=None, profile=None, network_profile=None, nic_opts=None, **kwargs)

Create a new container.
name  Name of the container
config  The config file to use for the container. Defaults to system-wide config (usually in /etc/lxc/lxc.conf).
profile  Profile to use in container creation (see lxc.get_container_profile). Values in a profile will be overridden by the Container Creation Arguments listed below.
network_profile  Network profile to use for container
New in version 2015.5.0.

Container Creation Arguments

**template** The template to use. For example, `ubuntu` or `fedora`. For a full list of available templates, check out the `lxc.templates` function.

Conflicts with the `image` argument.

**Note:** The `download` template requires the following three parameters to be defined in `options`:

- **dist** - The name of the distribution
- **release** - Release name/version
- **arch** - Architecture of the container

The available images can be listed using the `lxc.images` function.

**options** Template-specific options to pass to the lxc-create command. These correspond to the long options (ones beginning with two dashes) that the template script accepts. For example:

```py
options='{"dist": "centos", "release": "6", "arch": "amd64"}"
```

For available template options, refer to the lxc template scripts which are usually located under `/usr/share/lxc/templates`, or run `lxc-create -t <template> -h`.

**image** A tar archive to use as the rootfs for the container. Conflicts with the `template` argument.

**backing** The type of storage to use. Set to `lvm` to use an LVM group. Defaults to filesystem within `/var/lib/lxc`

**fstype** Filesystem type to use on LVM logical volume

**size** [1G] Size of the volume to create. Only applicable if `backing=lvm`

**vgname** [lxc] Name of the LVM volume group in which to create the volume for this container. Only applicable if `backing=lvm`

**lvname** Name of the LVM logical volume in which to create the volume for this container. Only applicable if `backing=lvm`

**thinpool** Name of a pool volume that will be used for thin-provisioning this container. Only applicable if `backing=lvm`

**nic_opts** give extra opts overriding network profile values

**path** parent path for the container creation (default: `/var/lib/lxc`)

**zfsroot** Name of the ZFS root in which to create the volume for this container. Only applicable if `backing=zfs`. (default: tank/lxc)

New in version 2015.8.0.

salt.modules.lxc.destroy(*name*,*stop=False*,*path=None*)

Destroy the named container.

**Warning:** Destroys all data associated with the container.

**path** path to the container parent directory (default: `/var/lib/lxc`)

New in version 2015.8.0.

**stop** [False] If True, the container will be destroyed even if it is running/frozen.

Changed in version 2015.5.0: Default value changed to `False`. This more closely matches the behavior of `lxc-destroy(1)`, and also makes it less likely that an accidental command will destroy a running container that was being used for important things.

CLI Examples:

```
salt '*' lxc.destroy foo
salt '*' lxc.destroy foo stop=True
```
salt.modules.lxc.edit_conf(conf_file, out_format='simple', read_only=False, lxc_config=None, **kwargs)

Edit an LXC configuration file. If a setting is already present inside the file, its value will be replaced. If it does not exist, it will be appended to the end of the file. Comments and blank lines will be kept in-tact if they already exist in the file.

- **out_format**: Set to simple if you need backward compatibility (multiple items for a simple key is not supported).
- **read_only**: Return only the edited configuration without applying it to the underlying lxc configuration file.
- **lxc_config**: List of dict containing lxc configuration items. For network configuration, you also need to add the device it belongs to, otherwise it will default to eth0. Also, any change to a network parameter will result in the whole network reconfiguration to avoid mismatches, be aware of that!

After the file is edited, its contents will be returned. By default, it will be returned in simple format, meaning an unordered dict (which may not represent the actual file order). Passing in an out_format of commented will return a data structure which accurately represents the order and content of the file.

CLI Example:

```
salt 'minion' lxc.edit_conf /etc/lxc/mycontainer.conf \
   out_format=commented lxc.network.type=veth
```

salt.modules.lxc.exists(name, path=None)

Returns whether the named container exists.

- **path**: path to the container parent directory (default: /var/lib/lxc)

    New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.exists name
```

salt.modules.lxc.freeze(name, **kwargs)

Freeze the named container.

- **path**: path to the container parent directory (default: /var/lib/lxc (system))

    New in version 2015.8.0.

- **start** [False] If True and the container is stopped, the container will be started before attempting to freeze.

    New in version 2015.5.0.

- **use_vt** run the command through VT

    New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.freeze name
```

salt.modules.lxc.get_container_profile(name=None, **kwargs)

Gather a pre-configured set of container configuration parameters. If no arguments are passed, an empty profile is returned.

Profiles can be defined in the minion or master config files, or in pillar or grains, and are loaded using
config.get. The key under which LXC profiles must be configured is `lxc.container_profile`. An example container profile would be as follows:

```python
lxc.container_profile:
    ubuntu:
        template: ubuntu
        backing: lvm
        vgsname: lxc
        size: 1G
```

Parameters set in a profile can be overridden by passing additional container creation arguments (such as the ones passed to `lxc.create`) to this function.

A profile can be defined either as the name of the profile, or a dictionary of variable names and values. See the `LXC Tutorial` for more information on how to use LXC profiles.

CLI Example:

```bash
salt-call lxc.get_container_profile centos
salt-call lxc.get_container_profile ubuntu template=ubuntu backing=overlayfs
```

salt.modules.lxc.get_network_profile(name=None, **kwargs)

New in version 2015.5.0.

Gather a pre-configured set of network configuration parameters. If no arguments are passed, the following default profile is returned:

```python
{'eth0': {'link': 'br0', 'type': 'veth', 'flags': 'up'}}
```

Profiles can be defined in the minion or master config files, or in pillar or grains, and are loaded using `config.get`. The key under which LXC profiles must be configured is `lxc.network_profile`. An example network profile would be as follows:

```python
lxc.network_profile.centos:
    eth0:
        link: br0
        type: veth
        flags: up
```

To disable networking entirely:

```python
lxc.network_profile.centos:
    eth0:
        disable: true
```

Parameters set in a profile can be overridden by passing additional arguments to this function.

A profile can be passed either as the name of the profile, or a dictionary of variable names and values. See the `LXC Tutorial` for more information on how to use network profiles.

Warning: The `ipv4`, `ipv6`, `gateway`, and `link` (bridge) settings in network profiles will only work if the container doesn't redefine the network configuration (for example in `/etc/sysconfig/network-scripts/ifcfg-<interface_name>` on RHEL/CentOS, or `/etc/network/interfaces` on Debian/Ubuntu/etc.)

CLI Example:
salt-call lxc.get_network_profile default

salt.modules.lxc.get_parameter(name, parameter, path=None)
Returns the value of a cgroup parameter for a container
path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.
CLI Example:
salt '*' lxc.get_parameter container_name memory.limit_in_bytes

salt.modules.lxc.get_pid(name, path=None)
Returns a container pid. Throw an exception if the container isn't running.

CLI Example:
salt '*' lxc.get_pid name

salt.modules.lxc.get_root_path(path)
Get the configured lxc root for containers

New in version 2015.8.0.
CLI Example:
salt '*' lxc.get_root_path

salt.modules.lxc.images(dist=None)
New in version 2015.5.0.
List the available images for LXC's download template.
dist [None] Filter results to a single Linux distribution
CLI Examples:
salt myminion lxc.images
salt myminion lxc.images dist=centos

salt.modules.lxc.info(name, path=None)
Returns information about a container
path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.
CLI Example:
salt '*' lxc.info name

salt.modules.lxc.init(name, config=None, cpuset=None, cpushare=None, memory=None, profile=None, network_profile=None, nic_opts=None, cpu=None, autostart=True, password=None, password_encrypted=None, users=None, dnsservers=None, searchdomains=None, bridge=None, gateway=None, pub_key=None, priv_key=None, force_install=False, unconditional_install=False, bootstrap_delay=None, bootstrap_args=None, bootstrap_shell=None, bootstrap_url=None, **kwargs)

Initialize a new container.
This is a partial idempotent function as if it is already provisioned, we will reset a bit the lxc configuration file but much of the hard work will be escaped as markers will prevent re-execution of harmful tasks.
name Name of the container
image A tar archive to use as the rootfs for the container. Conflicts with the template argument.

21.9. execution modules
cpus Select a random number of cpu cores and assign it to the cpuset, if the cpuset option is set then this option will be ignored.
cpuset Explicitly define the cpus this container will be bound to.
cpushare cgroups cpu shares.
autostart autostart container on reboot.
memory cgroups memory limit, in MB.

cpuset option will be ignored.

Changed in version 2015.5.0: If no value is passed, no limit is set. In earlier Salt versions, not passing this value causes a 1024MB memory limit to be set, and it was necessary to pass memory=0 to set no limit.
gateway the ipv4 gateway to use the default does nothing more than lxcutils does.
bridge the bridge to use the default does nothing more than lxcutils does.

network_profile Network profile to use for the container.

New in version 2015.5.0.
nic_opts Extra options for network interfaces, will override

or

users Users for which the password defined in the password param should be set. Can be passed as a comma separated list or a python list. Defaults to just the root user.

password Set the initial password for the users defined in the users parameter.

password_encrypted [False] Set to True to denote a password hash instead of a plaintext password.

New in version 2015.5.0.
profile A LXC profile (defined in config or pillar). This can be either a real profile mapping or a string to retrieve it in configuration.

start Start the newly-created container.
dnsservers list of dns servers to set in the container, default [] (no setting).

seed Seed the container with the minion config. Default: True.
install If salt-minion is not already installed, install it. Default: True.

config Optional config parameters. By default, the id is set to the name of the container.
master salt master (default to minion's master)
master_port salt master port (default to minion's master port)
pub_key Explicit public key to preseed the minion with (optional). This can be either a filepath or a string representing the key.

priv_key Explicit private key to preseed the minion with (optional). This can be either a filepath or a string representing the key.

approve_key If explicit preseeding is not used; Attempt to request key approval from the master. Default: True.

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.
clone_from Original from which to use a clone operation to create the container. Default: None.

bootstrap_delay Delay in seconds between end of container creation and bootstrapping. Useful when waiting for container to obtain a DHCP lease.

New in version 2015.5.0.
bootstrap_url See lxc.bootstrap
bootstrap_shell See lxc.bootstrap
bootstrap_args See lxc.bootstrap
force_install Force installation even if salt-minion is detected, this is the way to run vendor bootstrap scripts even if a salt minion is already present in the container.
unconditional_install  Run the script even if the container seems seeded
CLI Example:

```
salt 'minion' lxc.init name [cpuset=cpuset] \
    [cpushareshare=cpushareshare] [memory=memory] \
    [nic=nic] [profile=profile] \
    [nic_optss=nic_optss] [start=(True|False)] \
    [seed=(True|False)] [install=(True|False)] \
    [clone_from=original] [autostart=True] \
    [priv_key=/path_or_content] [pub_key=/path_or_content] \
    [bridge=lxcbr0] [gateway=10.0.3.1] \
    [dsservers[dns1,dns2]] \
    [users=[foo]] [password='secret'] \
    [password_encrypted=(True|False)]
```

```
salt.modules.lxc.list_(extra=False, limit=None, path=None)
```
List containers classified by state
extra  Also get per-container specific info. This will change the return data. Instead of returning a list of containers, a dictionary of containers and each container’s output from lxc.info.
path  path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

limit  Return output matching a specific state (frozen, running, or stopped).

New in version 2015.5.0.

CLI Examples:

```
salt '*' lxc.list
salt '*' lxc.list extra=True
salt '*' lxc.list limit=running
```

```
salt.modules.lxc.ls_(active=None, cache=True, path=None)
```
Return a list of the containers available on the minion
path  path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

active  If True, return only active (i.e. running) containers

New in version 2015.5.0.

CLI Example:

```
salt '*' lxc.ls
salt '*' lxc.ls active=True
```

```
salt.modules.lxc.read_conf(conf_file, out_format='simple')
```
Read in an LXC configuration file. By default returns a simple, unsorted dict, but can also return a more detailed structure including blank lines and comments.
out_format  set to ‘simple’ if you need the old and unsupported behavior. This won’t support the multiple lxc values (eg: multiple network nics)

CLI Examples:

```
salt 'minion' lxc.read_conf /etc/lxc/mycontainer.conf
salt 'minion' lxc.read_conf /etc/lxc/mycontainer.conf out_format=commented
```

```
salt.modules.lxc.reboot(name, path=None)
```
Reboot a container.
path  path to the container parent default: /var/lib/lxc (system default)
New in version 2015.8.0.

CLI Examples:

salt 'minion' lxc.reboot myvm

salt.modules.lxc.reconfigure(name, cpu=None, cpuset=None, cpushare=None, memory=None, profile=None, network_profile=None, nic_opts=None, bridge=None, gateway=None, autostart=None, utsname=None, rootfs=None, path=None, **kwargs)

Reconfigure a container.

This only applies to a few property

name Name of the container.

utsname utsname of the container.

New in version 2016.3.0.

rootfs rootfs of the container.

New in version 2016.3.0.

cpu Select a random number of cpu cores and assign it to the cpuset, if the cpuset option is set then this option will be ignored

cpuset Explicitly define the cpus this container will be bound to

cpushare cgroups cpu shares.

autostart autostart container on reboot

memory cgroups memory limit, in MB. (0 for nolimit, None for old default 1024MB)

gateway the ipv4 gateway to use the default does nothing more than lxcutils does

bridge the bridge to use the default does nothing more than lxcutils does

nic Network interfaces profile (defined in config or pillar).

nic_opts Extra options for network interfaces, will override

{"eth0": {"mac": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1", "ipv6": "2001:db8::ff00:42:8329"}}

or

{"eth0": {"mac": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1/24", "ipv6": "2001:db8::ff00:42:8329"}}

path path to the container parent

New in version 2015.8.0.

CLI Example:

salt-call ~lall mc_lxc_fork.reconfigure foobar nic_opts="{"eth1": {"mac": "00:16:3e:dd:ee:44"}}" memory=4

salt.modules.lxc.restart(name, path=None, lxc_config=None, force=False)

New in version 2015.5.0.

Restart the named container. If the container was not running, the container will merely be started.

name The name of the container

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

lxc_config path to a lxc config file config file will be guessed from container name otherwise

New in version 2015.8.0.

force [False] If True, the container will be force-stopped instead of gracefully shut down

CLI Example:
```
salt myminion lxc.restart name
```

```
salt.modules.lxc.reetcode(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, path=None, ignore_retcode=False, chroot_fallback=False, keep_env='http_proxy,https_proxy,no_proxy')
```

New in version 2015.5.0.

Run `cmd.reetcode` within a container

**Warning:** Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in stderr if the command being run does not exist. If the retcode is nonzero and not what was expected, try using `lxc.run_stderr` or `lxc.run_all`.

- **name** Name of the container in which to run the command
- **cmd** Command to run
- **no_start** [False] If the container is not running, don’t start it
- **preserve_state** [True] After running the command, return the container to its previous state
- **path** path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

- **stdin** [None] Standard input to be used for the command
- **output_loglevel** [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.
- **use_vt** [False] Use SaltStack’s `utils.vt` to stream output to console `output=all`.
- **keep_env** [https_proxy,http_proxy,no_proxy] A list of env vars to preserve. May be passed as comma-delimited list.
- **chroot_fallback** if the container is not running, try to run the command using chroot default: false

CLI Example:

```
salt myminion lxc.reetcode mycontainer 'ip addr show'
```

```
salt.modules.lxc.run(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, path=None, ignore_retcode=False, chroot_fallback=False, keep_env='http_proxy,https_proxy,no_proxy')
```

New in version 2015.8.0.

Run `cmd.run` within a container

**Warning:** Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in stderr if the command being run does not exist. If no output is returned using this function, try using `lxc.run_stderr` or `lxc.run_all`.

- **name** Name of the container in which to run the command
- **cmd** Command to run
- **path** path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

- **no_start** [False] If the container is not running, don’t start it
preserve_state [True] After running the command, return the container to its previous state
stdin [None] Standard input to be used for the command
output_loglevel [debug] Level at which to log the output from the command. Set to quiet to suppress logging.
use_vt [False] Use SaltStack’s utils.vt to stream output to console. Assumes output=all.
chroot_fallback if the container is not running, try to run the command using chroot default: false
keep_env [http_proxy,https_proxy,no_proxy] A list of env vars to preserve. May be passed as comma-delimited list.

CLI Example:

```bash
salt myminion lxc.run mycontainer 'ifconfig -a'
```

salt.modules.lxc.run_all(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, path=None, ignore_retcode=False, chroot_fallback=False, keep_env='http_proxy,https_proxy,no_proxy')

New in version 2015.5.0.

Run `cmd.run_all` within a container

**Note:** While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

**Warning:** Many shell builtins do not work, failing with stderr similar to the following:

```bash
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in stderr if the command being run does not exist.

name Name of the container in which to run the command
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

cmd Command to run
no_start [False] If the container is not running, don’t start it
preserve_state [True] After running the command, return the container to its previous state
stdin [None] Standard input to be used for the command
output_loglevel [debug] Level at which to log the output from the command. Set to quiet to suppress logging.
use_vt [False] Use SaltStack’s utils.vt to stream output to console output=all.
keep_env [http_proxy,https_proxy,no_proxy] A list of env vars to preserve. May be passed as comma-delimited list.
chroot_fallback if the container is not running, try to run the command using chroot default: false

CLI Example:

```bash
salt myminion lxc.run_all mycontainer 'ip addr show'
```

salt.modules.lxc.run_stderr(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, path=None, ignore_retcode=False, chroot_fallback=False, keep_env='http_proxy,https_proxy,no_proxy')

New in version 2015.5.0.

Run `cmd.run_stderr` within a container
Warning: Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed if the command being run does not exist.

**name** Name of the container in which to run the command

**cmd** Command to run

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

**no_start** [False] If the container is not running, don’t start it

**preserve_state** [True] After running the command, return the container to its previous state

**stdin** [None] Standard input to be used for the command

**output_loglevel** [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

**use_vt** [False] Use SaltStack’s `utils.vt` to stream output to console `output=all`.

**keep_env** [http_proxy, https_proxy, no_proxy] A list of env vars to preserve. May be passed as comma-delimited list.

**chroot_fallback** if the container is not running, try to run the command using chroot default: false

**CLI Example:**

```
salt myminion lxc.run_stderr mycontainer 'ip addr show'
```

salt.modules.lxc.run_stdout(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, path=None, ignore_retcode=False, chroot_fallback=False, keep_env='http_proxy,https_proxy,no_proxy')

New in version 2015.5.0.

Run `cmd.run_stdout` within a container

Warning: Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in stderr if the command being run does not exist. If no output is returned using this function, try using `lxc.run_stderr` or `lxc.run_all`.

**name** Name of the container in which to run the command

**cmd** Command to run

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

**no_start** [False] If the container is not running, don’t start it

**preserve_state** [True] After running the command, return the container to its previous state

**stdin** [None] Standard input to be used for the command

**output_loglevel** [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

**use_vt** [False] Use SaltStack’s `utils.vt` to stream output to console `output=all`.

**keep_env** [http_proxy, https_proxy, no_proxy] A list of env vars to preserve. May be passed as comma-delimited list.

**chroot_fallback** if the container is not running, try to run the command using chroot default: false

CLI Example:
slat myminion lxc.run_stdout mycontainer 'ifconfig -a'

salt.modules.lxc.running_systemd(name, cache=True, path=None)
    Determine if systemd is running
    path path to the container parent

    New in version 2015.8.0.

    CLI Example:
        salt '*' lxc.running_systemd ubuntu

salt.modules.lxc.search_lxc_bridge()
    Search the first bridge which is potentially available as LXC bridge

    CLI Example:
        salt '*' lxc.search_lxc_bridge

salt.modules.lxc.search_lxc_bridges()
    Search which bridges are potentially available as LXC bridges

    CLI Example:
        salt '*' lxc.search_lxc_bridges

salt.modules.lxc.set_dns(name, dnsservers=None, searchdomains=None, path=None)
    Changed in version 2015.5.0: The dnsservers and searchdomains parameters can now be passed as a comma-separated list.
    Update /etc/resolv.conf
    path
        path to the container parent default: /var/lib/lxc (system default)

        New in version 2015.8.0.

        CLI Example:
            salt myminion lxc.set_dns ubuntu "[8.8.8.8, 4.4.4.4]"

salt.modules.lxc.set_parameter(name, parameter, value, path=None)
    Set the value of a cgroup parameter for a container.
    path path to the container parent directory default: /var/lib/lxc (system)

    New in version 2015.8.0.

    CLI Example:
        salt '*' lxc.set_parameter name parameter value

salt.modules.lxc.set_password(name, users, password, encrypted=True, path=None)
    Changed in version 2015.5.0: Function renamed from set_pass to set_password. Additionally, this function now supports (and defaults to using) a password hash instead of a plaintext password.
    Set the password of one or more system users inside containers
    users Comma-separated list (or python list) of users to change password
    password Password to set for the specified user(s)
    encrypted [True] If true, password must be a password hash. Set to False to set a plaintext password (not recommended).

    New in version 2015.5.0.
path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

CLI Example:
```
salt '*' lxc.set_pass container-name root '$6$uJ2uAyLUSkO67t8As/→9fXt3OPchKGMnUpcoYnYcVRK6x93walmShTCQvJwq2 irreversible/b7KQSFnAo28/ek6716vEV1'
salt '*' lxc.set_pass container-name root foo encrypted=False
```

salt.modules.lxc.start(name, **kwargs)
Start the named container

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

lxc_config path to a lxc config file config file will be guessed from container name otherwise

New in version 2015.8.0.

use_vt run the command through VT

New in version 2015.8.0.

CLI Example:
```
salt myminion lxc.start name
```

salt.modules.lxc.state(name, path=None)
Returns the state of a container.

path path to the container parent directory (default: /var/lib/lxc)

New in version 2015.8.0.

CLI Example:
```
salt '*' lxc.state name
```

salt.modules.lxc.stop(name, kill=False, path=None, use_vt=None)
Stop the named container

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

kill: False Do not wait for the container to stop, kill all tasks in the container. Older LXC versions will stop containers like this irrespective of this argument.

Changed in version 2015.5.0: Default value changed to False

use_vt run the command through VT

New in version 2015.8.0.

CLI Example:
```
salt myminion lxc.stop name
```

salt.modules.lxc.systemd_running_state(name, path=None)
Get the operational state of a systemd based container

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:
```
salt lxc.systemd_running_state ubuntu
```

salt.modules.lxc.templates()
New in version 2015.5.0.
List the available LXC template scripts installed on the minion

CLI Examples:

```
salt myminion lxc.templates
```

```
salt.modules.lxc.test_bare_started_state(name, path=None)
```
Test if a non systemd container is fully started. For now, it consists only to test if the container is attachable.

```
path to the container parent default: /var/lib/lxc (system default)
```

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.test_bare_started_state ubuntu
```

```
salt.modules.lxc.test_sd_started_state(name, path=None)
```
Test if a systemd container is fully started.

```
path to the container parent default: /var/lib/lxc (system default)
```

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.test_sd_started_state ubuntu
```

```
salt.modules.lxc.unfreeze(name, path=None, use_vt=None)
```
Unfreeze the named container.

```
path to the container parent directory default: /var/lib/lxc (system)
```

New in version 2015.8.0.

```
use_vt run the command through VT
```

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.unfreeze name
```

```
salt.modules.lxc.update_lxc_conf(name, lxc_conf, lxc_conf_unset, path=None)
```
Edit LXC configuration options.

```
path to the container parent default: /var/lib/lxc (system default)
```

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.update_lxc_conf ubuntu \
  lxc_conf="[{'network.ipv4.ip':'10.0.3.5'}]" \
  lxc_conf_unset=['lxc.utsname']"
```

```
salt.modules.lxc.version()
```
Return the actual lxc client version.

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.version
```

```
salt.modules.lxc.wait_started(name, path=None, timeout=300)
```
Check that the system has fully initd.

This is actually very important for systemd based containers.
see https://github.com/saltstack/salt/issues/23847
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.
CLI Example:

```bash
salt myminion lxc.wait_started ubuntu
```

salt.modules.lxc.write_conf(conf_file, conf)
Write out an LXC configuration file

This is normally only used internally. The format of the data structure must match that which is returned from lxc.read_conf(), with out_format set to commented.

An example might look like:

```json
[
  {
    'lxc.utsname': '${CONTAINER_NAME}',
    '# This is a commented line
',
    '
',
    '{lxc.mount: '${CONTAINER_FSTAB}',
    '{lxc.rootfs: '{'comment': 'This is another test',
      'value': 'This is another test'}},
    '
',
    '{lxc.network.type: 'veth'},
    '{lxc.network.flags: 'up'},
    '{lxc.network.link: 'br0'},
    '{lxc.network.mac: '${CONTAINER_MACADDR}',
    '{lxc.network.ipv4: '${CONTAINER_IPADDR}',
    '{lxc.network.name: '${CONTAINER_DEVICENAME}',
  }
]
```

CLI Example:

```bash
salt 'minion' lxc.write_conf /etc/lxc/mycontainer.conf \
    out_format=commented
```

### 21.9.238 salt.modules.lxd

Module for managing the LXD daemon and its containers.

New in version 2019.2.0.

LXD(1) is a container "hypervisor". This execution module provides several functions to help manage it and its containers.

Note:
- pylxd(2) version >=2.2.5 is required to let this work, currently only available via pip.
  
  To install on Ubuntu:
  
  $ apt-get install libssl-dev python-pip $ pip install -U pylxd
- you need lxd installed on the minion for the init() and version() methods.
- for the config_get() and config_get() methods you need to have lxd-client installed.

maintainer René Jochum <rene@jochums.at>
maturity  new
depends  python-pyld

platform  Linux

salt.modules.lxd.authenticate(remote_addr, password, cert, key, verify_cert=True)
Authenticate with a remote LXDaemon.
  remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
    Examples: https://myserver.lan:8443
  password : The password of the remote.
  cert : PEM Formatted SSL Certificate.
    Examples: ~/config/lxc/client.crt
  key : PEM Formatted SSL Key.
    Examples: ~/config/lxc/client.key
  verify_cert  [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
  CLI Example:

  $ salt '*' lxd.authenticate https://srv01:8443 <yourpass> ~/.config/lxc/client.crt ~/.config/lxc/client.key false

  See the requests-docs for the SSL stuff.

salt.modules.lxd.config_get(key)
Get an LXD daemon config option
  key : The key of the config value to retrieve
  CLI Examples:

  salt '*' lxd.config_get core.https_address

salt.modules.lxd.config_set(key, value)
Set an LXD daemon config option
  CLI Examples:

  To listen on IPv4 and IPv6 port 8443, you can omit the :8443 its the default:

  salt '*' lxd.config_set core.https_address [::]:8443

  To set the server trust password:

  salt '*' lxd.config_set core.trust_password blah

salt.modules.lxd.container_config_delete(name, config_key, remote_addr=None, cert=None, key=None, verify_cert=True)
Delete a container config value
  name : Name of the container
  config_key : The config key to delete
  remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
    Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
  cert : PEM Formatted SSL Certificate.
    Examples: ~/.config/lxc/client.crt
  key : PEM Formatted SSL Key.
    Examples: ~/.config/lxc/client.key
**verify_cert**  [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

```python
salt.modules.lxd.container_config_get( name, config_key, remote_addr=None, cert=None, key=None, verify_cert=True )
```

Get a container config value

- **name**: Name of the container
- **config_key**: The config key to retrieve
- **remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  - **Examples**: https://myserver.lan:8443 /var/lib/mysocket.sock
- **cert**: PEM Formatted SSL Certificate.
  - **Examples**: ~/.config/lxc/client.crt
- **key**: PEM Formatted SSL Key.
  - **Examples**: ~/.config/lxc/client.key
- **verify_cert**  [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

```python
salt.modules.lxd.container_config_set( name, config_key, config_value, remote_addr=None, cert=None, key=None, verify_cert=True )
```

Set a container config value

- **name**: Name of the container
- **config_key**: The config key to set
- **config_value**: The config value to set
- **remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  - **Examples**: https://myserver.lan:8443 /var/lib/mysocket.sock
- **cert**: PEM Formatted SSL Certificate.
  - **Examples**: ~/.config/lxc/client.crt
- **key**: PEM Formatted SSL Key.
  - **Examples**: ~/.config/lxc/client.key
- **verify_cert**  [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

```python
salt.modules.lxd.container_create( name, source, profiles=None, config=None, devices=None, architecture='x86_64', ephemeral=False, wait=True, remote_addr=None, cert=None, key=None, verify_cert=True, _raw=False )
```

Create a container

- **name**: The name of the container
- **source**: Can be either a string containing an image alias: "xenial/amd64" or an dict with type "image" with alias:
  ```json
  {"type": "image", "alias": "xenial/amd64"}
  ```
  or image with "fingerprint":
  ```json
  {"type": "image", "fingerprint": "SHA-256"}
  ```
  or image with "properties":
  ```json
  {"type": "image",
   "properties": { "os": "ubuntu", "release": "14.04", "architecture": "x86_64"}}
  ```
  or none: {"type": "none"}
- **profiles**: List of profiles to apply on this container
config : A config dict or None (None = unset).
Can also be a list:

```python
['key': 'boot.autostart', 'value': 1], {'key': 'security.privileged', 'value': '1'}
```

devices : A device dict or None (None = unset).
architecture [x86_64]
Can be one of the following:

- unknown
- i686
- x86_64
- armv7l
- aarch64
- ppc
- ppc64
- ppc64le
- s390x

ephemeral [False] Destroy this container after stop?

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and
its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it
off as LXD normally uses self-signed certificates.

._raw [False] Return the raw pyxld object or a dict?

CLI Examples:

```bash
salt '*' lxd.container_create test xenial/amd64
```

See also the rest-api-docs.

salt.modules.lxd.container_delete(name, remote_addr=None, cert=None, key=None, verify_cert=True)

Delete a container

name : Name of the container to delete
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and
its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it
off as LXD normally uses self-signed certificates.

salt.modules.lxd.container_device_add(name, device_name, device_type='disk', remote_addr=None, cert=None, key=None, verify_cert=True, **kwargs)

Add a container device
name: Name of the container
device_name: The device name to add
device_type: Type of the device
**kwargs: Additional device args
remote_addr: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert: PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
dev_key: PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert: [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
salt.modules.lxd.container_device_delete(name, device_name, remote_addr=None, cert=None, key=None, verify_cert=True)

Delete a container device
name: Name of the container
device_name: The device name to delete
remote_addr: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert: PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
dev_key: PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert: [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
salt.modules.lxd.container_device_get(name, device_name, remote_addr=None, cert=None, key=None, verify_cert=True)

Get a container device
name: Name of the container
device_name: The device name to retrieve
remote_addr: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert: PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
dev_key: PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert: [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
salt.modules.lxd.container_execute(name, cmd, remote_addr=None, cert=None, key=None, verify_cert=True)

Execute a command list on a container.
name: Name of the container
cmd: Command to be executed (as a list)
Example: ['ls', '-l']
remote_addr: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert: PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
dev_key: PEM Formatted SSL Key.

21.9. execution modules
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:
```
salt '('* lxd.container_execute <container name> '['"ls", "-l"]'
```

**salt.modules.lxd.container_file_get**

Get a file from a container
```
name : Name of the container
src : The source file or directory
dst : The destination file or directory
mode : Set file mode to octal number
uid : Set file uid (owner)
gid : Set file gid (group)
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
```

**salt.modules.lxd.container_file_put**

Put a file into a container
```
name : Name of the container
src : The source file or directory
dst : The destination file or directory
recursive : Decent into src directory
overwrite : Replace destination if it exists
mode : Set file mode to octal number
uid : Set file uid (owner)
gid : Set file gid (group)
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
```

**salt.modules.lxd.container_freeze**

Freeze a container
```
salt '('* lxd.container_freeze <container name> remote_addr=None cert=None key=None verify_cert=True)
```

2140 Chapter 21. Salt Module Reference
name : Name of the container to freeze
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and
its a TCP Address!
  Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
  Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
  Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it
  off as LXD normally uses self-signed certificates.

salt.modules.lxd.container_get(name=None, remote_addr=None, cert=None, key=None, verify_cert=True, _raw=False)

Gets a container from the LXD
name : The name of the container to get.
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and
its a TCP Address!
  Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
  Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
  Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it
  off as LXD normally uses self-signed certificates.
_raw : Return the pylxd object, this is internal and by states in use.

salt.modules.lxd.container_list(list_names=False, remote_addr=None, cert=None, key=None, verify_cert=True)

Lists containers
list_names [False] Only return a list of names when True
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and
its a TCP Address!
  Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
  Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
  Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it
  off as LXD normally uses self-signed certificates.
CLI Examples:

```
salt '*' lxd.container_list
```

For a list of names:

```
salt '*' lxd.container_list true
```

See also container-attributes.

salt.modules.lxd.container_migrate(name, stop_and_start=False, remote_addr=None, cert=None, key=None, verify_cert=True, src_remote_addr=None, src_cert=None, src_key=None, src_verify_cert=None)

Migrate a container.
If the container is running, it either must be shut down first (use stop_and_start=True) or criu must be installed on the source and destination machines.

For this operation both certs need to be authenticated, use lxd.authenticate <salt.modules.lxd.authenticate to authenticate your cert(s).

**name**: Name of the container to migrate

**stop_and_start**: Stop the container on the source and start it on dest

**remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

  Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

**cert**: PEM Formatted SSL Certificate.

  Examples: ~/.config/lxc/client.crt

**key**: PEM Formatted SSL Key.

  Examples: ~/.config/lxc/client.key

**verify_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

**CLI Example:**

```bash
# Authorize
salt '*' lxd.authenticate https://srv01:8443 <yourpass> ~/.config/lxc/client.crt ~/.config/lxc/client.key false
salt '*' lxd.authenticate https://srv02:8443 <yourpass> ~/.config/lxc/client.crt ~/.config/lxc/client.key false

# Migrate phpmyadmin from srv01 to srv02
salt '*' lxd.container_migrate phpmyadmin stop_and_start=true remote_addr=https://srv02:8443 cert=~/.config/lxc/client.crt key=~/.config/lxc/client.key verify_cert=False src_remote_addr=https://srv01:8443
dir
```
Salt Documentation, Release 3001.1

off as LXD normally uses self-signed certificates.

salt.modules.lxd.container_start(name, remote_addr=None, cert=None, key=None, verify_cert=True)

Start a container

name : Name of the container to start

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

salt.modules.lxd.container_state(name=None, remote_addr=None, cert=None, key=None, verify_cert=True)

Get container state

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

salt.modules.lxd.container_stop(name, timeout=30, force=True, remote_addr=None, cert=None, key=None, verify_cert=True)

Stop a container

name : Name of the container to stop

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

salt.modules.lxd.container_unfreeze(name, remote_addr=None, cert=None, key=None, verify_cert=True)

Unfreeze a container

name : Name of the container to unfreeze

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
salt.modules.lxd.image_alias_add(image, alias, description='', remote_addr=None, cert=None, key=None, verify_cert=True)

Create an alias on the given image
image : An image alias, a fingerprint or a image object
alias : The alias to add
description : Description of the alias
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
CLI Examples:

```bash
$ salt '*' lxd.image_alias_add xenial/amd64 x "Short version of xenial/amd64"
```

salt.modules.lxd.image_alias_delete(image, alias, remote_addr=None, cert=None, key=None, verify_cert=True)

Delete an alias (this is currently not restricted to the image)
image : An image alias, a fingerprint or a image object
alias : The alias to delete
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
CLI Examples:

```bash
$ salt '*' lxd.image_alias_add xenial/amd64 x "Short version of xenial/amd64"
```

salt.modules.lxd.image_copy_lxd(source, src_remote_addr, src_cert, src_key, src_verify_cert, remote_addr, cert, key, verify_cert=True, aliases=None, public=None, auto_update=None, _raw=False)

Copy an image from another LXD instance
source : An alias or a fingerprint of the source.
src_remote_addr : An URL to the source remote daemon
Examples: https://mysourceserver.lan:8443
src_cert : PEM Formatted SSL Certificate for the source
Examples: ~/.config/lxc/client.crt
src_key : PEM Formatted SSL Key for the source
Examples: ~/.config/lxc/client.key
src_verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
remote_addr : Address of the destination daemon
Examples: https://mydestserver.lan:8443
cert : PEM Formatted SSL Certificate for the destination
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key for the destination
Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

aliases [[]] List of aliases to append to the copied image

public [None] Make this image public available, None = copy source

auto_update [None] Wherever to auto-update from the original source, None = copy source

_raw [False] Return the raw pylxd object or a dict of the destination image?

CLI Examples:

```
$ salt '*' lxd.image_copy_lxd xenial/amd64 https://srv01:8443 ~/.config/lxc/
     → client.crt ~/.config/lxc/client.key false https://srv02:8443 ~/.config/lxc/
     → client.crt ~/.config/lxc/client.key false aliases='["xenial/amd64"]'
```

```
salt.modules.lxd.image_delete(image, remote_addr=None, cert=None, key=None, verify_cert=True)

Delete an image by an alias or fingerprint

name : The alias or fingerprint of the image to delete, can be a obj for the states.

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Examples:

..code-block:: bash

   $ salt '*' lxd.image_delete xenial/amd64
```

```
salt.modules.lxd.image_from_file(filename, remote_addr=None, cert=None, key=None, verify_cert=True, aliases=None, public=False, saltenv='base', _raw=False)

Create an image from a file

filename : The filename of the rootfs

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

aliases [[]] List of aliases to append to the copied image

public [False] Make this image public available

saltenv [base] The saltenv to use for salt:// copies

_raw [False] Return the raw pylxd object or a dict of the image?

CLI Examples:

..code-block:: bash

   $ salt '*' lxd.image_from_file salt://lxd/files/busybox.tar.xz aliases=['"busybox-amd64"]
```

```
salt.modules.lxd.image_from_simplestreams(server, alias, remote_addr=None, cert=None, key=None, verify_cert=True, aliases=None, public=False, auto_update=False, _raw=False)

```

21.9. execution modules
Create an image from simplestreams

server : Simplestreams server URI
alias : The alias of the image to retrieve
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and it's a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
aliases [[]] List of aliases to append to the copied image
public [False] Make this image public available
auto_update [False] Should LXD auto update that image?
_raw [False] Return the raw pylxd object or a dict of the image?

CLI Examples:

.. code-block:: bash
   $ salt '*' lxd.image_from_simplestreams "https://cloud-images.ubuntu.com/releases"
   "trusty/amd64" aliases='["t", "trusty/amd64"]' auto_update=True

salt.modules.lxd.image_from_url(url, remote_addr=None, cert=None, key=None, verify_cert=True, aliases=None, public=False, auto_update=False, _raw=False)

Create an image from an url

url : The URL from where to download the image
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and it's a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
aliases [[]] List of aliases to append to the copied image
public [False] Make this image public available
auto_update [False] Should LXD auto update that image?
_raw [False] Return the raw pylxd object or a dict of the image?

CLI Examples:

.. code-block:: bash
   $ salt '*' lxd.image_from_url https://dl.stgraber.org/lxd aliases='["busybox-amd64"]'

salt.modules.lxd.image_get(fingerprint, remote_addr=None, cert=None, key=None, verify_cert=True, _raw=False)

Get an image by its fingerprint

fingerprint : The fingerprint of the image to retrieve
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and it's a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it
off as LXD normally uses self-signed certificates.

```bash
$ salt '*' lxd.image_get <fingerprint>
```

`salt.modules.lxd.image_get_by_alias` *(alias, remote_addr=None, cert=None, key=None, verify_cert=True, _raw=False)*

Get an image by an alias

- **alias**: The alias of the image to retrieve
- **remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  - **Examples**: `https://myserver.lan:8443` `/var/lib/mysocket.sock`
- **cert**: PEM Formatted SSL Certificate.
  - **Examples**: `~/.config/lxc/client.crt`
- **key**: PEM Formatted SSL Key.
  - **Examples**: `~/.config/lxc/client.key`
- **verify_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
- **_raw** [False] Return the raw pylxd object or a dict of it?

CLI Examples:

```bash
$ salt '*' lxd.image_get_by_alias xenial/amd64
```

`salt.modules.lxd.image_list` *(list_aliases=False, remote_addr=None, cert=None, key=None, verify_cert=True)*

Lists all images from the LXD.

- **list_aliases**: Return a dict with the fingerprint as key and a list of aliases as value instead.
- **remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  - **Examples**: `https://myserver.lan:8443` `/var/lib/mysocket.sock`
- **cert**: PEM Formatted SSL Certificate.
  - **Examples**: `~/.config/lxc/client.crt`
- **key**: PEM Formatted SSL Key.
  - **Examples**: `~/.config/lxc/client.key`
- **verify_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Examples:

```bash
$ salt '*' lxd.image_list true --out=json
$ salt '*' lxd.image_list --out=json
```

`salt.modules.lxd.init` *(storage_backend='dir', trust_password=None, network_address=None, network_port=None, storage_create_device=None, storage_create_loop=None, storage_pool=None)*

Calls lxd init --auto -- opts

- **storage_backend**: Storage backend to use (zfs or dir, default: dir)
- **trust_password**: Password required to add new clients
- **network_address**: [None] Address to bind LXD to (default: none)
- **network_port**: [None] Port to bind LXD to (Default: 8443)
- **storage_create_device**: [None] Setup device based storage using this DEVICE
- **storage_create_loop**: [None] Setup loop based storage with this SIZE in GB
storage_pool  [None] Storage pool to use or create
CLI Examples:

To listen on all IPv4/IPv6 Addresses:

```
salt '*' lxd.init dir PaSsW0rD [:]
```

To not listen on Network:

```
salt '*' lxd.init
```

```
salt.modules.lxd.normalize_input_values(config, devices)
```

normalize config input so returns can be put into mongodb, which doesn't like .

This is not meant to be used on the commandline.

CLI Examples:

```
salt '*' lxd.normalize_input_values config={} devices={}
```

```
salt.modules.lxd.profile_config_delete(name, config_key, remote_addr=None, cert=None, key=None, verify_cert=True)
```

Delete a profile config item.

name : The name of the profile to delete the config item.
config_key : The config key for the value to retrieve.
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```
$ salt '*' lxd.profile_config_delete autostart boot.autostart.delay
```

```
salt.modules.lxd.profile_config_get(name, config_key, remote_addr=None, cert=None, key=None, verify_cert=True)
```

Get a profile config item.

name : The name of the profile to get the config item from.
config_key : The key for the item to retrieve.
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```
$ salt '*' lxd.profile_config_get autostart boot.autostart
```
salt.modules.lxd.profile_config_set(name, config_key, config_value, remote_addr=None, cert=None, key=None, verify_cert=True)

Set a profile config item.

- **name**: The name of the profile to set the config item to.
- **config_key**: The items key.
- **config_value**: Its items value.
- **remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  - **Examples**: https://myserver.lan:8443 /var/lib/mysocket.sock
- **cert**: PEM Formatted SSL Certificate.
  - **Examples**: ~/.config/lxc/client.crt
- **key**: PEM Formatted SSL Key.
  - **Examples**: ~/.config/lxc/client.key
- **verify_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```
$ salt '*' lxd.profile_config_set autostart boot.autostart 0
```

salt.modules.lxd.profile_create(name, config=None, devices=None, description=None, remote_addr=None, cert=None, key=None, verify_cert=True)

Creates a profile.

- **name**: The name of the profile to get.
- **config**: A config dict or None (None = unset).
  - Can also be a list:
    ```python
    [{'key': 'boot.autostart', 'value': 1}, {'key': 'security.privileged', 'value': '1'}]
    ```
- **devices**: A device dict or None (None = unset).
- **description**: A description string or None (None = unset).
- **remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  - **Examples**: https://myserver.lan:8443 /var/lib/mysocket.sock
- **cert**: PEM Formatted SSL Certificate.
  - **Examples**: ~/.config/lxc/client.crt
- **key**: PEM Formatted SSL Key.
  - **Examples**: ~/.config/lxc/client.key
- **verify_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Examples:

```
$ salt '*' lxd.profile_create autostart config="{boot.autostart: 1, boot.
  →autostart.delay: 2, boot.autostart.priority: 1}".
$ salt '*' lxd.profile_create shared_mounts devices="{shared_mount: {type: 'disk',
  → source: '/home/shared', path: '/home/shared'}}"
```

See the lxd-docs for the details about the config and devices dicts.

salt.modules.lxd.profile_delete(name, remote_addr=None, cert=None, key=None, verify_cert=True)

Deletes a profile.

- **name**: The name of the profile to delete.
- **remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  - **Examples**: https://myserver.lan:8443 /var/lib/mysocket.sock
- **cert**: PEM Formatted SSL Certificate.
  - **Examples**: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
CLI Example:

```
$ salt '*' lxd.profile_delete shared_mounts
```

salt.modules.lxd.profile_device_delete(name, device_name, remote_addr=None, cert=None, key=None, verify_cert=True)
Delete a profile device.
name : The name of the profile to delete the device.
device_name : The name of the device to delete.
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
CLI Example:

```
$ salt '*' lxd.profile_device_delete autostart eth1
```

salt.modules.lxd.profile_device_get(name, device_name, remote_addr=None, cert=None, key=None, verify_cert=True)
Get a profile device.
name : The name of the profile to get the device from.
device_name : The name of the device to retrieve.
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
CLI Example:

```
$ salt '*' lxd.profile_device_get default eth0
```

salt.modules.lxd.profile_device_set(name, device_name, device_type='disk', remote_addr=None, cert=None, key=None, verify_cert=True, **kwargs)
Set a profile device.
name : The name of the profile to set the device to.
device_name : The name of the device to set.
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
  Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```bash
$ salt '*' lxd.profile_device_set autostart eth1 nic nictype=bridged parent=lxdbr0
```

salt.modules.lxd.profile_get(name, remote_addr=None, cert=None, key=None, verify_cert=True, _raw=False)

Gets a profile from the LXD

name : The name of the profile to get.

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
  Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
  Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

_CLI Examples:

```bash
$ salt '*' lxd.profile_get autostart
```

salt.modules.lxd.profile_list(list_names=False, remote_addr=None, cert=None, key=None, verify_cert=True)

Lists all profiles from the LXD.

list_names : Return a list of names instead of full blown dicts.

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
  Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
  Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

_CLI Examples:

```bash
salt '*' lxd.profile_list true --out=json
salt '*' lxd.profile_list --out=json
```

salt.modules.lxd.pylxd_client_get(remote_addr=None, cert=None, key=None, verify_cert=True)

Get an pylxd client, this is not meant to be run over the CLI.

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
  Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
  Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

See the requests-docs for the SSL stuff.

salt.modules.lxd.pylxd_save_object(obj)

Saves an object (profile/image/container) and translate its execpetion on failure

obj: The object to save

This is an internal method, no CLI Example.

salt.modules.lxd.pylxd_version()

Returns the actual pylxd version.

CLI Example:

```
salt '*' lxd.pylxd_version
```

salt.modules.lxd.snapshots_all(container, remote_addr=None, cert=None, key=None, verify_cert=True)

Get all snapshots for a container

container: The name of the container to get.

remote_addr: An URL to a remote server. The 'cert' and 'key' fields must also be provided if 'remote_addr' is defined.

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert: PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key: PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Verify the ssl certificate. Default: True

CLI Examples:

```
$ salt '*' lxd.snapshots_all test-container
```

salt.modules.lxd.snapshots_create(container, name=None, remote_addr=None, cert=None, key=None, verify_cert=True)

Create a snapshot for a container

container: The name of the container to get.

name: The name of the snapshot.

remote_addr: An URL to a remote server. The 'cert' and 'key' fields must also be provided if 'remote_addr' is defined.

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert: PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key: PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Verify the ssl certificate. Default: True

CLI Examples:

```
$ salt '*' lxd.snapshots_create test-container test-snapshot
```

salt.modules.lxd.snapshots_delete(container, name, remote_addr=None, cert=None, key=None, verify_cert=True)

Delete a snapshot for a container

container: The name of the container to get.

name: The name of the snapshot.

remote_addr: An URL to a remote server. The 'cert' and 'key' fields must also be provided if 'remote_addr' is defined.

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert: PEM Formatted SSL Certificate.
   Examples: ~/.config/lxc/client.crt
key: PEM Formatted SSL Key.
   Examples: ~/.config/lxc/client.key
verify_cert [True] Verify the ssl certificate. Default: True
CLI Examples:

```
salt '*' lxd.snapshots_delete test-container test-snapshot
```

salt.modules.lxd.snapshots_get(container, name, remote_addr=None, cert=None, key=None, verify_cert=True)

Get information about snapshot for a container

container: The name of the container to get.
name: The name of the snapshot.
remote_addr: An URL to a remote server. The 'cert' and 'key' fields must also be provided if 'remote_addr' is defined.
   Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert: PEM Formatted SSL Certificate.
   Examples: ~/.config/lxc/client.crt
key: PEM Formatted SSL Key.
   Examples: ~/.config/lxc/client.key
verify_cert [True] Verify the ssl certificate. Default: True
CLI Examples:

```
salt '*' lxd.snapshots_get test-container test-snapshot
```

salt.modules.lxd.sync_config_devices(obj, newconfig, newdevices, test=False)

Syncs the given config and devices with the object (a profile or a container) returns a changes dict with all changes made.

obj: The object to sync with / or just test with.
newconfig: The new config to check with the obj.
newdevices: The new devices to check with the obj.
test: Wherever to not change anything and give "Would change" message.

salt.modules.lxd.version()

Returns the actual lxd version.

CLI Example:

```
salt '*' lxd.version
```

21.9.239 salt.modules.mac_assistive module

This module allows you to manage assistive access on macOS minions with 10.9+

New in version 2016.3.0.

```
salt '*' assistive.install /usr/bin/osascript
```

salt.modules.mac_assistive.enable(app_id, enabled=True)

Enable or disable an existing assistive access application.

app_id The bundle ID or command to set assistive access status.
enabled Sets enabled or disabled status. Default is True.

CLI Example:
salt '*' assistive.enable /usr/bin/osascript
salt '*' assistive.enable com.smileonmymac.textexpander enabled=False

```python
salt.modules.mac_assistive.enabled(app_id)

Check if a bundle ID or command is listed in assistive access and enabled.

app_id  The bundle ID or command to retrieve assistive access status.

CLI Example:

salt '*' assistive.enabled /usr/bin/osascript
salt '*' assistive.enabled com.smileonmymac.textexpander
```

```python
salt.modules.mac_assistive.install(app_id, enable=True)

Install a bundle ID or command as being allowed to use assistive access.

app_id  The bundle ID or command to install for assistive access.

enabled  Sets enabled or disabled status. Default is True.

CLI Example:

salt '*' assistive.install /usr/bin/osascript
salt '*' assistive.install com.smileonmymac.textexpander
```

```python
salt.modules.mac_assistive.installed(app_id)

Check if a bundle ID or command is listed in assistive access. This will not check to see if it's enabled.

app_id  The bundle ID or command to check installed status.

CLI Example:

salt '*' assistive.installed /usr/bin/osascript
salt '*' assistive.installed com.smileonmymac.textexpander
```

```python
salt.modules.mac_assistive.remove(app_id)

Remove a bundle ID or command as being allowed to use assistive access.

app_id  The bundle ID or command to remove from assistive access list.

CLI Example:

salt '*' assistive.remove /usr/bin/osascript
salt '*' assistive.remove com.smileonmymac.textexpander
```

### 21.9.240 salt.modules.mac_brew_pkg

Homebrew for macOS

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see [here](#).

```python
salt.modules.mac_brew_pkg.available_version(*names, **kwargs)

This function is an alias of latest_version.

Return the latest version of the named package available for upgrade or installation

Currently chooses stable versions, falling back to devel if that does not exist.

CLI Example:

salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```
salt.modules.mac_brew_pkg.\texttt{hold}(name=None, pkgs=None, sources=None, **kwargs)

Set package in 'hold' state, meaning it will not be upgraded.

New in version 3001.

\begin{description}
\item [name] The name of the package, e.g., `tmux`
\end{description}

\begin{Verbatim}
\texttt{salt '*'} pkg.hold <package name>
\end{Verbatim}

\begin{description}
\item [pkgs] A list of packages to hold. Must be passed as a python list.
\end{description}

\begin{Verbatim}
\texttt{salt '*'} pkg.hold pkgs=['foo', 'bar']
\end{Verbatim}

salt.modules.mac_brew_pkg.\texttt{info\_installed}(*names, **kwargs)

Return the information of the named package(s) installed on the system.

New in version 2016.3.1.

\begin{description}
\item [names] The names of the packages for which to return information.
\end{description}

\begin{Verbatim}
\texttt{salt '*'} pkg.info\_installed <package1>
\texttt{salt '*'} pkg.info\_installed <package1> <package2> <package3> ...
\end{Verbatim}

salt.modules.mac_brew_pkg.\texttt{install}(name=None, pkgs=None, taps=None, options=None, **kwargs)

Install the passed package(s) with \texttt{brew install}

\begin{description}
\item [name] The name of the formula to be installed. Note that this parameter is ignored if "pkgs" is passed.
\end{description}

\begin{Verbatim}
\texttt{salt '*'} pkg.install <package name>
\end{Verbatim}

\begin{description}
\item [taps] Unofficial GitHub repos to use when updating and installing formulas.
\end{description}

\begin{Verbatim}
\texttt{salt '*'} pkg.install <package name> tap='<tap>'
\texttt{salt '*'} pkg.install zlib taps='homebrew/dupes'
\texttt{salt '*'} pkg.install php54 taps='["josegonzalez/php", "homebrew/dupes"]'
\end{Verbatim}

\begin{description}
\item [options] Options to pass to \texttt{brew}. Only applies to initial install. Due to how \texttt{brew} works, modifying chosen options requires a full uninstall followed by a fresh install. Note that if "pkgs" is used, all options will be passed to all packages. Unrecognized options for a package will be silently ignored by \texttt{brew}.
\end{description}

\begin{Verbatim}
\texttt{salt '*'} pkg.install <package name> tap='<tap>'
\texttt{salt '*'} pkg.install php54 taps='["josegonzalez/php", "homebrew/dupes"]'
\texttt{←options='["--with-fpm"]'}
\end{Verbatim}

Multiple Package Installation Options:

\begin{description}
\item [pkgs] A list of formulas to install. Must be passed as a python list.
\end{description}

\begin{Verbatim}
\texttt{salt '*'} pkg.install pkgs=['foo','bar']
\end{Verbatim}

Returns a dict containing the new package names and versions:
{'<package>': {'old': '<old-version>',
    'new': '<new-version>'}}

CLI Example:
salt '*' pkg.install 'package package package'

salt.modules.mac_brew_pkg.latest_version(*names, **kwargs)
Return the latest version of the named package available for upgrade or installation
Currently chooses stable versions, falling back to devel if that does not exist.

CLI Example:
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>

salt.modules.mac_brew_pkg.list_pkgs(versions_as_list=False, **kwargs)
List the packages currently installed in a dict:

[{'<package_name>': '<version>'}]

CLI Example:
salt '*' pkg.list_pkgs

salt.modules.mac_brew_pkg.list_upgrades(refresh=True, **kwargs)
Check whether or not an upgrade is available for all packages

CLI Example:
salt '*' pkg.list_upgrades

salt.modules.mac_brew_pkg.pin(name=None, pkgs=None, sources=None, **kwargs)
Set package in 'hold' state, meaning it will not be upgraded.

New in version 3001.
name The name of the package, e.g., 'tmux'

CLI Example:
salt '*' pkg.hold <package name>

pkgs A list of packages to hold. Must be passed as a python list.

CLI Example:
salt '*' pkg.hold pkgs='["foo", "bar"]'

salt.modules.mac_brew_pkg.refresh_db(**kwargs)
Update the homebrew package repository.

CLI Example:
salt '*' pkg.refresh_db

salt.modules.mac_brew_pkg.remove(name=None, pkgs=None, **kwargs)
Removes packages with brew uninstall.
name The name of the package to be deleted.

Multiple Package Options:
**pkg** A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.
New in version 0.16.0.
Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

**salt.modules.mac_brew_pkg.unhold** *(name=None, pkgs=None, sources=None, **kwargs)*
Set package current in 'hold' state to install state, meaning it will be upgraded.
New in version 3001.

name
The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.unhold <package name>
```

**pkgs** A list of packages to unhold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.unhold pkgs='["foo", "bar"]'
```

**salt.modules.mac_brew_pkg.unpin** *(name=None, pkgs=None, sources=None, **kwargs)*
Set package current in 'hold' state to install state, meaning it will be upgraded.
New in version 3001.

name
The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.unhold <package name>
```

**pkgs** A list of packages to unhold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.unhold pkgs='["foo", "bar"]'
```

**salt.modules.mac_brew_pkg.upgrade** *(refresh=True, **kwargs)*
Upgrade outdated, unpinned brews.

refresh Fetch the newest version of Homebrew and all formulae from GitHub before installing.
Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

**salt.modules.mac_brew_pkg.upgrade_available** *(pkg, **kwargs)*
Check whether or not an upgrade is available for a given package

CLI Example:
salt '*' pkg.upgrade_available <package name>

salt.modules.mac_brew_pkg.version(*names, **kwargs)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3>

21.9.241 salt.modules.mac_desktop module

macOS implementations of various commands in the "desktop" interface

salt.modules.mac_desktop.get_output_volume()

Get the output volume (range 0 to 100)

CLI Example:

salt '*' desktop.get_output_volume

salt.modules.mac_desktop.lock()

Lock the desktop session

CLI Example:

salt '*' desktop.lock

salt.modules.mac_desktop.say(*words)

Say some words.

words The words to execute the say command with.

CLI Example:

salt '*' desktop.say <word0> <word1> ... <wordN>

salt.modules.mac_desktop.screensaver()

Launch the screensaver.

CLI Example:

salt '*' desktop.screensaver

salt.modules.mac_desktop.set_output_volume(volume)

Set the volume of sound.

volume The level of volume. Can range from 0 to 100.

CLI Example:

salt '*' desktop.set_output_volume <volume>
21.9.242 salt.modules.mac_group

Manage groups on Mac OS 10.7+

salt.modules.mac_group.add(name, gid=None, **kwargs)
Add the specified group

CLI Example:
```
salt '*' group.add foo 3456
```

salt.modules.mac_group.adduser(group, name)
Add a user in the group.

CLI Example:
```
salt '*' group.adduser foo bar
```

Verifies if a valid username 'bar' as a member of an existing group 'foo', if not then adds it.

salt.modules.mac_group.chgid(name, gid)
Change the gid for a named group

CLI Example:
```
salt '*' group.chgid foo 4376
```

salt.modules.mac_group.delete(name)
Remove the named group

CLI Example:
```
salt '*' group.delete foo
```

salt.modules.mac_group.deluser(group, name)
Remove a user from the group
New in version 2016.3.0.

CLI Example:
```
salt '*' group.deluser foo bar
```

Removes a member user 'bar' from a group 'foo'. If group is not present then returns True.

salt.modules.mac_group.getent(refresh=False)
Return info on all groups

CLI Example:
```
salt '*' group.getent
```

salt.modules.mac_group.info(name)
Return information about a group

CLI Example:
```
salt '*' group.info foo
```

salt.modules.mac_group.members(name, members_list)
Replaces members of the group with a provided list.
New in version 2016.3.0.

CLI Example:
```
salt '*' group.members foo 'user1,user2,user3....'
```
Replaces a membership list for a local group 'foo'.

**21.9.243 salt.modules.mac_keychain module**

Install certificates into the keychain on Mac OS

New in version 2016.3.0.

```
salt.modules.mac_keychain.get_default_keychain(user=None, domain='user')
```
Get the default keychain
- **user** The user to check the default keychain of
- **domain** The domain to use valid values are user|system|common|dynamic, the default is user

CLI Example:
```
salt '*' keychain.get_default_keychain
```

```
salt.modules.mac_keychain.get_friendly_name(cert, password)
```
Get the friendly name of the given certificate
- **cert** The certificate to install
- **password** The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section

Note: The password given here will show up as plaintext in the returned job info.

CLI Example:
```
salt '*' keychain.get_friendly_name /tmp/test.p12 test123
```

```
salt.modules.mac_keychain.get_hash(name, password=None)
```
Returns the hash of a certificate in the keychain.
- **name** The name of the certificate (which you can get from keychain.get_friendly_name) or the location of a p12 file.
- **password** The password that is used in the certificate. Only required if your passing a p12 file. Note: This will be outputted to logs

CLI Example:
```
salt '*' keychain.get_hash /tmp/test.p12 test123
```

```
salt.modules.mac_keychain.install(cert, password, keychain='/Library/Keychains/System.keychain', allow_any=False, keychain_password=None)
```
Install a certificate
- **cert** The certificate to install
- **password** The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section.

Note: The password given here will show up as plaintext in the job returned info.
- **keychain** The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain
- **allow_any** Allow any application to access the imported certificate without warning
- **keychain_password** If your keychain is likely to be locked pass the password and it will be unlocked before running the import

Note: The password given here will show up as plaintext in the returned job info.

CLI Example:
salt.keychain.install test.p12 test123

salt.modules.mac_keychain.list_certs(keychain="/Library/Keychains/System.keychain")
List all of the installed certificates
keychain The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain
CLI Example:
salt '*' keychain.list_certs

salt.modules.mac_keychain.set_default_keychain(keychain, domain='user', user=None)
Set the default keychain
keychain The location of the keychain to set as default
domain The domain to use valid values are user|system|common|dynamic, the default is user
user The user to set the default keychain as
CLI Example:
salt '*' keychain.set_keychain /Users/fred/Library/Keychains/login.keychain

salt.modules.mac_keychain.uninstall(cert_name, keychain="/Library/Keychains/System.keychain", keychain_password=None)
Uninstall a certificate from a keychain
cert_name The name of the certificate to remove
keychain The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain
keychain_password If your keychain is likely to be locked pass the password and it will be unlocked before running the import
Note: The password given here will show up as plaintext in the returned job info.
CLI Example:
salt '*' keychain.install test.p12 test123

salt.modules.mac_keychain.unlock_keychain(keychain, password)
Unlock the given keychain with the password
keychain The keychain to unlock
password The password to use to unlock the keychain.
Note: The password given here will show up as plaintext in the returned job info.
CLI Example:
salt '*' keychain.unlock_keychain /tmp/test.p12 test123

21.9.244 salt.modules.mac_pkgutil module

Installer support for macOS.
Installer is the native .pkg/.mpkg package manager for macOS.
salt.modules.mac_pkgutil.forget(package_id)
New in version 2016.3.0.
Remove the receipt data about the specified package. Does not remove files.

**Warning:** DO NOT use this command to fix broken package design

Parameters **package_id**(str) -- The name of the package to forget
Returns True if successful, otherwise False
Return type bool

CLI Example:
```
salt '*' pkgutil.forget com.apple.pkg.gcc4.2Leo
```

salt.modules.mac_pkgutil.install(source, package_id)
Install a .pkg from an URI or an absolute path.

Parameters
- **source** *(str)* -- The path to a package.
- **package_id** *(str)* -- The package ID

Returns True if successful, otherwise False
Return type bool

CLI Example:
```
salt '*' pkgutil.install source=/vagrant/build_essentials.pkg package_id=com.apple.pkg.gcc4.2Leo
```

salt.modules.mac_pkgutil.is_installed(package_id)
Returns whether a given package id is installed.

Returns True if installed, otherwise False
Return type bool

CLI Example:
```
salt '*' pkgutil.is_installed com.apple.pkg.gcc4.2Leo
```

salt.modules.mac_pkgutil.list()
List the installed packages.

Returns A list of installed packages
Return type list

CLI Example:
```
salt '*' pkgutil.list
```

### 21.9.245 `salt.modules.mac_portspkg`

Support for MacPorts under macOS.

This module has some caveats.

1. Updating the database of available ports is quite resource-intensive. However, `refresh=True` is the default for all operations that need an up-to-date copy of available ports. Consider `refresh=False` when you are sure no db update is needed.

2. In some cases MacPorts doesn't always realize when another copy of itself is running and will gleefully tromp all over the available ports database. This makes MacPorts behave in undefined ways until a fresh complete copy is retrieved.

Because of 1 and 2 it is possible to get the salt-minion into a state where `salt mac-machine pkg./something/` won't want to return. Use
```
salt-run jobs.active
```
on the master to check for potentially long-running calls to `port`. 

Finally, ports database updates are always handled with `port selfupdate` as opposed to `port sync`. This makes sense in the MacPorts user community but may confuse experienced Linux admins as Linux package managers don’t upgrade the packaging software when doing a package database update. In other words, `salt mac-machine pkg.refresh_db` is more like `apt-get update; apt-get upgrade dpkg apt-get` than simply `apt-get update`.

```
salt.modules.mac_portspkg.available_version(*names, **kwargs)
```
This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation

Options:
- refresh Update ports with `port selfupdate`

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

```
salt.modules.mac_portspkg.install(name=None, refresh=False, pkgs=None, **kwargs)
```
Install the passed package(s) with `port install`

- name The name of the formula to be installed. Note that this parameter is ignored if "pkgs" is passed.

CLI Example:

```
salt '*' pkg.install <package name>
```

- version Specify a version to pkg to install. Ignored if pkgs is specified.

CLI Example:

```
salt '*' pkg.install <package name>
salt '*' pkg.install git-core version='1.8.5.5'
```

- variant Specify a variant to pkg to install. Ignored if pkgs is specified.

CLI Example:

```
salt '*' pkg.install <package name>
salt '*' pkg.install git-core version='1.8.5.5' variant='+credential_osxkeychain+doc+pcre'
```

Multiple Package Installation Options:
- pkgs A list of formulas to install. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo","bar"]'
salt '*' pkg.install pkgs='["foo@1.2","bar"]'
salt '*' pkg.install pkgs='["foo@1.2+ssl","bar@2.3"]'
```

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install 'package package package'
```

```
salt.modules.mac_portspkg.latest_version(*names, **kwargs)
```
Return the latest version of the named package available for upgrade or installation

Options:
- refresh Update ports with `port selfupdate`
**CLI Example:**

```python
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

```python
salt.modules.mac_portspkg.list_pkgs(versions_as_list=False, **kwargs)
```

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

**CLI Example:**

```python
salt '*' pkg.list_pkgs
```

**salt.modules.mac_portspkg.list_upgrades(refresh=True, **kwargs)**

Check whether or not an upgrade is available for all packages

Options:
- `refresh` Update ports with `port selfupdate`

**CLI Example:**

```python
salt '*' pkg.list_upgrades
```

**salt.modules.mac_portspkg.refresh_db(**kwargs)**

Update ports with `port selfupdate`

**CLI Example:**

```python
salt mac pkg.refresh_db
```

**salt.modules.mac_portspkg.remove(name=None, pkgs=None, **kwargs)**

Removes packages with `port uninstall`

- `name` The name of the package to be deleted.

Multiple Package Options:
- `pkgs` A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

**CLI Example:**

```python
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

**salt.modules.mac_portspkg.upgrade(refresh=True, **kwargs)**

Run a full upgrade using MacPorts 'port upgrade outdated'

Options:
- `refresh` Update ports with `port selfupdate`

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

**CLI Example:**
salt '*' pkg.upgrade

salt.modules.mac_portspkg.upgrade_available(pkg, refresh=True, **kwargs)
Check whether or not an upgrade is available for a given package

CLI Example:
salt '*' pkg.upgrade_available <package name>

salt.modules.mac_portspkg.version(*names, **kwargs)
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3>

### 21.9.246 Salt Modules

#### salt.modules.mac_power Module

Module for editing power settings on macOS

New in version 2016.3.0.

salt.modules.mac_power.get_computer_sleep()  
Display the amount of idle time until the computer sleeps.  
Returns A string representing the sleep settings for the computer  
Return type str  
CLI Example:  
.. code-block:: bash  
salt '*' power.get_computer_sleep  

salt.modules.mac_power.get_display_sleep()  
Display the amount of idle time until the display sleeps.  
Returns A string representing the sleep settings for the display  
Return type str  
CLI Example:  
.. code-block:: bash  
salt '*' power.get_display_sleep  

salt.modules.mac_power.get_harddisk_sleep()  
Display the amount of idle time until the hard disk sleeps.  
Returns A string representing the sleep settings for the hard disk  
Return type str  
CLI Example:  
.. code-block:: bash  
salt '*' power.get_harddisk_sleep  

salt.modules.mac_power.get_restart_freeze()  
Displays whether 'restart on freeze' is on or off if supported  
Returns A string value representing the "restart on freeze" settings  
Return type string  
CLI Example:
salt '*' power.get_restart_freeze

salt.modules.mac_power.get_restart_power_failure()

Displays whether 'restart on power failure' is on or off if supported

Returns A string value representing the "restart on power failure" settings

Return type string

CLI Example:
salt '*' power.get_restart_power_failure

salt.modules.mac_power.get_sleep()

Displays the amount of idle time until the machine sleeps. Settings for Computer, Display, and Hard Disk are displayed.

Returns A dictionary containing the sleep status for Computer, Display, and Hard Disk

Return type dict

CLI Example:
salt '*' power.get_sleep

salt.modules.mac_power.get_sleep_on_power_button()

Displays whether 'allow power button to sleep computer' is on or off if supported

Returns A string value representing the "allow power button to sleep computer" settings

Return type string

CLI Example:
salt '*' power.get_sleep_on_power_button

salt.modules.mac_power.get_wake_on_modem()

Displays whether 'wake on modem' is on or off if supported

Returns A string value representing the "wake on modem" settings

Return type str

CLI Example:
salt '*' power.get_wake_on_modem

salt.modules.mac_power.get_wake_on_network()

Displays whether 'wake on network' is on or off if supported

Returns A string value representing the "wake on network" settings

Return type string

CLI Example:
salt '*' power.get_wake_on_network

salt.modules.mac_power.set_computer_sleep(minutes)

Set the amount of idle time until the computer sleeps. Pass "Never" of "Off" to never sleep.

Parameters minutes -- Can be an integer between 1 and 180 or "Never" or "Off"

Ptype int, str

Returns True if successful, False if not

Return type bool

CLI Example:
salt '*' power.set_computer_sleep 120
salt '*' power.set_computer_sleep off

salt.modules.mac_power.set_display_sleep(minutes)

Set the amount of idle time until the display sleeps. Pass "Never" of "Off" to never sleep.
Parameters **minutes** -- Can be an integer between 1 and 180 or "Never" or "Off"

Ptype int, str

Returns True if successful, False if not

Return type bool

CLI Example:

```bash
salt '*' power.set_display_sleep 120
salt '*' power.set_display_sleep off
```

salt.modules.mac_power.set_harddisk_sleep(**minutes**)

Set the amount of idle time until the harddisk sleeps. Pass "Never" or "Off" to never sleep.

Parameters **minutes** -- Can be an integer between 1 and 180 or "Never" or "Off"

Ptype int, str

Returns True if successful, False if not

Return type bool

CLI Example:

```bash
salt '*' power.set_harddisk_sleep 120
salt '*' power.set_harddisk_sleep off
```

salt.modules.mac_power.set_restart_freeze(**enabled**)

Specifies whether the server restarts automatically after a system freeze. This setting doesn't seem to be editable. The command completes successfully but the setting isn't actually updated. This is probably a macOS. The functions remains in case they ever fix the bug.

Parameters **enabled**(bool) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type bool

CLI Example:

```bash
salt '*' power.set_restart_freeze True
```

salt.modules.mac_power.set_restart_power_failure(**enabled**)

Set whether or not the computer will automatically restart after a power failure.

Parameters **enabled**(bool) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type bool

CLI Example:

```bash
salt '*' power.set_restart_power_failure True
```

salt.modules.mac_power.set_sleep(**minutes**)

Sets the amount of idle time until the machine sleeps. Sets the same value for Computer, Display, and Hard Disk. Pass "Never" or "Off" for computers that should never sleep.

Parameters **minutes** -- Can be an integer between 1 and 180 or "Never" or "Off"

Ptype int, str

Returns True if successful, False if not

Return type bool

CLI Example:

```bash
salt '*' power.set_sleep 120
salt '*' power.set_sleep never
```

salt.modules.mac_power.set_sleep_on_power_button(**enabled**)

Set whether or not the power button can sleep the computer.
Parameters `enabled (bool)` -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type `bool`

CLI Example:

```
salt '*' power.set_sleep_on_power_button True
```

salt.modules.mac_power.set_wake_on_modem(`enabled`)

Set whether or not the computer will wake from sleep when modem activity is detected.

Parameters `enabled (bool)` -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type `bool`

CLI Example:

```
salt '*' power.set_wake_on_modem True
```

salt.modules.mac_power.set_wake_on_network(`enabled`)

Set whether or not the computer will wake from sleep when network activity is detected.

Parameters `enabled (bool)` -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type `bool`

CLI Example:

```
salt '*' power.set_wake_on_network True
```

### 21.9.247 salt.modules.mac_service module

The service module for macOS

New in version 2016.3.0.

This module has support for services in the following locations.

```
/System/Library/LaunchDaemons/
/System/Library/LaunchAgents/
/Library/LaunchDaemons/
/Library/LaunchAgents/
```

# As of version "2019.2.0" support for user-specific services were added.
/Users/foo/Library/LaunchAgents/

Note: As of the 2019.2.0 release, if a service is located in a LaunchAgent path and a `runas` user is NOT specified, the current console user will be used to properly interact with the service.

salt.modules.mac_service.available(`name`)

Check that the given service is available.

Parameters `name (str)` -- The name of the service

Returns True if the service is available, otherwise False

Return type `bool`

CLI Example:
salt '*/' service.available com.openssh.sshd

salt.modules.mac_service.disable(name, runas=None)
Disable a launchd service. Raises an error if the service fails to be disabled
Parameters
  • name (str) -- Service label, file name, or full path
  • runas (str) -- User to run launchctl commands
Returns True if successful or if the service is already disabled
Return type bool

CLI Example:
```
salt '*/' service.disable org.cups.cupsd
```

salt.modules.mac_service.disabled(name, runas=None, domain='system')
Check if the specified service is not enabled. This is the opposite of service.enabled
Parameters
  • name (str) -- The name to look up
  • runas (str) -- User to run launchctl commands
  • domain (str) -- domain to check for disabled services. Default is system.
Returns True if the specified service is NOT enabled, otherwise False
Return type bool

CLI Example:
```
salt '*/' service.disabled org.cups.cupsd
```

salt.modules.mac_service.enable(name, runas=None)
Enable a launchd service. Raises an error if the service fails to be enabled
Parameters
  • name (str) -- Service label, file name, or full path
  • runas (str) -- User to run launchctl commands
Returns True if successful or if the service is already enabled
Return type bool

CLI Example:
```
salt '*/' service.enable org.cups.cupsd
```

salt.modules.mac_service.enabled(name, runas=None)
Check if the specified service is enabled
Parameters
  • name (str) -- The name of the service to look up
  • runas (str) -- User to run launchctl commands
Returns True if the specified service enabled, otherwise False
Return type bool

CLI Example:
```
salt '*/' service.enabled org.cups.cupsd
```

salt.modules.mac_service.get_all(runas=None)
Return a list of services that are enabled or available. Can be used to find the name of a service.
Parameters runas (str) -- User to run launchctl commands
Returns A list of all the services available or enabled
Return type  list
CLI Example:
salt '*' service.get_all

salt.modules.mac_service.get_enabled(runas=None)
Return a list of all services that are enabled. Can be used to find the name of a service.
Parameters runas (str) -- User to run launchctl commands
Returns A list of all the services enabled on the system
Return type  list
CLI Example:
salt '*' service.get_enabled

salt.modules.mac_service.launchctl(sub_cmd, *args, **kwargs)
Run a launchctl command and raise an error if it fails
Parameters
  • sub_cmd (str) -- Sub command supplied to launchctl
  • args (tuple) -- Tuple containing additional arguments to pass to launchctl
  • kwargs (dict) -- Dictionary containing arguments to pass to cmd.run_all
  • return_stdout (bool) -- A keyword argument. If true return the stdout of the
    launchctl command
Returns True if successful, raise CommandExecutionError if not, or the stdout of the
launchctl command if requested
Return type  bool, str
CLI Example:
salt '*' service.launchctl debug org.cups.cupsd

salt.modules.mac_service.list_(name=None, runas=None)
Run launchctl list and return the output
Parameters
  • name (str) -- The name of the service to list
  • runas (str) -- User to run launchctl commands
Returns If a name is passed returns information about the named service, otherwise returns a list
of all services and pids
Return type  str
CLI Example:
salt '*' service.list
salt '*' service.list org.cups.cupsd

salt.modules.mac_service.missing(name)
The inverse of service.available Check that the given service is not available.
Parameters name (str) -- The name of the service
Returns True if the service is not available, otherwise False
Return type  bool
CLI Example:
salt '*' service.missing com.openssh.sshd
salt.modules.mac_service.restart(name, runas=None)
Unloads and reloads a launchd service. Raises an error if the service fails to reload

Parameters

- **name** (*str*) -- Service label, file name, or full path
- **runas** (*str*) -- User to run launchctl commands

Returns  True if successful
Return type  bool

CLI Example:

```
salt '*' service.restart org.cups.cupsd
```

salt.modules.mac_service.show(name)
Show properties of a launchctl service

Parameters **name** (*str*) -- Service label, file name, or full path

Returns  The service information if the service is found
Return type  dict

CLI Example:

```
salt '*' service.show org.cups.cupsd # service label
salt '*' service.show org.cups.cupsd.plist # file name
salt '*' service.show /System/Library/LaunchDaemons/org.cups.cupsd.plist # full path
```

salt.modules.mac_service.start(name, runas=None)
Start a launchd service. Raises an error if the service fails to start

Note: To start a service in macOS the service must be enabled first. Use `service.enable` to enable the service.

Parameters

- **name** (*str*) -- Service label, file name, or full path
- **runas** (*str*) -- User to run launchctl commands

Returns  True if successful or if the service is already running
Return type  bool

CLI Example:

```
salt '*' service.start org.cups.cupsd
```

salt.modules.mac_service.status(name, sig=None, runas=None)
Return the status for a service.

Parameters

- **name** (*str*) -- Used to find the service from launchctl. Can be any part of the service name or a regex expression.
- **sig** (*str*) -- Find the service with status.pid instead. Note that `name` must still be provided.
- **runas** (*str*) -- User to run launchctl commands

Returns  The PID for the service if it is running, or 'loaded' if the service should not always have a PID, or otherwise an empty string
Return type  str

CLI Example:
*salt* `service.status cups`

**salt.modules.mac_service.stop** *(name, runas=None)*
Stop a launchd service. Raises an error if the service fails to stop

**Note:** Though `service.stop` will unload a service in macOS, the service will start on next boot unless it is disabled. Use `service.disable` to disable the service

**Parameters**
- **name** *(str)* -- Service label, file name, or full path
- **runas** *(str)* -- User to run launchctl commands

**Returns**
- True if successful or if the service is already stopped

**Return type**
- bool

**CLI Example:**
*salt ')* `service.stop org.cups.cupsd`

### 21.9.248 salt.modules.mac_shadow module

Manage macOS local directory passwords and policies

New in version 2016.3.0.

**Note** that it is usually better to apply password policies through the creation of a configuration profile.

**salt.modules.mac_shadow.del_password** *(name)*

Delete the account password

**Parameters**
- **name** *(str)* -- The user name of the account

**Returns**
- True if successful, otherwise False

**Return type**
- bool

**Raises**
- CommandExecutionError on user not found or any other unknown error

**CLI Example:**
*salt ')* `shadow.del_password username`

**salt.modules.mac_shadow.get_account_created** *(name)*

Get the date/time the account was created

**Parameters**
- **name** *(str)* -- The username of the account

**Returns**
- The date/time the account was created (yyyy-mm-dd hh:mm:ss)

**Return type**
- str

**Raises**
- CommandExecutionError on user not found or any other unknown error

**CLI Example:**
*salt ')* `shadow.get_account_created admin`

**salt.modules.mac_shadow.get_change** *(name)*

Gets the date on which the password expires

**Parameters**
- **name** *(str)* -- The name of the user account

**Returns**
- The date the password will expire

**Return type**
- str

**Raises**
- CommandExecutionError on user not found or any other unknown error

**CLI Example:**
salt '*' shadow.get_change username

```
salt.modules.mac_shadow.get_expire(name)
    Gets the date on which the account expires
    Parameters name (str) -- The name of the user account
    Returns The date the account expires
    Return type str
    Raises CommandExecutionError on user not found or any other unknown error
    CLI Example:
    ```
salt '*' shadow.get_expire username
```

```
salt.modules.mac_shadow.get_last_change(name)
    Get the date/time the account was changed
    Parameters name (str) -- The username of the account
    Returns The date/time the account was modified (yyyy-mm-dd hh:mm:ss)
    Return type str
    Raises CommandExecutionError on user not found or any other unknown error
    CLI Example:
    ```
salt '*' shadow.get_last_change admin
```

```
salt.modules.mac_shadow.get_login_failed_count(name)
    Get the number of failed login attempts
    Parameters name (str) -- The username of the account
    Returns The number of failed login attempts
    Return type int
    Raises CommandExecutionError on user not found or any other unknown error
    CLI Example:
    ```
salt '*' shadow.get_login_failed_count admin
```

```
salt.modules.mac_shadow.get_login_failed_last(name)
    Get the date/time of the last failed login attempt
    Parameters name (str) -- The username of the account
    Returns The date/time of the last failed login attempt on this account (yyyy-mm-dd hh:mm:ss)
    Return type str
    Raises CommandExecutionError on user not found or any other unknown error
    CLI Example:
    ```
salt '*' shadow.get_login_failed_last admin
```

```
salt.modules.mac_shadow.get_maxdays(name)
    Get the maximum age of the password
    Parameters name (str) -- The username of the account
    Returns The maximum age of the password in days
    Return type int
    Raises CommandExecutionError on user not found or any other unknown error
    CLI Example:
    ```
salt '*' shadow.get_maxdays admin 90
```

```
salt.modules.mac_shadow.info(name)
    Return information for the specified user
    Parameters name (str) -- The username
```
Returns A dictionary containing the user’s shadow information
Return type dict

CLI Example:
salt '*' shadow.info admin

salt.modules.mac_shadow.set_change(name, date)
Sets the date on which the password expires. The user will be required to change their password. Format is mm/dd/yyyy
Parameters
- name (str) -- The name of the user account
- date (date) -- The date the password will expire. Must be in mm/dd/yyyy format.
Returns True if successful, otherwise False
Return type bool
Raises CommandExecutionError on user not found or any other unknown error

CLI Example:
salt '*' shadow.set_change username 09/21/2016

salt.modules.mac_shadow.set_expire(name, date)
Sets the date on which the account expires. The user will not be able to login after this date. Date format is mm/dd/yyyy
Parameters
- name (str) -- The name of the user account
- date (datetime) -- The date the account will expire. Format must be mm/dd/yyyy.
Returns True if successful, False if not
Return type bool
Raises CommandExecutionError on user not found or any other unknown error

CLI Example:
salt '*' shadow.set_expire username 07/23/2015

salt.modules.mac_shadow.set_inactdays(name, days)
Set the number if inactive days before the account is locked. Not available in macOS
Parameters
- name (str) -- The user name
- days (int) -- The number of days
Returns Will always return False until macOS supports this feature.
Return type bool

CLI Example:
salt '*' shadow.set_inactdays admin 90

salt.modules.mac_shadow.set_maxdays(name, days)
Set the maximum age of the password in days
Parameters
- name (str) -- The username of the account
- days (int) -- The maximum age of the account in days
Returns True if successful, False if not
Return type bool
Raises CommandExecutionError on user not found or any other unknown error
CLI Example:
```
salt '*' shadow.set_maxdays admin 90
```

`salt.modules.mac_shadow.set_mindays(name, days)`
Set the minimum password age in days. Not available in macOS.

Parameters
- `name (str)` -- The user name
- `days (int)` -- The number of days

Returns
Will always return False until macOS supports this feature.

Return type
`bool`

CLI Example:
```
salt '*' shadow.set_mindays admin 90
```

`salt.modules.mac_shadow.set_password(name, password)`
Set the password for a named user (insecure, the password will be in the process list while the command is running).

Parameters
- `name (str)` -- The name of the local user, which is assumed to be in the local directory service
- `password (str)` -- The plaintext password to set

Returns
True if successful, otherwise False

Return type
`bool`

Raises
`CommandExecutionError` on user not found or any other unknown error

CLI Example:
```
salt '*' mac_shadow.set_password macuser macpassword
```

`salt.modules.mac_shadow.set_warndays(name, days)`
Set the number of days before the password expires that the user will start to see a warning. Not available in macOS

Parameters
- `name (str)` -- The user name
- `days (int)` -- The number of days

Returns
Will always return False until macOS supports this feature.

Return type
`bool`

CLI Example:
```
salt '*' shadow.set_warndays admin 90
```

### 21.9.249 `salt.modules.mac_softwareupdate` module

Support for the softwareupdate command on MacOS.

`salt.modules.mac_softwareupdate.download(name)`
Download a named update so that it can be installed later with the `update` or `update_all` functions

Parameters
- `name (str)` -- The update to download.

Returns
True if successful, otherwise False

Return type
`bool`

CLI Example:
salt.modules.mac_softwareupdate.download_all(recommended=False, restart=True)

Download all available updates so that they can be installed later with the update or update_all functions. It returns a list of updates that are now downloaded.

Parameters

- **recommended** (bool) -- If set to True, only install the recommended updates. If set to False (default) all updates are installed.
- **restart** (bool) -- Set this to False if you do not want to install updates that require a restart. Default is True

Returns A list containing all downloaded updates on the system.

Return type list

CLI Example:

```sh
salt '*' softwareupdate.download_all
```

salt.modules.mac_softwareupdate.get_catalog()

New in version 2016.3.0.

Get the current catalog being used for update lookups. Will return a url if a custom catalog has been specified. Otherwise the word 'Default' will be returned

Returns The catalog being used for update lookups

Return type str

CLI Example:

```sh
salt '*' softwareupdates.get_catalog
```

salt.modules.mac_softwareupdate.ignore(name)

Ignore a specific program update. When an update is ignored the '-' and version number at the end will be omitted, so "SecUpd2014-001-1.0" becomes "SecUpd2014-001". It will be removed automatically if present. An update is successfully ignored when it no longer shows up after list_updates.

Parameters name -- The name of the update to add to the ignore list.

Ptype str

Returns True if successful, False if not

Return type bool

CLI Example:

```sh
salt '*' softwareupdate.ignore <update-name>
```

salt.modules.mac_softwareupdate.list_available(recommended=False, restart=False)

List all available updates.

Parameters

- **recommended** (bool) -- Show only recommended updates.
- **restart** (bool) -- Show only updates that require a restart.

Returns Returns a dictionary containing the updates

Return type dict

CLI Example:

```sh
salt '*' softwareupdate.list_available
```

salt.modules.mac_softwareupdate.list_downloads()

Return a list of all updates that have been downloaded locally.
Returns A list of updates that have been downloaded
Return type  list
CLI Example:

```salt '*' softwareupdate.list_downloads
```

salt.modules.mac_softwareupdate.list_ignored()
List all updates that have been ignored. Ignored updates are shown without the '-' and version number at the end, this is how the softwareupdate command works.
Returns The list of ignored updates
Return type  list
CLI Example:

```salt '*' softwareupdate.list_ignored
```

salt.modules.mac_softwareupdate.reset_catalog()
New in version 2016.3.0.
Reset the Software Update Catalog to the default.
Returns True if successful, False if not
Return type  bool
CLI Example:

```salt '*' softwareupdates.reset_catalog
```

salt.modules.mac_softwareupdate.reset_ignored()
Make sure the ignored updates are not ignored anymore, returns a list of the updates that are no longer ignored.
Returns True if the list was reset, Otherwise False
Return type  bool
CLI Example:

```salt '*' softwareupdate.reset_ignored
```

salt.modules.mac_softwareupdate.schedule_enable(enable)
Enable/disable automatic update scheduling.
Parameters enable -- True/On/Yes/1 to turn on automatic updates. False/No/Off/0 to turn off automatic updates. If this value is empty, the current status will be returned.
Type  bool str
Returns True if scheduling is enabled, False if disabled
Return type  bool
CLI Example:

```salt '*' softwareupdate.schedule_enable on|off
```

salt.modules.mac_softwareupdate.schedule_enabled()
Check the status of automatic update scheduling.
Returns True if scheduling is enabled, False if disabled
Return type  bool
CLI Example:

```salt '*' softwareupdate.schedule_enabled
```

salt.modules.mac_softwareupdate.set_catalog(url)
New in version 2016.3.0.
Set the Software Update Catalog to the URL specified
Parameters url (str) -- The url to the update catalog
Returns  True if successful, False if not
Return type  bool

CLI Example:
```
salt '*' softwareupdates.set_catalog http://swupd.local:8888/index.sucatalog
```

**salt.modules.mac_softwareupdate.update(name)**

Install a named update.

Parameters
- name (str) -- The name of the update to install.

Returns  True if successfully updated, otherwise False
Return type  bool

CLI Example:
```
salt '*' softwareupdate.update <update-name>
```

**salt.modules.mac_softwareupdate.update_all(recommended=False, restart=True)**

Install all available updates. Returns a dictionary containing the name of the update and the status of its installation.

Parameters
- recommended (bool) -- If set to True, only install the recommended updates. If set to False (default) all updates are installed.
- restart (bool) -- Set this to False if you do not want to install updates that require a restart. Default is True

Returns  A dictionary containing the updates that were installed and the status of its installation. If no updates were installed an empty dictionary is returned.
Return type  dict

CLI Example:
```
salt '*' softwareupdate.update_all
```

**salt.modules.mac_softwareupdate.update_available(name)**

Check whether or not an update is available with a given name.

Parameters
- name (str) -- The name of the update to look for

Returns  True if available, False if not
Return type  bool

CLI Example:
```
salt '*' softwareupdate.update_available <update-name>
salt '*' softwareupdate.update_available "<update with whitespace>"
```

21.9.250  **salt.modules.mac_sysctl module**

Module for viewing and modifying sysctl parameters

**salt.modules.mac_sysctl.assign(name, value)**

Assign a single sysctl parameter for this minion

name  The name of the sysctl value to edit.
value  The sysctl value to apply.

CLI Example:
```
salt '*' sysctl.assign net.inet.icmp.icmplim 50
```

**salt.modules.mac_sysctl.get(name)**

Return a single sysctl parameter for this minion
name The name of the sysctl value to display.

CLI Example:

```
salt '*' sysctl.get hw.physmem
```

**salt.modules.mac_sysctl.persist(name, value, config='/etc/sysctl.conf', apply_change=False)**

Assign and persist a simple sysctl parameter for this minion

- **name** The name of the sysctl value to edit.
- **value** The sysctl value to apply.
- **config** The location of the sysctl configuration file.
- **apply_change** Default is False; Default behavior only creates or edits the sysctl.conf file. If apply is set to True, the changes are applied to the system.

CLI Example:

```
salt '*' sysctl.persist net.inet.icmp.icmplim 50
salt '*' sysctl.persist coretemp_load NO config=/etc/sysctl.conf
```

**salt.modules.mac_sysctl.show(config_file=False)**

Return a list of sysctl parameters for this minion

CLI Example:

```
salt '*' sysctl.show
```

## 21.9.251 salt.modules.mac_system module

System module for sleeping, restarting, and shutting down the system on Mac OS X

New in version 2016.3.0.

**Warning:** Using this module will enable *atrun* on the system if it is disabled.

**salt.modules.mac_system.get_boot_arch()**

Get the kernel architecture setting from `com.apple.Boot.plist`

- **Returns** A string value representing the boot architecture setting
- **Return type** `str`

CLI Example:

```
salt '*' system.get_boot_arch
```

**salt.modules.mac_system.get_computer_name()**

Gets the computer name

- **Returns** The computer name
- **Return type** `str`

CLI Example:

```
salt '*' system.get_computer_name
```

**salt.modules.mac_system.get_disable_keyboard_on_lock()**

Get whether or not the keyboard should be disabled when the X Serve enclosure lock is engaged.

- **Returns** True if disable keyboard on lock is on, False if off
- **Return type** `bool`
CLI Example:

```bash
salt '*' system.get_disable_keyboard_on_lock
```

**salt.modules.mac_system.get_remote_events()**
Displays whether remote apple events are on or off.

- **Returns** True if remote apple events are on, False if off
- **Return type** bool

CLI Example:

```bash
salt '*' system.get_remote_events
```

**salt.modules.mac_system.get_remote_login()**
Displays whether remote login (SSH) is on or off.

- **Returns** True if remote login is on, False if off
- **Return type** bool

CLI Example:

```bash
salt '*' system.get_remote_login
```

**salt.modules.mac_system.get_restart_delay()**
Get the number of seconds after which the computer will start up after a power failure.

- **Returns** A string value representing the number of seconds the system will delay restart after power loss
- **Return type** str

CLI Example:

```bash
salt '*' system.get_restart_delay
```

**salt.modules.mac_system.get_startup_disk()**
Displays the current startup disk

- **Returns** The current startup disk
- **Return type** str

CLI Example:

```bash
salt '*' system.get_startup_disk
```

**salt.modules.mac_system.get_subnet_name()**
Gets the local subnet name

- **Returns** The local subnet name
- **Return type** str

CLI Example:

```bash
salt '*' system.get_subnet_name
```

**salt.modules.mac_system.halt(at_time=None)**
Halt a running system

- **Parameters**
  - **at_time** *(str)* -- Any valid at expression. For example, some valid at expressions could be:
    - noon
    - midnight
    - fri
    - 9:00 AM
- 2:30 PM tomorrow
- now + 10 minutes

**Note:** If you pass a time only, with no ‘AM/PM’ designation, you have to double quote the parameter on the command line. For example: "14:00"

CLI Example:

```bash
salt '*' system.halt
salt '*' system.halt 'now + 10 minutes'
```

**salt.modules.mac_system.list_startup_disks()**

List all valid startup disks on the system.

**Returns** A list of valid startup disks

**Return type** list

CLI Example:

```bash
salt '*' system.list_startup_disks
```

**salt.modules.mac_system.restart(at_time=None)**

Restart the system

**Parameters**

-

**at_time** *(str)* -- Any valid at expression. For example, some valid at expressions could be:

- noon
- midnight
- fri
- 9:00 AM
- 2:30 PM tomorrow
- now + 10 minutes

**Note:** If you pass a time only, with no ‘AM/PM’ designation, you have to double quote the parameter on the command line. For example: "14:00"

CLI Example:

```bash
salt '*' system.restart
salt '*' system.restart '12:00 PM fri'
```

**salt.modules.mac_system.set_boot_arch(arch='default')**

Set the kernel to boot in 32 or 64 bit mode on next boot.

**Note:** When this function fails with the error changes to kernel architecture failed to save!, then the boot arch is not updated. This is either an Apple bug, not available on the test system, or a result of system files being locked down in macOS (SIP Protection).

**Parameters**

-

**arch** *(str)* -- A string representing the desired architecture. If no value is passed, default is assumed. Valid values include:

- i386
• x86_64
• default

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' system.set_boot_arch i386
```

salt.modules.mac_system.set_computer_name(name)

Set the computer name

Parameters name (str) -- The new computer name

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' system.set_computer_name "Mike's Mac"
```

salt.modules.mac_system.set_disable_keyboard_on_lock(enable)

Get whether or not the keyboard should be disabled when the X Serve enclosure lock is engaged.

Parameters enable (bool) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' system.set_disable_keyboard_on_lock False
```

salt.modules.mac_system.set_remote_events(enable)

Set whether the server responds to events sent by other computers (such as AppleScripts)

Parameters enable (bool) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' system.set_remote_events On
```

salt.modules.mac_system.set_remote_login(enable)

Set the remote login (SSH) to either on or off.

Parameters enable (bool) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' system.set_remote_login True
```

salt.modules.mac_system.set_restart_delay(seconds)

Set the number of seconds after which the computer will start up after a power failure.

Warning: This command fails with the following error:

Error, IOServiceOpen returned 0x10000003
The setting is not updated. This is an apple bug. It seems like it may only work on certain versions of Mac Server X. This article explains the issue in more detail, though it is quite old.

**Parameters**

- **seconds** *(int)* -- The number of seconds. Must be a multiple of 30  
  
**Returns**  
True if successful, False if not  

**Return type**  
`bool`

**CLI Example:**

```bash
salt '*' system.set_restart_delay 180
```

**salt.modules.mac_system.set_startups_disk** *(path)*

Set the current startup disk to the indicated path. Use `system.list_startup_disks` to find valid startup disks on the system.

**Parameters**

- **path** *(str)* -- The valid startup disk path  
  
**Returns**  
True if successful, False if not  

**Return type**  
`bool`

**CLI Example:**

```bash
salt '*' system.set_startup_disk /System/Library/CoreServices
```

**salt.modules.mac_system.set_subnet_name** *(name)*

Set the local subnet name

**Parameters**

- **name** *(str)* -- The new local subnet name  
  
**Note:** Spaces are changed to dashes. Other special characters are removed.

**Returns**  
True if successful, False if not  

**Return type**  
`bool`

**CLI Example:**

```bash
salt '*' system.set_subnet_name "Mike's Mac"
```

**salt.modules.mac_system.shutdown** *(at_time=None)*

Shutdown the system

**Parameters**

- **at_time** *(str)* -- Any valid at expression. For example, some valid at expressions could be:

  - noon
  - midnight
  - fri
  - 9:00 AM
  - 2:30 PM tomorrow
  - now + 10 minutes

**Note:** If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: "14:00"

21.9. execution modules
CLI Example:

```bash
salt '*' system.shutdown
salt '*' system.shutdown 'now + 1 hour'
```

**salt.modules.mac_system.sleep** *(at_time=None)*

Sleep the system. If a user is active on the system it will likely fail to sleep.

**Parameters**

- `at_time` *(str)* -- Any valid `at` expression. For example, some valid `at` expressions could be:
  - noon
  - midnight
  - fri
  - 9:00 AM
  - 2:30 PM tomorrow
  - now + 10 minutes

**Note:** If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: "14:00"

CLI Example:

```bash
salt '*' system.sleep
salt '*' system.sleep '10:00 PM'
```

### 21.9.252 salt.modules.mac_timezone module

Module for editing date/time settings on macOS

New in version 2016.3.0.

**salt.modules.mac_timezone.get_date()**

Displays the current date

- **Returns** the system date
- **Return type** str

CLI Example:

```bash
salt '*' timezone.get_date
```

**salt.modules.mac_timezone.get_hwclock()**

Get current hardware clock setting (UTC or localtime)

CLI Example:

```bash
salt '*' timezone.get_hwclock
```

**salt.modules.mac_timezone.get_offset()**

Displays the current time zone offset

- **Returns** The current time zone offset
- **Return type** str

CLI Example:
salt '※' timezone.get_offset

salt.modules.mac_timezone.get_time()
Get the current system time.

Returns: The current time in 24 hour format
Return type: str

CLI Example:

salt '※' timezone.get_time

salt.modules.mac_timezone.get_time_server()
Display the currently set network time server.

Returns: the network time server
Return type: str

CLI Example:

salt '※' timezone.get_time_server

salt.modules.mac_timezone.get_using_network_time()
Display whether network time is on or off

Returns: True if network time is on, False if off
Return type: bool

CLI Example:

salt '※' timezone.get_using_network_time

salt.modules.mac_timezone.get_zone()
Displays the current time zone

Returns: The current time zone
Return type: str

CLI Example:

salt '※' timezone.get_zone

salt.modules.mac_timezone.get_zonecode()
Displays the current time zone abbreviated code

Returns: The current time zone code
Return type: str

CLI Example:

salt '※' timezone.get_zonecode

salt.modules.mac_timezone.list_zones()
Displays a list of available time zones. Use this list when setting a time zone using timezone.set_zone

Returns: a list of time zones
Return type: list

CLI Example:

salt '※' timezone.list_zones

salt.modules.mac_timezone.set_date(date)
Set the current month, day, and year

Parameters:
- date (str) -- The date to set. Valid date formats are:
  - %m:%d:%y

21.9. execution modules
Returns  True if successful, False if not
Return type  bool
Raises  SaltInvocationError on Invalid Date format
Raises  CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_date 1/13/2016
```

salt.modules.mac_timezone.set_hwclock(clock)
Sets the hardware clock to be either UTC or localtime

CLI Example:

```
salt '*' timezone.set_hwclock UTC
```

salt.modules.mac_timezone.set_time(time)
Sets the current time. Must be in 24 hour format.

Parameters  time (str) -- The time to set in 24 hour format. The value must be double quoted.
ie: "17:46"

Returns  True if successful, False if not
Return type  bool
Raises  SaltInvocationError on Invalid Time format
Raises  CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_time "17:34"
```

salt.modules.mac_timezone.set_time_server(time_server='time.apple.com')
Designates a network time server. Enter the IP address or DNS name for the network time server.

Parameters  time_server -- IP or DNS name of the network time server. If nothing is passed
the time server will be set to the macOS default of 'time.apple.com'

Type  str
Returns  True if successful, False if not
Return type  bool
Raises  CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_time_server time.acme.com
```

salt.modules.mac_timezone.set_using_network_time(enable)
Set whether network time is on or off.

Parameters  enable -- True to enable, False to disable. Can also use 'on' or 'off'

Type  str bool
Returns  True if successful, False if not
Return type  bool
Raises  CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_using_network_time True
```

salt.modules.mac_timezone.set_zone(time_zone)
Set the local time zone. Use timezone.list_zones to list valid time_zone arguments
Parameters **time_zone** *(str)* -- The time zone to apply

Returns True if successful, False if not

Return type bool

Raises SaltInvocationError on Invalid Timezone

Raises CommandExecutionError on failure

CLI Example:
```
salt '*' timezone.set_zone America/Denver
```

```python
def zone_compare(time_zone)
    # Compares the given timezone name with the system timezone name.
    # Returns True if they are the same, False if not
    return bool
```

CLI Example:
```
salt '*' timezone.zone_compare America/Boise
```

### 21.9.253 salt.modules.mac_user

**Manage users on Mac OS 10.7+**

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to 'user.info' is not available), see [here](#).

```python
def add(name, uid=None, gid=None, groups=None, home=None, shell=None, full_name=None, createhome=True, **kwargs)
    # Add a user to the minion
    return bool
```

CLI Example:
```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

```python
def chfullname(name, fullname)
    # Change the user's Full Name
    return bool
```

CLI Example:
```
salt '*' user.chfullname foo 'Foo Bar'
```

```python
def chgid(name, gid)
    # Change the default group of the user
    return bool
```

CLI Example:
```
salt '*' user.chgid foo 4376
```

```python
def chgroups(name, groups, append=False)
    # Change the groups to which the user belongs. Note that the user's primary group does not have to be one of the groups passed, membership in the user's primary group is automatically assumed.
    # groups Groups to which the user should belong, can be passed either as a python list or a comma-separated string
    # append Instead of removing user from groups not included in the groups parameter, just add user to any groups for which they are not members
    return bool
```

CLI Example:
salt '*' user.chgroups foo wheel,root

salt.modules.mac_user.chhome(name, home, **kwargs)
Change the home directory of the user

CLI Example:
salt '*' user.chhome foo /Users/foo

salt.modules.mac_user.chshell(name, shell)
Change the default shell of the user

CLI Example:
salt '*' user.chshell foo /bin/zsh

salt.modules.mac_user.chuid(name, uid)
Change the uid for a named user

CLI Example:
salt '*' user.chuid foo 4376

salt.modules.mac_user.delete(name, remove=False, force=False)
Remove a user from the minion

CLI Example:
salt '*' user.delete name remove=True force=True

salt.modules.mac_user.disable_auto_login()
New in version 2016.3.0.
Disables auto login on the machine
Returns True if successful, otherwise False
Return type bool

CLI Example:
salt '*' user.disable_auto_login

salt.modules.mac_user.enable_auto_login(name, password)
New in version 2016.3.0.
Configures the machine to auto login with the specified user
Parameters

• name (str) -- The user account use for auto login
• password (str) -- The password to user for auto login

New in version 2017.7.3.
Returns True if successful, otherwise False
Return type bool

CLI Example:
salt '*' user.enable_auto_login stevej

salt.modules.mac_user.get_auto_login()
New in version 2016.3.0.
Gets the current setting for Auto Login

Returns If enabled, returns the user name, otherwise returns False

Return type str, bool

CLI Example:

```
salt '*' user.get_auto_login
```

salt.modules.mac_user.getent(refresh=False)

Return the list of all info for all users

CLI Example:

```
salt '*' user.getent
```

salt.modules.mac_user.info(name)

Return user information

CLI Example:

```
salt '*' user.info root
```

salt.modules.mac_user.list_groups(name)

Return a list of groups the named user belongs to.

name

The name of the user for which to list groups. Starting in Salt 2016.11.0, all groups for the user, including groups beginning with an underscore will be listed.

Changed in version 2016.11.0.

CLI Example:

```
salt '*' user.list_groups foo
```

salt.modules.mac_user.list_users()

Return a list of all users

CLI Example:

```
salt '*' user.list_users
```

salt.modules.mac_user.primary_group(name)

Return the primary group of the named user

New in version 2016.3.0.

CLI Example:

```
salt '*' user.primary_group saltadmin
```

salt.modules.mac_user.rename(name, new_name)

Change the username for a named user

CLI Example:

```
salt '*' user.rename name new_name
```
21.9.254 salt.modules.mac_xattr module

This module allows you to manage extended attributes on files or directories

```
salt '*' xattr.list /path/to/file
```

salt.modules.mac_xattr.clear(path)
Causes the all attributes on the file/directory to be removed

```
Parameters path (str) -- The file(s) to get attributes from
Returns True if successful, otherwise False
Raises CommandExecutionError on file not found or any other unknown error
CLI Example:
```
salt '*' xattr.delete /path/to/file "com.test.attr"
```

salt.modules.mac_xattr.delete(path, attribute)
Removes the given attribute from the file

```
Parameters

  • path (str) -- The file(s) to get attributes from

  • attribute (str) -- The attribute name to be deleted from the file/directory

Returns True if successful, otherwise False
Return type bool
Raises CommandExecutionError on file not found, attribute not found, and any other unknown error
CLI Example:
```
salt '*' xattr.delete /path/to/file "com.test.attr"
```

salt.modules.mac_xattr.list_(path, **kwargs)
List all of the extended attributes on the given file/directory

```
Parameters

  • path (str) -- The file(s) to get attributes from

  • hex (bool) -- Return the values with forced hexadecimal values

Returns A dictionary containing extended attributes and values for the given file
Return type dict
Raises CommandExecutionError on file not found or any other unknown error
CLI Example:
```
salt '*' xattr.list /path/to/file
salt '*' xattr.list /path/to/file hex=True
```

salt.modules.mac_xattr.read(path, attribute, **kwargs)
Read the given attributes on the given file/directory

```
Parameters

  • path (str) -- The file to get attributes from

  • attribute (str) -- The attribute to read

  • hex (bool) -- Return the values with forced hexadecimal values

Returns A string containing the value of the named attribute
Return type str
Raises CommandExecutionError on file not found, attribute not found, and any other unknown error
CLI Example:
```
salt 'x' xattr.read /path/to/file com.test.attr
salt 'x' xattr.read /path/to/file com.test.attr hex=True

```
xattr.read(path, attribute, value, **kwargs)
```

Causes the given attribute name to be assigned the given value

- **path** *(str)* -- The file(s) to get attributes from
- **attribute** *(str)* -- The attribute name to be written to the file/directory
- **value** *(str)* -- The value to assign to the given attribute
- **hex** *(bool)* -- Set the values with forced hexadecimal values

**Parameters**

- **path** *(str)* -- The file(s) to get attributes from
- **attribute** *(str)* -- The attribute name to be written to the file/directory
- **value** *(str)* -- The value to assign to the given attribute
- **hex** *(bool)* -- Set the values with forced hexadecimal values

**Returns**

True if successful, otherwise False

**Return type** bool

**Raises** CommandExecutionError on file not found or any other unknown error

**CLI Example:**

```
salt 'x' xattr.write /path/to/file "com.test.attr" "value"
```

---

## 21.9.255 salt.modules.macdefaults

Set defaults on Mac OS

```
xattr.read(path, attribute, value, **kwargs)
```

Causes the given attribute name to be assigned the given value

**Parameters**

- **domain** *(str)* -- The name of the domain to read from
- **key** *(str)* -- The key of the given domain to read from
